Acknowledgments

Glenn W. King, Chief, Statistical Compendia Staff, was responsible for general supervision and compilation of this volume under the direction of Marie Argana. Lars B. Johanson was responsible for technical supervision and coordination. Assisting in the research and analytical phases of assigned sections and in the developmental aspects of new tables were Rosemary E. Clark, Edward C. Jagers and Rachael LaPorte. The latter two were also responsible for content and preparation of graphics. Geraldine W. Blackburn provided primary editorial assistance. Other editorial assistance was rendered by Kelvin Elmore, Patricia S. Lancaster, Joyce Morl, Dolores M. Roberson, and Marjorie M. Sproesser.

The staff of the Administrative and Publications Services Division, **Walter C. Odom**, Chief, performed publication planning, editorial review, design, composition, and printing planning and procurement. **Patricia Heiston** provided publication coordination and editing. **Janet Sweeney** provided design and graphics services.

The cooperation of many contributors to this volume is gratefully acknowledged. The source note below each table credits the various government and private agencies which have collaborated in furnishing information for the **Statistical Abstract**. In a few instances, contributors have requested that their data be designated as subject to copyright restrictions, as indicated in the source notes to the tables affected. Permission to use copyright material should be obtained directly from the copyright owner.

SUGGESTED CITATION

U.S. Bureau of the Census, Statistical Abstract of the United States: 1992 (112th edition.) Washington, DC, 1992

For sale by Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, Tel. 202–783–3238.

Preface

The Statistical Abstract of the United States, published since 1878, is the standard summary of statistics on the social, political, and economic organization of the United States. It is designed to serve as a convenient volume for statistical reference and as a guide to other statistical publications and sources. The latter function is served by the introductory text to each section, the source note appearing below each table, and Appendix I, which comprises the Guide to Sources of Statistics, the Guide to State Statistical Abstracts, and the Guide to Foreign Statistical Abstracts.

This volume includes a selection of data from many statistical publications, both government and private. Publications cited as sources usually contain additional statistical detail and more comprehensive discussions of definitions and concepts than can be presented here. Data not available in publications issued by the contributing agency but obtained from unpublished records are identified in the source notes as "unpublished data." More information on the subjects covered in the tables so noted may generally be obtained from the source.

Except as indicated, figures are for the United States as presently constituted. Although emphasis in the Statistical Abstract is primarily given to national data, many tables present data for regions and individual States and a smaller number for metropolitan areas and cities. Appendix II, Metropolitan Area Concepts and Components, presents explanatory text, a complete current listing and population data for metropolitan statistical areas (MSA's), the primary metropolitan statistical areas (PMSA's), and the consolidated metropolitan statistical areas (CMSA's). Table 34 in section 1 presents selected population characteristics for MSA's with population of 250,000 or more. Statistics for the Commonwealth of Puerto Rico and for outlying areas of the United States are included in many State tables and are supplemented by information in section 30. Additional information for States, cities, counties, metropolitan areas, and other small units, as well as more historical data, are available in

various supplements to the *Abstract* (see inside back cover).

Changes in this edition.—We have restructured our text material into a two column format with a larger type size and have included summary statistical highlights to give an overview of the scope of data in each section. The revised format and "In Brief" items should provide a more user-friendly text presentation.

Subject matter content changes include expanded coverage of 1990 census data in the Population and the Construction and Housing sections. A special presentation of 1990 census sample data begins on page xii with six pages of national and State data. Among other areas in which we have introduced new material are data on consumer finances in the Banking section and data on the communications industry in the Communications section. Other selected new topics include family planning services, outpatient surgery, crimes involving handguns. ·high-tech employment, household net worth, and minority-owned businesses. (See Appendix VI, pp. 927-929 for a complete list of new tables introduced in this edition.)

As mentioned in last year's preface, we have spent considerable time and effort in converting much of the *Abstract* into electronic form. We are now working toward the goal of providing the book on a CD-ROM. For price and availability, see inside back cover.

Statistics in this edition are generally for the most recent year or period available by late 1991. Special effort was made to include economic series which became available in early 1992 including series covering the labor force, the consumer price index, and wholesale trade. Each year almost 1,500 tables and charts are reviewed and evaluated, new tables and charts of current interest are added, continuing series are updated, and less timely data are condensed or eliminated. Text notes and appendices are revised as appropriate.

USA Statistics in Brief, 1992, a pocketsize pamphlet highlighting many statisticalseries in the *Abstract*, is available separately. Price and ordering information can be obtained from U.S. Bureau of the Census, Customer Services, Washington, DC 20233 (telephone 301- 763-4100). A 25 percent discount will be available on orders of 100 copies or more sent to the same address.

Historical statistics.—Specific headnote references in this Abstract link many tables to earlier data shown in Historical Statistics of the United States, Colonial Times to 1970. (See Appendix IV, pp. 920 and 921).

Statistics for States and metropolitan areas.—Data for States and metro areas may also be found in the State and Metropolitan Area Data Book, 1991 and its 1992 update, due out in the fall 1992.

Statistical reliability and responsibility.—The contents of this volume were taken from many sources. All data from either censuses and surveys or from administrative records are subject to error arising from a number of factors: Sampling variability (for statistics based on

samples), reporting errors in the data for individual units, incomplete coverage, nonresponse, imputations, and processing error. (See also Appendix III, pp. 905-919. The Bureau of the Census cannot accept the responsibility for the accuracy or limitations of the data presented here, other than those for which it collects. The responsibility for selection of the material and for proper presentation, however, rests with the Bureau.

For additional information on data presented.—Please consult the source publications available in local libraries or write to the agency indicated in the source notes. Write to the Bureau of the Census only if it is cited as the source.

Suggestions and comments.—Users of the Statistical Abstract and its supplements (see inside back cover) are urged to make their data needs known for consideration in planning future editions. Suggestions and comments for improving coverage and presentation of data should be sent to the Director, U.S. Bureau of the Census, Washington, DC 20233.

² I equipment.

Headnotes immediately below table titles provide information important for correct interpretation or evaluation of the table as a whole or for a major segment of it.

Footnotes below the bottom rule of tables give information relating to specific items or figures within the table.

Unit indicators show the specified quantities in which data items are presented. They are used for two primary reasons. Sometimes data are not available in absolute form and are estimates (as in the case of many surveys). In other cases we round the numbers in order to save space to show more data, as in the case above.

EXAMPLES OF UNIT INDICATOR INTERPRETATION FROM TABLE 1002

Year	Item	Unit Indicator	Number shown	Multiplier
1990	Car registrations	Millions	144 6,050	1,000,000 1,000

To Determine the Figure it is Necessary to Multiply the Number Shown by the Unit Indicator:

Car registrations = 144 * 1,000,000 or 144,000,000 (144 million). Sales = 6,050 * 1,000 or 6,050,000 (over 6 million).

When a table presents data with more than one unit indicator, they are found in the column headings or spanner (shown above), stub (table 64), or unit column (table 70). When the data in a table are shown in the same unit indicator, it is shown in boldface as the first part of the headnote (table 2). If no unit indicator is shown, data presented are in absolute form (table 1).

Heavy vertical rules are used to separate independent sections of a table, as shown above, or in tables where the stub is continued into one or more additional columns (table 4).

Averages. An average is a single number or value that is often used to represent the "typical value" of a group of numbers. It is regarded as a measure of "location" or "central tendency" of a group of numbers.

The arithmetic mean is the type of average used most frequently. It is derived by summing the individual item values of a particular group and dividing the total by the number of items. The arithmetic mean is often referred to as simply the "mean" or "average."

The *median* of a group of numbers is the middle number or value when each item in

² Includes taxis.

³ Includes standard

Source: Registrations—U.S. Federal Highway Administration, Selected Highway Statistics and Charts, annual; sales—Motor Vehicle Manufacturers Association of the United States, Inc., Detroit, MI, MVMA Motor Vehicle Facts and Figures, annual.

the group is arranged according to size (lowest to highest or visa versa); it generally has the same number of items above it as well as below it. If there is an even number if items in the group, the median is taken to be the average of the two middle numbers.

Per capita (or per person) quantities. A per capita figure represents an average computed for every person in a specified group (or population). It is derived by taking the total for an item (such as income, taxes, or retail sales) and dividing it by the number of persons in the specified population.

Index numbers. An index number is the measure of difference or change, usually expressed as a percent, relating one quantity (the variable) of a specified kind to another quantity of the same kind. Index numbers are widely used to express changes in prices over periods of time but may also be used to express differences between related subjects for a single point in time.

To compute a price index, a base year or period is selected. The base year price (of the commodity or service) is then designated as the base or reference price to which the prices for other years or periods are related. Many price indexes use the year 1982 as the base year; in tables this is shown as "1982=100". A method of expressing the price relationship is: The price of a set of one or more items for a related year (e.g. 1990) divided by the price of the same set of items for the base year (e.g. 1982). The result multiplied by 100 provides the index number. When 100 is subtracted from the index number, the result equals the percent change in price from the base year.

Average annual percent change. Unless otherwise stated in the Abstract (as in Section 1, Population), average annual percent change is computed by use of a compound interest formula. This formula assumes that the rate of change is constant throughout a specified compounding period (one year for average annual rates of change). The formula is similar to that used to compute the balance of a savings account which receives compound interest. According to this formula. at the end of a compounding period the amount of accrued change (e.g. school enrollment or bank interest) is added to the amount which existed at the beginning the period. As a result, over time (e.g., with each year or quarter), the same rate of change is applied to a larger and larger figure.

The exponential formula, which is based on continuous compounding, is often used to measure population change. It is preferred by population experts because they view population and population-related subjects as

changing without interruption, ever ongoing. Both exponential and compound interest formulas assume a constant rate of change. The former, however, applies the amount of change continuously to the base rather than at the end of each compounding period. When the average annual rates are small (e.g., less than 5 percent) both formulas give virtually the same results. For an explanation of these two formulas as they relate to population, see U.S. Bureau of the Census, *The Methods and Materials of Demography*, vol. 2, 3d printing (rev.), 1975, pp. 372-381.

Current and constant dollars. Statistics in some tables in a number of sections are expressed in both current and constant dollars (see, for example, table 698 in section Current dollar figures reflect actual prices or costs prevailing during the specified year(s). Constant dollar figures are estimates representing an effort to remove the effects of price changes from statistical series reported in dollar terms. In general, constant dollar series are derived by dividing current dollar estimates by the appropriate price index for the appropriate period (for example, the Consumer Price Index). The result is a series as it would presumably exist if prices were the same throughout, as in the base year-in other words as if the dollar had constant purchasing power. Any changes in this constant dollar series would reflect only changes in real volume of output, income, expenditures, or other measure.

Explanation of Symbols:

The following symbols, used in the tables throughout this book, are explained in condensed form in footnotes to the tables where they appear:

- Represents zero or rounds to less than half the unit of measurement shown.
- B Base figure too small to meet statistical standards for reliability of a derived figure.
- D Figure withheld to avoid disclosure pertaining to a specific organization or individual.
- NA Data not enumerated, tabulated, or otherwise available separately.
- NS Percent change irrelevant or insignificant. S Figure does not meet publication standards for reasons other than that covered by symbol B, above.
- X Figure not applicable because column heading and stub line make entry impossible, absurd, or meaningless.
- Z Entry would amount to less than half the unit of measurement shown.

In many tables, details will not add to the totals shown because of rounding.

Telephone Contacts List

To help Abstract users find more data and information about statistical publications, we are issuing this list of contacts for Federal agencies with major statistical programs. The intent is to give a single, first-contact point-of-entry for users of statistics. These agencies will provide general information on their statistical programs and publications, as well as specific information on how to order their publications.
