Annual Energy Outlook Retrospective Review: Evaluation of 2011 and Prior Reference Case Projections

March 2012

This report was prepared by the U.S. Energy Information Administration (EIA), the statistical and analytical agency within the U.S. Department of Energy. By law, EIA's data, analyses, and forecasts are independent of approval by any other officer or employee of the United States Government. The views in this report therefore should not be construed as representing those of the Department of Energy or other Federal agencies.

AEO Retrospective Review: Evaluation of 2011 and Prior Reference Case Projections

The U.S. Energy Information Administration (EIA) produces projections of energy production, consumption and prices each year in the *Annual Energy Outlook* (AEO). Each year, EIA also produces this *AEO Retrospective Review* document, which presents a comparison between realized energy outcomes and the Reference case projections included in previous editions of the AEO. The purpose of the *AEO Retrospective* is to demonstrate how the *AEO* projections have tracked actual energy indicators, enable trend analysis, and inform discussions of potential improvements to the *AEO*.

The projections in the *AEO* are not statements of what will happen but of what might happen, given assumptions and methodologies. The *AEO* Reference case projection assumes trends that are consistent with historical and current market behavior, technological and demographic changes, and current laws and regulations. The potential impacts of pending or proposed legislation, regulations, and standards are not reflected in the Reference case projections¹. Thus, the *AEO* Reference case provides an unbiased baseline that can be used to analyze potential new policies or legislative initiatives.

The discussion and analysis in each year's *AEO* primarily focus on a Reference case, lower and higher economic growth cases, and lower and higher oil price cases. In addition to these standard cases, numerous alternative cases have been included in recent *AEOs*. Readers are encouraged to review the full range of cases, which address many of the uncertainties inherent in long-term projections.

The *AEO Retrospective* comparison, by contrast, summarizes the differences between actual energy indicators and past *AEO* projections, by calculating the average absolute differences and the average absolute percent differences for several of the major variables for *AEO1994* through *AEO2011*². The average absolute percent difference is the simple mean of the absolute values of the percentage difference between the Reference case projection and the actual value. The historical data are primarily from the *Annual Energy Review* (*AER*)³. This edition includes tables for prices in constant dollars in addition to nominal-dollar tables. Projections for consumption concepts depend on real prices, so constant-dollar price comparisons give a clearer picture of the linkage between consumption projection differences and price projection differences.

The annual projection process begins with the development of assumptions for two key drivers – the world oil price and the macroeconomic growth baseline—that are determined exogenously to the National Energy Modeling System (NEMS) used to prepare the *AEO*. While the integrated nature of

¹ Each *Annual Energy Outlook* includes a variety of other cases with different assumptions – in *AEO2010* see, for example, the Extended Policies and No Sunset cases for different policy treatments.

² The National Energy Modeling System (NEMS) has been used to prepare the *Annual Energy Outlook* since *AEO1994* and this publication covers only these *AEOs*. The *AEO2009* results are from “An Updated *Annual Energy Outlook 2009* Reference Case reflecting Provisions of the American Recovery and Reinvestment Act and Recent Changes in the Economic Outlook” (passed after the publication of the formal hardcopy *AEO2009*). This version is only available on the EIA website at: [http://www.eia.doe.gov/oiaf/servicert/stimulus/pdf/sroiaf\(2009\)03.pdf](http://www.eia.doe.gov/oiaf/servicert/stimulus/pdf/sroiaf(2009)03.pdf). The *AEO* Retrospective only considers projections made since *AEO1994*.

³ GDP and the GDP price deflators come from the Bureau of Economic Analysis, while coal prices to electric generating plants are from the *Monthly Energy Review* (*MER*).

NEMS may result in some feedback that slightly modifies the initial assumptions about world oil price and the macroeconomic growth baseline, these feedbacks tend to be relatively small, so that the initial assumptions for these drivers largely determine the overall projection environment. To the extent that this general environment deviates from the initial assumptions, the NEMS projection results will also deviate.

Table 1 provides a summary for 25 comparisons based on 21 primary concepts – including both constant-dollar and nominal-dollar comparisons for each of the four price concepts projected. The detailed results that underlie Table 1 are presented in Tables 2 through 22. These tables show the Reference case projections, historical values and percent differences between projected and actual for all years available. They also provide the average absolute difference across all AEOs for each year of history. The tabulated results can change from one year's evaluation to the next due to data revisions for prior years that can occur in the *AER*, the *Monthly Energy Review (MER)*, and, occasionally, in gross domestic product (GDP).

The first column in Table 1 is the simple average of the absolute value of percent differences for each concept across all AEOs and across all available historical years. In general, energy consumption quantities tend to be less volatile and thus projected with greater accuracy than the relatively more volatile energy prices. This is because energy consumption trends reflect underlying sources of inertia in the energy-consuming capital stock, substantial lead times for capital purchase decisions, locked-in contract periods, and consumer perceptions of and responses to price changes. The average absolute percent differences for energy consumption, production, and carbon dioxide emissions range roughly between 4 and 11 percent. Net imports tend to exhibit somewhat larger average absolute differences ranging between 10 and 21 percent. The absolute percent differences for energy prices range between 10 and 33 percent.

The second column of Table 1 provides a summary of the percentage of cases in which a particular concept is overestimated relative to the total number of annual projections made across all AEOs. A zero would represent a concept that was always underestimated and 100 percent would represent a concept always overestimated. In an “unbiased” projection, one would expect the percentage of overestimates to be close to 50 percent when the sample size is large enough.

The underlying reasons for deviations between the AEO Reference case projections and actual outcomes are numerous and varied. In most cases, changes in economic, market, and technological trends led to the deviations. EIA monitors these developments and uses the best available data to continuously update NEMS and the AEO projections. Nonetheless, because the AEO Reference case is by definition a continuation of historic trends, breaks in trends lead to deviations between the projections and realized outcomes. EIA makes extensive use of scenarios in the AEO for precisely this reason; even though the precise timing and magnitude of a change in trend cannot be predicted, the likelihood that there will be some changes in trend is virtually certain, and the impact of such changes is estimated using the AEO scenarios. Thus, risks and opportunities presented by such potential outcomes cannot be evaluated with the AEO Reference case alone, but only in conjunction with the relevant AEO scenarios and other analysis as applicable to a specific situation.

Table 1. AEO Reference Case Projection Results

Variable	Average Absolute Percent Differences	Percent of Projections Over-Estimated
Gross Domestic Product		
Real Gross Domestic Product (Average Cumulative Growth)* (Table 2)	0.9	40.4
Petroleum		
Imported Refiner Acquisition Cost of Crude Oil (Constant \$) (Table 3a)	33.3	20.5
Imported Refiner Acquisition Cost of Crude Oil (Nominal \$) (Table 3b)	32.8	21.6
Total Petroleum Consumption (Table 4)	5.2	63.7
Crude Oil Production (Table 5)	6.2	62.0
Petroleum Net Imports (Table 6)	9.9	63.7
Natural Gas		
Natural Gas Wellhead Prices (Constant \$) (Table 7a)	31.4	24.0
Natural Gas Wellhead Prices (Nominal \$) (Table 7b)	30.9	26.3
Total Natural Gas Consumption (Table 8)	7.5	69.6
Natural Gas Production (Table 9)	7.0	70.8
Natural Gas Net Imports (Table 10)	21.3	67.3
Coal		
Coal Prices to Electric Generating Plants (Constant \$)** (Table 11a)	17.6	43.3
Coal Prices to Electric Generating Plants (Nominal \$)** (Table 11b)	20.2	47.4
Total Coal Consumption (Table 12)	6.5	55.6
Coal Production (Table 13)	5.1	60.2
Electricity		
Average Electricity Prices (Constant \$) (Table 14a)	9.6	40.9
Average Electricity Prices (Nominal \$) (Table 14b)	12.4	45.6
Total Electricity Sales (Table 15)	4.0	42.1
Total Energy, Carbon and Intensity		
Total Energy Consumption (Table 16)	5.0	76.0
Delivered Residential Energy Consumption (Table 17)	4.0	66.1
Delivered Commercial Energy Consumption (Table 18)	5.9	37.4
Delivered Industrial Energy Consumption (Table 19)	10.6	88.3
Delivered Transportation Energy Consumption (Table 20)	5.4	76.0
Total Energy Related Carbon Dioxide Emissions (Table 21)	5.5	57.3
Energy Intensity (Energy Consumption / Real \$ GDP) (Table 22)	10.5	96.5

AEO - Annual Energy Outlook

Source: These statistics summarize the calculations in Tables 2 through 22. The data in Tables 2 through 22 are based on the 1994 through 2011 *Annual Energy Outlook* Reference case projections. Historical data are taken from the *Annual Energy Review 2010*, DOE/EIA-0384(2010) (Washington, DC, October 2011) and the *Monthly Energy Review October 2011*, DOE/EIA-0035(2011/10) (Washington, DC, October 27, 2011).

* The basis for GDP comparison is the projection differences in the cumulative average growth rate of real GDP from the first year shown for each AEO. The summary information for projection differences given for GDP growth rates is absolute percentage point differences; for all other AEO concepts, the comparison basis is absolute percent differences.

** Coal prices to electric generating plants are from the *Monthly Energy Review*. Beginning in AEO2003, EIA electric generating projections incorporated combined heat and power (CHP) electricity generation in electricity generating plants. Prior to AEO2003, coal price projections reflected data collected, estimated, and reported to electric utilities and excluded CHP power generation.

Some notable factors contributing to deviations between actual outcomes and *AEO* projections are:

- Macroeconomic factors play a very important role in determining energy usage. The financial crisis and resulting economic weakness of 2007-2009 was not anticipated in *AEO* modeling as NEMS does not project future business cycles. *AEO2001* through *AEO2009* over-projected macroeconomic growth for 2007 (Table 2). Earlier *AEOs* systematically underestimated cumulative growth, even through 2007-2009, due in part to the robust 3.9% average growth in real GDP from 1993 through 2000 fueled by the “high tech bubble.” Post-2000 real GDP growth has decreased to an average of 1.6% and *AEOs* produced during this period have tended to over-project, even before the impacts of the latest recession. In general, the *AEO* tends to lag behind macroeconomic trends as a result of inherently conservative analytic framework which returns economic factors to long-run trends, rather than attempting to predict business cycles or other economic phenomena.
- The imported refiner acquisition cost of crude oil in 2008 was over 90 dollars per barrel and many of the *AEOs* prior to *AEO2006* projected nominal results less than 30 dollars per barrel. Underestimation of crude oil prices since 2000 contributed to overestimation of petroleum consumption. This coupled with the effects of the 2007-2009 recession has resulted in overestimates of petroleum consumption for the years 2008 through 2010 (Table 4). Only since *AEO2009* have the projection differences become more evenly distributed.
- Petroleum net imports peaked in 2005, falling successively in each year since. Before *AEO2006*, *AEOs* had projected rising net imports for this period. From *AEO2006* on, projections for net imports have included years of decline (Table 6). This effect was caused primarily by the economic situation, with a lesser contribution from increasing vehicle fuel efficiency.
- Natural gas production has increased each year after 2005 after a long period of relatively flat production (Table 9). Natural gas net imports peaked in 2007, falling successively in each year since (Table 10). *AEOs* since *AEO2006* have tended to underestimate production and consequently overestimate net imports.
- The fuel with the largest absolute percent difference between the projections and historical consumption has generally been natural gas. This can be partially traced to the performance of natural gas price projections. In earlier projections, the natural gas price was influenced by the changes in the world oil price, but this relationship has decoupled since 2000. Through *AEO2005*, the Reference case has generally overestimated natural gas consumption (Table 8), in part due to the tendency for significant underestimates of the natural gas wellhead price (Tables 7a, 7b). In addition, industrial natural gas usage is highly sensitive to business cycles, leading to greater volatility in overall natural gas consumption.
- Electricity prices were almost always underestimated in the Reference case projections from *AEO2000* on (Tables 14a, 14b) following the pattern in the coal and natural gas price projections and the partially deregulated generation market. In deregulated markets, natural gas tends to determine marginal electricity prices and follow the changes in the delivered natural gas prices. The recent underestimation of natural gas wellhead prices contributes to underestimates in more recent electricity price projections.
- Total energy consumption is lower in 2010 than it was in 2000 (although 5 intervening years were higher than 2010). Most *AEOs* projected rising consumption with *AEO2008* and *AEO2009*.

being exceptions. This is the result of not anticipating the recent recession and slow recovery in the projections. Projection differences tend to be relatively small; however, some pattern of overestimation is evident (Tables 16 to 20).

- Projected energy intensity has been the concept most often overestimated (Table 22). Energy intensity for the retrospective comparisons is defined as the ratio of two other projected concepts: total energy consumption and real GDP. As a ratio, the projection differences are dependent upon relative differences in energy consumption and real GDP. The overestimates of energy intensity are the result of two “reinforcing” features of past projections. During the period through *AEO2000*, GDP tended to be underestimated, which imparts a tendency to overestimate energy intensity. Post-*AEO2000*, energy consumption has tended to be overestimated, once again imparting a tendency to overestimate intensity. The combination of these two occurrences has resulted in energy intensity being overestimated for nearly all years.

Historical Data: U.S. Energy Information Administration, Annual Energy Review 2010, DOE/EIA-0384(2010) (Washington, DC, October 2011), Table 2.1d (total primary consumption + electricity retail sales). Comparisons through AEO 2002 have been adjusted for the AER 2001 revision to industrial energy consumption that was not incorporated in the earlier projections.
