# **SOURCE AND ACCURACY STATEMENT FOR THE SURVEY OF PROGRAM DYNAMICS THIRD LONGITUDINAL FILE**

## **DATA COLLECTION AND ESTIMATION**

### **Source of Data**

The data were collected in the Survey of Program Dynamics (SPD) for a period between 1992 and 2002. The population represented (the population universe) in the SPD is the civilian noninstitutionalized population living in the United States. The institutionalized population, which is excluded from the population universe, is composed primarily of the population in the correctional institutions and nursing homes (91 percent of the 4.1 million institutionalized people in Census 2000). The population also includes people living in group quarters, such as dormitories, rooming houses, and religious group dwellings. Crew members of merchant vessels, armed forces personnel living in military barracks, and institutionalized people, such as correctional facility inmates and nursing home residents, were not eligible to be in the survey. Also, United States citizens residing abroad were not eligible to be in the survey. Foreign visitors who work or attend school in this country and their families were eligible, but all other foreign visitors were not eligible to be in the survey. With the exceptions noted above, people who were at least 15 years of age (adults) at the time of the interview were eligible to provide self and/or proxy interviews for the survey; while the data of people who were less than 15 years of age (children) at the time of the interview were collected from proxy interviews provided by the adults.

The goal of the SPD program is to provide policy makers with survey data to assess the effects of the welfare reforms enacted by the U.S. Congress in 1996 and how these reforms interact with each other, and with employment, income, and family circumstances. The SPD program spans from the pre-reform through the post-reform period, 1992-2002. In order to obtain information about past economic history, employment, income, and program participation, two retired SIPP panels 1992 and 1993 were chosen as the SPD samples fielded between 1997 and 2002. Each of these SPD samples consisted of sample households selected from the SIPP panels 1992 and 1993 as described later.

The calendar year data for 1996 were collected during April, May, and June of 1997 as part of the SPD Bridge Survey (also known as the SPD 1997). Likewise, the calendar year data for 1997 to 2001 were collected during May, June, and July of 1998 to 2002 as part of the SPD 1998 to 2002 surveys, respectively. The SPD Bridge Survey data was collected in 1997 and intended to be a connection run between the SIPP and SPD data. Data that was merged from the previous SIPP surveys, the SPD Bridge survey, and the subsequent SPD surveys (the SPD 1998 to 2002) should give us the necessary pre-reform and post-reform information for sampled households. The SPD third longitudinal file longitudinally combines the data from the SIPP Panels 1992 and 1993, and the SPD Bridge file and the SPD 1998 to 2002 calendar year files. A full potential of the SPD data is generally achieved when using the SPD third (final) longitudinal file.

## **Background of SIPP 1992 and 1993 Panels and SPD Bridge Survey**

The 1992 and 1993 SIPP panel samples were located in 284 Primary Sampling Units (PSUs), each consisting of a county or a group of contiguous counties. Within these PSUs, expected clusters of two or four living quarters were systematically selected from lists of addresses prepared for the 1980 decennial census to form the bulk of the sample. To account for living quarters built within each of the sample areas after the 1980 census, a sample was drawn of permits issued for construction of residential living quarters up until shortly before the beginning of the panel. In jurisdictions that do not issue building permits, small land areas were sampled and the living quarters within were listed by field personnel and then subsampled. In addition, sample living quarters were selected from supplemental frames that included living quarters identified as missed in the 1980 census and group quarters.

At the time of the initial visit of the SIPP panels, the occupants of about 19,600 living quarters were interviewed for the 1992 panel and 19,900 were interviewed for the 1993 panel. This accounts for approximately 72% (1992) and 73% (1993) of the living quarters originally designated for the SIPP samples. Approximately 21% (1992) and 20% (1993) of the designated living quarters were found to be vacant, demolished, converted to nonresidential use, or otherwise ineligible for the survey. The remainder, approximately 2,000 living quarters, were not interviewed because the occupants refused to be interviewed, could not be found at home, were temporarily absent, or otherwise unavailable. Thus, occupants of about 91% of all eligible living quarters participated in the first interview of the 1992 and 1993 SIPP panels.

For the remaining nine interviews, only original sample people (those in Wave 1 sample households and interviewed in Wave 1) and people living with them were eligible to be interviewed. With certain restrictions, original sample people were to be followed even if they moved to a new address. When original sample people moved without leaving a forwarding address or moved to extremely remote parts of the country with no telephone number available for contact, additional non-interviews resulted.

The ten-wave cross-sectional and longitudinal files from SIPP Panel 1992 consist of data collected from February 1992 to April 1995. Data for up to 39 reference months are available for people on these files. The nine-wave cross-sectional and longitudinal files from SIPP Panel 1993 consist of data collected from February 1993 to January 1996. Data for up to 36 reference months are available for people on these files.

Table 1 indicates the interview and reference months for the collection of data from SIPP Panel 1992 (ten waves), SIPP Panel 1993 (nine waves), and SPD 1997 to 2002. For the SIPP, a person was classified as interviewed or non-interviewed based on the following definitions (note: a person may be classified differently for calculating different weights). Interviewed sample people (including children) were defined to be: “those for whom self or proxy responses were obtained for the month or months (e.g., a longitudinal period) under consideration”. The month or months under consideration for which people were deceased or residing in an ineligible address were identified on both the cross-sectional and longitudinal files. Non-interviewed people were defined to be those for whom neither self nor proxy responses were obtained for the month or months under consideration. However, for the weighting purpose, non-interviewed sample people whose responses were obtained by imputation for the month or months under consideration were reclassified as interviewed.

It is estimated that roughly 21,600 households (56,300 people) for SIPP Panel 1992 and 21,800 households (57,200 people) for SIPP Panel 1993 were initially designated in the sample for the SIPP interview. Approximately 19,600 households (51,100 people) for SIPP Panel 1992 and 19,900 households (51,900 people) for SIPP Panel 1993 were interviewed in wave 1. The balance, residing in approximately 4,000 (SIPP Panels 1992 and 1993 combined) living quarters not interviewed at wave 1, remained anonymous and became the initial source of the household (and person) non-response in the weighting procedures. For wave 2 and beyond, household non-response was due to *Type A non-interview* (direct or indirect refusal for interview), *Type B non-interview* (entire household institutionalized), *Type C non-interview* (entire household deceased or moved out of the SPD universe, e.g., out of the country), and *Type D non-interview* (unlocated mover's household). By the end of the panel, with sample growth due to household spawning outpacing the household non-response, roughly 23,600 households for SIPP Panel 1992 (waves 9 and 10) and 23,700 households for SIPP Panel 1993 (wave 9) were eligible for interview, and approximately 17,800 households for SIPP Panel 1992 and 17,600 households for SIPP Panel 1993 were interviewed. In an interviewed household, some household members refused to be interviewed which is referred to as *Type Z non-response*. For SIPP Panels 1992 and 1993, Type Z non-response rates varied from 1.3% to 8.0% among wave 2 and later waves, and the rates increased as the panels aged. In addition, some respondents did not respond to all of the questions. Therefore, item non-response rates, especially for sensitive income and money related items, are higher than the person non-response rates given above. The longitudinal file for the SIPP Panel 1992 contains approximately 59,700 sample people which includes the wave 1 interviewed people and about 8,600 people entered the surveyed sample households through births, marriages, and other reasons. Similarly, the longitudinal file for the SIPP panel 1993 contains approximately 62,700 sample people which includes the wave 1 interviewed people and about 10,600 people entered the surveyed sample households through births, marriages, and other reasons.

We define the SPD Bridge sample cohort as people that were in an interviewed household (or in a household that was spawned from an interviewed household) in the last waves of SIPP Panels 1992 and 1993. This amounted to approximately 38,300 designated sample households for the SPD Bridge sample among which 30,125 households were interviewed. Among the non-interviewed households, 4,335 were Type A, 302 were Type B, 1,181 were Type C, and 2,402 were Type D non-interviewed households.

### **1998 SPD Sub-sampling for SPD 1998 Survey**

Due to budget constraints, the SPD 1998 Survey did not visit all of the households eligible for interview (approximately 39,200 interviewed, Type A, Type B, and Type D non-interviewed households in the SPD Bridge plus their spawned households). The budget only allowed for SPD to visit 21,000 households. Thus, a sample cut was carried out in the following manner. Roughly 19,100 were sampled in this operation, since we needed to account for an expected 12.5 percent non-response and a growth of 10 percent of the total sample size due to household spawning. Only the interviewed and Type B non-interviewed households in the SPD Bridge sample were eligible for selection for the SPD 1998 sample. In the subsampling (sample selection), these sample households were demographically divided into six strata as shown in the table at the end of this section. The stratification was performed using the household information collected from the SPD Bridge. In each stratum, the households were randomly selected with the sampling rate as provided in the table below. As indicated among sampling rates in this table, the low income sample households were generally not subjected to the sample cut at all.

As a result of the sample cut, the number of the households selected for the SPD 1998 sample plus their spawned households was approximately 19,700, among which 16,395 households were interviewed. Among the non-interviewed households, 2,211 were Type A, 201 were Type B, 212 were Type C, and 673 were Type D non-interviewed households.

Stratum	Description	Sampling Rate	Designated Number	Projected Interviews
1	Households where the primary family or the primary individual has a total family income below 150% of the poverty threshold	1-in-1	6,182	5,950
2	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are children under 18	1-in-1	1,075	1,035
3	Households where the primary family or the primary individual has a total family income above 200% of the poverty threshold and there are children under 18	1-in-1.11	6,623	6,375
4	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are no children under 18	1-in-1.22	1,461	1,406
5	Households in the balance	1-in-3.70	3,707	3,568
6	Households entirely institutionalized (Outcome code = 228)	1-in-3.70	81	DK
Total			19,129	18,334

### SPD 1999 Survey

The sample for the SPD 1999 survey is simply a direct continuation of the SPD 1998 sample. (Namely, there is no additional sample cut or no bringing back of any addition sample households from either the SPD Bridge non-respondents or the SIPP Panel 1992/1993 non-respondents in the SPD 1999 survey.) In this survey, there are approximately 20,000 designated sample households (including spawned households), among which 16,659 households were interviewed. Among the non-interviewed households, 2,174 were Type A, 232 were Type B, 212 were Type C, and 718 were Type D non-interviewed households.

### SPD 2000 Survey

The sample for the SPD 2000 survey consists of two components. Part 1 of the SPD 2000 sample is simply a direct continuation of the SPD 1999 sample which will be hereinafter referred to as *the SPD core component* or *the SPD basic component*. Part 2 is composed of a subsample of the SPD Bridge Type A and Type D non-interviewed households which will be hereinafter referred to as *the SPD Bridge non-interview component*.

The SPD Bridge non-interview component of the sample was selected by classifying the Type A and Type D SPD Bridge non-interviewed households into six strata similar to those prescribed for the 1998 SPD sample cut as shown in the table below. The non-interviewed households in each stratum were then randomly selected at the sampling rate specified in the table below (which is the same sampling rate used for the 1998 SPD sample cut).

Stratum	Description <sup>1</sup>	Number of Households	Percent	Sampling Rate	Subsample Size
1	Households where the primary family or the primary individual has a total family income below 150% of the poverty threshold	1,444	22.5	1-in-1	1,444
2	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are children under 18	156	2.4	1-in-1	156
3	Households where the primary family or the primary individual has a total family income above 200% of the poverty threshold and there are children under 18	736	11.5	1-in-1.11	663
4	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are no children under 18	476	7.4	1-in-1.22	390
5	Households in the balance	3,605	56.2	1-in-3.70	974
6	Households institutionalized (outcome code = 228)	0	0.0	1-in-3.70	0
N/A	Total	6,417	100.0	N/A	3,627

<sup>1</sup> The characteristics of these households were determined based on Reference Month 4 of Wave 1 of either the SIPP Panel 1992 or 1993, depending on which panel they were originated from.

In the SPD core component of the sample, there are approximately 20,400 designated sample households (including the spawned households), among which 16,845 households were interviewed. Among the non-interviewed households in the SPD core component, 2,172 were Type A, 283 were Type B, 243 were Type C, and 873 were Type D non-interviewed households. In the SPD Bridge non-interview component of the sample, there are approximately 3,700 designated sample households (including the spawned households), among which 1,871 households were interviewed. Among the non-interviewed households in the SPD Bridge non-interview component, 806 were Type A, 32 were Type B, 98 were Type C, and 907 were Type D non-interviewed households. Thus, for the whole SPD 2000, there are approximately 24,100 designated sample households (including the spawned households), among which 18,716 households were interviewed. Among the non-interviewed households in the whole SPD 2000 sample, 2,978 were Type A, 315 were Type B, 341 were Type C, and 1,780 were Type D non-interviewed households. (Unlike the SPD second longitudinal file, the SPD Bridge non-interview component was also included in the SPD third longitudinal file.)

## SPD 2001 Survey

The sample for the SPD 2001 survey consists of three components. Part 1 of the SPD 2000 sample is simply a direct continuation of the SPD core component of the SPD 2000 sample. Part 2 is also simply a direct continuation of the SPD Bridge non-interview component of the SPD 2000 sample. Part 3 is composed of SIPP Panel 1992 and 1993 Type A and Type D non-interviewed households between wave 2 and the last wave. Part 3 of the SPD 2001 sample will be referred to as *the SIPP 92/93 non-interviewed component*.

The SIPP 92/93 non-interview component of the sample was selected by classifying the SIPP Panel 1992 and 1993 Type A and Type D non-interviewed households (between wave 2 and the last wave) into five strata (similar to those prescribed for the 1998 SPD sample cut) as shown in the table below. The non-interviewed households in each stratum were then randomly selected at the sampling rate specified in the table on the next page.

In the SPD core component of the sample, there are approximately 20,900 designated sample households (including the spawned households), among which 16,964 households were interviewed. Among the non-interviewed households in the SPD core component, 2,351 were Type A, 314 were Type B, 257 were Type C, and 1,023 were Type D non-interviewed households. In the SPD Bridge non-interview component of the sample, there are approximately 3,800 designated sample households (including the spawned households), among which 2,272 households were interviewed. Among the non-interviewed households in the SPD Bridge non-interview component, 816 were Type A, 42 were Type B, 50 were Type C, and 655 were Type D non-interviewed households. In the SIPP 92/93 non-interview component, there are approximately 6,400 designated sample household (including the spawned households), among which 3,104 households were interviewed. Among the non-interviewed households in the SIPP 92/93 non-interview component, 1,056 were Type A, 85 were Type B, 240 were Type C, and 1,907 were Type D non-interviewed households. Thus, for the whole SPD 2001, there are approximately 31,100 designated sample households (including the spawned households), among which 22,340 households were interviewed. Among the non-interviewed households in the whole SPD 2001 sample, 4,223 were Type A, 441 were Type B, 547 were Type C, and 3,585 were Type D non-interviewed households. (The SIPP 92/93 non-interview component were also included in the SPD third longitudinal file along with the SPD core component and the SPD Bridge non-interview component.)

Stratum	Description <sup>1</sup>	Number of Households		Percent		Sampling Rate		Subsample Size	
		1992	1993	1992	1993	1992	1993	1992	1993
1	Households where the primary family or the primary individual has a total family income below 150% of the poverty threshold	1317	1463	31.1	32.2	1 in 1	1 in 1	1317	1463
2	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are children under 18	182	254	4.3	5.6	1 in 1	1 in 1	182	254
3	Households where the primary family or the primary individual has a total family income above 200% of the poverty threshold and there are children under 18	723	807	17.0	17.7	1 in 1	1 in 1	723	807
4	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are no children under 18	270	293	6.4	6.4	1 in 1	1 in 1	270	293
5	Households in the balance	1746	1733	41.2	38.1	1 in 3.44	1 in 9.47	508	183
Total by Panel		4238	4550	100.0	100.0	N/A	N/A	3000	3000
Grand Total (1992 & 1993 Panels)		8788		N/A		N/A		6000	

<sup>1</sup> The characteristics of these households were determined based on Reference Month 4 of Wave 1 of either the SIPP Panel 1992 or 1993, depending on which panel they originally belonged.

## SPD 2002 Survey

Due to budget constraints, the SPD 2002 Survey did not visit all of the households eligible for interview (approximately 30,588 interviewed, Type A, Type B, and Type D non-interviewed households in the SPD 2001 sample and their spawned households). The budget only allowed for SPD to visit 20,000 households. Thus, a sample cut was carried out similar to the 1998 sample cut. Roughly 19,100 households were sampled in this operation, since we needed to account for an expected net 5 percent growth rate due to household spawning. Interviewed and Type A, Type B, and Type D non-interviewed households were eligible to be selected. The eligible households were classified into six strata and then randomly selected for the SPD 2002 sample such that each stratum took an approximately equal proportional cut to reduce the total sample size to approximately 19,100 as shown in the table below.

Stratum	Description	SPD 2001 Stratum Size	Subsampled Stratum Size for SPD 2002 Sample
1	Households where the primary family or the primary individual has a total family income below 150% of the poverty threshold	10,338	6,456
2	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are children under 18	1,935	1,209
3	Households where the primary family or the primary individual has a total family income above 200% of the poverty threshold and there are children under 18	10,490	6,551
4	Households where the primary family or the primary individual has a total family income between 150% and 200% of the poverty threshold and there are no children under 18	2,211	1,381
5	Households in the balance	5,583	3,487
6	Households institutionalized (Type B non-interviews)	31	20
Total		30,588	19,104

The SPD 2002 survey consists of three components as did the SPD 2001 survey. In the SPD core component of the sample, there were approximately 18,200 designated sample households (including spawned households), among which 10,765 households were interviewed. Among the non-interviewed households in the SPD core component, 4,266 were Type A, 246 were Type B, 2,405 were Type C, and 468 were Type D non-interviewed households. In the SPD Bridge non-interview component of the sample, there are approximately 2,000 designated sample households (including spawned households), among which 928 households were interviewed. Among the non-interviewed households in the SPD Bridge non-interview component, 662 were Type A, 16 were Type B, 273 were Type C, and 132 were Type D non-interviewed households. In the SIPP 92/93 non-interview component, there are approximately 2,500 designated sample households (including spawned households), among which 803 were interviewed. Among the non-interviewed households in the SIPP 92/93 non-interviewed component, 818 were Type A, 43 were Type B, 508 were Type C, and 361 were Type D non-interviewed households. Thus, for the whole SPD 2002, there are approximately 22,700 designated sample households (including spawned households), among which 12,496 were interviewed. Among the non-interviewed households in the whole SPD 2002 sample, 5,746 were Type A, 305 were Type B, 3,186 were Type C, and 961 were Type D non-interviewed households.

## ESTIMATION

The SPD third (last) longitudinal file supersedes the SPD first and second longitudinal files. Therefore, any analyses and statistical estimates utilizing an SPD longitudinal file shall be made based on the SPD third longitudinal file and its appropriate longitudinal weights as described below.

For estimation of the characteristics of the population in the SPD universe based on the SPD third longitudinal file, two sets of weights are provided for the sample people on the file. They are referred to

as *the traditional longitudinal panel weight set* and *the quasi-longitudinal weight set*. The procedure for calculating these two sets of weights was described earlier in the section titled “Weighting”. The composition of these two sets of weights and their application are described below.

### **Traditional Longitudinal Panel Weight Set**

To fully utilize the SPD core sample component for both before and after the SPD 2002 sample cut for the traditional longitudinal analyses and estimates of the characteristics of the SPD panel universe, a set of two traditional longitudinal panel final weights denoted by SPDTLW01 and SPDTLW02 was created. Namely:

1. SPDTLW01 covers the data years 1992, 1993, 1994, 1996, 1997, 1998, 1999, and 2000 (before the SPD 2002 sample cut) from the SIPP panels 1992 and 1993, SPD Bridge (1997), and SPD 1998 to SPD 2001. It was created to be used for estimates covering multiple years within data years 1992 to 2000. The data for data years 1996, ..., 2000 was collected in the SPD 1997 (Bridge), ..., SPD 2001, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.
2. SPDTLW02 covers the data years 1992, 1993, 1994, 1996, 1997, 1998, 1999, 2000, and 2001 (after the SPD 2002 sample cut) from the SIPP panels 1992 and 1993, SPD Bridge (1997), and SPD 1998 to SPD 2002. It was created to be used for estimates covering multiple years within data years 1992 to 2001. The data for data years 1996, ..., 2001 was collected in the SPD 1997 (Bridge), ..., SPD 2002, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.

Hereinafter, SPDTLW01 and SPDTLW02 will be referred to as *the 2001 SPD traditional longitudinal panel weight* and *the 2002 SPD traditional longitudinal panel weight*, respectively.

### **2001 SPD Traditional Longitudinal Panel Weight SPDTLW01 and Its Associated Longitudinal Annual Weight SPDTAW01**

Only the original sample people (lived in a 1992/1993 SIPP panel household during wave 1 interview) belonging to one of the following cohorts have a positive *2001 SPD traditional longitudinal panel weight* SPDTLW01 ( the definitions of the technical terms are available in the Weighting and Glossary sections).

*Cohort TLW01A* - The original sample people who belonged to sample component 1 (the SPD core sample component), and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person), and were interviewed (self, proxy, or imputed) in the SPD Bridge (1997) and the SPD 1998 through the SPD 2001.

*Cohort TLW01B* - The original sample people who belonged to sample component 1 (the SPD core sample component), and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person), and were interviewed (self, proxy, or imputed) or were institutionalized or moved to live in armed forces barracks or moved out of the country in each SPD cycle (the SPD Bridge, the SPD 1998, ...)

*until* they became a 2001 SPD panel universe leaver.

*Cohort TLW01C* - The original sample people who belonged to sample component 4 (the pre SPD panel universe leaver component) and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person).

*Cohort TLW01D* - The original sample people who belonged to sample component 5 (the pre 1998 SPD panel universe leaver sample component), and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person).

All the other sample people included on the file have zero 2001 SPD traditional longitudinal panel weight SPDTLW01.

Regarding making choice between using SPDTLW01 and SPDTLW02 for estimating a multiple year characteristic, SPDTLW01 is preferred to SPDTLW02 for making a multiple year estimate that does not involve data year 2001 because, due to sample cut in the SPD 2002, the effective sample size (sample people with positive final weights) associated with SPDTLW01 is larger than the effective sample size associated with SPDTLW02. Thus, the sampling variance of the multiple year estimate using SPDTLW01 is theoretically smaller than the sampling variance of the multiple year estimate using SPDTLW02, namely, the multiple year estimate using SPDTLW01 is more reliable (accurate) than the multiple year estimate using SPDTLW02. For a multiple year estimate of a characteristic that involves data year 2001, SPDTLW02 must be used in lieu of SPDTLW01 because SPDTLW01 was derived without accounting for the SPD 2002 (data year 2001).

The advantage and disadvantage of using the 2001 SPD traditional longitudinal panel SPDTLW01 versus using the 2000 SPD quasi-longitudinal panel weight SPDQLW00 to make estimates of multiple year longitudinal characteristics was described in the section titled *2000 SPD Quasi-Longitudinal Panel Weight SPDQLW00 and Its Associated Longitudinal Annual Weight SPDQAW00*. Similarly, the advantage and disadvantage of using the 2001 SPD traditional longitudinal panel SPDTLW01 versus using the 2001 SPD quasi-longitudinal panel weight SPDQLW01 to make estimates of multiple year longitudinal characteristics was described in the section titled *2001 SPD Quasi-Longitudinal Panel Weight SPDQLW01 and its Associated Longitudinal Annual Weight SPDQAW01*.

To provide a means for estimating the annual or calendar characteristics of young children based on the data and the 2001 SPD traditional longitudinal panel weight SPDTLW01 on the SPD third longitudinal file, the characteristics of the non-original sample children born after Wave 1 of the SIPP panels 1992 and 1993 must be also taken into account. (Namely, the children born after Wave 1 of the SIPP panels 1992 and 1993 are considered as young children.) By definition, the non-original young sample children associated with SPDTLW01 are those aged nine and below in 2001 if originated from the SIPP panel 1992, and aged eight and below in 2001 if originated from the SIPP panel 1993. To enable an accounting for the characteristics of these non-original young sample children in any annual estimates, positive longitudinal annual weights associates with SPDTLW01 were assigned to a cohort of these non-original sample children. The longitudinal annual final weight associated with SPDTLW01 was denoted by SPDTAW01. Hereafter, SPDTAW01 will be simply referred to as *the 2001 SPD traditional longitudinal*

*annual weight*. The 2001 SPD traditional longitudinal annual weight SPDTAW01 was assigned as described below.

3. For all sample people except the non-original young sample children, their SPDTAW01 were assigned the same as their SPDTLW01.
4. For the non-original young sample children whose designated parents are non-original sample people, their SPDTAW01 were assigned as zero.
5. For each non-original young sample child whose designated parent is an original sample person with zero SPDTLW01, their SPDTAW01 were assigned as zero.
6. For each non-original young sample child whose designated parent is an original sample person with positive SPDTLW01, an intermediate weight was assigned to her/him equal to her/his designated parent's positive SPDTLW01. To improve the coverage, their intermediate weights of these non-original young sample children were then adjusted to match a set of June 2001 controls (benchmark estimates) classified by sex, race, and ethnicity to obtain the final values (positive) of their SPDTAW01.

The 2001 SPD traditional longitudinal annual weight SPDTAW01 was created to be used for estimating the annual (calendar year) characteristics of young children aged nine and below in 2001 for a data year up to 2000 because SPDTAW01 was adjusted to match the controls (benchmark estimates) for the cohort of children aged eight and below in June 2001 (to improve coverages). (The data for data years 1996, ..., 2000 was collected in the SPD 1997, ..., SPD 2001, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.) However, the 2001 SPD traditional longitudinal annual weights SPDTAW01 of these young children are intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2001 because they were represented by the original sample young children (in a nine year old sample) and the non-original sample young children spawned from the original sample people (in a nine year old sample). Therefore, some caution should be given when interpreting results of the characteristic estimation for these young children.

Since the 2001 SPD traditional longitudinal annual weights SPDTAW01 were adjusted to match the June 2001 controls for the cohort consisting of children aged nine and below in 2001 (to improve coverages), the annual estimates of the characteristics of the young children in the entire age group of nine and below in 2001 using SPDTAW01 are theoretically more accurate than those of the young children of other age groups in 2001 (for examples, age group between six and nine in 2001, age group of five and below in 2001).

The advantage and disadvantage of using the 2001 SPD traditional longitudinal annual weight SPDTAW01 versus using the 2001 SPD quasi-longitudinal annual weight SPDQAW01 to make estimates of multiple year longitudinal characteristics was described in the section titled *2001 Quasi-Longitudinal Panel Weight SPDQLW01 and Its Associated Longitudinal Annual Weight SPDQAW01*.

Regarding making a choice between SPDTAW01 and SPDTAW02 for calendar year estimates of young children characteristics, SPDTAW01 and SPDTAW02 were created to be used for estimating calendar year characteristics of young children in 2001 and 2002, respectively. This is because SPDTAW01 was adjusted to match the June 2001 controls for the cohort consisting of children aged nine and below in 2001, and SPDTAW02 was adjusted to match the June 2002 controls for the cohort consisting of children aged ten and below in 2002.

## **2002 SPD Traditional Longitudinal Panel Weight SPDTLW02 and Its Associated Longitudinal Annual Weight SPDTAW02**

Only the original sample people (lived in a 1992/1993 SIPP panel household during wave 1 interview) belonging to one of the following cohorts have a positive *2002 SPD traditional longitudinal panel weight* SPDTLW02 ( the definitions of the technical terms are available in the Weighting and Glossary sections).

*Cohort TLW02A* - The original sample people who belonged to sample component 1 (the SPD core sample component), survived the SPD 2002 sample cut, and had positive SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person), and were interviewed (self, proxy, or imputed) in the SPD Bridge (1997), and the SPD 1998 through SPD 2002.

*Cohort TLW02B* - The original sample people who belonged to sample component 1 (the SPD core sample component), survived the SPD 2002 sample cut, and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person), and were interviewed (self, proxy, or imputed) or were institutionalized or moved to live in armed forces barracks or moved out of the country in each SPD cycle (the SPD Bridge, the SPD 1998, ...) *until* they became a 2002 SPD panel universe leaver.

*Cohort TLW02C* - The original sample people who belonged to sample component 4 (the pre SPD panel universe leaver component), and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person).

*Cohort TLW02D* - The original sample people who belonged to sample component 5 (the pre 1998 SPD panel universe leaver sample component) and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person).

*Cohort TLW02E* - The original sample people who belonged to both sample component 1 (the SPD core sample component), and sample component 6 (the pre 2002 SPD panel universe leaver sample component), and had *positive* SIPP 1992/1993 longitudinal panel weights (which implies he/she was classified as a SIPP 1992/1993 longitudinal panel interviewed sample person), and were interviewed (self, proxy, or imputed) or were deceased or were institutionalized or moved to live in armed forces barracks or moved out of the country in each of the SPD Bridge and the SPD 1998 through the SPD 2000. [Note that the SPD 2001 interview outcomes were not used in defining cohort TLW02E because, by definition, a pre 2002 SPD panel universe leaver had to remain to be or just became an SPD panel universe leaver in the SPD 2001 sample.]

All the other sample people included on the file have zero 2001 SPD traditional longitudinal panel weight SPDTLW02.

The advantage and disadvantage of using the 2002 SPD traditional longitudinal panel weight SPDTLW02 versus using the 2001 SPD traditional longitudinal panel weight SPDTLW01 to make estimates for

multiple year longitudinal characteristics was described in the section titled *2001 SPD Traditional Longitudinal Panel Weight SPDTLW01 and Its Associated Longitudinal Annual Weight SPDTAW01*.

The advantage and disadvantage of using the 2002 SPD traditional longitudinal panel SPDTLW02 versus using the 2002 SPD quasi-longitudinal panel weight SPDQLW02 to make estimates of multiple year longitudinal characteristics was described in the section titled *2002 SPD Quasi-Longitudinal Panel Weight SPDQLW02 and Its Associated Longitudinal Annual Weight SPDQAW02*.

To provide a means for estimating the annual or calendar characteristics of young children based on the data and the 2002 SPD traditional longitudinal panel weight SPDTLW02 on the SPD third longitudinal file, the characteristics of the non-original sample children born after Wave 1 of the SIPP panels 1992 and 1993 must be also taken into account. (Namely, the children born after Wave 1 of the SIPP panels 1992 and 1993 are considered as young children.) By definition, the non-original young sample children associated with SPDTLW02 are those aged ten and below in 2002 if originated from the SIPP panel 1992, and aged nine and below in 2002 if originated from the SIPP panel 1993. To enable an accounting for the characteristics of these non-original young sample children in any annual estimates, positive longitudinal annual weights associated with SPDTLW02 were assigned to a cohort of these non-original sample children. The longitudinal annual final weight associated with SPDTLW02 was denoted by SPDTAW02. Hereafter, SPDTAW02 will be simply referred to as *the 2002 SPD traditional longitudinal annual weight*. The 2002 SPD traditional longitudinal annual weight SPDTAW02 was assigned as described below.

7. For all sample people except the non-original young sample children, their SPDTAW02 were assigned the same as their SPDTLW02.
8. For the non-original young sample children whose designated parents are non-original sample people, their SPDTAW02 were assigned as zero.
9. For each non-original young sample child whose designated parent is an original sample person with zero SPDTLW02, their SPDTAW02 were assigned as zero.
10. For each non-original young sample child whose designated parent is an original sample person with positive SPDTLW02, an intermediate weight was assigned to her/him equal to her/his designated parent's positive SPDTLW02. Their intermediate weights of these non-original young sample children were then adjusted to match a set of June 2002 controls (benchmark estimates) classified by sex, race, and ethnicity to obtain the final values (positive) of their SPDTAW02.

The 2002 SPD traditional longitudinal annual weight SPDTAW02 was created to be used for estimating the annual (calendar year) characteristics of young children aged ten and below in 2002 for a data year up to 2001 because SPDTAW02 was adjusted to match the controls (benchmark estimates) for the cohort of children aged eight and below in June 2002 (to improve coverages). (The data for data years 1996, ..., 2001 was collected in the SPD 1997, ..., SPD 2002, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.) However, the 2002 SPD longitudinal annual weights SPDTAW02 of these young children are intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2002 because they were represented by the original sample young children (in a ten year old sample) and the non-original sample young children spawned from the original sample people (in a ten year old sample). Therefore, some caution should be given when interpreting results of the characteristic estimation for these young children.

Since the 2002 SPD traditional longitudinal annual weights SPDTAW02 were adjusted to match the June

2002 controls for the cohort consisting of children aged ten and below in 2002 (to improve coverages), the annual estimates of the characteristics of the young children in the entire age group of ten and below in 2002 using SPDTAW02 are theoretically more accurate than those of the young children of other age groups in 2002 (for examples, age group between six and ten in 2002, age group of five and below in 2002).

The advantage and disadvantage of using the 2002 SPD traditional longitudinal annual SPDTAW02 versus using the 2002 SPD quasi-longitudinal annual weight SPDQAW02 to make estimates of multiple year longitudinal characteristics was described in the section titled *2002 SPD Quasi-Longitudinal Panel Weight SPDQLW02 and Its Associated Longitudinal Annual Weight SPDQAW02*.

A description regarding making a choice between SPDTAW01 and SPDTAW02 for calendar year estimates of young children characteristics was provided in the section titled *2001 SPD Traditional Longitudinal Panel Weight SPDTLW01 and Its Associated Longitudinal Annual Weight SPDTAW01*.

### **Quasi-Longitudinal Panel Weight Set**

To utilize all six components of the SPD sample (the SPD core, Bridge non-interviewed, SIPP 1992/1993 non-interviewed, pre SPD panel universe leaver, pre 1998 SPD panel universe leaver, and pre 2002 SPD panel universe leaver sample components) for quasi-longitudinal analyses and estimates of the characteristics of the SPD panel universe, a set of three quasi-longitudinal panel final weights denoted by SPDQLW00, SPDQLW01, and SPDQLW02 was created. Namely:

11. SPDQLW00 is for analyses and estimates of the longitudinal characteristics of the people in the SPD panel universe covering any time spans or any two points in time within the period between data years 1992 and 1999, provided the analyst can appropriately approximate or impute any relevant missing data. (The data for data years 1996, ..., 1999 was collected in the SPD 1997 (Bridge, ..., SPD 2000, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.)
12. SPDQLW01 is for analyses and estimates of the longitudinal characteristics of the people in the SPD panel universe covering any time spans or any two points in time within the period between data years 1992 and 2001, provided the analyst can appropriately approximate or impute any relevant missing data. (The data for data years 1996, ..., 2000 was collected in the SPD 1997 (Bridge, ..., SPD 2001, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.)
13. SPDQLW02 is for analyses and estimates of the longitudinal characteristics of the people in the SPD panel universe covering any time spans or any two points in time within the period between data years 1992 and 2002, provided the analyst can appropriately approximate or impute any relevant missing data. (The data for data years 1996, ..., 2001 was collected in the SPD 1997 (Bridge, ..., SPD 2002, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.)

Hereinafter, SPDQLW00, SPDQLW01 and SPDQLW02 will be referred to as *the 2000 SPD quasi-longitudinal panel weight*, *2001 SPD quasi-longitudinal panel weight*, and *the 2002 SPD quasi-longitudinal panel weight*, respectively.

### **2000 SPD Quasi-Longitudinal Panel Weight SPDQLW00 and Its Associated Longitudinal Annual Weight SPDQAW00**

Only the original sample people (lived in a 1992/1993 SIPP panel household during wave 1 interview) belonging to one of the following cohorts have a positive *2000 SPD quasi-longitudinal panel weight* SPDQLW00 ( the definitions of the technical terms are available in the Weighting and Glossary sections).

*Cohort QLW00A* - The original sample people who belonged to sample component 1 (the SPD core sample component), and were *not* a 2000 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2000.

*Cohort QLW00B* - The original sample people who belonged to sample component 1 (the SPD core sample component), and *were* a 2000 SPD panel universe leaver.

*Cohort QLW00C* - The original sample people who belonged to sample component 2 (the SPD Bridge non-interviewed sample component), and were *not* a 2000 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2000.

*Cohort QLW00D* - The original sample people who belonged to sample component 2 (the SPD Bridge non-interviewed sample component), and *were* a 2000 SPD panel universe leaver.

*Cohort QLW00E* - All of the original sample people who belonged to sample component 4 (the pre SPD panel universe leaver sample component).

*Cohort QLW00F* - All of the original sample people who belonged to sample component 5 (the pre 1998 SPD panel universe leaver sample component).

All the other sample people included on the file have zero 2000 SPD quasi-longitudinal panel weight SPDQLW00.

Based on its weighting process, SPDQLW00 technically covers all data years (1992, 1993, 1994, 1996, 1997, 1998, and 1999). It was created to be used for estimates covering multiple years within data years 1992 to 1999. Note that the data for data years 1996, ..., 2001 was collected in the SPD 1997 (Bridge), ..., SPD 2002, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.

A description regarding how to make a choice among SPDQLW00, SPDQLW01 and SPDQLW02 to be used for estimating a multiple year characteristic was provided in the section titled *2001 SPD Quasi-Longitudinal Panel Weight SPDQLW01 and Its Associated Longitudinal Annual Weight SPDQAW01*.

The advantage of using SPDTLW01 over SPDQLW00 to make estimates is that all sample people with positive SPDTLW01 have complete annual data from data year 1992 to 2000. While (a) some sample people with positive SPDQLW00 do not have complete data for some data years except data year 1999,

and (b) based on the derivation of SPDQLW00, it is applicable only for longitudinal analyses or statistical estimates covered by a period of data years between 1992 through 1999.

On the other hand, the advantage of using the SPDQLW00 to make an estimate of a characteristic in lieu of using the SPDTLW01 is that the effective sample size (sample people with positive final weights) associated with SPDQLW00 is larger than the effective sample size associated with SPDTLW01. Thus, the sampling variance of an estimate using SPDQLW00 is theoretically smaller than the sampling variance (or standard error) of the estimate using SPDTLW00, namely, the estimate using the SPDQLW00 is more reliable (accurate) than the estimate using the SPDTLW01.

However, to use SPDQLW00 to estimate a characteristic involved with any data years other than data year 1999 if a sample person with positive SPDQLW00 was not interviewed (self, proxy, or imputed) for those data years, the characteristic of that sample person for those data years are blank (missing) on the file. Consequently, in estimating a characteristic of a cohort of people involved with data years other than 1999, if some of the sample people in the cohort have positive SPDQLW00 but do not have the characteristic data (missing value) for any of those data years, their missing data must be approximated or imputed (by the user) based on their available data from other data years; otherwise, SPDQLW00 should not be used for estimating the annual characteristic for that calendar year and SPDTLW01 or other more suitable weights should be used instead. Based on the derivation of SPDQLW00, it is particularly useful for evaluating socioeconomic changes among the SPD panel universe population between a pre welfare reform year of 1993 and a post welfare reform year of 1999.

To provide a means for estimating the annual or calendar characteristics of young children based on the data and the 2000 SPD quasi-longitudinal panel weight SPDQLW00 on the SPD third longitudinal file, the characteristics of the non-original sample children born after Wave 1 of the SIPP panels 1992 and 1993 must be also taken into account. (Namely, the children born after Wave 1 of the SIPP panels 1992 and 1993 are considered as young children.) By definition, the non-original young sample children associated with SPDQLW00 are those aged eight and below in 2000 if originated from the SIPP panel 1992, and aged seven and below in 2000 if originated from the SIPP panel 1993. To enable an accounting for the characteristics of these non-original young sample children in any annual estimates, positive longitudinal annual weights associated with SPDQLW00 were assigned to a cohort of these non-original sample children. The longitudinal annual final weight associated with SPDQLW00 was denoted by SPDQAW00. Hereafter, SPDQAW00 will be simply referred to as *the 2000 SPD quasi-longitudinal annual weight*. The 2000 SPD quasi-longitudinal annual weight SPDQAW00 was assigned as described below.

14. For all sample people except the non-original young sample children, their SPDQAW00 were assigned the same as their SPDQLW00.
15. For the non-original young sample children whose designated parents are non-original sample people, their SPDQAW00 were assigned as zero.
16. For each non-original young sample child whose designated parent is an original sample person with zero SPDQLW00, their SPDQAW00 were assigned as zero.
17. For each non-original young sample child whose designated parent is an original sample person with positive SPDQLW00, an intermediate weight was assigned to her/him equal to her/his designated parent's positive SPDQLW00. Their intermediate weights of these non-original young sample children were then adjusted to match a set of June 2000 controls (benchmark estimates)

classified by sex, race, and ethnicity to obtain the final values (positive) of their SPDQAW00.

The longitudinal annual weight SPDQAW00 was created to be used for estimating the annual (calendar year) characteristics of the young children aged eight and below in 2000 for a data year up to 1999 because SPDQAW00 was adjusted to match the controls (benchmark estimates) for the cohort of children aged eight and below in June 2000 (to improve coverages). (The data for data years 1996, ..., 2001 was collected in the SPD 1997, ..., SPD 2002, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.) However, the longitudinal annual weights SPDQAW00 of these young children are intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2000 because they were represented by the original sample young children (in an eight year old sample) and the non-original sample young children spawned from the original sample people (in an eight year old sample). Therefore, some caution should be given when interpreting results of the characteristic estimation for these young children.

Since the longitudinal annual weights SPDQAW00 were adjusted to match the June 2000 controls for the cohort consisting of children aged eight and below in 2000, the annual estimates of the characteristics of the young children in the entire age group of eight and below in 2000 using SPDQAW00 are theoretically more accurate than those of the young children of other age groups in 2000 (for examples, age group between six and eight in 2000, age group of five and below in 2000).

Similar to SPDQLW00, in using SPDQAW00 for estimating an annual characteristic (of young children aged eight or below in 2000) for a calendar year other than 1999 (data year) if a sample person with positive SPDQAW00 was not interviewed (self, proxy, or imputed) for that year, the characteristic of that sample person for that year is blank (missing) on the file. Consequently, in estimating an annual characteristic of a young children cohort for a calendar year, if some of the young sample children in the cohort have positive SPDQAW00 but do not have the annual characteristic data (missing value) for that calendar year, their data for that calendar year must be approximated or imputed (by the user) based on their available data from other years; otherwise, SPDQAW00 should not be used for estimating the annual characteristic for that calendar year, and other appropriate longitudinal annual weights on third longitudinal file should be used instead.

A description regarding how to make a choice among SPDQAW00, SPDQAW01, and SPDQAW02 to be used for calendar year estimates of young children characteristics was provided in the section titled *2001 SPD Quasi-Longitudinal Panel Weight SPDQLW01 and Its Associated Longitudinal Annual Weight SPDQAW01*.

### **2001 SPD Quasi-Longitudinal Panel Weight SPDQLW01 and Its Associated Longitudinal Annual Weight SPDQAW01**

Only the original sample people (lived in a 1992/1993 SIPP panel household during wave 1 interview) belonging to one of the following cohorts have a positive *2001 SPD quasi-longitudinal panel weight SPDQLW01* ( the definitions of the technical terms are available in the Weighting and Glossary sections).

*Cohort QLW01A* - The original sample people who belonged to sample component 1 (the SPD core sample component), were *not* a 2001 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2001.

*Cohort QLW01B* - The original sample people who belonged to sample component 1 (the SPD core sample component) and *were* a 2001 SPD panel universe leaver.

*Cohort QLW01C* - The original sample people who belonged to sample component 2 (the SPD Bridge non-interviewed sample component), were *not* a 2001 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2001.

*Cohort QLW01D* - The original sample people who belonged to sample component 2 (the SPD Bridge non-interviewed sample component) and *were* a 2001 SPD panel universe leaver.

*Cohort QLW01E* - The original sample people who belonged to sample component 3 (the SIPP 1992/1993 non-interviewed sample component), were *not* a 2001 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2001.

*Cohort QLW01F* - The original sample people who belonged to sample component 3 (the SIPP 1992/1993 non-interviewed sample component) and *were* a 2001 SPD panel universe leaver.

*Cohort QLW01G* - All of the original sample people who belonged to sample component 4 (the pre SPD panel universe leaver sample component).

*Cohort QLW01H* - All of the original sample people who belonged to sample component 5 (the pre 1998 SPD panel universe leaver sample component).

All the other sample people included on the file have zero 2001 SPD quasi-longitudinal panel weight SPDQLW01.

The advantage of using SPDTLW01 over SPDQLW01 to make estimates is that all sample people with positive SPDTLW01 have complete annual data from data year 1992 to 2000. While some sample people with positive SPDQLW01 do not have complete data for some data years except data year 2000.

On the other hand, the advantage of using the SPDQLW01 to make an estimate of a characteristic in lieu of using the SPDTLW01 is that the effective sample size (sample people with positive final weights) associated with SPDQLW01 is larger than the effective sample size associated with SPDTLW01. Thus, the sampling variance of an estimate using SPDQLW01 is theoretically smaller than the sampling variance (or standard error) of the estimate using SPDTLW01, namely, the estimate using the SPDQLW01 is more reliable (accurate) than the estimate using the SPDTLW01.

However, to use SPDQLW01 to estimate a characteristic involved with any data years other than data year 2000 if a sample person with positive SPDQLW01 was not interviewed (self, proxy, or imputed) for those data years, the characteristic of that sample person for those data years are blank (missing) on the file. Consequently, in estimating a characteristic of a cohort of people involved with data years other than 2000, if some of the sample people in the cohort have positive SPDQLW01 but do not have the characteristic data (missing value) for any of those data years, their missing data must be approximated or imputed (by the user) based on their available data from other data years; otherwise, SPDQLW01 should not be used for estimating the annual characteristic for that calendar year and SPDTLW01 or other more suitable weights should be used instead. Based on the derivation of SPDQLW01, it is particularly useful

for evaluating socioeconomic changes among the SPD panel universe population between a pre welfare reform year of 1993 and a post welfare reform year of 2000.

On the basis of weighting process, each of SPDQLW00, SPDQLW01, and SPDQLW02 can theoretically be used for making estimates covering multiple data years within 1992 to 2001. Consequently, regarding making a choice among using SPDQLW00, SPDQLW01, and SPDQLW02, missing data for any data years associated with an estimate of a multiple year characteristic must be taken into consideration on making a choice among using SPDQLW00, SPDQLW01, and SPDQLW02. It is cautioned that, for a multiple year estimate of a characteristic involving data year 2001, if SPDQLW00 or SPDQLW01 is used in lieu of SPDQLW02, a large number of sample people with positive SPDQLW00 or SPDQLW01 do not have data for the characteristic data year 2001 due to the SPD 2002 sample cut; and approximating or imputing a large number of missing data is likely inappropriate or impractical.

To provide a means for estimating the annual or calendar characteristics of young children based on the data and the 2001 SPD quasi-longitudinal panel weight SPDQLW01 on the SPD third longitudinal file, the characteristics of the non-original sample children born after Wave 1 of the SIPP panels 1992 and 1993 must be also taken into account. (Namely, the children born after Wave 1 of the SIPP panels 1992 and 1993 are considered as young children.) By definition, the non-original young sample children associated with SPDQLW01 are those aged nine and below in 2001 if originated from the SIPP panel 1992, and aged eight and below in 2001 if originated from the SIPP panel 1993. To enable an accounting for the characteristics of these non-original young sample children in any annual estimates, positive longitudinal annual weights associated with SPDQLW01 were assigned to a cohort of these non-original sample children. The longitudinal annual final weight associated with SPDQLW01 was denoted by SPDQAW01. Hereafter, SPDQAW01 will be simply referred to as *the 2001 SPD quasi-longitudinal annual weight*. The 2001 SPD quasi-longitudinal annual weight SPDQAW01 was assigned as described below.

18. For all sample people except the non-original young sample children, their SPDQAW01 were assigned the same as their SPDQLW01.
19. For the non-original young sample children whose designated parents are non-original sample people, their SPDQAW01 were assigned as zero.
20. For each non-original young sample child whose designated parent is an original sample person with zero SPDQLW01, their SPDQAW01 were assigned as zero.
21. For each non-original young sample child whose designated parent is an original sample person with positive SPDQLW01, an intermediate weight was assigned to her/him equal to her/his designated parent's positive SPDQLW01. Their intermediate weights of these non-original young sample children were then adjusted to match a set of June 2001 controls (benchmark estimates) classified by sex, race, and ethnicity to obtain the final values (positive) of their SPDQAW01.

The longitudinal annual weight SPDQAW01 was created to be used for estimating the annual (calendar year) characteristics of the young children aged nine and below in 2001 for a data year up to 2000 because SPDQAW01 was adjusted to match the controls (benchmark estimates) for the cohort of children aged eight and below in June 2001 (to improve coverages). (The data for data years 1996, ..., 2000 was collected in the SPD 1997, ..., SPD 2001, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.) However, the longitudinal annual weights SPDQAW01 of these young children are intended only as an approximate representation for the civilian noninstitutionalized young

children living in the United States in 2001 because they were represented by the original sample young children (in a nine year old sample) and the non-original sample young children spawned from the original sample people (in a nine year old sample). Therefore, some caution should be given when interpreting results of the characteristic estimation for these young children.

Since the longitudinal annual weights SPDQAW01 were adjusted to match the June 2001 controls for the cohort consisting of children aged nine and below in 2001, the annual estimates of the characteristics of the young children in the entire age group of nine and below in 2001 using SPDQAW01 are theoretically more accurate than those of the young children of other age groups in 2001 (for examples, age group between six and nine in 2001, age group of five and below in 2001).

Similar to SPDQLW01, in using SPDQAW02 for estimating an annual characteristic for a calendar year other than 2000 (data year) if a sample person with positive SPDQAW01 was not interviewed (self, proxy, or imputed) for that year, the characteristic of that sample person for that year is blank (missing) on the file. Consequently, in estimating an annual characteristic of a young children cohort for a calendar year, if some of the young sample children in the cohort have positive SPDQAW01 but do not have the annual characteristic data (missing value) for that calendar year, their data for that calendar year must be approximated or imputed (by the user) based on their available data from other years; otherwise, SPDQAW01 should not be used for estimating the annual characteristic for that calendar year, and other longitudinal annual weights on the file should be used instead.

The advantage of using SPDQAW01 in lieu of SPDTAW01 to make a calendar year estimate of a characteristic of a cohort of young children (aged nine or below in 2001) is that the effective sample size (sample people with positive final weights) associated with SPDQAW01 is larger than the effective sample size associated with SPDTAW01. Thus the sampling variance (or standard error) of the calendar year estimate using SPDQAW01 is theoretically smaller than the sampling variance of the calendar year estimate using SPDTAW01, namely, the calendar year estimate using SPDQAW01 is more reliable (accurate) than the calendar year estimate using SPDTAW01.

On the other hand, for a calendar estimate of a characteristic of a cohort of young children (aged nine or below in 2001) other than calendar year 2000, the calendar year estimate using SPDQAW01 in lieu of SPDTAW01 may encounter some sample people with positive SPDQAW01 having missing data for the characteristic for that calendar year. While, all the sample people with positive SPDTAW01 have data for the characteristic in every calendar up to calendar year (data year) 2000. Thus to use SPDQAW01 for a calendar year estimate other than 2000, the associated missing data of the sample people with positive SPDQAW01 for the calendar year must be approximated or imputed (by user), otherwise SPDTAW01 or other appropriate longitudinal annual weights (on the second or third longitudinal file) should be used instead.

Regarding making a choice among SPDQAW00, SPDQAW01, and SPDQAW02 for calendar year estimates of young children characteristics, SPDQAW00, SPDQAW01, and SPDQAW02 were created to be used for estimating calendar year characteristics of young children in 2000, 2001, and 2002, respectively. This is because SPDQAW00 was adjusted to match the June 2000 controls for the cohort consisting of children aged eight and below in 2000, SPDQAW01 was adjusted to match the June 2001 controls for the cohort consisting of children aged nine and below in 2001, and SPDQAW02 was adjusted to match the June 2002 controls for the cohort consisting of children aged ten and below in 2002.

## 2002 SPD Quasi-Longitudinal Panel Weight SPDQLW02 and Its Associated Longitudinal Annual Weight SPDQAW02

Only the original sample people (lived in a 1992/1993 SIPP panel household during wave 1 interview) belonging to one of the following cohorts have a positive *2002 SPD quasi-longitudinal panel weight* SPDQLW02 ( the definitions of the technical terms are available in the Weighting and Glossary sections).

*Cohort QLW02A* - The original sample people who belonged to sample component 1 (the SPD core sample component), survived the SPD 2002 sample cut, were *not* a 2002 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2002.

*Cohort QLW02B* - The original sample people who belonged to sample component 1 (the SPD core sample component), survived the SPD 2002 sample cut, and *were* a 2002 SPD panel universe leaver.

*Cohort QLW02C* - The original sample people who belonged to sample component 2 (the SPD Bridge non-interviewed sample component), survived the SPD 2002 sample cut, were *not* a 2002 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2002.

*Cohort QLW02D* - The original sample people who belonged to sample component 2 (the SPD Bridge non-interviewed sample component), survived the SPD 2002 sample cut, and *were* a 2002 SPD panel universe leaver.

*Cohort QLW02E* - The original sample people who belonged to sample component 3 (the SIPP 1992/1993 non-interviewed sample component), survived the SPD 2002 sample cut, were *not* a 2002 SPD panel universe leaver, and were interviewed (self, proxy, or imputed) in the SPD 2002.

*Cohort QLW02F* - The original sample people who belonged to sample component 3 (the SIPP 1992/1993 non-interviewed sample component), survived the SPD 2002 sample cut, and *were* a 2002 SPD panel universe leaver.

*Cohort QLW02G* - All of the original sample people who belonged to sample component 4 (the pre SPD panel universe leaver sample component).

*Cohort QLW02H* - All of the original sample people who belonged to sample component 5 (the pre 1998 SPD panel universe leaver sample component).

*Cohort QLW02I* - All of the original sample people who belonged to (a) sample component 1 (the SPD core sample component) and sample component 6 (the pre 2002 SPD panel universe leaver sample component) or (b) sample component 2 (the SPD Bridge non-interviewed sample component) and sample component 6 or (c) sample component 3 (the SIPP 1992/1993 non-interviewed sample component) and sample component 6. Note that, by definition, all of the original sample people belonging to sample component 6 are 2002 SPD quasi-longitudinal panel universe leavers.

All the other sample people included on the file have zero 2002 SPD quasi-longitudinal panel weight SPDQLW02.

The advantage of using SPDTLW02 over SPDQLW02 to make estimates is that all sample people with positive SPDTLW02 have complete annual data from data year 1992 to 2001. While some sample people with positive SPDQLW02 do not have complete data for some data years except data year 2000.

On the other hand, the advantage of using the SPDQLW02 to make an estimate of a characteristic in lieu of using the SPDTLW02 is that the effective sample size (sample people with positive final weights) associated with SPDQLW02 is larger than the effective sample size associated with SPDTLW02. Thus, the sampling variance of an estimate using SPDQLW02 is theoretically smaller than the sampling variance (or standard error) of the estimate using SPDTLW02, namely, the estimate using the SPDQLW02 is more reliable (accurate) than the estimate using the SPDTLW02.

However, to use SPDQLW02 to estimate a characteristic involved with any data years other than 2001 if a sample person with positive SPDQLW02 was not interviewed (self, proxy, or imputed) for those data years, the characteristic of that sample person for those data years are blank (missing) on the file. Consequently, in estimating a characteristic of a cohort of people involved with data years other than 2001, if some of the sample people in the cohort have positive SPDQLW02 but do not have the characteristic data (missing value) for any of those data years, their missing data must be approximated or imputed (by the user) based on their available data from other data years; otherwise, SPDQLW02 should not be used for estimating the annual characteristic for that calendar year and SPDTLW02 or other more suitable weights should be used instead. Based on the derivation of SPDQLW02, it is particularly useful for evaluating socioeconomic changes among the SPD panel universe population between a pre welfare reform year of 1993 and a post welfare reform year of 2001.

A description regarding how to make a choice among SPDQLW00, SPDQLW01 and SPDQLW02 for estimating a multiple year characteristic was provided in the section titled *2001 SPD Quasi-Longitudinal Panel Weight SPDQLW01 and Its Associated Longitudinal Annual Weight SPDQAW01*.

To provide a means for estimating the annual or calendar characteristics of young children based on the data and the 2002 SPD quasi-longitudinal panel weight SPDQLW02 on the SPD third longitudinal file, the characteristics of the non-original sample children born after Wave 1 of the SIPP panels 1992 and 1993 must be also taken into account. (Namely, the children born after Wave 1 of the SIPP panels 1992 and 1993 are considered as young children.) By definition, the non-original young sample children associated with SPDQLW01 are those aged ten and below in 2002 if originated from the SIPP panel 1992, and aged eight and below in 2002 if originated from the SIPP panel 1993. To enable an accounting for the characteristics of these non-original young sample children in any annual estimates, positive longitudinal annual weights associated with SPDQLW02 were assigned to a cohort of these non-original sample children. The longitudinal annual final weight associated with SPDQLW02 was denoted by SPDQAW02. Hereafter, SPDQAW02 will be simply referred to as *the 2002 SPD quasi-longitudinal annual weight*. The 2002 quasi-longitudinal annual weight SPDQAW02 was assigned as described below.

22. For all sample people except the non-original young sample children, their SPDQAW02 were assigned the same as their SPDQLW02.

23. For the non-original young sample children whose designated parents are non-original sample people, their SPDQAW02 were assigned as zero.
24. For each non-original young sample child whose designated parent is an original sample person with zero SPDQLW02, their SPDQAW02 were assigned as zero.
25. For each non-original young sample child whose designated parent is an original sample person with positive SPDQLW02, an intermediate weight was assigned to her/him equal to her/his designated parent's positive SPDQLW02. Their intermediate weights of these non-original young sample children were then adjusted to match a set of June 2002 controls (benchmark estimates) classified by sex, race, and ethnicity to obtain the final values (positive) of their SPDQAW02.

The longitudinal annual weight SPDQAW02 was created to be used for estimating the annual (calendar year) characteristics of the young children aged ten and below in 2002 for a data year up to 2001 because SPDQAW02 was adjusted to match the controls (benchmark estimates) for the cohort of children aged eight and below in June 2002 (to improve coverages). (The data for data years 1996, ..., 2001 was collected in the SPD 1997, ..., SPD 2002, respectively, and the data for other data years was from the SIPP panels 1992 and 1993.) However, the longitudinal annual weights SPDQAW02 of these young children are intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2002 because they were represented by the original sample young children (in a ten year old sample) and the non-original sample young children spawned from the original sample people (in a ten year old sample). Therefore, some caution should be given when interpreting results of the characteristic estimation for these young children.

Since the longitudinal annual weights SPDQAW02 were adjusted to match the June 2002 controls for the cohort consisting of children aged ten and below in 2002, the annual estimates of the characteristics of the young children in the entire age group of ten and below in 2002 using SPDQAW02 are theoretically more accurate than those of the young children of other age groups in 2002 (for examples, age group between six and ten in 2002, age group of five and below in 2002).

Similar to SPDQLW02, in using SPDQAW02 for estimating an annual characteristic for a calendar year other than 2001 (data year) if a sample person with positive SPDQAW02 was not interviewed (self, proxy, or imputed) for that year, the characteristic of that sample person for that year is blank (missing) on the file. Consequently, in estimating an annual characteristic of a young children cohort for a calendar year, if some of the young sample children in the cohort have positive SPDQAW02 but do not have the annual characteristic data (missing value) for that calendar year, their data for that calendar year must be approximated or imputed (by the user) based on their available data from other years; otherwise, SPDQAW02 should not be used for estimating the annual characteristic for that calendar year, and other longitudinal annual weights on the file should be used instead.

The advantage of using SPDQAW02 in lieu of SPDTAW02 to make a calendar year estimate of a characteristic of a cohort of young children (aged ten or below in 2002) is that the effective sample size (sample people with positive final weights) associated with SPDQAW02 is larger than the effective sample size associated with SPDTAW02. Thus the sampling variance (or standard error) of the calendar year estimate using SPDQAW02 is theoretically smaller than the sampling variance of the calendar year estimate using SPDTAW02, namely, the calendar year estimate using SPDQAW02 is more reliable (accurate) than the calendar year estimate using SPDTAW02.

On the other hand, for a calendar estimate of a characteristic of a cohort of young children (aged ten or below in 2002) other than calendar year 2001, the calendar year estimate using SPDQAW02 in lieu of SPDTAW02 may encounter some sample people with positive SPDQAW02 having missing data for the characteristic for that calendar year. While, all the sample people with positive SPDTAW02 have data for the characteristic in every calendar up to calendar year (data year) 2001. Thus to use SPDQAW02 for a calendar year estimate other than 2002, the associated missing data of the sample people with positive SPDQAW02 for the calendar year must be approximated or imputed (by user), otherwise SPDTAW02 or other appropriate longitudinal annual weights (on the second or the third longitudinal file) should be used instead.

A description regarding how to make a choice among SPDQAW00, SPDQAW01, and SPDQAW02 to be used for a calendar year estimate of a young children characteristic was provided in the section titled *2001 SPD Quasi-Longitudinal Panel Weight SPDQLW01 and Its Associated Longitudinal Annual Weight SPDQAW01*.

### **Summary of the Weights on the SPD Files**

A summary of the weights on the SPD third longitudinal files and their application for estimation described above are provided in table 8.

### **Estimation of Person Characteristics**

For the estimation of the person characteristics in the SPD panel universe using the SPD third longitudinal file, one must first determine which one of the five panel weights to be used based on the advantage and disadvantage discussion provided earlier in the Estimation section. As described earlier, these five weights are the 2001 traditional longitudinal panel weight (SPDTLW01), the 2002 traditional longitudinal panel weight (SPDTLW02), the 2000 quasi-longitudinal panel weight (SPDQLW00), the 2001 quasi-longitudinal panel weight (SPDQLW01), and 2002 quasi-longitudinal panel weight (SPDQLW02). Hereinafter, a panel weight (SPDTLW01, SPDTLW02, SPDQLW00, SPDQLW01, SPDQLW02) chosen for estimating a characteristic or characteristics of a cohort of people (persons) in the SPD panel universe, it will be generically referred to as “*the longitudinal person weight*” for further discussion. Some basic types of longitudinal estimates (using the SPD second longitudinal file) can be constructed using the longitudinal person weights are described below in terms of estimated numbers.

1. The number of people who have ever experienced a characteristic or situation during a given period of time (for example, the number of people who experience unemployment during 2001). To construct such an estimate, sum the weights over all people who possessed the characteristic of interest at some point during the time period of interest.
2. The amount of a characteristic accumulated by people during a given time period (for example, the amount of unemployment compensation received by unemployed people during 2001). To construct such an estimate, compute the product of the weight times the amount of the characteristic and sum this product over all appropriate people.
3. The average number of consecutive months or years of possession of a characteristic (i.e., the spell length for a characteristic.) For example, one could estimate the average spell of unemployment

that elapsed before a person found a new job. (*Note that, similar to the SPD first and second longitudinal files, the SPD third longitudinal file provides the employment data only in terms of week numbers with and without employment in a given year. Thus, for calculation the average unemployment spell length in a time period of interest, the data user needs to match the sample person's record back to the one on the SIPP longitudinal file to determine the number of spells in the time period and/or needs to make some justifiable approximation on the number of unemployment spells within the time period of interest.*) To construct such an estimate, first identify the sample persons possessing the characteristic at some point during the time period of interest. Then, create two sums of these (longitudinal person) weights: Sum 1 is the sum of the products of the weights times the number of months (or years) the spell lasted, and Sum 2 is the sum of the weights only. The average spell length in months (or years) is given by Sum 1 divided by Sum 2. A person who experienced two spells during the time period of interest would be treated as two persons and appear twice in Sum 1 and Sum 2. An alternate method of calculating the average can be found in the section "Standard Error of a Mean or an Aggregate."

*Note that spells extending before or after the time period of interest are cut off (censored) at the boundaries of the time period. If they are used in estimating average spell length, a downward bias will result.*

4. The number of year-to-year changes in the status of a characteristic (i.e., number of transitions) summed over every set of two consecutive years during the time of interest. To construct such estimate, sum the longitudinal person weights each time a change is reported between two consecutive years during the time period of interest. For example, to estimate the number of persons who changed from receiving any public assistance in 1999 to not receiving in 2000 add together the longitudinal person weights of each person who had such a change.
5. Yearly estimates of a characteristic average over a number of consecutive years. For example, we could estimate the yearly average number of food stamp recipients over 1996 through 2001. To construct such an estimate, first form an estimate for each year in the time period of interest by summing up the longitudinal person weights of those who possessed the characteristic of interest. Then sum the yearly estimates and divide it by the number of years in the time period of interest.

## **ACCURACY OF ESTIMATES**

SPD estimates are based on a sample; they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaire, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: non-sampling and sampling. We are able to provide estimates of the magnitude of SPD sampling error, but this is not true of non-sampling error. The next sections describe sources of SPD non-sampling error, followed by a discussion of sampling error, its estimation, and its use in data analysis.

Note that estimates from this sample for individual states are subject to very high sampling errors and are not recommended. The state codes on the file are primarily of use for linking respondent characteristics with appropriate contextual variables (e.g., state-specific welfare criteria) and for tabulating data by user-defined groupings of states.

## Non-sampling Errors

Non-sampling errors can be attributed to many sources, for examples, inability to obtain information about all cases in the sample, difficulties in precisely stating some definitions, differences in the interpretation of questions, inability or unwillingness on the part of the respondents to provide correct information, inability to recall information, and the following errors made. These errors generally include collection such as in recording or coding the data, processing the data, estimating values for missing data, biases resulting from the differing recall periods caused by the rotation pattern used, and under coverage. Quality control and edit procedures were used to reduce errors made by respondents, coders and interviewers.

Under-coverage in SPD results from missed living quarters and missed people within sample households. It is known that under coverage varies with age, race, and gender. Generally, under-coverage is larger for males than for females and larger for Blacks than for non-Blacks. Ratio estimation to independent age-race-gender population controls (benchmark estimates) partially corrects for the bias due to survey under-coverage. However, biases exist in the estimates to the extent that people in missed households or missed people in interviewed households have characteristics different from those of interviewed people in the same age-race-gender group. In addition, the independent population controls used have not been adjusted for under-coverage in the decennial census. The Census Bureau has used complex techniques to adjust the weights for non-response. For an explanation of the techniques used, see the "Non-response Adjustment Methods for Demographic Surveys at the U.S. Bureau of the Census," November 1988, Working Paper 8823, by R. Singh and R. Petroni. An example of successfully avoiding bias can be found in "Current Non-response Research for the Survey of Income and Program Participation" (paper by Petroni, presented at the Second International Workshop on Household Survey Non-response, October 1991). The procedure for calculating the longitudinal person weights on the SPD third longitudinal file was derived based on such complex techniques.

Unlike SIPP data that can be analyzed from a cross-sectional or longitudinal view point, the SPD data are practically just longitudinal (due to the high age of the SPD sample) and should be used as such. Utilizing the SPD data cross-sectionally is generally not recommended. For example, the income and poverty estimates in a given single year may not be comparable with those from other surveys such as the Current Population Survey (CPS) and the SIPP. This is principally attributable to the fact that the sample per se and the longitudinal person weights on the SPD third longitudinal file essentially represents just the cohort of civilian people around March 1993. As the SPD sample aged more, it will become less adequate to represent the more current population (say, the 2001 population). In addition, the high non-response rate in the SPD may reduce the degree of the effectiveness of the non-interview adjustment process to fully compensate for differential attrition. The non-response rates of the SPD full sample between 1997 to 2002 vary approximately between 15% and 35%, and the accumulative sample loss rates of the SPD full sample between 1992 to 2002 vary approximately between 34.2% and 50%. (The SPD full sample consists of the components: the SPD core, Bridge non-interview, and the SIPP 1992/1993 non-interview components.) Note that the SPD sample inherits approximately 27% sample loss from the SIPP panels 1992 and 1993.

## Comparability with Other Estimates

Caution should be exercised when comparing data from this file with data from SIPP publications or with data from other surveys, such as Current Population Survey (CPS). The comparability problems are caused by such sources as the seasonal patterns for many characteristics, different non-sampling errors, and different concepts and procedures. Refer to the *SIPP Quality Profile* for known differences with data from other sources and further discussion.

## Sampling Variability

Standard errors indicate the magnitude of the sampling error. They also partially measure the effect of some non-sampling errors in response and enumeration, but do not measure any systematic biases in the data. The standard errors for the most part measure the variations that occurred by chance because a sample rather than the entire population was surveyed.

## USES AND COMPUTATION OF STANDARD ERRORS

### Confidence Intervals

The sample estimate and its standard error enable one to construct confidence intervals (ranges that would include the average result of all possible samples with a known probability). For example, if all possible samples were selected, each of these being surveyed under essentially the same conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.
2. Approximately 95 percent of the intervals from 1.960 standard errors below the estimate to 1.960 standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with a specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

### Hypothesis Testing

Standard errors may also be used for hypothesis testing, a procedure for distinguishing between population characteristics using sample estimates. The most common types of hypothesis tests are the population characteristics being identical versus being different. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the characteristics are different when, in fact, they are identical.

To perform the most common test, compute the difference  $X_A - X_B$ , where  $X_A$  and  $X_B$  are sample estimates of the characteristics of interest. A later section explains how to derive an estimate of the standard error of the difference  $X_A - X_B$ . Let that standard error be  $s_{DIFF}$ . If  $X_A - X_B$  is between  $-1.645$

times  $s_{DIFF}$  and  $+1.645$  times  $s_{DIFF}$ , no conclusion about the characteristics is justified at the 10 percent significance level. If, on the other hand,  $X_A - X_B$  is smaller than  $-1.645$  times  $s_{DIFF}$  or larger than  $+1.645$  times  $s_{DIFF}$ , the observed difference is significant at the 10 percent level. In this event, it is commonly accepted practice to say that the characteristics are different. We recommend that users report only those differences that are significant at the 10 percent level or better. Of course, sometimes this conclusion will be wrong. When the characteristics are, in fact, the same, there is a 10 percent chance of concluding that they are different.

Note that as more tests are performed, more erroneous significant differences will occur. For example, at the 10 percent significance level, if 100 independent hypothesis tests are performed in which there are no real differences, it is likely that about 10 erroneous differences will occur. Therefore, the significance of any single test should be interpreted cautiously. However, we can generally increase the power of the test by using a multiple test (multiple comparison procedure) in lieu of a series of independent pair tests. For a number of simultaneous tests of five or less, we recommend Bonferroni's procedure which generally provides a simple and acceptable answer to multiple tests. It is, however, highly conservative and not recommended if the number of tests are higher than five because other available multiple comparison procedures (such as least significant difference test, Newman-Kuels test, Scheffe's test, etc.) are generally preferable.

### **Caution Concerning Small Estimates and Small Differences**

Because of the large standard errors involved, there is little chance that estimates will reveal useful information when computed on a base smaller than 200,000. Also, non-sampling error in one or more of the small number of cases providing the estimate can cause large relative error in that particular estimate. Therefore, care must be taken in the interpretation of small differences since even a small amount of non-sampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

### **Standard Error Parameters**

Most SPD estimates have greater standard errors than those obtained through a simple random sample because clusters of living quarters were sampled for the SIPP Panels 1992 and 1993 from which the SPD 1997 to SPD 2002 samples were originated. To derive standard errors that would be applicable to a wide variety of estimates and could be prepared at a moderate cost, a number of approximations were required. Estimates with similar standard error behavior were grouped together and two parameters (denoted  $a$  and  $b$ ) were developed to approximate the standard error behavior of each group of estimates. Because the actual standard error behavior was not identical for all estimates within a group, the standard errors computed from these parameters provide an indication of the order of magnitude of the standard error for any specific estimate. These  $a$  and  $b$  parameters vary by characteristic and by demographic subgroup to which the estimate applies. The  $a$  and  $b$  parameters are also known as "generalized variance parameters."

For the SPD third longitudinal file, the  $a$  and  $b$  parameters for various groups of the populations and the six types of weights (described below) are provided in Tables 3 to 7. Hereinafter, *the a and b parameters in Tables 3 to 7* will be referred to as *the base a and b parameters*.

As described earlier in the Weighting section, there are ten types of weights on the SPD third longitudinal file as listed below.

1. 2001 traditional longitudinal panel weight (SPDTLW01)
2. 2001 longitudinal annual weight (SPDTAW01) associated with the traditional longitudinal panel weight (SPDTLW01)
3. 2002 traditional longitudinal panel weight (SPDTLW02)
4. 2002 longitudinal annual weight (SPDTAW02) associated with the traditional longitudinal panel weight (SPDTLW02)
5. 2000 quasi-longitudinal panel weight (SPDQLW00)
6. 2000 quasi-longitudinal annual weight (SPDQAW00) associated with the 2000 quasi-longitudinal panel weight (SPDQLW00)
7. 2001 quasi-longitudinal panel weight (SPDQLW01)
8. 2001 quasi-longitudinal annual weight (SPDQAW01) associated with the 2001 quasi-longitudinal panel weight (SPDQLW01)
9. 2002 quasi-longitudinal panel weight (SPDQLW02)
10. 2002 quasi-longitudinal annual weight (SPDQAW02) associated with the 2002 quasi-longitudinal panel weight (SPDQLW02)

The applications for each of the ten weights are described earlier in the Estimation section which also includes the applications of the traditional and quasi-longitudinal annual weights (SPDTAW01, SPDTAW02, SPDQAW00, SPDQAW01, and SPDQAW02) for annual estimates of characteristics of young children (based on non-original sample children born after wave 1 of the SIPP panels 1992 and 1993).

The generalized variance parameters (*a* and *b*) for the 2001 traditional longitudinal panel weight (SPDTLW01) and the associated traditional longitudinal annual weight (SPDTAW01) are the same as provided in Table 3. The generalized variance parameters (*a* and *b*) for the 2002 traditional longitudinal panel weight (SPDTLW02) and the associated traditional longitudinal annual weight (SPDTAW02) are the same as provided in Table 4. Similarly, the generalized variance parameters (*a* and *b*) for the 2000 quasi-longitudinal panel weight (SPDQLW00) and the associated quasi-longitudinal annual weight (SPDQAW00) are the same as provided in Table 5, the generalized variance parameters (*a* and *b*) for the 2001 quasi-longitudinal panel weight (SPDQLW01) and the associated quasi-longitudinal annual weight (SPDAWQ01) are the same as provided in Table 6, and the generalized variance parameters (*a* and *b*) for the 2002 quasi-longitudinal panel weight (SPDQLW02) and the associated quasi-longitudinal annual weight (SPDAWQ02) are the same as provided in Table 7. The sample sizes associated with longitudinal annual weights, SPDTAW01, SPDTAW02, and SPDQAW00, SPDQAW01, and SPDQAW02 are slightly

larger than the sample sizes associated with the traditional and quasi longitudinal panel weights, SPDTLW01, SPDTLW02, SPDQLW00, SPDQLW01, and SPDQLW02, respectively, because some of the non-original sample children were included as part of the longitudinal annual sample as described earlier in the Weighting section. The generalized variance parameters (*a* and *b*) were derived based on the sample sizes associated with SPDTLW01, SPDTLW02, SPDQLW00, SPDQLW01, and SPDQLW02. Therefore, the generalized variances parameters provided in Tables 3 to 7 will theoretically produce slightly more conservative variance estimates associated with young children born after wave 1 of the SIPP panels 1992 and 1993.

### Computation of Standard Error Parameters

In this section we discuss the adjustment of base *a* and *b* parameters (Tables 3 to 7) to provide *a* and *b* parameters appropriate for each type of longitudinal described in the section "Estimation of Person Characteristics." Later sections will discuss the use of the adjusted parameters in various formulas to compute standard errors of estimated numbers, percents, averages, etc. Tables 3 to 7 provide the base *a* and *b* parameters needed to compute the approximate standard errors for estimates.

The creation of appropriate *a* and *b* parameters for the types of estimates discussed in the section "Estimation of Person Characteristics" is described below. It is assumed that the full sample is used for the estimation.

1. The number of people who have ever experienced a characteristic during a given time period. The appropriate *a* and *b* parameters are taken directly from Tables 3 to 7 (the base *a* and *b* parameters). The choice of parameter depends on the characteristic of interest and the demographic subgroup of interest.
2. Amount of a characteristic accumulated by people during a given time period. The appropriate *a* and *b* parameters are also taken directly from Tables 3 to 7.
3. The average number of consecutive months or years of possession of a characteristic per spell (i.e., the average spell length for a characteristic) during a given time period. Start with the appropriate base *a* and *b* parameters from Tables 3 to 7. The parameters are then inflated by an additional factor, *g* to account for persons who experience multiple spells during the time period of interest. The *g* factor is computed by Formula 1 below.

$$g = \frac{\sum_{i=1}^n m_i^2}{\sum_{i=1}^n m_i} \quad (1)$$

where there are *n* persons with at least one spell and *m<sub>i</sub>* is the number of spells experienced by person *i* during the time period of interest.

4. The number of years-to-year changes in the status of a characteristic (i.e., number of transitions) summed over every set of two consecutive years during the time period of interest. Obtain a set of adjusted  $a$  and  $b$  parameters exactly as just described in 3, then multiply these parameters by an additional factor of 2.0. The factor of 2.0 is based on the assumption that each spell produces two transitions within the time period of interest.
5. Yearly estimates of characteristic averaged over a number of consecutive years. Appropriate base  $a$  and  $b$  parameters are taken directly from Tables 3 to 7.

### Standard Errors of Estimated Numbers

The approximate standard error  $s_x$  of an estimated number  $x$  of people, families and so forth, can be obtained by using Formula 2 provided below.

$$s_x = \sqrt{ax^2 + bx} \tag{2}$$

Here  $a$  and  $b$  are the standard error parameters associated with the particular type of characteristic for the appropriate longitudinal time period. For the analysis using the SPD data on the SPD third longitudinal file, the  $a$  and  $b$  parameters are provided in Tables 3 to 7.

$$s_x = \sqrt{(-0.0001656)(34,122,000)^2 + (28,254)(34,122,000)} = 878,222 \text{ people}$$

An illustration would be to suppose that using the SPD

third longitudinal file data, the estimate of the number of people ever receiving Social Security since 1993 and continuing to 2001 is

34,122,000 which was derived using the 2002 traditional longitudinal panel weight (SPDTLW02). The appropriate  $a$  and  $b$  parameters to use in calculating a standard error for the estimate are obtained from Table 4. They are  $a = -0.0001656$ ,  $b = 28,254$ . Using Formula (2), the approximate standard error  $s_x$  is

The 90-percent confidence interval as shown by the data is from 32,677,454 to 35,566,546. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 90 percent of all samples. Similarly, the 95-percent confidence interval as shown by the data is from 32,400,717 to 35,843,283 and we could conclude that the average estimate derived from all possible samples lies within this interval.

## Standard Error of a Mean or an Aggregate

A mean  $\bar{x}$  is defined here to be the average quantity of some characteristic (other than the number of people, families, or households) per person, family, or household. An aggregate  $k$  is defined to be the total quantity of some characteristic summed over all units in a sub-population. For example, a mean could be the average annual income of females age 25 to 34. The standard error  $s_{\bar{x}}$  of a mean can be approximated by Formula 3 and the standard error  $s_k$  of an aggregate can be approximated by Formula 4. Because of the approximations used in developing Formulas 3 and 4, an estimate of the standard error of the mean or aggregate obtained from these formulas will generally underestimate the true standard error. The formula used to estimate the standard error  $s_{\bar{x}}$  of a mean  $\bar{x}$  is

$$s_{\bar{x}} = \sqrt{\left(\frac{b}{y}\right) s^2} \quad (3)$$

where  $y$  is the base  $s^2$  is the estimated population variance of the characteristic and  $b$  is the standard error parameter associated with the type of the characteristic. The standard error  $s_k$  of an aggregate  $k$  is

$$s_k = \sqrt{by s^2} \quad (4)$$

The population variance  $s^2$  may be estimated by one of two methods: the first method uses data that has been grouped into intervals, the second method uses ungrouped data. The second method is recommended because it is more precise. However, the first method will be easier to implement if grouped data are already being used as part of the analysis. In both methods, let  $x_i$  denote the value of the characteristic for the  $i^{\text{th}}$  person.

To use the first method, the range of values for the characteristic is divided into  $c$  intervals, where the lower and upper boundaries of interval  $j$  are  $Z_{j-1}$  and  $Z_j$ , respectively. Each person is placed into one of the  $c$  groups such that the value of the characteristic,  $x_i$  is between  $Z_{j-1}$  and  $Z_j$ . The estimated population variance,  $s^2$  is then given by Formula 5 below.

$$s^2 = \sum_{j=1}^c p_j m_j^2 - \bar{x}^2 \quad (5)$$

where  $p_j$  is the estimated proportion of people in group  $j$  (based on weighted data), and  $m_j$  is given by the equation below.

$$m_j = \frac{Z_{j-1} + Z_j}{2}, \text{ for } j = 1, 2, \dots, c$$

The most representative value of the characteristic in group  $j$  is assumed to be  $m_j$ . If group  $c$  is open-ended, that is, no upper interval boundary exists, then an approximate value for  $m_c$  is by the equation below.

$$m_c = \left(\frac{3}{2}\right)Z_{c-1}$$

The mean  $\bar{x}$  can be obtained using Formula 6 below.

$$\bar{x} = \sum_{j=1}^c p_j m_j \tag{6}$$

In the second method, the estimated population variance  $s^2$  is determined using Formula 7 below.

$$s^2 = \frac{\sum_{i=1}^n w_i x_i^2}{\sum_{i=1}^n w_i} - \bar{x}^2 \tag{7}$$

where there are  $n$  sample people with the characteristic of interest and  $w_i$  is the final weight for person  $i$ . The mean  $\bar{x}$  can be obtained from Formula 8 below.

$$\bar{x} = \frac{\sum_{i=1}^n w_i x_i}{\sum_{i=1}^n w_i} \tag{8}$$

Note that, by definition,  $y$  (the size of the base) in Formulas 3 and 4 can be obtained from the equation below.

$$y = \sum_{i=1}^n w_i$$

An illustration of Method 1 would be to suppose that, based on the 2002 traditional longitudinal panel weight (SPDTLW02), the 2001 distribution of annual incomes is given in Table 2 for people aged 25 to 34, in 2002, who were employed for all 12 months of 2001. The mean annual cash income from Formula 8 is

$$\bar{x} = \frac{1,371}{39,851}(2,500) + \frac{1,651}{39,851}(6,250) + \dots + \frac{1,493}{39,851}(105,000) = \$26,717$$

Using Formula 7 and the mean annual cash income of \$26,717 the estimated population variance,  $s^2$  is

$$s^2 = \frac{1,371}{39,851}(2,500)^2 + \frac{1,651}{39,851}(6,250)^2 + \dots + \frac{1,493}{39,851}(105,000)^2 = 468,331,633$$

The appropriate  $b$  parameter from Table 4 is 15427. Now, using Formula 3, the estimated standard error of the mean is

$$s_{\bar{x}} = \sqrt{\frac{15,427}{39,851,000}(468,331,633)} = \$426$$

An illustration of Method 2 would be to suppose that we are interested in estimating the average length of spell of receiving public assistance during 1992-1994 (just prior to the Welfare Reform) for a given sub-population using the 2002 traditional longitudinal panel weight (SPDTLW02). Also, suppose there are only 10 sample persons in the sub-population who were public assistance recipients. (This example is for illustrative purpose only; in reality, 10 sample units or cases would be too few for a reliable estimate.) The number of consecutive years of receiving public assistance during 1992-1994 are given for each sample person in the table below. *(Caveat - In reality, only the total number of months of receiving public assistance in a given year is available in the SPD third longitudinal file. Thus, the actual number of spells in a time period of interest is not known or equivalently the actual spell length is not known. Consequently, to use such data in the SPD third longitudinal file for assessing average spell length in a time period of interest, it is the responsibility of the data user to match back the sample person record to the one in the SIPP longitudinal file to determine the number of spells in the time period of interest and/or make his/her own justifiable assumption on what should be the number of spells in the time period of interest given the total number of months in a year that a sample person possessed a spell characteristic, e.g., receiving public assistance.)*

Sample Person Number	Number of Spells During 1992-1994	Spell Lengths in Months	Final Longitudinal Weight
1	2	12, 6	5300
2	1	2	7100
3	1	5	4900
4	2	3, 6	6500
5	1	13	4700
6	1	14	5500
7	2	3, 6	4100
8	1	24	4200
9	1	6	4500
10	1	4	6100

Using Formula 8, the average spell  $\bar{x}$  of receiving public assistance is estimated to be

$$\bar{x} = \frac{5300 \times 12 + 5300 \times 6 + 7100 \times 2 + \dots + 6100 \times 4}{5300 + 5300 + 7100 + \dots + 6100} = \frac{472800}{68800} = 6.872 \text{ months}$$

The standard error  $s_{\bar{x}}$  will be computed by Formula 3. First, estimate the population variance  $s^2$  by Formula 7

$$s^2 = \frac{5300 \times 12^2 + 5300 \times 6^2 + 7100 \times 2^2 + \dots + 6100 \times 4^2}{5300 + 5300 + 7100 + \dots + 6100} - 6.872^2 = 41.92 \text{ months}^2$$

Next, the base  $b$  parameter from Table 4 is 29,769. To account for the multiple number of spells during 1992-1994 of three sample persons (two spells for Sample Persons 1, 4, and 7), multiply the base  $b$  parameter by a factor  $g$  computed from Formula 1 as shown below.

$$g = \frac{2^2 + 1 + 1 + 2^2 + 1 + 1 + 2^2 + 1 + 1 + 1}{2 + 1 + 1 + 2 + 1 + 1 + 2 + 1 + 1 + 1} = 1.462$$

Therefore, the adjusted  $b$  parameter is  $29769 \times 1.462 = 43522$  and the standard error  $s_{\bar{x}}$  of the mean is

$$s_{\bar{x}} = \sqrt{\frac{43522}{68800}} \times 41.92 = 5.150 \text{ months}$$

### Standard Errors of Estimated Percentages

This section refers to the percentages of a group of people, families, or households possessing a particular attribute and to percentages of money or related concepts. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are more than 50 percent. For example, the percent estimate of employed people is more reliable than the estimated number of employed people. When the numerator and denominator of the percentage have different parameters, use the parameter of the numerator. If proportions are presented instead of percentages, note that the standard error of a proportion is equal to the standard error of the corresponding percentage divided by 100.

There are two types of percentages commonly estimated. The first type is the percentage of people sharing a particular characteristic such as the percentage of people owning their own home or the percentage of 1998 food stamp recipients who were also receiving food stamps in 1999. The second type is the percentage of money or some similar concept held by a particular group of people or held in a particular form. Examples are the percentage of wealth held by people with high income and the percentage of annual income received by females.

For the percentage of people, the approximate standard error,  $s_{x,p}$ , of the estimated percentage,  $p$ , can be obtained by Formula 9 below.

$$s_{x,p} = \sqrt{\frac{b}{x} p(100 - p)} \tag{9}$$

Here,  $x$  is the base of the percentage  $p$  is the percentage ( $0 < p < 100$ ), and  $b$  is parameter for the numerator of the percentage calculation. For the analysis using the SPD data and the SPD third longitudinal file, the  $b$  parameters are provided in Tables 3 to 7.

An illustration would be to suppose that, based on the 2002 traditional longitudinal panel weight (SPDTLW02), in 2002, an estimate of number of male aged 22 to 55 was 46,023,000. Among all the males in this age group, an estimate of 2.4 percent was unemployed in 2001. The  $b$  parameter associated

with the numerator (the number of unemployed male) is 15,427 (from Table 4). Using Formula 9, the approximate standard error  $s_{x,p}$  is

$$s_{x,p} = \sqrt{\frac{15,427}{46,023,000}(2.4)(100 - 2.4)} = 0.28\%$$

Consequently, the 90-percent confidence interval for the unemployment estimate is 1.94% to 2.86%.

To calculate the percentages of money, the formula is more complicated. A percentage of money will usually be estimated in one of two ways. It may be the ratio,  $p_M$  of two aggregates as defined in Formula 10 below.

$$p_M = 100 \left( \frac{X_A}{X_N} \right) \tag{10}$$

or it may be the ratio,  $p_M$  of two means with an adjustment,  $\hat{p}_A$  for different bases as defined in Formula 11 below.

$$p_M = 100 \left( \frac{\bar{X}_A}{\bar{X}_N} \right) \hat{p}_A \tag{11}$$

where  $X_A$  and  $X_N$  in Formula 10 are aggregate money figures,  $\bar{X}_A$  and  $\bar{X}_N$  in Formula 11 are mean money figures, and  $\hat{p}_A$  is the estimated number in Group A divided by the estimated number in Group N. In either way of estimating  $p_M$  (Formula 10 or 11), we estimate the standard error  $s_{p_M}$  of  $p_M$  using Formula 12 provided below.

$$s_{p_M} = \sqrt{\left( \frac{\hat{p}_A \bar{X}_A}{\bar{X}_N} \right)^2 \left[ \left( \frac{s_{\hat{p}_A}}{\hat{p}_A} \right)^2 + \left( \frac{s_{\bar{X}_A}}{\bar{X}_A} \right)^2 + \left( \frac{s_{\bar{X}_N}}{\bar{X}_N} \right)^2 \right]} \tag{12}$$

where  $s_{\hat{p}_A}$  is the standard error of  $\hat{p}_A$ ,  $s_{\bar{X}_A}$  is the standard error of  $\bar{X}_A$  and  $s_{\bar{X}_N}$  is the standard error

of  $\bar{X}_N$ . To calculate  $s_{\hat{p}_A}$ , use Formula 9. The standard errors  $s_{\bar{X}_A}$  and  $s_{\bar{X}_N}$  are calculated using Formula 3.

Note that there is frequently some correlation among the characteristics estimated by  $\hat{p}_A$ ,  $\bar{X}_A$ , and  $\bar{X}_N$ . These correlations, if present, will cause a tendency toward overestimates or underestimates, depending on the relative sizes of the correlations and whether they are positive or negative.

An illustration would be to suppose that, based on the 2002 traditional longitudinal panel weight (SPDTLW02), in 2002, an estimated 8.8% of males aged 16 and over was Black, the 2001 mean annual earning of these Black males was \$15,456, the 2001 mean annual earning of all males aged 16 and over was \$22,932, and the corresponding standard errors are 0.37 percent, \$432, and \$324, respectively. Then, the percent ( $p_M$ ) of male earnings made by Blacks in 2001 per Formula 11 is

$$p_M = 100 \left( \frac{15,456}{22,932} \right) (0.088) = 5.9\%$$

Using Formula 12, the approximate standard error,  $s_{p_M}$  is

$$s_{p_M} = \sqrt{\left( \frac{(0.088)(15,456)}{22,932} \right)^2 \left[ \left( \frac{0.0037}{0.088} \right)^2 + \left( \frac{432}{15,456} \right)^2 + \left( \frac{324}{22,932} \right)^2 \right]} = 0.31\%$$

### Standard Error of a Difference

The standard error  $s_{x-y}$  of a difference between two sample estimates  $x$  and  $y$  is equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2 - 2rs_x s_y} \tag{13}$$

where  $s_x$  and  $s_y$  are the standard errors of the estimates  $x$  and  $y$ . The estimates can be numbers, averages, percents, ratios, etc. The correlation between  $x$  and  $y$  is represented by  $r$  ( $0 \leq r \leq 1$ ). If  $r$  is assumed to be zero and the true correlation is really positive (negative), then this assumption will result in a tendency toward overestimates (underestimates) of the true standard error.

An illustration would be to suppose that we are interested in the difference in the 2002 average annual number of adult males (aged 16 and above) versus the 2002 adult females with annual cash income above \$9,000 in 2001. An estimate of the number of adult people in this income bracket has been obtained for both males and females using the 2002 SPD traditional longitudinal panel weight (SPDTLW02). For

females, the estimate is 1,619,000. A similar estimate for males is 2,198,000. The difference in estimates is 579,000.

The standard error of the adult female estimate is computed next. The  $a$  and  $b$  parameters from Table 4 for females are -0.0001723 and 15,427, respectively. Based on Formula 2, the standard error,  $s_x$  of the female estimate is

$$s_x = \sqrt{(-0.0001723)(1,619,000)^2 + (15,427)(1,619,000)} = 156,604$$

Similarly, the  $a$  and  $b$  parameters from Table 4 for males are -0.0001908 and 15,427, respectively. Based on Formula 2, the standard error,  $s_y$  of the male estimate is

$$s_y = \sqrt{(-0.0001908)(2,198,000)^2 + (15,427)(2,198,000)} = 181,623$$

Now, the standard error of the difference is computed using the above two standard errors. The correlation  $r$  for this example is assumed to be zero. The standard error,  $s_{x-y}$  of the difference is computed by Formula 13 as shown below.

$$s_{x-y} = \sqrt{(156,604)^2 + (181,623)^2} = 239,815$$

Suppose that it is desired to test at the 10 percent significance level whether the number of adult males and females with 2001 monthly cash income above \$9,000 were different in 2002, one can compare the difference of 579,000 to the product  $1.645 \times 239,815 = 394,461$ . Since the difference is larger than 1.645 times the standard error ( $s_{x-y}$ ) of the difference, the data allow us to conclude that, in 2000, the number of adult males with 2001 annual cash income above \$9,000 is significantly higher than the number of the adult females at the 10 percent confidence level.

### Standard Error of a Median

The median quantity,  $X_{med}$  of some item (characteristic),  $X$  such as income for a given group of people, families, or households is that quantity such that at least half the group has as much or more and at least half the group has as much or less. The sampling variability of an estimated median  $\hat{X}_{med}$  depends upon the form of the distribution of the item as well as the size of the group. To estimate the median ( $X_{med}$ ) and the standard error of the median  $s_{X_{med}}$  the procedure described below may be used.

The median ( $X_{med}$ ) like the mean, can be estimated using either data which has been grouped into intervals (e.g., income intervals) or ungrouped data. If grouped data are used, the median ( $X_{med}$ ) is

estimated using either Formula 15 or 16 with  $p = 0.5$ . If ungrouped data are used, the data records are ordered based on the value of the item (e.g., income level), then the estimated median is the value of the item such that the weighted estimate of 50 percent of the sub-population falls at or below that value and 50 percent is at or above that value. The method of standard error computation presented here requires the use of grouped data, because it is deemed easier to compute the median by grouping the data and then using Formula 15 or 16.

An approximate method for measuring the reliability of an estimated median ( $\hat{X}_{med}$ ) is to determine a confidence interval about it. (See the section on "Confidence Intervals.") The following procedure (four steps) may be used to estimate the 68-percent confidence limits (i.e., approximately  $\pm$  one standard error from the median) and hence the standard error (of a median based on sample data).

Step 1 - Determine, using Formula 9, the standard error ( $s_{x,p=50}$ ) of an estimate of 50 percent of the group (sub-population).

Step 2 - Subtract from and add to 50 percent the standard error determined in Step 1 to obtain the percentages associated with the lower and upper limits of the 68-percent confidence interval of the item. Namely, the smaller percentage is  $50 - s_{x,p=50}$  percent, and the larger percentage is  $50 + s_{x,p=50}$  percent.

Step 3 - Using the distribution of the item within the group, calculate the quantity,  $X_{UCL}$  of the item such that the percent of the group owning more of the item is equal to the smaller percentage ( $50 - s_{x,p=50}$ ) found in Step 2. This quantity ( $X_{UCL}$ ) will be the upper limit for the 68-percent confidence interval (assuming that the interval with higher item value is ranked at lower percentile as illustrated in Table 2.) In a similar fashion, calculate the quantity,  $X_{LCL}$  of the item such that the percent of the group owning more of the item is equal to the larger percentage ( $50 + s_{x,p=50}$ ) found in Step 2. This quantity ( $X_{LCL}$ ) will be the lower limit for the 68-percent confidence interval. (Note that a median computed from ungrouped data may or may not fall in this confidence interval).

Step 4 - Divide the difference between the two quantities ( $X_{UCL}$  and  $X_{LCL}$ ) determined in Step 3 by two to obtain the standard error estimate ( $s_{\hat{X}_{med}}$ ) of the median estimate ( $\hat{X}_{med}$ ). Namely,

$$\hat{s}_{\hat{X}_{med}} = \frac{X_{UCL} - X_{LCL}}{2} \tag{14}$$

To perform Step 3, it will be necessary to interpolate, which may be done using different methods. The most common is simple linear interpolation (Formula 15) and Pareto interpolation (Formula 16). The appropriateness of the method depends on the form of the distribution around the median. We recommend Pareto interpolation in most instances. Interpolation is used as follows. The quantity of the item,  $X_{pN}$  such that  $p$  percent own more of the item is

$$X_{pN} = A_1 \exp \left[ \frac{\ln \left( \frac{pN}{N_1} \right)}{\ln \left( \frac{N_2}{N_1} \right)} \ln \left( \frac{A_2}{A_1} \right) \right] \quad (15)$$

if Pareto Interpolation is indicated and

$$X_{pN} = \left[ \frac{pN - N_1}{N_2 - N_1} (A_2 - A_1) + A_1 \right] \quad (16)$$

if linear interpolation is indicated, where  $N$  is the size of the group;  $A_1$  and  $A_2$  are the lower and upper bounds, respectively, of the interval in which  $X_{pN}$  falls;  $N_1$  and  $N_2$  are the estimated numbers of group members owning more than  $A_1$  and  $A_2$ , respectively;  $exp$  refers to the exponential function; and  $Ln$  refers to the natural logarithm function. One should note that a mathematically equivalent result is obtained by using common logarithms (base 10) and antilogarithms.

An illustration would be in order to calculate the standard error of a median, we return to the first example used to illustrate the standard error of a mean. As indicated in Table 2, the size ( $N$ ) of the group is 39,851,000 and the median annual income estimate ( $\hat{X}_{med}$ ) for the group falls in between \$17,500 and \$19,999. With  $p = 0.5$ ,  $A_1 = \$17,500$ ,  $A_2 = \$19,999$ ;  $N_1 = 5,799,000 + 4,730,000 + \dots + 1,493,000 = 22,106,000$ , and  $N_2 = 4,730,000 + 3,723,000 + \dots + 1,493,000 = 16,307,000$ ; the median annual income estimate,  $\hat{X}_{med}$  for this group is computed using Formula 16 (with  $p = 0.5$ ) to be \$18,316. The standard error estimate ( $s_{\hat{X}_{med}}$ ) of the median annual income estimate is calculated using the above four step procedure as follows.

Step 1 - Using Formula 9 and the appropriate  $b$  parameter of 15,427 (from table 4), the standard error estimate of 50 percent on a base of 39,851,000 is about 0.98 percentage points, (i.e.,  $s_{x,p=50} = 0.98\%$ ).

Step 2 - Obtain the two percentages associated with the lower and upper limits of the 68-percent confidence: the smaller percentage =  $50 - s_{x,p=50} = 49.02$  and the larger percentage =  $50 + s_{x,p=50} = 50.98$ .

Step 3 - By examining Table 2, we see that the percentage 48.98 falls in the income interval from \$17,500 to \$19,999. Thus as determined previously,  $A_1 = \$17,500$ ,  $A_2 = \$19,999$ ,  $N_1 = 22,106,000$ ,  $N_2 =$

16,307,000, and  $N = 39,851,000$  and  $p = 49.02\%$ . Based on Formula 15, the upper bound ( $X_{UCL}$ ) of a 68-percent confidence interval for the median estimate ( $\hat{X}_{med}$ ) is

$$X_{UCL} = 17,500 \exp \left[ \frac{\ln \left( \frac{0.4902 \times 39,851,000}{22,106,000} \right)}{\ln \left( \frac{16,307,000}{22,106,000} \right)} \ln \left( \frac{19,999}{17,500} \right) \right] = \$18,476$$

Also by examining Table 2, the 50.98 percent fall in the same income interval. Thus,  $A_1$ ,  $A_2$ ,  $N_1$ , and  $N_2$  are the same as above, but  $p = 50.98\%$ . The lower bound ( $X_{LCL}$ ) of a 68-percent confidence interval for the median ( $\hat{X}_{med}$ ) is

$$X_{LCL} = 17,500 \exp \left[ \frac{\ln \left( \frac{0.5098 \times 39,851,000}{22,106,000} \right)}{\ln \left( \frac{16,307,000}{22,106,000} \right)} \ln \left( \frac{19,999}{17,500} \right) \right] = \$18,160$$

**Step 4** - Based on Formula 14, the standard error estimate ( $s_{\hat{X}_{med}}$ ) of the median annual income estimate ( $\hat{X}_{med}$ ) is

$$s_{\hat{X}_{med}} = \frac{\$18,476 - \$18,160}{2} = \$158$$

If the linear interpolation is used, the median is then estimated using Formula 16 to be \$18,440 and the 68-percent confidence interval of the estimated median is from \$18,609 to \$18,271. The standard error estimate is \$169.

### Standard Error of Ratio of Means or Medians

The standard error for a ratio of means or medians is approximated by Formula 17 provided below.

$$s_{\frac{X}{Y}} = \sqrt{\left(\frac{X}{Y}\right)^2 \left[ \left(\frac{s_X}{X}\right)^2 + \left(\frac{s_Y}{Y}\right)^2 \right]} \quad (17)$$

where  $X$  and  $Y$  are the means or medians, and  $s_X$  and  $s_Y$  are their associated standard errors. Formula 17 assumes that the means or medians are not correlated. If the correlation between the population means or medians estimated by  $X$  and  $Y$  are actually positive (negative), then this procedure will tend to produce overestimates (underestimates) of the true standard error for the ratio of means or medians.

Table 1 - Reference months and interview months of the SIPP 1992 Panel, SIPP 1993 Panel, SPD Bridge (1997), and SPD 1998 to SPD 2002 survey samples.

Survey Sample	Months of Interview	Reference Months
SIPP Panel 1992	February 1992 - April 1995	October 1991 - March 1995
SIPP Panel 1993	February 1993 - January 1996	October 1992 - December 1995
SPD Bridge (1997)	April 1997 - June 1997	January 1996 - December 1996: rolled-up as 1996 yearly data
SPD 1998	May 1998 - July 1998	January 1997 - December 1997: rolled up as 1997 yearly data
SPD 1999	May 1999 - July 1999	January 1998 - December 1998: rolled up as 1998 yearly data
SPD 2000	May 2000 - July 2000	January 1999 - December 1999: rolled up as 1999 yearly data
SPD 2001	May 2001 - July 2001	January 2000 - December 2000: rolled up as 2000 yearly data
SPD 2002	May 2002 - July 2002	January 2001 - December 2001: rolled up as 2001 yearly data

Table 2 - Distribution of annual income among people 25 to 34 years old.

	Total Number of People	Number of People in Annual Income Interval												
		Under \$500	\$500 to \$749	\$750 to \$999	\$1000 to \$1249	\$1250 to \$1499	\$1500 to \$1749	\$1750 to \$1999	\$2000 to \$2999	\$3000 to \$3999	\$4000 to \$4999	\$5000 to \$5999	\$6000 to \$6999	\$7000 and Over
Number of People (in Thousands)	39851	1371	1651	2259	2734	3452	6278	5799	4730	3723	2591	2619	1223	1493
Percent with at Least as Much as Lower Bound of Interval	N/A	100.0	96.6	92.4	86.7	79.9	71.2	55.5	40.9	29.1	19.7	13.4	6.8	3.7

Note: This table contains a fictitious distribution of annual income and is used only to illustrate standard error calculation.

Table 3 - SPD Generalize variance parameters for estimates using the 2001 traditional longitudinal panel weights (SPDTLW01) or the 2001 traditional longitudinal annual weights (SPDTAW01) associated with the 2001 traditional longitudinal panel weights (SPDTLW01) on the SPD third longitudinal file.

Table 8 - A summary of the weights on the SPD third longitudinal file and their application for estimation.

Weight Variable	Weight Description and Application
SPDTLW01	<p>The 2001 SPD traditional longitudinal panel weight SPDTLW01 was created to be used for estimates covering multiple years within data years 1992 to 2000 (e.g., the data for data year 2000 was collected in the SPD 2001).</p> <p>For a multiple year estimate not involved with data year 2001, SPDTLW01 is preferred to SPDTLW02 because the effective sample size associated with SPDTLW01 is larger than the effective sample size associated with SPDTLW02 because of the SPD 2002 sample cut. For a multiple year estimate involved data year 2001, SPDTLW02 must be used in lieu of SPDTLW01 because SPDTLW01 was derived without accounting for the SPD 2002 (data year 2001).</p> <p>The advantage of using SPDTLW01 over SPDQLW01 to make a multiple year estimate is that all sample people with positive SPDTLW01 have data for every data year needed for the estimate, but this is not necessarily true for SPDQLW01 and imputing missing data (by the user) is needed if SPDQLW01 is used.</p> <p>The advantage of using SPDQLW01 over SPDTLW01 to make a multiple year estimate is that the effective sample size associated with SPDQLW01 is larger than that of SPDTLW01. Thus SPDQLW01 theoretically produces a smaller sampling variance (or standard error) for the estimate than the one produced by SPDTLW01.</p> <p>Note - The SPD panel universe leavers (per the definitions in the Weighting and Glossary sections) who were also classified as a 2001 SPD traditional longitudinal panel interviewed person (as defined in the Weighting section or the sub-section Estimation of the Source and Accuracy Statement section) have a positive SPDTLW01. However; these SPD panel universe leavers do not have data for the data years associated with the year and after the year that they became an SPD panel universe leaver because they were no longer in the SPD panel (sample). Consequently, for an estimate based on a cohort of sample people including any SPD panel universe leavers with positive SPDTLW01 as part of the cohort, if the estimate is for a year or years at or after which a subset (some) of these SPD panel universe leavers became an SPD panel universe leaver then this subset must be excluded from the estimate for that particular year or those particular years (even though they have a positive SPDTLW01).</p>

Weight Variable	Weight Description and Application
SPDTLW02	<p>The 2002 SPD traditional longitudinal panel weight SPDTLW02 was created to be used for estimates covering multiple years within data years 1992 to 2001 (e.g., the data for data year 2001 was collected in the SPD 2002).</p> <p>A description regarding how to make a choice between SPDTLW01 and SPDTLW02 to be used for a multiple year estimate was provided earlier in this table.</p> <p>The advantage of using SPDTLW02 over SPDQLW02 to make a multiple year estimate is that all sample people with positive SPDTLW02 have data for every data year needed for the estimate, but this is not necessarily true for SPDQLW02 and imputing missing data (by the user) is needed if SPDQLW02 is used.</p> <p>The advantage of using SPDQLW02 over SPDTLW02 to make a multiple year estimate is that the effective sample size associated with SPDQLW02 is larger than that of SPDTLW02. Thus SPDQLW02 theoretically produces a smaller sampling variance (or standard error) for the estimate than the one produced by SPDTLW02.</p> <p>Note - The SPD panel universe leavers (per the definitions in the Weighting and Glossary sections) who were also classified as a 2002 SPD traditional longitudinal panel interviewed person (as defined in the Weighting section or the sub-section Estimation of the Source and Accuracy Statement section) have a positive SPDTLW02. However; these SPD panel universe leavers do not have data for the data years associated with the year and after the year that they became an SPD panel universe leaver because they were no longer in the SPD panel (sample). Consequently, for an estimate based on a cohort of sample people including any SPD panel universe leavers with positive SPDTLW02 as part of the cohort, if the estimate is for a year or years at or after which a subset (some) of these SPD panel universe leavers became an SPD panel universe leaver then this subset must be excluded from the estimate for that particular year or those particular years (even though they have a positive SPDTLW02).</p>

Weight Variable	Weight Description and Application
SPDQLW00	<p>The 2000 SPD quasi-longitudinal panel weight SPDQLW00 was created to be used for estimates covering multiple years within data years 1992 to 1999 (e.g., the data for data year 1999 was collected in the SPD 2000).</p> <p>The advantage of using SPDQLW00 over SPDTLW00 to make a multiple year estimate is that the effective sample size associated with SPDQLW00 on the third longitudinal file is larger than that of SPDTLW00. Thus SPDQLW00 theoretically produces a smaller sampling variance (or standard error) for the estimate than the one produced by SPDTLW00.</p> <p>The advantage of using SPDTLW01 over SPDQLW00 to make a multiple year estimate is that all sample people with positive SPDTLW01 have data for every data year needed for the estimate, but this is not necessarily true for SPDQLW00 and imputing missing data (by the user) is needed if SPDQLW00 is used.</p> <p>Based on the derivation of SPDQLW00, it is particularly useful for evaluating socioeconomic changes among the SPD panel universe population between a pre welfare reform year of 1993 and a post welfare reform year of 1999.</p> <p>Regarding making a choice among SPDQLW00, SPDQLW01, and SPDQLW02 for a multiple year estimate, the appropriateness and practicality of imputing missing data associated with each of SPDQLW00, SPDQLW01, and SPSQLW02 (needed for the estimate) must be taken into account.</p> <p>Note - The SPD panel universe leavers (per the definitions in the Weighting section or the Glossary section) who were also classified as a 2000 SPD quasi-longitudinal panel interviewed person (as defined in the Weighting section or the sub-section Estimation of the Source and Accuracy Statement section) have a positive SPDQLW00. However; these universe leavers do not have data for the data years associated with the year and after the year that they became an SPD panel universe leaver because they were no longer in the SPD panel (sample). Consequently, for an estimate based on a cohort of sample people including any SPD panel universe leavers with positive SPDQLW00 as part of the cohort, if the estimate is for a year or years at or after which a subset (some) of these SPD panel universe leavers became an SPD panel universe leaver then this subset must be excluded from the estimate for that particular year or those particular years (even though they have a positive SPDQLW00).</p>

Weight Variable	Weight Description and Application
SPDQLW01	<p>The 2001 quasi-longitudinal panel final weight SPDQLW01 was created to be used for estimates covering multiple years within data years 1992 to 2000 (e.g., the data for data year 2000 was collected in the SPD 2001).</p> <p>The advantage and disadvantage of using SPDQLW01 in lieu of SPDTLW01 for a multiple year estimate were described earlier in this table.</p> <p>Based on the derivation of SPDQLW01, it is particularly useful for evaluating socioeconomic changes among the SPD panel universe population between a pre welfare reform year of 1993 and a post welfare reform year of 2000.</p> <p>A description regarding how to make a choice among SPDQLW00, SPDQLW01, and SPDQLW02 for a multiple year estimate was provided earlier in this table.</p> <p>Note - The SPD panel universe leavers (per the definitions in the Weighting section or the Glossary section) who were also classified as a 2001 SPD quasi-longitudinal panel interviewed person (as defined in the Weighting section or the sub-section Estimation of the Source and Accuracy Statement section) have a positive SPDQLW01. However; these universe leavers do not have data for the data years associated with the year and after the year that they became an SPD panel universe leaver because they were no longer in the SPD panel (sample). Consequently, for an estimate based on a cohort of sample people including any SPD panel universe leavers with positive SPDQLW01 as part of the cohort, if the estimate is for a year or years at or after which a subset (some) of these SPD panel universe leavers became an SPD panel universe leaver then this subset must be excluded from the estimate for that particular year or those particular years (even though they have a positive SPDQLW01).</p>

<b>Weight Variable</b>	<b>Weight Description and Application</b>
SPDQLW02	<p>The 2002 quasi-longitudinal panel final weight SPDQLW02 was created to be used for estimates covering multiple years within data years 1992 to 2001 (e.g., the data for data year 2001 was collected in the SPD 2002).</p> <p>The advantage and disadvantage of using SPDQLW02 in lieu of SPDTLW02 for a multiple year estimate were described earlier in this table.</p> <p>Based on the derivation of SPDQLW02, it is particularly useful for evaluating socioeconomic changes among the SPD panel universe population between a pre welfare reform year of 1993 and a post welfare reform year of 2001.</p> <p>A description regarding how to make a choice among SPDQLW00, SPDQLW01, and SPDQLW02 for a multiple year estimate was provided earlier in this table.</p> <p>Note - The SPD panel universe leavers (per the definitions in the Weighting section or the Glossary section) who were also classified as a 2002 SPD quasi-longitudinal panel interviewed person (as defined in the Weighting section or the sub-section Estimation of the Source and Accuracy Statement section) have a positive SPDQLW02. However; these universe leavers do not have data for the data years associated with the year and after the year that they became an SPD panel universe leaver because they were no longer in the SPD panel (sample). Consequently, for an estimate based on a cohort of sample people including any SPD panel universe leavers with positive SPDQLW02 as part of the cohort, if the estimate is for a year or years at or after which a subset (some) of these SPD panel universe leavers became an SPD panel universe leaver then this subset must be excluded from the estimate for that particular year or those particular years (even though they have a positive SPDQLW02).</p>

Weight Variable	Weight Description and Application
SPDTAW01	<p>The 2001 traditional longitudinal annual weight SPDTAW01 was created to be used for calendar year estimates for young children aged nine and below in 2001 for calendar year up to 2001 (data year 2000).</p> <p>Some caution should be given when interpreting results of the characteristic estimation for these young children because SPDTAW01 is intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2001.</p> <p>The calendar year characteristic estimates of the young children in the entire age group of nine and below in 2001 using SPDTAW01 are theoretically more accurate than those of the young children of other age groups because SPDTAW01 was adjusted to match the June 2001 controls for the cohort consisting of children aged nine and below in 2001 (to improve coverages).</p> <p>The advantage of using SPDTAW01 in lieu of SPDQAW01 for a calendar year estimate is that no missing data for any calendar (up to calendar year 2000), thus no missing data imputation is needed. While, this is not necessarily true for SPDQAW01 except for calendar year 2000.</p> <p>The disadvantage of using SPDTAW01 in lieu of SPDQAW01 is that the effective sample size associated with SPDQAW01 is larger than the one associated with SPDTAW01. Thus the sampling variance (or standard error) for a calendar year estimate using SPDQAW01 is smaller than the one using SPDTAW01.</p> <p>Regarding making a choice between SPDTAW01 and SPDTAW02 for calendar year estimates of young children characteristics, based on the weighting process, SPDTAW01 and SPDTAW02 were created to be used for estimating calendar year characteristics of young children in 2001 and 2002, respectively.</p>

<b>Weight Variable</b>	<b>Weight Description and Application</b>
SPDTAW02	<p>The 2002 traditional longitudinal annual weight SPDTAW02 was created to be used for calendar year estimates for young children aged ten and below in 2002 for calendar year up to 2002 (data year 2001).</p> <p>Some caution should be given when interpreting results of the characteristic estimation for these young children because SPDTAW02 is intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2002.</p> <p>The calendar year characteristic estimates of the young children in the entire age group of ten and below in 2002 using SPDTAW02 are theoretically more accurate than those of the young children of other age groups because SPDTAW02 was adjusted to match the June 2002 controls for the cohort consisting of children aged ten and below in 2002 (to improve coverages).</p> <p>The advantage of using SPDTAW02 in lieu of SPDQAW02 for a calendar year estimate is that no missing data for any calendar (up to calendar year 2001), thus no missing data imputation is needed. While, this is not necessarily true for SPDQAW02 except for calendar year 2001.</p> <p>The disadvantage of using SPDTAW02 in lieu of SPDQAW02 is that the effective sample size associated with SPDQAW02 is larger than the one associated with SPDTAW02. Thus the sampling variance (or standard error) for a calendar year estimate using SPDQAW02 is smaller than the one using SPDTAW02.</p> <p>Regarding making a choice between SPDTAW01 and SPDTAW02 for calendar year estimates of young children characteristics, based on the weighting process, SPDTAW01 and SPDTAW02 were created to be used for estimating calendar year characteristics of young children in 2001 and 2002, respectively.</p>

<b>Weight Variable</b>	<b>Weight Description and Application</b>
SPDQAW00	<p>The 2000 quasi-longitudinal annual final weight SPDQAW00 was created to be used for calendar year estimates for young children aged eight and below in 2000 for a data year up to 1999 (e.g., the data for data year 1999 was collected in the SPD 2000).</p> <p>Some caution should be given when interpreting results of the characteristic estimation for these young children because SPDQAW00 is intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2000.</p> <p>The calendar year characteristic estimates of the young children in the entire age group of eight and below in 2000 using SPDQAW00 are theoretically more accurate than those of the young children of other age groups because SPDQAW00 was adjusted to match the June 2000 controls for the cohort consisting of children aged eight and below in 2000 (to improve coverages).</p> <p>When using SPDQAW00 to make a calendar year estimate of a characteristic of a cohort of young children (aged eight or below in 2000) other than calendar year 1999, some sample people with positive SPDQAW00 may have missing data for the characteristic in that calendar year, their missing data needs to be imputed for the calendar estimate; otherwise other appropriate longitudinal annual final weights should be used instead.</p> <p>Regarding making a choice among SPDQAW00, SPDQAW01, and SPDQAW02 for calendar year estimates of young children characteristics, based on the weighting process, SPDQAW00, SPDQAW01, and SPDQAW02 were created to be used for estimating calendar year characteristics of young children in 2000, 2001, and 2002, respectively.</p>

Weight Variable	Weight Description and Application
SPDQAW01	<p>The 2001 quasi-longitudinal annual final weight SPDQAW01 was created to be used for calendar year estimates for young children aged nine and below in 2001 for a data year up to 2000 (e.g., the data for data year 2000 was collected in the SPD 2001).</p> <p>Some caution should be given when interpreting results of the characteristic estimation for these young children because SPDQAW01 is intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2001.</p> <p>The calendar year characteristic estimates of the young children in the entire age group of nine and below in 2001 using SPDQAW01 are theoretically more accurate than those of the young children of other age groups because SPDQAW01 was adjusted to match the June 2001 controls for the cohort consisting of children aged nine and below in 2001 (to improve coverages).</p> <p>When using SPDQAW01 to make a calendar year estimate of a characteristic of a cohort of young children (aged nine or below in 2001) other than calendar year 2000, some sample people with positive SPDQAW01 may have missing data for the characteristic in that calendar year, their missing data needs to be imputed for the calendar estimate; otherwise other appropriate longitudinal annual weights should be used instead.</p> <p>The advantage of using SPDQAW01 in lieu of SPDTAW01 to make a calendar year estimate of a characteristic of a cohort of young children (aged nine or below in 2001) is that the effective sample size associated with SPDQAW01 is larger than the one associated with SPDTAW01. Thus the sampling variance (or standard error) of the calendar year estimate using SPDQAW01 is theoretically smaller than the one using SPDTAW01.</p> <p>The disadvantage of using SPDQAW01 in lieu of SPDTAW01 to make a calendar year estimate of a characteristic of a cohort of young children (aged nine or below) for a calendar year other than 2000 is that, some of the sample people with positive SPDQAW01 may have missing data for the characteristic in that calendar year. While all sample people with positive SPDTAW01 have data for the characteristic in that calendar year. Thus to use SPDQAW01 for a calendar year estimate other than 2000, the associated missing data of sample people with positive SPDQAW01 for the calendar year must be approximated or imputed (by user), otherwise SPDTAW01 or other appropriate longitudinal annual final weights should be used instead.</p> <p>Regarding making a choice among SPDQAW00, SPDQAW01, and SPDQAW02 for calendar year estimates of young children characteristics, based on the weighting process, SPDQAW00, SPDQAW01, and SPDQAW02 were created to be used for estimating calendar year characteristics of young children in 2000, 2001, and 2002,</p>

Weight Variable	Weight Description and Application
SPDQAW02	<p>The 2002 quasi-longitudinal annual final weight SPDQAW02 was created to be used for calendar year estimates for young children aged ten and below in 2002 for a data year up to 2001 (e.g., the data for data year 2001 was collected in the SPD 2002).</p> <p>Some caution should be given when interpreting results of the characteristic estimation for these young children because SPDQAW02 is intended only as an approximate representation for the civilian noninstitutionalized young children living in the United States in 2002.</p> <p>The calendar year characteristic estimates of the young children in the entire age group of ten and below in 2002 using SPDQAW02 are theoretically more accurate than those of the young children of other age groups because SPDQAW02 was adjusted to match the June 2002 controls for the cohort consisting of children aged ten and below in 2002 (to improve coverages).</p> <p>When using SPDQAW02 to make a calendar year estimate of a characteristic of a cohort of young children (aged ten or below in 2002) other than calendar year 2001, some sample people with positive SPDQAW02 may have missing data for the characteristic in that calendar year, their missing data needs to be imputed for the calendar estimate; otherwise other appropriate longitudinal annual final weights should be used instead.</p> <p>The advantage of using SPDQAW02 in lieu of SPDTAW02 to make a calendar year estimate of a characteristic of a cohort of young children (aged ten or below in 2002) is that the effective sample size associated with SPDQAW02 is larger than the one associated with SPDTAW02. Thus the sampling variance (or standard error) of the calendar year estimate using SPDQAW02 is theoretically smaller than the one using SPDTAW02.</p> <p>The disadvantage of using SPDQAW02 in lieu of SPDTAW02 to make a calendar year estimate of a characteristic of a cohort of young children (aged ten or below) for a calendar year other than 2001 is that, some of the sample people with positive SPDQAW02 may have missing data for the characteristic in that calendar year. While all sample people with positive SPDTAW02 have data for the characteristic in that calendar year. Thus to use SPDQAW02 for a calendar year estimate other than 2001, the associated missing data of sample people with positive SPDQAW02 for the calendar year must be approximated or imputed (by user), otherwise SPDTAW02 or other appropriate longitudinal annual final weights should be used instead.</p> <p>Regarding making a choice among SPDQAW00, SPDQAW01, and SPDQAW02 for calendar year estimates of young children characteristics, based on the weighting process, SPDQAW00, SPDQAW01, and SPDQAW02 were created to be used for</p>

# APPENDIX A

## Industry Classification Codes for Detailed Industry (3-digit)

There are 236 categories for the employed, with one additional category for the experienced unemployed. To assist you in your coding the categories listed below are aggregated into 15 major self-employment recodes (see page A-10). (Numbers in parentheses are the 1987 SIC code equivalent; see Executive Office of the President, Office of Management and Budget, Standard Industrial Classification Manual, 1987. "Pt" means part, "n.e.c." means not elsewhere classified.)

<b>Code</b>	<b>Industry</b>
000-009	Not used
010-030	AGRICULTURE
010	Agricultural production, crops (01)
011	Agricultural production, livestock (02)
012	Veterinary services (074)
013-019	Not used
020	Landscape and horticultural services (078)
021-029	Not used
030	Agricultural services, n.e.c. (071, 072, 075, 076)
031-032	FORESTRY AND FISHERIES
031	Forestry (08)
032	Fishing, hunting, and trapping (09)
033-039	Not used
040-050	MINING
040	Metal mining (10)
041	Coal mining (12)
042	Oil and gas extraction (13)
043-049	Not used
050	Nonmetallic mining and quarrying, except fuel (14)
051-059	Not used
060	CONSTRUCTION (15, 16, 17)
061-099	Not used
100-392	MANUFACTURING
100-222	NONDURABLE GOODS
100-122	Food and kindred products
100	Meat products (201)
101	Dairy products (202)

<b>Code</b>	<b>Industry</b>
102	Canned, frozen and preserved fruits and vegetables (203)
103-109	Not used
110	Grain mill products (204)
111	Bakery products (205)
112	Sugar and confectionery products (206)
113-119	Not used
120	Beverage industries (208)
121	Miscellaneous food preparations and kindred products (207, 209)
122	Not specified food industries
123-129	Not used
130	Tobacco manufactures (21)
131	Not used
132-150	Textile mill products
132	Knitting mills (225)
133-139	Not used
140	Dyeing and finishing textiles, except wool and knit goods (226)
141	Carpets and rugs (227)
142	Yarn, thread, and fabric mills (221-224, 228)
143-149	Not used
150	Miscellaneous textile mill products (229)
151-152	Apparel and other finished textile products
151	Apparel and accessories, except knit (231-238)
152	Miscellaneous fabricated textile products (239)
153-159	Not used
160-162	Paper and allied products
160	Pulp, paper, and paperboard mills (261-263)
161	Miscellaneous paper and pulp products (267)
162	Paperboard containers and boxes (265)
163-170	Not used
171-172	Printing, publishing, and allied industries
171	Newspaper publishing and printing (271)
172	Printing, publishing, and allied industries, except newspapers (272-279)
173-179	Not used
180-192	Chemicals and allied products
180	Plastics, synthetics, and resins (282)
181	Drugs (283)
182	Soaps and cosmetics (284)
183-189	Not used
190	Paints, varnishes, and related products (285)
191	Agricultural chemicals (287)
192	Industrial and miscellaneous chemicals (281, 286, 289)
193-199	Not used
200-201	Petroleum and coal products
200	Petroleum refining (291)
201	Miscellaneous petroleum and coal products (295, 299)

<b>Code</b>	<b>Industry</b>
202-209	Not used
210-212	Rubber and miscellaneous plastics products
210	Tires and inner tubes (301)
211	Other rubber products, and plastics footwear and belting (302-306)
212	Miscellaneous plastics products (308)
213-219	Not used
220-222	Leather and leather products
220	Leather tanning and finishing (311)
221	Footwear, except rubber and plastic (313, 314)
222	Leather products, except footwear (315-317, 319)
223-229	Not used
230-392	<b>DURABLE GOODS</b>
230-241	Lumber and wood products, except furniture
230	Logging (241)
231	Sawmills, planing mills, and millwork (242, 243)
232	Wood buildings and mobile homes (245)
233-240	Not used
241	Miscellaneous wood products (244, 249)
242	Furniture and fixtures (25)
243-249	Not used
250-262	Stone, clay, glass, and concrete products
250	Glass and glass products (321-323)
251	Cement, concrete, gypsum, and plaster products (324, 327)
252	Structural clay products (325)
253-260	Not used
261	Pottery and related products (326)
262	Miscellaneous nonmetallic mineral and stone products (328, 329)
263-269	Not used
270-301	Metal industries
270	Blast furnaces, steelworks, rolling and finishing mills (331)
271	Iron and steel foundries (332)
272	Primary aluminum industries (3334, part 334, 3353-3355, 3363, 3365)
273-279	Not used
280	Other primary metal industries (3331, 3339, part 334, 3351, 3356, 3357, 3364, 3366, 3369, 339)
281	Cutlery, hand tools, and general hardware (342)
282	Fabricated structural metal products (344)
283-289	Not used
290	Screw machine products (345)
291	Metal forgings and stampings (346)
292	Ordnance (348)
293-299	Not used
300	Miscellaneous fabricated metal products (341, 343, 347, 349)
301	Not specified metal industries

<b>Code</b>	<b>Industry</b>
302-309	Not used
310-332	Machinery and computing equipment
310	Engines and turbines (351)
311	Farm machinery and equipment (352)
312	Construction and material handling machines (353)
313-319	Not used
320	Metalworking machinery (354)
321	Office and accounting machines (3578, 3579)
322	Computers and related equipment (3571-3577)
323-330	Not used
331	Machinery, except electrical, n.e.c. (355, 356, 358, 359)
332	Not specified machinery
333-339	Not used
340-350	Electrical machinery, equipment, and supplies
340	Household appliances (363)
341	Radio, TV, and communication equipment (365, 366)
342	Electrical machinery, equipment, and supplies, n.e.c. (361, 362, 364, 367, 369)
343-349	Not used
350	Not specified electrical machinery, equipment, and supplies
351-370	Transportation equipment
351	Motor vehicles and motor vehicle equipment (371)
352	Aircraft and parts (372)
353-359	Not used
360	Ship and boat building and repairing (373)
361	Railroad locomotives and equipment (374)
362	Guided missiles, space vehicles, and parts (376)
363-369	Not used
370	Cycles and miscellaneous transportation equipment (375, 379)
371-381	Professional and photographic equipment, and watches
371	Scientific and controlling instruments (381, 382 except 3827)
372	Medical, dental, and optical instruments and supplies (3827, 384, 385)
373-379	Not used
380	Photographic equipment and supplies (386)
381	Watches, clocks, and clockwork operated devices (387)
382-389	Not used
390	Toys, amusement, and sporting goods (394)
391	Miscellaneous manufacturing industries (39 except 394)
392	Not specified manufacturing industries
393-399	Not used
400-472	TRANSPORTATION, COMMUNICATIONS, AND OTHER PUBLIC UTILITIES
400-432	TRANSPORTATION
400	Railroads (40)

<b>Code</b>	<b>Industry</b>
401	Bus service and urban transit (41, except 412)
402	Taxicab service (412)
403-409	Not used
410	Trucking service (421, 423)
411	Warehousing and storage (422)
412	U.S. Postal Service (43)
413-419	Not used
420	Water transportation (44)
421	Air transportation (45)
422	Pipelines, except natural gas (46)
423-431	Not used
432	Services incidental to transportation (47)
433-439	Not used
440-442	<b>COMMUNICATIONS</b>
440	Radio and television broadcasting and cable (483, 484)
441	Telephone communications (481)
442	Telegraph and miscellaneous communications services (482, 489)
443-449	Not used
450-472	<b>UTILITIES AND SANITARY SERVICES</b>
450	Electric light and power (491)
451	Gas and steam supply systems (492, 496)
452	Electric and gas, and other combinations (493)
453-469	Not used
470	Water supply and irrigation (494, 497)
471	Sanitary services (495)
472	Not specified utilities
473-499	Not used
500-571	<b>WHOLESALE TRADE</b>
500-532	<b>DURABLE GOODS</b>
500	Motor vehicles and equipment (501)
501	Furniture and home furnishings (502)
502	Lumber and construction materials (503)
503-509	Not used
510	Professional and commercial equipment and supplies (504)
511	Metals and minerals, except petroleum (505)
512	Electrical goods (506)
513-520	Not used
521	Hardware, plumbing and heating supplies (507)
522-529	Not used
530	Machinery, equipment, and supplies (508)
531	Scrap and waste materials (5093)
532	Miscellaneous wholesale, durable goods (509 except 5093)

<b>Code</b>	<b>Industry</b>
533-539	Not used
540-571	NONDURABLE GOODS
540	Paper and paper products (511)
541	Drugs, chemicals and allied products (512, 516)
542	Apparel, fabrics, and notions (513)
543-549	Not used
550	Groceries and related products (514)
551	Farm-product raw materials (515)
552	Petroleum products (517)
553-559	Not used
560	Alcoholic beverages (518)
561	Farm supplies (5191)
562	Miscellaneous wholesale, nondurable goods (5192-5199)

018	Managers, properties and real estate (1353)
019	Funeral directors (part 1359)
020	Not used
021	Managers, service organizations, n.e.c. (127, 1352, 1354, part 1359)
022	Managers and administrators, n.e.c. (121, 126, 132-1343, 136-139)
023-037	Management Related Occupations
023	Accountants and auditors (1412)
024	Underwriters (1414)
025	Other financial officers (1415, 1419)
026	Management analysts (142)
027	Personnel, training, and labor relations specialists (143)
028	Purchasing agents and buyers, farm products (1443)
029	Buyers, wholesale and retail trade except farm products (1442)
030-032	Not used
033	Purchasing agents and buyers, n.e.c. (1449)
034	Business and promotion agents (145)
035	Construction inspectors (1472)

<b>Code</b>	<b>Occupation</b>
036	Inspectors and compliance officers, except construction (1473)
037	Management related occupations, n.e.c. (149)
038-042	Not used
043-199	<b>PROFESSIONAL SPECIALTY OCCUPATIONS</b>
043-063	<b>Engineers, Architects, and Surveyors</b>
043	Architects (161)
044-059	<b>Engineers</b>
044	Aerospace (1622)
045	Metallurgical and materials (1623)
046	Mining (1624)
047	Petroleum (1625)
048	Chemical (1626)
049	Nuclear (1627)
050-052	Not used
053	Civil (1628)
054	Agricultural (1632)
055	Electrical and electronic (1633, 1636)
056	Industrial (1634)
057	Mechanical (1635)
058	Marine and naval architects (1637)
059	Engineers, n.e.c. (1639)
060-062	Not used
063	Surveyors and mapping scientists (164)
064-068	<b>Mathematical and Computer Scientists</b>
064	Computer systems analysts and scientists (171)
065	Operations and systems researchers and analysts (172)
066	Actuaries (1732)
067	Statisticians (1733)
068	Mathematical scientists, n.e.c. (1739)
069-083	<b>Natural Scientists</b>
069	Physicists and astronomers (1842, 1843)
070-072	Not used
073	Chemists, except biochemists (1845)
074	Atmospheric and space scientists (1846)
075	Geologists and geodesists (1847)
076	Physical scientists, n.e.c. (1849)
077	Agricultural and food scientists (1853)
078	Biological and life scientists (1854)
079	Forestry and conservation scientists (1852)
080-082	Not used
083	Medical scientists (1855)
084-089	<b>Health Diagnosing Occupations</b>
084	Physicians (261)
085	Dentists (262)

<b>Code</b>	<b>Occupation</b>
086	Veterinarians (27)
087	Optometrists (281)
088	Podiatrists (283)
089	Health diagnosing practitioners, n.e.c. (289)
090-094	Not used
095-106	Health Assessment and Treating Occupations
095	Registered nurses (29)
096	Pharmacists (301)
097	Dietitians (302)
098-105	Therapists
098	Respiratory therapists (3031)
099	Occupational therapists (3032)
100-102	Not used
103	Physical therapists (3033)
104	Speech therapists (3034)
105	Therapists, n.e.c. (3039)
106	Physicians' assistants (304)
107-112	Not used
113-154	Teachers, Postsecondary
113	Earth, environmental, and marine science teachers (2212)
114	Biological science teachers (2213)
115	Chemistry teachers (2214)
116	Physics teachers (2215)
117	Natural science teachers, n.e.c. (2216)
118	Psychology teachers (2217)

345-347	Duplicating, Mail and Other Office Machine Operators
345	Duplicating machine operators (4722)
346	Mail preparing and paper handling machine operators (4723)
347	Office machine operators, n.e.c. (4729)
348-353	Communications Equipment Operators
348	Telephone operators (4732)
350-352	Not used
353	Communications equipment operators, n.e.c. (4733, 4739)
354-357	Mail and Message Distributing Occupations
354	Postal clerks, except mail carriers (4742)
355	Mail carriers, postal service (4743)
356	Mail clerks, except postal service (4744)
357	Messengers (4745)
358	Not used
359-374	Material Recording, Scheduling, and Distributing Clerks
359	Dispatchers (4751)
360-362	Not used
363	Production coordinators (4752)
364	Traffic, shipping, and receiving clerks (4753)
365	Stock and inventory clerks (4754)

<b>Code</b>	<b>Occupation</b>
366	Meter readers (4755)
367	Not used
368	Weighers, measurers, checkers, and samplers (4756, 4757)
369-372	Not used
373	Expeditors (4758)
374	Material recording, scheduling, and distributing clerks, n.e.c. (4759)
375-378	Adjusters and Investigators
375	Insurance adjusters, examiners, and investigators (4782)
376	Investigators and adjusters, except insurance (4783)
377	Eligibility clerks, social welfare (4784)
378	Bill and account collectors (4786)
379-389	Miscellaneous Administrative Support Occupations
379	General office clerks (463)
380-382	Not used
383	Bank tellers (4791)
384	Proofreaders (4792)
385	Data-entry keyers (4793)
386	Statistical clerks (4794)
387	Teachers' aides (4795)
388	Not used
389	Administrative support occupations, n.e.c. (4787, 4799)
390-402	Not used
403-469	<b>SERVICE OCCUPATIONS</b>
403-407	<b>PRIVATE HOUSEHOLD OCCUPATIONS</b>
403	Launderers and ironers (503)
404	Cooks, private household (504)
405	Housekeepers and butlers (505)
406	Child care workers, private household (506)
407	Private household cleaners and servants (502, 507, 509)
408-412	Not used
413-427	<b>PROTECTIVE SERVICE OCCUPATIONS</b>
413-415	Supervisors, Protective Service Occupations
413	Supervisors, firefighting and fire prevention occupations (5111)
414	Supervisors, police and detectives (5112)
415	Supervisors, guards (5113)
416-417	Firefighting and Fire Prevention Occupations
416	Fire inspection and fire prevention occupations (5122)
417	Firefighting occupations (5123)
418-424	Police and Detectives
418	Police and detectives, public service (5132)
419-422	Not used
423	Sheriffs, bailiffs, and other law enforcement officers (5134)
424	Correctional institution officers (5133)
425-432	Guards

<b>Code</b>	<b>Occupation</b>
425	Crossing guards (5142)
426	Guards and police, except public service (5144)
427	Protective service occupations, n.e.c. (5149)
428-432	Not used
433-469	<b>SERVICE OCCUPATIONS, EXCEPT PROTECTIVE AND HOUSEHOLD</b>
433-444	<b>Food Preparation and Service Occupations</b>
433	Supervisors, food preparation and service occupations (5211)
434	Bartenders (5212)
435	Waiters and waitresses (5213)
436	Cooks (5214, 5215)
437	Not used
438	Food counter, fountain and related occupations (5216)
439	Kitchen workers, food preparation (5217)
440-442	Not used
443	Waiters'/waitresses' assistants (5218)
444	Miscellaneous food preparation occupations (5219)
445-447	<b>Health Service Occupations</b>
445	Dental assistants (5232)
446	Health aides, except nursing (5233)
447	Nursing aides, orderlies, and attendants (5236)
448-455	<b>Cleaning and Building Service Occupations, Except Household</b>
448	Supervisors, cleaning and building service workers (5241)
449	Maids and housemen (5242, 5249)
450-452	Not used
453	Janitors and cleaners (5244)
454	Elevator operators (5245)
455	Pest control occupations (5246)
456-469	<b>Personal Service Occupations</b>
456	Supervisors, personal service occupations (5251)
457	Barbers (5252)
458	Hairdressers and cosmetologists (5253)
459	Attendants, amusement and recreation facilities (5254)
460	Not used
461	Guides (5255)
462	Ushers (5256)
463	Public transportation attendants (5257)
464	Baggage porters and bellhops (5262)
465	Welfare service aides (5263)
466	Family child care providers (part 5264)
467	Early childhood teacher's assistants (part 5264)
468	Child care workers, n.e.c. (part 5264)
469	Personal service occupations, n.e.c. (5258, 5269)
470-472	Not used

<b>Code</b>	<b>Occupation</b>
473-499	<b>FARMING, FORESTRY, AND FISHING OCCUPATIONS</b>
473-476	Farm Operators and Managers
473	Farmers, except horticultural (5512-5514)
474	Horticultural specialty farmers (5515)
475	Managers, farms, except horticultural (5522-5524)
476	Managers, horticultural specialty farms (5525)
477-489	Other Agricultural and Related Occupations
477-484	Farm Occupations, Except Managerial
477	Supervisors, farm workers (5611)
478	Not used
479	Farm workers (5612-5617)
480-482	Not used
483	Marine life cultivation workers (5618)
484	Nursery workers (5619)
485-489	Related Agricultural Occupations
485	Supervisors, related agricultural occupations (5621)
486	Grounds keepers and gardeners, except farm (5622)
487	Animal caretakers, except farm (5624)
488	Graders and sorters, agricultural products (5625)
489	Inspectors, agricultural products (5627)
490-493	Not used
494-496	Forestry and Logging Occupations
494	Supervisors, forestry and logging workers (571)
495	Forestry workers, except logging (572)
496	Timber cutting and logging occupations (573, 579)
497-499	Fishers, Hunters, and Trappers
497	Captains and other officers, fishing vessels (part 8241)
498	Fishers (583)
499	Hunters and trappers (584)
500-502	Not used
503-699	<b>PRECISION PRODUCTION, CRAFT, AND REPAIR OCCUPATIONS</b>
503-552	Mechanics and Repairers
503	Supervisors, mechanics and repairers (60)
504	Not used
505-549	Mechanics and Repairers, Except Supervisors
505-517	Vehicle and Mobile Equipment Mechanics and Repairers
505	Automobile mechanics (part 6111)
506	Automobile mechanic apprentices (part 6111)
507	Bus, truck, and stationary engine mechanics (6112)
508	Aircraft engine mechanics (6113)
509	Small engine repairers (6114)
510-513	Not used
514	Automobile body and related repairers (6115)
515	Aircraft mechanics, except engine (6116)

<b>Code</b>	<b>Occupation</b>
516	Heavy equipment mechanics (6117)
517	Farm equipment mechanics (6118)
518	Industrial machinery repairers (613)
519	Machinery maintenance occupations (614)
520-522	Not used
523-533	Electrical and Electronic Equipment Repairers
523	Electronic repairers, communications and industrial equipment (6151, 6153, 6155)
524	Not used
525	Data processing equipment repairers (6154)
526	Household appliance and power tool repairers (6156)
527	Telephone line installers and repairers (6157)
528	Not used
529	Telephone installers and repairers (6158)
530-532	Not used
533	Miscellaneous electrical and electronic equipment repairers (6152, 6159)
534	Heating, air conditioning, and refrigeration mechanics (616)
535-549	Miscellaneous Mechanics and Repairers
535	Camera, watch, and musical instrument repairers (6171, 6172)
536	Locksmiths and safe repairers (6173)
537	Not used
538	Office machine repairers (6174)
539	Mechanical controls and valve repairers (6175)
540-542	Not used
543	Elevator installers and repairers (6176)
544	Millwrights (6178)
545-546	Not used
547	Specified mechanics and repairers, n.e.c. (6177, 6179)
548	Not used
549	Not specified mechanics and repairers
550-552	Not used
553-599	Construction Trades
553-558	Supervisors, Construction Occupations
553	Supervisors, brick masons, stonemasons, and tile setters (6312)
554	Supervisors, carpenters and related workers (6313)
555	Supervisors, electricians and power transmission installers (6314)
556	Supervisors, painters, paperhangers, and plasterers (6315)
557	Supervisors, plumbers, pipefitters, and steam fitters (6316)
558	Supervisors, construction, n.e.c. (6311, 6318)
559-562	Not used
563-599	Construction Trades, Except Supervisors
563	Brickmasons and stonemasons (part 6412, part 6413)
564	Brick mason and stonemason apprentices (part 6412, part 6413)
565	Tile setters, hard and soft (part 6414, part 6462)
566	Carpet installers (part 6462)

<b>Code</b>	<b>Occupation</b>
567	Carpenters (part 6422)
568	Not used
569	Carpenter apprentices (part 6422)
570-572	Not used
573	Drywall installers (6424)
574	Not used
575	Electricians (part 6432)
576	Electrician apprentices (part 6432)
577	Electrical power installers and repairers (6433)
578	Not used
579	Painters, construction and maintenance (6442)
582	Not used
583	Paperhangers (6443)
584	Plasterers (6444)
585	Plumbers, pipefitters, and steamfitters (part 645)
586	Not used
587	Plumber, pipefitter, and steamfitter apprentices (part 645)
588	Concrete and terrazzo finishers (6463)
589	Glaziers (6464)
590-592	Not used
593	Insulation workers (6465)
594	Paving, surfacing, and tamping equipment operators (6466)
595	Roofers (6468)
596	Sheetmetal duct installers (6472)
597	Structural metal workers (6473)
598	Drillers, earth (6474)
599	Construction trades, n.e.c. (6467, 6475, 6476, 6479)
600-612	Not used
613-617	Extractive Occupations
613	Supervisors, extractive occupations (632)
614	Drillers, oil well (652)
615	Explosives workers (653)
616	Mining machine operators (654)
617	Mining occupations, n.e.c. (656)
618-627	Not used
628-699	Precision Production Occupations
628	Supervisors, production occupations (67, 71)
629-633	Not used
634-655	Precision Metal Working Occupations
634	Tool and die makers (part 6811)
635	Tool and die maker apprentices (part 6811)
636	Precision assemblers, metal (6812)
637	Machinists (part 6813)
638	Not used
639	Machinist apprentices (part 6813)

<b>Code</b>	<b>Occupation</b>
640-642	Not used
643	Boilermakers (6814)
644	Precision grinders, filers, and tool sharpeners (6816)
645	Pattern makers and model makers, metal (6817)
646	Lay-out workers (6821)
647	Precious stones and metals workers (Jewelers) (6822, 6866)
648	Not used
649	Engravers, metal (6823)
650-652	Not used
653	Sheet metal workers (part 6824)
654	Sheet metal worker apprentices (part 6824)
655	Miscellaneous precision metal workers (6829)
656-659	Precision Woodworking Occupations
656	Patternmakers and model makers, wood (6831)
657	Cabinet makers and bench carpenters (6832)
658	Furniture and wood finishers (6835)
659	Miscellaneous precision woodworkers (6839)
660-665	Not used
666-674	Precision Textile, Apparel, and Furnishings Machine Workers
666	Dressmakers (part 6852, part 7752)
667	Tailors (part 6852)
668	Upholsterers (6853)
669	Shoe repairers (6854)
670-673	Not used
674	Miscellaneous precision apparel and fabric workers (6856, 6859, part 7752)
675-684	Precision Workers, Assorted Materials
675	Hand molders and shapers, except jewelers (6861)
676	Patternmakers, lay-out workers, and cutters (6862)
677	Optical goods workers (6864, part 7477, part 7677)
678	Dental laboratory and medical appliance technicians (6865)
679	Bookbinders (6844)
680-682	Not used
683	Electrical and electronic equipment assemblers (6867)
684	Miscellaneous precision workers, n.e.c. (6869)
685	Not used
686-688	Precision Food Production Occupations
686	Butchers and meat cutters (6871)
687	Bakers (6872)
688	Food batch makers (6873, 6879)
689-693	Precision Inspectors, Testers, and Related Workers
689	Inspectors, testers, and graders (6881, 828)
690-692	Not used
693	Adjusters and calibrators (6882)
694-699	Plant and System Operators

<b>Code</b>	<b>Occupation</b>
694	Water and sewage treatment plant operators (691)
695	Power plant operators (part 693)
696	Stationary engineers (part 693, 7668)
697-698	Not used
699	Miscellaneous plant and system operators (692, 694, 695, 696)
700-702	Not used
703-889	<b>OPERATORS, FABRICATORS, AND LABORERS</b>
703-799	<b>MACHINE OPERATORS, ASSEMBLERS, AND INSPECTORS</b>
703-779	Machine Operators and Tenders, Except Precision
703-715	Metal Working and Plastic Working Machine Operators
703	Lathe and turning machine set-up operators (7312)
704	Lathe and turning machine operators (7512)
705	Milling and planing machine operators (7313, 7513)
706	Punching and stamping press machine operators (7314, 7317, 7514, 7517)
707	Rolling machine operators (7316, 7516)
708	Drilling and boring machine operators (7318, 7518)
709	Grinding, abrading, buffing, and polishing machine operators (7322, 7324, 7522)
710-712	Not used
713	Forging machine operators (7319, 7519)
714	Numerical control machine operators (7326)
715	Miscellaneous metal, plastic, stone, and glass working machine operators (7329, 7529)
716	Not used
717	Fabricating machine operators, n.e.c. (7339, 7539)
718	Not used
719-725	Metal and Plastic Processing Machine Operators
719	Molding and casting machine operators (7315, 7342, 7515, 7542)
720-722	Not used
723	Metal plating machine operators (7343, 7543)
724	Heat treating equipment operators (7344, 7544)
725	Miscellaneous metal and plastic processing machine operators (7349, 7549)
726-733	Woodworking Machine Operators
726	Wood lathe, routing, and planing machine operators (7431, 7432, 7631, 7632)
727	Sawing machine operators (7433, 7633)
728	Shaping and joining machine operators (7435, 7635)
729	Nailing and tacking machine operators (7636)
730-732	Not used
733	Miscellaneous woodworking machine operators (7434, 7439, 7634, 7639)
734-737	Printing Machine Operators
734	Printing press operators (7443, 7643)
735	Photoengravers and lithographers (6842, 7444, 7644)

<b>Code</b>	<b>Occupation</b>
736	Typesetters and compositors (6841, 7642)
737	Miscellaneous printing machine operators (6849, 7449, 7649)
738-749	Textile, Apparel, and Furnishings Machine Operators
738	Winding and twisting machine operators (7451, 7651)
739	Knitting, looping, taping, and weaving machine operators (7452, 7652)
740-742	Not used
743	Textile cutting machine operators (7654)
744	Textile sewing machine operators (7655)
745	Shoe machine operators (7656)
746	Not used
747	Pressing machine operators (7657)
748	Laundering and dry cleaning machine operators (6855, 7658)
749	Miscellaneous textile machine operators (7459, 7659)
750-752	Not used
753-779	Machine Operators, Assorted Materials
753	Cementing and gluing machine operators (7661)
754	Packaging and filling machine operators (7462, 7662)
755	Extruding and forming machine operators (7463, 7663)
756	Mixing and blending machine operators (7664)
757	Separating, filtering, and clarifying machine operators (7476, 7666, 7676)
758	Compressing and compacting machine operators (7467, 7667)
759	Painting and paint spraying machine operators (7669)
760-762	Not used
763	Roasting and baking machine operators, food (7472, 7672)
764	Washing, cleaning, and pickling machine operators (7673)
765	Folding machine operators (7474, 7674)
766	Furnace, kiln, and oven operators, except food (7675)
767	Not used
768	Crushing and grinding machine operators (part 7477, part 7677)
769	Slicing and cutting machine operators (7478, 7678)
770-772	Not used
773	Motion picture projectionists (part 7479)
774	Photographic process machine operators (6863, 6868, 7671)
775-776	Not used
777	Miscellaneous machine operators, n.e.c. (part 7479, 7665, 7679)
778	Not used
779	Machine operators, not specified
780-782	Not used
783-795	Fabricators, Assemblers, and Hand Working Occupations
783	Welders and cutters (7332, 7532, 7714)
784	Solderers and brazers (7333, 7533, 7717)
785	Assemblers (772, 774)
786	Hand cutting and trimming occupations (7753)
787	Hand molding, casting, and forming occupations (7754, 7755)
788	Not used

<b>Code</b>	<b>Occupation</b>
789	Hand painting, coating, and decorating occupations (7756)
790-792	Not used
793	Hand engraving and printing occupations (7757)
794	Not used
795	Miscellaneous hand working occupations (7758, 7759)
796-799	Production Inspectors, Testers, Samplers, and Weighers
796	Production inspectors, checkers, and examiners (782, 787)
797	Production testers (783)
798	Production samplers and weighers (784)
799	Graders and sorters, except agricultural (785)
800-802	Not used
803-859	<b>TRANSPORTATION AND MATERIAL MOVING OCCUPATIONS</b>
803-814	Motor Vehicle Operators
803	Supervisors, motor vehicle operators (8111)
804	Truck drivers (8212-8214)
805	Not used
806	Driver-sales workers (8218)
807	Not used
808	Bus drivers (8215)
809	Taxicab drivers and chauffeurs (8216)
810-812	Not used
813	Parking lot attendants (874)
814	Motor transportation occupations, n.e.c. (8219)
815-822	Not used
823-834	Transportation Occupations, Except Motor Vehicles
823-826	Rail Transportation Occupations
823	Railroad conductors and yardmasters (8113)
824	Locomotive operating occupations (8232)
825	Railroad brake, signal, and switch operators (8233)
826	Rail vehicle operators, n.e.c. (8239)
827	Not used
828-834	Water Transportation Occupations
828	Ship captains and mates, except fishing boats (part 8241, 8242)
829	Sailors and deckhands (8243)
830-832	Not used
833	Marine engineers (8244)
834	Bridge, lock, and lighthouse tenders (8245)
835-842	Not used
843-859	Material Moving Equipment Operators
843	Supervisors, material moving equipment operators (812)
844	Operating engineers (8312)
845	Long shore equipment operators (8313)
846-847	Not used

<b>Code</b>	<b>Occupation</b>
848	Hoist and winch operators (8314)
849	Crane and tower operators (8315)
850-852	Not used
853	Excavating and loading machine operators (8316)
854	Not used
855	Grader, dozer, and scraper operators (8317)
856	Industrial truck and tractor equipment operators (8318)
857-858	Not used
859	Miscellaneous material moving equipment operators (8319)
860-863	Not used
864-889	<b>HANDLERS, EQUIPMENT CLEANERS, HELPERS, AND LABORERS</b>
864	Supervisors, handlers, equipment cleaners, and laborers, n.e.c. (85)
865	Helpers, mechanics, and repairers (863)
866-868	Helpers, Construction, and Extractive Occupations
866	Helpers, construction trades (8641-8645, 8648)
867	Helpers, surveyor (8646)
868	Helpers, extractive occupations (865)
869	Construction laborers (871)
870-873	Not used
874	Production helpers (861, 862)
875-883	<b>Freight, Stock, and Material Handlers</b>
875	Garbage collectors (8722)
876	Stevedores (8723)
877	Stock handlers and baggers (8724)
878	Machine feeders and off bearers (8725)
879-882	Not used
883	Freight, stock, and material handlers, n.e.c. (8726)
884	Not used
885	Garage and service station related occupations (873)
886	Not used
887	Vehicle washers and equipment cleaners (875)
888	Hand packers and packagers (8761)
889	Laborers, except construction (8769)
890-904	Not used
905	Assigned to people whose current labor force status is unemployed and whose last job was Armed Forces.
997	Refused, Classified, etc
998	Blank, NA, DK

## SIPP to CPS Cross-Reference Map

### Introduction

The following cross-reference map accounts for all variables on the 1994 March CPS. For CPS fields that can be coded from SIPP data, column 2 indicates the SIPP source, and column 3 shows the coding scheme used and, in some instances, contains comments regarding the coding.

In column 2, which lists SIPP source fields, parentheses following the name of the field reference the column number on the 1992 SIPP Tenwave file of the beginning of the field, the field length, and a letter that indicates field frequency. A field frequency of M indicates that the field has values for each of the 40 months in the survey, W indicates that the field has values for each of the 10 waves, and P indicates that the field has a single value for the entire panel. If the SIPP data field is from a wave file, then the parentheses following the field name contains the word "Wave."

The comments column contains coding details, notes regarding mapping deficiencies, and other pertinent information relating to the mapping of fields. If coding details are provided that reference another CPS variable, parentheses following the variable name indicate the variable location; e.g., P32 means the variable is located on person records at column position 32. "H" and "F" reference household and family records. Both the CPS codebook and this cross-reference map are ordered by CPS column number within the household, family, and person sections.

### Determining Annual Values From Monthly Data

In the SIPP, family and household units evolve from month to month. Persons may leave a family by going away to school, joining the armed forces, establishing a new household, or dying. Others may join a family through birth of a child, marriage, or some other reason. There are no static family and household structures that exist for the duration of the survey, or even for a year. The monthly family and household information collected by the SIPP apply to the units that exist as of the month the data are collected. However, the CPS family and household sample units are defined as of a point in time--March of the survey year--and annual data for the preceeding year, the data year, are collected for units in existence as of the time of survey.

In order to construct annual information such as is contained on a CPS file from information that varies by month, as is provided by SIPP, it is necessary to determine a fixed reference point for the construction of family and household units and the determination of demographic characteristics. December of the reference year has been chosen as that point on the SIPP file. Thus, the coding of all household and family relationship codes and demographic fields such as race, sex, marital status, and age and any other fields requiring a fixed reference point will be based on December values for

the reference year.

The necessity of defining annual units from units that exist as of a given point in time (December of the reference year) also means that many of the household and family fields must be constructed from person fields, rather than the reverse coding scheme which would follow the coding logic of the CPS. For instance, on the CPS, if a household has any person who received social security benefits, the household field HSS-YN is coded with a 1 to indicate “Yes.” Only then are questions asked that enable coding of person fields that refer to receipt of social security benefits. Thus, the universe for the person fields is  $HSS-YN = 1$ . However, a reverse process must be used for the CPS look-alike file. The CPS person fields are first coded from SIPP data. Then, the household and family fields are coded by cycling through persons in the family or household units that existed as of December. Thus, some of the universes on the SIPP to CPS look-alike file must differ from those on a CPS file. For example, DSS-YN, a CPS person field, has a universe of  $HSS-YN = 1$ . On the look-alike file, DSS-YN has a universe of all persons. This difference in universe is regarded as insignificant, but it is one that should be noted when frequencies on the SIPP to CPS look-alike file are compared with those from other CPS files.

Since longitudinal units are not identified for the SIPP, monthly data that pertain to monthly family and household units have little meaning for a longitudinal file, and, for the most part, such data are omitted from the longitudinal file. However, the CPS collects annual data that apply to family and household units that are identified as of the time of survey. To reproduce some of the family and household data from the SIPP that are provided by the CPS, it is necessary not only to define the family and household units as of a point in time (December of the reference year), it is also necessary to obtain information from the monthly data provided by SIPP wave files. SIPP data that are obtained from a wave file are identified as wave data in parentheses following the name of the field in the SIPP source column. Household information is taken from the record of the household reference person (identified by SIPP variable RRP) for December of the reference year; and family information is taken from the record of the family reference person (identified by SIPP variables FAMREL and RRP).

#### Identification of Longest Job or Business

Many CPS labor force codes refer to one’s longest job during the reference year (“last year”), and the CPS universe for the longest job codes is  $WORKYN = 1$ .  $WORKYN$  is coded 1 (yes) if a person spent any time working during the reference year at a job or business, even time without pay in a family business. Thus, one of the initial coding steps of the SAS processing routine that codes person fields is to identify a person’s longest job or business by examining the monthly values for  $JOB-ID1$ ,  $JOB-ID2$ ,  $WKS-EMP1$ ,  $WKS-EMP2$ ,  $BUS-ID1$ ,  $BUS-ID2$ ,  $SE-WWB1$ , and  $SE-WWB2$ . Once longest job or business is identified, then industry, occupation, and class of worker codes associated with that job or business is used for the CPS codes that refer to a

person's longest job last year.

The following procedure was used to identify a person's longest job or business. Cycle through all months of the reference year, setting up an array of unique job ID's (from JOB-ID1 and JOB-ID2) and another array of unique business ID's (from BUS-ID1 and BUS-ID2) and associate with each the sum of weeks worked from either WKS-EMP1 and WKS-EMP2 or SE-WWB1 and SE-WWB2. Identify as the longest job or business during the year the job or business having the greatest number of weeks worked. If more than one job and/or business tie for most weeks worked, then also examine earnings associated with each (from ERN-AMT1, ERN-AMT2, SE-AMT1, and SE-AMT2) to determine "primary" job or business. Identify the longest job or business as either a job or business, and also identify the associated industry and occupation, using the last industry and occupation codes available during the reference year for the longest job or business. At the same time, also determine total wage and salary earnings (sum of ERN-AMT1 and ERN-AMT2 for all jobs and all months), total farm and non-farm self-employment earnings (sum of SE-AMT1 and SE-AMT2 for all business and all months, including negative amounts), and total earnings for the year (sum of wage and salary earnings and self-employment earnings). [Analysts rejected a more complex coding scheme that would also use the occupational codes OCC1, OCC2, SE-OCC1, and SE-OCC2 to identify individual jobs.]

## SIPP to CPS Cross-Reference Map

<b>HOUSEHOLD RECORD</b>		
Note that on the look-alike file, household income fields have no upper limit beyond that imposed by field width.		
CPS	SIPP Source	Coding/Comments
D HRECORD 1 1 (1:1) U All households V 1 .Household record		Created by SAS processing routine. Coded with "1" to identify household records.
D H-SEQ 5 2 (00001:99999) Household sequence number V All households V 00001-99999 .Household sequence number		Created by SAS processing routine. Unique household sequence number beginning with 1.
D HHPOS 2 7 (00:00) Trailer portion of unique household ID. 00 for HH record. Same function in family record is field FFPOS (01-39) Same function in person record is PPPOS (41-79)		Created by SAS processing routine. Serves no function and coded with "00" for household records.

# APPENDIX E

## Countries and Areas of the World Variable NATVTY

### List A -- Alphabetical List of Areas of the World and Countries

If the specific country reported was not on the interviewer's list, or if the respondent did not know the specific country, the following codes for broad areas of the world were available for coding:

<b>Code</b>	<b>Name</b>
468	Africa: North
462	Africa: Other
245	Asia
353	Caribbean
318	Central America
148	Europe
252	Middle East
304	North America
527	Pacific Islands
389	South America
555	Elsewhere (includes country not known)

The countries (or areas) shown below were coded separately, if reported.

<b>Code</b>	<b>Name</b>	<b>Code</b>	<b>Name</b>
200	Afghanistan	213	Iraq
60	American Samoa	119	Ireland/Eire
375	Argentina	214	Israel
185	Armenia	120	Italy
501	Australia	343	Jamaica
102	Austria	215	Japan
130	Azores	216	Jordan
333	Bahamas	427	Kenya
202	Bangladesh	217/218	Korea/South Korea
334	Barbados	221	Laos
103	Belgium	183	Latvia
310	Belize	222	Lebanon
300	Bermuda	184	Lithuania
376	Bolivia	224	Malaysia
377	Brazil	315	Mexico
205	Burma	436	Morocco
206	Cambodia	126	Netherlands

<b>Code</b>	<b>Name</b>	<b>Code</b>	<b>Name</b>
301	Canada	514	New Zealand
378	Chile	316	Nicaragua
207	China	440	Nigeria
379	Colombia	142	Northern Ireland
311	Costa Rica	127	Norway
337	Cuba	229	Pakistan
155	Czech Republic	253	Palestine
105	Czechoslovakia	317	Panama
106	Denmark	385	Peru
339	Dominican Republic	231	Philippines
338	Dominica	128	Poland
380	Ecuador	129	Portugal
415	Egypt	72	Puerto Rico
312	El Salvador	132	Romania
139	England	192	Russia
417	Ethiopia	233	Saudi Arabia
507	Fiji	140	Scotland
108	Finland	234	Singapore
109	France	156	Slovakia/Slovak Republic
110	Germany	449	South Africa
421	Ghana	134	Spain
138	Great Britain	136	Sweden
116	Greece	137	Switzerland
340	Grenada	237	Syria
66	Guam	238	Taiwan
313	Guatemala	239	Thailand
383	Guyana	351	Trinidad & Tobago
342	Haiti	240	Turkey
126	Holland	57	United States
314	Honduras	78	U.S. Virgin Islands
209	Hong Kong	180	USSR
117	Hungary	195	Ukraine
210	India	387	Uruguay
211	Indonesia	388	Venezuela
212	Iran	242	Vietnam
		147	Yugoslavia

## List B. Numeric List of Countries and Areas of the World

The following list of countries/areas is in numeric order by code.

Code	Name	Code	Name
57	United States	231	Philippines
60	American Samoa	233	Saudi Arabia
66	Guam	234	Singapore
72	Puerto Rico	237	Syria
78	U.S. Virgin Islands	238	Taiwan
96	Outlying areas of U.S. (Guam, USVI, PR etc.)	239	Thailand
102	Austria	240	Turkey
103	Belgium	242	Vietnam
105	Czechoslovakia	245	Asia
106	Denmark	252	Middle East
108	Finland	253	Palestine
109	France	300	Bermuda
110	Germany	301	Canada
116	Greece	304	North America
117	Hungary	310	Belize
119	Ireland/Eire	311	Costa Rica
120	Italy	312	El Salvador
126	Holland	313	Guatemala
126	Netherlands	314	Honduras
127	Norway	315	Mexico
128	Poland	316	Nicaragua
129	Portugal	317	Panama
130	Azores	318	Central America
132	Romania	333	Bahamas
134	Spain	334	Barbados
136	Sweden	337	Cuba
137	Switzerland	338	Dominica
138	Great Britain	339	Dominican Republic
139	England	340	Grenada
140	Scotland	342	Haiti
142	Northern Ireland	343	Jamaica
147	Yugoslavia	351	Trinidad & Tobago
148	Europe	353	Caribbean
155	Czech Republic	375	Argentina
156	Slovakia/Slovak Republic	376	Bolivia
180	USSR	377	Brazil
183	Latvia	378	Chile
184	Lithuania	379	Colombia
185	Armenia	380	Ecuador
192	Russia	383	Guyana

<b>Code</b>	<b>Name</b>	<b>Code</b>	<b>Name</b>
195	Ukraine	385	Peru
200	Afghanistan	387	Uruguay
202	Bangladesh	388	Venezuela
205	Burma	389	South America
206	Cambodia	415	Egypt
207	China	417	Ethiopia

## Working Papers

### SPD Working Papers

The SPD working papers are available on the SPD Internet site <<http://www.sipp.census.gov/spd>> under “SPD Publications”.

- SPD97-1: Kominski, R and D. Weinberg. 1997. “Tracking Devolution: The Survey of Program Dynamics.” Paper presented at the Population Association of America Annual Meeting, Washington, D.C., March 1997.
- SPD97-2: Weinberg, D., P. Johnson, and the SPD Team HHES. 1997. “What Are the Issues in Implementing the Survey of Program Dynamics”? Prepared for the Census Advisory Committee of Professional Associations, May 1997.
- SPD97-3: Hess, J. and J. Rothgeb. 1997. “Measuring the Impact of Welfare Reform: Issues in Designing the Survey of Program Dynamics Questionnaire.” Invited paper presented at Symposium 97: New Directions in Surveys and Censuses, Statistics Canada.
- SPD97-4: Hess, J., J. Rothgeb, and A. Zukerberg. 1997. “Survey of Program Dynamics Pretest Evaluation Report.” Unpublished report (U.S. Census Bureau.)
- SPD98-1: Hess, J., J. Rothgeb, A. Zukerberg, K. Richter, S. Menestrel, K. Moore, and E. Terry. 1998. “Teens Talk: Are Adolescents Willing and Able to Answer Survey Questions?” Paper presented at the Annual Conference of the American Association for Public Opinion Research, St. Louis, MO, May 1998.
- SPD98-2: Hess, J., J. Rothgeb, and E. Nichols. 1998. “Report on Cognitive Interview Results for the 1999 Survey of Program Dynamics.” Unpublished report (U.S. Census Bureau), June 1998.
- SPD98-3: Kominski, R. and L. Bass. 1998. “Developing Children’s Data for the Survey of Program Dynamics.” Paper presented at the Association for Public Policy Analysis and Management (APPAM) annual meetings, New York, NY, August 1998.
- SPD98-4: Hess, J. and J. Rothgeb. 1998. “Summary Report - 1998 SPD Taped Interviews”, September 1998.

- SPD98-5: Weinberg, D., P. Doyle, A. Jones Jr, and S. Shipp. 1998. "Measuring the Impact of Welfare Reform With The Survey of Program Dynamics." Presented at the Joint Statistical Meetings, Dallas, Texas, and the 1998 Association for Public Policy Analysis and Management (APPAM) annual meetings, New York NY. (U. S. Census Bureau), October 1998.
- SPD99-1: Karen King, 1999, "Proposal for Incentives in the 1999 Survey of Program Dynamics", January 1999.
- SPD99-2: Donald J. Hernandez, 1999, "Comparing Response Rates for SPD, PSID, and NLSY," memorandum to Daniel H. Weinberg, January 1999.
- SPD99-3: Alan R. Tupek, 1999, "SPD99: Proposal to Provide Incentives in the Upcoming 1999 Survey of Program Dynamics - Revised," memorandum to Dr. Nancy Kirkendall, February 1999.
- SPD99-4: Bass, L. and B. Downs. 1999. "What Can the SPD Adolescent SAQ Tell Us About the Well-being of Adolescents in the Aftermath of the 1996 Welfare Reform Act?" Paper presented at the Annual Meeting of the Population Association of America, New York, NY, March 1999.
- SPD99-5: Hess, J. and B. Belli. 1999. "Results of cognitive testing on the Residential History Module for Survey of Program Dynamics 2000," memorandum to SPD Steering Committee, April 1999.
- SPD99-6: Fant, G., K. Bryson, L. Bass, and B. Downs. 1999. "Survey of Program Dynamics 1997 Bridge survey and Current Population Survey 1997 March supplement: Evaluating selected demographic data." Paper presented at the American Statistical Association Joint Statistical Meeting, Baltimore, MD, August 1999.
- SPD99-7: Downs, B. and L. Bass. 1999. "The Survey of Program Dynamics: A New Source of Data to Explore the Effects of the 1996 Welfare Reform Act on Adolescents." Paper presented at the American Sociological Association Annual meetings, Chicago, IL, August 1999.
- SPD99-8: Galvin, L., K. King, and S. Sae-Ung. 1999. "Evaluation of the Survey of Program Dynamics (SPD) Exploratory Attrition Study", November 1999.
- SPD99-9: Jones Jr., A., B. Downs, and S. Shipp. 2000. "Measuring Welfare Reform, Preliminary Results from the Survey of Program Dynamics", August 1999.
- SPD99-10: Weinberg, D. and S. Shipp. 2000. "The Survey of Program Dynamics - A Mid-Term Status Report", October 1999.

- SPD2000-1: Nusser, S., C. Fletcher, and D. Anderson. 2000. "The Iowa Survey of Program Dynamics Feasibility Study", March 2000.
- SPD2000-2: Hess, J., P. Doyle, and E. Welniak. 2000. "Measuring Welfare Reform: Questions from Four Census Bureau Surveys." Presented at the Midwest Welfare Peer Assistance Network (WELPAN) Meeting, Washington, D.C., February 2000.
- SPD2001-1: Moore, Hair, Bronte-Tinkew, Kinukawa, Halle & LeMenestrel. 2001. "Documentation of Child and Family Well-Being Measures in the 1998 Wave of the Survey of Program Dynamics." Contractor report prepared by Child Trends, Inc., August 1, 2001.
- SPD2002-1: Sandra L. Hofferth, 2002, "Use of the Survey of Program Dynamics for Studying the Implications of Welfare Reform for Families and Children." Contractor report prepared by Child Trends, Inc., April 16, 2002.
- SPD2002-2: John J. Hisnanick, 2002, "Participation in Public Assistance Programs, 1993-1997: A First Look at the Survey of Program Dynamics (SPD) Longitudinal Data." Presented at the Annual Meetings of the American Statistical Association, New York, NY, August 2002.
- SPD2002-3: Fronczek, P., P. Doyle, R. Kominski, and C. Nelson. 2002. "Complex Problems - Complex Data: Welfare Reform and the Survey of Program Dynamics." Presented at the Annual Meetings of the American Statistical Association, New York, NY, August 13, 2002.
- SPD2003-1: Overturf, J. and B. Downs. 2003. "Adolescent Behavior and Family Relationships." Presented at the Annual Meeting of the Population Association of America, Minneapolis, MN, May 1-3, 2003.
- SPD2003-2: Hisnanick, J. and K. Walker. 2003. "Assessing Employment Outcomes from the Survey of Program Dynamics Second Longitudinal File: What type of jobs do welfare leavers get?." Presented at the 2003 Joint Statistical Meetings, American Statistical Association, San Francisco, CA, August 2-5, 2003

### **SIPP Working Papers**

The SIPP working papers are available on the Census Bureau's Internet site <<http://www.census.gov>>. A subset of the SIPP working papers can also be found on the SIPP Internet site <<http://www.sipp.census.gov/sipp>>.

# APPENDIX G

## User Notes for the SPD Longitudinal File

This section contains information relevant to the *Survey of Program Dynamics Longitudinal File*. For an updated list of user notes always refer to the U.S. Census Bureau's SPD Internet site at <http://www.sipp.census.gov/spd>. The user notes are part of the technical documentation which is found under "SPD Publications." In addition, some user notes are found under "SPD News User Notes." The Internet site will be updated as additional user notes become available.

### User Notes for the SPD Longitudinal File

#### *1. General Cautionary Notes*

The original SPD sample is nine to ten years old and has undergone a substantial amount of attrition (sample loss) from 1992 (or 1993) through 2002. As a result, estimates from this file are not as representative of the U.S. population as a cross-sectional survey or a longitudinal survey with less sample attrition would be. Therefore, results should be viewed with caution.

In addition, it should be noted that this file contains data collected using three different survey collection vehicles: the 1992/93 SIPP paper instruments that were used to produce data for calendar years (CY) 1992, 1993, and 1994, a modified March CPS CAPI instrument that was used to collect data for calendar year 1996, and the 1998 CAPI instrument that was used to collect data for calendar years 1997 to 2001 (the SPD 1998 to the SPD 2002). Therefore, the different questions and modes of interview used to produce the estimates should be considered when analyzing changes over time. These effects are explained more fully in later notes.

#### *a. 1992 Data*

The SPD Longitudinal file does not contain a complete set of CY1992 data for 1993 SIPP Panel households because interviewing did not begin until 1993. Using weighted counts for 1992 data is not meaningful unless the necessary adjustments to the longitudinal weight are made. See the user note below titled *1992 Estimates* for further instructions.

#### *b. 1995 Data*

The SPD Longitudinal file does not contain any data for CY1995. The 1992 SIPP Panel did not collect any data for 1995 and the 1993 SIPP Panel did not collect data for the entire 1995 calendar year.

#### *c. 1992, 1993, and 1994 Calendar Year Data - Recodes*

Analysts interested in variable by variable mapping of SIPP to CPS need to review the SIPP and CPS Cross-Reference map on the SPD Website or Appendix D in the Technical Documentation.

The CY1992, CY1993, and CY1994 data were created by recoding the data collected in the SIPP 92/93 Panels to similar variables collected in the March 1994 CPS. Not all of the 1994 March CPS variables are recoded from the 1992/1993 SIPP data and no imputation flags were carried from the component SIPP data onto the 1992 - 1994 calendar year files. This recoding operation was done by the Urban Institute under contract with the Census Bureau, the Social Security

Administration, the Office of the Assistant Secretary for Planning and Evaluation, and the Department of Health and Human Services. Collectively, the 1992, 1993, and 1994 data are referred to as the “CPS Look-Alike” file.

#### *d. Creating Family and Household Structures*

In the SIPP, family and household units evolve from month to month. Persons may leave a family by going away to school, joining the armed forces, establishing a new household, or dying. Others may join a family through birth of a child, marriage, or some other reason. There are no static family and household structures that exist for the duration of the survey, or even for a year. The monthly family and household information collected by the SIPP apply to the units that exist as of the month the data are collected. However, the CPS family and household sample units are defined as of a point in time--March of the survey year--and annual data for the preceding year, the reference year, are collected for units in existence as of the time of the survey.

In order to construct annual information such as is contained on a CPS file from information that varies by month, as is provided by SIPP, it is necessary to determine a fixed reference point for the construction of family and household units and the determination of demographic characteristics. December of the reference year has been chosen as that point on the SIPP file. Thus, the coding of all household and family relationship codes and demographic fields such as race, sex, marital status, and age and any other fields requiring a fixed reference point will be based on December values for the reference year.

The necessity of defining annual units from units that exist as of a given point in time (December of the reference year) also means that many of the household and family fields must be constructed from person fields, rather than the reverse coding scheme which would follow the coding logic of the CPS. For instance, on the CPS, if a household has any person who received social security benefits, the household field HSS-YN is coded with a 1 to indicate “Yes.” Only then are questions asked that enable coding of person fields that refer to receipt of social security benefits. Thus, the universe for the person fields is  $HSS-YN = 1$ . However, a reverse process must be used for the CPS look-alike file. The CPS person fields are first coded from SIPP data. Then, the household and family fields are coded by cycling through persons in the family or household units that existed as of December. Thus, some of the universes on the SIPP to CPS look-alike file must differ from those on a CPS file. For example, DSS-YN, a CPS person field, has a universe of  $HSS-YN = 1$ . On the “look-alike” file, DSS-YN has a universe of all persons. This difference in universe is regarded as insignificant, but it is one that should be noted when frequencies on the SIPP to CPS look-alike file are compared with those from other CPS files.

Since longitudinal units are not identified for the SIPP, monthly data that pertain to monthly family and household units have little meaning for a longitudinal file, and, for the most part, such data are omitted from the longitudinal file. However, the CPS collects annual data that apply to family and household units that are identified as of the time of survey. To reproduce some of the family and household data from the SIPP that are provided by the CPS, it is necessary not only to define the family and household units as of a point in time (December of the reference year), it is also necessary to obtain information from the monthly data provided by SIPP wave files. Household information is taken from the record of the household reference person (identified by SIPP variable RRP) for December of the reference year; and family information is taken from the record of the family reference person (identified by SIPP variables FAMREL and RRP).

### ***e. Modes of Data Collection and Data Creation***

This SPD file covers a variety of subject areas which may be differentially affected by the mode of collection. For example, more frequent interviews (and the collection of contemporaneous data) may result in more reports of part time work, one-time income sources, or part-year health insurance coverage. Be aware that observed changes over time may be the result of the different modes of collection over the lifetime of this survey.

The 1992 and 1993 SIPP Panels (CY1992- CY1994 data) collected data using a paper questionnaire. The data was collected three times per year and used a four-month recall. The 1992 and 1993 SIPP data was converted to a calendar year format to resemble the CPS March data. Users of the 1992 through 1994 data need to review Appendix D, “SIPP to CPS Cross-Reference Map,” to understand the conversion of SIPP variables to CPS variables.

The 1997 SPD collected data using a slightly modified 1997 CPS March automated instrument. The data was collected between May and June 1997 and used a “last year” (i.e.,1996) recall for most questions.

The 1998 to 2002 SPD collected data using an automated instrument specifically designed for the SPD. The data were collected between May and June or July of each year from 1998 to 2002 and used a “last year” (1997, 1998, 1999, 2000 or 2001, as appropriate) recall for most questions.

### ***f. Variable Naming Convention***

The variable name (also referred to as data item, item name, or data field name) is no longer than 8 characters, for example WORKYNE0, AGET0 or MARITLE0. The first 6 characters provide a descriptive name. Character 7 (or 2nd from right if the variable name is less than 8 characters) is the variable type code [unedited (U), edited (E), recoded (®), weights (W), imputation flag (I), or topcoded (T)]. The final character, character 8 (or the last character if the variable name is less than 8 characters) reflects the interview year, that is the year in which the data was collected (for example, 2000 = 0). In the case of 1992 through 1994, the interview year and the data year are the same. The 1997 through 2002 interview (data collection) years are not the same as the data year for most variables. For example WORKYNE0 refers to working during 1999 while MARITLE0 refers to marital status as of the interview date in 2000. Most variables collected during the 1997 interview refer to 1996 data year, most variables collected in 1998 refer to 1997 data year, most variables collected during the 1999 interview refer to 1998, most variables collected in 2000 refer to 1999 data year, most variables collected during the 2001 interview refer to 2000, and most variables collected during the 2002 interview refer to 2001. However, there are variables in 1997 through 2002 that refer to the interview year. The short descriptions of a variable specifies the year to which the variable refers.

### ***g. Families***

Like households, families are also defined each year. In order to look at everyone who is in the same family for a given year, concatenate the IHHKEY variable for that year with the variable indicating family number. For example, to look at families in 1993, concatenate IHHKEY93 with FAMNUM3 (e.g.,B1200107406901101).

### ***h. Matching to the SIPP Data***

When matching to the SIPP 1992 or 1993 panel, core, or topical module files note the field lengths differences in the following variables:

#### **Field Length Differences**

Short Variable Description	SIPP 1992 Panel Files			SIPP 1993 Panel Files			SPD Third Longitudinal File
	Panel	Wave	Topical Modules	Panel	Wave	Topical Modules	
Person Number	4	3	3	3	3	3	4
Entry Address ID	3	2	2	2	2	2	3
Address ID	3	2	2	2	2	2	3

### ***2. Weighting and Estimation - Technical Notes***

The records on the SPD 3<sup>rd</sup> Longitudinal File were weighted to the March 1993 non-institutionalized civilian population. Therefore, you should compare the population characteristics from this file with those from the CPS March 1993 survey universe.

There are five longitudinal panel weights (SPDTLW01, SPDTLW02, SPDQLW00, SPDQLW01, and SPDQLW02) and five longitudinal annual weights (SPDTAW01, SPDTAW02, SPDQAW00, SPDQAW01, and SPDQAW02 associated with SPDTLW01, SPDTLW02, SPDQLW00, SPDQLW01, and SPDQLW02, respectively). Each of these five longitudinal panel weights was derived for estimates of the multiple year longitudinal characteristics of the cohorts of the non-institutionalized civilian people residing in the U.S. in the month of March 1993 (the SPD panel universe). The criteria for selecting which one of these five weights for an multiple year longitudinal analysis were described in the Weighting section. Each of the five longitudinal annual weights was derived for estimates of the annual characteristics of the cohorts of young children born after wave 1 of the SIPP panel 1992 or the SIPP panel 1993 as further described in item b below.

A revised data dictionary and data file were released on March 7, 2006. In the previous SPD 3<sup>rd</sup> longitudinal file, people who permanently left the universe were incorrectly classified as "longitudinally non-interviewed." Zero weights were given to people who were qualified to be classified as longitudinally interviewed until they died or permanently moved outside the survey universe, and through the non-interview adjustment, others in the sample were weighted up to account for them. This error creates a bias by transferring the weights of these dead and out-of-universe people to the living, longitudinally interviewed sample people. Therefore, on the previous SPD 3<sup>rd</sup> longitudinal file, the longitudinally interviewed sample people represented incorrectly both the living people and the dead and out-of-scope people in the SPD/SIPP universe. From the estimation standpoint, the final weights on the previous SPD 3<sup>rd</sup> longitudinal file would produce substantial over-estimation of living people. On the current SPD 3<sup>rd</sup>

longitudinal file, we have corrected this error by reweighting the file and classifying these people as longitudinally interviewed up until they came out of scope.

#### ***a. Household weight***

There is no weight for household analysis in the SPD Longitudinal file. Instead it has become acceptable in the research community to assign sample people the characteristics of their household or family. The analytic estimate then becomes the number of people in households (or families) with a particular characteristic.

#### ***b. Longitudinal weight with non-original sample children***

Each of the longitudinal annual weights (SPDTAW01, SPDTAW02, SPDQAW00, SPDQAW01, and SPDQAW02) on the SPD third longitudinal file was derived for calculating annual (calendar year) estimates of young children (born after wave 1 of the SIPP panel 1992 or the SIPP panel 1993). Only the non-original sample children born after wave 1 of the SIPP panel 1992 or the SIPP panel 1993 and having a designated parent being an original sample person with a positive longitudinal panel weight SPDTLW01 (SPDTLW02, SPDQLW00, SPDQLW01, SPDQLW02) have a positive SPDTAW01 (SPDTLW02, SPDQLW00, SPDQLW01, SPDQLW02); all other non-original sample children have a zero SPDTAW01 (SPDTLW02, SPDQLW00, SPDQLW01, SPDQLW02). The criteria for selecting which one of these five weights for an annual (calendar) analysis were described in the Weighting section. When calculating annual estimates of these young children, include only the original and non-original sample children born during or in prior to the calendar year under consideration. Some caution should be given when interpreting results of the young children's estimates because the original and non-original sample children all together only approximate the SPD annual universe of a calendar year after the inception of the SIPP panel 1992 and the SIPP panel 1993 (more detailed discussion are provided in the Weighting section).

#### ***c. 1992 Estimates***

To estimate for calendar year 1992 using the SPD longitudinal weight, analysts should multiply the weight of people present in 1992 by 2. This covers all situations, but gives only an approximation. Variance parameters will also need to be inflated by 2 for analysis of 1992 estimates. For more accurate 1992 calendar year estimates, use the 1992 SIPP Longitudinal file with its 1992 calendar year weight, FNLWGT92.

### ***3. Demographic Variables - Technical Notes***

The specific notes below address standards for editing relationship to reference person and cases that switch values in the unedited data for sex, vet, and race status. Note that in 1997, using the CPS instrument, Field Representatives could change demographic data that was input since the data provided was from SIPP paper control cards. If the information was incorrect during SIPP, they got a chance to change it in 1997, yet because demographic variables are edited forward from 1994, the edits force the responses to be consistent with the original SIPP data. That is why there is a higher number of imputations for 1997 than for other years.

#### ***a. Relationship to Reference Person (RRP)***

An adult must be at least 12 years older than a child who points to them as their designated biological parent.

Same sex partners who report they are married are made unmarried partners if they report being spouses.

Parent pointers for adults age 18 and over were blanked out during the editing process for 1998 data.

People less than 15 years old must be 'never married.'

A person to whom a child points as their designated parent must be at least 15 years old.

A person under 18 years of age cannot be the reference person if their parent is present in the household.

In 1999 through 2002, we edited and output the designated parent pointer for people of all ages, so checks for the age gap between parents and children were done for people of all ages. For 1999, we also used the TYPMOM and TYPDAD variables which indicate whether a parent is a biological, step or adoptive parent. If the parent was identified as a step or adoptive parent, we allowed an otherwise illogical age gap between parent and child since remarriage sometimes creates situations where step parents are not old enough to be the biological parent of their spouse's biological children. Users should note that the edit for RRP, MARITL, SPOUSE, and DESPAR is not truly longitudinal, but checks for consistency in each year cross sectionally. So the RRP values of two people shift over time, even though they are the same people. This happens at times when a later interview gives us more information and we are able to specify the relationship in greater detail-for example, making someone a grandchild rather than other relative.

## ***b. Age***

Some people who were recorded as children in 1992, 1993 or 1994 are recorded as adults in 1997 or 1998 in the unedited data, or vice versa. Since we are only editing forward, some of these people end up on the longitudinal file with information for variables like income and labor force status when they may no longer fit the universe for those variables. For example, if an individual reports being age 7 in 1992, 8 in 1993 and 9 in 1994, but in 1997 reports being 32 in the unedited data, they will appear as age 12 in the edited longitudinal file, even though they may have edited labor force information in 1997 which shows they work 40 hours a week and have an annual personal income of \$25,000. In the same way, the family structure variables which were edited in the cross sectional files for 1992, 1993, 1994 and 1997 may now be incorrect in some cases where age or sex switched over time.

In reviewing the 2001 file, a glitch in the edit was discovered which allowed a person to remain the same age as last year, from year to year, since the second interview could have happened before they had their next birthday. However, in running this edit from year to year, it allows people to keep the same age and not get any older. So, for the 2001 file, we changed it so that if people were the same age 3 years running (or the equivalent, if they were not interviewed all three consecutive years), we bump their age up a logical number of years in 2001.

### ***b.1. AGE User Notes for the Third Longitudinal File***

We have not filled in DOBYRT for all cases, although users could easily create it using the year and the age. At this point it is filled in for interviews in 1998 and 1999 and 2000.

### *c. Sex*

Demographic variables are edited forward in the SPD. So the earliest value for SEX is carried through the entire time the person is interviewed. The imputation variable SEXI (if it =4) will let you know which cases contained contradictory reports in the unedited data. Cases which have a record in the 2<sup>nd</sup> longitudinal file were kept the same sex as they were in that file if they reported being a different sex in the 3<sup>rd</sup> longitudinal file unedited data.

### *d. Veterans' Status*

There are 101 cases which have an illogical change in VET status in the 1992, 1993, or 1994 data. We are not changing the 1992, 1993, or 1994 data, but are only editing forward.

- There are 28 cases that have a value of yes for vet for 1992 and not a vet in 1993.
- There are 72 cases that have a value of yes for vet for 1993 and not a vet in 1994.
- The remaining case has a value of yes for vet for 1992 and not a vet for 1994. The value is missing for 1993—they were probably not interviewed in that year.

Note that in 1993, two cases are marked as vets in the unedited data, and are then recoded to non-vets because they are outside the age universe, since they are 15 and 16 years old.

### *e. Race*

Each person receives one value for RACE, since this is not allowed to change over time. We take the earliest valid value and hold it constant. So for people who changed their reported RACE, we keep the earliest reported race regardless. Note that since we do not allow a value of “other” in the output file, new people who reported “other” in 2002 are imputed into one of the listed race groups. For people who were already on the file previously, and so have a RACE value, but who report a value different from the one which they have on the SPD 1<sup>st</sup> longitudinal file, we note this by making the value of RACEI=4 for these cases.

### *f. NATVTY*

We have added a value of 4 for the imputation flag so that we can indicate cases whose value on the first longitudinal file differs from the value they reported in an earlier year. If a person who was in the 2<sup>nd</sup> longitudinal file already had a NATVTYI value of 4, they will have a value of 4 in the 3<sup>rd</sup> longitudinal file as well.

In 2001, for the first time, we needed to hot deck cases since they came in blank, and were new cases for which we had no prior interview information. No value for NATVTY was output, although this question is supposed to be asked of everyone. New cases for whom no other household member had a valid value for NATVTY were hot decked. There were 311 such cases in 2001 and 85 such cases that were new in 2002.

### *g. Educational Attainment Variables*

To create the educational attainment variables for 1992, 1993 and 1994 (HGAR2, HGAR3, HGAR4) the response categories from the SIPP were edited to match those from the CPS. Unfortunately, the SIPP codes do not contain sufficient detail to exactly re-create the CPS field. In particular, coding of college attainment is deficient. The assumption is made that SIPP HIGRADE codes 21-24 refer to undergraduate study, 25 to master's level work, and 26 to the doctorate level. There is no information to determine associate or professional school degrees.

The variables that measure individual, family, and household receipt of educational assistance are not strictly comparable across time. The educational aid variables for 1992 (ED\_YNE2), 1993 (ED\_YNE3), and 1994 (ED\_YNE4) depict higher levels of aid receipt than the variables for 1997 (ED\_YNE7), 1998 (ED\_AIDE8), 1999 (ED\_AIDE9), 2000 (ED\_AIDE0), 2001 (ED\_AIDE1), and 2002 (ED\_AIDEX). Some of this difference is likely attributable to differences in variable universes, question wording, and reference periods. The 1992-1994 variables were constructed from the 1992 and 1993 SIPP panels. The SIPP asked a very detailed question about receipt of financial aid during the last 4 months of all individuals age 15 and over. Data from multiple waves were then combined to construct the variable for financial aid receipt in the last year (because the reference months differ for the four SIPP rotation groups the reference period for the financial assistance variable is not the same for all sample members). In 1997 a much less detailed question was asked of all individuals age 15 and older regarding financial aid receipt in the last calendar year. The 1998, 1999, 2000, 2001, and 2002 questions were similar to the 1997 question but was asked only of individuals age 18 and over who were enrolled in either high school or college and collected information on financial aid receipt during the last 9-month academic year, September to May, rather than the prior calendar year. For more detailed information on financial aid receipt in 1992, 1993, and 1994 users should go directly to the 1992 and 1993 SIPP panels.

#### ***h. Marital Status Variables***

The imputation rate for MARITLE1 is higher than for other years, likely because of cases which were brought back and interviewed in that year.

#### ***4. Poverty Variables - Technical Notes***

Data users should be aware that SPD income and poverty data are affected by the different survey instruments implemented in different years. For example, poverty rates have historically been lower when using the SIPP survey instrument, where there are detailed income questions every four months, than in the Current Population Survey (CPS) instrument, where income questions are asked once annually. The 1992-94 SPD data come from the SIPP instrument, while the 1996-97 income and poverty data come from annual, retrospective questions such as in the CPS. Data users should therefore use caution when examining temporal trends in poverty.

#### ***5. Income Variables - Technical Notes***

Be aware that the dollar amount reported for the variable "other income received in 1997" - "other income received in 2001", (OIVALT8 -- OIVALTX) are not comparable to the dollar amounts reported in the prior years, 1992 (OIVALT2), 1993 (OIVALT3), 1994 (OIVALT4) and 1996 (OIVALT7). For these prior years the dollar amounts reported reflect the summation of, at most, two sources of other income received. Starting with the 1997 data (OIVALT8), the dollar amount reported for OIVAL reflects the summation of income reported from the following sources: other income; income from National Guard duty; income from casual earnings, such as hobbies; farm income; charitable assistance; and foster child care payments. This holds true, as well, across the years for both household (HOIVAL) and family (FOIVAL) amounts.

In calculating the income percentile rank (PCTCUT) for the 2001 and 2002 data, a quasi-longitudinal weight (SPDQLW01, SPDQLW0X) was used rather than the traditional longitudinal weight because of the 2001 sample cut. Using the quasi-longitudinal weight allowed for more people to be used in calculating the percentile ranking. For both 2001 and 2002 estimates the universe is all households interviewed with a positive household income.

### ***a. Energy Assistance Variables***

Starting with data collecting in 1998, the reference time frame for HENGASE (Energy assistance received Y/N) and HENGVLR (Value of energy assistance received) was “in the past 12 months”. For 1992 - 2002, the reference period was the six month time frame of October 1 through March 31 prior to the survey.

### ***b. Public Assistance***

Users need to be aware of the following discrepancy in the longitudinal file variables (PAWMONE7 – PAWMONEX) that record the number of months that an individual received public assistance, AFDC, and TANF. The discrepancy occurs when an individual has a response of “yes” to having received public assistance in the prior year, but the reported value for the number of months in receipt of public assistance is coded as zero ( for example, PAWMONE7=0 – PAWMONEX=0). This limited situation is the result of editing the data for consistency in the dollar amount of public assistance, AFDC, or TANF that an individual received. In the interview, respondents are given the opportunity at the very end of the interview to list any other sources of income that they might have received, in addition to those already reported. For those limited number of cases where another income sources are reported, the cases are manually reviewed by a subject matter analyst to see if the reported source can be included into an existing income source. While reviewing the data several analysts reported income sources which fit into the category of public assistance. This amount was then added to the public assistance amount and the values for PAWYNE7 -- PAWYNEX was changed from “no” to “yes”. The other income source reported, however, did not provide information on the number of months having received this income source, so the value for this limited number of cases will still contain a value of “0” for PAWMONE7 -- PAWMONEX.

While it was still possible to list multiple sources of assistance payments such as TANF, general assistance, and other assistance (TANFVL, GENVAL, OASVAL), the data collection instrument was changed in 1999 and only the total amount of public assistance received, not the three distinct groups was collected. The majority of assistance payments reported were usually from one source but in the case of multiple sources, only the combined value is reported.

### ***c. Dividends Variables***

The universe for the variables which identify receipt of dividend income, DIVYNE7=1 – DIVYNEX=1 include individuals who reported owning stocks, mutual funds or other financial instruments that could pay a dividend, but reported not being paid dividends on these assets, DIVNONE7=1 – DIVNONEX=1. In the prior years, individuals that were not paid dividends on the potential dividend bearing assets they owned, DIVNONE2=1, DIVNONE3=1 and DIVNONE4=1, were not included as part of the universe for those variables concerning receipt of dividend income; DIVYNE2=1, DIVYNE3=1 and DIVYNE4=1. A similar situation exists for the variables HDIVYNE2, HDIVYNE3 and HDIVYNE4 because these household variables are aggregates of the person level variables.

#### ***c.1. Dividends Variables User Notes for the Third Longitudinal File***

For 1999 - 2002, the imputation procedure to estimate a dollar value for dividends. DIVVAL, was modified to take into account if information was collected on the average value of all investments held by the household. A review of the relevant research indicated that on average, the dividend return to an average investment portfolio was approximately 4.5% over the past fifty years. This average return value was then used to estimate a value for missing dividends if an average value for investments was reported and the imputation flag for the variable was set to

a value of three indicating that a statistical imputation was performed. Otherwise, if it was not possible to statistically impute the missing dividend value, a suitable donor was used to impute the missing dividend value and the imputation flag was set to one.

#### ***d. Free Lunch Variables***

Comparisons over time for the reported values in the variables HFLUNC and HFLUNN are not appropriate. In particular, the universe of children for these questions changed between the 1997 and 1998 data collections. For calendar year 1996 (HFLUNCE7), approximately 33% of households reported having one child receiving a free or reduced price meal at school, and for calendar year 1997 (HFLUNCE8), nearly 95% of respondents indicated that they had one child receiving a free or reduced price meal at school.

##### ***d.1. Free Lunch Variables User Notes for the Third Longitudinal File***

For 1998 - 2002, the edited variable, FLUNC that determines whether a household has children that participate in the free or reduced price lunch and breakfast program at their school was modified to reflect the income tests required by this program. Specifically, households where the income to poverty threshold was greater than 185% should not be reporting children participating in this program.

#### ***e. Earnings Variables***

There are 1,250 observations where the data reported in 1992, 1993 and 1994 are a positive number of weeks worked (WKSWRK > 0), but there was no reported earning source from the longest job (ERNSRCE = 0) and no wage and salary data reported as well (WSVAL = 0). However, for these cases there is a reported value for longest job class of worker (CLSWKR > 0). Using this information, if the value of CLSWKR > 0, the value of ERNSRCE = 0 and the value of WKSWRK > 0, then the value of ERNSRCE was set to reflect the value of CLSWKR. Be aware that for these cases there will still be no wage and salary data (WSVAL = 0).

## ***6. Employment Variables - Technical Notes***

### ***a. Number of Weeks Nonworker on Layoff***

Use caution when using data for the number of weeks nonworker on layoff, ELAYWKE8, ELAYWKE9, ELAYWKE0, ELAYWKE1, and ELAYWKE5 as the weighted data is based on a very small number of observations. Data for this variable has been included for completeness.

### ***b. Number of Stretches Looking for Work or on Layoff***

The 1998, 1999, 2000, 2001 and 2002 SPD do not specifically ask the respondent whether the weeks looking for work or on layoff were in one stretch. Instead, LKSTRHE8, LKSTRHE9, LKSTRHE0, LKSTRHE1, and LKSTRHE5, the number of stretches looking for work, are constructed from the respondent's answers to questions 25 and 27 in the 'Employment and Earnings' section of the SPD questionnaire. In the 1998, 1999, 2000, 2001 and 2002 SPD, a stretch of looking for work or on layoff is considered to be interrupted when the respondent found employment or ceased looking for work for at least a one week period. For LKSTRHE7 (which is based on the CPS question design), a stretch of looking for work or on layoff is considered to be interrupted when the respondent found employment or ceased looking for work for at least a two week period. Hence, LKSTRHE7 is not perfectly comparable to LKSTRHE8, LKSTRHE9, LKSTRHE0, LKSTRHE1, and LKSTRHE5.

### ***c. Weeks Looking for Work or On Layoff from a Job - Nonworker***

The values for the variable NWLKWK, weeks looking for work or on layoff from a job (nonworker), vary considerably between the survey years 1994, 1997 and 1998. This is primarily due to the different survey designs associated with these years. Because information on the weeks spent looking for work or on layoff for the years 1992-1994 was collected monthly concerning current time spent looking for work or on layoff, while the 1997 information was collected from a fixed reference point about activities during the past year, the variables NWLKWKE4, NWLKWKE7 and NWLKWKE8 have considerable variation. To create annual information for the years 1992-1994, the time spent looking for work or on layoff was aggregated from data collected for the previous 4 months and then expanded to create an annual measure.

### ***d. Industry of Longest Job by Major Industry Group***

Individuals with a three-digit industry group code of 991 “Active Duty Armed Forces” are given a major industry group code 15 (“Never Worked”) for the ‘Bridge’ data (WEMINDR7) and a major industry group code of ‘14’ (“Public Administration”) for the 1998, 1999, 2000, 2001 and 2002 SPD data (WEMINDR8, WEMINDR9, WEMINDR0, WEMINDR1, and WEMINDRX ).

### ***e. Number of Weeks Worked***

These variables are a composite variable, composed of the number of weeks worked and the number of weeks on paid leave, such as vacation and sick leave. While most respondents reported their weeks worked, very few provided a response for weeks spent on paid leave (for example, there are 309 unweighted responses for the survey year 1998). Consequently, this led to a high imputation rate for these variables (WKSWRKE8, WKSWRKE9, WKSWRKE0, WKSWRKE1, and WKSWRKEX ). However, for the majority of respondents, this high imputation rate reflects missing paid leave information, not missing weeks worked information. Note that for the years 1992, 1993 and 1994, WKSWRK (weeks worked and on paid leave) is an aggregate of monthly values, whereas for the survey years 1997, 1998, 1999, 2000, 2001 and 2002 the information was collected from a fixed reference point about the previous year’s activities. Fluctuations between the survey years 1992 – 1994 and 1997 – 2002 may be due to these different reference periods.

NOTE: For further questions concerning variables comparability between survey years (particularly when comparing 1992 - 1994 variables to 1997 variables), please consult the “SIPP to CPS Cross-Reference Map” (Urban Institute, 1998) in Appendix D.

## ***7. Health Insurance Variables***

Several health insurance variables have inconsistent definitions over time, despite being named with the same base characters. Please read the data dictionary closely when using these variables, including MCAREE2-MCAREE8 and CH\_MCE2-CH\_MCE8.

### ***a. HIOWNE2 - HIOWNE8: Did adult covered by private health insurance plan have policy in own name?***

The universe for this variable is adults with a private health insurance plan (HI\_YNEX=1). For 1992, 1993, and 1994, adults who had no private health insurance plan (HI\_YNEX=2) were assigned a value of 2 (no) to the HIOWNEX. In 1997 and 1998 people without a private plan

were assigned a 0, the correct code for "not in universe". One way to correct the problem is to use HI\_YNEX. If HI\_YNEX=2 then HIOWNEX=0.

### ***b. Household Variables On Children's Health Insurance Coverage***

The household variables reflecting health insurance coverage of children include some inconsistencies in 1994 and 1997. CMCAREEX and CHIEX have as their universes households with children under 15 years old. In 1994, there is some random noise with a handful of cases where people should be in universe but are not and vice versa. Double check the universe variable (UNDR15RX) before completing your analysis. In 1997, most people living in households without children have a 2 meaning no children in the household have that coverage type. These people should instead have a 0 for "not in universe".

### ***c. Notes as a result of 1999 Instrument Changes. These notes apply to the 1999 and 2000 instruments only.***

**MCAID** - Was person covered by Medicaid at any time between January and December [of previous calendar year]?

NOTE(S): This variable also includes 1999 survey instrument items Q950\_8 (Stateplan) and Q950\_9 (Another government program). The 1999 survey instrument item Q950\_9 is not capturing the same data as in the 1998 instrument (definition is not the same as OTYP\_5E8). The 1999 instrument question is a measurement of Medicaid. For consistency in the longitudinal file, MCAID combines these three categories (Q950\_4, Q950\_8, and Q950\_9).

**MON** - Number of months covered by Medicaid [in previous calendar year] (values are 1-12)

NOTE(S): This variable counts months of coverage for either Medicaid or (Stateplan) or "another government program" (since all three are capturing Medicaid coverage). Since the three were combined in the MCAID variable, starting with the 1999 Instrument, it does not make sense to record occurrences (and sums) of each variable separately.

**OTYP\_5** - Was person covered by other (state plan) health plan at any time during [previous calendar year]?

NOTE(S): Based on inputs from 1998 Instrument variable (OTYP\_5E8), it has been determined that this variable is NOT equivalent to Q950\_9 in the 1999 instrument. The question was previously combined with CHAMP in the 1998 instrument, but when broken down as a separate question in the 1999 instrument, it lost its original intent, which was to collect "other types of military coverage." The 1999 Instrument variable, Q950\_9, will be included in the MCAID variable.

**OTH** - Excluding Medicare and Medicaid, was person covered by CHAMPUS, CHAMPVA, VA, military health, or Indian Health Services?

NOTE(S): The edit for OTHE9 is significantly changed from previous year (OTHE8), and only captures military types of coverage and Indian Health Services (CHAMP AND OTYP\_4). Imputation flags for this variable are carried over from the imputations done on the corresponding coverage variables.

**HI** - Was adult household member a policyholder of a group health plan?

NOTE(S): There are new questions in the 1999 instrument that ask up front whether the respondent is the policy holder or dependent of the plan they recorded being covered by in Q950. This variable is created from the new questions (Q951A and Q951C). Previously in the 1998 instrument employer-provided and union provided were asked in the same question. The 1999 instrument separates them. To retain comparability over

time, responses to Q951A and Q951C are combined in HI. Minimal changes to edit were made to accommodate for this change.

DEPHI - Was person a dependent on a household group health plan?

NOTE(S): This is the companion variable to HI and is derived from the same question (Q951A and Q951C). Those respondents less than 15 years of age (if they checked that they were covered by an employer or union-provided plan) auto-default to dependents (they skip question Q951A or Q951C and go right to the questions that ask about line number of policy holder – Q951B or Q951D). (See HI for changes to instrument that affected this variable.)

COV\_GH - Was person covered by a group health insurance plan during [previous calendar year]?

NOTE(S): This variable is created from HI and DEPHI (if you were a dependent or a policyholder and marked employer-provided or union provided in Q950 (Q950\_1 or Q950\_2), you're considered covered by a group health plan). (See HI for changes to instrument that affected this variable.)

PAID - What part of health insurance premium did employer/union pay?

NOTE(S): As a result of changes to the 1999 Instrument, this variable combines data asked of those covered by either an employer-provided or union-provided plan (given that employer-provided coverage and union-provided coverage were asked independently of each other).

PRIV - Was adult household member a policyholder of a direct-purchase health insurance plan?

NOTE(S): Previously this variable had a universe of GE 15 years of age. The 1999 instrument, however, allowed for those under 15 years of age to answer as policyholders for a direct-purchase health plan. The unedited data file contains 29 occurrences of policyholders under age fifteen. 23 of these cases reported a dollar amount when asked how much they paid last year for this plan. Given that the longitudinal file does not contain any occurrences of a policyholder under the age of 15, it was decided to maintain consistency and edit those under-age-15 policyholders, placing them in the category of dependent. It is possible that a proxy (i.e., the child's parent) responded that their child was the policyholder of the plan, because the parent bought the policy, put it in the child's name, and paid for it. This is why a dollar amount could also be recorded when asked.

DEPRIV - Was person a dependent on a direct purchase private health plan?

NOTE(S): (see PRIV for policyholders under 15)

CH\_HI - What is the child's private health insurance status? (Values are: Private coverage through someone in household, someone outside household, or not covered by private health plan.)

NOTE(S): Group health insurance (COV\_GH) and dependent of a direct purchase (DEPRIV) are used for this variable. Universe is those people less than age 15.

CURR - Was person covered by any health plan last week?

NOTE(S): This variable is constructed from responses to a variety of questions in the health insurance section. As a result, the universe of the variable CURR (created from the 1999 instrument), takes into account responses to questions throughout the instrument that ask respondents about current coverage by the same plan as last year:

(q955 = '1' or q959 = '1' or q962 = '1' or q964 = '1' or q966 = '1' or q968 = '1' or q970 = '1' or q971C = '1' or q972 = '1' or q974 = '1')

So, if a respondent said “yes” to Q977 or they said “yes” to (Q955, Q959, Q962, Q964, Q966, Q968, Q970, Q971C, Q972, or Q974), then they were coded as “being covered by a health plan last week.”

CTYP\_(1-5) - What type of health plan was person covered by last week? (allow up to five types to be selected.)

NOTE(S): The 1999 instrument does not necessarily capture every type of “current coverage.” If respondents had one type of coverage last year and they were “currently covered” by that same plan at the time of interview, the instrument is not designed to capture new types of coverage that the respondent might have picked up between the reference period of “last year” and the time the survey questions were asked. Also, if respondents had more than one type of coverage and they were “currently covered” by one plan but not the other (lost a type of coverage), the instrument is not designed to capture any new types of coverage that the respondent might have picked up between the reference period of “last year” and the time the survey questions were asked.

This variable was created from the “current coverage” questions asked after responses were gathered for each type of health insurance. It also includes the current coverage question at the end of the section (Q978). Values for the edited variable were changed due to a change in the instrument from 1998 to 1999. All types of military health are included in one value. There is no dependent or policyholder separation. “Other government health care” was dropped.

***d. Notes as a result of 2002 Instrument Changes. These notes apply to the 2002 instrument only.***

HIP Aid – What part of health insurance premium did policyholder’s employer/union pay?

NOTE(S): This is the duplicate variable to PAID. The occurrence of two variables containing the same information can be traced back to the Current Population Survey (CPS), from which the bridge survey instrument fielded in 1997 was based. The CPS health insurance field contained the same variables, PAID and HIP Aid, with HIP Aid a duplicate of PAID. There is no reason to include both variables therefore the 2002 instrument excludes the variable HIP Aid.

PAID - What part of health insurance premium did employer/union pay?

NOTE(S): A duplicated variable was created for PAID, called HIP Aid. The occurrence of two variables containing the same information can be traced back to the Current Population Survey (CPS), from which the bridge survey instrument fielded in 1997 was based. The CPS health insurance field contained the same variables, PAID and HIP Aid, with HIP Aid a duplicate of PAID. There is no reason to have both variables; therefore the 2002 instrument excludes the variable HIP Aid.

CURR - Was person covered by any health plan last week?

NOTE(S): This variable is constructed from responses to a variety of questions in the health insurance section. With the addition of coverage by a Children’s Health Insurance Plan (CHIP) (created from the 2002 instrument), CURR now includes responses to questions regarding coverage by Children’s Health Insurance Plan (CHIP). As a result, the universe of the variable CURR (created from the 1999 instrument), takes into account responses to questions throughout the instrument that ask respondents about current coverage by the same plan as last year:

(q955 = '1' or q959 = '1' or q962 = '1' or q964 = '1' or q964c = '1' or q966 = '1'  
or q968 = '1' or  
q970 = '1' or q971c = '1' or q972 = '1' or q974 = '1')

So, if a respondent said “yes” to Q977 or they said “yes” to (Q955, Q959, Q962, Q964, Q964c, Q966, Q968, Q970, Q971c, Q972, or Q974), then they were coded as “being covered by a health plan last week.”

CTYP\_(1-5) - What type of health plan was person covered by last week? (allow up to five types to be selected.)

NOTE(S): The 2002 instrument does not necessarily capture every type of “current coverage.” If respondents had one type of coverage last year and they were “currently covered” by that same plan at the time of interview, the instrument is not designed to capture new types of coverage that the respondent might have picked up between the reference period of “last year” and the time the survey questions were asked. Also, if respondents had more than one type of coverage and they were “currently covered” by one plan but not the other (lost a type of coverage), the instrument is not designed to capture any new types of coverage that the respondent might have picked up between the reference period of “last year” and the time the survey questions were asked.

This variable was created from the “current coverage” questions asked after responses were gathered for each type of health insurance. It also includes the current coverage question at the end of the section (Q978). The 2002 instrument included Children’s Health Insurance Plan (CHIP) as another option for the type of health plan the person was covered by.

MOMCHP – Were you covered by CHIP or (state plane name) at any time between January and December 2001?

NOTE(S): This variable was first introduced in the 2002 instrument. This variable is constructed from responses to CHPCOV. The universe of the variable MOMCHP, takes into account responses to question Q950\_4c. If a respondent said “yes” to this question, they were coded as being covered by CHIP at any time in the specified year.

***e. HILIN1E7 - HILIN1EX and PILIN1E7 - PILIN1EX: Policy Holder Variables***

The 1997 SPD Bridge collected data using a slightly modified 1997 Current Population Survey (CPS) March automated instrument. Consequently, we formatted the 1997 Bridge data in a CPS-like data format. As a result the variables HILIN1E7 and PILIN1E7 contain line numbers as opposed to person numbers. All other panel years, HILIN1E8, HILIN1E9, HILIN1E0, HILIN1E1, HILIN1EX and PILIN1E8, PILIN1E9, PILIN1E0, PILIN1E1, PILIN1EX, contain person number data.

# **APPENDIX H**

## **Control Counts**

The control counts are a set of frequency distributions for each variable which is included in the documentation.
