Employment outlook: 2008–18

The employment projections for 2008–18 3

An overview of the 10-year projections of the U.S. macroeconomy, labor force, industry output and employment, and occupational employment

Kristina J. Bartsch

The U.S. economy to 2018: from recession to recovery 11

Real GDP growth is expected to average 2.4 percent annually over the next decade while productivity growth is expected to slow

Ian D. Wyatt and Kathryn J. Byun

Labor force projections to 2018: older workers staying more active 30

Labor force trends—such as slowed growth, aging, and increasing diversity—are expected to continue to transform this large and dynamic workforce

Mitra Toossi

Industry output and employment projections to 2018 52

The professional and business services and health care and social assistance sectors account for more than half of the projected new jobs

Rose A. Woods

Occupational employment projections to 2018 82

Total employment, a measure of all jobs in the U.S. economy, is projected to increase by 15.3 million over the 2008–18 period, representing a growth rate of 10.1 percent

T. Alan Lacey and Benjamin Wright

The November Review

The Bureau of Labor Statistics began developing long-term employment projections nearly 60 years ago, soon after World War II ended, to provide career information to veterans reentering the civilian workforce. As Kristina J. Bartsch notes in the initial article this month, the customer base for the BLS projections—which are updated every 2 years—has widened substantially. High school and college students, adult jobseekers and career changers, guidance counselors, career development specialists, and others are now routine users of the information. The *Review* serves as the principal vehicle for a detailed look at the various components of the projections, including projected changes in the labor force and the industrial and occupational mix of employment. This issue presents five articles showcasing the newest set of projections, which cover the 2008–18 period.

Ian D. Wyatt and Kathryn J. Byun present an article describing the macroeconomic projections that serve as a key component in the development of the overall set of projections. The use of 2008 as a base for the new projection period is an example of a rare occurrence, as for just the second time in the last 3 decades a year characterized by an economic recession serves as the basis for the BLS projections. The article discusses projected data on output, productivity, personal savings, and other macroeconomic variables. Although the recession has had a notable impact on the current economy, in terms of job loss and unemployment, the long-term horizon is not expected to change drastically because short-term fluctuations tend to smooth out substantially over the long term. As with most recessions, the downturn's impact has been unevenly distributed throughout the

economy, with some sectors experiencing large job declines and others being not so severely affected. The authors give examples of how some recessionary effects influence the projections.

Labor force projections serve as a crucial parameter influencing all of the macroeconomic, industry, and occupational projections. As described in the article by Mitra Toossi, slower population growth is expected over the projections period than that which occurred in the years spanning 1998–2008. This will, in part, affect labor force growth, which is projected to slow from its 1.1-percent growth rate for the 1998–2008 period to 0.8 percent for the projection period. A shrinking rate of participation in the labor force also will contribute to slower labor force growth. The aging of the population, as the so-called baby-boom generation (those born between 1946 and 1964) moves into age groups that traditionally have lower labor force participation rates, will be one of the prime contributors to the slowing of labor force growth. The continuation of recent trends showing lower labor force participation rates for the youngest working-age groups also is seen as a contributor.

With the foundation for the macroeconomic and labor force projections laid, BLS develops industry employment and output projections at a detailed level. Rose A. Woods points out that total employment in the United States is expected to increase by 15.3 million over the 2008–18 period, rising to more than 165 million. This represents a 1.0-percent average annual growth rate, one somewhat faster than the 0.7-percent annual rate experienced during the 1998–2008 period. In general, BLS does not foresee large structural changes to the economy. The professional and business services sector and the health care and social assistance sector account for more than half

of projected job growth. Construction also is expected to add jobs, whereas manufacturing and agricultural employment is expected to decline, although at more moderate rates than seen historically. With regard to industry employment changes at a more detailed level, the educational services sector is projected to have the most rapid growth in the economy, adding over 800,000 jobs by 2018—an average annual growth rate of 2.4 percent. In terms of output, the information sector, perhaps not surprisingly, is projected to have the fastest growth, increasing by nearly 5.5 percent per year.

The final article in this issue of the *Review*, by Alan Lacey and Benjamin Wright, presents the employment outlook by occupational group, as well as for 750 detailed occupations. It discusses sources of job openings and describes typical education and training for workers in new and existing jobs in the economy. In 2008, the occupational groups with the highest levels of employment were professional and related occupations, and service occupations. Because of their large size, as well as their relatively fast projected growth rates (each over 13 percent, as compared with the 10-percent growth projected for the average of all occupations), these two categories together are expected to add more than 9 million of the 15.3 million new jobs created throughout the economy over the projection period. Both groups also will see their shares of overall employment increase. □

Want more projections?

In addition to the November *Review*, BLS also is issuing a news release providing an overview of the new projections, a special issue of the *Occupational Outlook Quarterly*, and other materials. All of these items are available on the Bureau's Web site (www.bls.gov).

Employment outlook: 2008–18

The employment projections for 2008–18

The employment structure of the U.S. economy in 2018 is expected to remain similar to that of 2008, although changes in shares of employment will result from continuing increases or declines among some occupations; in general, goods-producing sectors, excluding agriculture, will lose employment while service-providing sectors will expand

Kristina J. Bartsch

This issue of the *Monthly Labor Review* marks the release of the 2008–18 employment projections of the Bureau of Labor Statistics (BLS). Four sets of projections are presented in separate articles on the labor force, the U.S. macroeconomy, industry output and employment, and occupational employment. These articles outline the assumptions and rationales underlying expected changes in the economy and present detailed results for each set of projections. For just the second time in the last 30 years, the base-year employment and output of the projections reflect an economy in a deep recession.¹ Among the major highlights of the 2008–18 projections are the following:

- Slowdowns in population, labor force, and productivity growth, among other factors, are expected to keep real gross domestic product (GDP) growth at 2.4 percent annually between 2008 and 2018, very close to the 2.5-percent growth seen in the previous decade.
- Annual employment growth of 1.0 percent is projected to add about 15.3 million new jobs to the economy by

2018, with total employment growing from 150.9 million to 166.2 million.

- The professional and business services sector and the health care and social assistance sector are anticipated to grow at more than twice the annual average of 1.0 percent for all industries, adding the most employment, 4.2 million and 4.0 million, respectively.
- Nearly two-thirds of the 30 occupations with the largest expected numerical increase have short-, moderate-, or long-term on-the-job training as their most significant source of education or training.

The BLS started developing long-term employment projections nearly 60 years ago, soon after World War II ended, to provide career information to veterans reentering the civilian workforce. Today, the customer base for the BLS projections has widened considerably and includes high school and college students, adult jobseekers and career changers, career development specialists, guidance counselors, other Federal agencies, and academic and other researchers. State workforce agencies use the BLS national projections as their starting point for preparing State and local area industry and occupational employment projections.

Kristina J. Bartsch is Chief, Occupational Outlook Division, Office of Occupational Statistics and Employment Projections, Bureau of Labor Statistics. E-mail: bartsch.kristina@bls.gov

The time horizon for the projections is 10 years, and the projections are updated every other year.

The first section of this article focuses on how the recession affected the development and results of the 2008–18 projections. Next, a summary of the labor force projections is presented, followed by a brief overview of the macroeconomic projections. The labor force and macroeconomic assumptions and projections provide the foundation and context for the projections of industry output and employment and occupational employment. Finally, the article concludes with some highlights of these projections.

Impact of the recession on the projections

The National Bureau of Economic Research (NBER) declared December 2007 as the peak of a 73-month economic expansion and also the beginning of a recession. Throughout 2008, the Nation's economic activity contracted across most industrial sectors, as evidenced by declines in domestic production and employment; these declines, in turn, affected real income and other economic indicators. The unemployment rate stood at 7.2 percent in December 2008, reflecting a loss of more than 3 million jobs during the previous year. Because 2008 employment is used as the base-year employment in these *Review* articles, questions have naturally arisen among BLS data users about how to interpret the recession's impact on the development of the 2008–18 projections, especially inasmuch as job losses continued as the Agency finalized its projections in mid-2009.

To understand the impact of the recession, it is necessary to understand the basics of the BLS projection process. In developing long-run projections, the focus is on long-run trends, including trends in population, labor force, productivity, and output growth. The population and the labor force have been aging, their growth rates slowing. These long-run trends are expected to continue, regardless of the fluctuations in the economy.

The BLS uses a macroeconomic model of the U.S. economy provided by Macroeconomics Advisers, LLC, to derive measures of output growth. The model solves a system of 543 equations for output through equilibration of supply and demand, with the labor force as the primary constraint on the supply side. The demand side is manifested as the following components of GDP: personal consumption, business investment, government spending, and net foreign trade flows.

The macromodel solves its equations on the basis of long-run behavioral relationships and certain key

assumptions. Two assumptions in particular are especially important to the ensuing discussion: that the U.S. economy will return to the long-run trend growth path by 2018 and therefore will be at full employment at that time, and that no other events or “shocks” will occur that would precipitate an economic downturn, or recession. Examples of such shocks are the oil crises of the early 1970s and 1980s, the collapse of the dot-com bubble in the early 2000s, and the severe losses in the financial and real estate markets in the latest recession. Because shocks and recessions are difficult to predict, the default assumption is a labor market in a state of equilibrium, in which labor demand and supply are equal and unemployment is frictional, not a consequence of a recession-induced decrease in demand.

Thus, although the base-year output and employment measures of the current projections are at a low point relative to previous years, the target-year measures are based on a full-employment economy. To illustrate what the projections might have looked like before the recession led to job losses, table 1 includes 2007 data from before the recession, together with the resultant 2007–18 growth rates, compared with the 2008 employment and 2008–18 growth rates, for major industry sectors. Differences are most noticeable in construction, manufacturing, and financial activities—sectors that lost the most jobs relative to their size.

Because the economy is expected to emerge from the recession and return to full employment over the 10-year projection period, the current projections indicate faster growth rates and more numerous openings than might have been expected in several industries had employment not fallen in 2008. It is important to note, however, that the already palpable impacts of the recession compelled BLS staff to account for expected long-range changes to several GDP sectors, as well as revise assumptions regarding some exogenous variables. Some of these changes and assumptions have to do with personal consumption expenditures and government consumption and investment as shares of GDP, and changes in the Federal deficit and the personal savings rate. The revised assumptions and projections affected the final results pertaining to the composition and growth of GDP, which in turn affected the industry and occupational projections. Although these macroeconomic impacts are less palpable than the data in table 1 show, they are, nevertheless, factors in generating the final employment levels.²

Overview of the 2008–18 projections

Projection methods. The BLS uses a series of separate, yet interrelated, procedures to develop projections for the labor force, the aggregate economy, industry output and employ-

from the Current Population Survey.

² Includes data on private households from the Current Population Survey.

ment, and occupational employment.³ In brief, the labor force projections begin with the Census Bureau's latest population projections by age, sex, race, and ethnic origin. Projected labor force participation rates for 136 combinations of these groups are then developed by analyzing past trends, with some modifications based on expected demographic changes, such as an influx of immigrants with lower median ages. To obtain estimates of the labor force in 2018, projected labor force participation rates are multiplied by the Census Bureau's population projections.

The labor force projections are then used as inputs to the aggregate economic projection process. As already mentioned, the BLS uses the Macroeconomic Advisers econometric model of the U.S. economy to derive estimates of the components of GDP. These estimates are then disaggregated into commodity-level demand, which is then applied to an input-output model to derive output by industry. Next, industry-level employment is determined on the basis of projected industry output and expectations of productivity growth.

Projections of detailed industry employment are then used as part of the process of projecting occupational em-

ployment. An industry-occupation matrix—also called the National Employment Matrix—is used to develop detailed occupational employment by industry. The BLS projects changes in occupational shares of industries to account for technological changes, shifts in product mix, and other factors. These new staffing patterns are then applied to projected industry employment to yield estimates of occupational employment in 2018.

Labor force highlights. Mitra Toossi's article, "Labor force projections to 2018: older workers staying more active," presents new labor force projections that form the starting point for the BLS macroeconomic, industry, and occupational projections. Toossi uses Census Bureau projections of the resident U.S. population⁴ as the basis for projecting labor force participation rates.

Population growth, which is driven by fertility rates, life expectancy, and net migration, is expected to slow from an annual average growth rate of 1.3 percent in 1998–2008 to 1.0 percent over the next 10 years, despite an expected increase in the number of immigrants in the population. This slower growth will, in part, affect labor force growth, which is expected to slow from its 1.1-percent rate be-

tween 1998 and 2008 to 0.8 percent in the coming decade. A shrinking overall labor force participation rate, falling from 66.0 percent in 2008 to 64.5 percent in 2018, also will contribute to slower labor force growth. Changes in the labor force participation rate will be driven by several factors, including the following:

- the aging of the population, as the large baby-boom generation, born between 1946 and 1964, moves into age groups that have traditionally lower labor force participation rates;
- the relatively small size of the baby-bust cohort (those born between 1965 and 1975), whose members will fall into the 25- to 54-years age group—the group with the traditionally highest labor force participation rates—during 2008–18; and
- the continuation of recent trends showing lower labor force participation rates for the youngest working-age groups.

Sharply increased immigration to the United States is expected to mitigate the projected labor force slowdown caused by the preceding factors, but also will continue to change the racial and ethnic composition of the labor force. Hispanics, accounting for 14.3 percent of the labor force in 2008, are expected to increase their share to 17.6 percent by 2018. Other minority groups—including Blacks and Asians—also will increase their share of the labor force, while White non-Hispanics become an increasingly smaller segment. (See table 2.)

Macroeconomy highlights. The article by Ian Wyatt and Kathryn Byun, “The U.S. economy to 2018: from recession to recovery,” examines the 2008–18 macroeconomic projections. The authors describe an economy returning to a path of long-run trend growth, with yearly average GDP growth projected at 2.4 percent. This growth rate represents a slowdown from both 1998–2008, when GDP increased at a 2.5-percent annual rate, and 1988–98, when it rose at a 3.0-percent annual rate. The primary factors constraining faster GDP growth are the expected slowing of both labor force and productivity growth.

Productivity is expected to grow at an annual rate of 1.8 percent between 2008 and 2018, slower than the 2.6-percent growth seen in 1998–2008 and nearer to the growth rates of 1988–98. As reported in the Toossi article, the labor force is expected to increase by 12.6 million, which is 3.4 million less than the increase from 1988 to 1998

and 4.0 million less than that during 1998–2008.

The components of GDP are expected to retain their relative shares until 2018. Personal consumption expenditures account for the largest segment—about 70.5 percent in 2008—of nominal GDP. This share is expected to decrease slightly, to 70.2 percent, in 2018. Gross private domestic investment is the next-largest component, followed by exports, State and local government expenditures and investment, and Federal Government expenditures and investment.

In terms of real dollars, personal consumption expenditures are expected to grow, but at a slower rate than in the past two decades, as easy credit becomes less available than in the past because of growing consumer debt and as many consumers, especially older ones on the verge of or in retirement, develop more risk-averse spending patterns. Demand for nonresidential private investment will drive growth similar to that seen from 1998 to 2008—growth spurred by purchases of computer equipment and software. Residential investment is expected to return to its long-run trend level by 2018 to accommodate changing demographics. Gross private investment, including nonresidential and residential investment, is projected to increase its nominal share of GDP from 14.0 percent in 2008 to 15.7 percent in 2018. Personal consumption expenditures are expected to grow more slowly between 2008 and 2018 than they did between 1998 and 2008, as well as in comparison to some other components of GDP; therefore, their contribution to the percent change in real GDP is expected to fall from 2.1 percent to 1.8 percent over the next decade. Nevertheless, personal consumption expenditures will remain the largest contributor to GDP.

Federal spending is expected to slow down for both defense and nondefense consumption and gross investment. Defense expenditures accounted for the lion’s share—more than two-thirds—of all Federal spending in 2008, and this share is expected to increase to nearly 70 percent by 2018 as defense expenditures continue to outpace nondefense expenditures. In total, Federal expenditures accounted for 7.5 percent of nominal GDP in 2008, a share that is anticipated to decrease to 7.0 percent in 2018.

International trade is expected to grow more quickly than GDP as a whole, with import growth outpacing export growth. Indeed, the nominal trade imbalance is expected to almost double from \$669 billion in 2008 to \$1.2 trillion in 2018.

Industry output and employment. The next article in the projection series is “Industry output and employment

projections to 2018," by Rose Woods. Various macroeconomic assumptions and projections translate into final demand for commodities and total industry production, which together determine industry employment levels. Woods outlines projected output and employment growth and levels at the major industry sector, as well as at the detailed industry level.

The economy comprises 17 major industry sectors, the majority of which provide services. Major industry service sectors include information, financial activities, health care and social assistance, and government, for example. In total, all service sector industries accounted for 84 percent of wage and salary jobs in 2008. The remaining major sectors—mining, construction, manufacturing, and agriculture—produce goods. More than 90 percent of the 151 million jobs in the economy in 2008 were filled by wage and salary workers, with the remainder performed by self-employed or unpaid family workers. Although output is expected to grow in both the goods-producing and the service-providing sectors, only the service sector will see substantial employment gains at the aggregate level.

Output. Total output⁵ is expected to increase by 2.8 per-

cent, on average, each year during 2008–18, faster than the 2.1-percent rate posted in the previous decade. In nominal terms, the service-providing sectors accounted for more than two-thirds of total output in 2008. That share is expected to increase to nearly 73 percent by 2018. Growth in the service sector is driven by increasing demand for information, wholesale and retail trade, health care and social assistance, and professional and business services.

The push to keep businesses competitive and profitable will increase demand for services within professional and business services. Management, scientific, and technical consulting services; computer systems design and related services; and employment services are needed to develop and implement new technologies, ensure compliance with government regulations, provide computer security, and develop, improve, and maintain computer networks. The need to accommodate an aging population will spur demand for health care and social assistance. Strong increases in output in offices of health practitioners, home health care services, and other health care and social assistance industries reflect changing demographics and increasing life expectancies.

Output growth—averaging 2.0 percent per year—for goods-producing industries is expected to lag the 3.1-percent growth of service-providing industries. Among the goods-producing industries, construction is expected to have the fastest output growth, an average annual rate of 2.9 percent during 2008–18, spurred primarily by investment in residential construction. The manufacturing share of total nominal output will continue to diminish as demand for services in other sectors strengthens. However, manufacturing still will continue to account for the largest share of output of the goods-producing sector, as well as of the total economy.

Employment. The Nation's employment is expected to increase from 150.9 million to 166.2 million over the coming decade, adding 15.3 million jobs. This average annual growth rate of 1.0 percent is slightly faster than the 0.7 percent seen between 1998 and 2008, largely because 2008 was a recession year during which employment in several sectors that, historically, had been growing actually declined. Nearly all of the 15.3 million job increase will be in the service-providing sector, led by gains in professional and business services and in health care and social assistance, which are projected to contribute a combined 8.2 million new jobs, more than half of all new jobs created in the Nation. State and local government (which includes public hospitals and schools) and leisure and hospitality also will generate numerous jobs. These four sectors are among those exhibiting the fastest job growth.

Employment in the goods-producing sector, by contrast, will add only 27,300 net jobs over the 2008–18 period, with only one sector—construction—expected to expand. Although demand for output in the goods-producing sector continues to grow, many of these industries are affected by labor-saving equipment and processes. Construction is the notable exception and is expected to recover its job losses from the recession and return to its former growth trend, ultimately adding 1.3 million jobs over the 2008–18 period.

The job gains in construction, however, will be largely offset by losses in manufacturing, mining, and agriculture. Manufacturing will continue its long-run decline, but at a slower pace than during 1998–2008. Businesses will continue to realize efficiencies by automating more production processes and streamlining their use of labor. Some industries are expected to decline because more production is taking place overseas and because import competition will reduce demand for many products manufactured in the United States. Among declining industries will be those in the textile, apparel, footwear, and leather and al-

lied product subsectors, whose products are anticipated to face stiff competition from foreign manufacturers.

Occupational employment. Trends in occupational employment are pushed by, among other factors, demand for various products and services and the resultant industry employment change. Employment of many, if not most, occupations is expected to change concomitantly with changes in the industries in which they are concentrated. However, changes in technology, productivity, and business practices, as well as changes in the mix of demand for goods and services, may affect occupational employment disproportionately, causing some occupations to grow or decline faster than their employing industries. One example is data entry keyers, whose employment over the last few decades shrank both in numerical terms and relative to other occupations in the information industry, as the growing use of automated data entry systems obviated the need for these workers. Changing occupational demand, in turn, leads to changes in education and training requirements.

The final article in this issue of the *Review*, “Occupational employment projections to 2018,” by Alan Lacey and Benjamin Wright, presents the employment outlook by occupational group, as well as for 750 detailed occupations; discusses sources of job openings other than economic growth; and describes the education and training requirements for new and existing jobs in the economy.

Occupations, like industries, are categorized into groups for analysis and reporting purposes. BLS occupational projections data are categorized into 10 groups based on the Standard Occupational Classification Manual. (See table 3.) In 2008, the occupational groups with the largest employment were professional and related occupations and service occupations. Because of their large size, as well as their relatively fast growth rates—16.8 percent and 13.8 percent, respectively, compared with the 10.1-percent⁶ growth for all occupations over the projection decade—professional and related occupations and service occupations together are expected to add 9.3 million of the 15.3 million new jobs created throughout the economy during the next 10 years—and both occupational groups will see their shares of overall employment increase. At the opposite end of the employment spectrum are farming, fishing, and forestry; and production occupations, both of which are expected to lose jobs over the projection decade.

Some of the fastest growing occupations in the service and professional and related groups are found within fast-growing industries: home health aides work in the 4th-

Table 3. Employment, by occupational group, 2008 and projected 2018

[Numbers in thousands]

Occupational group	Employment		Percent distribution		Change, 2008–18	
	2008	2018	2008	2018	Number	Percent
Total, all occupations	150,931.7	166,205.6	100.0	100.0	15,273.9	10.1
Management, business, and financial occupations	15,746.7	17,410.9	10.4	10.5	1,664.2	10.6
Professional and related occupations	31,053.5	36,280.0	20.6	21.8	5,226.5	16.8
Service occupations	29,575.9	33,645.1	19.6	20.2	4,069.2	13.8
Sales and related occupations	15,902.7	16,883.1	10.5	10.2	980.4	6.2
Office and administrative support occupations	24,100.6	25,942.7	16.0	15.6	1,842.1	7.6
Farming, fishing, and forestry occupations	1,035.4	1,026.3	.7	.6	-9.1	-9
Construction and extraction occupations	7,810.3	8,828.8	5.2	5.3	1,018.6	13.0
Installation, maintenance, and repair occupations	5,798.0	6,238.2	3.8	3.8	440.2	7.6
Production occupations	10,083.0	9,733.9	6.7	5.9	-349.2	-3.5
Transportation and material-moving occupations	9,825.5	10,216.6	6.5	6.1	391.1	4.0

fastest-growing home health care services industry; physician assistants, physical therapist aides, dental hygienists, dental assistants, medical assistants, and occupational therapist aides are in the 9th-fastest-growing offices of health practitioners; and network systems and data communications analysts and computer software engineers are concentrated in the data processing, hosting, related services, and other information services industry and in the computer systems design industry, both of which are projected to be among the top 10 fastest growing industries. Employment declines in other occupations, such as farmers and ranchers and sewing machine operators, are similarly affected by the direction of employment change in the agriculture and manufacturing industries.

Numerous occupations are projected to grow faster than the 10.1-percent average for all occupations over the 2008–18 decade, adding hundreds of thousands of new jobs by virtue of their large size in 2008. Among these occupations are registered nurses (adding 581,500 jobs), home health aides (460,900 jobs), and personal and home care aides (375,800 jobs). In addition, many occupations with average or slower-than-average growth still will contribute a good number of new jobs because of their employment size: retail salespersons (374,700 jobs), bookkeeping, accounting, and auditing clerks (212,400 jobs), and waiters and waitresses (151,600 jobs).

Thus far, discussions of job opportunities have been limited to those resulting from growth in the economy. However, Lacey and Wright point out that a much larger source

of job openings during the coming decade will result from the need to replace workers who retire or move to different occupations. In fact, replacement needs are expected to account for 34.3 million openings, more than twice as many as the 15.3 million due to economic growth. The importance of factoring in replacement openings when calculating employment opportunities can be illustrated by examining cashiers, an occupation that employed nearly 3.6 million in 2008. Job growth among cashiers is projected to be slower than average, generating only 123,200 openings. However, because the workers generally are younger than average and have low attachment to this occupation, the need to replace those who move on to other occupations is anticipated to create an additional 1.6 million openings.

Finally, Lacey and Wright describe the education or training typically needed to qualify for entry into various occupations over the projection period. They show that, among the 30 fastest growing occupations, nearly half belong to the professional and related group and have a bachelor's degree or higher as their most significant source of training. Most of the top 30 occupations with the largest job growth, however, fall into service, office and administrative support, and other major groups that have fewer education or training requirements; short- or moderate-term on-the-job training is sufficient for many of these large occupations. Thus, even though occupations requiring higher education levels are growing quickly, those occupations requiring no postsecondary training will continue to make up the larger part of the workforce.

THE BLS PROJECTS THE EMPLOYMENT STRUCTURE of the U.S. economy in 2018 to remain similar to that in 2008, but several major industry sectors will continue their historical employment increases or declines over the 2008–18 period, leading to changes in the percent distribution of industries. At the aggregate level, goods-producing sectors, excluding agriculture, will lose employment, dropping from 14.2 percent of total employment in 2008 to an expected 12.9 percent in 2018, while service-providing sectors will expand their employment, growing from 77.2 percent of total employment in 2008 to an anticipated 78.8 percent in 2018. Driving this increase is the strong

growth of professional and business services, educational services, and health care and social assistance. Construction also will grow, but declines in manufacturing will nearly offset the growth. At the detailed occupation level, changing demographics—particularly the aging population and labor force—and competitive pressures will grow the demand for health care workers, computer specialists, and others. Many of these occupations require high levels of education or training. However, jobs for workers with a variety of skills, education, and training will be available between 2008 and 2018. □

Notes

¹ Although the recessions of 1980 and 1990 also occurred during BLS projection base years, those recessions were considered milder—of shorter duration, with lower drops in gross domestic product (GDP), and with relatively lower unemployment rates—than the recession of 1981–82 and the recession beginning in 2007.

² For additional information on how the recession influenced the development of the macroeconomic projections, see Ian D. Wyatt and Kathryn J. Byun, “The U.S. economy to 2018: from recession to recovery,” this issue, pp. 11–29.

³ Detailed descriptions of the projection methodology for each of these stages are found at the BLS Web site, on the Internet at www.bls.gov/emp/ep_tech_documentation.htm.

⁴ The Census Bureau develops projections of various demographic characteristics of the resident U.S. population, including the institutionalized, those in the Armed Forces, immigrants, and children. The BLS then lowers the Census Bureau’s population projections by subtracting people in the Armed Forces, residents of institutions, and all children under the age of 16, to be consistent with the conceptual definition used in other BLS data sets.

⁵ Total output is gross duplicated output, which includes intermediate demand. (See Woods, “Industry output and employment projections to 2018,” this issue, pp. 52–81.)

⁶ Rates of change over the 10-year projection period are used in discussing occupational employment, rather than the annual average rates of change used in discussing industry employment.

Employment outlook: 2008–18

The U.S. economy to 2018: from recession to recovery

Real GDP growth is projected to average 2.4 percent annually over the next decade, near its previous 10-year trend of 2.5 percent, while productivity growth is expected to slow; an increased personal savings rate, slower growth in personal consumption expenditures, rising medical expenses, and the continuation of the trade deficit also will characterize the coming decade

Ian D. Wyatt
and
Kathryn J. Byun

In the summer of 2009, U.S. payroll employment continued to fall as a result of the recession that began more than a year and a half earlier in December 2007. The recession has been one of the most severe since World War II, with the unemployment rate jumping from 4.7 percent in November 2007 to 10.2 percent in October 2009. However, as with other business cycles, the Bureau of Labor Statistics (BLS) projects that the economy will return to a path of long-run growth over the next decade.

Although the recession has had a short-run impact on the economy, the BLS expects that the accompanying slowdown in the growth of both productivity and the labor force also will have an important long-run impact on the economy over the projection period. During the next decade, the massive baby-boomer generation will be leaving the labor force, moving from the prime working-age years to retirement age. As a result, the BLS projects a 0.8-percent average annual growth of the labor force from 2008 to 2018, 0.3 percentage point lower than the historical rate of 1.1 percent posted from 1998 to 2008. Productivity, as measured by output per hour, is projected to grow at 1.8 percent annually during 2008–18,

lower than the exceptionally high 2.6-percent growth from 1998 to 2008, but consistent with average annual growth since 2004 and the 1.7-percent growth rate between 1988 and 1998. These levels of productivity and labor force growth contribute to BLS projections of real growth in the U.S. gross domestic product (GDP) from \$11.7 trillion in 2008 to \$14.7 trillion in 2018, an annual growth rate of 2.4 percent over the 2008–18 period.¹

As regards employment prospects in the next decade, household employment is projected to increase by about 13.1 million between 2008 and 2018, less than the increase of 13.9 million across the 1998–2008 decade. This employment projection is accompanied by an assumed unemployment rate of 5.1 percent in 2018, 0.7 percentage point lower than the actual rate in 2008.

International trade—specifically, exports and imports—has increased by about half as a share of nominal GDP over the last 20 years. The BLS projects international trade to continue growing faster than GDP, with 3.9-percent average annual growth in exports, and 4.2-percent growth in imports, over the projection horizon. Personal consumption expenditures are expected to exhibit slower growth—2.5

Ian D. Wyatt and Kathryn J. Byun are economists in the Division of Industry Employment Projections, Office of Occupational Statistics and Employment Projections, Bureau of Labor Statistics. E-mail: wyatt.ian@bls.gov and byun.kathryn@bls.gov

percent annually from 2008 to 2018, in comparison to the 3.0-percent average annual growth experienced over the previous two decades. Business spending on equipment and software is anticipated to grow above the trend of the previous decade. Investment in residential construction is expected to return to long-run trend levels. Growing demand for Medicare and Social Security is expected to put mounting stress on the Federal Government's spending, contributing to a projected budget deficit approaching \$900 billion in 2018, accounting for 4.3 percent of nominal GDP.

It is important to note that creating complex economic projections requires time and many steps. The projections presented in this article were completed in midsummer 2009, and by the time the results are published, data will exist and events will have occurred that were unknown at the time the projections were prepared.²

The article begins with a discussion of the macroeconomic model and the major assumptions underlying the aggregate economic projections. The discussion then moves to projections of GDP from the demand side, including personal consumption expenditures, business investment, foreign trade, and government spending. There then follows an examination of GDP from the income side, after which projections of employment and productivity are discussed. The last section addresses the uncertain factors that may affect the economic projection. A separate box on page 10 considers how the recession that began in December 2007 affected the various parts of the 2008–18 projections.

The macroeconomic model

The projections that follow are based on a macroeconomic model (macromodel) created by Macroeconomic Advisers.³ The model provides a theoretical framework for the projections, maintaining a balance between different economic variables. The company's quarterly model comprises 744 variables in 543 equations descriptive of the U.S. economy; 201 of the variables are exogenous—variables whose values must be provided to the model to calculate a solution for a given period. Among the exogenous variables, only a relatively small number have a major impact on the long-term projections of the value of GDP and its demand makeup, as well as the level of employment necessary to produce that value of GDP. Critical exogenous variables include monetary and fiscal policy, future energy prices, and demographics (including population growth). The key BLS assumptions are listed in table 1.

Beyond the 201 exogenous variables are the remain-

ing 543 endogenous variables. The values of endogenous variables are calculated within the model, resulting from the 543 descriptive equations. In addition, the projections generally are prepared with some selected variables, such as the unemployment rate, the labor productivity growth rate, and the level and growth of both imports and exports, more carefully evaluated than other variables in the model. Because these selected variables are key components of the model, setting target ranges for them, in consultation with other analysts, helps BLS economists define the parameters around which the aggregate projections are developed.

Major assumptions

Monetary policy assumptions. For the purpose of developing its projections, the BLS assumes that, in the long term, the Federal Reserve Board (hereafter, simply, the Fed) will set monetary policy to fulfill its dual mandate: keeping inflation within a “comfort zone” and achieving and maintaining full employment.⁴ As the Federal funds (Fed funds) rate⁵ rises over the course of the projection period and returns to more normal levels, the spread between that rate and the 10-year Treasury note yield is projected to return to levels consistent with a strong, low-inflation economy. The spread is projected to be about 1.0 percent in 2018. The rate is projected to average 3.9 percent in 2018, and the yield on the 10-year Treasury note is projected to average 4.9 percent that year.⁶

Over the past several years, the Fed has moved from a conventional monetary policy in which it tightens and loosens interest rates in response to economic growth cycles in the economy to far less conventional policies in response to unstable financial markets. In 2004, as the economy expanded at a healthy clip, the Fed began to move toward a more neutral stance and capped a 2-year credit-tightening campaign with 17 consecutive quarter-point rate hikes until the Fed funds rate reached 5.25 percent. In September 2007, because of growing market uncertainty, the Fed cut the target funds rate by half a percentage point, to 4.75 percent, in order to stabilize financial markets. Then, in October 2007, the Fed again lowered the funds rate by a quarter of a percentage point, to 4.5 percent, in hopes of warding off a possible economic slowdown.⁷

Throughout 2008 the Fed cut the funds rate, and by December it reached 0.00–0.25 percent.⁸ The last time the rate fell below 1.00 percent was in the 1950s. During most previous recessions, the Fed was concerned that rate cuts could increase inflation considerably. However,

BLS projections and the recession

The recession that began in December 2007 affected the BLS projections in a number of ways. However, because of the long time horizon of the projections and the nature of projecting a full-employment economy, the impact was smaller than some might expect. In creating its projections, the BLS analyzes long-run economic trends and assumes unemployment levels consistent with a full-employment economy. The BLS does *not* attempt to project turning points in the business cycle. The impact of the recession was unevenly distributed throughout the economy, with some sectors experiencing large declines while others remained relatively unscathed. Focusing on three key economic variables—inflation, unemployment, and new home starts—provides some insight into how the recession affected the projections.

The BLS projection of inflation was affected by the recession. In the 2006–16 projections, the average annual rate of change of inflation in the GDP price index was 2.7 percent. In the 2008–18 projections, the average annual rate is 1.9 percent. During the development of the projections, unemployment was well above inflationary levels and was accompanied by low levels of capacity utilization. Given those circumstances, the BLS expected that inflation would be below long-run trends over the first few years of the projection period, before returning to the Federal Reserve’s comfort zone of around 2.0 percent. Low levels of inflation in the early years of the coming decade are anticipated to reduce the average level over the entire 10 years.

Over the long run, labor markets normally clear and unemployment returns to levels associated with full employment. The unemployment rate associated with full employment is thought to be around 5.0 percent. In a full-employment economy, the number of jobs is driven primarily by the supply of workers. Although the average unemployment rate over the 2008–18 period is expected to reflect the unemployment rate associated with the recession, the BLS assumes that labor market conditions will be consistent with an economy that is at full employment by 2018. Therefore, the number of jobs projected in 2018 is influenced chiefly by the growth in the labor force.

A good example of how the economy moved off of long-term trends in 2008 because of the recession is seen in new-home starts, which were about 900 thousand in 2008. The BLS projects new-home starts to be 1.7 million in 2018. The resultant fast average annual growth of 6.6 percent for the category seems quite dramatic. In reality, however, the projection of 1.7 million new-home starts is a return to long-run trends and is quite similar to the 1.6 million new-home starts in 1998. In this case, the growth rate over the course of the projections is much higher because of the low level of construction in 2008 and the level of new-home starts is actually quite similar to historical levels.

For all three variables, the levels in 2018 were generally not affected by the recession. However, the growth rates of inflation and home starts over the course of the projection period were altered by the recession.

by late 2008, the Agency thought that there was more of a risk of deflation, not inflation.

With the Fed funds rate at nearly zero percent, the Fed pursued a number of policies to stimulate the economy and add liquidity to the credit markets. These policies included increasing lending to banks,⁹ providing funding for the commercial paper market and money market funds,¹⁰ and purchasing mortgage-backed securities.¹¹ With the funds rate falling to near zero, the spread between 10-year Treasury note yields and the funds rate widened from about 1.0 percent in early 2008¹² to around 3.3 percent by late August 2009.¹³ In the long run, the projections assume that the Fed will return to a more conventional monetary policy, returning the funds rate to levels similar to those existing before the recession and exiting asset markets, such as commercial paper and mortgage-backed securities, that the Agency avoided prior to the financial crisis.

Fiscal policy assumptions. Fiscal policy describes two

Federal Government actions: spending and tax policy. Assumptions about Government outlays, or spending, cover several areas and are based on current Government policies. The BLS expects real gross defense investments to be affected by two conflicting trends: winding down the war in Iraq will reduce investments, but the need to update aging equipment, replace equipment worn out by the wars in Iraq and Afghanistan, and fight and defend against terrorism will require considerable investment dollars. Also, mostly because of the coming retirement of baby boomers, as well as continued growth in health care costs, rapid growth is assumed in the Federal Government’s Medicare and Social Security programs.

The tax-related assumptions, such as the effective marginal tax rate, which measures the tax rate applied to an extra dollar in income, affect Federal Government revenues. The effective marginal personal tax rates on interest and wages is held at the same levels in 2018 as in 2008. The long-term capital-gains tax rate was cut to 15.0 percent in 2003 and is assumed to remain unchanged through 2018. The maxi-

imum Federal corporate tax rate has been left unchanged at 35.0 percent since 1993 and also is assumed to hold at the same level throughout the entire projection period.

Demographic assumptions. Demographic factors play a key role in determining the growth potential of the economy over the long term. The growth rate of the U.S. population, together with changes in the composition of the population, affects the labor force, the unemployment rate, housing demand, and many categories of spending. BLS projections in these areas are based on the Census Bureau's middle-series population projection, which in

turn is based on the mid-level projection for each of the demographic components.¹⁴ The Census Bureau projects the U.S. population expanding at an average rate of 1.0 percent annually between 2008 and 2018, growing from 305.0 million to 335.4 million.

Growth in the older age groups will be strong as the baby boomers age. The 77 million baby boomers, who currently make up a quarter of the Nation's population, will have a variety of effects on the labor force and on labor force participation rates. The BLS prepares labor force and participation rate projections for detailed age, sex, racial, and ethnic groups. Presented elsewhere in this issue,¹⁵

these detailed projections are aggregated to produce the estimate of the size of the total labor force. Overall, the BLS expects the labor force to grow from 154.3 million in 2008 to 166.9 million in 2018, representing an annual growth rate of 0.8 percent over the projection period.

Unemployment assumptions. Under the assumption of long-term economic stability, the BLS model assumes that during the 2008–18 period the economy will return to levels of employment that existed prior to the recent recession. The unemployment rate is assumed to be 5.1 percent in 2018 in the macroeconomic model.

The civilian unemployment rate fell from 7.5 percent in 1992 to 4.0 percent in 2000, the lowest level in 30 years. Over the 1992–2000 period, nonfarm payroll employment expanded by about 24.2 million (seasonally adjusted). In February 2001, payroll employment peaked at 132.5 million jobs. In March 2001, a business-cycle peak marked the end of an expansion and beginning of a recession; the country then sustained about 3 years of declines in payroll employment. After payroll employment bottomed at 129.9 million jobs in 2003, it began to grow again and reached 138.2 million jobs in December 2007. Then, when the recession began at that time, payrolls declined sharply, dropping to 131.3 million jobs in August 2009. Since the December 2007 beginning of the recession, the unemployment rate has risen from 4.9 percent to 10.2 percent in October 2009—the highest rate since the early 1980s. On the basis of the labor force projections and a target GDP growth rate, the economy is expected to be at full employment with the earlier mentioned assumed unemployment rate of 5.1 percent in 2018.

Inflation assumptions. Inflation was fairly low from the late 1990s until mid-2004, after which it increased, partly in response to rising housing, health care, and commodity costs. In 2008, inflation slowed again as the U.S. economic slowdown became global. Over the long run, as mentioned earlier, the BLS assumes that the Fed intends to keep inflation within a target range. As measured by the chain-weighted GDP price index, inflation averaged 2.4 percent over the 1998–2008 period. With low inflationary expectations over the near term, the inflation rate, as measured by the GDP price index, is expected to pick up moderately later in the 2008–18 projection period, to reach an overall average annual growth rate of 1.9 percent over the period.

Energy assumptions. Oil price projections in the macro-model come from the Department of Energy's Energy

Information Administration's projections.¹⁶ Given no major supply shocks, continued growth in global demand, and higher production costs associated with unconventional liquid fuels, oil prices are projected to increase to around \$132 per barrel in nominal dollars in 2018.

Since the recent economic downturn became global in scope, both the demand for oil and the price of oil have fallen. The average monthly price of a barrel of oil peaked at \$133.88 in June 2008, bottomed at \$39.09 in February 2009, and recovered to \$75.72 in October 2009.¹⁷ Although, obviously, prices are quite volatile in the short term, as evidenced by the February 2009 price being less than one-third the June 2008 price, long-run trends in the consumption and production of oil drive long-run price changes.

Global economic growth, particularly in large emerging markets, is expected to increase global oil demand. Over the long term, the Energy Information Administration projects global oil consumption to rise at an annual rate of 1.4 percent.

The production of unconventional liquid fuels¹⁸ is expected to be an increasing share of global oil production, thereby increasing price projections because unconventional liquid fuels normally are more expensive to produce than conventional liquid fuels.¹⁹ The level of unconventional liquid fuel production depends upon technological advances and how competitive the price of the fuel is with the price of conventional liquid fuels.²⁰

GDP from the demand side

The U.S. economy will face some important challenges over the 2008–18 period, including the Nation's aging population, growing demand for medical care, and lingering effects of the recession. After a major fall in the stock market and the bursting of the housing market bubble between 2007 and 2009, consumers are expected to be more risk averse from 2008 to 2018, saving more and increasing their spending at a slower pace than in 1998–2008. Recovery in the housing market is projected to be an important driver in GDP growth over the coming decade. The BLS also expects continued expansion of both imports and exports, although at a slower rate than that exhibited over the past 10 years. Import growth is anticipated to outpace export growth, resulting in a continued trade deficit. Government expenditures, projected to slow somewhat as recession-related spending trails off, will face challenges in controlling the growth of medical and Social Security costs.

In sum, GDP is projected to grow by 2.4 percent per year between 2008 and 2018, only a slight decline from

the 2.5-percent annual growth from 1998 to 2008, but slower than the 3.0-percent annual growth exhibited from 1988 to 1998. (See table 2.) GDP per capita provides an alternative measure for assessing economic performance. Whereas GDP indicates the total output of the economy, GDP per capita measures the per-person output. The BLS expects growth in GDP per capita also to slow slightly, from 1.5 percent annually, on average, from 1998 to 2008 to 1.4 percent from 2008 to 2018.

Personal consumption expenditures. Personal consumption expenditures—which account for more than two-thirds of GDP—posted impressive gains over the past two decades. Growth in consumer expenditures in the earlier years of this period mirrored growth in the overall economy, while increases in the latter years were related to the bubble in the housing market. The steady decline in the savings rate over these two decades also contributed to growth. The BLS expects that the recent decline in home prices, substantial swings in the stock market over the previous decade, and the impact of the recession will all contribute to a slowing of growth in consumer spending from 3.0 percent annu-

ally over 1988–2008 to 2.5 percent per year from 2008 to 2018. Although spending on services is expected to maintain its growth rate from the previous decade, purchases of goods are anticipated to slow considerably.

One way to study consumer spending patterns is to examine their contribution to the percentage change in GDP. Consumer purchases accounted for 2.0 percent of the 3.0 percent of GDP growth from 1988 to 1998, or 68.0 percent of the expansion during that period. During the next decade, from 1998 to 2008, consumption accounted for 2.1 percent of the 2.5-percent annual GDP growth, or 83.8 percent of the economic advancement. Over the projection horizon, consumers are anticipated to change their purchases in proportion to gains in real disposable income, rather than relying upon increases in the value of their assets, such as home equity and stock market wealth. Therefore, increases in consumer expenditures are expected to contribute 1.8 percent of the 2.4-percent GDP growth, or 74.3 percent of economic expansion, from 2008 to 2018.

From the mid-1960s through 1980, personal consumption expenditures accounted for between 61.0 percent and 63.1 percent of nominal GDP. Over the years

that followed, consumers tapered off their savings rate from around 10 percent in the early 1980s to less than 1 percent from 2005 to 2007. Consequently, consumer purchases rose steadily, from 65.7 percent of GDP in 1988, to 67.2 percent of GDP in 1998, and to 70.5 percent in 2008. (See table 3.) Slower growth in consumer purchases is projected to end this trend over the coming decade, with consumer expenditures edging downward to 70.2 percent of GDP in 2018.

Consumption expenditures are divided into three major categories: services, nondurable goods, and durable goods. Services, the largest category, grew 2.7 percent

annually from 1998 to 2008 and are projected to maintain this growth rate from 2008 to 2018. (See table 4.) Medical services have been growing faster than other service categories. As baby boomers reach retirement age and technological advances persist, demand and costs for health care are expected to continue their rapid ascent. A number of factors, however, are expected to limit this growth, including budgetary constraints by Federal, State, and local governments, an increase in outpatient care and home health services, integrated delivery of care, and the elimination of unnecessary procedures. Therefore, the BLS projects that medical expenditures will grow 3.6 percent

annually from 2008 to 2018, nearly equivalent to the 3.5-percent annual growth from 1998 to 2008.

Nondurable goods include products with a life expectancy of less than 3 years, such as food, clothing, and gasoline. Demand for these types of goods tends to be less sensitive to income changes than demand for durable goods. As consumers' disposable income grew, purchases of nondurable goods increased by 2.4 percent annually from 1988 to 1998 and by 2.9 percent annually from 1998 to 2008, much more slowly than growth in demand for durable goods. Expecting consumers to trim their spending over the coming decade, the BLS projects that growth in demand for nondurable goods will slow to 1.6 percent annually between 2008 and 2018.

The macromodel breaks out purchases of durable goods into purchases of motor vehicles and purchases of other durable goods. The latter category has grown faster than any other consumption category over the past two decades, increasing 6.8 percent annually, on average, from 1988 to 1998 and 8.1 percent per year from 1998 to 2008. These goods, which include such big-ticket items as appliances, computers, video and audio goods, and furniture, need to be replaced less frequently than nondurable goods. Historically, this sector has exhibited large swings around the business cycle, indicating that purchases of durable goods may be more flexible than other consumption categories. Therefore, the BLS anticipates that the projected slowdown in overall consumer spending growth will affect this category, resulting in substantially slower growth of 4.9 percent annually over the 2008–18 period.

Sales of cars and light trucks first reached 16 million in 1986, but did not return to that level again for 13 years. In order to increase sales, the motor vehicle industry offered unprecedented sales incentives. Buyers responded, and purchases reached a record 17.3 million units in 2000. Continued incentives and the easing of credit allowed sales to stay above 16 million through 2007. The subsequent downturn in economic conditions, along with stricter lending standards, contributed to sales declining to 13.1 million units in 2008, the lowest level since 1992. The BLS expects that technological improvements in motor vehicles, coupled with increased savings by consumers, will lead to individuals holding onto their vehicles for a longer time. Sales are therefore projected to pick up to 14.4 million units in 2018, but are not anticipated to reach the levels exhibited in the previous decade.

Nonresidential investment. As theory holds, nonresidential investment was a lagging indicator of the 2008 recession. Demand for nonresidential investment at first

appeared somewhat resilient, but then slowed considerably from mid-2008 through mid-2009. As the recession comes to an end, demand is expected to return to the long-term-trend level. Investment in computers and software is anticipated to contribute substantially to this growth, while demand for nonresidential construction is expected to slow. In total, the BLS anticipates that nonresidential investment will grow by 3.0 percent per year from 2008 to 2018, about the same as the 3.1-percent annual growth exhibited from 1998 to 2008. (See table 5.)

Within nonresidential investment, demand for equipment and software has grown more quickly in recent history than demand for structures. From 1988 to 1998, equipment and software posted an 8.5-percent annual growth rate. Despite the bursting of the “dot-com” bubble and the resulting 2001 recession, business investment in equipment and software maintained an overall healthy average annual growth rate of 3.5 percent from 1998 to 2008. The sector is projected to grow at 4.3 percent annually from 2008 through 2018, slightly faster than it grew the previous decade. Demand for computers and software is expected to contribute the majority of this growth as the category expands at 8.0 percent annually over 2008–18. A number of factors are anticipated to contribute to this continuation of growth, including increasing development of Internet and intranet sites, the adoption of e-prescribing and electronic health records, the need for computer security, and growing demand for compatibility with mobile technologies.

The “dot-com” bubble and tax incentives of the late 1990s led to an excess supply of office buildings, dampening demand for nonresidential structures for some time. The housing boom during the early to mid-2000s may have contributed further to pulling construction projects toward the more profitable residential sector. After housing starts peaked in 2005, nonresidential construction posted increases, even during the recession year of 2008. The BLS projects that investment in nonresidential structures will decline slightly, to 0.7-percent annual growth from 2008 to 2018, from a growth rate of 1.4 percent annually the previous decade. As the market for residential construction returns to its historical growth pattern, demand for nonresidential structures is anticipated to slow slightly. However, continued demand for nursing homes, medical treatment facilities, and educational structures is expected to facilitate some growth.

Residential investment. Many economic trends contributed to the formation of a bubble in the housing market in the early to mid-2000s, including the securitizing of

SOURCE: Historical data—Bureau of Economic Analysis; projected data—Bureau of Labor Statistics.

mortgages (which helped sustain a large amount of available credit), record low mortgage rates, and lenient lending requirements, resulting in an upsurge in subprime mortgages. As prices reached unsustainable levels, the bubble started to show the first signs of weakening in 2006, when private housing starts declined by 12.6 percent. Soon thereafter, a severe decline in the stock market, tighter lending requirements, and general fear due to the recession put additional stress on home sales and prices.

In 2008, investment in residential construction fell to \$359.5 billion, the lowest level since 1995. Sales plunged by nearly 40 percent from their 2005 peak of \$595.4 billion. Moreover, in 2008 private housing starts fell to 900,000, the lowest level since at least 1966. Consequently, demand for fixed residential structures declined by 1.5 percent annually, on average, from 1998 to 2008.²¹

Investment in the housing market generally is driven by changing demographics. In the bubble years, however, the demand stemmed from other sources, including rapid price appreciation and an easing of credit requirements. Therefore, the BLS expects that, as excess supply from the bubble period clears and consumer confidence in the housing market returns, investment in residential construction will return to the long-run-trend level by 2018. In order to account for the low starting point in 2008, investment in residential structures is projected to grow by 5.1 percent

annually between 2008 and 2018 and reach \$592.9 billion, not quite the peak exhibited in 2005. Private housing starts are anticipated to recover to 1.7 million in 2018, near the 2002 level.

Within residential construction, single-family structures were the most affected by the housing bubble. In 2008, investment in single-family homes fell to their lowest point since 1991, resulting in an average annual decline of 4.6 percent from 1998 to 2008. Construction of single-family homes is projected to grow by an average of 7.5 percent annually from 2008 to 2018. Demand in 2018, however, is anticipated to be roughly equal to the 2003 level, 13.7 percent lower than the peak in 2005.

Gross private domestic investment, in its entirety, including nonresidential and residential investment, is anticipated to account for 15.7 percent of overall nominal GDP in 2018, an increase from 14.0 percent in 2008, but lower than the category's 17.3-percent contribution in 1998. (See table 3.) BLS projections indicate that real business investment will grow at 3.9 percent annually over the 2008-18 period, much faster than during 1998-2008, when it increased by only 1.0 percent annually. Business investment is expected to be an important factor in economic growth over the next decade, contributing an anticipated 0.6 percentage point, on average, to the 2.4-percent GDP growth, or one-quarter of the expansion.

Much of the progress is expected to be attributable to a resumption of growth in residential construction as the housing market rebounds.

Foreign trade in goods and services and the current account. The BLS projects that the United States will become increasingly integrated with the rest of the world in the trade of goods and services over the projection period. Increased savings and a slowdown in consumption expenditures are anticipated to continue to support slower, but still relatively strong, import growth. Global demand for U.S. exports is expected to grow over the projection period, although at a slower pace than in the previous two decades. The BLS expects that, in order to minimize the impact of the recession and aid in the recovery, the Nation will continue to import more than it exports, relying upon foreign support to fund this debt.

Because exports have not grown as much as imports, the U.S. trade balance has been in a deficit for quite some time now. In real 2000 dollars, the United States has maintained a negative trade balance every year since at least the mid-1960s, except for 1980 and 1981. Even in nominal terms, the trade balance has been negative every year since 1976. In nominal terms, the deficit grew steadily from \$27.5 billion dollars in 1991 to \$757.3 billion in 2006. With the onset of the recession, it receded to \$669.2 billion in 2008. The BLS projects that the trade deficit will reach \$1.2 trillion in 2018. The deficit also has been increasing steadily in real dollars since 1991, except for a small decline in 2005 and more substantial declines in 2007 and 2008. In real dollars, the trade deficit is expected to reach \$652.8 billion in 2018, about \$37 billion higher than its peak in 2006.

As a share of GDP, nominal exports increased from 8.7 percent in 1988 to 10.9 percent in 1998 and 13.0 percent in 2008. Meanwhile, imports also grew as a share of GDP, from 10.9 percent in 1988, to 12.8 percent in 1998, to 17.7 percent in 2008. (See table 3.) Over the projection period, the BLS expects the world to continue along a path of increased trade. Both imports and exports are projected to grow as a proportion of GDP, but at a slower pace than their growth during the past two decades. The BLS projects that exports will amount to 13.9 percent of GDP, and imports will make up 19.5 percent, in 2018.

Exports expanded from \$966.5 billion (in real 2000 dollars) in 1998 to \$1.5 trillion by 2008, exhibiting 4.6-percent average annual growth. (See table 6.) Demand for exports is projected to slow to 3.9 percent annually from 2008 to 2018, with the level of exports reaching \$2.2 trillion by 2018. Over this time, exports of services are ex-

pected to grow considerably faster than exports of goods, which are anticipated to slow from 4.5 percent annually between 1998 and 2008 to an annual rate of 3.2 percent from 2008 to 2018. Service exports are projected to pick up their pace from 4.7-percent annual growth during the past 10 years to 5.3 percent over the projection period.

Imports grew by an average of 5.0 percent a year over the last decade, from \$1.2 trillion in 1998 to \$1.9 trillion in 2008. Imports of goods supported the majority of this increase, with a 5.1-percent annual growth rate, while services posted 4.3-percent annual growth. The BLS projects that import growth as a whole will slow to 4.2 percent annually from 2008 to 2018, with import goods declining to a 4.4-percent annual growth rate and services falling to a 3.4-percent rate. Since the early 2000s, rising oil prices have been a major contributor to the rapid growth of U.S. imports. Higher prices and an increasing reliance on alternative fuels are expected to slow the growth of U.S. petroleum imports from 1.4 percent per year during 1998–2008 to 1.1 percent annually over 2008–18.

The growing trade deficit and a corresponding increase in foreign investment in the United States have caused the current-account deficit (the excess of imports and income flows to foreigners over exports and foreign income of Americans) to increase dramatically since the 1990s. Economic prosperity made the Nation an attractive destination for foreign investors, thereby enabling the current-account deficit to inflate from 2.1 percent of GDP in 1998 to 5.9 percent in 2006. Then, as the stock market slipped and the United States entered a recession, the current-account deficit fell to 4.6 percent of GDP in 2008. The BLS projects the current-account deficit to be 5.1 percent of GDP by 2018, reflecting an expectation of continued foreign investor confidence in the U.S. economy.²²

Federal Government. As society ages and medical technologies advance, the cost of Medicare, Medicaid, and Social Security programs is expected to take up a growing share of the Federal Government's budget. Replacing military equipment worn down from the wars in Iraq and Afghanistan and maintaining current troop levels are together anticipated to require substantial defense expenditures. In sum, the BLS expects that the current budget deficit will continue—and even increase—by 2018 as the Federal Government faces both growing demand for social programs by an aging society and the continued cost of national security.

The primary budgetary challenge the Federal Government is expected to face over the projection period is limiting spending on Social Security and Medicare programs.

SOURCE: Historical data—Bureau of Economic Analysis; projected data—Bureau of Labor Statistics.

The oldest baby boomers reached age 62 in 2008 and qualified for partial Social Security retirement benefits. In 2011, they will be eligible to receive full Medicare benefits. In addition, new technology is expected to further increase medical costs at a pace much faster than the rest of the economy grows.²³ Social Security and Medicare grew from 27.5 percent of nominal Government expenditures in 1988 to 33.1 percent in 1998 and 34.2 percent in 2008. This trend is expected to continue, with these two programs together making up 35.1 percent of Government expenditures by 2018.²⁴

As mentioned a couple of paragraphs ago, the need to replace worn-down equipment is anticipated to require a considerable amount of funding. Also, on the basis of Department of Defense estimates, the BLS assumes that military force levels will remain fixed at 1.4 million troops throughout the coming decade. The cost of maintaining current troop levels and replacing worn-down equipment is expected to lead to a rise in real defense spending from a 40-year record high of \$538.1 billion in 2008 to a yet-higher \$644 billion in 2018, an annual growth rate of 1.8 percent, in comparison to 3.9 percent per year between 1998 and 2008.²⁵ (See table 7.) Defense expenditures are expected to account for 4.9 percent of nominal GDP

in 2018, a slight decline from 5.2 percent in 2008, but substantially higher than the 4.0-percent figure registered in 1998. (See table 3.) Nondefense expenditures also are projected to fall, from 2.4 percent of nominal GDP in 2008 to 2.1 percent in 2018.

As mentioned earlier, the Federal Government has run nominal annual budget deficits for most of the past 40 years. The deficit started to abate in 1993 and continued to decline for almost 10 years, culminating in 4 years of surplus from 1998 to 2001. The bursting of the “dot-com” bubble, along with costs related to the terrorist attacks of September 11, 2001, the wars in Iraq and Afghanistan, and tax cuts, pushed the budget back into larger and larger deficits since that time. The crisis in the housing and financial markets in 2008 put additional stress on the Government’s balance sheet.²⁶ The deficit more than doubled from 2007 to 2008, from \$229 billion and 1.7 percent of GDP to \$525 billion and 3.7 percent of GDP. Taking into account mounting financial responsibilities to care for an aging society and continued growth in defense spending, the BLS projects a budget deficit of almost \$900 billion—4.1 percent of nominal GDP—in 2018.²⁷ (See table 8.)

As the recession ends, individual and corporate tax revenues are projected to pick up from their low levels

in 2008. Federal Government receipts are anticipated to increase by 5.4 percent annually over 2008–18, faster than the 3.8-percent annual growth exhibited over the 1998–2008 period. Although the cost of the medical and Social Security programs is anticipated to grow rapidly during the next decade, the cost of the stimulus packages during the 2008 recession is projected to end. Federal ex-

penditures are expected to slow in nominal terms from 6.0-percent annual growth over the 1998–2008 period to 5.4 percent per year between 2008 and 2018. The BLS projects that transfer payments by the Federal Government will decline from 58.4 percent of total Government spending in 2008 to 54.3 percent in 2018. Interest payments to persons, businesses, and the rest of the world are

anticipated to rise from 10 percent of spending in 2008 to 18.4 percent in 2018.

State and local governments. State and local governments will face increasing fiscal challenges in the coming decade that, in many ways, echo the problems that will confront the Federal Government. Funding for Medicaid will account for a growing share of States' budgets as demand continues to grow and the Federal Government offers

less money in grants-in-aid to fund State programs. Most States have some form of balanced-budget requirement allowing only short-term minimal deficits. Therefore, any failure on their part to contain costs in the medical sector would constrain spending in other categories of State and local expenditures.²⁸

Current receipts of State and local governments are projected to grow at 4.7 percent annually from 2008 to 2018, slightly more slowly than the increase of 5.2 percent

per year from 1998 to 2008. (See table 9.) In particular, grants-in-aid from the Federal Government for Medicaid and other programs are expected to decelerate to an annual growth rate of 4.4 percent between 2008 and 2018. Grants-in-aid have been declining from 8.8-percent annual growth between 1988 and 1998 to 6.2 percent between 1998 and 2008. A continued slowdown is expected as the Federal Government struggles to meet growing demands for health care while limiting the budget deficit.

As growth in receipts slow, so will expenditures by State and local government. Expenditures are expected to increase by 4.2 percent annually over the 2008–18 period, a much slower pace than the 6.1-percent annual growth between 1998 and 2008. By 2018, State and local government expenditures on Medicaid alone are projected

to outgrow the Federal grants-in-aid received. The BLS projects that declining Federal funds will force State and local governments to slow the growth rates for all spending categories. The only anticipated exception is interest payments, which make up a small part of their budgets.

Consumption and gross investment by State and local governments increased by 1.8 percent annually from 1998 to 2008. (See table 7.) The BLS projects that these categories will grow slightly more slowly, at 1.4 percent annually, from 2008 to 2018. Consumption by State and local governments is anticipated to represent 12.6 percent of nominal GDP in 2018, nearly equivalent to the 12.7-percent figure registered in 2008. (See table 3.) In sum, the BLS projects that the States will run a small nominal surplus of \$8.8 billion in 2018. (See table 9.)

GDP from the income side

The compensation of employees, or labor income, has declined as a share of total personal income over the past 20 years, accounting for 69.8 percent of personal income in 1988, 67.6 percent in 1998, and 66.5 percent in 2008. Similarly, wage and salary disbursements, the largest segment of labor income, also have shown a decline in share, from 57.7 percent in 1988 to 54.1 percent in 2008. Wage and salary disbursements have declined more than compensation as the percentage of income received in benefits has risen. Employer contributions for insurance and re-

tirement programs have risen from 7.1 percent of income in 1998 to 8.5 percent in 2008. The BLS anticipates that, over the next 10 years, labor income's share will continue to decline slightly, reaching 64.8 percent of total income in 2018, accompanied by a 52.5-percent share for wage and salary disbursements (see table 10) and little change to employer insurance and retirement contributions, at 8.7 percent of income in 2018.

Another major component of personal income—business-related personal income, which includes proprietors' income, rental income, and personal income on assets—has remained steady over the past 20 years, at a 27.1-percent

SOURCE: Historical data—Bureau of Economic Analysis; projected data—Bureau of Labor Statistics.

share of personal income in 1988, 27.6 percent in 1998, and 26.2 percent in 2008. The BLS projects that the share for this type of income will be a similar 27.9 percent in 2018.

By contrast, the receipt of transfer payments has become an increasingly substantial source of personal income over the past two decades. Transfer payments rose as a share of personal income from 11.7 percent in 1988, to 13.2 percent in 1998, to 15.4 percent in 2008. The BLS projects that this category of income receipts will account for 15.7 percent of personal income in 2018.

The use of income can be broken up into the following categories: consumption, taxation, interest payments, and savings. Consumption (also called personal consumption) is by far the major use of income, accounting for 83.1 percent of personal income in 2008, when the personal savings rate was 1.8 percent. Over the past few years, the personal savings rate has dipped below historical levels. During the peak of the housing bubble, 2005–07, as households saw their net worth rise rapidly because of growing home values, the savings rate declined.²⁹ As the housing bubble burst and the value of homes declined, households began to feel more of a need to save: from the latter half of 2008 into the first half of 2009, the savings rate rose, staying above 4.0 percent in the second quarter of 2009.³⁰ The BLS anticipates that personal consumption will ease over the projection period and settle down to a 79.9-percent share of total personal income in 2018, compared with an 83.1-percent share in 2008. The savings rate is projected to be 3.9 percent in 2018, above the 1.8-percent rate posted in 2008.

Per capita real disposable personal income is projected to increase at an average annual rate of 1.7 percent from 2008 to 2018, reaching a level of around \$34,100 in 2018, a gain of about \$5,400 over the projection span. Another way of interpreting this growth is that, measured on the basis of growth of disposable personal income, standards of living will rise at about 1.7 percent per year over the projection period, 0.1 percentage point lower than the rate of growth between 1998 and 2008. Thus, the BLS expects its projections to be characterized by long-term stable growth in the real standard of living.

Employment

The expectation of slower increases in the labor force over the projection period indicates more moderate long-run employment growth in the future. Total civilian household employment is projected to rise by 0.9 percent per year from 2008 to 2018, resulting in an increase of about 13.1 million workers over the 10-year projection period,

slightly below the increase of 13.9 million during the 1998–2008 span. Nonfarm payroll employment is projected to grow at an annualized rate of 1.0 percent between 2008 and 2018, rising from 137.0 million to 151.6 million, an increase of 14.6 million jobs.³¹

Productivity

Increases in productivity are an important driver of the long-term growth of GDP. In this article, labor productivity is measured as output per hour in the private nonfarm business sector. Rising productivity is a critical part of improving living standards. Growth in labor productivity allows companies to increase the salaries and benefits of workers on the basis of their greater efficiency, rather than passing salary increases through to consumers in the form of higher prices.

BLS expects that productivity will grow at 1.8 percent per year over the 2008–18 period, a slower rate than the strong 2.6-percent average annual growth achieved over the 1998–2008 period, but in line with growth since 2004 and the 1.7-percent rate posted during the 1988–98 decade. (See table 11.) The anticipated productivity growth stems in part from the healthy growth of capital stocks resulting from projected rates of business investment.³²

Uncertainty of the economic projections

Any look at the future is uncertain. Although the use of the macroeconomic model to prepare the aggregate economic projections is a scientific approach, different assumptions would naturally lead to different economic projection paths. For instance, in the macromodel, the population 16 years and older influences real GDP. Principally, the demographic characteristics of this population, along with certain other variables, are used to determine the size of the labor force in the BLS macroeconomic projections. Accordingly, because the labor force itself is the most important element in determining the economy's ability to supply output within the macroeconomic model, the demographics of the 16-years-and-older population has a substantial effect on output and, hence, GDP.

Besides affecting the supply of output, an increase in the population influences various components of demand. For example, an increase in the number of 35- to 50-year-olds would result in a larger home-buying population, which in turn would lead to more housing starts, along with a greater demand for residential construction.

A large change in oil prices also could change the projection. Because the United States imports a large amount of oil, changes in oil prices can alter the balance of trade.

Table 11. Labor supply and factors affecting productivity, 1988, 1998, 2008, and projected 2018

Category	Level				Average annual rate of change		
	1988	1998	2008	2018	1988–98	1998–2008	2008–18
Labor supply (in millions, unless noted):

In addition, higher oil prices encourage the domestic production of oil, can change whether consumers buy cars or light trucks, and affect the rate of inflation. As mentioned earlier in connection with interest rates and the Fed's policy, a change in the inflation rate could cause the Fed to change the funds rate. A shift in the funds rate in turn alters the cost of borrowing for consumers and businesses and may alter their decisions when they are contemplat-

ing buying a house or building a new factory.

In conclusion, a hallmark of the BLS projections is that the assumptions and model-based findings on which they are based are made explicit, although any number of unexpected key factors may modify the path of the 2018 projections. With these points in mind, readers will be better able to grasp and appreciate the projections and estimates presented in this issue of the *Review*. □

Notes

¹ All figures in this article, except growth rates and dollar values, are real values using year-2000 dollars.

² The model used for this year's projections reflects the National Income and Product Accounts (NIPA) data published in July 2009, including GDP data and other data for the first quarter of 2009. Revisions to GDP data released after that time are not included in the BLS projections. However, it is important to remember that those projections are long-run projections based upon long-run trend analysis. The major NIPA revision, if incorporated, would have a limited impact on the BLS projections.

³ This model has been used to prepare BLS aggregate economic projections since May 2002. Macroeconomic Advisers developed and still supports the Washington University Macro Model, which the firm's team uses as a central analytical tool for its short- and long-term forecasts of the U.S. economy. The model operates and performs simulations on a Windows-based software program called wummsim.

⁴ Until the recent release of Federal Open Market Committee notes, the levels of unemployment and inflation that the Fed targeted were frequently debated. According to the minutes from the January 2009 meeting, the Fed's targets are to keep core personal consumption expenditure price index inflation at 1.7 percent to 2.0 percent, unemployment at 4.8 percent to 5.0 percent, and GDP growth at 2.5 percent to 2.7 percent. In the Macroeconomic Advisers' model, the BLS assumes that the Fed will adjust interest rates to push the economy toward the stated goals for inflation, unemployment, and GDP growth. For a discussion of the Fed's recent stances toward targeting inflation, see "Real Time Economics: Inflation Targeting Makes Fed Comeback," *Wall Street Journal* Blogs, Nov. 3, 2009, on the Internet at blogs.wsj.com/economics/2009/01/08/inflation-targeting-makes-fed-comeback (visited Nov. 18, 2009).

⁵ The Fed funds rate is the Fed's target for the rate banks charge other banks for overnight loans. More information on the rate can be found in "Open Market Operations" (Federal Reserve Board, Dec. 16, 2008), on the Internet at the Fed's Web site, www.federalreserve.gov/fomc/fundsrate.htm (visited Nov. 18, 2009).

⁶ The BLS follows the commonly held belief that 10-year Treasury yields reflect the market's forecast of future short-term interest rates. Because short-term rates cannot be cut below zero, it is logical to expect the spread between the Fed funds rate and the 10-year Treasury note yield to widen because future rates cannot be cut further, but must only stay flat or increase. Under a more normal interest rate environment, the spread would be narrower, as the market would be pricing in the possibility of both future rate decreases and increases, instead of simply pricing in increases.

⁷ Recently, much has happened in financial markets. Problems in the subprime lending market spread to other credit markets. At its August 2007 meeting, the Fed maintained the funds rate target at 5.25 percent, but turned quickly to concerns about the liquidity of short-term credit markets. Initially, the Fed intervened to increase liquidity through open-market operations. Then, on August 17, 2007, the Fed announced a 50-basis-point cut in its discount rate (the rate at which the Agency will lend to commercial banks), to 5.75 percent. Finally, the aforementioned half-percent funds rate cut to 4.75 percent came on September 18, followed by a cut to 4.5 percent in October.

¹⁸ Unconventional liquid fuels include gas-to-liquid biofuels (natural gas converted to gasoline or diesel fuel) and coal-to-liquid biofuels (coal converted to gasoline or diesel fuel), such as ethanol, as well as oil refined from extraheavy oil or oil sands.

¹⁹ See “Issues in Focus,” in *Annual Energy Outlook 2009* (Energy Information Administration, 2009), pp. 28–55, especially p. 31, on the Internet at www.eia.doe.gov/oiaf/aeo/pdf/issues.pdf (visited Nov. 18, 2009).

²⁰ See Appendix G, “Projections of Liquid Fuels and Other Petroleum Production in Five Cases: Reference; High Price; Low Price; High Economic Growth; Low Economic Growth,” in *Annual Energy Outlook 2009*, pp. 225–44, on the Internet at www.eia.doe.gov/oiaf/ieo/pdf/ieopol.pdf (visited Nov. 18, 2009).

²¹ The Federal Government instituted several measures aimed at stimulating demand. The central bank brought down the Fed funds rate to less than 1 percent in late 2008. Although mortgage rates then fell, this stimulus was not enough to lure buyers back into the market. Also in 2008, the Government offered home buyers up to a \$7,500 tax credit. Buyers were required to pay back the credit over the next 15 years, but no interest was charged. This allowance, too, did little to persuade buyers back into the market. Finally, in 2009, the Government offered a true tax credit of up to \$8,000 for first-time home buyers. This program has been effective at increasing demand and has since been extended through mid-2010 on somewhat modified terms.

²² On the basis of national accounting identities, the national savings rate is calculated by adding the current-account balance (exports less imports, with net factor income added) to gross investment and dividing the resulting sum by GDP. In other words, the current-account balance is the mathematical difference of national savings and domestic investment. Thus, a decrease in the national savings rate reflects a widening of the external deficit.

²³ It is important to note that the macromodel assumes that current health care policy will remain in place over the projection period. Recently, there has

been much discussion regarding health care reform that, if implemented, could affect the projection significantly. There are bills in both the Senate and the House proposing radical changes to the current health care system. The Congressional Budget Office estimates that a similar plan would increase Government spending on health care, further contributing to the upcoming problems in this sector of the economy.

²⁴ The Congressional Budget Office estimates that, left in their current situation, the Medicare, Medicaid, and Social Security programs alone would entirely crowd out all discretionary spending, including defense, education, and homeland security, by 2040. (See *Overview of the President’s 2009 Budget* (Government Printing Office, no date), especially p. 7.), on the Internet at www.gpoaccess.gov/usbudget/fy09/pdf/budget/overview.pdf (visited Nov. 12, 2009).

²⁵ For a discussion of defense spending and estimates of military force levels, see *National Defense Budget Estimates for FY 2009* (Office of the Under Secretary of Defense, September 2008); and *Fiscal 2010 Department of Defense Budget Release* (Department of Defense, May 7, 2009).

²⁶ In order to restore confidence in the financial sector, the Treasury Department was given the authority to purchase \$700 billion of “toxic” assets through the Troubled Assets Relief Program (TARP). The Congressional Budget Office estimates that TARP injected roughly \$247 billion into the economy in 2008. By June 6, 2009, approximately \$432.7 billion had been distributed through TARP, including \$85 billion to the auto industry and \$69.8 billion to American International Group (AIG). Most of the remaining funds went to stabilize banks. (See *TARP Transactions Report* (U.S. Department of the Treasury, June 6, 2009); *Tranche Report to Congress* (U.S. Department of the Treasury, January 2009); and *The Troubled Assets Relief Program: Report on Transactions through December 31, 2008* (Congressional Budget Office, January 2009), on the Internet at www.cbo.gov/ftpdocs/99xx/doc9961/01-16-TARP.pdf (visited Nov. 12, 2009).)

²⁷ The BLS projection of nearly \$900 billion for the Federal budget deficit in 2018 is slightly lower than the Congressional Budget Office’s March 2009 forecast of \$1 trillion. (See *A Preliminary Analysis of the President’s Budget and an Update of CBO’s Budget and Economic Outlook* (Congressional Budget Office, March 2009), on the Internet at www.cbo.gov/ftpdocs/100xx/doc10014/03-20-PresidentBudget.pdf (visited Nov. 12, 2009).) In August 2009, however, the Office revised its forecast to \$622 billion. (See *The Budget and Economic Outlook, An Update* (Congressional Budget Office, August 2009), on the Internet at www.cbo.gov/ftpdocs/105xx/doc10521/08-25-BudgetUpdate.pdf (visited Nov. 12, 2009).) The Office of Management and Budget expects the deficit to be \$688 billion in 2018. (See *Updated Summary Tables, May 2009: Budget of the U.S. Government, Fiscal Year 2010* (Office of Management and Budget, May 2009), on the Internet at www.whitehouse.gov/omb/budget/fy2010/assets/summary.pdf (visited Nov. 12, 2009).)

³⁰ See “Personal Savings Rate” (U.S. Department of Commerce, Bureau of Economic Analysis, Oct. 29, 2009), on the Internet at www.bea.gov/briefrm/saving.htm (visited Nov. 12, 2009).

³¹ The measure of civilian employment used in the aggregate economic projections discussed in this article is a count of persons who are working. Estimates of civilian employment are derived from the Current Population Survey (CPS), a survey of households carried out for the Bureau of Labor Statistics by the Census Bureau. Payroll employment is a count of jobs and is based on the Current Employment Statistics survey (CES), a BLS survey of establishments. Although the employment measures from the two surveys show similar trends over the long term, shorter term differences have arisen. For further information on these two employment measures and on employment growth differences, see Mary K. Bowler and Teresa L. Morisi, “Understanding the employment meas-

ures from the CPS and CES survey,” *Monthly Labor Review*, February 2006, pp. 23–38; on the Internet at www.bls.gov/opub/mlr/2006/02/art2full.pdf (visited Nov. 12, 2009). The BLS maintains a monthly update on CES and CPS employment trends on the Internet at www.bls.gov/web/ces_cps_trends.pdf (visited Nov. 12, 2009).

³² For more detailed information on labor productivity and employment, see

Rose Woods, “Industry output and employment projections to 2018,” this issue, pp. 52–81. See also *Labor Productivity: Developments since 1995* (Congressional Budget Office, March 2007); James A. Kahn and Robert W. Rich, “Tracking Productivity in Real Time,” *Current Issues in Economics and Finance* (Federal Reserve Bank of New York, November 2006); and “Productivity Growth,” *Economic Report of the President, the Annual Report of the Council of Economic Advisers*, chapter 2, February 2007, pp. 45–62.

Data in table 7 (page 50) were corrected online December 29, 2010. See Errata online at www.bls.gov/opub/mlr/2010/12/errata.pdf.

Employment outlook: 2008–18

Labor force projections to 2018: older workers staying more active

As the baby-boom generation ages, the share of workers in the 55-years-and-older age group will increase dramatically; the participation rates of older workers in the labor force are expected to increase, but will remain significantly lower than those for the prime age group, and, as a result, the participation rate and overall labor force growth rate will decline

Mitra Toossi

The U.S. labor force is undergoing a gradual but significant change. Beginning in the latter part of the 20th century, three major demographic trends—slowing growth, aging, and increasing diversity—led to changes that have had a considerable impact on the profile of the labor force in the United States and are projected to affect the workforce in the foreseeable future.

Slowdown in the growth of the labor force. The high growth rate of the labor force from the 1970s to the 1990s has been replaced by a much slower growth since 2000. The slow growth rate of the labor force is expected to continue over the next decade.

Aging of the labor force. With the aging of the baby-boom generation, defined as persons born between 1946 and 1964, the older age cohorts are expected to make up a much larger share of the labor force. In 2008, the baby-boom cohort was 44 to 62 years of age. By 2018, almost all the baby boomers will be in the 55-years-and-older age group. Age is a major factor in labor

market behavior, and the aging of the labor force will dramatically lower the overall labor force participation rate and the growth of the labor force.

Changes in the racial and ethnic composition of the labor force. As a result of higher population growth—stemming from an increased number of births and increased immigration—and high labor force participation rates by Hispanics and Asians, the share of the workforce held by minorities is expected to increase significantly.

In addition to exploring these trends, this article describes the labor force projections by the Bureau of Labor Statistics (BLS) for the 2008–18 timeframe, for 136 demographic groups broken down by age, sex, race, and Hispanic origin. The dynamic factors that have led to changes in the composition of the workforce resulting from persons entering, leaving, or staying in the labor force also are highlighted. Finally, the article discusses the median age of the labor force for the different groups, along with the economic dependency ratio in the labor force.¹

The U.S. labor force is projected to increase by 12.6 million over the 2008–18 period, reaching nearly 167 million in 2018.² (See

Mitra Toossi is an economist in the Office of Occupational Statistics and Employment Projections, Bureau of Labor Statistics.
E-mail: Toossi.Mitra@bls.gov

chart 1.) During each of the last two decades (1988 to 1998 and 1998 to 2008) the labor force grew by more than 16 million. The projected 8.2-percentage-point increase is less than both the 12.1-percentage-point increase over the previous decade and the 13.2-percentage-point growth over the 1988–98 timeframe. The BLS projects that nearly 12 million of the 12.6 million additional workers in the labor force over the next 10 years will be in the 55-and-older age group. This group is expected to be nearly 40 million in 2018, an increase of 43 percentage points. As a result, this age cohort will compose nearly a quarter of the labor force in 2018. (See table 1.)

The prime age group, composed of 25- to 54-year-olds, is projected to increase by 1.6 million and make up 63.5 percent of the total labor force in the target year. The youth labor force, composed of 16- to 24-year-olds, is expected to decline from the 2008 level, but will remain over 21 million in 2018. The share of youths in the overall labor force is estimated to be 12.7 percent in 2018, roughly half of that for the older age group.

The annual rate of growth for women in the labor force is expected to slow to 0.9 percent over the 2008–18 timeframe, still a faster growth rate than that of men. As a result, women are projected to increase their share of the

labor force slightly from 46.5 percent in 2008 to 46.9 percent in 2018. The number of men in the labor force is projected to grow by an annual rate of 0.7 percent during 2008–18, a much slower rate than the 1.1-percent rate during the 1998–2008 period.

With an anticipated increase in the number of immigrants, the U.S. population is expected to increase its size and composition. As a result of different fertility rates and major differences in their immigration patterns, the various race and ethnic groups are projected to continue to show different trends in population and labor force growth. The Hispanic labor force is expected to increase rapidly. By 2018, Hispanics are expected to reach more than 29 million in number, composing 17.6 percent of the labor force as a result of an annual growth rate of 2.9 percent over the projected timeframe. Although the share of Asians in both the population and labor force is relatively small, the number of Asians has been growing rapidly in the past two decades. The BLS projects that Asians will grow at an annual rate of 2.6 percent, reaching more than 9 million workers by 2018. The black labor force is projected to continue to have a steady growth of 1.3 percent over the next decade and is anticipated to surpass 20 million in 2018.

Chart 1. Civilian noninstitutional population and labor force, 1988, 1998, 2008, and projected 2018

Dash indicates no data collected for category. Details may not sum to totals because of rounding.

The labor force projections are a product of two factors: population growth and participation rate changes. The Census Bureau provides projections of population by age, sex, race, and ethnicity, while the BLS develops future trends of the labor force participation rates for various age, sex, race, and ethnic groups. The next two sections discuss these two components in turn.

Population

In the past century, a number of unique birth patterns have substantially affected the future size and composition of the U.S. population and labor force. These influen-

tial birth patterns are

- the birth dearth cohorts, born in the late 1920s and early 1930s
- the baby-boom generation, born between 1946 and 1964
- the baby bust cohort, born between 1965 and 1975
- the baby-boom echo, also known as Generation Y or the millennial generation, born between 1976 and 2001.³

In addition to birth patterns, immigration patterns af-

fect the growth and composition of the U.S. population and labor force.

The BLS labor force projections are based on Census Bureau projections of the resident population of the United States. These projections in turn are based on alternative assumptions having to do with the three factors that affect population growth: fertility, life expectancy, and net international migration. The BLS uses the Census Bureau's published "middle series" population projections, based on the mid-level assumption for each of the preceding factors. The "middle series" population projections are considered the most likely path of future population change. The most recent of the resident population projections were provided to the BLS in November 2008.⁴

The BLS converts the resident population concept of the Census Bureau population projections to the civilian noninstitutional population concept of the Current Population Survey (CPS). The conversion takes place in four steps. First, the population of children under age 16 is subtracted from the total resident population. Second, the population of the Armed Forces, broken down into different age, sex, race, and ethnic categories, is subtracted. Third, the institutional population is subtracted from the civilian population for all the different categories.⁵ Finally, the Census Bureau's long-term population projections are benchmarked to CPS data.⁶

Of the three factors affecting population growth, immigration is of paramount importance to the future size and composition of the U.S. population. Immigration, however, is the greatest uncertainty in population projections. A significant number of immigrants to the United States, both legal and illegal, are of Hispanic ethnicity. According to the Census Bureau's most recent projections, net immigration to the United States is projected to add 1.5 million persons annually to the U.S. resident population. This is a sharp increase over the roughly 800,000 immigrants per year projected by the Census Bureau's previous long-term projections of the resident population. As the projected number of immigrants to the United States nearly doubles, a substantial change will occur in both the size and composition of the population.

Table 2 provides four snapshots of the civilian noninstitutional population at 10-year intervals over the 1988–2008 period and as projected over the 2008–18 period. The civilian noninstitutional population is expected to continue to increase by an annual rate of 1.0 percent over the 2008–18 period. This projected rate of growth is slower than that of the 1998–2008 period, when it was 1.3 percent.

The share of youths in the population peaked in 1976 at 22.9 percent. The group's share dropped to 17.9 percent in 1988 and to 16.2 percent in 1998. In 2008, the share of youths in the civilian noninstitutional population declined to 16.0 percent. The BLS projects that their share will further decrease to 15 percent of the total civilian noninstitutional population in 2018, continuing a declining trend. (See chart 2.) The number of youths is anticipated to increase by 1.3 million, reaching 38.8 million in 2018. The 25-to-54-year-old group is expected to increase by 2.8 million over the 2008–18 period, considerably less than both the 16.1 million figure the group posted during the 1988–98 period and the 8.2 million it registered over the 1998–2008 timeframe. The 55-and-older age group increased by 4.3 million from 1988 to 1998 and then by more than 16 million—four times that amount—in the 1998–2008 period. During the 2008–18 timeframe, the civilian noninstitutional population aged 55 years and older is projected to increase by nearly 21 million, to reach a total of 91.6 million. The older group's share of the civilian noninstitutional population in 2018 is expected to be 35.4 percent, an increase from 26.6 percent in 1998 and 30.2 percent in 2008.

In addition to its role in affecting the size of the population, immigration also influences the composition of the population by age distribution. For example, persons age 25 to 34 years numbered 38.8 million in 1998 and 40.0 million in 2008. The only way this cohort could have increased by that much is through net immigration. Because the main reason for immigration is the opportunity to work, the composition of the population and the labor force at younger age groups are most affected by immigration.

As a result of more immigrants entering the country and their significantly higher fertility rates, the rapid diversification of the population is projected to continue. Immigration of different race and ethnic groups to the United States changes the racial and ethnic composition of the U.S. population over time. Although growth rates of Hispanics and Asians are expected to be lower than they were in previous decades, the projected growth rates for these two groups are nevertheless much higher than for the other groups. Hispanics and Asians are projected to have about 3.0 percent annual growth over the 2008–18 timeframe. Blacks are expected to experience an annual growth rate of 1.4 percent, greater than the growth rate of the overall labor force. By contrast, the white non-Hispanic group is projected to grow more slowly, at a rate of 0.3 percent.

Chart 2. Percentage of 16- to 24-year-olds in the total civilian noninstitutional population, 1948–2008

Labor force participation rates

Because some Government agencies adopt different assumptions in projecting the overall labor force participation, their projections often differ. However, there is a general consensus that the overall participation rate will be inching downward for the foreseeable future.⁷ This trend is primarily a result of the baby-boom generation's entry into the 55-and-older age group.⁸

As the historical trends in table 3 indicate, the labor force participation rate of youths aged 16 to 24 years has decreased significantly since 1988. The major factor in this continual decrease has been an increase in school attendance at all levels, especially secondary school and college. This decreasing trend in participation among youths is projected to continue in the future. The prime age group also has experienced declining participation rates—since 2000—from a period of relatively flat participation in the 1990s. This group's declining trend in participation is projected to continue into the future.

The older age group is the only group that has significantly increased its labor force participation rate

in 2008 and that is projected to exhibit further increases in the future. As previous literature on this subject has noted, a number of factors are responsible for the increase in the participation rates of older workers since the late 1980s. First, people are living longer and healthier lives, so older people are working more years to earn additional income. In addition, the high cost of health insurance has forced many older workers to remain in the labor force in order to keep their employer-based health insurance or to return to work in order to obtain health insurance through their employer.⁹

In addition, changes in Social Security laws since 2000 have raised the normal retirement age for certain birth dates and decreased the benefits for early retirement. The modified laws were intended to discourage workers from early retirement and encourage increased participation of older workers in the labor market. The changes also established credits for delayed retirements, and that has encouraged older workers to delay their retirement and benefit from higher income for each additional year of work.

The changing structure of pension plans from *defined benefit* to *defined contribution* has affected the activity

rate of the older workers, influencing them to stay in the labor market for longer intervals. On the one hand, defined-benefit plans encourage retirement at an early age, before the plan’s standard retirement age. On the other hand, defined-contribution pension plans are based on an individual’s contribution, the employer’s contribution, and the investment returns on those contributions. The structure of defined-contribution plans is such that the plans are age neutral and are indifferent to retirement age. However, under defined-contribution plans, the benefits increase with additional years of work. In 2008, more workers were covered by defined-contribution plans than defined-benefit plans.

In addition, the Age Discrimination in Employment Act was amended in 1986 to eliminate any mandatory retirement age. Also, today’s older individuals are more educated than their counterparts in the past. In general, those with more years of higher education have higher participation rates in the labor market than those who are less educated. Finally, the current financial crisis has

hit the retirement savings of all workers, including older workers, so these older workers may decide to stay in the labor market longer in order to replenish their retirement assets as markets recover. As a result, the labor force participation rate of older workers is expected to increase in the future.

Factors in the decreasing participation rate. After 60 years of steady increase, the overall labor force participation rate reached an all-time high of 67.1 percent between 1997 and 2000. Since 2001, however, the overall participation rate has been on a gradual decline, reaching 66.0 percent in 2008, the latest year for which CPS data are available. A number of factors are responsible for this recent downward pressure on the overall labor force participation rate:

- As the baby-boom generation has aged and moved from the prime age group to the older age group, the overall labor force participation rate has declined and will continue to do so in the future. In 2008,

¹ The "all other groups" category includes (1) those classified as being of multiple racial origin and (2) the race categories of (2a) American Indian and Alaska Native or (2b) Native Hawaiian and Other Pacific Islanders. Dash indicates no data collected for category.

the baby-boom cohort was 44 to 62 years of age. In 2018, they will be 54 to 72 years old. In 2008, the participation rate of 25- to 54-year-olds was 83.1 percent, whereas the participation rate of those 55 years and older was 39.4 percent, less than half that for the prime age group. The movement of roughly 77 million baby boomers from participation rates above 80 percent to the significantly lower (less than 40 percent) participation rates of older age groups will significantly dampen the overall participation rate.

- The labor force participation of women seems to have peaked in 1999 and has been decreasing in the past 2 years. It is not expected to rebound to higher rates in the near future.
- The labor force participation rate of men has been steadily declining since its peak at the end of the 1940s. The increased availability of disability and So-

cial Security benefits has been one factor. In addition, the structure of benefits and defined-benefit pension plans has been responsible for the early retirement of men in the past two decades. The downward trend of the men's participation rate is projected to continue in the future.

- The labor force participation rate of youths decreases in recessions and has declined considerably since the 2001 recession. With increasing school enrollments, more young people than ever are continuing their education in hopes of pursuing better paying careers and becoming more marketable.¹⁰ As a result, the participation rate of youths is not projected to increase in the coming years.

In contrast to the factors producing decreasing trends of participation in the aforementioned groups, a number of factors have been responsible for an upward pressure on the overall labor force participation rate. However,

the strength of two factors has not been able to keep the overall rate from falling even further:

- The labor force participation rate of the 55-years-and-older age group has increased significantly since the mid-1990s. (See chart 3.) The participation rate of this group were relatively flat during the 1970s and 1980s. By 1988, the group's rate was 30.0 percent. In 1998, the rate increased again to 31.3 percent. A decade later, in 2008, the rate had risen significantly, to 39.4 percent. All the subgroups of the older age group, including 65- to 74-year-olds and those older than 75, experienced significant growth in their participation rates. (See chart 4.) In addition, chart 5 highlights the monthly participation rates of the 55-years-and-older group from January 2007 to August 2009, the last month for which data were available at the time this article was written.¹¹
- The labor force participation rate of Hispanics and Asians has been increasing steadily in the past several decades. Compared with other groups, Hispanic and Asian men have very strong attachments to the labor market.

Labor force participation peaks between the ages of 25 and 54. In 2008, the participation rate of this age group was 83.1 percent. The BLS projects that this group's participation rate in 2018 will be 82.5 percent, a decline of 0.6 percentage point. The participation rate of the 55-and-older age group in 2008 was 39.4 percent, less than half of the activity rate of the prime age group. In 2018, the baby boomers will be between 54 and 72, and they will be past their strongest years of attachment to the labor market. Thus, the main factor in reducing the overall labor force participation rate in the next decade will be the aging of the baby-boom generation and its movement into the 55-and-older age group.

Over the next 10 years, decreases in participation rates are projected to be mainly in the young and prime age groups, together comprising those from 16 to 54 years of age. However, all the subgroups in the 55-and-older age group are projected to increase their participation rates. The strong growth of the older group's participation rates is a continuation of the trends of the last two decades. The BLS projects that the labor force participation rate of the 55-and-older age group will continue its strong growth and reach 43.5 percent by 2018. In particular, two subgroups of the older group—those 62 to 64 years and those 65 to 74 years—are projected to show strong growth in

their participation rates. Chart 6 shows the labor force participation rates of youths, the prime age group, and older people in 1988–2008 and projected 2018 figures. Note that the increase in the labor force participation rates of older workers will not be able to compensate for the decreasing participation rates of the other age groups and, as a result, the overall labor force participation rate is projected to decrease by 1.5 percentage points between 2008 and 2018, dropping to 64.5 percent.

Demographic Patterns. Labor force participation rates follow different, but consistent, patterns over time across specific age groups, between the sexes, and among race and ethnic groups.

Age. Labor force participation is low for youths because some are still enrolled in school. Labor force participation increases during the prime working years (ages 25 to 54) and then declines sharply after age 55, as workers retire. For example, the participation rate was 58.8 percent in 2008 for persons aged 16 to 24 years, 83.1 percent for the prime age group, and 39.4 percent for the 55-and-older age groups.

Sex. Historically, the men's participation rate has exhibited a downward trend since at least the 1950s, while the women's rate has been steadily increasing. The long-term declines in the labor force participation rates of men in all age groups are expected to continue for a variety of reasons. With an increase in school attendance at all levels, especially the secondary school and college levels, labor force participation rates of the younger age groups—for both men and women—have decreased drastically. The increased availability of pensions and Social Security disability benefits beginning in the 1980s has resulted in a decrease in the activity rates of older men and encouraged their early retirement from the workforce. The slower-than-average labor market recovery since 2000 and the serious economic downturn and financial crisis of the most recent recession has contributed to a lower participation rate of men in the labor market, and this outcome is expected to continue to affect the labor market in the foreseeable future.

In addition, men are employed predominantly in the construction and manufacturing industries, both of which have been hit hard by the current economic slowdown. In 2008, men represented nearly 93 percent of employed workers in the construction industry and 72 percent in the manufacturing industries¹². In contrast, women are

Chart 3. Labor force participation rate of individuals 55 years and over

Chart 4. Labor force participation rates of older workers, 1978, 1988, 2008, and projected 2018

NOTE: Shaded area represents projection.

Chart 5. Monthly labor force participation rate, 55 years and older, January 2007 to August 2009

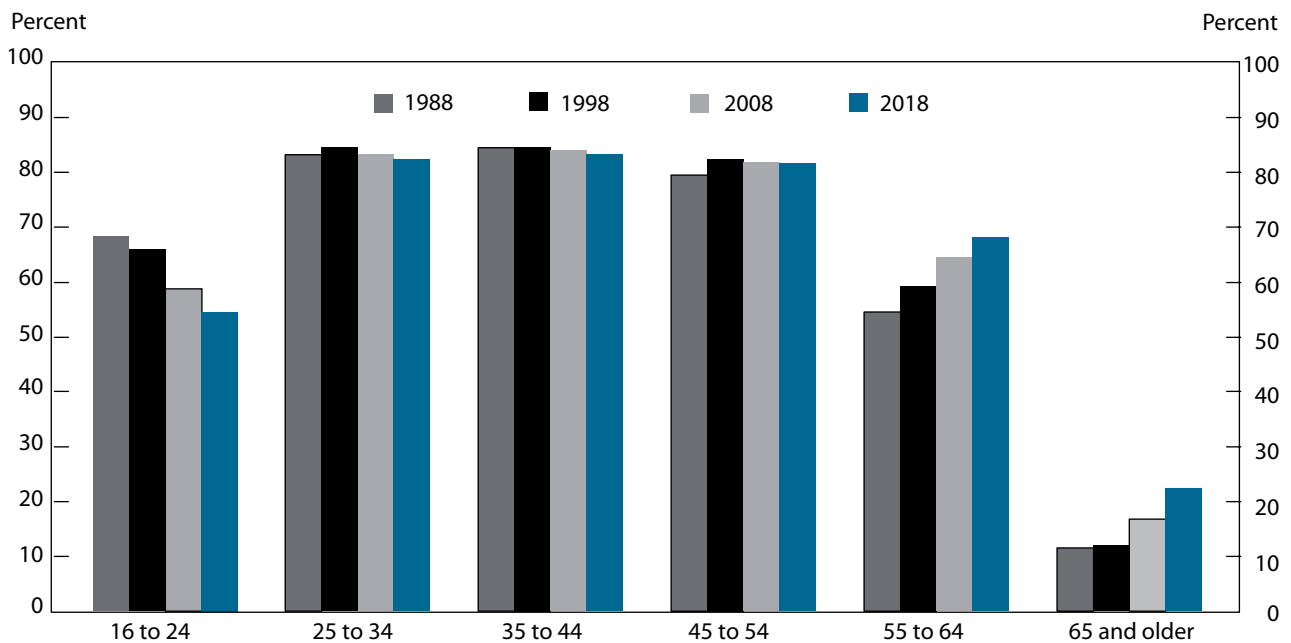

Chart 6. Labor force participation rates by age, 1988, 1998, 2008, and projected 2018

employed predominantly in the service sector, which has done relatively better during this recession. Moreover, women are more likely to work part time and without any benefits. During recessions, the probability of employees losing their jobs is less for workers in part-time jobs that do not offer benefits than for workers in full-time jobs with full benefits. Women, therefore, have had the ability to hold on to their part-time jobs.

Historically, men's participation rates, both in the aggregate and for the various age groups, have been higher than women's participation rates. This trend, however, has changed since 2006, when the labor force participation rates of 16-to-19-year-old women caught up with their male counterparts, at 43.7 percent. The participation rate for both teen groups will decline by 2018, but the women's participation will continue to be higher than that of men. The difference in rates by sex holds across race and Hispanic origin groups. (See table 3.)

1. *Men.* The decrease in the labor force participation rate of men is expected to continue over the next decade. The overall labor force participation rate of men is projected to drop by another 2.4 percentage points between 2008 and 2018 and is expected to reach 70.6 percent in 2018. Men in the 16-to-24 age group are projected to decrease their participation in the labor market from a rate of 61 percent in 2008 to 56.3 percent in 2018. The 25-to-54-year age cohort of men also is projected to decrease its participation rate to 89.9 percent by 2018, a decline of 0.6 percentage point from 2008. In contrast, the 55-and-older age group of men is projected to increase its participation rate by 2.0 percentage points from 46 percent in 2008 to 48 percent in 2018. Those in the 60-to-64-years age group also are anticipated to increase their participation rate—by 3.2 percentage points—and are expected to reach 63.1 percent in 2018. Even the older age group of 65- to 74-year-olds is expected to show an increase of 4.7 percentage points in its participation, reaching 34.4 percent in 2018.
2. *Women.* The labor force participation rate of women, which had displayed a pattern of steady increases in the past and peaked in 1999, is projected to decrease in the future. From its 2008 value of 59.5 percent the participation rate of women is projected to decline to 58.7 percent in 2018. Young women aged 16 to 24 years are

expected to decrease their participation in the labor force from a rate of 56.5 percent in 2008 to 52.7 percent in 2018. Similarly, 25- to 54-year-old women are projected to decrease their participation rate to 75.1 percent in 2018, a loss of 0.7 percentage point from the 2008 rate. In contrast to the younger age groups, the 55-years-and-older age group of women is projected to have a significant increase of 5.6 percentage points, reaching 39.5 percent in 2018. Likewise, those in the 60-to-64-years group are anticipated to experience a significant increase—7.9 percentage points—in participation, attaining a rate of 56.6 percent in 2018. Even the older age group of 65- to 74-year-olds are expected to show an increase of 6.0 percent in their participation rates, reaching 27.1 percent in 2018.

Race and ethnic origin. Although the labor force participation rates of the various racial and ethnic categories are different, the differences usually are not as great as those observed for the different age and sex groups. Both participation rate changes and population growth for the various racial and ethnic categories result in substantial differences in their future labor force growth.

The data shown in the lower part of table 3 are duplicated in the following box, which shows the variation in, and ranking of, the various labor force participation rates by race in 2008 (the groups are ranked from 1, which signifies the highest labor force participation rates in 2008, to 4, the lowest).

<i>Total</i>	<i>Men</i>	<i>Women</i>	<i>Rank</i>
Hispanic	Hispanic	Black	1
Asian	Asian	White non-Hispanic	2
White non-Hispanic	White non-Hispanic	Asian	3
Black	Black	Hispanic	4

As the table indicates, the rankings of labor force participation rates by race and by sex are different. The overall Hispanic labor force participation rate and the rate for Hispanic men are the highest relative to men's rates in other racial and ethnic categories. Hispanic women, by contrast, have the lowest participation of all women in the workforce. The Hispanic population is younger relative to other race and ethnic groups and has a greater proportion

of workers at the ages with higher participation rates. The overall Asian participation rate and the rate of Asian men ranked second among the rates of all the race and ethnic groups. Asian women rank third among all women. Black women have the highest labor force participation rate among all race and ethnic groups of women, while both the overall black participation rate and the rate of black men were the lowest among all race and ethnic groups. The overall white non-Hispanic participation rate and the rate of non-Hispanic men were third among the race and ethnic groups, while white non-Hispanic women had the second-highest ranking among women. Interestingly, as a general pattern, the women's rankings were the reverse of both the men's rankings and the overall rankings.

These preceding examples, based on 2008 data, indicate that age, sex, and race are important in describing the complexities inherent in the future scenario of labor force participation. Although the overall labor force participation rates for men and women are projected to change during the next 10 years, the changes are not expected to alter the current ranking of the different racial and ethnic categories.

Significantly higher participation in the labor force by Hispanic men and Asians are expected to increase their shares of the labor force over the next 10 years, continuing the trend of even more racial and ethnic diversity in the labor force.

Labor force growth

Labor force growth has always been a significant factor in the growth of the U.S. economy. Over the 2008–18 period, the U.S. population is expected to grow at a slower rate than it did in the previous decade, and the labor force participation rate is projected to decrease from its 2008 value. Both factors indicate a slowdown of labor force growth during the next decade. The annual labor force growth over the 1988–98 period was 1.2 percent. The next decade saw labor force growth decline even further, to 1.1 percent. It is projected that, over the 2008–18 decade, the annual growth rate of the labor force will be a much lower 0.8 percent. The labor force grew by more than 16 million during each of the 1988–98 and 1998–2008 periods; it is expected to grow by a lesser 12.6 million over the next 10 years. (See table 4.)

Age. The rapid growth of the labor force during the 1988–98 period was brought about largely by the baby boomers' entrance into the prime working-age years. Another significant factor was the earlier mentioned increase in the

labor force participation of women during that timeframe.

The youth labor force, which was about 22 million in 2008, is projected to be around 21 million in 2018, a decrease of more than 900,000 workers. The prime-age labor force is projected to increase its numbers by about 1.5 million over the 2008–18 timeframe. In this age group, the subgroup of workers aged 25 to 34 years is expected to increase by 3.5 million. Because 35- to 44-year-olds and 44- to 54-year-olds, members of the baby bust generation, are each projected to have a reduction in their labor force numbers, the overall prime age group will grow by just 0.1 percent annually.

The older workers' labor force, which has experienced the fastest rates of population growth and the greatest increases in labor force participation, is expected to grow by nearly 12 million in the next decade. Within that group, 55- to 64-year-olds are expected to add more than 7 million to their 2008 numbers, and 65- to 74-year-olds are projected to increase their numbers by more than 4 million. The labor force cohort of those 75 years and older is projected to grow by nearly 800,000. As a result of the rising shares of the older age groups in the labor force, the 55-years-and-older labor force is anticipated to increase its share to nearly 24 percent of the total labor force. Similarly, the share held by 55- to 64-year-olds is projected to increase to about 17 percent, while that of 65- to 74-year-olds is expected to grow to 5.4 percent. Even the 75-years-and-older labor force is projected to increase its share to 1.2 percent of the total labor force.

Sex. The men's labor force grew by 10.5 percentage points in the 1988–98 timeframe. The growth rate then increased to 11.6 percentage points between 1998 and 2008. As women's labor force participation rates rose significantly during the 1988–98 period, the women's labor force increased by more than 16 percentage points. The growth rate was still an impressive 12.6 percentage points during the 1998–2008 period.

Labor force growth for men was less than that for women in the past two decades. Following the trends of the past 20 years, the labor force growth rates of both men and women are projected to slow, with the men's labor force projected to grow more slowly than the women's. The slowing labor force growth rates result from more gradual population growth and decreasing participation rates for both groups. The men's labor force is projected to have a 0.7-percent annual growth rate, while the women's is expected to grow by 0.9 percent. The women's share of the labor force is projected to increase from 46.5 percent to 46.9 percent, and the men's share is projected to de-

Table 4. Civilian labor force, by age, sex, race, and ethnicity, 1988, 1998, 2008, and projected 2018

¹ The "all other groups" category includes (1) those classified as of being of multiple racial origin and (2) the race categories of (2a) American Indian and Alaska Native and (2b) Native Hawaiian and Other Pacific Islanders.

Dash indicates no data collected for category. Details may not sum to totals because of rounding.

crease from 53.5 percent to 53.1 percent, during the next decade.

In contrast to both prime age workers and the older labor force, the labor force of 16-to-24-year-old men had an annual decrease of 0.2 percent, and women of the same age group had an annual decrease of 0.3 percent, over the 1988–98 period. Both groups had a negligible positive growth rate of 0.1 percent the next decade. From 2008 to 2018, the growth rate is projected to become negative for both once again: an annual decrease of 0.5 percent for men and a 0.3-percent annual decline for women. As regards the prime age group, men had a growth rate of 1.3 percent and women experienced a growth rate of 2.0 percent between 1988 and 1998. In the next decade, the men's and women's growth rates converged at around 0.6 percent and 0.5 percent, respectively. The BLS expects that the growth rate of the prime age group of men and women will increase by negligible amounts during 2008–18.

The men's 55-years-and-older labor force had a growth rate of 0.8 percent in 1988–98 and a much stronger growth of 4.5 percent in 1998–2008. The BLS projects that over the 2008–18 period, the growth rate of the older men's

labor force will be about 3.3 percent. Women in the 55-and-older age group had a stronger growth rate—1.9 percent—than their male counterparts over the 1988–98 timeframe and then experienced an even stronger growth rate of 5.6 percent from 1998 to 2008. The BLS expects that, over the next 10 years, older women's labor force participation will grow by 4.0 percent.

Race and Hispanic origin. White non-Hispanics were the largest group in the labor force in 1988, accounting for 79 percent of the total. However, this group had the lowest growth rate of all race and ethnic groups—0.6 percent—in 1988–98 and then fell to half of that rate—0.3 percent—in 1998–2008. The BLS projects that, in the next decade, the growth rate of this group will continue to decline, to 0.2 percent. The slower growth rate of the white non-Hispanic labor force, which has led the group to an increasingly smaller share in the total labor force over the last several decades, is a reflection of a variety of factors. First, the white non-Hispanic share of immigrants to the United States has declined considerably during the past two decades. Second, white non-Hispanic birthrates have been on the decline compared with those of other popula-

tion groups. Finally, white non-Hispanic men make up a significant share of the aging and retiring labor force each year. As a result of all three of the preceding factors, the white non-Hispanic share of the labor force decreased to 73.9 percent in 1998 and to 68.2 percent in 2008.

Asians, who make up the smallest share of the labor force, increased their share from 3.1 percent to 4.6 percent from 1988 to 1998 and then to 4.7 percent in 2008. The Asian labor force, which is projected to reach more than 9 million in 2018, will remain the smallest group in the labor force. Still, it is expected that Asians will have the second-highest annual rate of labor force growth of all the race and ethnic groups, 2.6 percent, increasing their share to 5.6 percent of the labor force. The highest labor force growth rate over the 2008–18 period will be that of Hispanics, projected at 2.9 percent annually. Hispanics increased their share of the total labor force from 7.4 percent to 10.4 percent over the 1988–98 period, and then to an even greater 14.3 percent in 2008. The BLS projects that the Hispanic share will increase yet further, to 17.6 percent of the total labor force by 2018. Blacks increased their share from 10.9 percent in 1988 to 11.6 percent in 1998 and to 11.5 percent over the next decade. The black labor force is projected to total more than 20 million and compose 12.1 percent of the labor force in 2018.

By 2018, because of Hispanics' younger population, higher fertility rates, and increased immigration, the Hispanic labor force is expected to reach 29 million. As a result of their divergent rates of growth of both population and labor force participation over the past several decades, the racial and ethnic groups that make up the U.S. labor force are projected to continue to show widely varying rates of growth.

Dynamic changes in the labor force

The labor force is projected to increase by 12.6 million during the 2008–18 timeframe. This growth is based on the dynamic changes that underlie the movement of workers into and out of the labor force. (See table 5.) From 2008–2018, changes are projected to emerge from three dynamic groups:

- Entrants—those who were not in the labor force in 2008, but will enter during the 2008–18 period and continue to be part of the labor force in 2018.
- Leavers—those who were in the labor force in 2008, but will leave during the 2008–18 period and will not be in the labor force in 2018.

- Stayers—those who were in the labor force in 2008 and will remain in it through 2018.¹³

The 2018 labor force will be different from today's labor force to the extent that the demographic composition of labor force entrants between 2008 and 2018 is different from the composition of those now in the labor force. During the 2008–18 period, the labor force will be affected by the demographic composition of those leaving, those entering, and those staying in the labor force.

The BLS projects that, between 2008 and 2018, 37.6 million workers will enter the labor force and 25 million will leave. (See chart 7.) These figures compare with 36 million entrants and 19.4 million leavers over the 1998–2008 period. The number of entrants into the labor force is anticipated to be around 1.6 million more than in the previous decade. However, 5.6 million more people are expected to leave the labor force, mainly as a result of aging and retirement. (See chart 8.) Continuing the trends of the previous decade, the entrants are projected to be mostly men. During the 2008–18 timeframe, more than 20 million men are expected to enter the labor force, compared with 17 million women. The leavers also are more likely to be men because the male labor force—especially white non-Hispanic men—has greater number of older workers than the women's labor force. According to BLS projections, 14.3 million men are projected to leave the labor force by 2018, resulting in a labor force of 88.7 million men. Similarly, 10.7 million women are projected to leave the workforce by 2018. Because relatively fewer women are expected to leave the labor force in 2008–18, the share of women in the overall labor force is projected to increase to 46.9 percent in 2018.

Race and Hispanic origin. The BLS projects that there will be nearly 28 million white entrants to the labor force between 2008 and 2018. The largest share is expected to be from the white non-Hispanic group, with 20.8 million entrants. However, the white non-Hispanic share of entrants is much smaller than the group's share of the labor force, reflecting the group's lower population growth, as a result of both lower birthrates and very little migration of white non-Hispanics into the United States. The result is relatively fewer labor force entrants and relatively more labor force leavers, a reflection of the aging of the white non-Hispanic men in the labor force. About 19 million white non-Hispanic workers are projected to leave over the 2008–18 period, resulting in the share of white non-Hispanics in the labor force falling to 64 percent in 2018—a drop of 4.2 percentage points from the 2008 share and

Chart 8. Labor force leavers, 1998–2008 and projected 2008–18

nearly 10 percentage points from the group's 1998 share. In the 1998–2008 period, white non-Hispanic men also had supplied the most entrants: 28.8 percent of all entrants. White non-Hispanic men made up 47.5 percent of job leavers.

Blacks are projected to add 2.5 million workers to the labor force between 2008 and 2018. The BLS expects that among new entrants during this period, 14.4 percent will be black, compared to 12.1 percent of the entrants during the 1998–2008 period. The black labor force is projected to grow slightly faster than the overall labor force because of higher-than-average birthrates and immigration.

In 1998, the Hispanics labor force made up 10.4 percent of the total labor force, with 14.3 million participants. Because of higher levels of immigration, some 8.7 million Hispanics entered the labor force during the 1998–2008 period. Over the same time span, just slightly more than one million Hispanics left the labor force, reflecting their group's relatively young age composition. By 2008, the Hispanic labor force numbered 22 million, making up 14.3 percent of the labor force. The Hispanic labor force is projected to grow by 7.3 million, increasing to a workforce of 29 million in 2018. Significantly more Hispanic labor force entrants, 9.2 million, and relatively fewer Hispanic labor force leavers, nearly 2 million, are projected during the 2008–18 timeframe. The Hispanic share of the labor force is expected to increase more than that of any other demographic group, because of both overall population growth—from higher births and increased immigration—and significantly higher labor force participation rates.

Currently, Asians have the least numbers of all the race and ethnic groups in the labor force. During the 2008–18 period, about 3 million Asians are projected to enter the labor force and about 694,000 are projected to leave. As a result, the share of Asians in the 2018 labor force is projected to be 5.6 percent. Increases in the number of Asians in the labor force reflect their continued high immigration and very high labor force participation rates.

The aging labor force

Gary Becker has called the increase in life expectancy over the last hundred years the “20th century's greatest gift.”¹⁴ As a result of increases in life expectancy, declines in birthrates, and trends toward longer and healthier lives, the U.S. population is getting older. There are different methods for analyzing the age structure of the population and labor force. One way is to compare the relative shares of younger workers (those in the 16-to-24-years age

group) with the shares of older workers in the 55-and-older groups in the labor force. Alternatively, the 16-to-64 age group can be compared with the 65-and-older age groups. When the labor force share of the 65-and-older group increases or when the share of those less than 25 years of age decreases, the labor force becomes older. The third method is to calculate the median ages of the population and the labor force. The median age is an index that summarizes the age distribution of the labor force; it is the age such that half of the labor force is above it and half below. All these metrics point to the rapid aging of the U.S. population. This aging has a considerable effect on labor market behavior and its measures, such as the participation rate and unemployment.¹⁵ As the baby-boom generation entered the labor force, the median age of the labor force decreased steadily until 1980. Since then, as the baby boomers have aged, so has the labor force. As a result, the median age of the labor force has been increasing. In 1962, it was 40.5 years, the highest level attained before the baby boomers entered the labor force. After that event, it dropped steadily until 1980, and it has been rising steadily since then, all in tandem with the aging of the baby boomers. With the population projected to continue aging as rapidly as in the past, the median age of the labor force in 2018 is expected to exceed the level reached in 1962. (See table 6.)

For much of the past six decades, the men's labor force has been older than the women's labor force. In 1998, however, the median age of the men's labor force was 38.8 years, and the median age of the women's was a very close 38.7 years. In 2008, the median age of the women's labor force, at 41.4 years, surpassed that of the men's, which stood at 41.0 years. The trend is expected to continue over the 2008–18 timeframe, with the median age of the women's labor force increasing by much more than that of the men's, reflecting not only the higher level of participation of older women, and the withdrawal of older men from the labor force.

Historically, white participants have been older than the rest of the labor force, and they will continue to be older in 2018. Compared with whites, blacks and Hispanics are younger, reflecting their higher birthrates and larger shares of young workers in the labor force. Hispanics are projected to continue to have a lower median age than the overall labor force, but their median age of 34.5 years in 1998 is expected to increase to 38.3 years in 2018, reflecting the aging of earlier immigrants.

Black participants have been about 1.5 to 2.5 years younger than the overall labor force, and this age gap is projected to continue through 2018. Asian labor force

Table 6. Median age of the labor force, by sex, race, and ethnicity, 1978, 1988, 1998, 2008, and projected 2018

Group	1978	1988	1998	2008	2018

Table 7. Economic dependency ratio, by age, 1975–2008 and projected 2018

Group	1975	1988	1998	2008	2018
Total population.....	126.3	99.1	96.3	96.4	103.3
Under 16 years.....	61.4	45.2	43.3	43.1	43.5
16 to 64 years.....	44.2	31.8	30.8	31.0	34.7
65 years and older.....	20.7	22.1	22.2	22.3	25.1

participants have been slightly younger than the overall labor force, but this trend is expected to change by 2018.

Economic dependency

The economic dependency ratio is a measure of the number of persons in the total population (including the Armed Forces overseas and children) who are *not* in the labor force, per hundred of those who are. (See table 7.) In 2008, for every 100 persons in the labor force, 96 were not. Of those not in the labor force, about 43 were children, 31 were 16 to 64 years of age, and 22 were older than 64 years.

The economic dependency ratio for various age groups shows that the decrease in the overall rate from 1975 to 2008 is attributable to the change in the number of children. Since the 1970s, as the number of births diminished and the baby boomers aged beyond 16 years, the overall economic dependency ratio declined. Most of the 30-percentage-point drop in the ratio between 1975 and 2008 was due to the decline in the number of births.

The projected economic dependency ratios have several implications. That the portion of the ratio attributed to children is expected to continue decreasing implies that there will be fewer children per labor force participant in the future. The dependency ratio for the 16-to-64 age

group dropped 13.2 percentage points, from 44.2 in 1975 to 31.0 in 2008. This ratio is projected to decrease, reflecting an expected decrease in participation among men and women between 16 and 64 years old.

The one part of the dependency ratio that has been steadily increasing is the portion attributable to older persons. In 1975, this was by far the smallest part of the dependency ratio, and it is still expected to be the smallest proportion by 2018. However, between 1975 and 2008, the older persons' dependency ratio grew, and it is projected to continue increasing, to 25 persons in 2018.

THE GROWTH OF THE U.S. LABOR FORCE is projected to slow down in the next 10 years. With the aging of the overall U.S. population and the baby boomers, the share of older workers in the labor force is expected to increase. Because labor force participation rates decline significantly for the older age groups, the overall labor force participation rate and the growth of the labor force will decline. In contrast, the labor force participation rate of older workers has been increasing and is projected to continue to do so in the future. The growing labor force shares of Asians, blacks, and especially Hispanics have been an important development of the past several decades. Consequently, the 2018 labor force is projected to become much more diverse. Between 2008 and 2018, 37.6 mil-

lion workers are expected to enter the labor force, 25 million are anticipated to leave, and 129.3 million workers are expected to remain in the labor force. As a result, the labor force of 2018 is projected to be nearly 167 million,

an increase of 12.6 million workers over the 2008 level. This increase represents a rate of growth of 0.8 percent, the same growth rate that was projected for the 2006–16 period. □

Notes

¹ The projections presented supersede those described by Mitra Toossi in “Labor Force projections to 2016: more workers in their golden years,” *Monthly Labor Review*, November 2007, pp. 33–52. The BLS carries out labor force projections every 2 years based on the most recent demographic data.

² The civilian noninstitutional labor force consists of all employed and unemployed persons actively looking for a job. This group excludes inmates of mental and penal institutions and homes for the aged and persons who are on active duty in the Armed Forces. Historical data for this series are from the Current Population Survey (CPS), conducted by the Census Bureau for the Bureau of Labor Statistics.

¹² National labor force statistics (CPS) data are available on the Internet at www.bls.gov/cps (visited November 24, 2009).

¹³ The numbers of entrants and leavers are computed by comparing the labor force numbers for birth cohorts at two points in time. If the labor force numbers at the second point are larger, the difference is termed the number of entrants. If the labor force numbers at the second point are smaller, the difference is said to be the number of leavers. These concepts understate the actual numbers likely to enter and leave the labor force over the period covered by the two points in time, but are still a valid comparison. For a further discussion of the methods, see Howard N Fullerton, Jr., “Measuring Rates of Labor Force Dynamics,” *Proceedings of the Social Statistics Section*, American Statistical Association, 1993.

Employment outlook: 2008–2018

Industry output and employment projections to 2018

Professional and business services and the health care and social assistance sectors account for more than half of the projected job growth from 2008 to 2018; construction also is expected to add jobs, while agriculture and manufacturing employment is expected to decline over the period

Rose A. Woods

The most recent BLS projections have the labor force increasing at 0.8 percent per year and Gross Domestic Product (GDP) growing 2.4 percent annually over the coming decade. How do these predictions affect specific industries? With the foundation for the labor force and macroeconomy laid, the BLS develops industry employment projections every 2 years, which, in turn, are used to project growth for detailed occupations.¹ This article examines and reports on the results for detailed industry employment and output projections from 2008 to 2018.

These results project total employment in the United States to increase by 15.3 million over the 2008–18 period, rising from 150.9 million to 166.2 million.² This represents a 1.0-percent average annual growth rate, which is somewhat faster than the 0.7-percent annual rate experienced during the 1998–2008 period, when employment increased by 10.4 million jobs. The slower growth in the earlier period was due in large part to the recession which began in December 2007.³

Over the 2007–08 period, average annual employment fell by 803,900 jobs, down 0.5 percent over the year. Since 2008, further declines in employment have worsened the labor market. From December 2008 through August 2009, monthly employ-

ment (seasonally adjusted) for nonfarm wage and salary workers fell by more than 3.8 million jobs. These relatively large losses in employment since 2008 are not part of the analysis in the present article. Rather, the purpose of this article is to evaluate and present the long-term trends in industry employment, as well as the factors affecting these trends over the 10-year projection period from 2008 through 2018. Nevertheless, because of the relatively low levels for the base year employment, the projected growth rates over the 2008–18 period for some industries may be uncharacteristically high, as part of this growth will likely be due to the recovery of jobs lost during the recession.⁴

Nonagricultural wage and salary employment accounts for about 9 out of 10 projected jobs in the coming period.⁵ Within this broad category, most growth is expected within service-providing industries, in which employment is projected to increase by 14.6 million, rising to 131.1 million by 2018. In contrast, jobs in goods-producing industries are projected to show virtually no growth, remaining at 21.4 million in 2018. The number of agriculture workers, which includes self-employed persons, unpaid family workers, and wage and salary workers, is projected to decline by 78,200. Most remaining job growth is accounted for by a projected increase of 630,500 among nonagricultural self-employed and unpaid family workers, rising to 9.9 million by 2018. (See table 1.)

¹ Employment data for wage and salary workers are from the BLS Current Employment Statistics survey, which counts jobs, whereas self-employed, unpaid family workers, and agriculture, forestry, fishing, and hunting are from the Current Population Survey (household survey), which counts workers.

² Includes wage and salary data from the Current Employment Statistics survey, except private households, which is from the Current Populations Survey. Logging workers are excluded.

³ Includes agriculture, forestry, fishing, and hunting data from the Current Population Survey, except logging, which is from Current Employment Statistics survey. Government wage and salary workers are excluded.

⁴ Workers who hold a secondary wage and salary job in agricultural production, forestry, fishing, and private household industries.

⁵ Wage and salary workers who hold a secondary job as a self-employed or unpaid family worker.

Projected industry employment is determined by a number of inputs, including projected industry output. BLS projects industry output to expand to \$27.7 trillion (in chain-weighted 2000 dollars) by 2018, an increase of \$6.7 trillion from 2008.⁷ The resulting average annual growth rate of 2.8 percent is somewhat faster than the

2.1-percent rate experienced during the previous decade. Most growth is expected to come from service-providing sectors. Output in these sectors is projected to increase to \$20.0 trillion by 2018, an average annual growth rate of 3.1 percent. As the growth rate is similar to the 3.0-percent rate of the 1998–2008 period, and is faster than

the overall growth rate for output, the service-providing sectors are expected to continue to increase their share of nominal output from 68.4 percent in 2008 to 72.8 percent in 2018.⁸

Output in the goods-producing sectors, excluding agriculture, and the agriculture, forestry, fishing and hunting sector is projected to grow at a 2.0-percent annual rate. This is an improvement from the previous decade, in which the recession at the end of the period negated any growth, resulting in a zero-percent growth rate for the goods-producing sectors, overall. Output in the agriculture, forestry, fishing and hunting sector is projected to grow at a 0.9-percent annual rate to reach \$318.9 billion in 2018. Despite growth in these two sectors, neither is expected to outpace growth among service-providing industries. As a result, their respective shares of nominal

output are expected to decline. (See table 2.)

The 2008–18 BLS projections have the labor force growing at an annual rate of 0.8 percent in the coming period, which is somewhat slower than the 1.1-percent growth rate experienced during the 1998–2008 period.⁹ The growth rate of the nonfarm labor productivity index is projected to average 1.8 percent annually over the projection period, which is significantly slower than the 2.6-percent growth rate experienced in the previous decade.⁹ The projected annual growth in GDP is expected to remain essentially unchanged, from 2.5 percent over the 1998–08 period to 2.4 percent per year over the projection period. These macroeconomic constraints, along with the industry models, shape the final projections of industry employment and output.

In addition, changes within the various GDP com-

Table 2. Output by major industry sector (gross duplicated output), 1998, 2008, and projected 2018

ponents can directly influence employment and output projections. As globalization and international competition continue to take on greater significance, exports and imports will affect the future prospects of many industries. Indeed, two of the GDP components with the fastest projected growth in the coming period are imports (4.2 percent) and exports (3.9 percent).¹⁰ As a result, a variety of industries—from agriculture and manufacturing to financial services—are expected to benefit from globalization in the form of rapidly rising exports. At the same time, however, increased globalization is projected to lead to even faster increases in imports. While some industries may benefit from increased imports in terms of improved productivity¹¹, others, such as apparel and textiles, are likely to be affected adversely.

Sector highlights

Service-providing sectors include those with the fastest projected rates of employment and output growth over the projection period. In terms of employment, the educational services sector¹² is projected to have the most rapid growth in the economy, adding 805,500 jobs by 2018, an annual average growth rate of 2.4 percent. (See table 1.) Professional and business services is projected to generate the greatest number of jobs, with employment increasing by 4.2 million during the 2008–18 period (2.1 percent per year). In terms of output, the information sector is projected to have the fastest growth, increasing by 5.4 percent per year and reaching nearly \$1.9 trillion by 2018. (See table 2.)

Within the goods-producing sectors, the only sector projected to show employment growth over the projection period is construction, which is expected to add 1.3 million jobs and reach 8.6 million by 2018. The job gains in the construction sector will be almost entirely offset by the projected 1.2-million decline in manufacturing employment during the 2008–18 period. The manufacturing sector's seemingly large employment loss, which projects an employment level of 12.2 million in 2018, still represents a contrast to what was experienced during the previous decade when the sector lost 4.1 million jobs. Employment in mining is projected to decline from its 2008 level of 717,000, shedding jobs at a rate of 1.6 percent per year to reach 613,200 by 2018.

Due to continued productivity gains, output in the goods-producing sector is expected to paint a different picture than employment, as both construction and manufacturing are expected to have rising output. Specifically, output for the goods-producing sector is projected

to increase 2.0 percent annually and reach \$6.2 trillion by 2018. Manufacturing, the dominant major industry in the goods-producing sector, is projected to expand output 2.1 percent annually, reaching \$4.9 trillion in 2018.

The recession that began in December 2007 affected some sectors more severely. As a percent of total employment, the largest employment declines over the 2007–08 period occurred in construction, manufacturing, and financial activities. Construction had a 5.4-percent decrease, representing a loss of 415.1 thousand jobs. Manufacturing lost the most jobs, 448,000, as employment fell by 3.2 percent over the 1-year period. The financial activities sector was also severely affected by the recession, as employment fell by 1.9 percent, losing 155.9 thousand jobs.¹³

Service-providing sectors

Service-providing sectors are projected to generate almost all of the employment gain from 2008 to 2018. Two of these sectors—professional and business services and health care and social assistance services—are expected to generate 8.2 million jobs over the period, more than half the increase in total employment. Projected employment growth in the leisure and hospitality sector and in the State and local government sector will contribute an additional 2.7 million jobs by 2018. Employment declines are projected in only one service-providing sector—utilities—where employment is expected to decline by 59,000 jobs over the period. (See table 1.)

Service-providing sectors are also expected to produce strong gains in output, which is projected to grow by \$5.3 trillion over the 2008–18 period. At the sector level, real output is projected to grow fastest in the information, wholesale trade, and retail trade sectors. (See table 2.)

Professional and business services. Employment in the professional and business services sector is projected to reach 22.0 million by 2018, an increase of 4.2 million jobs, more than any other sector in the economy. Business demand for consultants, sophisticated computer networks, and a variety of employment services to address complex business issues is expected to generate much of the demand. Employment is projected to grow 2.1 percent annually over the projection period, higher than the 1.6-percent rate experienced during the 1998 to 2008 period, as the sector returns to the prerecession employment growth rates. Demand for professional and business services is projected to remain strong; output in the sector is expected to increase by 3.5 percent per year (\$1.0 trillion), reaching a \$3.5 trillion by 2018.

Much of the employment growth in the professional and business services sector will be in management, scientific, and technical consulting services. This industry is projected to have the fastest employment growth of all industries and the third largest employment increase. (See tables 3 and 4.) Employment in the industry is projected to increase by 835,200 jobs (6.2 percent annually), reaching a level of 1.8 million by 2018. Strong job growth is expected due to continued business demand for advice on planning and logistics, implementation of new technologies, and compliance with workplace safety, environmental, and employment regulations. Increasing globalization, trends towards outsourcing and mergers, and a heightened need for security also provide opportunities for consulting firms.¹⁴ For the management, scientific and technical consulting services industry, output is projected to rise by \$115.4 billion (5.3 percent annually) and reach \$287.2 billion by 2018, which places this industry among those with the fastest and largest projected output growth. (See tables 5 and 6.)

Computer systems design and related services is also among the industries projected to experience the fastest and largest employment growth. (See tables 3 and 4.) Employment is projected to increase by 656,400 jobs, bringing the level of employment to 2.1 million by 2018. This represents an average annual growth rate of 3.8 percent, slightly slower than the rate experienced during the previous decade, largely due to a deceleration in the growth of new markets for this industry. Still, with increasing demand for the design and integration of sophisticated networks and Internet and intranet sites, employment in the industry is expected to continue to rise over the projection period. Other factors driving growth include the need for compatibility with mobile technologies, the adoption of e-prescribing and electronic health records, and increasing requirements for computer-related security services.¹⁵ These demands are expected to increase output by \$94.5 billion (3.8 percent annually), resulting in a level of \$302.0 billion in 2018.

The employment services industry, comprising employment placement agencies, temporary help services, and professional employer organizations, is projected to have one of the largest employment increases over the projection period. (See table 4.) This industry is expected to add 599,700 jobs and reach 3.7 million by 2018, an average annual rate of 1.8 percent. Output is projected to increase by \$64.3 billion (3.2 percent annually) and reach \$238.0 billion by 2018. The demand for temporary help services is expected to generate much of the growth. These services include the placement of temporary workers and those

with specialized skills, such as health care staff needed to meet the needs of aging baby boomers. Demand for the services of professional employer organizations is also expected to drive growth. As companies face increasingly complex employee regulations, they are expected to shift responsibility for human resource and personnel management to these organizations to help control costs and reduce risks.

Health care and social assistance. Employment in health care and social assistance is projected to generate 4.0 million jobs, the second largest increase among all sectors. Employment in this sector is projected to reach 19.8 million in 2018, growing at an average annual rate of 2.3 percent, the second fastest among all sectors. The strong growth is driven largely by projected changes in demographics. The total number of persons aged 65 years and older is projected to increase from 38.7 million in 2008 to nearly 51.4 million in 2018; this age group will account for 15.3 percent of the total population in 2018, up from 12.7 percent in 2008.¹⁶ Advances in medical technology and the increasing population of the elderly, whose health care needs are greater than average, are expected to drive growth.

Cost pressures are expected to continue to impact the distribution of employment within the health care and social assistance sector. The delivery of services is expected to continue shifting from costly inpatient facilities, such as hospitals, to less expensive outpatient settings. The demand for integrated delivery of different types of care is expected to continue to grow,¹⁷ and pressures to limit unnecessary or low-priority services will continue as well. Although cost pressures may dampen employment growth in hospitals, they are also expected to help drive demand for services provided by offices of health practitioners, home health care services, and individual and family services.

Offices of health practitioners provide medical, surgical, and dental services outside the traditional hospital setting. This industry is expected to be among those with the largest employment and output increases over the projection period. (See tables 4 and 6.) The industry is projected to add 1.3 million jobs (3.0 percent, annually) and reach a level of 5.0 million by 2018. Output is projected to grow by \$246.2 billion (4.3 percent annually) and reach \$714.1 billion by 2018. This growth will be driven by several factors. First, innovations in medical technology are expected to increase life expectancy and the number of elderly persons seeking medical care. In addition, medical advances are expected to improve survival rates of severely ill and injured patients of all ages, which will increase the need

Table 3. Industries with the fastest growing and most rapidly declining wage and salary employment, 2008–18

for extensive care to aid in their recovery. Finally, cost pressures are expected to shift delivery of some services from expensive inpatient facilities to the offices of health practitioners.¹⁸

The home health care services industry is also projected to experience strong employment growth over the projection period. This industry provides skilled nursing or other medical care in the patient's home. Home health care services are expected to add 441,400 jobs, reaching an employment level of 1.4 million by 2018. This represents an annual growth rate of 3.9 percent, making it the fourth fastest among all industries. (See table 3.) Output growth in home health care services is projected to increase by \$26.4 billion and reach \$79.1 billion by 2018, an average annual growth rate of 4.1 percent. Strong growth is expected due to the rising population of elderly, for whom most home health services are provided, and the lower cost of delivering some services in a home health care setting compared with more costly inpatient facilities.

The nursing and residential care facilities industry is projected to add 636,800 jobs over the projection period and is among those with the largest employment increases. (See table 4.) Employment in this industry is projected to reach a level of 3.6 million by 2018, growing at a 1.9-percent average annual rate. Output in this industry is projected to increase by \$29.3 billion from 2008 to 2018, reaching \$160.4 billion by the end of the period, an annual growth rate of 2.0 percent. Nursing and residential care facilities provide inpatient nursing, rehabilitation, and health-related personal care to those who need continuous nursing care but do not require hospital services. The increasing share of elderly persons in the population is expected to drive growth among these facilities. As life expectancy continues to increase, so does the number of people who require nursing and residential care.

Employment growth in private hospitals is expected to increase at an average annual rate of only 1.1 percent during the projection period. (See the government section of this article for a discussion of employment in public hospitals.) Still, because of the large employment base, this annual growth rate represents one of the largest employment increases among all industries. (See table 4.) Hospitals are expected to add 550,700 jobs and reach an employment level of 5.2 million by 2018. Over the same period, output is projected to increase by \$154.8 billion, at a 3.2-percent average annual rate, to reach \$580.4 billion. The slow rate of employment growth relative to most other health care services results from cost pressures. Services currently provided on a costly inpatient basis in a hospital are expected to be increasingly provided as an outpatient

or home health service. In addition, continued emphasis on preventive care, the elimination of unnecessary procedures, and the integrated delivery of care are expected to dampen growth in this industry.

Individual and family services provide a variety of social assistance services to children, the elderly, persons with disabilities, and others. This industry is projected to be the third-fastest in terms of employment growth over the projection period, increasing at a 4.0-percent average annual rate. (See table 3.) This rate of growth represents an additional 530,200 jobs by 2018, which is one of the largest projected increases among all industries, bringing the employment level to 1.6 million. (See table 4.) Projected growth in this industry is driven by the expected increase in the share of elderly in the population and the resulting increase in demand for services such as senior centers, adult day care, and programs that provide home care services. In addition, cost pressures are expected to shift delivery of some services from relatively expensive inpatient facilities to less costly individual and family service providers.

Outpatient, laboratory, and other ambulatory care, which stands to benefit from cost-reduction measures, includes services such as medical and diagnostic laboratories in addition to outpatient care centers. The employment growth in this industry is projected to be one of the largest increases, adding 308,400 jobs, at a rate of 2.8 percent annually, which also ranks it as one of the fastest growing industries. (See table 3.) Output in this industry is projected to grow 4.5 percent annually, increasing by \$64.5 billion over the projection period to reach \$180.0 billion in 2016.

Information. The information sector is projected to experience output growth at an average annual rate of 5.4 percent, faster than any other sector in the economy. (See table 2.) Output in the information sector is expected to increase by \$759.4 billion over the projection period, reaching \$1.9 trillion in 2018. Most of this projected growth is expected in three industries: telecommunications; software publishing; and data processing, hosting, related services, and other information services. These three industries are among those with the fastest and the largest projected output growth. (See tables 5 and 6.) However, employment in the information sector is projected to grow at an average annual rate of only 0.4 percent, which is lower than the expected growth rate of total employment. Slow job growth is due mostly to two large industries within the information sector that are projected to see declining employment. Telecommunications and

newspaper, periodical, book, and directory publishers are expected to lose a combined 209,300 jobs over the projection period. Overall, the information sector is projected to add 118,100 jobs during the projection period, to reach 3.1 million jobs by 2018.

Within the information sector, the telecommunications industry accounted for about a third of employment in 2008. Over the projection period, telecommunications employment is projected to decrease at a 0.9-percent average annual rate, declining by 89,600 jobs to reach 931,900 jobs in 2018. Despite an increase in demand for telecommunications services, more reliable networks and consolidation among organizations will lead to productivity gains, reducing the need for workers. In terms of output, telecommunications is projected to be among the industries with the fastest and the largest output growth, as households and businesses demand an expanding range of communications services. (See tables 5 and 6.) Output is expected to increase by \$342.0 billion over the projection period, reaching \$822.3 billion by 2018, an average annual rate of 5.5 percent.

In terms of output, software publishing is expected to be the second-fastest growing industry. (See table 5.) Real output is expected to grow over the projection period at a rate of 10.5 percent, increasing by \$334.7 billion to reach \$529.6 billion by 2018. Employment is expected to increase at an annual rate of 2.7 percent, placing this industry among those with the fastest employment growth. (See table 3.) Software publishers are expected to add 79,100 jobs over the period, reaching an employment level of 342,800 in 2018. Relative to the previous decade, employment growth should be rapid as organizations of all types continue to adopt the newest software products. In addition, software companies will continue to offer a wider range of IT services, many of which are labor-intensive.

The data processing, hosting, related services, and other information services industry is also projected to be among those with the strongest employment growth, increasing at 3.8 percent annually, to reach 574,100 jobs by 2018. (See table 3.) Included in this industry are establishments that provide Web hosting, streaming services and application hosting and service provisioning. Establishments supplying information or storing and providing access to information, for the purpose of searching, publishing or broadcasting content are also included in this industry. These can include news syndicates, libraries, archives and Web search portals. Real output in the industry is projected to grow at an average annual rate of 9.3 percent, the third fastest increase among all industries. (See table 5.) Output is expected to increase by \$203.4 billion over

the projection period, placing this industry among those with the largest output increases and bringing output to \$345.3 billion in 2018. (See table 6.) Internet publishing and broadcasting and Web search portals are expected to grow rapidly, as Web search portals continue to expand into major IT providers, and as Internet publishing and broadcasting gain market share from more traditional mediums.

Financial activities. This sector comprises industries related to finance, insurance, real estate, and renting and leasing. While large output growth is projected for several industries in this sector (see table 5 and table 6), employment growth is expected to be more in line with the overall employment growth rate in the economy. The sector is projected to add 557,200 jobs over the projection period, growing at a rate of 0.7 percent annually. Output in the financial sector is projected to increase at a 3.0-percent annual growth rate—somewhat slower than the 1998-2008 period, which grew 3.4 percent annually.

The industries within the financial sector expected to have the largest increases in employment are real estate; monetary authorities, credit intermediation, and related activities; and agencies and brokerages, and other insurance related activities. Real estate is projected to add 196,100 jobs, growing at average annual rate of 1.3 percent. Two other industries—monetary authorities, credit intermediation, and related activities, along with agencies, brokerages, and other insurance related activities—are expected to add 137,400 and 131,200 jobs, respectively. The employment growth in these three industries accounts for over 80 percent of the job growth in the financial sector, over the projection period.

One industry projected to be among the fastest growing in terms of employment and output is lessors of nonfinancial intangible assets (except copyrighted works). Output is projected to rise as the composition of the economy changes and trademarks, licensing, and branding become more important aspects of firms' activity. Employment in this industry is projected to rise more slowly than output, as the nature of the work allows for increased output (value of the assets leased) without increasing employment. This industry is expected to add 9,700 jobs over the projection period and reach an employment level of 37,900. Output in this industry is expected to grow 4.9 percent annually, making it one of the fastest growing industries in terms of output. (See table 5.)

Other industries within the financial sector projected to be among the largest or fastest growing in terms of output include securities, commodity contracts, and other

financial investments and related activities (\$44.7 billion increase); monetary authorities, credit intermediation, and related activities (\$370.6 billion increase); and real estate (\$205.3 billion increase). One factor expected to drive growth in these industries is the movement of many members of the baby boom generation into retirement in the coming years. The prevalence of defined contribution retirement plans will lead many retirees to seek professional investment advice to manage their retirement accounts. Globalization is another factor expected to drive growth, as the continued removal of trading boundaries increases the number of Americans seeking to invest abroad and of foreigners seeking to invest in U.S. securities.

Educational services. The educational services sector includes private education at elementary and secondary schools, colleges, and training centers. (For a discussion of public educational services, see the government section.) Employment is projected to reach 3.8 million in 2018, growing at an average annual rate of 2.4 percent, the fastest among all sectors. The overall demand for workers in educational services is expected to increase with a growing emphasis on improving education and making it available not only to more children and young adults, but also to those currently employed and in need of improving their skills.

Employment in other educational services—which include establishments that specialize in business, computer, and management training; schools offering technical, trade, and other instruction; and educational consulting services—is projected to grow at an average annual rate of 4.5 percent during the 2008–2018 period, second fastest among all industries. (See table 3.) The industry is expected to add 316,000 jobs to reach an employment level of 894,900 in 2018. As adults seek additional training to improve their skills, educational services such as professional and management development, technical and computer training, and fine arts schools are expected to grow. In addition, educational reforms are expected to increase demand for educational consultants who advise districts on how to improve test scores and other achievement measures.

Accounting for nearly a third of the projected increase, jobs at private junior colleges, colleges, universities, and professional schools are projected to increase by 254,700, representing an average annual growth rate of 1.5 percent. As more high school graduates attend college, and more working adults return to school, employment at these post-secondary institutions is projected to grow to 1.9 million by 2018.

Employment in elementary and secondary schools is

projected to be among the fastest growing industries, increasing at a rate of 2.5 percent annually. This represents a gain of 234,800 jobs over the projection period, with employment reaching 1.1 million in 2018. Much of this growth is expected as a result of continued enrollment growth and reforms. In addition, the number of special education teachers is expected to increase because of continued emphasis on the inclusion of disabled students in general education classrooms and an effort to reach students with problems at younger ages.

Wholesale and retail trade. Employment in wholesale trade is projected to increase at a 0.4-percent average annual rate over the 2008–18 period. Although slower than the growth rate of overall employment, the change represents one of the largest increases among all industries. (See table 4.) Wholesale trade is projected to add about 255,900 jobs, reaching an employment level of 6.2 million in 2018. Consolidation of wholesale trade firms into fewer and larger companies will contribute to slower than average employment growth in the industry in the future. With strong competition among wholesale distribution companies, manufacturers' representative companies, and logistics companies for business from manufacturers, cost pressures are likely to continue to force wholesale distributors to merge with other firms or to acquire smaller firms. The consolidation of wholesale trade into fewer, larger firms will make some staff redundant and reduce demand for some workers. Technological improvements such as electronic data interchange that allow better tracking of product information; radio frequency identification that streamlines the distribution process; and electronic commerce will also increase productivity, putting additional pressure on demand for employment.

Output in wholesale trade is projected to grow by \$713.5 billion over the projection period, the second largest increase among all industries. (See table 6.) This represents a 5.3-percent average annual growth rate, bringing output to \$1.8 trillion in 2018. Strong output growth is expected as demand continues for the industry's essential distribution services, as well as for newer services such as financing, marketing, and product support.

The retail trade industry is projected to add 654,000 jobs over the projection period, growing at an average annual rate of 0.4 percent, to reach an employment level 16.0 million in 2018. Although the projected increase is one of the largest among all industries, the rate of growth is slightly slower than it was in the previous decade. (See table 4.) The slower growth is expected because of continued consolidation and slower projected growth in

personal consumption than in the previous decade.¹⁹ Real output in the retail trade industry is projected to increase by \$631.5 billion over the projection period, bringing the level to \$1.9 trillion by 2018, an annual average growth rate of 4.2 percent. The output increase is the third largest among all industries. (See table 6.)

Leisure and hospitality: The leisure and hospitality sector is projected to have the fourth-largest employment increase among the service-providing sectors. (See table 1.) This sector is projected to add 1.1 million jobs over the projection period, reaching 14.6 million in 2018. This represents a 0.8-percent average annual growth rate, slightly slower than the overall economy. While this sector comprises many industries in arts, entertainment, and recreation as well as accommodation and food services, over half of the projected growth is found in a single industry. Food services and drinking places is projected to generate 738,800 jobs, the fourth largest increase among all industries. (See table 4.). This represents a 0.7-percent annual growth rate, resulting in an employment level of 10.4 million jobs in 2018. Output for this industry is projected to grow at a 1.5-percent annual rate over the projection period, increasing by \$69.0 billion to reach \$499.1 billion in 2018. Factors driving growth in food services and drinking places include the increasing population of the elderly and the growing demand for more convenient dining options.

Utilities: The only employment decline among service-providing sectors is expected in utilities. This sector is projected to shed 59,000 jobs, declining at a 1.1-percent average annual rate. (See table 1.) The largest projected decline is in electric power generation, transmission, and distribution. This industry is expected to lose 59,000 jobs over the projection period, an average annual rate of decline of 1.6 percent, resulting in an employment level of 345,700 by 2018. Job losses are projected to occur even as increasing demand for electricity causes output to grow by \$35.0 billion to reach a level of \$282.4 billion by 2018, an average annual rate of 1.3 percent. The downward trend in employment in past years has mainly resulted from changes in scale, although the deregulation of energy markets in the 1990s was certainly a factor. The trend has been in the direction of building larger facilities, resulting in more efficient plants. At the same time, new technologies have decreased the number of workers needed at all plants—including older plants with lower capacities.

Natural gas distribution is projected to lose 6,000 jobs

over the projection period, resulting in an employment level of 100,800 in 2018, or an average annual decline of 0.6 percent. The projected job losses are partly the result of no output growth in the industry, which forces distributors to contain costs. Real output in the industry is expected to remain flat over the period, holding steady at a level of \$67.1 billion in 2018. Industry consolidation has affected this industry significantly and will continue to do so. Further, new equipment that is more heavily automated means that fewer operators are needed to monitor these systems. The adoption of new technologies is costly, so companies are taking these steps gradually.

The expected job losses among natural gas distributors are offset by an expected job gain in water, sewage, and other systems, because of the rapid expansion of water systems. Employment is projected to increase from 48,000 to 54,000 jobs, over the projection period. Rising demand for water, sewage and other systems is projected to increase output at an average annual rate of 1.6 percent, adding \$1.4 billion to reach a level of \$9.6 billion in 2018. As the population continues to grow and move toward the suburbs, more water treatment facilities are being built. Further, changing EPA and State water quality regulations may require more workers to ensure that water is safe to drink and to release into the environment.

Government. Public sector employment is expected to grow by 1.7 million jobs over the projection period, reaching 24.2 million in 2018. This represents an average annual growth rate of 0.7 percent, compared with the 1.2-percent rate of the previous decade. Projected gains in State and local government employment account for nearly 95 percent of the job gains.

Federal government employment is expected to increase over the projection period by 94,800 jobs, an average annual increase of 0.3 percent, to reach 2.9 million in 2018. Employment increases are expected in both Federal defense government and Federal nondefense government except enterprises, growing by 50,800 and 165,100 jobs, respectively. The Postal Service, however, is expected to be the fourth largest industry in terms of employment loss, reaching 650,000 jobs in 2018—a decline of 97,500 (see Table 4). Job losses are also projected for Federal enterprises except the Postal Service and electric utilities, declining by 18,600, a rate of 3.4 percent per year. Over the coming decade, employment growth within Federal government is expected to be supported by domestic programs in areas such as public health, information security, and scientific research.

The State and local government sector is projected to

add 1.6 million jobs during the 2008–18 period, an average annual growth rate 0.8 percent, to reach 21.3 million. Most of this growth is expected to come from State and local government educational services, which accounted for more than half the sector’s employment in 2008. (For a discussion of private educational services, see the educational services section.) The local government educational services industry is among those with the largest projected employment growth, adding 652,700 jobs, an average annual growth rate of 0.8 percent. (See table 4.) Growing enrollments, along with educational reforms are expected to drive much of the increased demand for teachers and other workers in elementary and secondary schools.²⁰

Employment in State government educational services is expected to grow somewhat faster than in local government, increasing at a 0.9-percent annual growth rate, as these services are concentrated at the postsecondary level. Trends expected in private postsecondary education, such as increasing numbers of high school graduates attending college and more working adults returning to school, are also expected to apply here. As a result, State government educational services are projected to add 225,000 jobs, reaching 2.6 million in 2018.

State and local government hospitals are projected to see little employment growth as a result of cost pressures similar to those facing private hospitals. (For a discussion of private hospitals, see the health care and social assistance section.) Local government hospitals, where most of the employment is found, are projected to add 6,400 jobs over the projection period, growing at a 0.1-percent average annual rate to reach a level of 669,000 in 2018. State government hospitals, which are mostly psychiatric and substance abuse hospitals, are projected to add 13,900 jobs, growing at an average annual rate of 0.4 percent, to reach an employment of 377,300.

The rest of State and local government is projected to experience employment growth due to increasing demand for services, particularly public safety and health services. The increasing population of the elderly, combined with State and local assumption of responsibility for services such as security and disaster response are driving growth in these services. Although employment is projected to rise, the growth is expected to be dampened by budgetary constraints, primarily from the increasing proportion of revenue devoted to the Medicaid program and health insurance for government employees and retirees.²¹ Resistance to tax increases is expected to limit employment growth, although to a lesser degree than health-related cost pressures.

Goods-producing sectors

The goods-producing sectors comprise agriculture, mining, construction, and manufacturing. Employment in these sectors decreased over the 1998–2008 period and is expected to show virtually no growth through 2018, remaining at 21.4 million jobs. As output in the goods-producing sectors is expected to increase, labor-saving techniques and productivity improvements are expected to continue to put downward pressure on any employment growth. As a percent of total employment, the goods-producing sectors are projected to fall from 14.2 percent in 2008 to 12.9 percent in 2018. In contrast, output for the goods produced by these sectors (excluding agriculture) is expected to grow at a rate of 2.0 percent annually through 2018, somewhat slower than the 2.8-percent growth rate of output for the overall economy. The share of total nominal output for the goods-producing sector is also expected to fall, from 25.9 percent to 23.7 percent, as demand in the service sectors continues to grow more quickly than in the goods-producing sectors.

Agriculture, forestry, fishing, and hunting. This sector comprises two large industries—production of crops and production of animals—in addition to four smaller industries: forestry, logging, fishing, and agricultural support activities. Establishments in this sector are generally described as farms, ranches, dairies, greenhouses, nurseries, orchards, or hatcheries. Employment in the agriculture, forestry, fishing, and hunting sector, which has a significant proportion of self-employed workers, is projected to decline by 78,200 over the 2008–18 period, an annual rate of –0.4 percent. Overall, employment in the sector is expected to decline to 2.0 million by 2018.

Despite the declines in employment, however, output is projected to expand by 0.9 percent per year to reach \$318.9 billion in 2018, up from \$292.6 billion in 2008. According to the U.S. Department of Agriculture²², long run developments for global agriculture reflect continued demand for biofuels, particularly in the United States and the European Union (EU). Increases in corn-based ethanol production in the United States are projected to slow; however, demand for ethanol is expected to remain high and will affect production, use, and prices of farm commodities throughout the sector. Expansion of biodiesel use in the EU is also expected to raise demand for vegetable oils in global markets.

Other crops, some of which might be more efficient than corn in the production of ethanol, are likely to be introduced as well. Cellulosic ethanol, for example, which

can be made from straw, switchgrass, or wood chips, will likely play a larger role in this market. Nevertheless, employment is expected to decline in the coming period, as technological improvements in farm equipment continue to reduce the number of workers needed in the sector and market pressures on small family farms continue to drive consolidation in the industry.

The downward trend in employment in agriculture, forestry, fishing, and hunting is dominated by declines in the crop production and animal production, which are projected to post job losses of 69,900 and 36,700, respectively, over the coming period. This places both of these industries among the largest industry employment declines in the economy over the period. (See table 4.)

Other industries within the sector are expected to increase employment. Logging is expected to gain 18,200 jobs, growing at a rate of 2.0 percent annually. Support activities for agriculture and forestry is projected to add 8,800 jobs. Consolidation of farms should continue to lead to more demand for this industry's services.

Crop production and animal production make up the vast majority of output in the agriculture, forestry, fishing, and hunting sector—over 80 percent of nominal output in 2008. These two industries are expected to expand production through 2018. Crop production, which will be affected by the increased demand for corn-based ethanol products and other biofuels, is projected to increase output at an annual rate of 0.7 percent, down from the 1.8-percent annual rate experienced during the 1998–2018 period. Output in animal production is projected to grow 1.1 percent annually, virtually unchanged from the 1.0-percent growth rate experienced during the 1998–2008 period.

Output in the other industries within agriculture, forestry, fishing, and hunting, which currently account for only a small portion of total output in the sector, is expected to show some growth over the projection period. Forestry is expected to increase output at a 3.2-percent annual rate, albeit from a smaller numerical base for output relative to agriculture, as the industry is expected to raise timber stands to meet future demand for alternative fuels. Support activities for agriculture and forestry is projected to increase its output at a 2.9-percent annual growth rate, as the forestry industry expands, and also with the consolidation of other farms.

Mining. Employment in the mining sector is expected to reach 613,200 by 2018, down 103,800 from its 2008 level. As a whole, the mining sector is expected to experience an average annual decline in employment of 1.6

percent. Output is expected to decrease slightly at an average annual rate of 0.2 percent and reach \$227.3 billion by 2018. Mining production is tied closely to prices and demand for the raw materials the industry produces. As prices for oil, gas, and metals have risen rapidly in recent years, production and employment in the industry have also grown. In the recent past, employment may have fluctuated due to changes in prices, but over the course of the projection period, prices are expected to stabilize, and output is expected to return to historic levels. Technological advances are expected to increase productivity and cause employment declines in the mining industry as a whole.

The oil and gas extraction industry, which accounted for almost 60 percent of the nominal output and 23 percent of employment within the mining sector in 2008, is expected to decline in terms of employment over the projection period by 25,800 jobs. This represents an annual rate of decline of 1.7 percent, in contrast to the 1.4-percent annual rate of increase that occurred between 1998 and 2008. Output in oil and gas extraction is projected to decrease at an annual rate of 0.3 percent, from \$125.6 billion in 2008 to \$121.9 billion in 2018. Petroleum and natural gas exploration and development in the United States depends on prices for these resources and the size of accessible reserves. Rising worldwide demand for oil and gas is likely to cause prices to remain strong and generate the incentive for oil and gas producers to continue exploring and developing oil and gas reserves. U.S. reserves of oil and gas should remain adequate to support continued production through 2018.²³ Factors dampening output growth include environmental concerns, accompanied by strict regulation and limited access to protected Federal lands. Restrictions on drilling in environmentally sensitive areas and other environmental constraints should continue to limit exploration and development, both onshore and offshore.

Within the mining sector, coal mining is the only industry expected to show employment growth, increasing by 3,300 jobs to reach 83,900 in 2018. Output in this industry is expected to increase 1.5 percent annually, reaching \$23.7 billion in 2018. Demand for coal will increase as coal remains the primary fuel source for electricity generation. Although environmental concerns exist regarding coal power—burning coal releases pollutants and carbon dioxide—few alternatives exist on a scale large enough to meet the fuel demand of utilities. Natural gas burns cleaner than coal, but coal power plants equipped with scrubbers reduce this disadvantage somewhat. Future increased use of nuclear power or renewable energy sources, such as solar or wind power, could reduce demand for coal,

but over the projection period neither is expected to increase rapidly enough to contribute significantly to U.S. energy supplies.

Metal ore mining is projected to lose 4,000 jobs over the projection period, an annual decrease of 1.1 percent. Metals are used primarily as raw materials by other industries, such as telecommunications, construction, steel, aerospace, and automobile manufacturing. Consequently, the strength of the metal ore mining industry is greatly affected by the strength of these industries. Most metals are bought and sold in a world market, so demand stems not only from domestic industries but also from fast growing industries in developing countries. Demand on the world market from fast growing countries has caused prices for many metals to increase substantially in recent years. This has caused U.S. mining companies to expand production at existing mines and restart production at some mines that were closed when low metal prices made them unprofitable. However, in the long term the potential stabilization of prices together with many of the same environmental concerns as in coal mining will cause employment in metal ore mining to decline. Output is projected to grow 0.6 percent annually, up from the 3.5-percent average annual decline that occurred during the 1998–2008 period.

Nonmetallic mineral mining is projected to experience little change in employment, as it is projected to fall at a 0.1-percent rate over the projection period. Output is projected to increase 2.8 percent annually, reaching \$23.2 billion in 2018. Although demand will continue to increase for crushed stone, sand, and gravel used in construction activities, advances in mining technology will require fewer workers for operation and maintenance of new mining machines. Like the metal ore mining industry, the nonmetallic mineral mining industry is influenced by the strength of the industries that use its outputs in the manufacture of their products. Nonmetallic minerals are used to make concrete and asphalt for road construction and also as materials in residential and nonresidential building construction.

Construction. The construction industry, which is projected to add 1.3 million jobs by 2018 (1.7 percent annually), is the only major sector within the goods-producing sectors expected to show employment growth over the projection period. In fact, with employment expected to reach a level of 8.5 million in 2018, the construction sector is ranked first among the industries with largest projected increases in terms of employment growth. (See table 4.) The construction industry was hit particularly hard by the recession, as average annual employment for wage and sal-

ary workers fell by 415,100 jobs; this represents a 5.4-percent annual decline for the 2007–08 period.²⁴ From December 2008 through August 2009, employment for wage and salary workers fell by an additional 748,000 jobs. The relatively low starting point for 2008 contributes to the large change and relatively fast rate of growth for employment over the projection period. During the 1998–2008 period, the share of total employment represented by the construction industry rose from 4.4 percent to 4.8 percent. As employment in the construction industry is expected to grow at a faster rate than overall employment, the percent of all employees in the construction industry is expected to rise to 5.1 percent in 2018.

Construction is also expected to be among the largest sources of output growth in the economy over the projection period, with output projected to increase at a rate of 2.9 percent per year to reach \$1.1 trillion by 2018. Construction's share of nominal output decreased during the 1998–2008 period, falling slightly from 4.8 percent of total expenditures to 4.4 percent. As this sector returns to historical growth rates, the share of nominal output is expected to increase to 5.6 percent in 2018.

Investment in residential and nonresidential structures strongly influences the growth of output and employment in construction. While there was some growth (1.4 percent annually) in nonresidential investment during the previous decade, it is expected to slow, growing at 0.7 percent annually over the 2008–18 projection period. Expanding construction of nursing homes and other medical treatment facilities, as well as new schools in faster growing regions, is expected to continue through 2018, as changing demographics play a greater role in nonresidential investment. Continued improvements to roads, bridges, and other infrastructure across the country will also contribute to output growth in this industry. Delayed replacement and remodeling of industrial plants will require improvements for a large number of structures, further supporting this expansion.

Investment in residential construction is projected to grow at an annual rate of 5.1 percent throughout the 2008–18 period. This represents a turnaround from the overall decline that occurred in residential investment over the 1998–2008 period, an average annual decline of 1.5 percent. Much of the rapid growth rate over the projection period is due to the low starting point. In 2008, investment in residential construction fell to \$359.5 billion (in 2000 dollars), which is a level not seen since 1995. The growth in residential construction will be strongly influenced by demographic trends, including an aging population. The building of new retirement communities, as well as remodeling and

home improvement for existing structures, is expected to continue throughout the projection period.²⁵

Manufacturing. Led by consumer demand, business investment, and exports, output in manufacturing is expected to increase by \$937.6 billion over the projection period, reaching \$4.9 trillion by 2018, or an average annual growth rate of 2.1 percent. The share of total nominal output allocated to manufacturing is expected to continue to drop—after falling from 24.0 percent in 1998 to 19.3 percent in 2008, the share is projected to be 15.9 percent by 2018. As the share of expenditures increase for service-providing sectors such as health care and professional and business services, the manufacturing sector is projected to continue to account for a smaller percentage of the total nominal output.

Employment in manufacturing is projected to fall over the 2008–18 period. However, since 2008, the decline in employment has accelerated to the point where manufacturing employment levels reported for August 2009 are below the projected levels for 2018.²⁶ For this reason, the projected employment levels in 2018 compared with those of 2009 will show some recovery. When looking at the longer term 2008–18 period, however, the overall trend reflects the continued declining demand for employment in this sector. The discussion of the manufacturing sector—like the other sectors—is based on the 2008–18 period, and the factors affecting the long-term trend.

The rate at which employment is expected to decline in manufacturing over the 2008–18 period is projected to slow compared with the preceding decade: the average annual decline is expected to be 0.9 percent through 2018, compared with 2.6 percent during the 1998–2008 period. In 1998, manufacturing wage and salary employment stood at 17.6 million, accounting for 12.5 percent of all jobs in the economy. By 2008, employment in this sector had fallen to 13.4 million, or 8.9 percent of economy-wide employment. The projected loss of 1.2 million jobs from 2008 to 2018, in addition to the 14.6 million jobs gained in the service-providing sectors, will result in the manufacturing sector's share of employment falling to 7.4 percent by 2018.

Within the manufacturing sector, 69 of the 84 industries reviewed are expected to experience employment declines over the projection period. The remaining 15 industries are projected to gain only 283,600 jobs from a base of 3.2 million jobs in 2008. As import competition increases and demand for some domestically manufactured products falls, declining output in some of these industries will contribute to the employment loss; 15 of

the 84 manufacturing industries reviewed are expected to see a decrease in output during the 2008–18 period. As mentioned previously, output for the manufacturing sector is expected to expand, at 2.1 percent annually. Among these 69 expanding industries, 54 are projected to decrease employment, as improvements in their manufacturing processes will allow them to produce more output with fewer workers.

The industry subsectors that are projected to experience the fastest declines in employment are apparel manufacturing; textile mills; and leather and allied product manufacturing. The largest declines are expected in computer and electronic product manufacturing; transportation equipment manufacturing; and fabricated metal product manufacturing, losing a combined total of 539,600 jobs over the projection period.

The computer and electronic product manufacturing subsector, which includes computer, communications, semiconductor, and navigational equipment production, is expected to lead the manufacturing sector in terms of output growth over the projection period; output is projected to grow at an annual rate of 6.3 percent, up substantially from the 2.4-percent rate experienced during the 1998–2008 period. The well-known productivity improvements associated with this subsector are expected to continue, resulting in employment falling from 1.2 million in 2008 to 1.0 million in 2018. This corresponds to an average annual employment decline of 2.1 percent, which is an improvement over the 3.8-percent annual rate of decline experienced during the 1998–2008 period.

The computer and peripheral equipment manufacturing industry is projected to post the largest and fastest real output gain of all the detailed industries reviewed in the BLS projection process. (See tables 5 and 6.) However, output comparisons with other industries are problematic, because changes in price measures for this industry, which are used to capture the pace of technological change, are so rapid.²⁷ With a 17.0-percent projected growth rate, output in the industry is expected to reach \$967.3 billion (in chained 2000 dollars) by 2018. In contrast, in terms of employment, computer and peripheral equipment manufacturing is expected to be among the fastest and largest declining industries over the projection period. (See tables 3 and 4.) Employment is projected to decline at an average annual rate of 3.8 percent, reaching 124,700 in 2018, down 58,100 from 2008. Despite the strong growth in output, employment is expected to decline due to continued productivity gains in this industry. Extensive use of automation in the production processes and more efficient use of labor will keep employment

from rising in spite of rapidly rising output.

Semiconductor and other electronic component manufacturing is projected to have the largest employment decline over the projection period, losing 145,600 jobs. The industry is also among those with the most rapidly declining employment, falling at a rate of 4.0 percent annually. The industry is expected to continue its output growth, however, increasing at an average annual rate of 5.9 percent. (See table 5.) Continued technological advancements are also expected in this industry, driving declining employment in spite of rapid growth in output. Productivity improvements in the industry have often been associated with Moore's Law, which states that the number of transistors per integrated circuit will double roughly every 2 years, resulting in increasingly more computing power. Since the 1960s, the trend has been maintained. While there is some evidence to suggest the processes are reaching their physical limits,¹⁸ rapid productivity gains are still expected over the projection period.

Other industries within the computer and electronic product manufacturing subsector include communications equipment manufacturing; audio and video equipment manufacturing; navigational, measuring, electromedical, and control instruments manufacturing; and manufacturing and reproducing magnetic and optical media. Audio and video equipment manufacturing is also expected to be among the industries with rapid employment loss as output expands at a faster than average pace. This industry is expected to be the fourth fastest growing in terms of output, while employment is ranked fifth among the most rapidly declining (see table 3 and table 5). Communications equipment is projected to increase its output 3.8 percent annually, as demand for wireless communications devices, along with enhanced wireless applications, continues to expand. Employment, however, is expected to decline slightly, falling to 120,100. The navigational, measuring, electromedical, and control instruments industry, is expected to decrease its employment over the projection period (-0.2 percent annually), as output is projected to increase 3.3 percent per year, on average.

The transportation equipment manufacturing subsector, which includes motor vehicle and parts manufacturing, aerospace, railroad, and ship production, historically has been responsible for the largest share of manufacturing employment—approximately 12.0 percent in 2008. This subsector's share of employment within manufacturing is expected to remain mostly flat at 11.8 percent. Overall, employment in transportation equipment manufacturing is projected to fall by 169,200 jobs from 2008 to 2018, or

an annual growth rate of -1.1 percent per year. Output is expected to expand at a rate of 2.5 percent per year over the 2008-18 period.

The motor vehicle parts manufacturing industry accounts for the largest share (34 percent) of employment within the transportation subsector. Output in this industry is projected to grow at 1.2 percent over the projection period, up from the 0.6-percent average annual decline that occurred during the previous period. Employment in motor vehicle parts manufacturing is expected to decrease from 544,400 in 2008 to 443,300 in 2018, making this industry one of the largest declining industries in terms of employment. (See table 4.) Strong foreign competition from low-wage countries has weakened the industry domestically.

Other industries within the transportation subsector expected to expand their output include aerospace products and parts, ship and boat building, and other transportation equipment. With the introduction of major new aircraft for both military and civilian applications, output in the aerospace products industry is projected to grow at a 2.5-percent rate during the projection period. However, this will not translate into an employment increase, as the industry is expected to show no growth, maintaining a level of 502,400 jobs. Output in ship and boat building and in other transportation equipment, which includes motorcycles, bicycles, military armored vehicles, ATVs, and golf carts, is expected to continue its growth over the projection period. Although employment in ship and boat building is expected to decline by 16,900 jobs, additional employment is expected in other transportation equipment manufacturing, as 3,300 jobs are added to this industry.

Falling employment has been one of the main stories in the manufacturing sector for the last several decades. In general, over the 2008-18 projection period, this long-term trend is expected to continue. Highlighting this phenomenon, industries within the textile, apparel, footwear, and leather and allied product manufacturing subsectors are projected to be among the most rapidly declining industries in terms of employment over the projection period. Together, these industries are projected to reduce employment by approximately 248,800 from their 2008 level of 530,700 jobs. During the previous period, even larger reductions occurred, when combined employment in these industries fell by 832,800 from 1998 to 2008. This large employment reduction is due mostly to the continued rapid decline in U.S. production in these industries. The labor intensive nature of the industry, import competition, and changing trade regulations are the

most important factors behind output and employment change.

Output is projected to decline 0.4 percent annually in the textile mills subsector, 3.6 percent annually for apparel manufacturing and 0.4 percent for the leather and allied product subsector over the projection period. Among the various industries, the cut and sew apparel industry is projected to lose the most employment, 88,500 jobs, an annual rate of decline of 8.1 percent. Output for this industry is expected to continue to fall over the projection period, averaging -4.1 percent per year. The second largest decline in employment within these subsectors will occur in the textile furnishing mills industry, which is projected to lose 33,500 jobs, an average annual decline of 5.7 percent. Although these declines are relatively small compared with those of the previous decade, the industries within the apparel, textile, footwear, and leather products subsectors are expected to account for 20.6 percent of the overall employment decrease in the manufacturing sector over the projection period.

Fabricated metal product manufacturing is projected to lose 129,200 jobs by 2018. This average annual decline of 0.9 percent is somewhat slower than the 1.3-percent annual decline that occurred during the 1998–2008 period. Industries within this subsector contributing to the large projected employment decline include machine shops; turned product; and screw, nut, and bolt manufacturing (-40,600); other fabricated metal product manufacturing (-31,900); and forging and stamping (-23,000). Increased output growth in the computer, motor vehicle, and aerospace products manufacturing industries is expected to support additional output growth in machine shops and turned product and screw, nut, and bolt manufacturing. Although output in this industry is projected to grow at an annual rate of 1.7 percent, greater use of robotics and computer numerically controlled machine improvements is expected to result in the relatively large employment downturn. Output in the other fabricated metal industry is projected to grow at a 0.7-percent average annual rate over the projection period, but improved robotic welding and other heat treating processes will eliminate many jobs.

The paper manufacturing and printing and related support activities subsectors are projected to lose a combined 203,100 jobs by 2018. As employment in paper manufacturing is projected to decline at a 2.7-percent rate and printing and related support activities falls 1.7 percent

per year, declining output in these subsectors is driving much of this employment loss. This decrease reflects the increasing computerization of the printing process, growing imports of some types of printed products, and the expanding use of the Internet, which reduces the need for printed materials. Smaller firms are also consolidating in order to afford investment in new technology, and this development is expected to lead to further declines in employment.

Conclusion

BLS industry employment and output projections are based on various assumptions about the size of the labor force, how the macroeconomy will perform, and industry-specific attributes such as labor-saving technological improvements and future industry demand. In general, BLS assumes no large unforeseen structural changes to the economy. However, because some industries were affected more severely by the recession, projections of employment growth rates may be uncharacteristically high compared with previous projections. Because of the uncertainty associated with these assumptions, actual outcomes are likely to differ from these projections.

In sum, relative to the previous decade, BLS projects employment growth to improve over the coming decade, as output expands and more workers are required to meet future demand. This will be seen in the goods-producing sectors, as the historical rates of job loss will moderate in the manufacturing and agricultural sectors, and improvements in the construction industry are projected to offset employment losses in those sectors. The service-providing sectors will grow at a slightly lower rate over the projection period than in the previous decade, but are expected to grow faster than overall employment.

The service-providing sectors are expected to account for the largest source of employment gains and to increase their share of total employment, making up more than three-quarters of all jobs in 2018. Professional business services and health care and social assistance services—the sectors with the largest employment growth—will add half of the new jobs and represent nearly a quarter of all employment in 2018. Industries with the fastest growth in employment are projected to come from within the service-providing sectors. In contrast, the goods-producing sectors contain many industries with rapidly declining employment. □

Notes

¹ For a detailed description of the methods used in projecting industry output and employment, see *BLS Handbook of Methods*, chapter 13, “Economic growth and employment projections,” on the Internet at <http://www.bls.gov/opub/hom/pdf/homch13.pdf>.

² Total employment is a summation of nonagricultural wage and salary workers; the data are from the BLS Current Employment Statistics survey, and self-employed, unpaid family workers, and agriculture, forestry, fishing, and hunting workers, which are from the Current Population Survey.

³ The National Bureau of Economic Research (NBER) is generally recognized as the official arbiter of recessions in the United States. The NBER identified December 2007 as the beginning of a recession. The NBER has not yet determined an end point for the recession that began in December 2007. For further information, visit the NBER Web site on the Internet at www.nber.org (visited Nov. 12, 2009).

⁴ This effect is somewhat dampened by the use of average annual employment, as opposed to monthly employment. From 2007 to 2008, the average annual employment for nonfarm wage and salary workers fell by 532 thousand jobs, compared with over 3.0 million (seasonally adjusted) from December 2007 to December 2008.

⁵ Nonagricultural wage and salary employment includes data from the Current Employment Statistics survey, except private households, which is from the Current Population Survey. Logging workers are excluded.

⁶ Throughout this article, unless otherwise noted, output refers to real output in chain-weighted 2000 dollars.

⁷ This article uses the gross duplicated output concept. Gross duplicated output measures not only GDP, or all final demand purchases of new goods and services, but also all new goods and services produced as intermediate goods for use in further production. Real output is measured as a 2000 based chain-weighted Fisher index and is used for historical rate of growth comparisons. Real output on an industry basis does not add to their higher level aggregates because of chain weighting. See Charles Steindel, “Chain-weighting: The New Approach to Measuring GDP,” *Current Issues in Economics and Finance*, Federal Reserve Board of New York, December 1995.

⁸ Providing a more accurate measure of the relative importance of aggregated sectors of the economy, current-dollars estimates were used in lieu of chain-weighted measures. See J. Steven Landefeld, Brent R. Moulton, and Cindy M. Vojtech, “Chained-Dollar Indexes: Issues, Tips on Their Use, and Upcoming Changes,” *Survey of Current Business*, U.S. Department of Commerce, November 2003, pp. 8–16.

²⁵ For more information on macroeconomic projections, see Kathryn Byun and Ian Wyatt, “The U.S. economy to 2018, from recession to recovery,” this issue, pp. 11–29.

²⁶ The CES seasonally adjusted employment levels for manufacturing in August 2009 were 11.8 million, compared with the projected 12.2 million for 2018.

²⁷ The price measures used for computer and peripheral equipment are designed to capture technological change and to facilitate historical output comparisons within the industry. Reflecting this industry’s rapid pace of technological change, strong price declines relative to other industries translate into very large real output changes. Therefore, output comparisons between this industry and others are problematic. This phenomenon is expected to persist over the projected period due to the assumption that strong technological growth will continue and thereby cause similar price declines relative to other products. For an explanation of the computer and peripheral equipment price deflator, see Allan H. Young, “BEA’s Measurement of Computer Output,” *Survey of Current Business*, US Department of Commerce, July 1998, pp. 108–115.

¹ Includes agriculture, forestry, fishing, and hunting wage and salary, self-employed, and unpaid family workers data from the Current Population Survey, except logging, which is from Current Employment Statistics survey. Government wage and salary workers are excluded.

² Comparable estimate of output growth is not available.

³ Workers who hold a secondary wage and salary job in agricultural production, forestry, fishing, and private household industries.

⁴ Wage and salary workers who hold a secondary job as a self-employed or unpaid family worker.

⁵ Employment data for wage and salary workers are from the BLS Current Employment Statistics survey, which counts jobs, whereas self-employed, unpaid family workers, and agriculture, forestry, fishing, and hunting are from the Current Population Survey (household survey), which counts workers.

⁶ Output subcategories do not necessarily add to higher categories as a by product of chain-weighting.

NOTE: Dash indicates data not available.

This article, originally posted to the BLS Web site December 10, 2009, was revised and reposted December 22, 2010. The revisions were for clarification and primarily affected the concluding text on p. 98.

Employment outlook: 2008–18

Occupational employment projections to 2018

Professional and related occupations and service occupations are expected to create more new jobs than all other occupational groups from 2008 to 2018; in addition, growth will be faster among occupations for which postsecondary education is the most significant form of education or training, and, across all occupations, replacement needs will create many more job openings than will job growth

T. Alan Lacey
and
Benjamin Wright

The Bureau of Labor Statistics publishes long-term occupational employment projections every 2 years. Various factors affect occupational employment levels over time, including population and industry growth, technological advances, and changes in consumer demand. Total employment, a measure of all jobs in the U.S. economy, is projected to increase by 15.3 million over the 2008–18 period, representing a growth rate of 10.1 percent.¹ Among occupational groups, strong employment growth is expected in healthcare occupations and in computer-related occupations, whereas employment in production occupations as well as farming, fishing, and forestry occupations is expected to decline.

The first section of this article provides a brief overview of the BLS projections, including expectations for growth in the population, in the labor force, and in Gross Domestic Product (GDP). These factors, among others, influence occupational employment and provide context for the occupational projections. The second section of the article details employment projections for occupational groups and gives an overview of broad trends across these groups. The third section discusses education and training and how they relate to the projections, and includes statistics on employment change, job

openings, and wages by education or training category. The fourth section details the projections for noteworthy individual occupations, including the occupations with the fastest projected rates of growth, those with the largest projected growth in numerical terms, and those with the greatest projected declines in numerical terms. The last section of this article provides information on job openings and on projected replacement needs, which refers to the demand that results when workers permanently leave an occupation.

Overview of BLS projections

BLS publishes projections for a range of economic factors, including, but not limited to, the size and makeup of the labor force, the size of the economy, industry employment and output, and occupational employment. The occupational employment projections, the focus of this article, are partially dependent on expectations for the other aforementioned economic factors.

Over the 2008–18 projection period, the U.S. population will continue to experience significant demographic changes.² Whereas the number of people aged 16–54 is expected to increase more slowly than during the previous decade, the 55-and-older population is

Alan Lacey and Benjamin Wright are economists in the Division of Occupational Outlook, Office of Occupational Statistics and Employment Projections, Bureau of Labor Statistics. E-mail: lacey.thomas@bls.gov or wright.benjamin@bls.gov

expected to match its previous rate of growth, increasing by almost 21 million. As a result, the 55-and-older group will account for a larger share of the total population. Because the 55-and-older age group has a substantially lower labor force participation rate than the younger group, the labor force is expected to increase by only 12.6 million individuals from 2008 to 2018. This average annual rate of growth of 0.8 percent will be considerably slower than the 1.1-percent annual rate seen over the previous decade.

Changes in the population and labor force, along with other factors, affect the size of the economy, as well as the demand for goods and services. Real GDP is expected to increase at an average annual rate of 2.4 percent from 2008 to 2018, only slightly slower than the 2.5-percent annual rate seen over the previous 10 years.³ BLS projects that several factors, such as slower growth in the labor force, a slower rate of growth in personal consumption expenditures, a higher savings rate, and a continued trade deficit will put downward pressure on GDP growth. However, relatively strong productivity growth, a rebound in the housing market, and continued demand for medical services will help to keep GDP growth at a rate similar to that of the previous decade.

On the basis of the expectations concerning population, labor force, and GDP growth, total employment growth is projected to be relatively slow. The projected 10.1-percent rate of employment growth can be attributed, in large part, to the anticipated slow growth of the labor force. Projected employment growth is higher than would otherwise be expected, however, as a result of the recession that began in December 2007. The analysis underlying BLS employment projections uses currently available information to focus on long-term structural changes in the economy. The 2008–18 projections assume a full-employment economy in 2018.⁴ The impact of the most recent recession on the long-term structure of the economy will not be fully known until some point during or after the recovery. Because the 2008 starting point is a recession year, the projected growth to an assumed full-employment economy in 2018 will generally be stronger than if the starting point were not a recession year. This effect can have an impact on total employment, as well as on employment levels of individual occupational groups such as production occupations and construction and extraction occupations, both of which are largely in industries that were heavily affected by the recession.

Changes in U.S. demographics, as well as a dynamic business environment, will have implications for the demand for certain types of workers. As the 55-and-older age group accounts for a larger portion of the population,

the demand for medical care will increase rapidly, leading to strong employment growth in healthcare and related occupations. In addition, as the U.S. business environment becomes increasingly competitive and organizations strive to increase efficiency and reduce costs through the use of information technology, computer and mathematical science occupations will see strong employment growth.

Total employment can be divided into two main segments: wage and salary workers, who work for other individuals or establishments, and the self-employed, who work for themselves. In 2008, approximately 9 of every 10 jobs were held by wage and salary workers, the remainder being held by the self-employed. Whereas wage and salary employment is expected to grow by 10.5 percent, increasing from 139.2 million to 153.8 million jobs, self-employment is projected to increase 5.5 percent over the 2008–18 decade, from 11.7 million to 12.4 million jobs.

Occupational groups

Employment change in occupational groups can point to broad trends in the economy. For example, as a result of changing demographics, demand for healthcare services is expected to increase rapidly, leading to strong employment growth in the occupational groups that provide such services. BLS publishes projections for 750 detailed occupations that are classified into 10 occupational groups.⁵ (See table 1.) Among these groups, employment growth will vary considerably over the 2008–18 projection period. It is expected that the most rapid growth, estimated at 16.8 percent, will occur among professional and related occupations, while production occupations will see the fastest rate of decline, decreasing by 3.5 percent. Professional and related occupations are projected to add the largest number of new jobs—more than 5.2 million—whereas production occupations are expected to lose approximately 349,200.

Management, business, and financial occupations. The employment of management, business, and financial occupations is expected to increase by 10.6 percent, resulting in 1.7 million new jobs over the 2008–18 projection period. The workers in these occupations will be needed to help organizations navigate the increasingly complex and competitive business environment. Much of the projected growth will be in the fast-growing management, scientific, and technical consulting industry group. A substantial number of net jobs gains are expected in several large or rapidly growing sectors as well, including government, health care and social assistance, finance and insurance, and construction.

¹ Major occupational groups 11–0000 through 13–0000 in the 2000 Standard Occupational Classification (SOC).

² Major occupational groups 15–0000 through 29–0000 in the 2000 Stan-

dard Occupational Classification (SOC).

³ Major Occupational groups 31–0000 through 39–0000 in the 2000 Standard Occupational Classification (SOC).

Employment in business and financial operations occupations, an occupational group within the management, business, and financial group, is projected to grow by 17.7 percent, resulting in 1.2 million new jobs. Increasing financial regulations and the need for greater accountability will drive demand for accountants and auditors, an occupation that is expected to add roughly 279,400 jobs from 2008 to 2018. In addition, an increasingly competitive business environment will result in greater demand for management analysts, an occupation that is anticipated to add 178,300 jobs. It estimated that, together, these two occupations will account for almost 4 in 10 new business and financial operations jobs.

Employment in management occupations, by contrast, is projected to grow more slowly, increasing by 5.1 percent, or 454,300 new jobs. This slow growth is, in part, the result of projected declines in two occupations: general and operations managers, the largest management occupation, is expected to decrease by about 0.1 percent, and farmers and ranchers, the second largest, is projected to decline by 8.0 percent. Aside from these two occupations, employment in all other management occupations combined is expected to increase by 8.2 percent from 2008 to 2018.

Professional and related occupations. The employment of professional and related occupations is expected to increase by 16.8 percent, resulting in 5.2 million new jobs over the projection period. It is estimated that more than 1.4 million new professional and related jobs will arise in the healthcare industry. In addition, more than 1.3 mil-

lion are expected to be created in educational services, and more than 1.2 million are expected to be added in the rapidly growing professional, scientific, and technical services industry sector.

Employment among healthcare practitioner and technical occupations, an occupational group within the professional and related category, is expected to increase by 21.4 percent. (See table 2.) This growth, which, according to projections, will result in almost 1.6 million new jobs, will be driven by an increasing demand for healthcare services. As the number of older people continues to grow and as new developments allow for the treatment of more medical conditions, more healthcare professionals will be needed. With roughly 581,500 new jobs anticipated for the projection period, the most of any single occupation in the economy, registered nurses will account for more than one-third of the growth in this occupational group. Licensed practical and licensed vocational nurses, as well as pharmacy technicians, also are expected to increase by a substantial number of jobs: roughly 155,600 and 99,800, respectively.

It is estimated that education, training, and library occupations will add more than 1.3 million jobs, representing a growth rate of more than 14.4 percent. As the U.S. population grows, large numerical increases will be seen for primary, secondary, and special education teachers, occupations which, together, are projected to contribute 647,300 jobs. In addition, as a larger share of adults seeks educational services, a substantial number of jobs for post-secondary teachers also will arise.

Computer and mathematical occupations are expected to add 785,700 new jobs from 2008 to 2018, and, as a group, they will grow more than twice as fast as the average for all occupations in the economy, according to projections. It is anticipated that computer specialists will account for the vast majority of this growth, increasing by 762,700 jobs. Demand for computer specialists will be driven by the continuing need for businesses, government agencies, and other organizations to adopt the latest technologies. It is projected that computer software applications engineers will increase by 175,100 jobs—more than the projected increase for any other type of computer specialists. Network systems and data communications analysts are projected to see an increase of 155,800 jobs. New computer specialist jobs will arise in almost every industry, but roughly half will be located in the computer systems design industry, which is expected to employ more than one in four computer specialists in 2018.

Employment in community and social services occupations is projected to increase by 16.5 percent, growing by roughly 448,400 jobs. As health insurance providers increasingly cover mental and behavioral health treatment, and as a growing number of elderly individuals seek social services, demand for workers in these occupations will increase. It is estimated that counselors, social workers, and other community and social services specialists will account for roughly 349,700 of the new jobs and that religious workers will account for about 98,800.

It is projected that arts, design, entertainment, sports, and media occupations will see employment growth of rough-

ly 12.1 percent from 2008 to 2018, resulting in 332,600 new jobs. This growth will be spread broadly across the occupations within this group. Media and communications-related occupations will add a substantial number of jobs, led by rapid growth among public relations specialists. These workers will be needed in greater numbers as firms place greater emphasis on managing their public image. Employment in the occupational group of entertainers and performers, sports and related occupations, also will increase, partly as a result of increasing demand for coaches and scouts. Furthermore, art and design occupations will see substantial growth as demand increases for graphic and interior designers. As more advertising is conducted over the Internet, a medium that generally includes many graphics, and as businesses and households increasingly seek professional design services, a greater number of these workers will be needed.

Employment in life, physical, and social science occupations is expected to increase by 277,200 jobs over the 2008–18 projection period. This increase represents a growth rate of 19.0 percent, almost twice the average for all occupations across the economy. It is anticipated that about 116,700 of the new jobs created will be in social science and related occupations and that there will be especially strong growth among market and survey researchers. As businesses increase their marketing efforts in order to remain competitive and as public policy firms and government agencies conduct more public opinion research, the employment of market and survey researchers will grow at a projected rate of 28.3 percent. Employment in life sci-

39–0000	Personal care and service occupations.....	5,044.2	6,074.8	1,030.6	20.4

ence occupations also will increase rapidly. Medical scientists, except epidemiologists, will account for much of the growth in these occupations and, at an estimated growth rate of 40.4 percent, will be among the fastest growing occupations across the economy.

Architecture and engineering occupations are expected to add roughly 270,600 jobs, representing a growth rate of 10.3 percent over the 2008–18 period. About 178,300 of these jobs, more than 6 out of 10, are expected to be for engineers, and the growth of civil engineers is anticipated to be especially robust. As a greater emphasis is placed on improving the Nation's infrastructure, civil engineers will be needed to design, implement, and upgrade transportation, water supply, and pollution control systems. In addition, it is estimated that the occupation of drafters, engineering, and mapping technicians will increase by roughly 52,200 jobs and that architects, surveyors, and cartographers will increase by 40,100.

Legal occupations are expected to add the fewest new jobs among all the professional and related occupations, increasing by roughly 188,400. However, with a projected growth rate of almost 15.1 percent, legal occupations will grow faster than the average for all occupations in the economy. It is anticipated that lawyers will account for 98,500 of these jobs and that paralegals and legal assistants will account for 74,100. In part because legal establishments are expected to continue to expand the role of paralegals and legal assistants and assign them more of the tasks once performed by lawyers, it is estimated that the employment of paralegals and legal assistants will increase at a rate of 28.1 percent.

Service occupations. Employment in service occupations is projected to increase by 13.8 percent from 2008 to 2018, resulting in roughly 4.1 million new jobs. It is estimated that about 1.2 million of these jobs will appear in the health care industry sector and that more than 736,000 will arise in the food services and drinking places industry subsector.

Among service occupations, the largest number of new jobs is expected to arise in healthcare support occupations. (See table 2.) With more than 1.1 million new jobs expected, employment in healthcare support occupations is projected to increase by 28.8 percent. Much of this growth will be the result of high demand for home health aides. Compared with all occupations across the economy, home health aides are expected to see the second-largest number of new jobs—460,900—and experience the third-fastest rate of growth, 50.0 percent. Because home care can be a lower cost alternative to institutional care,

and because many individuals prefer home care to long-term stays in healthcare facilities, hiring a home health aide will become an increasingly popular option. Many individuals, however, will require treatment in healthcare facilities. As a result, demand for nursing aides, orderlies, and attendants will increase rapidly, leading to roughly 276,000 new jobs.

Employment in personal care and service occupations is projected to grow by 20.4 percent over the 2008–18 projection period, adding 1.0 million jobs. This group contains a wide variety of occupations, but two of them, personal and home care aides and child care workers, will account for a large proportion of the new jobs. It is estimated that personal and home care aides will increase by 375,800 jobs as a growing number of elderly individuals require assistance with daily tasks. Child care workers are expected to see 142,100 new jobs, mainly because formal preschool programs, which employ child care workers alongside preschool teachers, are expected to become more prevalent.

Food preparation and serving related occupations are expected to add roughly 1.0 million jobs from 2008 to 2018, representing a growth rate of 8.7 percent. It is anticipated that almost 6 in 10 new jobs in this occupational group will appear among two occupations: fast food and counter workers, with a projected increase of 443,300 jobs, and waiters and waitresses, with a projected increase of 151,600 jobs. As consumers continue to prefer the convenience of prepared foods, demand for these occupations will grow.

Building and grounds cleaning and maintenance occupations are expected to see 483,900 new jobs over the projection period, representing a growth rate of 8.5 percent. Grounds maintenance workers are expected to increase by 236,800, and building cleaning workers are projected to increase by 191,500. As businesses place a larger emphasis on grounds aesthetics and as households increasingly rely on contract workers to maintain their yards, grounds maintenance workers will see rapid growth. In addition, more building cleaning workers will be needed to maintain an increasing number of residential and commercial structures. Almost 6 in 10 new jobs in the occupational group are expected to appear in the services to buildings and dwellings industry group, as the job functions relevant to this occupational group are increasingly outsourced to this industry group.

Protective service occupations are expected to see the fewest new jobs among all service occupations, with an increase of about 400,100 jobs, or 12.2 percent. Almost 152,500 new security guards, the occupation in this group

with the largest projected job growth, are expected as an increasing number of businesses and other organizations emphasize crime and vandalism reduction. In addition, it is estimated that about 121,500 new law enforcement jobs will arise, largely as a result of population growth.

Sales and related occupations. Employment in this occupational group is projected to increase by 980,400 jobs from 2008 to 2018, representing a growth rate of 6.2 percent. More than half of the new jobs in this group, about 513,800, are expected to be for retail sales workers. As organizations offer a wider array of products and devote an increasing share of resources to customer service, many new retail sales workers will be needed. Job growth in this group will be spread across a wide variety of industries, but almost half is expected to occur in retail trade establishments.

Office and administrative support occupations. With a projected growth rate of 7.6 percent, this occupational group is expected to add more than 1.8 million jobs over the projection period. This group contains a wide variety of occupations with very different employment outlooks. Secretaries and administrative assistants are expected to see a large number of new jobs, 471,600. It is anticipated that customer service representatives will increase by about 399,500 as businesses place a growing emphasis on relationships with customers. The occupation of Postal Service workers, by contrast, is projected to lose more than 72,100 jobs, declining by 12.0 percent. Because the use of electronic mail and bill-pay services is increasing and many Postal Service tasks are becoming automated, fewer of these workers will be needed by 2018. The new office and administrative support jobs will be distributed across a variety of industries, but about 516,900 are expected to appear in the professional, scientific, and technical services industry sector and roughly 501,500 are expected to arise in the health care and social assistance industry sector. In addition, the employment of office and administrative support workers will grow relatively fast—at a rate of 15.2 percent, according to projections—in the administrative and support services industry subsector, as more office and administrative support work is outsourced to this industry subsector.

Farming, fishing, and forestry occupations. Employment in this small occupational group is projected to remain largely unchanged from its 2008 level. Productivity increases in agriculture will lead to declining employment among agricultural workers, which will offset small gains among

forest, conservation, and logging workers. It is anticipated that the majority of the jobs in this group, about 7 in 10, will continue to be found in the agriculture, forestry, fishing, and hunting industry sector.

Construction and extraction occupations. Employment in construction and extraction occupations is projected to increase by 13.0 percent from 2008 to 2018, expanding by more than 1.0 million new jobs. Demand for workers in these occupations will grow as, over the 2008–18 projection period, construction on homes, office buildings, and infrastructure projects increases. Growth will also be influenced by the recession that began in 2007. The construction industry was hit particularly hard by this recession as average annual employment for wage and salary workers fell by 415,100 jobs from 2007 to 2008, a decline of 5.4 percent.⁶ Because of this low starting point, growth over the 2008–18 period will be stronger than it would have been had 2008 not been a recession year. It is estimated that more than half of the new jobs in this occupational group, about 543,100, will arise in the specialty trade contracting industry subsector and that about 227,400 will appear in the building construction industry subsector. In addition, about 98,800 new jobs are expected to arise among self-employed workers.

Installation, maintenance, and repair occupations. This group is expected to add about 440,200 jobs over the projection period, representing a 7.6-percent rate of growth. It is projected that more than one in three new jobs in this group will arise in the construction industry sector; workers in this sector are integral to the development of buildings, communication structures, transportation systems, and other types of infrastructure. As construction on these types of projects increases over the projection period, these workers will be needed in greater numbers.

Production occupations. Employment in production occupations is expected to decline by more than 349,200 jobs, roughly 3.5 percent, from 2008 to 2018. Like many other occupational groups, this group was heavily affected by the recession that began in 2007; from 2007 to 2008, the manufacturing industry sector lost an annual average of 448,000 wage and salary jobs, a decline of 3.3 percent.⁷ Because of the low starting point, declines over the 2008–18 period will be smaller than they would have been had 2008 not been a recession year. Production occupations represent a wide array of jobs, but it is projected that almost half of all job losses in the group will occur among metal workers and plastic workers. In addition, textile, ap-

parel, and furnishing occupations will lose a large number of jobs. Roughly 7 in 10 production jobs are located in the manufacturing industry sector. As productivity increases in manufacturing reduce the need for workers and as a growing number of production jobs are outsourced offshore, demand for production workers will decline.

Transportation and material moving occupations. Employment in this occupational group is projected to increase by 4.0 percent from 2008 to 2018, resulting in roughly 391,100 new jobs. Job gains will be spread across many industries, but a sizeable portion will arise in the transportation and warehousing industry sector. It is estimated that more than 6 in 10 new jobs in this group will be for truck drivers. As the economy grows over the projection period and the demand for goods increases, truck drivers will be needed to transport these goods to businesses, consumers, and other entities. In addition, a substantial number of jobs will arise for taxi drivers and chauffeurs as people seek alternative transportation options.

Growth by education or training category

BLS assigns each occupation to an education or training category that represents the most significant source of postsecondary education or training among workers in the occupation.⁸ The categories range from “short-term

on-the-job training” to “first professional degree.” (See the box on page 89 for descriptions.) In 2008, about 3 in 10 jobs were in occupations that were classified in a category involving some form of postsecondary award or degree. It is projected that occupations in such categories will account for almost half of all new jobs created from 2008 to 2018. (See table 3.)

Employment in occupations in the associate degree category, with a projected growth rate of 19.1 percent, is expected to increase more rapidly than employment in any other education or training category over the 2008–18 period. Several fast-growing healthcare occupations, such as dental hygienists and physical therapist assistants, will drive a substantial proportion of this change. Despite this rapid growth, however, jobs in this category are expected to account for only about 2.4 million total openings, about half of which will come from replacement needs. (Job openings and replacement needs are discussed in the next section.) With a projected growth rate of 7.5 percent, occupations in the long-term on-the-job training category will see the slowest rates of growth. Many occupations in this category are in the construction and extraction; installation, maintenance, and repair; or production occupational group.

Generally, occupations in lower education or training categories have lower pay than those in higher categories. Although the median annual wage for all occupations

Table 3. Employment and total job openings, by education and training category, 2008 and projected 2018

(Numbers in thousands)

Most significant source of education or training	Employment				Change, 2008–18		Total job openings due to growth and replacement needs, 2008–18 ¹		Median annual wages, May 2008 ²

¹ Total job opening represent the sum of employment increases and net replacements. If employment change is negative, job openings due to growth are zero and total job openings equal net replacements.

² For wage and salary workers, from the Occupational Employment Statistics survey.

Classification of occupations by most significant source of education or training

Occupations are classified into 1 of 11 categories according to the following principles:

- An occupation is placed into the category that best describes the education or training needed by most workers to become fully qualified in that occupation.
- If generally needed for entry into an occupation, postsecondary awards take precedence over work-related training, even though additional skills or experience may be needed for a worker to become fully qualified in the occupation.
- The length of time an average worker generally needs to become fully qualified in an occupation through a combination of on-the-job training and experience is used to categorize occupations in which a postsecondary award generally is not needed for entry into the occupation.

Postsecondary awards

First professional degree. Completion of such a degree usually requires at least 3 years of full-time academic study beyond a bachelor's degree. Examples of occupations in this category are lawyers, and physicians and surgeons.

Doctoral degree. Completion of a Ph.D. or other doctoral degree usually requires at least 3 years of full-time academic study beyond a bachelor's degree. Examples of occupations in this category are postsecondary teachers, and medical scientists, except epidemiologists.

Master's degree. Completion of the degree usually requires 1 or 2 years of full-time academic study beyond a bachelor's degree. Examples of occupations in this category are educational, vocational, and school counselors, and clergy.

Bachelor's or higher degree, plus work experience Most occupations in this category are management occupations. All occupations in this category require experience in a related non-management position for which a bachelor's or higher degree is usually required. Examples of occupations in this category are general and operations managers; and judges, magistrate judges, and magistrates.

Bachelor's degree. Completion of the degree generally requires about 4 years of full-time academic study. Examples of occupations in this category are accountants and auditors, and elementary school teachers, except special education.

Associate degree. Completion of the degree usually requires at least 2 years of full-time academic study. Examples of occupations in this category are paralegals and legal assistants, and

medical records and health information technicians.

Postsecondary vocational award. Some of these programs last only a few weeks, whereas others last more than a year. Programs lead to a certificate or other award, but not a degree. Examples of occupations in this category are nursing aides, orderlies, and attendants, and hairdressers, hairstylists, and cosmetologists.

Work-related training

Work experience in a related occupation. Most of the occupations in this category are first-line supervisors or managers of service, sales and related, production, or other occupations, or are management occupations.

Long-term on-the-job training. Generally, occupations in this category require more than 12 months of on-the-job training or require combined work experience and formal classroom instruction for workers to develop the skills necessary to be fully qualified in the occupation. Occupations in this category include formal and informal apprenticeships that may last up to 5 years. Long-term on-the-job training also includes intensive occupation-specific, employer-sponsored programs that workers must complete. Among such programs are those conducted by fire and police academies and by schools for air traffic controllers and flight attendants. In other occupations—insurance sales and securities sales, for example—trainees take formal courses, often provided at the jobsite, to prepare for the required licensing exams. Individuals undergoing training generally are considered to be employed in the occupation. Also included in this category are occupations that generally involve the development of a natural ability—such as that possessed by musicians, athletes, actors, or other entertainers—that must be cultivated over several years, frequently in a nonwork setting.

Moderate-term on-the-job training. In this category of occupations, the skills needed to be fully qualified in the occupation can be acquired during 1 to 12 months of combined on-the-job experience and informal training. Examples of occupations in this category are truckdrivers, heavy and tractor-trailer; and secretaries, except legal, medical, and executive.

Short-term on-the-job training. In occupations in this category, the skills needed to be fully qualified in the occupation can be acquired during a short demonstration of job duties or during 1 month or less of on-the-job experience or instruction. Examples of these occupations are retail salespersons, and waiters and waitresses.

was \$32,390 in May 2008, occupations in the categories involving a postsecondary award or degree or extensive work experience in a related occupation had much higher

median wages. Occupations in the short-term on-the-job training category, for example, had median annual wages of \$21,320, while occupations that generally require

a first professional degree had median annual wages of \$122,550.

Detailed occupations

Occupational employment projections can be analyzed in a number of ways. In this article, projections are typically presented and discussed in terms of percent changes and numeric changes. Both perspectives are important, as focusing on only one can be misleading. In many cases, occupations with low levels of employment, such as financial examiners, may grow very rapidly (projected growth of 41.2 percent) but generate relatively few new jobs (11,100). Alternatively, an occupation with a large number of jobs, like retail salespersons, may grow more slowly (projected growth of 8.3 percent) but generate a much larger number of new jobs over the 10-year projection period (374,700).

As is the case with occupational groups, growth will vary among individual occupations. It is estimated that the employment of biomedical engineers, the occupation with the fastest projected rate of growth, will increase by 72.0 percent from 2008 to 2018. (See table 4.) Textile bleaching and dyeing machine operators and tenders, conversely, are expected to decrease in number by 44.8 percent, more rapidly than any other occupation. Registered nurses are expected to increase by more than 581,500 new jobs, the largest numerical increase, while farmers and ranchers, at the other extreme, will lose roughly 79,200.

In total, 577 occupations are expected to show increasing employment, resulting in more than 16.6 million new jobs from 2008 to 2018. The remaining 173 occupations are expected to decline in employment, losing almost 1.4 million jobs. This will result in an increase of more than 15.3 million jobs for all occupations combined, according to projections. It is estimated that the 30 occupations with the most robust growth in numerical terms will account for roughly 7.3 million new jobs, which represent almost half of the total growth among occupations with increasing employment. This projected increase in employment is far greater than that of the 30 fastest growing occupations, which will account for about 2.3 million new jobs. Because rapidly growing occupations tend to have lower levels of employment, they generally contribute less to total job growth than many occupations that are growing less quickly.

The 30 occupations with the largest projected declines are expected to decrease by a total of about 910,300 jobs, roughly two-thirds of the total among occupations with declining employment. Four occupations will be among

both the occupations with the largest numbers of new jobs and those with the fastest rates of growth, each of the four projected to increase by at least 34.0 percent and expand by at least 155,800 new jobs: network systems and data communications analysts, computer applications software engineers, home health aides, and personal and home care aides.

Fastest growing occupations. According to projections, the 30 occupations with the fastest rates of growth will each increase by more than 29 percent from 2008 to 2018. (See table 4.) Seventeen of these are professional and related occupations, seven of which are in the healthcare practitioners and technical occupations occupational group. Ten of the thirty fastest growing occupations are service occupations, including seven occupations from the healthcare support occupations occupational group. Three of the fastest growing are management occupations or business and financial operations occupations.

For 14 of the 30 fastest growing occupations, a bachelor's or higher degree is the most significant source of education or training. Seven are in the postsecondary vocational award or associate degree category, one is categorized under work experience in a related occupation, and the remaining eight are in an on-the-job training category.

A substantial portion of the 30 fastest growing occupations are directly related to healthcare. As elderly individuals account for an increasing share of the U.S. population and as new developments allow for the treatment of a broader range of medical conditions, demand for healthcare services will grow rapidly. Several of the fastest growing occupations, such as home health aides and personal and home care aides, are generally employed outside of traditional inpatient establishments. It is anticipated that, as cost pressures mount and as individuals seek alternatives to long-term institutional care, employment in these occupations will grow by 50.0 percent and 46.0 percent, respectively. Fitness trainers and aerobics instructors, in addition, will increase rapidly in number as a growing number of individuals participate in programs promoting health and wellness.

Cost pressures will, to some extent, influence demand for a number of other healthcare occupations as well. Physician assistants and occupational therapist assistants, for example, will be used to treat individuals with fairly basic medical needs, allowing physicians and surgeons and occupational therapists, who command higher salaries, to focus on patients with more complex treatment needs. Pharmacy technicians also will assume a broader range of duties, as pharmacists devote more effort to patient care.

Table 4. Fastest growing occupations, 2008–18

(Numbers in thousands)

Matrix code	2008 National Employment Matrix title	Occupational group	Employment		Change, 2008–18		Quartile rank by 2008 median wages ¹	Most significant source of postsecondary education or training ²

¹ The quartile rankings of Occupational Employment Statistics survey annual wage data are presented in the following categories: VH = very high (\$51,540 or more), H = high (\$32,390 to \$51,530), L = low (\$21,590 to \$32,380), and VL = very low (under \$21,590). Wages are for wage and salary workers.

² An occupation is placed into 1 of 11 categories that best describes the

postsecondary education on training needed by most workers to become fully qualified in that occupation. For more information about the categories, see *Occupational Projections and Training Data*, 2008–09 edition, bulletin 2702 (Bureau of Labor Statistics), on the Internet at www.bls.gov/emp/optd (visited Dec. 8, 2009); and the technical documentation accompanying the 2008–18 employment projections, available on the Internet at www.bls.gov/emp/ep_education_tech.htm (visited Dec. 8, 2009).

Although most athletic trainers will remain employed in schools and universities, more athletic trainers will be needed in hospitals, outpatient treatment facilities, and other settings as overall health and wellness is emphasized more by healthcare establishments.

Several occupations involved in medical research also will grow rapidly. Growth among biomedical engineers, biochemists and biophysicists, and medical scientists, except epidemiologists, will be driven by continued emphasis on researching new diseases, alleviating more ailments, and further improving patients' quality of life.

Three of the fastest growing occupations are computer specialist occupations. Network systems and data communications analysts, the occupation with the second-fastest rate of growth, will see gains across a wide range of industries. Because businesses will continue to adopt newer networking technologies and individuals and organizations will develop a growing reliance on the Internet, employment in this occupation is expected to increase by 53.4 percent. Furthermore, as new software products are needed to facilitate this reliance on technology, computer software applications engineers and systems software engineers also will grow rapidly in number.

Several business and financial operations occupations also will grow much faster than the average for all occupations. As a large segment of the workforce reaches retirement age, a greater number of personal financial advisors will be needed to help these individuals prepare for their financial futures. In addition, because many businesses are replacing traditional pension plans with personal savings options, a growing number of younger individuals will seek financial advice long before they retire. Furthermore, as the financial regulatory environment becomes more complex, the employment of financial examiners, as well as that of the occupation of compliance officers, except agriculture, construction, health and safety, and transportation, will increase at rapid rates.

Increased interest in and awareness of environmental issues should spur rapid growth among environmental engineers and environmental engineering technicians. As organizations devise ways to reduce their impact on the environment and as more emphasis is placed on preventing damage before it occurs, employment in each of these specialties is expected to increase by 30.6 percent and 30.1 percent, respectively, from 2008 to 2018.

The increasing popularity of household pets will lead to employment growth among veterinarians, as well as veterinary technologists and technicians. As the pet population grows, as households increasingly seek medical services for their pets, and as new developments lead to treatments

for a wider variety of conditions, these occupations are expected to expand rapidly. Over the course of the projection decade, as the number of cosmetic and health spas increases, the employment of skin care specialists will grow by a projected rate of 37.9 percent. Skin care treatments should remain popular as consumers continue to see them as an affordable luxury.

Self-enrichment teachers offer instruction in a wide range of areas, such as foreign languages, computer literacy, and public speaking. These workers are expected to see an increase in demand as individuals look to expand their skill sets. Survey researchers will show rapid growth as businesses, government agencies, and other organizations attempt to measure a variety of phenomena, such as the popularity of mass transit and the need for social assistance programs.

Occupations with the largest numerical growth. It is estimated that each of the 30 occupations with the largest projected job growth in numerical terms will add at least 134,900 new jobs over the 2008–18 projection period. (See table 5.) The occupations on this list are very diverse, coming from a wide range of occupational groups. Nine are service occupations, including three from the health-care support group and two from the personal care and service group. Six are from the office and administrative support occupational group, and eight are professional and related occupations. Two are business and financial operations occupations, and two are construction and extraction occupations. In addition, the sales and related; installation, maintenance, and repair; and transportation and material moving occupational groups each contain 1 of the 30 occupations with the most new jobs.

Of the 30 occupations on this list, most are projected to grow faster in percent terms than the average for all occupations across the economy. Two, however, will grow more slowly. Because these occupations had a large number of jobs in 2008, however, their projected modest growth rates are still expected to lead to substantial job creation. The employment of waiters and waitresses, for example, is expected to grow by 6.4 percent over the projection period, slower than the projected average of 10.1 percent for all occupations. However, because there were 2.4 million waiters and waitresses in 2008, this slower rate of growth still is expected to lead to 151,600 new jobs, placing it in the 26th spot on this list.

Seven of the thirty occupations on the list are classified under a bachelor's or higher degree education or training category. For three, an associate degree or postsecondary vocational award is the most significant form of education

Table 5. Occupations with the largest projected job growth, 2008–18

¹ The quartile rankings of Occupational Employment Statistics survey annual wage data are presented in the following categories: VH = very high (\$51,540 or more), H = high (\$32,390 to \$51,530), L = low (\$21,590 to \$32,380), and VL = very low (under \$21,590). Wages are for wage and salary workers.

² An occupation is placed into 1 of 11 categories that best describes the postsecondary education on training needed by most workers to become fully qualified in that occupation. For more information about the categories, see *Occupational Projections and Training Data, 2008–09* edition, bulletin 2702 (Bureau of Labor Statistics), on the Internet at www.bls.gov/emp/optd (visited Dec. 8, 2009); and the technical documentation accompanying the 2008–18 employment projections, available on the Internet at www.bls.gov/emp/ep_education_tech.htm (visited Dec. 8, 2009).

or training. The remaining 20 all fall under an on-the-job training category or under the category of work experience in a related occupation.

Several occupations with substantial projected job growth are associated with healthcare. Registered nurses are expected to expand by more than 581,500 new jobs over the course of the projection period, more than any other occupation. In addition, it is estimated that the employment of these workers will increase by 22.2 percent, more than twice as fast as the average. As elderly individuals constitute a larger portion of the population and the demand for healthcare services grows, a large number of new nurses will be needed. Home health aides, as well as personal and home care aides, also will benefit from this trend and will see increasing demand for their services as more individuals seek care outside of traditional institutional settings. Likewise, physicians and surgeons, medical assistants, licensed practical and licensed vocational nurses, and nursing aides, orderlies, and attendants all will experience strong job growth as a result of high demand for healthcare.

Accountants and auditors, as well as bookkeeping, accounting, and auditing clerks, will benefit from an increasingly complex regulatory environment. As financial scrutiny intensifies and as additional transparency requirements are established, both of these occupations are expected to exhibit large numerical increases. Growth

among bookkeeping, accounting, and auditing clerks will be tempered, somewhat, by improvements in technology that will lead to greater productivity and more automation of tasks. However, as one of the occupations with the highest levels of employment in 2008, its projected 10.3-percent growth rate still is expected to lead to more than 212,400 new jobs. Accountants and auditors are expected to grow by a rapid 21.7 percent, creating an even greater 279,400 jobs. In addition, as businesses strive to stay competitive and increase efficiency, more management analyst jobs will be created.

Two computer specialist occupations also will see large increases in employment. As businesses and other organizations continue to invest in information technology in order to increase efficiency and reduce costs, computer software applications engineers, as well as network systems and data communications analysts, will increase by roughly 175,100 and 155,800 jobs, respectively. In addition, as a result of high demand, these two occupations will be among those with the fastest rates of growth.

Customer service representatives and retail salespersons also are expected to add large number of jobs, increasing by 399,500 and 374,700, respectively. As businesses place a growing emphasis on customer service and client relationships and as retail establishments offer a wider range of products, these workers will be needed in greater numbers. In addition, as trade at the retail level expands and

as producers continue to transport a growing amount of goods, more heavy and tractor-trailer truck drivers will be needed to transport these items to various locations across the country.

Two food preparation and serving occupations also will be among the occupations with the largest numerical increases. Waiters and waitresses, as well as combined food preparation and service workers, including fast food, will experience substantial gains as consumers continue to take advantage of the convenience of prepared foods. As both fast-food and full-service restaurants increase in popularity and as more individuals purchase prepared foods from grocery stores, many new jobs will be created within these occupations.

Elementary school teachers, except special education, as well as teacher assistants, also will add large numbers of jobs. Growth will be driven by an increase in school enrollment and the demand for teacher assistants who can provide individual attention to children with special needs. In addition, as a greater emphasis is placed on early childhood education, a substantial number of new jobs will be created for child care workers, who often work alongside preschool teachers. Furthermore, as enrollment in colleges and universities increases, a large number of new postsecondary teachers will be needed.

The number of executive secretaries and administrative assistants, workers who perform fewer clerical duties than workers in many other office and administrative support occupations, will not be heavily affected by technological advances. As a result, employment in this large occupation will increase about as fast as the average, leading to a large number of new jobs. Receptionists and information clerks, as well as general office clerks, will see employment gains as a result of work restructuring. As the duties of workers in other administrative occupations are automated, reducing the need for specialized clerical workers, a larger number of employees will be given more general tasks and will be classified under these two occupations. In addition, as many new jobs are created in these office and administrative support occupations, a large number also will arise for the first-line supervisors of these workers.

Two occupations in particular, construction laborers and carpenters, will benefit from relatively strong growth in the construction industry. As new homes, office buildings, and other structures are built and as many existing buildings are remodeled, many new jobs will be created in these occupations. In addition, as the number of buildings expands, a substantial number of new jobs will be created for general maintenance and repair workers, who are already great in number.

Because businesses are expected to place a higher premium on grounds aesthetics and more individuals likely will choose to have their yards professionally maintained, demand will be high for landscaping and groundskeeping workers. Security guards will be needed in greater numbers as more businesses, multifamily housing units, and other organizations place greater emphasis on the prevention of crime and vandalism.

Occupations in decline. This section focuses on the occupations with the largest projected job declines in numerical terms. Decreases in employment occur for many reasons, including productivity gains and reduced demand for a particular good or service. The 30 occupations with the largest projected numerical declines each will lose at least 12,500 jobs over the projection period. (See table 6.) These occupations are highly concentrated in two occupational groups: 12 are production occupations and 11 are office and administrative support occupations. As for the rest, three are transportation and material moving occupations, two are sales and related occupations, and one is a management occupation.

None of these 30 occupations is classified in an education or training category that involves postsecondary education. For 29, the most significant form of education or training involves some on-the-job training. For the other occupation, the most significant form of education or training is work experience in a related occupation. Production occupations make up a substantial proportion of this list, largely as a result of a high concentration in the declining manufacturing industry sector. Because productivity in manufacturing operations is expected to increase rapidly and competition from foreign producers will intensify, fewer production workers will be needed. Together, the production occupations on this list are expected to account for a decline of 299,200 jobs.

Office and administrative support occupations also are heavily represented on this list. Whereas some occupations in this occupational group will see growth as a result of technology, as exemplified by the occupations from this group on the list of occupations with the greatest projected job growth in numerical terms, other occupations, including those on the list of declining occupations, will bear losses that also will result from improved technology. For example, Postal Service clerks and Postal Service mail sorters, processors, and processing machine operators will see declines as electronic communication continues to reduce demand for correspondence by post. File clerks, computer operators, data entry keyers, and switchboard operators also will see a reduction in jobs; as a result of

Occupational Employment

Table 6. Occupations with the largest projected job declines in numerical terms, 2008–18

(Numbers in thousands)

¹ The quartile rankings of Occupational Employment Statistics survey annual wage data are presented in the following categories: VH = very high (\$51,540 or more), H = high (\$32,390 to \$51,530), L = low (\$21,590 to \$32,380), and VL = very low (under \$21,590). Wages are for wage and salary workers.

² An occupation is placed into 1 of 11 categories that best describes the

postsecondary education on training needed by most workers to become fully qualified in that occupation. For more information about the categories, see *Occupational Projections and Training Data*, 2008–09 edition, bulletin 2702 (Bureau of Labor Statistics), on the Internet at www.bls.gov/emp/optd (visited Dec. 8, 2009); and the technical documentation accompanying the 2008–18 employment projections, available on the Internet at www.bls.gov/emp/ep_education_tech.htm (visited Dec. 8, 2009).

electronic document storage, sophisticated software packages, and efficient telecommunications equipment, demand for the services of these workers will decline.

The occupation of farmers and ranchers also will lose a substantial number of jobs. With a projected decrease of 79,200 jobs, farmers and ranchers will see greater losses than any other occupation. Because productivity in agriculture will increase, and because continuing consolidation in the farming industry will eliminate many small farms, fewer farmers and ranchers will be employed in 2018. In addition, because of these advances in productivity, miscellaneous agricultural workers, an occupation with a wide range of duties, will decline by 18,200 jobs.

Two sales and related occupations also are included among the occupations with the largest numerical declines. It is projected that telemarketers will decrease by 37,800 jobs, or 11.1 percent, as more consumers use the “do not call” list and as telemarketer jobs are increasingly sent offshore. It is anticipated that door-to-door sales workers, news and street vendors, and related workers will decrease by 26,900 jobs, or 14.8 percent, as these workers are less able to compete with large vendors and as newspaper circulation rates decline.

Several transportation and material moving occupations, additionally, will see large declines in employment. Advancements in technology and supply management processes, such as automated storage, retrieval, and data collection systems, will improve productivity among these occupations, reducing the need for workers.

Job openings from replacement needs

Projected job openings are a measure of the total number of workers who will be needed to meet demand for a particular occupation. Job openings arise when new jobs are created from economic growth and also when workers who have permanently left an occupation need to be replaced. Although economic growth will create a substantial number of job openings over the 2008–18 projection period, the majority are expected to come from replacement needs. Except in occupations that employ large numbers of young workers, such as the occupations of cashiers and retail salespersons, many of the job openings due to replacement needs are expected to arise in occupations that will lose workers to retirement. Replacement needs are anticipated to generate 34.3 million job open-

ings, compared with an expected net increase of 15.3 million jobs expected to be generated by economic growth.⁹ The projections of replacement needs, however, are based on past trends. Should retirement trends in an occupation change, actual needs may be greater or less than projected.

For the majority of occupations, job openings due to replacement needs exceed job openings due to growth. Most of the exceptions are occupations that are among the fastest growing occupations and occupations that require high levels of education or training. Because postsecondary education can be expensive and time consuming, individuals working in occupations with high educational and training requirements, such as financial analysts and civil engineers, often stay in their professions until retirement; thus, replacement needs in such occupations tend to be lower. Conversely, occupations that have lower education or training requirements, such as cashiers and customer service representatives, tend to have high numbers of job openings due to replacements. For example, it is estimated that there will be nearly 1.3 million openings for retail salespersons that will stem from replacement needs, but only around 374,700 openings due to growth. Similarly, although it is projected that the occupation of waiters and waitresses will generate only around 151,600 openings due to growth, the occupation is expected to provide close to 1.3 million openings from replacement needs.

Several occupations that are projected to decline over the 2008–18 period, ranging from managerial to material moving occupations, will actually account for substantial numbers of openings due to replacement needs. For example, the occupation of general and operations managers, though expected to decline by 2,300 jobs over the next decade, will provide 502,200 openings due to replacement needs. In addition, the occupation of laborers and freight, stock, and material movers, hand, is expected to generate 745,800 openings, while declining by 18,700 jobs. For declining occupations, all projected job openings come from replacement needs.

From the perspective of total job openings (jobs generated by economic growth combined with openings generated

by replacement needs), the number of openings in occupations falling into the bachelor's degree or higher category is expected to be 11.7 million. It is estimated that roughly 5.3 million will occur among occupations in the associate degree category and postsecondary vocational award category combined, and that 4.2 million will arise in occupations in the work experience in a related occupation category. It is projected that occupations in the short-term and moderate-term on-the-job-training categories will see 26.7 million, or about half, of total job openings and that occupations in the long-term on-the-job training category will account for a much smaller 3.1 million openings.

IN PROJECTING OCCUPATIONAL growth and decline, BLS makes assumptions about the size and makeup of the labor force, the size of the economy, demand for goods and services, and other factors that affect levels of employment. Changes in laws, business and consumer preferences, and technology may alter the BLS projections over time. However, given the set of assumptions found in the articles in this issue of the *Review*, BLS attempts to provide the reader with the best estimates of occupational employment change.

BLS projects that total employment will increase by 10.1 percent from 2008 to 2018, resulting in 15.3 million new jobs. Rapid growth is expected among healthcare occupations, as a larger elderly population requires more medical services, and among computer and mathematical science occupations, as organizations continue to use information technology to improve efficiency and reduce costs. Over the decade, occupations classified into education or training categories that involve a postsecondary award or degree will see faster employment growth than occupations in categories that involve on-the-job training. Most job openings, however, will occur among occupations in the on-the-job training categories. Of the 50.9 million total job openings that are expected to arise over the 2008–18 period, it is estimated that 34.3 million will result from replacement needs. By comparison, it is estimated that a net increase of 15.3 million jobs will result from economic growth.¹⁰ □

Notes

¹ BLS makes assumptions about the factors that affect occupational growth. Detailed information on these projections can be found at the Employment Projections Program section of the BLS Web site at www.bls.gov/emp/ (visited Oct. 29, 2009), and in the *BLS Handbook of Methods*, on the Internet at www.bls.gov/opub/hom/homch13_a.htm (visited Oct. 29, 2009). The projections will also be presented in the forthcoming 2010–11 *Occupational Outlook Handbook*. The Internet version of this edition of the *Handbook*, which will be accessible at

www.bls.gov/oco (visited Oct. 29, 2009), is expected to be available in late December 2009; the print version of the 2010–11 *Handbook*, BLS Bulletin 2800, is expected to be available by the spring of 2010.

² See Mitra Toossi, “Labor force projections to 2018: older workers staying more active,” this issue, pp. 30–51.

³ See Ian D. Wyatt and Kathryn J. Byun, “The U.S. economy to 2018: from recession to recovery,” this issue, pp. 11–29.

⁴ See Wyatt and Byun, “The U.S. economy to 2018.”

⁵ The Standard Occupational Classification (SOC) system broadly classifies occupations into 23 major occupational groups. This article uses an aggregation of the 23 major groups, referred to as the SOC intermediate aggregation, which comprises 11 groups. The groupings of management, business, and financial occupations; professional and related occupations; and service occupations are part of the intermediate aggregation, and they are made up of some of the 23 major occupational groups. Military specific occupations are excluded; they stand alone as 1 of the the 23 major groups and are also their own group in the the intermediate aggregation. For more information on the SOC, see *Standard Occupation Classification Manual 2000* (Lanham, MD, Bernan Associates, 2000).

⁶ See Rose A. Woods, “Industry output and employment projections to 2018,” this issue, pp. 52–81. The employment figures for the 2007–08 period that are referenced here describe industry sector 23—construction—in the North American Industry Classification System (NAICS). A substantial portion of the jobs in the construction and extraction occupational group are within the construction industry sector.

⁷ These data come from the BLS Current Employment Statistics program. The data referenced describe the NAICS manufacturing industry sector, which is composed of NAICS industries 31–33.

⁸ Because of the variability of job functions within a given occupation,

and because different employers may have different requirements for education or training, workers in the same occupation can have substantially different education and training backgrounds. For more information on education and training categories and the educational attainment of workers in various occupations, see *Occupational Projections and Training Data*, 2008–09 edition, Bulletin 2702 (Bureau of Labor Statistics), on the Internet at www.bls.gov/emp/optd (visited Dec. 8, 2009); and the technical documentation accompanying the 2008–18 employment projections, available on the Internet at www.bls.gov/emp/ep_education_tech.htm (visited Dec. 8, 2009).

⁹ For a detailed discussion of the methods used to determine replacement needs, as well as data on replacement needs for all occupations, see *Occupational Projections and Training Data*, 2008–09 edition; and the technical documentation accompanying the 2008–18 employment projections, available on the Internet at www.bls.gov/emp/ep_replacements.htm (visited Dec. 8, 2009).

¹⁰ Total job openings may not equal the sum of replacement needs and employment change. If employment change for a detailed occupation is negative, job openings due to growth are zero and total job openings equals replacement needs. For summary occupations, including the total of all occupations, job openings due to growth are summed from detailed occupations. If some detailed occupations are declining and others are growing, job openings due to growth will not equal the employment change.

Appendix: Employment and job openings by occupation and occupational group, 2008 and projected 2018

Community colleges: a report card

Do Community Colleges Respond to Local Needs? Evidence from California. By Duane E. Leigh and Andrew M. Gill, Kalamazoo, MI, W.E. Upjohn Institute for Employment Research, 2007, 219 pp., \$40/cloth; \$18/paperback.

When Duane Leigh and Andrew Gill ask the question, “Do community colleges respond to local needs?” they are using the term “needs” in two distinct senses. The more obvious interpretation is that of employer demand: to what extent do these educational institutions satisfy the requirements of job providers? But they also address the extent to which the student customers of community colleges, who are part of the labor supply to local employers, get what they want from the institutions in the way of career preparation and personal growth.

Community colleges play a multitude of roles: trainer of labor, provider of further education, and facilitator of student transfers to 4-year institutions among them. Leigh and Gill address two research questions about the California Community College system using the criteria that a labor-market-responsive community college seeks to develop programs that are aligned to changes in both the demand and supply sides of its local labor market. The first question concerns the supply-side changes associated with immigration into the California labor market and transfer to 4-year colleges. The second question asks whether community colleges provide occupational training that enables students to acquire marketable skills in the local labor market.

On the supply side, Leigh and Gill

analyze differences between Latinos and Whites and Asians and Whites in terms of receipt of an Associate’s degree, total credits earned, and transfer to a 4-year institution. They also analyze subgroups of first generation immigrants, high school dropouts, and students of specific national origins. First generation immigrant Asian students (57 percent of all Asian freshmen students on California community college campuses in 1996-97) do better than other immigrant groups and about as well as non-immigrant Asian students on the three outcome measures. Latino immigrant students (32 percent of all Latino students in the sample) do less well than other immigrant groups and Latino non-immigrants.

Just 35 percent of all entering students in the California Community College system used by Leigh and Gill stated plans to transfer to a 4-year institution. Looking at actual rates of transfer to 4-year institutions of male students, here are the percentages: Latino immigrant, 5.0; Latino nonimmigrant, 8.5; Asian immigrant, 23.4; Asian nonimmigrant, 28.0; White immigrant, 11.4 and Black immigrant, 14.1 Nonimmigrant transfer percentages for Whites and Blacks are not provided, but can be inferred to be lower than immigrant Whites and Blacks in contrast to the Latino and Asian numbers. The percentages were slightly higher for females in each subgroup except for Black immigrants, for whom the female transfer rate was lower than the male rate.

An important finding of the study is that “clustering” of students of particular ethnic backgrounds in specific colleges has different effects on the transfer rates of Latinos and Asians. A high concentration of Latino stu-

dents decreases their transfer rates, controlling for student background characteristics, while a high concentration of Asian students increases the rate at which they transfer to 4-year institutions. The authors attribute these differences to differences in cultural norms and educational aspirations within the various ethnic groups.

The authors measure the extent to which community colleges satisfy the skill requirements of local employers by comparing the distribution of occupational credits completed by students in their sample to the occupational distribution of projected new jobs. This measure of “responsiveness” does not provide any information on whether students actually find employment in their fields of specialization. Leigh and Gill find considerable variability in responsiveness across the 106 community colleges in their sample. However, multi-campus districts appear to be more responsive than single campus districts, perhaps because individual campuses within multi-campus systems in a district specialize in ways that complement each other. The authors contend that this means that the heterogeneity in programs and curricular emphases observed among individual colleges in a district is consistent with their being more responsive as a group; that one-size fits-all performance measures don’t fully capture the variety of programs, including transfer-oriented as well as vocationally-oriented, available in the district as a whole.

As the authors acknowledge, the two research approaches used cannot be melded together to answer the question of whether immigrants, or ethnic group members generally, are obtaining training and credentials of value in the various California labor

markets. Their preliminary findings, however, of which those mentioned in this review are but a share, indicate that further work on the ways in which different groups of students enter and prepare for the labor market and fur-

ther education, and complementary work on how skill demands get translated into careers, will yield helpful insights. It should be mentioned, finally, that the authors are scrupulous in their descriptions of the data and

their limitations, and provide a good example of productive labor market research.

Recession affects beliefs as well as wallets

Will the current economic downturn profoundly affect the political, economic, and personal ideologies of the generation that is coming of age during these tough times? Or were the beliefs of this generation already ingrained prior to adulthood?

Economists Paola Giuliano and Antonio Spilimbergo try to answer these questions in a recent National Bureau of Economic Research (NBER) study entitled “Growing Up in a Recession: Beliefs and the Macroeconomy” (NBER Working Paper 15321, September 2009). Giuliano and Spilimbergo argue that “the system of individual beliefs and attitudes is conditioned by the collective experience of a recession”—especially for those individuals who experience a recession during “early adulthood,” defined by the authors as ages 18 to 25. Among the various age groups, the 18- to 25-year-olds are probably the most sensitive to macroeconomic conditions; it is the time in life during which many socioeconomic beliefs are formed, according to social psychology research done by the authors.

The authors used the self-reported answers from participants in the National Opinion Research Center’s General Social Survey, which provides repeated cross sections over a 30-year period with information on economic beliefs, demographic characteristics, and the location and economic conditions of the participants when they were teens. With data from the 1940s through the 1980s to assess respondents’ beliefs and attitudes, Giuliano and Spilimbergo then matched survey answers to the macroeconomic experiences of the survey respondents over a number of years. The authors used regional recessions as the measure for macroeconomic shocks, making their analysis both time and location specific.

Giuliano and Spilimbergo found

three major commonalities in beliefs adopted later in life by people who experienced recessions during their formative early adult years, suggesting that recessions have a long-lasting effect on economic beliefs and personal values. These individuals are more likely to

- believe that luck rather than effort is the most important driver of individual success;
- support more government-initiated redistribution of wealth;
- have less confidence in public institutions.

The influence of a recession on an individual’s belief system in turn has a profound long-term effect on labor market experience. Young people entering the job market during a recession experience considerable initial earning losses that may be permanent, and they generally choose a more conservative capital structure in business dealings. These individuals are also less likely to invest a large fraction of their wealth in stocks.

Giuliano and Spilimbergo also found that, until they are in their 40s, adults can have their trust in government institutions shaken by macroeconomic shocks. People who are 40 and older do not tend to change their beliefs in response to negative economic shocks they have experienced.

Employers’ online job postings

It goes without saying that the Internet has transformed the ways in which jobseekers hunt for work and employers search for candidates to fill open positions. There are a number of examples of recent research documenting the causes and consequences of employers using the Internet to search, but there is little known about *how* employers use the Web to search

for workers. In the article “Employers’ Online Search: An Empirical Analysis,” (*Industrial Relations*, October 2009, pp. 684–709) Vera Brenčič and John B. Norris present a study they conducted in an attempt to provide more answers to the “how” question.

The researchers use data on 172,219 job vacancies on Monster.com between late April and early July of 2005. They set out to determine whether, in general, the urgency in filling a position has a substantial effect on the content of the job posting. The authors control for numerous factors—the length of the job description, whether the job is a temporary assignment, whether the vacancy was posted by the employer that intends to hire or by a recruitment agency, and various other factors—in order to obtain robust results.

The study finds some interesting general trends. For example, compared with employers who did not specify that a position was immediately available, employers who indicated in job postings that the vacancies were ready to be filled right away were less likely to specify required work experience and also less likely to list educational requirements. Brenčič and Norris believe that this result suggests that, when the costs of continuing a search are high, employers elect to provide less information about the types of candidates they are looking for—and that they do so in order to increase the size of the applicant pool. The study also finds that employers with immediately available jobs gave more details about the application process and were quicker to remove the job postings from the Web site. Although there remains much to be learned about the ways in which the Web is used in matching jobseekers with employers, this article provides evidence that vacancy costs influence the ways in which employers use the Internet to find candidates for jobs. □

To the Editor:

This refers to the article titled “An international analysis of workplace injuries,” by Al-Amin Ussif that appeared in the March 2004 issue of the *Monthly Labor Review* (<http://www.bls.gov/opub/mlr/2004/03/art3full.pdf>).

In the article, the author discusses occupational injury data for the United States, Canada, Finland, France, and Sweden and draws cross-country comparisons. On page 44, he gives both the BLS and ILO as sources (see end of Chart 1) and states that “the sources of the data are different, but are comparable.” Our analysis indicates that these are false statements. We believe that fundamental inconsistencies in the data preclude meaningful comparisons, not only of levels but also of trends in the data. At a minimum, the author should have discussed limitations of the data. Furthermore, the U.S. data series is presented incorrectly. (Jeffery Brown, an Economist in the BLS Office of Compensation and Working Conditions, Division of Safety and Health Statistics, provided the information about the U.S. data series.) Below is a more detailed analysis of these and other points.

Source data cited incorrectly. All data are from ILO; BLS is listed as a source incorrectly on Chart 1. BLS does not publish international data on occupational injuries; therefore, data for Canada, Finland, France, and Sweden are clearly from ILO. The U.S. data are not directly from BLS; the series graphed by the author shows an unusual trend not characteristic of the occupational injury series published by BLS. The ILO series on U.S. occupational injuries data, however, shows the same unusual trend (as discussed further below), so we conclude that the U.S. data were taken from ILO rather than directly from BLS. In fact, footnote 8 of the article states that “The data employed in this analysis are obtained from the International Labor Office Web site: www.laborsta.ilo.org.” This contradicts the author’s source note on Chart 1, which sources BLS directly.

International data are not comparable. ILO metadata show that occupational injury data are not strictly comparable across the five countries. For example, type of injuries—whether reported or compensated—has a significant impact on comparisons across countries. Thus, data for the U.S. and Sweden, which are based on reported injuries, should not be compared with those of Canada, Finland, and France, since these are based on insurance claims. Table 1 provides an overview of the various differences in coverage for the five countries.

Furthermore, the ILO provides the following caveats about the statistics on occupational injuries:

- “Care should be taken when using the data provided in these tables, particularly when making international comparisons. The sources, methods of data collection, coverage and classifications used differ between countries. For example, coverage may be limited to certain types of workers (employees, insured persons, full-time workers, etc.), certain economic activities, establishments employing more than a given number of workers, cases of injury losing more than a certain number of days of work, etc.”
- “It should be borne in mind that a rise or fall in the number of cases of occupational injury or in the rates of injury over a period of time may reflect not only changes in

conditions of work and the work environment, but also modifications in reporting procedures or data collection methods, or revisions to laws or regulations governing the reporting or compensation of occupational injuries in the country concerned.”

These caveats appear online at <http://laborsta.ilo.org/applv8/data/c8e.html> and in the ILO Yearbook of Labor Statistics publications.

Table 1. ILO metadata on occupational injury data

Coverage	United States	Canada	Finland	France	Sweden
Source	Establishment survey for non-fatal and census for fatal injuries	Insurance claims	Insurance claims	Insurance claims	Insurance claims
Type of injuries	Reported injuries	Compensated injuries	Compensated injuries	Compensated injuries	Reported injuries
Persons	Paid employees	Paid employees and self-employed if covered by workers' compensation board	Paid employees and trainees	Paid employees	All (employees, self-employed, family workers); also includes trainees
Economic activities	All except public sector and private household services	All except defense	All	All except public administration and services	All
Establishments	All except farms with fewer than 11 employees	All	All	All	All
Injuries outside country	Not included	Included if covered by workers' compensation board	Included if employer registered in Finland	Not included	Included if claim filed to Swedish company
Metadata source	http://laborsta.ilo.org/applv8/data/SSM8/E/US.html	http://laborsta.ilo.org/applv8/data/SSM8/E/FI.html	http://laborsta.ilo.org/applv8/data/SSM8/E/FR.html	http://laborsta.ilo.org/applv8/data/SSM8/E/SE.html	http://laborsta.ilo.org/applv8/data/SSM8/E/SE.html

Data series identified incorrectly. The author incorrectly identifies the type of occupational injury data series used. The ILO provides three data series on occupational injuries: fatal injuries, non-fatal injuries, and total injuries. Based on the data discussed in the article, the author appears to have used the series on total injuries, which includes both fatal and non-fatal cases. However, on page 41, the author states “the injury counts are cases with lost workdays, that is, injuries resulting in days away from work.” Thus the author is implying that he is using the series on non-fatal injuries, which is not true based on the data shown in the article.

Misuse of data. As briefly discussed above, the U.S. data presented show an unusual trend. Chart 1 on page 43 shows U.S. injuries falling from above 5 million in 1977 to about 2.5 million in 1978. Although this trend is consistent with the ILO data series on total reported injuries in the United States, the author does not reproduce the break in series for 1977 indicated by the ILO, resulting in a misleading graph. In addition, he makes no attempt to explain the sharp drop from one year to the other in the U.S. data series.

The underlying problem, however, is the ILO's inaccurate presentation of the U.S. data from BLS. The ILO series on total reported occupational injuries for the United States is actually a combination of two separate BLS data series: total injuries for 1976–77 and counts of cases resulting in days away from work for 1978 onward. Thus, the classification of this dataset as total reported injuries is incorrect, since only the first two years of data reflect total injuries. The majority of the data presented (i.e., data for 1978 onward) are days away from work cases, a subset of total injuries.

Also note that the 1977 break in series for the U.S. data is inaccurately described by the ILO, and, more importantly, it is inappropriate. Although it is placed at the seam of the two different data series, it incorrectly characterizes the difference between the two series. The ILO's explanation for the break is that the figures for 1976–77 include non-fatal cases without lost workdays, implying that the figures are larger because they are based on a broader definition for non-fatal cases. As discussed above, this is incorrect; the difference is in fact due to the exclusion of fatal cases for all years after 1977. However, the error in the explanation of the break is moot since the two BLS series should not be combined into one.

Missing breaks in series. The author does not reproduce the breaks in series given in the ILO metadata for four of the five countries studied in the article. Table 2 provides an overview of the omitted breaks.

Table 2. ILO metadata on breaks in series		
Country	Year	Explanation
United States	1992	Establishment of Census of Fatal Occupational Injuries. Previously, fatal injuries figures were estimations based on survey data.
Canada	1991	Geographic coverage expanded to include the Yukon.
Finland	1992	Revisions to definitions of establishment, occupation and branch of industry.
Sweden	1993	Revisions to definition of economic activities and work injuries.
	1990	Revisions to definition of occupation.
	1997	Further revisions to definition of occupation.

Other comments. Footnote 2 on Chart 1 is incorrectly placed after the United States. This footnote relates only to France.

Nominations Sought for 2010 Julius Shiskin Award

Nominations are invited for the annual Julius Shiskin Memorial Award for Economic Statistics. The Award is given in recognition of unusually original and important contributions in the development of economic statistics or in the use of statistics in interpreting the economy. Contributions are recognized for statistical research, development of statistical tools, application of information technology techniques, use of economic statistical programs, management of statistical programs, or developing public understanding of measurement issues. The Award was established in 1980 by the Washington Statistical Society (WSS) and is now cosponsored by the WSS, the National Association for Business Economics, and the Business and Economics Statistics Section of the American Statistical Association (ASA). In 2009, Dr. Helen Stone Tice received the award for her innovative research in developing improved measures of the activities on nonprofit institutions throughout the world and for leadership in providing users with comprehensive documentation of the methodologies used for the U.S. economic accounts.

Because the program was initiated many years ago, statisticians and economists often ask, "Who was Julius Shiskin?" At the time of his death in 1978, "Julie" was the Commissioner of the Bureau of Labor Statistics (BLS); he earlier served as the Chief Statistician at the Office of Management and Budget (OMB), and the Chief Economic Statistician and Assistant Director of the Census Bureau. Throughout his career, he was known as an innovator. At Census he was instrumental in developing an electronic computer method for seasonal adjustment. In 1961, he published *Signals of Recession and Recovery*, which laid the groundwork for the calculation of monthly economic indicators, and he developed the monthly Census report *Business Conditions Digest* to disseminate them to the public. In 1969, he was appointed Chief Statistician at OMB where he developed the policies and procedures that govern the release of key economic indicators (Statistical Policy Directive Number 3), and originated a Social Indicators report. In 1973, he was selected to head BLS where he was instrumental in preserving the integrity and independence of the BLS labor force data and directed the most comprehensive revision in the history of the Consumer Price Index (CPI), which included a new CPI for all urban consumers.

Nominations for the 2010 award are now being accepted. Individuals and groups in the public or private sector from any country can be nominated. The award will be presented with an honorarium of \$750 plus additional recognition from the sponsors. A nomination form and a list of all previous recipients are available on the ASA Website at www.amstat.org/sections/bus_econ/shiskin.html.

For questions or more information, please contact Steven Paben, Julius Shiskin Award Committee Secretary, via e-mail at paben.steven@bls.gov or call 202-691-6147.

Completed nominations must be *received* by March 5, 2010.

Notes on Current Labor Statistics

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force; employment; unemployment; labor compensation; consumer, producer, and international prices; productivity; international comparisons; and injury and illness statistics. In the notes that follow, the data in each group of tables are briefly described; key definitions are given; notes on the data are set forth; and sources of additional information are cited.

General notes

The following notes apply to several tables in this section:

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as “seasonally adjusted.” (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of current and past experiences. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted data appear in tables 1–14, 17–21, 48, and 52. Seasonally adjusted labor force data in tables 1 and 4–9 and seasonally adjusted establishment survey data shown in tables 1, 12–14, and 17 are revised in the March 2007 *Review*. A brief explanation of the seasonal adjustment methodology appears in “Notes on the data.”

Revisions in the productivity data in table 54 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month-to-month and quarter-to-quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All-Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data—such as the “real” earnings shown in table 14—are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current-dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of \$3 and a current price index number of 150, where 1982 = 100, the hourly rate expressed in 1982 dollars is \$2 ($\$3/150 \times 100 = \2). The \$2 (or any other resulting

values) are described as “real,” “constant,” or “1982” dollars.

Sources of information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Definitions of each series and notes on the data are contained in later sections of these Notes describing each set of data. For detailed descriptions of each data series, see *BLS Handbook of Methods*, Bulletin 2490. Users also may wish to consult *Major Programs of the Bureau of Labor Statistics*, Report 919. News releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule appearing on the back cover of this issue.

More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in the Bureau’s monthly publication, *Employment and Earnings*. Historical unadjusted and seasonally adjusted data from the household survey are available on the Internet:

www.bls.gov/cps/

Historically comparable unadjusted and seasonally adjusted data from the establishment survey also are available on the Internet:

www.bls.gov/ces/

Additional information on labor force data for areas below the national level are provided in the BLS annual report, *Geographic Profile of Employment and Unemployment*.

For a comprehensive discussion of the Employment Cost Index, see *Employment Cost Indexes and Levels, 1975–95*, BLS Bulletin 2466. The most recent data from the Employee Benefits Survey appear in the following Bureau of Labor Statistics bulletins: *Employee Benefits in Medium and Large Firms*; *Employee Benefits in Small Private Establishments*; and *Employee Benefits in State and Local Governments*.

More detailed data on consumer and producer prices are published in the monthly periodicals, *The CPI Detailed Report* and *Producer Price Indexes*. For an overview of the 1998 revision of the CPI, see the December 1996 issue of the *Monthly Labor Review*. Additional data on international prices appear in monthly news releases.

Listings of industries for which productivity indexes are available may be found on the Internet:

www.bls.gov/lpc/

For additional information on international comparisons data, see *International Comparisons of Unemployment*, Bulletin

1979.

Detailed data on the occupational injury and illness series are published in *Occupational Injuries and Illnesses in the United States, by Industry*, a BLS annual bulletin.

Finally, the *Monthly Labor Review* carries analytical articles on annual and longer term developments in labor force, employment, and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

Symbols

n.e.c. = not elsewhere classified.

n.e.s. = not elsewhere specified.

p = preliminary. To increase the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.

r = revised. Generally, this revision reflects the availability of later data, but also may reflect other adjustments.

Comparative Indicators

(Tables 1–3)

Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

Labor market indicators include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-population ratio, and unemployment rates for major demographic groups based on the Current Population (“household”) Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonfarm payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on **changes in compensation, prices, and productivity** are presented in table 2. Measures of rates of change of compensation and wages from the Employment Cost Index

program are provided for all civilian nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in consumer prices for all urban consumers; producer prices by stage of processing; overall prices by stage of processing; and overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

Alternative measures of wage and compensation rates of change, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data.

Employment and Unemployment Data

(Tables 1; 4–29)

Household survey data

Description of the series

Employment data in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons include (1) all those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work

because they were on layoff are also counted among the unemployed. **The unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The **civilian labor force** consists of all employed or unemployed persons in the civilian noninstitutional population. Persons **not in the labor force** are those not classified as employed or unemployed. This group includes discouraged workers, defined as persons who want and are available for a job and who have looked for work sometime in the past 12 months (or since the end of their last job if they held one within the past 12 months), but are not currently looking, because they believe there are no jobs available or there are none for which they would qualify. The **civilian noninstitutional population** comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy. The **civilian labor force participation rate** is the proportion of the civilian noninstitutional population that is in the labor force. The **employment-population ratio** is employment as a percent of the civilian noninstitutional population.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the intercensal years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appears in the Explanatory Notes of *Employment and Earnings*. For a discussion of changes introduced in January 2003, see “Revisions to the Current Population Survey Effective in January 2003” in the February 2003 issue of *Employment and Earnings* (available on the BLS Web site at www.bls.gov/cps/rvcps03.pdf).

Effective in January 2003, BLS began using the X-12 ARIMA seasonal adjustment program to seasonally adjust national labor force data. This program replaced the X-11 ARIMA program which had been used since January 1980. See “Revision of Seasonally Adjusted Labor Force Series in 2003,” in the February 2003 issue of *Employment and Earnings* (available on the BLS Web site at www.bls.gov/cps/cpsrs.pdf) for a discussion of the introduction of the use of X-12 ARIMA for seasonal adjustment of the labor force data and the effects that it had on the data.

At the beginning of each calendar year, historical seasonally adjusted data usually are revised, and projected seasonal adjustment factors are calculated for use during the January–June period. The historical season-

ally adjusted data usually are revised for only the most recent 5 years. In July, new seasonal adjustment factors, which incorporate the experience through June, are produced for the July–December period, but no revisions are made in the historical data.

FOR ADDITIONAL INFORMATION on national household survey data, contact the Division of Labor Force Statistics: (202) 691–6378.

Establishment survey data

Description of the series

Employment, hours, and earnings data in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by about 160,000 businesses and government agencies, which represent approximately 400,000 individual worksites and represent all industries except agriculture. The active CES sample covers approximately one-third of all nonfarm payroll workers. Industries are classified in accordance with the 2002 North American Industry Classification System. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

Definitions

An **establishment** is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th day of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in the goods-producing industries cover employees, up through the level of working supervisors, who engage directly in the manufacture or construction of the establishment’s product. In private service-providing industries, data are collected for nonsupervisory workers, which include most employees except those in executive, managerial, and supervisory positions. Those

workers mentioned in tables 11–16 include production workers in manufacturing and natural resources and mining; construction workers in construction; and nonsupervisory workers in all private service-providing industries. Production and nonsupervisory workers account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received, and are different from standard or scheduled hours. **Overtime hours** represent the portion of average weekly hours which was in excess of regular hours and for which overtime premiums were paid.

The **Diffusion Index** represents the percent of industries in which employment was rising over the indicated period, plus one-half of the industries with unchanged employment; 50 percent indicates an equal balance between industries with increasing and decreasing employment. In line with Bureau practice, data for the 1-, 3-, and 6-month spans are seasonally adjusted, while those for the 12-month span are unadjusted. Table 17 provides an index on private non-farm employment based on 278 industries, and a manufacturing index based on 84 industries. These indexes are useful for measuring the dispersion of economic gains or losses and are also economic indicators.

Notes on the data

Establishment survey data are annually adjusted to comprehensive counts of employment (called “benchmarks”). The March 2003 benchmark was introduced in February 2004 with the release of data for January 2004, published in the March 2004 issue of the *Review*. With the release in June 2003, CES completed a conversion from the Standard Industrial Classification (SIC) system to the North American Industry Classification System (NAICS) and completed the transition from its original quota sample design to a probability-based sample design. The industry-coding update included reconstruction of historical estimates in order to preserve

time series for data users. Normally 5 years of seasonally adjusted data are revised with each benchmark revision. However, with this release, the entire new time series history for all CES data series were re-seasonally adjusted due to the NAICS conversion, which resulted in the revision of all CES time series.

Also in June 2003, the CES program introduced concurrent seasonal adjustment for the national establishment data. Under this methodology, the first preliminary estimates for the current reference month and the revised estimates for the 2 prior months will be updated with concurrent factors with each new release of data. Concurrent seasonal adjustment incorporates all available data, including first preliminary estimates for the most current month, in the adjustment process. For additional information on all of the changes introduced in June 2003, see the June 2003 issue of *Employment and Earnings* and “Recent changes in the national Current Employment Statistics survey,” *Monthly Labor Review*, June 2003, pp. 3–13.

Revisions in State data (table 11) occurred with the publication of January 2003 data. For information on the revisions for the State data, see the March and May 2003 issues of *Employment and Earnings*, and “Recent changes in the State and Metropolitan Area CES survey,” *Monthly Labor Review*, June 2003, pp. 14–19.

Beginning in June 1996, the BLS uses the X-12-ARIMA methodology to seasonally adjust establishment survey data. This procedure, developed by the Bureau of the Census, controls for the effect of varying survey intervals (also known as the 4- versus 5-week effect), thereby providing improved measurement of over-the-month changes and underlying economic trends. Revisions of data, usually for the most recent 5-year period, are made once a year coincident with the benchmark revisions.

In the establishment survey, estimates for the most recent 2 months are based on incomplete returns and are published as preliminary in the tables (12–17 in the *Review*). When all returns have been received, the estimates are revised and published as “final” (prior to any benchmark revisions) in the third month of their appearance. Thus, December data are published as preliminary in January and February and as final in March. For the same reasons, quarterly establishment data (table 1) are preliminary for the first 2 months of publication and final in the third month. Fourth-quarter data are published as preliminary in January and February and as final in March.

FOR ADDITIONAL INFORMATION ON

establishment survey data, contact the Division of Current Employment Statistics: (202) 691–6555.

Unemployment data by State

Description of the series

Data presented in this section are obtained from the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions, and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act. Seasonally adjusted unemployment rates are presented in table 10. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

Notes on the data

Data refer to State of residence. Monthly data for all States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates are revised to new population controls, usually with publication of January estimates, and benchmarked to annual average CPS levels.

FOR ADDITIONAL INFORMATION on data in this series, call (202) 691–6392 (table 10) or (202) 691–6559 (table 11).

Quarterly Census of Employment and Wages

Description of the series

Employment, wage, and establishment data in this section are derived from the quarterly tax reports submitted to State employment security agencies by private and State and local government employers subject to State unemployment insurance (UI) laws and from Federal, agencies subject to the Unemployment Compensation for Federal Employees (UCFE) program. Each quarter, State agencies edit and process the data and send the information to the Bureau of Labor Statistics.

The Quarterly Census of Employment and Wages (QCEW) data, also referred as ES-202 data, are the most complete enumeration of employment and wage information by industry at the national, State, metropolitan area, and county levels. They have broad economic significance in evaluating labor

market trends and major industry developments.

Definitions

In general, the Quarterly Census of Employment and Wages monthly employment data represent the number of **covered workers** who worked during, or received pay for, the pay period that included the 12th day of the month. **Covered private industry employment** includes most corporate officials, executives, supervisory personnel, professionals, clerical workers, wage earners, piece workers, and part-time workers. It excludes proprietors, the unincorporated self-employed, unpaid family members, and certain farm and domestic workers. Certain types of nonprofit employers, such as religious organizations, are given a choice of coverage or exclusion in a number of States. Workers in these organizations are, therefore, reported to a limited degree.

Persons on paid sick leave, paid holiday, paid vacation, and the like, are included. Persons on the payroll of more than one firm during the period are counted by each UI-subject employer if they meet the employment definition noted earlier. The employment count excludes workers who earned no wages during the entire applicable pay period because of work stoppages, temporary layoffs, illness, or unpaid vacations.

Federal employment data are based on reports of monthly employment and quarterly wages submitted each quarter to State agencies for all Federal installations with employees covered by the Unemployment Compensation for Federal Employees (UCFE) program, except for certain national security agencies, which are omitted for security reasons. Employment for all Federal agencies for any given month is based on the number of persons who worked during or received pay for the pay period that included the 12th of the month.

An **establishment** is an economic unit, such as a farm, mine, factory, or store, that produces goods or provides services. It is typically at a single physical location and engaged in one, or predominantly one, type of economic activity for which a single industrial classification may be applied. Occasionally, a single physical location encompasses two or more distinct and significant activities. Each activity should be reported as a separate establishment if separate records are kept and the various activities are classified under different NAICS industries.

Most employers have only one establishment; thus, the establishment is the predominant reporting unit or statistical entity for reporting employment and wages

data. Most employers, including State and local governments who operate more than one establishment in a State, file a Multiple Worksite Report each quarter, in addition to their quarterly UI report. The Multiple Worksite Report is used to collect separate employment and wage data for each of the employer's establishments, which are not detailed on the UI report. Some very small multi-establishment employers do not file a Multiple Worksite Report. When the total employment in an employer's secondary establishments (all establishments other than the largest) is 10 or fewer, the employer generally will file a consolidated report for all establishments. Also, some employers either cannot or will not report at the establishment level and thus aggregate establishments into one consolidated unit, or possibly several units, though not at the establishment level.

For the Federal Government, the reporting unit is the **installation**: a single location at which a department, agency, or other government body has civilian employees. Federal agencies follow slightly different criteria than do private employers when breaking down their reports by installation. They are permitted to combine as a single statewide unit: 1) all installations with 10 or fewer workers, and 2) all installations that have a combined total in the State of fewer than 50 workers. Also, when there are fewer than 25 workers in all secondary installations in a State, the secondary installations may be combined and reported with the major installation. Last, if a Federal agency has fewer than five employees in a State, the agency headquarters office (regional office, district office) serving each State may consolidate the employment and wages data for that State with the data reported to the State in which the headquarters is located. As a result of these reporting rules, the number of reporting units is always larger than the number of employers (or government agencies) but smaller than the number of actual establishments (or installations).

Data reported for the first quarter are tabulated into **size** categories ranging from worksites of very small size to those with 1,000 employees or more. The size category is determined by the establishment's March employment level. It is important to note that each establishment of a multi-establishment firm is tabulated separately into the appropriate size category. The total employment level of the reporting multi-establishment firm is not used in the size tabulation.

Covered employers in most States report total **wages** paid during the calendar quarter, regardless of when the services were performed. A few State laws, however, specify that wages be reported for, or based on the period during which services are performed

rather than the period during which compensation is paid. Under most State laws or regulations, wages include bonuses, stock options, the cash value of meals and lodging, tips and other gratuities, and, in some States, employer contributions to certain deferred compensation plans such as 401(k) plans.

Covered employer contributions for old-age, survivors, and disability insurance (OASDI), health insurance, unemployment insurance, workers' compensation, and private pension and welfare funds are not reported as wages. Employee contributions for the same purposes, however, as well as money withheld for income taxes, union dues, and so forth, are reported even though they are deducted from the worker's gross pay.

Wages of covered Federal workers represent the gross amount of all payrolls for all pay periods ending within the quarter. This includes cash allowances, the cash equivalent of any type of remuneration, severance pay, withholding taxes, and retirement deductions. Federal employee remuneration generally covers the same types of services as for workers in private industry.

Average annual wage per employee for any given industry are computed by dividing total annual wages by annual average employment. A further division by 52 yields average weekly wages per employee. Annual pay data only approximate annual earnings because an individual may not be employed by the same employer all year or may work for more than one employer at a time.

Average weekly or annual wage is affected by the ratio of full-time to part-time workers as well as the number of individuals in high-paying and low-paying occupations. When average pay levels between States and industries are compared, these factors should be taken into consideration. For example, industries characterized by high proportions of part-time workers will show average wage levels appreciably less than the weekly pay levels of regular full-time employees in these industries. The opposite effect characterizes industries with low proportions of part-time workers, or industries that typically schedule heavy weekend and overtime work. Average wage data also may be influenced by work stoppages, labor turnover rates, retroactive payments, seasonal factors, bonus payments, and so on.

Notes on the data

Beginning with the release of data for 2001, publications presenting data from the Covered Employment and Wages program have switched to the 2002 version of the North American Industry Classification System

(NAICS) as the basis for the assignment and tabulation of economic data by industry. NAICS is the product of a cooperative effort on the part of the statistical agencies of the United States, Canada, and Mexico. Due to difference in NAICS and Standard Industrial Classification (SIC) structures, industry data for 2001 is not comparable to the SIC-based data for earlier years.

Effective January 2001, the program began assigning Indian Tribal Councils and related establishments to local government ownership. This BLS action was in response to a change in Federal law dealing with the way Indian Tribes are treated under the Federal Unemployment Tax Act. This law requires federally recognized Indian Tribes to be treated similarly to State and local governments. In the past, the Covered Employment and Wage (CEW) program coded Indian Tribal Councils and related establishments in the private sector. As a result of the new law, CEW data reflects significant shifts in employment and wages between the private sector and local government from 2000 to 2001. Data also reflect industry changes. Those accounts previously assigned to civic and social organizations were assigned to tribal governments. There were no required industry changes for related establishments owned by these Tribal Councils. These tribal business establishments continued to be coded according to the economic activity of that entity.

To insure the highest possible quality of data, State employment security agencies verify with employers and update, if necessary, the industry, location, and ownership classification of all establishments on a 3-year cycle. Changes in establishment classification codes resulting from the verification process are introduced with the data reported for the first quarter of the year. Changes resulting from improved employer reporting also are introduced in the first quarter. For these reasons, some data, especially at more detailed geographic levels, may not be strictly comparable with earlier years.

County definitions are assigned according to Federal Information Processing Standards Publications as issued by the National Institute of Standards and Technology. Areas shown as counties include those designated as independent cities in some jurisdictions and, in Alaska, those areas designated by the Census Bureau where counties have not been created. County data also are presented for the New England States for comparative purposes, even though townships are the more common designation used in New England (and New Jersey).

The Office of Management and Budget (OMB) defines metropolitan areas for use

in Federal statistical activities and updates these definitions as needed. Data in this table use metropolitan area criteria established by OMB in definitions issued June 30, 1999 (OMB Bulletin No. 99-04). These definitions reflect information obtained from the 1990 Decennial Census and the 1998 U.S. Census Bureau population estimate. A complete list of metropolitan area definitions is available from the National Technical Information Service (NTIS), Document Sales, 5205 Port Royal Road, Springfield, Va. 22161, telephone 1-800-553-6847.

OMB defines metropolitan areas in terms of entire counties, except in the six New England States where they are defined in terms of cities and towns. New England data in this table, however, are based on a county concept defined by OMB as New England County Metropolitan Areas (NECMA) because county-level data are the most detailed available from the Quarterly Census of Employment and Wages. The NECMA is a county-based alternative to the city- and town-based metropolitan areas in New England. The NECMA for a Metropolitan Statistical Area (MSA) include: (1) the county containing the first-named city in that MSA title (this county may include the first-named cities of other MSA, and (2) each additional county having at least half its population in the MSA in which first-named cities are in the county identified in step 1. The NECMA is officially defined areas that are meant to be used by statistical programs that cannot use the regular metropolitan area definitions in New England.

FOR ADDITIONAL INFORMATION on the covered employment and wage data, contact the Division of Administrative Statistics and Labor Turnover at (202) 691-6567.

Job Openings and Labor Turnover Survey

Description of the series

Data for the **Job Openings and Labor Turnover Survey** (JOLTS) are collected and compiled from a sample of 16,000 business establishments. Each month, data are collected for total employment, job openings, hires, quits, layoffs and discharges, and other separations. The JOLTS program covers all private nonfarm establishments such as factories, offices, and stores, as well as Federal, State, and local government entities in the 50 States and the District of Columbia. The JOLTS sample design is a random sample drawn from a universe of more than eight million establishments compiled as part of the operations of the Quarterly Census of Em-

ployment and Wages, or QCEW, program. This program includes all employers subject to State unemployment insurance (UI) laws and Federal agencies subject to Unemployment Compensation for Federal Employees (UCFE).

The sampling frame is stratified by ownership, region, industry sector, and size class. Large firms fall into the sample with virtual certainty. JOLTS total employment estimates are controlled to the employment estimates of the Current Employment Statistics (CES) survey. A ratio of CES to JOLTS employment is used to adjust the levels for all other JOLTS data elements. Rates then are computed from the adjusted levels.

The monthly JOLTS data series begin with December 2000. Not seasonally adjusted data on job openings, hires, total separations, quits, layoffs and discharges, and other separations levels and rates are available for the total nonfarm sector, 16 private industry divisions and 2 government divisions based on the North American Industry Classification System (NAICS), and four geographic regions. Seasonally adjusted data on job openings, hires, total separations, and quits levels and rates are available for the total nonfarm sector, selected industry sectors, and four geographic regions.

Definitions

Establishments submit **job openings** information for the last business day of the reference month. A job opening requires that (1) a specific position exists and there is work available for that position; and (2) work could start within 30 days regardless of whether a suitable candidate is found; and (3) the employer is actively recruiting from outside the establishment to fill the position. Included are full-time, part-time, permanent, short-term, and seasonal openings. Active recruiting means that the establishment is taking steps to fill a position by advertising in newspapers or on the Internet, posting help-wanted signs, accepting applications, or using other similar methods.

Jobs to be filled only by internal transfers, promotions, demotions, or recall from layoffs are excluded. Also excluded are jobs with start dates more than 30 days in the future, jobs for which employees have been hired but have not yet reported for work, and jobs to be filled by employees of temporary help agencies, employee leasing companies, outside contractors, or consultants. The job openings rate is computed by dividing the number of job openings by the sum of employment and job openings, and multiplying that quotient by 100.

Hires are the total number of additions

to the payroll occurring at any time during the reference month, including both new and rehired employees and full-time and part-time, permanent, short-term and seasonal employees, employees recalled to the location after a layoff lasting more than 7 days, on-call or intermittent employees who returned to work after having been formally separated, and transfers from other locations. The hires count does not include transfers or promotions within the reporting site, employees returning from strike, employees of temporary help agencies or employee leasing companies, outside contractors, or consultants. The hires rate is computed by dividing the number of hires by employment, and multiplying that quotient by 100.

Separations are the total number of terminations of employment occurring at any time during the reference month, and are reported by type of separation—quits, layoffs and discharges, and other separations. Quits are voluntary separations by employees (except for retirements, which are reported as other separations). Layoffs and discharges are involuntary separations initiated by the employer and include layoffs with no intent to rehire, formal layoffs lasting or expected to last more than 7 days, discharges resulting from mergers, downsizing, or closings, firings or other discharges for cause, terminations of permanent or short-term employees, and terminations of seasonal employees. Other separations include retirements, transfers to other locations, deaths, and separations due to disability. Separations do not include transfers within the same location or employees on strike.

The separations rate is computed by dividing the number of separations by employment, and multiplying that quotient by 100. The quits, layoffs and discharges, and other separations rates are computed similarly, dividing the number by employment and multiplying by 100.

Notes on the data

The JOLTS data series on job openings, hires, and separations are relatively new. The full sample is divided into panels, with one panel enrolled each month. A full complement of panels for the original data series based on the 1987 Standard Industrial Classification (SIC) system was not completely enrolled in the survey until January 2002. The supplemental panels of establishments needed to create NAICS estimates were not completely enrolled until May 2003. The data collected up until those points are from less than a full sample. Therefore, estimates from earlier months should be used with caution, as fewer sampled

units were reporting data at that time.

In March 2002, BLS procedures for collecting hires and separations data were revised to address possible underreporting. As a result, JOLTS hires and separations estimates for months prior to March 2002 may not be comparable with estimates for March 2002 and later.

The Federal Government reorganization that involved transferring approximately 180,000 employees to the new Department of Homeland Security is not reflected in the JOLTS hires and separations estimates for the Federal Government. The Office of Personnel Management's record shows these transfers were completed in March 2003. The inclusion of transfers in the JOLTS definitions of hires and separations is intended to cover ongoing movements of workers between establishments. The Department of Homeland Security reorganization was a massive one-time event, and the inclusion of these intergovernmental transfers would distort the Federal Government time series.

Data users should note that seasonal adjustment of the JOLTS series is conducted with fewer data observations than is customary. The historical data, therefore, may be subject to larger than normal revisions. Because the seasonal patterns in economic data series typically emerge over time, the standard use of moving averages as seasonal filters to capture these effects requires longer series than are currently available. As a result, the stable seasonal filter option is used in the seasonal adjustment of the JOLTS data. When calculating seasonal factors, this filter takes an average for each calendar month after detrending the series. The stable seasonal filter assumes that the seasonal factors are fixed; a necessary assumption until sufficient data are available. When the stable seasonal filter is no longer needed, other program features also may be introduced, such as outlier adjustment and extended diagnostic testing. Additionally, it is expected that more series, such as layoffs and discharges and additional industries, may be seasonally adjusted when more data are available.

JOLTS hires and separations estimates cannot be used to exactly explain net changes in payroll employment. Some reasons why it is problematic to compare changes in payroll employment with JOLTS hires and separations, especially on a monthly basis, are: (1) the reference period for payroll employment is the pay period including the 12th of the month, while the reference period for hires and separations is the calendar month; and (2) payroll employment can vary from month to month simply because part-time and on-call workers may not always work during

the pay period that includes the 12th of the month. Additionally, research has found that some reporters systematically underreport separations relative to hires due to a number of factors, including the nature of their payroll systems and practices. The shortfall appears to be about 2 percent or less over a 12-month period.

FOR ADDITIONAL INFORMATION on the Job Openings and Labor Turnover Survey, contact the Division of Administrative Statistics and Labor Turnover at (202) 961-5870.

Compensation and Wage Data

(Tables 1-3; 30-37)

The National Compensation Survey (NCS) produces a variety of compensation data. These include: The Employment Cost Index (ECI) and NCS benefit measures of the incidence and provisions of selected employee benefit plans. Selected samples of these measures appear in the following tables. NCS also compiles data on occupational wages and the Employer Costs for Employee Compensation (ECEC).

Employment Cost Index

Description of the series

The **Employment Cost Index** (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It is a Laspeyres Index that uses fixed employment weights to measure change in labor costs free from the influence of employment shifts among occupations and industries.

The ECI provides data for the civilian economy, which includes the total private nonfarm economy excluding private households, and the public sector excluding the Federal government. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Sample establishments are classified by industry categories based on the 2002 North American Classification System (NAICS). Within a sample establishment, specific job categories are selected and classified into about 800 occupations according to the 2000 Standard Occupational Classification (SOC) System. Individual occupations are combined to represent one of ten intermediate aggregations, such as professional and related occupations, or one of five higher level aggre-

gations, such as management, professional, and related occupations.

Fixed employment weights are used each quarter to calculate the most aggregate series—civilian, private, and State and local government. These fixed weights are also used to derive all of the industry and occupational series indexes. Beginning with the March 2006 estimates, 2002 fixed employment weights from the Bureau's Occupational Employment Statistics survey were introduced. From March 1995 to December 2005, 1990 employment counts were used. These fixed weights ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the series based on bargaining status, census region and division, and metropolitan area status, fixed employment data are not available. The employment weights are reallocated within these series each quarter based on the current ECI sample. The indexes for these series, consequently, are not strictly comparable with those for aggregate, occupational, and industry series.

Definitions

Total compensation costs include wages, salaries, and the employer's costs for employee benefits.

Wages and salaries consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

Benefits include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as Social Security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as payment-in-kind, free room and board, and tips.

Notes on the data

The ECI data in these tables reflect the conversion to the 2002 North American Industry Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. ECI series based on NAICS and SOC became the official BLS estimates starting in March 2006.

The ECI for changes in wages and salaries in the private nonfarm economy was published beginning in 1975. Changes in total compensation cost—wages and salaries and

benefits combined—were published beginning in 1980. The series of changes in wages and salaries and for total compensation in the State and local government sector and in the civilian nonfarm economy (excluding Federal employees) were published beginning in 1981. Historical indexes (December 2005=100) are available on the Internet: www.bls.gov/ect/

ADDITIONAL INFORMATION on the Employment Cost Index is available at www.bls.gov/ncs/ect/home.htm or by telephone at (202) 691-6199.

National Compensation Survey Benefit Measures

Description of the series

NCS benefit measures of employee benefits are published in two separate reports. The annual summary provides data on the incidence of (access to and participation in) selected benefits and provisions of paid holidays and vacations, life insurance plans, and other selected benefit programs. Data on percentages of establishments offering major employee benefits, and on the employer and employee shares of contributions to medical care premiums also are presented. Selected benefit data appear in the following tables. A second publication, published later, contains more detailed information about health and retirement plans.

Definitions

Employer-provided benefits are benefits that are financed either wholly or partly by the employer. They may be sponsored by a union or other third party, as long as there is some employer financing. However, some benefits that are fully paid for by the employee also are included. For example, long-term care insurance paid entirely by the employee are included because the guarantee of insurability and availability at group premium rates are considered a benefit.

Employees are considered as having access to a benefit plan if it is available for their use. For example, if an employee is permitted to participate in a medical care plan offered by the employer, but the employee declines to do so, he or she is placed in the category with those having access to medical care.

Employees in contributory plans are considered as **participating** in an insurance or retirement plan if they have paid required contributions and fulfilled any applicable service requirement. Employees in noncontributory plans are counted as participating

regardless of whether they have fulfilled the service requirements.

Defined benefit pension plans use predetermined formulas to calculate a retirement benefit (if any), and obligate the employer to provide those benefits. Benefits are generally based on salary, years of service, or both.

Defined contribution plans generally specify the level of employer and employee contributions to a plan, but not the formula for determining eventual benefits. Instead, individual accounts are set up for participants, and benefits are based on amounts credited to these accounts.

Tax-deferred savings plans are a type of defined contribution plan that allow participants to contribute a portion of their salary to an employer-sponsored plan and defer income taxes until withdrawal.

Flexible benefit plans allow employees to choose among several benefits, such as life insurance, medical care, and vacation days, and among several levels of coverage within a given benefit.

Notes on the data

ADDITIONAL INFORMATION ON THE NCS benefit measures is available at www.bls.gov/ncs/ebs/home.htm or by telephone at (202) 691-6199.

Work stoppages

Description of the series

Data on work stoppages measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of work time lost because of stoppage. These data are presented in table 37.

Data are largely from a variety of published sources and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

Definitions

Number of stoppages: The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

Workers involved: The number of workers directly involved in the stoppage.

Number of days idle: The aggregate number of workdays lost by workers involved in the stoppages.

Days of idleness as a percent of esti-

mated working time: Aggregate workdays lost as a percent of the aggregate number of standard workdays in the period multiplied by total employment in the period.

Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

ADDITIONAL INFORMATION on work stop-pages data is available at www.bls.gov/cba/home.htm or by telephone at (202) 691-6199.

Price Data

(Tables 2; 38-46)

Price data are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period—December 2003 = 100 for many Producer Price Indexes (unless otherwise noted), 1982-84 = 100 for many Consumer Price Indexes (unless otherwise noted), and 1990 = 100 for International Price Indexes.

Consumer Price Indexes

Description of the series

The **Consumer Price Index** (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI-W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all-urban consumer index (CPI-U), introduced in 1978, is representative of the 1993-95 buying habits of about 87 percent of the noninstitutional population of the United States at that time, compared with 32 percent represented in the CPI-W. In addition to wage earners and clerical workers, the CPI-U covers professional, managerial, and technical workers, the self-employed, short-term workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors'

and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items are kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 23,000 retail establishments and 5,800 housing units in 87 urban areas across the country are used to develop the "U.S. city average." Separate estimates for 14 major urban centers are presented in table 39. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are measured for the CPI-U. A rental equivalence method replaced the asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes. An updated CPI-U and CPI-W were introduced with release of the January 1987 and January 1998 data.

FOR ADDITIONAL INFORMATION, contact the Division of Prices and Price Indexes: (202) 691-7000.

Producer Price Indexes

Description of the series

Producer Price Indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 80,000 quotations per month, selected to represent the movement of prices of all commodities produced in the manufacturing; agriculture, forestry, and fishing; mining; and gas and electricity and public utilities sectors. The stage-of-processing structure of PPI organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end use or material composition. The industry and product structure of PPI organizes data in accordance with the 2002 North American Industry Classification System and product codes developed by the U.S. Census Bureau.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1992, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1987. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

FOR ADDITIONAL INFORMATION, contact the Division of Industrial Prices and Price Indexes: (202) 691-7705.

International Price Indexes

Description of the series

The **International Price Program** produces monthly and quarterly export and import price indexes for nonmilitary goods and services traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts; it includes corporations, businesses, and individuals, but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected primarily by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S. border for imports. For nearly all products, the prices refer to transactions completed during the first week of the month. Survey respondents are asked to indicate all discounts, allow-

ances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined according to the five-digit level of detail for the Bureau of Economic Analysis End-use Classification, the three-digit level for the Standard International Trade Classification (SITC), and the four-digit level of detail for the Harmonized System. Aggregate import indexes by country or region of origin are also available.

BLS publishes indexes for selected categories of internationally traded services, calculated on an international basis and on a balance-of-payments basis.

Notes on the data

The export and import price indexes are weighted indexes of the Laspeyres type. The trade weights currently used to compute both indexes relate to 2000.

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

FOR ADDITIONAL INFORMATION, contact the Division of International Prices: (202) 691-7155.

Productivity Data

(Tables 2; 47-50)

Business and major sectors

Description of the series

The productivity measures relate real output to real input. As such, they encompass a family of measures which include single-factor input measures, such as output per hour, output per unit of labor input, or output per unit of capital input, as well as measures of

multifactor productivity (output per unit of combined labor and capital inputs). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

Definitions

Output per hour of all persons (labor productivity) is the quantity of goods and services produced per hour of labor input.

Output per unit of capital services (capital productivity) is the quantity of goods and services produced per unit of capital services input. **Multifactor productivity** is the quantity of goods and services produced per combined inputs. For private business and private nonfarm business, inputs include labor and capital units. For manufacturing, inputs include labor, capital, energy, nonenergy materials, and purchased business services.

Compensation per hour is total compensation divided by hours at work. Total compensation equals the wages and salaries of employees plus employers' contributions for social insurance and private benefit plans, plus an estimate of these payments for the self-employed (except for nonfinancial corporations in which there are no self-employed). **Real compensation per hour** is compensation per hour deflated by the change in the Consumer Price Index for All Urban Consumers.

Unit labor costs are the labor compensation costs expended in the production of a unit of output and are derived by dividing compensation by output. **Unit nonlabor payments** include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current-dollar value of output and dividing by output.

Unit nonlabor costs contain all the components of unit nonlabor payments except unit profits.

Unit profits include corporate profits with inventory valuation and capital consumption adjustments per unit of output.

Hours of all persons are the total hours at work of payroll workers, self-employed persons, and unpaid family workers.

Labor inputs are hours of all persons adjusted for the effects of changes in the education and experience of the labor force.

Capital services are the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures,

land, and inventories—weighted by rental prices for each type of asset.

Combined units of labor and capital inputs are derived by combining changes in labor and capital input with weights which represent each component's share of total cost. Combined units of labor, capital, energy, materials, and purchased business services are similarly derived by combining changes in each input with weights that represent each input's share of total costs. The indexes for each input and for combined units are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

Notes on the data

Business sector output is an annually-weighted index constructed by excluding from real gross domestic product (GDP) the following outputs: general government, nonprofit institutions, paid employees of private households, and the rental value of owner-occupied dwellings. Nonfarm business also excludes farming. Private business and private nonfarm business further exclude government enterprises. The measures are supplied by the U.S. Department of Commerce's Bureau of Economic Analysis. Annual estimates of manufacturing sectoral output are produced by the Bureau of Labor Statistics. Quarterly manufacturing output indexes from the Federal Reserve Board are adjusted to these annual output measures by the BLS. Compensation data are developed from data of the Bureau of Economic Analysis and the Bureau of Labor Statistics. Hours data are developed from data of the Bureau of Labor Statistics.

The productivity and associated cost measures in tables 47-50 describe the relationship between output in real terms and the labor and capital inputs involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input.

Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; shifts in the composition of the labor force; capital investment; level of output; changes in the utilization of capacity, energy, material, and research and development; the organization of production; managerial skill; and characteristics and efforts of the work force.

FOR ADDITIONAL INFORMATION on this productivity series, contact the Division of Productivity Research: (202) 691-5606.

Industry productivity measures

Description of the series

The BLS industry productivity indexes measure the relationship between output and inputs for selected industries and industry groups, and thus reflect trends in industry efficiency over time. Industry measures include labor productivity, multifactor productivity, compensation, and unit labor costs.

The industry measures differ in methodology and data sources from the productivity measures for the major sectors because the industry measures are developed independently of the National Income and Product Accounts framework used for the major sector measures.

Definitions

Output per hour is derived by dividing an index of industry output by an index of labor input. For most industries, **output** indexes are derived from data on the value of industry output adjusted for price change. For the remaining industries, output indexes are derived from data on the physical quantity of production.

The **labor input** series is based on the hours of all workers or, in the case of some transportation industries, on the number of employees. For most industries, the series consists of the hours of all employees. For some trade and services industries, the series also includes the hours of partners, proprietors, and unpaid family workers.

Unit labor costs represent the labor compensation costs per unit of output produced, and are derived by dividing an index of labor compensation by an index of output. **Labor compensation** includes payroll as well as supplemental payments, including both legally required expenditures and payments for voluntary programs.

Multifactor productivity is derived by dividing an index of industry output by an index of combined inputs consumed in producing that output. **Combined inputs** include capital, labor, and intermediate purchases. The measure of **capital input** represents the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories. The measure of **intermediate purchases** is a combination of purchased materials, services, fuels, and electricity.

Notes on the data

The industry measures are compiled from

data produced by the Bureau of Labor Statistics and the Census Bureau, with additional data supplied by other government agencies, trade associations, and other sources.

FOR ADDITIONAL INFORMATION on this series, contact the Division of Industry Productivity Studies: (202) 691-5618, or visit the Web site at: www.bls.gov/lpc/home.htm

International Comparisons

(Tables 51–53)

Labor force and unemployment

Description of the series

Tables 51 and 52 present comparative measures of the labor force, employment, and unemployment approximating U.S. concepts for the United States, Canada, Australia, Japan, and six European countries. The Bureau adjusts the figures for these selected countries, for all known major definitional differences, to the extent that data to prepare adjustments are available. Although precise comparability may not be achieved, these adjusted figures provide a better basis for international comparisons than the figures regularly published by each country. For further information on adjustments and comparability issues, see Constance Sorrentino, “International unemployment rates: how comparable are they?” *Monthly Labor Review*, June 2000, pp. 3–20, available on the Internet at www.bls.gov/pub/mlr/2000/06/art1full.pdf.

Definitions

For the principal U.S. definitions of the labor force, employment, and unemployment, see the Notes section on Employment and Unemployment Data: Household survey data.

Notes on the data

Foreign country data are adjusted as closely as possible to the U.S. definitions. Primary areas of adjustment address conceptual differences in upper age limits and definitions of employment and unemployment, provided that reliable data are available to make these adjustments. Adjustments are made where applicable to include employed and unemployed persons above upper age limits; some European countries do not include persons older than age 64 in their labor force measures, because a large portion of this population has retired. Adjustments are made to exclude active duty military from employment figures, although a small

number of career military may be included in some European countries. Adjustments are made to exclude unpaid family workers who worked fewer than 15 hours per week from employment figures; U.S. concepts do not include them in employment, whereas most foreign countries include all unpaid family workers regardless of the number of hours worked. Adjustments are made to include full-time students seeking work and available for work as unemployed when they are classified as not in the labor force.

Where possible, lower age limits are based on the age at which compulsory schooling ends in each country, rather than based on the U.S. standard of 16. Lower age limits have ranged between 13 and 16 over the years covered; currently, the lower age limits are either 15 or 16 in all 10 countries.

Some adjustments for comparability are not made because data are unavailable for adjustment purposes. For example, no adjustments to unemployment are usually made for deviations from U.S. concepts in the treatment of persons waiting to start a new job or passive job seekers. These conceptual differences have little impact on the measures. Furthermore, BLS studies have concluded that no adjustments should be made for persons on layoff who are counted as employed in some countries because of their strong job attachment as evidenced by, for example, payment of salary or the existence of a recall date. In the United States, persons on layoff have weaker job attachment and are classified as unemployed.

The annual labor force measures are obtained from monthly, quarterly, or continuous household surveys and may be calculated as averages of monthly or quarterly data. Quarterly and monthly unemployment rates are based on household surveys. For some countries, they are calculated by applying annual adjustment factors to current published data and, therefore, are less precise indicators of unemployment under U.S. concepts than the annual figures. The labor force measures may have breaks in series over time due to changes in surveys, sources, or estimation methods. Breaks are noted in data tables.

For up-to-date information on adjustments and breaks in series, see the Technical Notes of *Comparative Civilian Labor Force Statistics, 10 Countries*, on the Internet at www.bls.gov/fls/flscomparelf.htm, and the Notes of *Unemployment rates in 10 countries, civilian labor force basis, approximating U.S. concepts, seasonally adjusted*, on the Internet at www.bls.gov/fls/flsjec.pdf.

FOR ADDITIONAL INFORMATION on this series, contact the Division of Foreign Labor Statistics: (202) 691-5654 or flshelp@bls.gov.

Manufacturing productivity and labor costs

Description of the series

Table 53 presents comparative indexes of manufacturing output per hour (labor productivity), output, total hours, compensation per hour, and unit labor costs for the United States, Australia, Canada, Japan, the Republic of Korea, Singapore, Taiwan, and 10 European countries. These measures are trend comparisons—that is, series that measure changes over time—rather than level comparisons. BLS does *not* recommend using these series for level comparisons because of technical problems.

BLS constructs the comparative indexes from three basic aggregate measures—output, total labor hours, and total compensation. The hours and compensation measures refer to employees (wage and salary earners) in Belgium and Taiwan. For all other economies, the measures refer to all employed persons, including employees, self-employed persons, and unpaid family workers.

The data for recent years are based on the United Nations System of National Accounts 1993 (SNA 93). Manufacturing is generally defined according to the International Standard Industrial Classification (ISIC). However, the measures for France include parts of mining as well. For the United States and Canada, manufacturing is defined according to the North American Industry Classification System (NAICS 97).

Definitions

Output. For most economies, the output measures are real value added in manufacturing from national accounts. However, output for Japan prior to 1970 and for the Netherlands prior to 1960 are indexes of industrial production. The manufacturing value added measures for the United Kingdom are essentially identical to their indexes of industrial production.

For United States, the output measure for the manufacturing sector is a chain-weighted index of real gross product originating (deflated value added) produced by the Bureau of Economic Analysis of the U.S. Department of Commerce. Most of the other economies now also use chain-weighted as opposed to fixed-year weights that are periodically updated.

To preserve the comparability of the U.S. measures with those of other economies, BLS uses gross product originating in manufacturing for the United States. The gross product originating series differs from the manufacturing output series that BLS pub-

lishes in its quarterly news releases on U.S. productivity and costs (and that underlies the measures that appear in tables 48 and 50 in this section). The quarterly measures are on a “sectoral output” basis, rather than a value-added basis. Sectoral output is gross output less intrasector transactions.

Total hours refer to hours worked in all economies. The measures are developed from statistics of manufacturing employment and average hours. For most other economies, recent years’ aggregate hours series are obtained from national statistical offices, usually from national accounts. However, for some economies and for earlier years, BLS calculates the aggregate hours series using employment figures published with the national accounts, or other comprehensive employment series, and data on average hours worked.

Hourly compensation is total compensation divided by total hours. Total compensation includes all payments in cash or in-kind made directly to employees plus employer expenditures for legally required insurance programs and contractual and private benefit plans. For Australia, Canada, France, Singapore, and Sweden, compensation is increased to account for important taxes on payroll or employment. For the United Kingdom, compensation is reduced between 1967 and 1991 to account for subsidies.

Labor productivity is defined as real output per hour worked. Although the labor productivity measure presented in this release relates output to the hours worked of persons employed in manufacturing, it does not measure the specific contributions of labor as a single factor of production. Rather, it reflects the joint effects of many influences, including new technology, capital investment, capacity utilization, energy use, and managerial skills, as well as the skills and efforts of the workforce.

Unit labor costs are defined as the cost of labor input required to produce one unit of output. They are computed as compensation in nominal terms divided by real output. Unit labor costs can also be computed by dividing hourly compensation by output per hour, that is, by labor productivity.

Notes on the data

The measures for recent years may be based on current indicators of manufacturing output (such as industrial production indexes), employment, average hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available.

sion of International Labor Comparison at (202) 691-5654.

Occupational Injury and Illness Data

(Tables 54–55)

Survey of Occupational Injuries and Illnesses

Description of the series

The Survey of Occupational Injuries and Illnesses collects data from employers about their workers’ job-related nonfatal injuries and illnesses. The information that employers provide is based on records that they maintain under the Occupational Safety and Health Act of 1970. Self-employed individuals, farms with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies are excluded from the survey.

The survey is a Federal-State cooperative program with an independent sample selected for each participating State. A stratified random sample with a Neyman allocation is selected to represent all private industries in the State. The survey is stratified by Standard Industrial Classification and size of employment.

Definitions

Under the Occupational Safety and Health Act, employers maintain records of nonfatal work-related injuries and illnesses that involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment other than first aid.

Occupational injury is any injury such as a cut, fracture, sprain, or amputation that results from a work-related event or a single, instantaneous exposure in the work environment.

Occupational illness is an abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

Lost workday injuries and illnesses are cases that involve days away from work, or days of restricted work activity, or both.

Lost workdays include the number of workdays (consecutive or not) on which the employee was either away from work or at work in some restricted capacity, or both,

because of an occupational injury or illness. BLS measures of the number and incidence rate of lost workdays were discontinued beginning with the 1993 survey. The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked, such as a Federal holiday, even though able to work.

Incidence rates are computed as the number of injuries and/or illnesses or lost work days per 100 full-time workers.

Notes on the data

The definitions of occupational injuries and illnesses are from *Recordkeeping Guidelines for Occupational Injuries and Illnesses* (U.S. Department of Labor, Bureau of Labor Statistics, September 1986).

Estimates are made for industries and employment size classes for total recordable cases, lost workday cases, days away from work cases, and nonfatal cases without lost workdays. These data also are shown separately for injuries. Illness data are available for seven categories: occupational skin diseases or disorders, dust diseases of the lungs, respiratory conditions due to toxic agents, poisoning (systemic effects of toxic agents), disorders due to physical agents (other than toxic materials), disorders associated with repeated trauma, and all other occupational illnesses.

The survey continues to measure the number of new work-related illness cases which are recognized, diagnosed, and reported during the year. Some conditions, for example, long-term latent illnesses caused by exposure to carcinogens, often are difficult to relate to the workplace and are not adequately recognized and reported. These long-term latent illnesses are believed to be understated in the survey's illness measure. In contrast, the overwhelming majority of the reported new illnesses are those which are easier to directly relate to workplace activity (for example, contact dermatitis and carpal tunnel syndrome).

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses per 100 equivalent

full-time workers. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Full detail on the available measures is presented in the annual bulletin, *Occupational Injuries and Illnesses: Counts, Rates, and Characteristics*.

Comparable data for more than 40 States and territories are available from the BLS Office of Safety, Health and Working Conditions. Many of these States publish data on State and local government employees in addition to private industry data.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration. Data from these organizations are included in both the national and State data published annually.

With the 1992 survey, BLS began publishing details on serious, nonfatal incidents resulting in days away from work. Included are some major characteristics of the injured and ill workers, such as occupation, age, gender, race, and length of service, as well as the circumstances of their injuries and illnesses (nature of the disabling condition, part of body affected, event and exposure, and the source directly producing the condition). In general, these data are available nationwide for detailed industries and for individual States at more aggregated industry levels.

FOR ADDITIONAL INFORMATION on occupational injuries and illnesses, contact the Office of Occupational Safety, Health and Working Conditions at (202) 691-6180, or access the Internet at: www.bls.gov/iif/

Census of Fatal Occupational Injuries

The Census of Fatal Occupational Injuries compiles a complete roster of fatal job-related injuries, including detailed data about the fatally injured workers and the fatal events. The program collects and cross checks fatality information from multiple sources, including death certificates, State and Federal workers' compensation reports, Occupational Safety and Health Administration and Mine Safety

and Health Administration records, medical examiner and autopsy reports, media accounts, State motor vehicle fatality records, and follow-up questionnaires to employers.

In addition to private wage and salary workers, the self-employed, family members, and Federal, State, and local government workers are covered by the program. To be included in the fatality census, the decedent must have been employed (that is working for pay, compensation, or profit) at the time of the event, engaged in a legal work activity, or present at the site of the incident as a requirement of his or her job.

Definition

A fatal work injury is any intentional or unintentional wound or damage to the body resulting in death from acute exposure to energy, such as heat or electricity, or kinetic energy from a crash, or from the absence of such essentials as heat or oxygen caused by a specific event or incident or series of events within a single workday or shift. Fatalities that occur during a person's commute to or from work are excluded from the census, as well as work-related illnesses, which can be difficult to identify due to long latency periods.

Notes on the data

Twenty-eight data elements are collected, coded, and tabulated in the fatality program, including information about the fatally injured worker, the fatal incident, and the machinery or equipment involved. Summary worker demographic data and event characteristics are included in a national news release that is available about 8 months after the end of the reference year. The Census of Fatal Occupational Injuries was initiated in 1992 as a joint Federal-State effort. Most States issue summary information at the time of the national news release.

FOR ADDITIONAL INFORMATION on the Census of Fatal Occupational Injuries contact the BLS Office of Safety, Health, and Working Conditions at (202) 691-6175, or the Internet at: www.bls.gov/iif/

¹ Quarterly data seasonally adjusted.

² Annual changes are December-to-December changes. Quarterly changes are calculated using the last month of each quarter.

³ The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

⁴ Excludes Federal and private household workers.

⁵ Goods-producing industries include mining, construction, and manufacturing. Service-providing industries include all other private sector industries.

NOTE: Beginning in January 2003, household survey data reflect revised population controls. Nonfarm data reflect the conversion to the 2002 version of the North American Industry Classification System (NAICS), replacing the Standard Industrial Classification (SIC) system. NAICS-based data by industry are not comparable with SIC based data.

¹ The population figures are not seasonally adjusted.

² Civilian employment as a percent of the civilian noninstitutional population.

³ Beginning in 2003, persons who selected this race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race.

NOTE: Estimates for the above race groups (white and black or African American) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race. Beginning in January 2003, data reflect revised population controls used in the household survey.

2009.....	8.4	4.8	4.8	4.8	6.0	6.0	6.6	4.8	4.8			

NOTE: Figures are the percent of industries with employment increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.

See the "Definitions" in this section. See "Notes on the data" for a description of the most recent benchmark revision.

Data for the two most recent months are preliminary.

¹ Includes workers covered by Unemployment Insurance (UI) and Unemployment Compensation for Federal Employees (UCFE) programs.

² Includes data for Metropolitan Statistical Areas (MSA) as defined by OMB Bulletin No. 04-03 as of February 18, 2004.

³ Each year's total is based on the MSA definition for the specific year. Annual changes include differences resulting from changes in MSA definitions.

⁴ Totals do not include the six MSAs within Puerto Rico.

27. Annual data: Employment status of the population

[Numbers in thousands]

¹ Cost (cents per hour worked) measured in the Employment Cost Index consists of wages, salaries, and employer cost of employee benefits.

² Consists of private industry workers (excluding farm and household workers) and State and local government (excluding Federal Government) workers.

³ Consists of legislative, judicial, administrative, and regulatory activities.

NOTE: The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

¹ The 2002 North American Industry Classification System (NAICS) replaced the 1987 Standard Industrial Classification (SIC) System. Estimates for goods-producing and service-providing (formerly service-producing) industries are considered comparable. Also introduced was the 2000 Standard Occupational Classification (SOC) to replace the 1990 Census of Population system. Only service occupations are considered comparable.

² The white-collar and blue-collar occupation series were discontinued effective 2007.

³ The take-up rate is an estimate of the percentage of workers with access to a plan who participate in the plan.

Note: Where applicable, dashes indicate no employees in this category or data do not meet publication criteria.

¹ Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:

M—Every month.
¹—January, March, May, July, September, and November.
²—February, April, June, August, October, and December.

² Regions defined as the four Census regions.

³ Indexes on a December 1996 = 100 base.

⁴ The "North Central" region has been renamed the "Midwest" region by the Census Bureau. It is composed of the same geographic entities.

⁵ Indexes on a December 1986 = 100 base.

⁶ In addition, the following metropolitan areas are published semiannually and appear in tables 34 and 39 of the January and July issues of the *CPI Detailed*

Report: Anchorage, AK; Cincinnati, OH—KY—IN; Kansas City, MO—KS; Milwaukee—Racine, WI; Minneapolis—St. Paul, MN—WI; Pittsburgh, PA; Portland—Salem, OR—WA; St. Louis, MO—IL; San Diego, CA; Tampa—St. Petersburg—Clearwater, FL.

⁷ Indexes on a November 1996 = 100 base.

NOTE: Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller sample size and is, therefore, subject to substantially more sampling and other measurement error. As a result, local area indexes show greater volatility than the national index, although their long-term trends are similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in their escalator clauses. Index applies to a month as a whole, not to any specific date. Dash indicates data not available.

41. Producer Price Indexes, by stage of processing

[1982 = 100]

Grouping	Annual average		2008				2009								
	2007	2008	Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June ^P	July ^P	Aug. ^P	Sept. ^P
Finished goods.....	166.6	177.1	182.2	177.4	172.0	168.8	170.4	169.9	169.1	170.3	171.1	174.3	172.6	174.3	173.4
Finished consumer goods.....	173.5	186.3	193.0	185.5	178.2	173.7	175.8	175.2	174.2	176.0	177.3	181.7	179.6	181.8	180.6
Finished consumer foods.....	167.0	178.3	181.5	180.7	179.8	177.7	177.7	175.0	173.8	175.9	174.0	176.1	173.4	173.9	173.9
Finished consumer goods excluding foods.....	175.6	189.1	197.2	187.0	177.0	171.5	174.4	174.5	173.5	175.2	177.5	182.7	180.7	183.5	181.9
Nondurable goods less food.....	191.7	210.5	223.4	205.4	190.6	182.1	186.5	186.6	185.2	187.7	191.2	198.7	196.5	200.6	198.4
Durable goods.....	138.3	141.2	140.3	144.8	144.2	144.4	144.3	144.3	144.1	144.4	144.2	144.7	143.3	143.7	143.1
Capital equipment.....	149.5	153.8	154.3	157.0	156.9	157.2	157.4	157.2	156.9	156.8	156.3	156.6	156.0	156.4	156.1
Intermediate materials, supplies, and components.....	170.7	188.3	198.6	189.0	179.2	171.6	171.4	169.7	168.0	168.6	170.2	172.7	172.4	174.9	175.3
Materials and components for manufacturing.....	162.4	177.2	186.7	180.3	171.1	163.7	162.7	161.0	159.5	158.9	160.1	160.9	161.4	163.7	165.6
Materials for food manufacturing.....	161.4	180.4	185.2	179.4	175.5	170.8	167.3	164.3	163.2	164.2	166.2	166.0	163.4	164.0	164.4
Materials for nondurable manufacturing...	184.0	214.3	234.7	222.4	200.6	185.0	186.8	185.6	182.3	182.6	187.4	190.1	191.8	195.7	199.3
Materials for durable manufacturing.....	189.8	203.3	214.5	202.2	190.0	178.6	172.8	168.2	165.8	163.2	162.1	162.7	163.7	169.0	173.7
Components for manufacturing.....	136.3	140.3	142.4	142.5	142.3	141.9	141.7	141.5	141.3	140.8	140.8	140.7	140.6	140.9	141.0
Materials and components for construction.....	192.5	205.4	214.0	212.2	210.2	207.9	207.0	204.8	204.2	203.2	202.8	202.0	201.7	201.6	201.8
Processed fuels and lubricants.....	173.9	206.2	224.5	193.9	168.7	151.2	153.4	150.7	146.5	151.4	156.5	167.0	165.2	172.6	170.0
Containers.....	180.3	191.8	198.4	199.1	199.0	198.1	200.8	199.5	198.4	197.6	196.1	195.4	194.5	193.3	193.5
Supplies.....	161.7	173.8	179.0	177.0	175.3	173.4	172.9	172.3	171.9	172.0	172.3	172.8	172.2	172.1	172.1
Crude materials for further processing.....	207.1	251.8	254.2	212.0	183.3	172.6	170.2	160.7	160.1	163.9	171.5	179.8	172.8	178.0	174.1
Foodstuffs and feedstuffs.....	146.7	163.4	167.6	147.9	144.2	135.5	136.1	133.3	131.0	136.5	140.5	141.0	133.2	129.8	127.3
Crude nonfood materials.....	246.3	313.9	314.2	253.9	203.2	191.6	186.5	171.5	172.6	174.6	184.7	199.8	194.3	207.2	202.3
Special groupings:															
Finished goods, excluding foods.....	166.2	176.6	182.1	176.3	169.6	166.1	168.0	168.0	167.2	168.3	169.7	173.1	171.7	173.6	172.5
Finished energy goods.....	156.3	178.7	197.0	167.8	144.1	130.6	136.4	136.3	133.2	137.2	142.9	154.4	150.5	156.6	153.5
Finished goods less energy.....	162.8	169.8	171.2	173.1	172.7	172.3	172.7	172.1	171.9	172.4	171.7	172.4	171.5	171.8	171.5
Finished consumer goods less energy.....	168.7	176.9	178.7	180.2	179.7	179.0	179.4	178.6	178.5	179.2	178.5	179.4	178.3	178.6	178.3
Finished goods less food and energy.....	161.7	167.2	167.9	170.8	170.6	170.8	171.3	171.3	171.4	171.4	171.1	171.4	171.0	171.2	170.9
Finished consumer goods less food and energy.....	170.0	176.4	177.2	180.2	180.0	180.1	180.7	181.0	181.4	181.5	181.3	181.7	181.4	181.5	181.1
Consumer nondurable goods less food and energy.....	197.0	206.8	209.7	210.7	210.9	211.0	212.4	212.9	214.0	213.8	213.7	213.9	214.8	214.7	214.6
Intermediate materials less foods and feeds.....	171.5	188.7	199.1	189.5	179.4	171.8	171.8	170.1	168.4	168.9	170.4	172.9	172.8	175.5	176.1
Intermediate foods and feeds.....	154.4	181.6	190.0	179.9	174.7	167.9	165.8	164.6	163.5	164.5	167.3	169.3	166.4	166.8	165.7
Intermediate energy goods.....	174.6	208.1	227.5	197.4	167.3	147.7	152.2	149.3	144.1	149.5	157.2	167.8	166.4	174.9	172.0
Intermediate goods less energy.....	167.6	180.9	188.8	184.5	179.8	175.3	174.0	172.7	171.9	171.2	171.3	171.8	171.7	172.6	173.9
Intermediate materials less foods and energy.....	168.4	180.9	188.8	184.8	180.2	175.9	174.6	173.4	172.6	171.8	171.6	171.9	172.2	173.2	174.7
Crude energy materials.....	232.8	309.4	303.7	244.4	194.9	181.1	173.0	152.1	153.3	155.0	164.2	181.2	172.5	184.2	174.3
Crude materials less energy.....	182.6	205.4	211.7	182.0	167.6	159.8	161.2	158.8	156.4	161.2	166.9	168.9	163.5	163.8	163.7
Crude nonfood materials less energy.....	282.6	324.4	337.5	276.7	224.8	221.3	225.2	224.9	222.9	224.4	234.9	242.6	247.6	262.0	271.1

p = preliminary.

42. Producer Price Indexes for the net output of major industry groups

[December 2003 = 100, unless otherwise indicated]

NAICS	Industry	2008				2009								
		Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June ^P	July ^P	Aug. ^P	Sept. ^P

Quarterly figures for France, Germany, Italy, and the Netherlands are calculated by applying annual adjustment factors to current published data and therefore should be viewed as less precise indicators of unemployment under U.S. concepts than the annual figures. For further qualifications and historical annual data, see the BLS report *International Comparisons of Annual Labor Force Statistics, Adjusted to U.S. Concepts, 10 Countries* (on the internet at <http://www.bls.gov/flscompare.htm>).

For monthly unemployment rates, as well as the quarterly and annual rates published in this table, see the BLS report *International Unemployment Rates and Employment Indexes, Seasonally Adjusted* (on the Internet at http://www.bls.gov/ilc/intl_unemployment_rates_monthly.htm). Unemployment rates may differ between the two reports mentioned, because the former is updated annually, whereas the latter is updated monthly and reflects the most recent revisions in source data.

52. Annual data: employment status of the working-age population, adjusted to U.S. concepts, 10 countries

¹ Labor force as a percent of the working-age population.

² Employment as a percent of the working-age population.

³ Unemployment as a percent of the labor force.

NOTE: There are breaks in series for the United States (1999, 2000, 2003, 2004), Australia (2001), France (2003), Germany (1999, 2005), the Netherlands (2000, 2003), and Sweden (2005). For further qualifications and historical annual data, see the BLS

report *International Comparisons of Annual Labor Force Statistics, Adjusted to U.S. Concepts, 10 Countries* (on the internet at <http://www.bls.gov/flsccomparelf.htm>). Unemployment rates may differ from those in the BLS report *International Unemployment Rates and Employment Indexes, Seasonally Adjusted* (on the Internet at http://www.bls.gov/intl_unemployment_rates_monthly.htm), because the former is updated annually, whereas the latter is updated monthly and reflects the most recent revisions in source data.

53. Annual indexes of manufacturing productivity and related measures, 17 economies

[2002 = 100]

¹ Data for 1989 and subsequent years are based on the *Standard Industrial Classification Manual*, 1987 Edition. For this reason, they are not strictly comparable with data for the years 1985-88, which were based on the *Standard Industrial Classification Manual*, 1972 Edition, 1977 Supplement.

² Beginning with the 1992 survey, the annual survey measures only nonfatal injuries and illnesses, while past surveys covered both fatal and nonfatal incidents. To better address fatalities, a basic element of workplace safety, BLS implemented the Census of Fatal Occupational Injuries.

³ The incidence rates represent the number of injuries and illnesses or lost workdays per 100 full-time workers and were calculated as (N/EH) X 200,000, where:

N = number of injuries and illnesses or lost workdays;

EH = total hours worked by all employees during the calendar year; and 200,000 = base for 100 full-time equivalent workers (working 40 hours per week, 50 weeks per year).

⁴ Beginning with the 1993 survey, lost workday estimates will not be generated. As of 1992, BLS began generating percent distributions and the median number of days away from work by industry and for groups of workers sustaining similar work disabilities.

⁵ Excludes farms with fewer than 11 employees since 1976.

NOTE: Dash indicates data not available.

55. Fatal occupational injuries by event or exposure, 1996-2005

Event or exposure ¹	1996-2000 (average)	2001-2005 (average) ²	2005 ³

Fires--unintended or uncontrolled	103	95	93	2
Explosion	92	78	65	1

¹ Based on the 1992 BLS Occupational Injury and Illness Classification Manual.

² Excludes fatalities from the Sept. 11, 2001, terrorist attacks.

³ The BLS news release of August 10, 2006, reported a total of 5,702 fatal work injuries for calendar year 2005. Since then, an additional 32 job-related fatalities were identified, bringing the total job-related fatality count for 2005 to 5,734.

NOTE: Totals for all years are revised and final. Totals for major categories may include subcategories not shown separately. Dashes indicate no data reported or data that do not meet publication criteria. N.e.c. means "not elsewhere classified."
