## EXECUTIVE SUMMARY

### Test Objective

- In January through March of 2006, the American Community Survey (ACS) conducted the first test of new and modified content since the ACS reached full implementation levels of data collection. The results of that testing will determine the content for the 2008 ACS.
- The questions on school enrollment and grade enrolled were examined in response to concerns about question interpretation and by increased data needs at the Department of Education. The test included minor revisions of question wording and the addition of a write in response option for recording enrollment in grade levels 1 through 12. The objective of the proposed changes is to improve the data collected and provide information on the school enrollment of the US population ages 3 and older.

### Methodology

- Analyses compare responses of the current ACS wording to the proposed question wording and relate these to respondents' answers on the follow-up interview. The control version replicated the current ACS question. The test version modified the stem by substituting "school" for "regular school" and including home school students in the instructions and response categories. The test version also modified the response categories by adding the qualifier of "beyond a bachelor's degree" to the graduate or professional level of enrollment and including a write in response for enrollment in grades 1 through 12. The Content Follow-Up attempted to get at response bias by asking more detailed questions about type and level of school enrollment.

### Research Questions and Results

- **Rates and reliability of school enrollment** were not statistically different between test and control in most cases, however reliability of private school enrollment was significantly higher in the test version compared to the control.
- **Enrollment of vocational, business, and technical students** was not statistically different between test and control.
- The overall **distribution of enrollment level** did not vary between test and control, but the test version did produce significantly lower estimates of the proportion enrolled in nursery school/kindergarten and grades 9-12.
- **Misreporting of professional school by vocational, business, or technical students** was not significantly different between test and control.
- **Item nonresponse for school enrollment** was not significantly different between test and control. However, item nonresponse was significantly in the test for enrollment level.
- The **match between grade enrolled and age** was not significantly different for all levels of enrollment, except the consistency was significantly lower in the test version.
- Although the empirical results do not conclusively suggest one version over the other, the test version provides additional information on single year of enrollment and provides a consistent format with proposed changes in the educational attainment question.

# **1. BACKGROUND**

## **1.1 Motivation for the 2006 ACS Content Test**

In January through March of 2006, the American Community Survey (ACS) conducted the first test of new and modified content since the ACS reached full implementation levels of data collection. The results of that testing will determine the content for the 2008 ACS. The year 2008 marks the first year of a three-year aggregated data product that includes data from the same year as the 2010 decennial census (2008 - 2010). Similarly, 2008 is the midpoint year for the first five-year data product that includes data from 2010 (2006-2010). Given the significance of the year 2008, the ACS committed to a research program during 2006 that will result in final content determination in time for the 2008 ACS. This research is the 2006 ACS Content Test.

Through the Office of Management and Budget (OMB) Interagency Committee on the ACS, the Census Bureau included subject matter experts and key data users from other federal agencies in identifying questions for inclusion in the Content Test. In general the Content Test evaluated alternatives for questions which showed some indication of a problem, for example, high missing data rates, estimates which differed systematically from other sources of the same information, or high simple response variance as measured in the Census 2000 Content Reinterview survey. In addition, the Content Test also included testing of three new topics proposed by other federal agencies for inclusion in the ACS.

To meet the primary objective of the 2006 ACS Content Test, analysts evaluated changes to question wording, response categories, instructions, or examples relative to the current version of the questions. Additionally, the Content Test design reflected two secondary objectives. One of the secondary objectives addressed form design alternatives for the basic demographic section of the form. The second addressed the content of the questionnaire mailing package. Results indicated no interaction between either of the two secondary objectives and the first objective addressing changes made to questions. Thus, this report will only address testing specific to the first objective - testing of alternative questions, response categories, etc.. Specifically, this report discusses school enrollment.

## **1.2 Previous Testing or Analysis for School Enrollment**

Other than the cognitive interviews in Fall of 2004, we have no previous testing of adding “home schooling” and simultaneously removing “regular” in the enrollment question, nor do we have previous testing of the changes to the “Graduate or Professional school” rewording. The design of the write-in is taken from the educational attainment question used for the 1996-1998 American Community Survey.

Many of the proposed changes to the ACS questionnaire emerge from our own experience in working with data from the existing questionnaires.

## **2. RESEARCH QUESTIONS AND SELECTION CRITERIA**

### **2.1 Research Question 1: Rates and Reliability of School Enrollment**

Appendix A lists all research questions and evaluation measures. The first question is, what effect does dropping the word “regular” and adding “home school” in part (a) of the school enrollment question have on rates of enrollment, the balance between public and private school enrollment, and the reliability of responses? We assess this question by comparing the proportion age 3 and older that report being enrolled in school in response to the test and control versions of the question. We also address the consistency of reports by comparing the net difference rate and simple response variance between the two versions and the follow-up responses. The primary selection criterion for part (a): Test version should reflect equal or higher proportion reporting as enrolled, no change or increase in proportion enrolled in private school, and the same or lower net difference rate as compared to control.

### **2.2 Research Question 2: Enrollment of Vocational, Technical, or Business Students<sup>1</sup>**

The second question tests what effect dropping the word “regular” has on reported enrollment for vocational, technical, or business students. We assess this question by comparing the enrollment status for people who report on the follow-up that they are enrolled in schooling leading only towards a “technical, business, or vocational certificate or license (for example, computers, cosmetology, nursing assistant, mechanics and repair)”. Secondary selection criterion for part (b): The test version of the enrollment question reflects no change or a drop in the proportion of technical and vocational/business students reporting as enrolled.

### **2.3 Research Question 3: Distribution of Enrollment Level**

The third question is whether the question on single grade of enrollment in part (b) of the school enrollment question results in the same proportions enrolled in grades 1 to 4, 5 to 8, and 9 to 12 as results of the categorical control question. We compare the distribution of grade of enrollment for all enrolled persons age 3 and older. Primary selection criterion for part (b): Distribution should be equal between test and control.

### **2.4 Research Question 4: Misreporting of Professional School by Vocational, Business, or Technical Students**

The fourth question addresses the addition of the qualifier “beyond a bachelor’s degree” to the “graduate or professional school” category for grade enrolled. Specifically, does the amount of erroneous reporting as enrolled in graduate or professional school by vocational, business, or technical students differ between test and control versions of part (b) of the school enrollment question? To address this research question, we compare the

---

<sup>1</sup> Business courses included in the vocational/technical category refer to those leading towards a certificate or license rather than courses leading towards a Bachelor’s or Master’s Degree.

follow-up responses about vocational enrollment among those who report being enrolled in graduate or professional school in the control and test. Secondary selection criterion for part (b): Test version should reflect no change or a drop in proportion enrolled in vocational, business, or technical school among those enrolled in graduate or professional school.

## **2.5 Research Question 5: Item Nonresponse Rates for School Enrollment**

The fifth question asks: what effect does the addition of the write-in response for enrollment in grades 1 through 12 have on the rate of non-response? We will address this question by comparing the item non-response rates between test and control versions of the school enrollment question. Secondary selection criterion for part (b): Test version should have the same or lower missing data rates for grades 1-12 compared to control.

## **2.6 Research Question 6: Match between Grade Enrolled and Age**

The final question addresses the agreement of grade-level write-ins with reported age. Do the results of the single grade of enrollment question agree with reported age as well as the categorical question for part (b) of the school enrollment question? We will compare the proportion of students who report an age within an appropriate range for the grade level between the test and control. Secondary selection criterion for part (b): The consistency between level of enrollment and reported age should be equal or better in the test version compared to the control.

# **3. METHODOLOGY**

## **3.1 Data Collection Methods**

### *3.1.1 The 2006 ACS Content Test data collection*

The 2006 ACS Content Test consisted of a national sample of approximately 62,900 residential addresses in the contiguous United States. (The sample universe did not include Puerto Rico, Alaska and Hawaii). To meet the primary test objective of evaluating question wording changes, approximately half of the sample addresses were assigned to a test group (31,450) and the other half to a control group (31,450). For the topics already covered in the ACS, the test group included the proposed alternative versions of the questions, and the control group included the current version of the questions as asked on the ACS. Both the test and control questionnaires included three new topics not currently on the ACS. Both test and control included the three new topics to keep context and questionnaire length consistent between the two versions.

The ACS Content Test used a similar data collection methodology as the current ACS, though cost and time constraints resulted in some deviations. Initially, the ACS collects data by mail from sampled households, following a mailing strategy geared at maximizing mail response (i.e., a pre-notice letter, an initial questionnaire packet, a reminder postcard, and a replacement questionnaire packet). The Content Test

implemented the same methodology, mailing each piece on the same dates as the corresponding panel in the ACS. However, the Content Test did not provide a toll-free number on the printed questionnaires for respondents to call if they had questions, as the ACS does. The decision to exclude this service in the Content Test primarily reflects resource issues in developing the materials needed to train and implement the operation for a one-time test. However, excluding this telephone assistance allows us to collect data that reflects the respondent's interpretation and response without the aid of a trained Census Bureau interviewer.

The ACS follows-up with mail nonrespondents first by Computer Assisted Telephone Interviewing (CATI) if a phone number is available, or by Computer Assisted Personal-visit Interviewing (CAPI) if the unit cannot be reached by mail or phone. For cost purposes, the ACS subsamples the mail and telephone nonrespondents for CAPI interviewing. In comparison, the Content Test went directly to CAPI data collection for mail nonrespondents, dropping the CATI data collection phase in an effort to address competing time and resource constraints for the field data collection staff. While skipping the CATI phase changes the data collection methods as compared to the ACS, eliminating CATI allowed us to meet the field data collection constraints while also maintaining the entire mail nonrespondent universe for possible CAPI follow-up. Using CATI alone for follow-up would have excluded households for whom we do not have a phone number.

The ACS also implements an edit procedure on returned mail questionnaires, identifying units for follow-up who provided incomplete information on the form, or who reported more than five people living at the address. (The ACS questionnaire only has space to collect data for five people.) This is called the Failed Edit Follow Up operation (FEFU). The ACS calls all households identified as part of the FEFU edit to collect the remaining information via a CATI operation. The Content Test excluded this follow-up operation in favor of a content reinterview, called the Content Follow-Up (CFU). The CFU also contacts households via CATI but the CFU serves as a method to measure response error, providing critical evaluative information. The CFU operation included all households who responded by mail or CAPI and for whom we had a phone number. More information about the CFU operation follows below.

The Content Test mailed questionnaires to sampled households around December 28, 2005, coinciding with the mailing for the ACS January 2006 panel. The Content Test used an English-only mail form but the automated instruments (both CAPI and CFU) included both English and Spanish translations. Beginning February 2006, a sample of households that did not respond by mail was visited by Census Bureau field representatives in attempt to collect the data. The CAPI operations ended March 2, 2006.

### *3.1.2 Content Follow-Up data collection*

The CFU reinterview, conducted by the Census Bureau's three telephone centers, provided a method for measuring response error. About two weeks after receiving the returned questionnaire or completed CAPI interview, the responding unit entered the

CFU operation. Telephone staff completed the CFU interviews between January 17 and March 17, 2006. At the first contact with a household, interviewers asked to speak with the original respondent. If that person was not available, interviewers scheduled a callback at a time when the household member was expected to be home. If at the second contact we could not reach the original respondent, interviewers completed the interview with another adult household member.

The CFU reinterview did not replicate the full ACS interview. Rather, the CFU used the roster and basic demographic information from the original interview and only asked questions specific to the analytical needs of the Content Test. Reinterview questions were of two general formats: the same question as asked in the original interview (in some cases, modified slightly for a CATI interview), or a different set of questions providing more detail than the question(s) asked in the original interview for the same topic. For topics in which the CFU asked the same question as the original interview, the CFU asked the test or control version of the question based on the original treatment. For these cases, the goal was to measure the reliability of the answers – how often we obtained the same answer in the CFU as we did in the original mail or CAPI data collection. For topics using a different question or set of questions than the original interview, we asked the same detailed series of questions regardless of the original treatment condition. Generally, these questions were more numerous than what we could ask in the ACS. In some cases the questions came from another existing survey, for example, for labor force, we asked the labor force questions from the Current Population Survey questions. In other cases the CFU asked additional probing questions based on prior testing results, such as for health insurance. For these topics, the goal was to measure how close the original answers were to the more detailed CFU answers.

### **3.2 Sample Design**

The sample design for the ACS Content Test consisted of a multi-stage design, with the first stage following the Census 2000 Supplementary Survey (C2SS) design for the selection of Primary Selection Units (PSUs) defined as counties or groups of counties. The first stage selection of PSUs resulted in 413 PSUs or approximately 900 counties being selected.

Within sampled PSUs, households were stratified into high and low response strata based on tract-level mail response rates to the Census 2000 long form and a stratified systematic sample of households was selected. The strata were defined such that the high response stratum contained 75 percent of the housing units that reside in tracts with the highest mail response rate. The balance of the tracts was assigned to the low response stratum. To achieve similar expected number of mail returns for the high and low response strata, 55 percent of the sample was allocated to the low response strata and 45 percent to the high response strata.

A two-stage sampling technique was used to help contain field costs for CAPI data collection. The initial sample of PSUs was sorted by percentage of foreign-born population since the majority of that target population responds via CAPI. At least one

item undergoing testing in the content test required an adequate sample of this population. The 20 PSUs with the highest percentage of foreign-born population were included with certainty and the remaining PSUs were sampled at a rate of 1 in 3. For the second stage, mail nonresponding households were sampled at a rate of 1 in 2 within the top 20 PSUs and at a sampling rate of 2 in 3 within the remaining PSUs. The final design designated 151 PSUs be included in the CAPI workload.

In the majority of PSUs, we assigned cases to both the control and test groups. To maintain field data collection costs and efficiencies, PSUs with an expected CAPI workload of less than 10 sampled addresses had all of their work assigned to only one treatment (either control or test). The PSUs were allocated to the two groups such that the aggregated PSU characteristics between the two groups are similar for employment, foreign born, high school graduates, disabled, poverty status, tenure, and Hispanic origin. For more information on the 2006 ACS Content Test sample design, see Asiala (2006).

There was no sampling for CFU. A CFU interview was attempted for all responding households to the Content Test for which we had a phone number.

### **3.3 Methodology Specific to the Research Questions**

The Content Test was evaluated by comparing the results from the control panel with the test panel, comparing results from both panels to CFU results, examining the effects of mode of collection across both panels, and comparing results of both panels to data collected on educational attainment.

Most analyses relied on tabulations of results from the test and control questions. We examined nonresponse rates, and the distribution of responses across categories of both questions. To examine the effect of asking about single grade of enrollment, we collapsed these into categories of grades 1 to 4, 5 to 8, and 9 to 12, for comparison with control results. We also created tabulations of the distribution of educational attainment by level of school enrollment and age by level of school enrollment.

We also pursued the question of technical school enrollment. The CFU included specific questions about the type of program and institution being pursued by those enrolled in postsecondary programs. Other CFU questions involve homeschoolers. We examine their distribution across types of enrollment. Also, cognitive work seemed to show some difficulties for homeschoolers picking a grade category for their children. We explored this with a CFU item. Most of these follow-up items were not examined as part of the Content Test evaluation and therefore are not included in this report.

## 4. LIMITATIONS

### 4.1 General Content Test and Content Follow-Up Limitations

As noted in section 3.1, Data Collection Methods, the Content Test maintained the same general mail data collection methodology as the ACS, but differed in the mail nonresponse follow-up operations. In general the deviations did not impact the validity of the results, and in many cases increased the effectiveness of the testing. However, some aspects of the Content Test implementation should be considered in evaluating the data.

- As noted, the Content Test did not include CATI data collection in order to meet field data collection constraints. While the design of the Content Test allowed all sampled housing units an opportunity to participate even without CATI, questions administered differently over the phone did not get the benefit of a full CATI operation (though some of the CAPI interviews actually do occur by phone). However, since only ten percent of ACS data is collected by CATI and CATI interviewers are trained to help respondents understand question intent and response categories, overall ACS data quality should not suffer when questions are implemented using CATI.
- Though the test design required that field interviewers work only control or only test cases, interviewers in both conditions worked regular ACS production interviews at the same time they completed the Content Test cases. By design the control instrument very closely replicated the ACS production instrument, only differing in the addition of the three newly proposed topics. As a result, interviewers in the test condition had to learn and use two very different instruments, while control interviewers used basically the same instrument between their Content Test cases and ACS production. Thus, test interviewers experienced more challenges in completing their overall caseload. Interviewer debriefing suggested that test interviewers had some difficulty dealing with the two very different instruments simultaneously which may have some impact on the administration of the test version.
- On the first day of CFU interviewing, we discovered a usability problem with the CFU instrument. Left unaddressed, the usability problem could have potentially impacted comparisons between the Content Test and CFU responses when looking specifically at gross difference rate or simple response variance calculations. However, we immediately implemented two steps to mitigate any data problems -- a special instruction sheet to remind interviewers about how to avoid the potential problem and a procedure to report any problems to headquarters for repair. Interviewers followed the instructions and reported 90 cases to us. Post-collection processing corrected all reported errors, though it is possible that some cases went unreported.

- The CFU universe did not include non-telephone households and vacant housing units. This only affects those question topics included in the CFU study that are related to the non-telephone household or vacant universes.

## 4.2 Limitations Specific to School Enrollment

A limitation to research on grade of enrollment is that one proposed change – write-in of grade of enrollment – only affected the mailout-mailback portion of the sample. CAPI (and CATI, not tested in the 2006 test) does not ask specifically for single grades of enrollment, but, rather, offers them as potential answer categories for interviewers, unseen by respondents. In effect, then, the content test only affected a part of the sample for the purposes of this particular change. In addition to the analyses reported here for the entire sample, we examined differences in results separately for the mailout-mailback respondents. None of the major conclusions reported here were changed by virtue of relying on the sample taken as a whole. Nonetheless, it should be recognized that the power of the test on this particular aspect of the questionnaire is less than it is for other proposed changes.

## 5. RESULTS

### 5.1 Response to the Content Test and Content Follow-Up

Control and test treatments groups obtained equivalent response rates overall, and for each mode of collection. Similarly, response to the Content Test is comparable to response for the production ACS.

The table below gives the weighted response rates for each data collection operation and a test of differences between the control and test groups. The overall response rate reflects the final response to the initial data collection (mail and CAPI only). There were no significant differences between response rates for the control and test groups. Note that the denominator for each calculation included only eligible cases for each mode.

**Table 1. Content Test Response Rates, Control vs. Test**

Response Rate	Total (%)	Control (%)	Test (%)	Difference (%)	Margin of Error (%)	Significant
Overall response rate	95.7	95.8	95.5	-0.3	± 0.9	No
Mail response rate	51.3	51.5	51.2	-0.3	± 2.2	No
CAPI response rate	92.4	92.6	92.1	-0.4	± 1.7	No
CFU response rate	76.2	75.9	76.4	0.5	± 1.6	No

## 5.2 Rates and Reliability of School Enrollment

The first research question addressed whether there was any significant change in the proportion enrolled and the item reliability when “regular” was removed and “home school” was added to part (a) of the school enrollment question. Table 2 (see appendix B for evaluation tables) shows that a weighted 26.6 percent of control respondents and 27.2 percent of test respondents were recorded as attending school. The difference between these two numbers is not significant, indicating that no change took place in the proportion enrolled between the test version and the control version. The overall chi-square test of independence statistic for the enrollment distribution was not significant (chi-square=3.75,  $p=.29$ ), indicating that the distribution of enrollment status did not vary between test and control versions.

Table 3 displays the net difference rates and the simple response variance for enrollment status and type of school. The net difference rate between the test and CFU questions on enrollment in public school was 0.5 percent, and the net difference between the control and CFU questions was 0.6 percent. These net difference rates were both low and not significantly different. Similarly, there were no significant differences between test and control in the net difference rates for the categories of enrollment in private school and non-enrollment. This indicates that there is no difference in the systematic error between the test and control versions.

The right side of the table addresses reliability in school enrollment items. For the test version, there was a significantly lower simple response variance than in the control (1.6 percent versus 2.0 percent) for private school. This suggests that there is improved reliability in the measurement of private school enrollment in the test version. These results meet the first primary selection criterion for part (a) of the school enrollment question.

Although not a major criterion, we were able to examine the impact of the test question on the enrollment rate of the population identifying themselves (or their children) as being homeschooled in the CFU. Table 4 shows that a nominally larger percentage of home-schooled students are reported to be enrolled in the test than in the control (54.9% versus 48.1%). However, this difference is not statistically significant and does not significantly alter the estimated proportion of the population enrolled.

## 5.3 Enrollment of Vocational, Technical, or Business Students

The second research question addressed whether dropping “regular” affected the enrollment responses for students enrolled in vocational, technical, or business schools. Table 5 displays the cross-tabulation of enrollment status for people who report vocational, technical, or business enrollment in the CFU. A similar percentage of these students report being enrolled in both test and control (40.7% versus 41.0%), suggesting that dropping “regular” does not influence enrollment reporting for this group of students. This finding meets the secondary selection criterion for part (a) of the school enrollment question.

#### **5.4 Distribution of Enrollment Level**

The third question addresses the consistency in the distribution of level of enrollment from part (b) of the school enrollment question between test and control. Table 6 compares the distribution in the categories of grade level. While the differences between test and control are statistically significant for some categories, the overall chi-square test of independence statistic for the grade distribution was not significant (chi-square=9.76,  $p=.13$ ), indicating that the distribution of level of enrollment did not vary between test and control version. These findings meet the primary selection criterion for part (b) of the school enrollment question.

While the overall distribution did not change, Table 6 shows significant differences in the proportion of students enrolled in nursery school/kindergarten and grades 9-12 between control and test. We explored these differences by comparing responses to answers in the CFU. Table 7 shows no significant difference in the net difference rate between control and test for any of the grade levels. However, the test version had a significantly lower simple response variance for grades 9-12, suggesting improved reliability in the measurement of high school enrollment with the test version.

#### **5.5 Misreporting of Professional School by Vocational, Business, or Technical Students**

The fourth research question addresses whether adding the wording “beyond a bachelor’s degree” to the graduate/professional school category reduces the misreporting of vocational, business, or technical school students to this category. Table 8 addresses the CFU report of type of professional school enrollment for those who indicate professional school enrollment in the initial test/control survey. The percentage of students who report being enrolled in courses leading towards a vocational, business, or technical degree is approximately 5% for both test and control. This suggests that in both versions, a low proportion of vocational/technical students erroneously reported being enrolled in graduate or professional school. This finding meets the first secondary selection criterion for part (b) of the school enrollment question.

#### **5.6 Item Nonresponse for School Enrollment**

The fifth research question considers differences in the nonresponse rates between test and control. Table 9 shows that the item nonresponse rates for part (a) of the school enrollment question were 3.9 percent in the control questionnaire, and 3.5 percent in the test. These rates are not significantly different. This supports our selection criterion for the test version of part (a). On the other hand, for part (b), the grade attending question, the nonresponse rate was significantly higher for the overall sample ages 3 and above. This secondary selection criterion does not support selection of the test question.

We think there are good reasons to choose the test version of the enrollment questionnaire despite the failure of the secondary selection criterion. First, the item nonresponse rate is still generally quite low, and there was no significant difference for the school age population (ages 6-18). This seems primarily to result from the smaller sample size in the school-age group, rather than a narrowing of the difference in this important age range. Nevertheless, it shows the problem may not be serious for the group most directly affected by the introduction of the write-in. In fact, less than 1% of respondents in the school age population were missing the write-in for a specific grade (see the last row of Table 9). Another reason to not be overly concerned about a slight increase in non-response is the potential availability of other information – age and educational attainment – that might improve the imputation of missing answers that do occur.

### **5.7 Match between Grade Enrolled and Age**

The final research question addresses the extent to which respondents in the test versus control versions report enrollment levels consistent with reported age. Table 10 shows that the single grade of enrollment question matches with reported age in similar proportions to the categorical question in all but one case. For the grade 1-4 category, the test version has a significantly lower match rate with valid age range compared to the control version. However, the match remains over 95%, and the overall levels of age-grade agreement seem to be at least as good in the test question for all other grade levels. This finding meets the fourth secondary selection criterion for part (b) of the school enrollment question for all grades except 1-4.

## **6. SUMMARY OF EMPIRICAL RESULTS**

The results from these analyses suggest that the test version of the school enrollment question provides estimates of rates of school enrollment that are equal in quality to the original measure. Moreover, the test version of the school enrollment question measures enrollment in private school with slightly higher reliability. Therefore, the test version of part (a) of the question meets our primary selection criteria.

The results for the grade of enrollment question suggest there are few slight differences in the quality of the measures of level of school enrollment. The test question meets the primary selection criterion of statistically similar distributions of grade of enrollment. It also does not significantly increase item nonresponse rates for the school age population, and generally produces estimates of grade of enrollment that match well with recorded age. Findings that did not meet the selection criteria included higher nonresponse rates for grade level among the population age 3 and above, and lower age-grade consistency for the grades 1-4 category. Despite the significance differences in these two areas, data quality in both versions are generally good with low nonresponse rates overall and high age-grade consistency for the grade school categories regardless of treatment.

The test version of the question performs as well as the original question in almost all respects and provides additional information by partitioning level of enrollment into single grades. Furthermore, adopting the test version of level of enrollment along with the test version of educational attainment will provide consistency in the format of ACS education questions. So although the empirical findings do not conclusively suggest the test or control version, the benefits of having consistent format between education items and obtaining single grade level of enrollment suggest adoption of the test version of the school enrollment question.

## Research Questions & Evaluation Measures

No.	Research Questions	Evaluation Measures
1.	<p>How is the distribution for enrollment question (a) impacted by the following changes?</p> <ul style="list-style-type: none"> <li>-including 'home school' in the italicized instruction</li> <li>-including 'home school' in the private school response category</li> <li>-dropping the word 'regular' from the question stem</li> </ul>	<p>Compare distributions between the test and control versions</p>
2.	<p>What impact do these changes have on item nonresponse for question (a)?</p>	<p>Compare item nonresponse rates between the test and control versions.</p>
3.	<p>Does the amount of erroneous reporting as "enrolled" (technical/vocational students) or erroneous reporting of "not enrolled" (homeschoolers) differ between the test and control versions?</p>	<p>Using responses to detailed questions in the CFU, compare net difference rates' between test and control</p>
4.	<p>Of the persons reported as 'homeschool,' is there a difference in the distribution between private and public?</p>	<p>Compare distribution between test and control of public versus private for only persons who are homeschooled.</p>
5.	<p>How is the distribution for the level of enrollment question (b) impacted by the following changes?</p> <ul style="list-style-type: none"> <li>-indicating single grade of enrollment (grades 1- 12)</li> <li>-adding additional text to the graduate and professional school category</li> <li>-modifying the examples in the graduate and professional school category</li> </ul>	<p>Compare distributions between the test and control versions</p>
6.	<p>What impact do these changes have on item nonresponse for question (b)?</p>	<p>Compare item nonresponse rates between the test and control versions.</p>
7.	<p>Does the internal consistency with reported age differ between the test and control versions for the level of enrollment question?</p>	<p>Compare percentage of persons who report an age consistent with their level of enrollment between test and control</p>
8.	<p>Does the internal consistency with reported educational attainment differ between the test and control versions?</p>	<p>Compare percentage of persons who report an attainment level consistent with their enrollment between test and control</p>
9.	<p>What criteria do homeschool families use to classify their student into a grade of school? Does it differ between the test and control versions?</p>	<p>Identify criteria used to classify homeschooled students into a grade in the CFU, and compare distribution of reasons between test and control</p>

10.	For the enrollment question (a), do the changes impact the differences in distributions currently observed across modes of collection?	Calculate distributions for each mode separately, and compare differences between modes, between test and control
11.	For the enrollment question (b), do the changes impact the differences in distributions currently observed across modes of collection?	Calculate distributions for each mode separately, and compare differences between modes, between test and control

### Selection Criteria

Research Q	Criteria
1	The test version of the enrollment question (question a) reflects an equal or higher proportion reporting as enrolled and no change or an increase in the proportion of those enrolled who are in private school.
3	The test version of the enrollment question reflects no change or a drop in the proportion of technical and vocational/business students reporting as enrolled.
5, 7	The switch to a question on single grade of school in the level enrolled question (question b) is supported if the proportion of students enrolled in grades 1-4, grades 5-8, and grades 9-12 are equal between the test and control versions and consistency between the level of enrollment and reported age for the test version should be equal to or better than that of the control version
5	The test version of the level enrolled question is supported if the proportion of vocational students enrolled in graduate or professional school is the same or lower than the control version of the questionnaire.
2, 6	Test version has the same or lower item missing data rates.
4, 8-11	Not selection criteria. For informational purposes only

Minimum criteria for selecting the test version of the enrollment question (part a):

- The test version results in the same or higher levels of enrollment, and the same or lower net difference rate as compared to control. (Note: level of enrollment may not increase even with more homeschoolers indicating enrollment if the test version successfully reduces the number of vocational and technical students erroneously indicating enrolled in school.)

Minimum criteria for selecting the test version of the level enrolled question (part b):

- The consistency between level of enrollment and reported age is equal to or better than the control version, and there is no increase in the item missing data rates for grades 1 - 11 (write-in field).

## Appendix B: Tables

**Table 2. Enrollment Status, Control Vs. Test, Age ≥ 3**

	Control	Test	Diff	ME	Significant
Enrolled	26.6%	27.2%	0.7%	±1.3%	No

## APPENDICES

	A. ACS Education Items Tested.....	21
	B. Recruiting Screener .....	34

# 1. METHOD

We conducted cognitive interviews with 80 persons in the Washington, DC area. In this chapter we discuss the study design, process for recruiting study participants, and describe the participants and educational characteristics of their households. We also describe the ACS items of interest for the study and the interview procedures.

## 1.1 Study Design

The Census Bureau requested that we cognitive test the ACS items of interest in forms suitable for three different survey modes:

- Self-administered (paper and pencil)
- Administered in-person
- Administered by telephone

In addition, there were multiple versions of an item within each mode:

- Self-administered – includes two versions of the educational achievement item (Q11). One version groups the response categories under broader headings, while the other version does not.
- Administered in-person – this mode also includes two versions of the educational achievement item (Q11). The response categories are presented on a flashcard, with one version grouping the response categories under broader headings, while the other version does not.
- Administered by telephone – this mode includes two versions of the question assessing the grade or education level a person is currently attending. One version combines graduate school and professional school into one category, the other version presents these options as separate categories.

Appendix A presents each version of the ACS items we tested, by mode of interview. The table below shows how respondents were distributed across the modes and versions.

	Self-administered	Administered In-person	Administered by Telephone	Total
<b>Version 1</b>	15	15	10	40
<b>Version 2</b>	15	15	10	40
<b>Total</b>	30	30	20	<b>80</b>

## 1.2 Recruitment

We recruited participants for this project through a variety of means. We placed an ad for research volunteers in the *Gazette*, a weekly newspaper serving Montgomery, Prince George’s, and Frederick counties of Maryland. We also placed an ad in the *Washington City Paper*. Additional recruiting was done over the Internet through ads posted to [www.craigslist.com](http://www.craigslist.com). Approximately 300 persons contacted Westat in response to these ads, and this group largely served as our pool of potential study participants. We also tried to recruit some persons with a GED through flyers posted at Montgomery College. A small number of persons were recruited by “word of mouth” referrals from Westat staff and study participants themselves. Westat employees were not eligible for participation.

In our recruiting, we targeted persons with a variety of specific educational characteristics, including parents of home-schooled children, parents of nursery and preschoolers, parents of children attending persons with technical school educations, persons with some college credit but no degree. Most respondents were recruited from households with two or more persons, so that the ACS education items would be asked with multiple persons.

Volunteers were screened for eligibility on an “as needed” basis prior to being scheduled for interviews. In order to ensure we obtained sufficient numbers of respondents with characteristics of interest for the study, a key screening item was designed to get potential participants to describe in their own words, with careful probing on the part of the recruiter, the educational backgrounds of people in their household. This was done so as to minimize potential influence of the recruitment screening on the participants’ reactions to ACS items we were testing. The recruiting screener used for this study can be found in Appendix A.

The table below shows the number of households with at least one household member having a given educational characteristic of interest. We found it enormously difficult to recruit households containing someone with only a GED – although the recruiter did identify and schedule seven persons from these households, one did not show up for the interview, and in four others it turned out that the person with a GED had eventually earned at least some college credit.

Educational Characteristic	Number of households <sup>#</sup>
Children being home-schooled	19
Children attending nursery school	6
Children attending grades 1-12	17
Person with GED only	2
Person attending (or completed) technical/vocational school	16
Person left college before completing a full year of credit	18
Person has more than one year of college credit, no degree	10
Other/miscellaneous	31

<sup>#</sup>Some households were classified into more than one category.

The table below presents a demographic summary of the 80 study participants.

Demographic Characteristics	Number of Respondents
<b>Gender</b>	
Male	25
Female	55
<b>Age</b>	
18-25	10
26-35	23
36-45	26
46-55	14
56-65	6
Over 65	1
<b>Race/Ethnicity</b>	
White	41
Black/African-American	27
Hispanic	6
Asian	7

As noted above, most respondents were recruited from households containing multiple persons per household, so that the education items could be tested with more than one person per household. The table below shows the total number of household members addressed in the interviews, and the number of these persons reported to be currently attending school, by mode of interview. We were able to ask the items on current school attendance and highest level achieved for a total of 273 persons. A total of 96 persons were reported as currently attending school.

	Self-administered Mode (30 interviews)	In-person Mode (30 interviews)	Telephone Mode (20 interviews)
Total number of persons in Household	100	108	65
Number of person currently attending school	34	41	21

### 1.3 Interview Logistics and Procedures

The interviews were conducted by Westat staff and adhere to a semi-structured interview guide consisting of the following three elements:

- **Interview introduction:** Here we explained the purpose of the project and assured participants that all information they share will be treated as confidential. Participants were also informed that the interviews were to be audio-taped, and (if applicable) that Census Bureau staff were observing behind a one-way mirror. Participants were also asked to sign consent forms.
- **Administration of the ACS:** All participants were asked to respond to demographic Questions 1-13 of the ACS for each member of their household. The intervening ACS questions on housing characteristics were not included in the interview. Participants were asked to respond to these questions through one of three survey modes:
  - **Self-administered.** These participants were provided a paper-and-pencil copy of the ACS specially prepared for the cognitive interviews. They were given a pen and asked to fill it out at their own pace, but reading along and “thinking aloud” as they did so. The cognitive interviewer closely observed and took notes of any apparent difficulties experienced by the respondent.
  - **“In-Person” administered.** The cognitive interviewer read the ACS questions as much as possible the way a Census Bureau field interviewer would read the questions. That is, the Westat staff interviewers were instructed to read the questions, as worded, in the ACS. Flashcards presenting the response choices to the participant were used, as appropriate.
  - **Telephone administered.** The cognitive interviewer entered the room behind the one-way mirror and called into the room where the participant sat. The participant answered a phone placed on the table upon hearing it ring. The interviewer then administered the ACS items in much the same way as a Census telephone interviewer would (reading the questions, as worded).
- **Cognitive debriefing:** Here, the Westat interviewer followed up on any observed confusion or difficulties that participants may have experienced when answering the key ACS items of interest. For example, verbal cues such as hesitation or changing one’s answer, as well as nonverbal cues such as eye rolling can suggest evidence of respondents’ difficulty in understanding a question. The interviewer will also probe as to how he or she interpreted the key questions. A substantial amount of probing was done concurrently with administration of a questionnaire. But in all interviews, much of the probing was done after completed administration of the ACS items. To obtain additional data on how respondents interpreted the ACS items, the probing

included presenting respondents with a series of hypothetical scenarios, and asking them how they would respond to an ACS item if the situation applied to them.

The majority of the cognitive interviews were conducted onsite at Westat's headquarters in Rockville, MD. These interviews were conducted in a qualitative interviewing suite equipped with a one-way mirror for observation purposes. Census Bureau staff observe many of the interviews. Some interviews were conducted at a downtown Washington, DC hotel conference room. Interviews typically lasted 35 to 50 minutes. Participants received an incentive payment of \$40.

## 2. FINDINGS

### 2.1 Reporting Current School Attendance.

In this section we discuss the cognitive interview findings for the ACS items on current school attendance. We discuss the accuracy with which participants answered these items, as well as difficulties observed with respect to comprehending the intent of these items. When applicable, we differentiate between mode of administration for the ACS questionnaire (in-person, self-administered, or telephone). Finally, we discuss the two version of these items administered within the telephone mode.

**2.1.1. Response errors in reporting current school attendance.** Across the 80 interviews, the items on current school attendance were asked for a total of 273 persons. Through probing, we were able to determine that incorrect reporting occurred in nine interviews, and for nine persons. The incorrect reporting appeared to be unrelated to interview mode, as three cases were in the in-person mode, three were in the self-administered mode, while three were in the telephone mode. Most of these response errors were “false positives” – reporting that someone has been attending school or college, yet the attendance is not consistent with the Census Bureau’s definition since it does not involve seeking a degree. In addition, two cases involved parents being unable to place their home-schooled child into a grade-level category. These nine cases are described below:

- A respondent answered that his wife had attended college in the past three months, yet probing revealed that she was taking a class for “personal edification and fun.” She clearly was not working towards a college degree (in-person mode).
- Someone reported that a housemate had attended college in the past three months. But later during probing he recalled the housemate had dropped out of college more than three months ago (in-person mode).
- One participant who home-schools her son could not place him into a single grade level, describing him “*all over the board.*” Apparently he is currently in 4<sup>th</sup>, 5<sup>th</sup>, and 6<sup>th</sup> grades, depending on the subject area.
- Another participant answered that he had attended college in the past three months, but later remembered that he had graduated and received his degree just over three months ago (self-administered mode).
- A respondent reported that a housemate had attended nursing school at a public college (Montgomery College). It turned out the housemate had obtained her nursing degree years ago and recently had only taken a short class to earn Continuing Education credit (self-administered mode).

- Another respondent reported that her three children are being home-schooled. One of the children is four years old, and was reported to be attending “Nursery school, preschool.” But the respondent noted that this schooling was strictly “informal,” and is not recognized by the home schooling program which regularly reviews the work of her other two (older) children (self-administered mode).
- An elderly respondent, for who English is a second language, reported that she had been attending school, but it was merely a class at a senior center on how to use computers and the internet. She clearly was not seeking any type of degree, but was either unwilling or unable to attend to the instruction contained in question 10a (telephone mode).
- After reporting that her 17-year-old son had been attending school, a respondent could not place her son into a category at question 10b. Her son is home-schooled but also takes a class at Montgomery College (a public school), for which he will obtain both high school and college credit. The interviewer in this case perhaps could have done more to encourage the respondent to select a category, since later the respondent noted that if she had to pick one category, she would place her son in the “Private school.....home school” category. But it’s worth noting that when shown the self-administered version of the survey, she said that she would have marked both of the available categories for this question and returned it to the Census Bureau (telephone mode).
- One person reported that his roommate was not currently attending school, even though he knows that she is attending the University of Maryland and understands her to be working toward a master’s degree. It turned out he misinterpreted the question as asking if the person was attending college “for the first time” – he had answered “no” because his roommate had graduated from college years ago, but recently returned to school to improve her career prospects (telephone mode).

In addition, there were three cases where we are unsure as to whether a participant reported correctly for current school attendance. In each case, it was somewhat ambiguous as to whether a person’s school attendance involved seeking a college degree:

- A respondent reported that he is currently attending college. Probing revealed that he is taking classes at Montgomery College to become certified in automotive electronics. He further suggested that he may decide to get an Associate’s degree. According to information found on the Montgomery College website, the program does allow students completing the necessary classes for certification to continue working toward an A.S. degree in automotive technology. The ambiguity seems due to the respondent’s own unclear intentions (in-person mode).
- Another person reported that her husband is attending college. He is taking classes related to computer networking security at Strayer College. Although she

knows he will attend the school for about two years, she is not sure whether he is seeking a degree, or what type of degree it might be (in-person mode).

- A respondent reported that her daughter is attending college. When she experienced difficulty indicating the level of school she was attending, she explained her daughter has completed her Bachelor's degree and is now completing a two year certification program. This certification program involves actual undergraduate coursework, but the respondent readily acknowledged that the certificate her daughter is working towards "is not considered a degree." She ultimately chose to report that her daughter is attending the "College undergraduate years." The respondent was quite adamant that her daughter is attending college, since "...she's attending the University of Maryland....I'm paying for it!...She's not in limbo somewhere, she's still going to college, it's just not a degree" (self-administered mode).

The above cases suggest that the most common response error with regard to the ACS items on current school attendance may be over-reporting, due to some persons' educational activities not being consistent with the Census Bureau's intent for these items. Another factor may be a tendency to report educational activities that ceased prior to the three month reference period. It should be noted that there were many cases among the interviews where respondents correctly disregarded educational endeavors in which they or another household member were participating. These encompassed a wide variety of classes and activities, including Continuing Education courses for maintaining professional certifications, language and computer software classes, music lessons, employer-sponsored training courses, and a math course sponsored by a social-welfare agency. Furthermore, the vast majority of the 19 parents of home-schooled children readily placed their children into a grade-level category, even though several of these children were completing a limited amount of coursework at a different level. Still, the observations noted above suggest that the instructions provided by the Census Bureau to "include only nursery or preschool, kindergarten, elementary school, home school and schooling which leads to a high school diploma or college degree" are sometimes overlooked or misinterpreted by respondents. This issue is discussed in the next section.

**2.1.2 Difficulties comprehending the intent of the ACS items on current school attendance.** There were numerous observations indicating that the instruction which serves to define "current school attendance" (in question 10a) for respondents is problematic due to its *length*. This was especially true in the in-person and telephone modes of administration, which requires interviewers to verbally provide the instruction to respondents immediately after asking if they have attended school or college in the past three months. Respondents often asked for part or all of the question and instruction to be repeated. For example, one telephone mode participant lost track of the reference period and asked the interviewer: "For the last how many years, did you say?" A few minutes later during probing, she noted: "I sort of got lost in the question." Similar comments were made by several others:

*“...it’s lengthy and convoluted” (in-person mode)*

*“...to listen to all those options, I got confused.” (in-person mode)*

*“It’s a really long sentence....and it mixes a lot of things together.” (in-person mode)*

While the problematic length of the instruction was most noticeable in the in-person and telephone interviews, we also observed a few respondents in the self-administered mode reading only part of the instruction, or skipping it altogether. In the instrument, the question is printed in bold font, and the subsequent instruction on what to include is printed in italics. As one person put it:

*“I wouldn’t read that....to be honest with you. If it’s not in bold, I don’t read it.”*

The instruction provided by the item is designed to apply to any household member, of any age. As a result, the instruction refers to types of schooling which are unlikely to apply to any given household member. In other words, “...nursery or preschool, kindergarten, elementary school...” does not apply to adults. This appeared to distract respondents at times, compounding the length problem:

*“It was like: ‘I wonder if she’s paying attention to how old I am?’ I mean, nursery school?...It just seemed like a weird set of questions.” (telephone mode)*

*“I just find it funny that they list preschool first for an adult male. But yeah, they have to cover everyone.” (telephone mode)*

*“Bringing up kindergarten for a grown-up was sort of odd.” (telephone mode)*

*“...the kindergarten or the nursery, I don’t understand, why is this mentioned? It almost sounds as if you are asking me if they’re trying to become a nurse or a kindergarten teacher.”<sup>1</sup> (telephone mode).*

As illustrated by the last comment above, the fact that the instruction mentions types of schooling that do not apply to a given household member made the question more difficult for some to interpret. In fact, a few participants wondered (at least briefly) if the question might be asking them about visits or volunteering activities that parents may engage in at their children’s school:

*“...it could mean that you signed up to take a course or visited a child’s classroom.” (telephone mode).*

---

<sup>1</sup> English was a second language for this participant. He thought “nursery school” meant schooling to become a nurse.

A couple of participants pointed out that the word “attended” in the question is ambiguous to them. One discussed a friend who is seeking her college degree by taking classes online – this participant said she would not know how to answer the question for that person, since “attending” implies “*being physically present*” somewhere. Another person initially asked the interviewer if “attended” means “*walking into versus being a student at,*” noting she volunteers and attends PTA meetings at her son’s school. After considering the full instruction, however, this respondent realized these activities should not be counted as having attended school.

As noted in the Methods chapter, one way we examined respondent comprehension for these items was through the use of hypothetical scenarios. Scenarios can be useful since they allow cognitive interviewers to explore how survey respondents may interpret and apply the questions to a broader range of situations, thus offering additional insights into cognitive aspects of the survey response process. Extra caution must be taken when interpreting reactions to scenarios, since respondents are typically considering something rather abstract and may fill in details they perceive to be missing in the scenario. Also, scenarios often present respondents with concepts or experiences with which they have little familiarity. Participants were verbally presented with a scenario, and asked to respond to question 10a (“*At any time in the last three months, has [NAME] attended school or college?*”) Most of the scenarios we presented to participants were somewhat difficult, and thus yielded a high degree of variability in the responses. In fact, quite a few participants in the in-person and telephone modes noted that they would qualify their answer by specifying the type of schooling it was, or ask the interviewer for clarification. Below we present each scenario, along with a summary of participant reactions.

- **Technical school.** Suppose someone in your household was currently attending a technical school, with the goal of becoming a licensed electrician - how would you have answered [question 10a] for that person? What about someone attending a cosmetology school to become a licensed beautician or hairstylist?

About three-quarters of the participants given this scenario said that they would not consider the person to be attending school (at least for purposes of question 10a), and thus would answer the question with “no.” A few of these person initially said they would report “yes,” and changed their answer to “no” only after rereading or being re-exposed to the instruction. Some persons noted they would answer “no” only because they perceived the question to be requiring them to do so, not because they feel it is the accurate answer. While most participants seemed to have no particular reaction on this matter, a few did comment that the question seems to unfairly overlook or ignore technical school educations:

*“[the questions] are very white collar....there are a lot of people in the blue collar field.....I think this question eliminates the blue collar worker.” (self-administer mode);*

*“I just feel like they’re excluding a lot of people in that question.” (in-person mode);*

*“...it’s skewed...that whole branch of education is totally omitted.” (self-administered mode).*

Among respondents who said they would answer “yes” to question 10a in this scenario, most felt that their answer was consistent with the Census Bureau’s intent. They noted that technical school “*is like a college,*” and implies that a “curriculum” or “course of study” that is being followed. As one person put it:

*“It doesn’t say anything about licenses...I would go ahead and answer ‘yes’ because I think the point of the question is to see if someone is pursuing education, not that they’re pursuing...only a college degree.” (self-administered mode).*

Some of the participants who told us they would answer “yes” at question 10a for the technical school scenario were asked how they would handle the follow-up item asking for the grade or level of school attendance (question 10b in the self-administered mode, question 10c in the telephone and in-person modes). The most common response was that they would classify the attendance as “College undergraduate years.” Some admitted that the category wasn’t quite correct, but that they were “*making it fit,*” or choosing the next best category. But one said she would classify technical school as “Graduate or professional school,” and one person in the self-administered mode said she would simply write in “technical school” on the questionnaire.

- **Software certification class.** Suppose someone had just graduated college, and was now taking classes to become certified in certain types of computer software. How do you think you would have answered (attending school or no

Participants generally viewed this scenario as being similar to the technical school scenario. About three-quarters of participants given the scenario said they would not count it as attending school or college - virtually all stated that a certification is not considered a college degree, and thus the instruction provided by question 10a rules this out. The other one-quarter of participants said they would count it as attending school, with a couple noting their answers are based on the assumption that the software certification is based on a course of study that occurs over some length of time, rather than a something like a 3-day training class. Furthermore, a few persons said they would report “Graduate or professional school beyond a bachelor’s degree” as the level of

school attendance, since the scenario describes the individual as already possessing a bachelor's degree.

- **Internship.** In some fields, students have to work in an internship for a year or two before they are considered to have the proper credentials for their field (such as medical doctors and many psychologists). Suppose someone in your home was currently working in an internship – how do you think you would have answered (attending school or no?)

About two-thirds of participants given this scenario said they would consider working in an internship to be attending school. They usually pointed out that the internship is required in order to obtain the degree, and thus falls under the definition provided in the question 10a instruction. About one-third disagreed, however, noting that an internship is based in a “work setting,” and thus is more like job training rather than formal schooling.

- **Post-baccalaureate certificate program.** In some fields, students often take a few additional classes beyond the bachelor's degree – it's often called a “post-baccalaureate certificate program” Suppose someone in your home was currently in that type of program at UMD – how do you think you would have answered (attending school or no?)

About two-thirds of participants presented with this scenario said they would count this as attending school. They pointed out that this individual is earning college credit, or that the certification to be obtained from the college “*is like a college degree.*” Most of these participants said they would classify the level of attendance as “Graduate or professional school beyond a bachelor's degree.” The other one-third of the participants said they would not count this as attending school or college, generally stating that the certification is not a degree.

- Suppose someone had completed their Bachelor's degree, and was now working on their Master's degree. How would you have answered for that person? (What is that?)

This scenario was inspired by a comment made by a participant in one of the early interviews. This person noted that if someone in the household were still in graduate school working toward a master's degree, she would not count this as attending school or college in response to question 10a. Her reasoning was that it doesn't meet the requirements contained in the instruction: to count only “*schooling...which leads to a college degree.*” As she saw it, a college degree refers to a bachelor's degree. So we asked many other participants to imagine this scenario, but the vast majority replied that they would consider schoolwork toward the master's degree to be included in the

definition provided by the instruction. A few people did disagree, however. As one argued, the master's is "*an advanced, or post-college degree.*"

**2.1.3 Version 1 versus Version 2 for level of current school attendance.** In interviews testing the telephone mode, we administered one of two versions of the item assessing level of current school attendance. Version 1 presented "Professional school beyond a bachelor's degree" and "Graduate school" as separate response categories, while Version 2 combined these levels into one category: "Graduate or professional school beyond a bachelor's degree." From our observations, it seems to make no difference which version is asked. Respondents almost always easily answered this question, regardless of the version administered. Thus, we detected no advantage for one version, relative to the other version.

## **2.2 Reporting Highest Level of School Completed.**

In this section we discuss the findings for the ACS items on highest level of school completed. We discuss the apparent accuracy with which participants answered these items, as well as difficulties observed with respect to comprehending the intent of these items. When applicable, we differentiate between mode of administration for the ACS questionnaire (in-person, self-administered, or telephone).

**2.2.1. Response errors in reporting highest level completed.** Across the 80 interviews, we administered the items seeking to establish the highest level of school completed for a total of 273 persons. We determined that incorrect reporting occurred in 17 interviews, for a total of 22 persons: Eight cases were in the in-person mode, five were in the self-administered mode, while four were in the telephone mode. The causes of the errors had little or nothing to do the characteristics of data collection within a mode. A description of each of the response errors is discussed below:

- One participant reported that her daughter and son in-law had completed "1 or more years of college credit, no degree." Her daughter had trained in ballet for a few years at a prestigious school in Venezuela, and though the training did not involve any academic coursework, the respondent felt it was comparable to a year or more college credit. The son in-law was placed in the same category based on his having taken construction classes at a technical college in Caracas. She had no knowledge of any additional classes he had completed (self-administered mode).
- Two respondents reported someone as having completed "1 or more years of college credit, no degree" although it appeared the person had actually completed less college credit. One explained that she put her husband into this category "*because he has more than 16 credit hours but he has no degree.*" This participant estimated her husband completed six or seven classes while attending Montgomery College. The other participant said she had completed about 18 college credits, and admitted she didn't really know what the category "1 or more

years of college credit” means. She said she put herself in that category because she had attended college for more than a year. Based on the information provided by these respondents, we believe “Some college credit, but less than 1 year of college credit” would be the appropriate answer for both (self-administered mode).

- A participant had recently moved into a home with two new roommates whom he did not know very well. He had no knowledge at all of the schooling that they had completed. For one, he guessed “Regular high school diploma,” and for the other he left the question blank. Presumably he could have asked the roommates for this information had he been filling out the questionnaire for the ACS (self-administered mode).
- One participant marked the “Grade 1 through 11” category for her first-grade son, and wrote “k” in the entry box for the specific grade in an attempt to communicate that her son had completed kindergarten. She said that having previously checked the “Grade 1 though 11” category for her two older children led to overlook the “Kindergarten” category (self-administered mode).
- Two participants could not correctly place their children currently attending preschool in a category consistent with the Census Bureau’s intent. Both believed that the “No schooling completed” category did not apply, since the children had completed one or two years of preschool. One respondent placed her son in the “Nursery school, preschool” category, and explained: *“He completed a grade last year. There’s a 2-year program, a 3-year program, there’s a 4-year program. He completed the 2-year program.”* The other participant initially asked the interviewer to define the term “completed” in the question. She was unable to place her son into any category, stating that a category between “No schooling completed” and “Nursery school, preschool” was needed. (in-person mode).
- Two participants (one in the in-person mode, the other in the telephone mode), reported that their children had completed the same grade level that was previously reported for current level of attendance. Both participants chose the grade level since their children had completed part of the grade. One answered “grade 5” for his son, since: *“he’s halfway through it...he’ll complete grade 5 by the end of June.”* The other participant noted that he was trying to give as precise an answer as possible, trying to communicate that his son had completed the first two months of first grade. After some probing and hearing the question a second time, he acknowledged that “Kindergarten” is a more appropriate answer.
- Four participants reported that family members had completed a “Regular high school diploma,” when in fact they had obtained some college credit. Two respondents in the in-person mode, when looking for a category to represent what they family member had completed, overlooked the categories applicable to those with some college credit. As one participant put it: *“I wasn’t even looking for that, to be honest. I didn’t realize you would [have a category] for someone who*

*is attending school, working their way up, who hasn't gotten a degree yet.*" The second participant noted that the term "completed" in the question had led her to think immediately about credentials (*"pieces of paper"*) earned. The other two participants were in the telephone mode, and the incorrect classification arose largely due to a structural limitation stemming from the instrument's skip patterns. Both respondents provided an answer at Q11a which was placed in the "Grade 12" category by the interviewer, and were thus asked the follow-up item: "Did NAME receive a regular high school diploma, a GED or alternative credential?" The skip pattern tested did not allow for follow-up items asking about college credit – however, in both cases we later learned that the target individuals had completed some college coursework.

- A participant placed her mother in the "Associate's Degree" category, because she had received a professional certification from a Massage Therapy school. The issue here did not seem to be one of comprehension – the respondent recognized that none of the categories applied to her mother's post-high school education, but also argued: "*She finished, she has a piece of paper that says she can practice what she's learned.*" Regarding the "Regular high school diploma" category, this respondent said: "*I don't think that would be accurate, or giving her the credit she deserves*" (in-person mode).
- Three participants (all happened to be in the in-person mode) placed either themselves or other household members in the "Some college credit, but less than 1 year of college credit" category, even though these persons were in their first semester of college at the time of the interview. They stated that they were choosing the category that best applies to the person's situation. As one put it: "*....it's the closest to what she's completed.*" Another pointed out that he is "*near the end of his first semester.*" Each of these interviews took place in mid-November or later.
- A participant placed herself in the "Some college credit, but less than 1 year of college credit" category. She had completed a ten month program at Washington Business School, earning a certification as a legal secretary. She realized that it would not be correct to report that she had a college degree, yet believed that her certification reflected that she had completed some college credit (in-person mode).
- One person in the telephone mode initially answered that the highest level of schooling she had completed was "some college." So the follow-up question "Did you complete 1 or years of college credit?" was asked, which she heard incorrectly as asking if had *completed more than one credit*. She answered "yes," although it turned out she did not have this level of college credit. Probing revealed that she could understand the question well enough, but had not attended closely to it when it was presented by the interviewer.

There were two cases where we are unsure whether a response was accurate or not. In both cases, the participant claimed to have earned some college credit from an institution that clearly was not a college:

- One respondent acknowledged he wasn't certain what category he should place himself into. He had completed 64 semester hours at a technical school, from which he received a certification as an electronics technician. He ultimately chose to put himself into the "Some college credit, but less than 1 year of college credit" category. He stated that eight of his 64 credits counted as college credit, but we were unable to determine his basis for this. Also, the fact that this school has changed its name to a "College of Technology" since the time he graduated seemed to contribute to his decision (self-administered mode).
- Another participant was placed in the "1 or more years of college credit, no degree" category. She based this on her having completed some music classes at the Conservatory of the National Orchestra of Venezuela. She said that this is "considered some kind of college" in that the music classes she took there would be accepted as college credit at other universities in the country (telephone mode).

The erroneous cases discussed above suggest that comprehension problems and misclassifications surrounding the categories of "Regular high school diploma," "Some college, but less than 1 year of credit" and "1 or more years of college credit, no degree" may be the common types of response error in this question. It seems respondents can easily misreport technical training beyond high school as having completed at least some college credit.<sup>2</sup> Furthermore, it appears some persons who have earned some college credit overlook the category that applies to them, at least partly because the questions asks for the level of schooling they *completed* (this mistake was almost made by several other participants in the in-person and self-administered modes). Although one must be very cautious in drawing conclusions about mode differences from our small sample, there is reason to believe that the telephone mode may have an advantage in this regard, since it has follow-up items designed to probe educational backgrounds and differentiate between having completed high school, less than one year of college credit, and more than one year of college credit. These follow-up items tended to work quite well when used in the interviews. They would no doubt be even more effective if after differentiating between a high school diploma and the GED in question 11b, respondents were then asked question 11c ("Did you/NAME complete any college credit?"), rather than being immediately skipped to question 12.

However, part of the problem also stems from difficulty many people have understanding the distinction between "Some college, but less than 1 year of credit" and "1 or more years of college credit, no degree." In fact, in some interviews we presented respondents with a scenario about someone having taken one class per semester for a year and a half, and asked them to tell us how they would classify this person. About one-

---

<sup>2</sup> Perhaps the findings overstate this. We are unsure of the extent to which technical school classes can be considered college credit.

third of these respondents incorrectly stated it would count as “1 or more years of college credit.” Some viewed the category as being “*time-sensitive*,” or pointed out the individual would have attended more than “*a physical year of college*.” This miscomprehension of the categories was even observed among two recent college graduates.

**2.2.2. Additional observations for reporting highest level of school attendance.** Several other respondent reactions to question 11 are worth noting. These persons appeared to have answered the question correctly, but experienced some initial difficulty or raised compelling questions about the item or a category. For example, one participant wondered why the question refers to persons currently “enrolled,” whereas the previous item refers to current “attendance.” Since different terms were used, this made him hesitate and wonder if they had different meanings that he was supposed to take into account somehow. Another participant who had completed one year of graduate school initially commented that there did not seem to be a category for her level of education. Another person (in the telephone mode) initially stated that her 5<sup>th</sup> grade daughter had not completed any schooling yet – this respondents suggested that “grade” be included in the question wording, since it sounded to her as if it applies only to older children and adults. A couple of participants in the in-person mode answered question 11 by simply reading off the category number from the showcard. In both cases, the interviewer thought the person might be providing a grade level – thus, a person with an M.B.A was almost placed into the “Grade 12” category. Finally, a participant had difficulty placing herself into the “1 or more years of college credit, no degree” category. She had completed one year of college, and then attended a nursing school from which she earned a nursing degree. She felt the “no degree” terminology in the category did not apply to her.

**2.2.3. Version 1 versus Version 2 for highest level of schooling completed.** The in-person and self-administered modes both presented the 14 response categories for this question visually to respondents. Within each mode, we tested two versions varying how the response categories were displayed. In Version 1, headings were used to group response categories, whereas in Version 2 the categories were listed without headings. While administering the questions we observed virtually no difference in how respondents reacted to the categories. The only exception was a participant who initially commented that she did not see a category in which to place her young child, but she did find the “No schooling completed” category on her own.

In many interviews, we showed participants the version not used in the interview and asked them to compare the two versions. The vast majority of respondents preferred the Version 1 format with the headings, regardless of which version was used in their interview. This was true for both the in-person and self-administered modes. The primary reason given by respondents preferring Version 1 was that the headings made it easier and faster to locate the appropriate response category. As some put it:

*“Because you don’t have to go through all the items...it’s more efficient.”*

*“I can jump down to the right category without reading them all”*

*“It helps you zero in.”*

One respondent commented that the grouped responses made her realize that four categories were available for those who attended college and that she needed to read all four to make sure she answered correctly. Another said that if he had been using Version 2, he might have stopped looking at the list after seeing “high school diploma,” not realizing there was a category for someone with “some college credit.”

However, several respondents suggested some design changes for the Version 1 show cards used in the in-person interviews. They thought the format would be more effective if the headings were in bold type and the response options in regular type. A couple of respondents in this group commented that it is easy to overlook the first response option “No schooling completed,” which appears before the first heading. Concern about respondents’ overlooking the first option, particularly if the headings appear in bold type, might be eased if a generic label, such as “Response Choices,” appeared at the beginning of the list of options.

### 3. CONCLUSIONS

In this chapter we discuss the major conclusions we believe can be drawn from this study. Of course, the usual cautions for interpreting cognitive interview results apply here. The participants were volunteers paid an incentive to respond and share their reactions to a part of the ACS instrument. Furthermore, many of the volunteers were recruited specifically because they or other household members had engaged in educational endeavors we expected to be difficult for the ACS items of interest to handle (especially, person with technical or other non-college training). Thus, the sample of volunteers over-represented persons with these characteristics. Although the research setting was artificial, the interview findings described in this report provide useful insights into potential respondent concerns and sources of confusion underlying response errors.

The conclusions we would derive from this study are as follows:

- The instruction (“Include only.....”) that is presented with the question assessing current school attendance provides critically important information to respondents regarding the Census Bureau’s intent. However, its purpose is often defeated by its length and the long list of schooling types that it mentions – many of which will not apply to a given respondent. It serves little purpose to instruct respondents to include nursery or preschool and kindergarten when answering for an adult. We recommend that in the in-person and telephone modes, this instruction be somewhat tailored to the respondent’s age. The potential for mode effects (*vis-à-vis* the self-administered instrument) is probably minimal, given that such an instruction is much easier for respondents to read than it is to listen to during verbal administration. Given the greater difficulty of processing the instruction in the in-person and telephone modes, the current standardization of the instruction across modes may actually contribute to (rather than minimize) mode effects.
- Although the extent to which current school attendance is over-reported (due to technical training and other educational activities inconsistent with the Census Bureau’s intent being reported as current school attendance) cannot be estimated from these interviews, the findings suggest it does occur. Tailoring the instruction as suggested above may help to address this problem. But it also occurs because some respondents mistakenly consider technical certifications to be “like a college degree,” or assume the Census Bureau does not mean for its intent to be so strictly interpreted. While appropriate interviewer training should help to minimize this over-reporting in the in-person and telephone modes, we see no practical way to address it in the self-administered mode.

- Respondents reporting on current school attendance for home-schooled children should report with much greater ease and accuracy for the version tested in these interviews, relative to the current ACS item. The current item makes no reference home-schooling, and thus is no doubt problematic for these persons. Although we did not explore their reactions to the current version, it is clear that they consider home schooling something apart from “private school” and thus would not place their home-schooled children in the “private school” category if it did not include a specific reference to home school. However, some states allow home-schooled children to attend public school part-time. Furthermore, it is fairly common for home-schooled high school seniors to begin college before completing high school. So reporting school attendance for this population may remain problematic.
- It is rather easy for respondents to misreport that they (or another household member) has completed only a high school education, when in fact they have completed either “some college credit, but less than 1 year of credit” or “1 or more years of college credit, no degree.” Since the question is asking them to report the highest level of school completed, persons with this background may not realize that some college attendance (rather than completion of degree requirements) is of interest to the Census Bureau. This problem is especially likely in the in-person and self-administered modes, since the telephone mode includes a series of effective follow-up probes. The Census Bureau might consider including similar follow-up probes in the in-person mode. An effective way of addressing this problem in the self-administered instrument is not readily apparent. But perhaps it is worth considering printing an instruction out to the right side of the “High School Graduate” categories, such as: *“If any college credit, note categories below.”*
- The interviews suggest that it may be quite common for person with technical school backgrounds and certifications to be reported in the categories representing college credit (those below a bachelor’s degree) for highest level of schooling completed. There appears to be two distinct reasons for this: a) respondents believe that technical school educations do in fact reflect college credit, and b) respondents willingly misreport due to a motivation to give themselves or others credit for having obtained education beyond the high school level. This problem will be a very difficult one to solve. It is made even more difficult by the fact that many technical institutes refer to themselves as “colleges,” and that college credit can be obtained at some technical schools.
- On a more encouraging note, our interviews suggest that errors surrounding the categories for high school graduates and persons with some college credit tend to be of a rather small magnitude for any given respondent – that is, a degree of one or two categories. It is worth noting that we had no instances of persons with a technical school background being reported as having a “Professional degree.”

## **Appendix A**

### **ACS Education Items Tested**

Questions for cognitive testing:  
PAPER

**10a. At any time IN THE LAST 3 MONTHS has this person attended school or college?** *Include only nursery or preschool, kindergarten, elementary school, home school and schooling which leads to a high school diploma or college degree.*

- No, has not attended in the last 3 months – *skip to question 11*
- Yes, public school, public college
- Yes, private school, private college, home school

**10b. What grade or level was this person attending?** *Mark(X) one box.*

- Nursery school, preschool
- Kindergarten
- Grade 1 through 12 → specify grade 1 - 12 \_\_\_\_\_
- College undergraduate years (freshman to senior)
- Graduate or professional school beyond a bachelor's degree (for example: MA, or PhD program or medical or law school)

VERSION 1

**11. What is the highest degree or level of school this person has COMPLETED?** *Mark (X) one box. If currently enrolled, mark the previous grade or highest degree received.*

- No schooling completed
- NURSERY OR PRESCHOOL THROUGH GRADE 12**
- Nursery school
- Kindergarten
- Grade 1 through 11 → specify grade 1 – 11 \_\_\_\_\_
- 12 grade, NO DIPLOMA
- HIGH SCHOOL GRADUATE**
- Regular high school diploma
- GED or alternative credential
- COLLEGE**
- Some college credit, but less than 1 year of college credit
- 1 or more years of college credit, no degree
- Associate degree (for example: AA, AS)
- Bachelor's degree (for example: BA, BS)
- AFTER BACHELOR'S DEGREE**
- Master's degree (for example: MA, MS, MEng, MEd, MSW, MBA)
- Professional degree beyond a bachelor's degree (for example: MD, DDS, DVM, LLB, JD)
- Doctorate degree (for example: PhD, EdD)

VERSION 2

**11. What is the highest degree or level of school this person has COMPLETED? Mark (X) one box.** *If currently enrolled, mark the previous grade or highest degree received.*

- No schooling completed
- Nursery school
- Kindergarten
- Grade 1 through 11 → specify grade 1 – 11 \_\_\_\_\_
- 12 grade, NO DIPLOMA
- Regular high school diploma
- GED or alternative credential
- Some college credit, but less than 1 year of college credit
- 1 or more years of college credit, no degree
- Associate degree (for example: AA, AS)
- Bachelor's degree (for example: BA, BS)
- Master's degree (for example: MA, MS, MEng, MEd, MSW, MBA)
- Professional degree beyond a bachelor's degree (for example: MD, DDS, DVM, LLB, JD)
- Doctorate degree (for example: PhD, EdD)

**CATI**

**10A. At any time IN THE LAST 3 MONTHS, (has <Name>/ have you) attended school or college? Include only nursery or preschool, kindergarten, elementary school, home school and schooling which leads to a high school diploma or college degree.**

- No – skip to 11
- Yes

**10b. Was that a public school or college, a private school or college, or home school?**

- public school or public college
- private school or private college, or home school

VERSION 1

**10c. What grade or level (was <Name> / were you) attending?**  
< based on age, trim the list presented to phone respondents >

- Nursery school or preschool – skip to 11

**Recruiting Screener**

**NHES Cognitive Interviews on Education Items  
– Participant Screener –**

Name: \_\_\_\_\_ Phone: \_\_\_\_\_  
ID# \_\_\_\_\_

A few (days/weeks) ago, you called us in response to an advertisement for research volunteers. We are looking for people willing to meet with us (here at Westat or at a conference room near Gallery Place in downtown DC ) for a study being conducted for the U.S. Census Bureau. It will take less than an hour, and we're paying people \$40 for participating. We're scheduling interviews for Monday, Nov. 1<sup>st</sup> through Tues., Dec. 7th [DOWNTOWN DC DATES ARE: Friday, Nov. 12<sup>th</sup> and Thursday, Nov. 18<sup>th</sup>]

In order to find out if you are eligible to participate in this study, I need to ask you a few questions.

1. First, have you ever worked for Westat? (since 2002?)

YES :\_\_\_: [IF SINCE 2002, TERMINATE]  
NO :\_\_\_:

2. Have you participated in any kind of interview study for Westat since January of this year?

YES :\_\_\_: [TERMINATE]  
NO :\_\_\_:

3. What is your age?

:\_\_\_\_\_: [IF UNDER 18, TERMINATE]

4. How many people live in your household (including yourself)? [IF SOME PERSONS LIVE MULTIPLE PLACES, ASK: How many people live there *most* of the time?]

:\_\_\_\_\_: [IF UNDER 2, TERMINATE]

5. Can you tell me the ages of the others you live with?

:\_\_\_\_\_: :\_\_\_\_\_: :\_\_\_\_\_: :\_\_\_\_\_: :\_\_\_\_\_:  
:\_\_\_\_\_:

6. RECORD GENDER. IF NOT OBVIOUS, ASK: Are you male or female?

MALE :\_\_\_:  
FEMALE :\_\_\_:

7. What is your race or ethnic background?

WHITE :\_\_\_\_:  
BLACK/AFRICAN AMER. :\_\_\_\_:  
HISPANIC/LATINO :\_\_\_\_:  
ASIAN :\_\_\_\_:  
SOMETHING ELSE :\_\_\_\_:

8. What is your educational background?

PROBES:

What school was that?

Did you graduate?

Did you attend any school after (finishing/leaving) high school? What kind of school? How long/how much?

Are/Were you working toward a professional license of some kind?

---

---

---

9. Can you tell me about the educational background of the other persons in your household?

PROBES:

What school was/is that?

Did he/she graduate?

Did he/she attend any school after (finishing/leaving) high school? What kind of school? How long/how much?

Is/Was he/she working toward a professional license of some kind?

---

---

---

10. Are you employed? (What kind of work do you do?)

---

11. In the interview, we may ask you to read and fill out a questionnaire - would you have any difficulty doing that?

YES :\_\_\_: [EXPLAIN:\_\_\_\_\_]  
NO :\_\_\_:

**CLASSIFY HOUSEHOLD INTO ONE OR MORE OF THE FOLLOWING CATEGORIES (NOT ELIGIBLE OTHERWISE):**

:\_\_\_: **Children attending nursery or preschool**

:\_\_\_: **Children attending grades 1-12**

:\_\_\_: **Children being home schooled**

:\_\_\_: **Person with GED only**

:\_\_\_: **Person attending/completed vocation/tech school education toward a professional license**

:\_\_\_: **Person left college before completing first year**

**DETERMINE WHETHER RESPONDENT IS NEEDED IN THIS ROUND.....**

**IF TERMINATED, ASK IF THEY WOULD LIKE TO BE CONSIDERED FOR SOME FUTURE STUDY. IF SO, TELL THEM WE WILL KEEP THEIR INFORMATION ON FILE AND CHECK HERE → :\_\_\_:**

**APPOINTMENT**

**Thank you for answering my questions. I'd like to schedule an appointment for an interview at a time that's convenient for you. Let me read you some times I have available and you can choose the time that is best for you:**
