

Welcome to MAG 2.0.5

This upgrade performed on June 5, 2012 fixes a bug in the four panel products.

Currently the MAG site's hardware and web services platforms are undergoing some dramatic improvements that will make the MAG more robust, less prone to outages, and a more powerful environment to incorporate further enhancements.

Our quarterly upgrade schedule has been impacted by the need to test and tune this new environment before switching to it. If there are no unforeseen difficulties, the switch to this new environment could happen as early as June 2012.

Additional product images for the NAM High Resolution will occur shortly afterward.

The [Rapid Refresh Model](#) (RAP) has replaced the Rapid Update Cycle (RUC).
