(NOTE: This release was reissued on Thursday, February 12, 2009, to correct mean annual wage data in table 1 for two occupations: (1) flight attendants and (2) airline pilots, copilots, and flight engineers. These corrections did not affect any other tables in the release or the analysis of occupational employment and wage data.)

OCCUPATIONAL EMPLOYMENT AND WAGES, 2007

Retail salespersons, cashiers, general office clerks, combined food preparation and serving workers, and registered nurses were among the occupations with the highest U.S. employment in 2007, according to the Bureau of Labor Statistics (BLS) of the U.S. Department of Labor. The highest paying occupations included physician specialists, dentist specialists, and chief executives, while dishwashers, fast food cooks, and combined food preparation and serving workers were among the lowest paying occupations. Employment and wage information for all occupations is shown in table 1.

These data are from the Occupational Employment Statistics (OES) program, which provides employment and wage estimates for wage and salary workers in 22 major occupational groups and 801 detailed occupations. OES produces data by occupation for the nation, states, metropolitan areas, metropolitan divisions, and nonmetropolitan areas, and by occupation and industry for the nation. Data are available on the OES homepage at <http://www.bls.gov/oes/>.

OES data can be used to compare wages and employment for different occupations, or to compare wages and employment for a given occupation across industries. For example, the largest occupational group was office and administrative support occupations, with employment of over 23 million. Occupations within this group ranged in size from general office clerks and customer service representatives, with employment of nearly 3 million and 2.2 million, respectively, to smaller occupations such as communications equipment operators, all other (3,830); correspondence clerks (15,550); and proof-readers and copy markers (15,650). The office and administrative support group's high employment reflects, in part, its wide distribution across industries. (See table 2.) The largest employers of office and administrative support occupations included the finance and insurance, health care and social assistance, and retail trade sectors, but no single sector employed more than 13 percent of this group.

Mean hourly wages for the office and administrative support group ranged from \$18.83 in the utilities sector to \$11.60 in accommodation and food services. (See table 3.) Among the highest paying

occupations in the office and administrative support group were first-line supervisors and managers of office and administrative support workers, with a mean hourly wage of \$22.89; postal service clerks (\$21.29); postal service mail carriers (\$21.17); and production, planning, and expediting clerks (\$19.74). Hotel, motel, and resort desk clerks (\$9.66); stock clerks and order fillers (\$10.93); and tellers (\$11.36) were among the lowest paid occupations in the group.

OES data also can be used to make comparisons across geographical areas. For instance, loan interviewers and clerks earned a mean hourly wage of \$22.65 in Santa Cruz-Watsonville, Calif., as compared to \$9.79 in Alexandria, La. Employment of loan interviewers and clerks was similar in both areas: 130 in Santa Cruz-Watsonville and 110 in Alexandria. (See table 7.)

Major Occupational Group Employment and Wages by Industry Sector

After office and administrative support occupations, sales and related occupations was the largest occupational group, with employment of over 14 million. Food preparation and serving related occupations, production occupations, and transportation and material moving occupations also were among the largest occupational groups. While some occupational groups were highly concentrated in specific industry sectors, others were widely distributed across sectors. For example, nearly 89 percent of employment in education, training, and library occupations was found in the educational services sector, and over 87 percent of employment in healthcare support occupations was found in the health care and social assistance sector. In contrast, management occupations; business and financial operations occupations; and installation, maintenance, and repair occupations were more evenly distributed across sectors. (See table 2.)

Management was the highest paying occupational group, with a mean hourly wage of \$46.22, followed by legal occupations at \$42.53. Food preparation and serving related occupations; farming, fishing, and forestry occupations; and building and grounds cleaning and maintenance occupations were among the lowest paying occupational groups. (See table 3.)

Utilities; management of companies and enterprises; finance and insurance; information; and professional, scientific, and technical services were among the highest paying sectors for several occupational groups. Accommodation and food services; retail trade; and agriculture, forestry, fishing, and hunting were among the lowest paying sectors. For example, mean hourly wages for business and financial operations occupations ranged from \$34.27 in professional, scientific, and technical services to \$21.84 in accommodation and food services, while wages for sales and related occupations ranged from \$32.40 in finance and insurance to \$9.54 in accommodation and food services.

Detailed Occupational Employment and Wages by Detailed Industry

In addition to the occupational group and industry sector data previously discussed, OES data also are available for detailed occupations and industries. For example, table 4 shows employment and wages by industry for loan officers. Nearly 71 percent of loan officers were employed in two industries: depository credit intermediation (includes commercial banks, savings institutions, and credit unions) and nondepository credit intermediation (includes credit card issuing, consumer lending, and real estate credit). The other large employers of this occupation are: activities related to credit intermediation (includes mortgage and nonmortgage loan brokers), management of companies and enterprises, and insurance carriers. The mean hourly wage for loan officers in depository credit intermediation was \$28.43, below the U.S. average of \$30.10 for this occupation. Wages for loan officers in nondepository credit intermediation and in management of companies and enterprises were slightly above the U.S.

average, at \$31.09 and \$31.28, respectively, while wages in the other two industries were similar to the U.S. average.

Although depository credit intermediation was the largest employer of loan officers, loan officers was only the second largest occupation in this industry, representing about 7 percent of industry employment. (See table 5.) Tellers was by far the largest occupation in the industry, with 545,470 jobs making up over 30 percent of industry employment. Many of the largest occupations in depository credit inter-mediation were office and administrative support occupations. In addition to tellers, these occupations included first-line supervisors/managers of office and administrative support workers; customer service representatives; new accounts clerks; loan interviewers and clerks; bookkeeping, accounting, and auditing clerks; and general office clerks. Financial managers and securities, commodities, and financial services sales agents also were among the largest occupations in this industry.

Occupational Wages by State and Area

OES data also allow comparison of occupational employment and wages across states and metropolitan areas. Tables 6 and 7 show the highest- and lowest-paying states and metropolitan areas for selected detailed occupations. For example, state mean hourly wages for financial managers ranged from \$66.20 in New York to \$32.02 in West Virginia, while wages for construction laborers ranged from \$21.48 in Alaska to \$10.38 in Texas.

California, Massachusetts, Minnesota, New Jersey, and New York were among the highest paying states for 2 of the 4 selected occupations. Although significantly smaller in terms of employment than the states listed above, Alaska also was among the highest paying states for three of the selected occupations, and Hawaii was among the highest paying states for two. West Virginia was among the lowest paying states for 3 of the 4 selected occupations, while Louisiana, Mississippi, New Mexico, South Dakota, and Wyoming were among the lowest paying states for 2 of the 4 occupations. Although in general the lowest paying states did not have large employment of the selected occupations, one notable exception is Texas, where nearly 120,000 construction laborers were employed, but which also was one of the lowest paying states for this occupation.

At the metropolitan area level, mean hourly wages for the selected occupations were about twice as much in the highest paying areas as in the lowest paying areas. (See table 7.) For example, wages for financial managers ranged from \$68.22 in New York-Northern New Jersey-Long Island, N.Y.-N.J.-Pa., to \$27.18 in Pocatello, Idaho, while wages for construction laborers ranged from \$23.91 in Leominster-Fitchburg-Gardner, Mass., to \$8.23 in Brownsville-Harlingen, Texas. Metropolitan areas in California appeared several times among the highest paying areas for the selected occupations; Anchorage, Alaska, and New York-Northern New Jersey-Long Island, N.Y.-N.J.-Pa., also were among the highest paying areas for 2 of the 4 occupations. Several of the lowest paying areas for construction laborers were located in Texas, while metropolitan areas in Idaho were among the lowest paying areas for both financial managers and loan officers. Outside of these two states, many of the remaining lower paying areas for the selected occupations were located in the South.

Additional Information

The Occupational Employment Statistics program produces cross-industry occupational employment and wage estimates nationwide and for all states, 375 metropolitan areas, 34 metropolitan divisions, and 175 nonmetropolitan areas. OES also publishes national industry-specific occupational employment and wage estimates for sectors and 3-, 4-, and selected 5-digit North American Industry Classification System (NAICS) industries. In addition to mean hourly and annual wages, wage data include 10th, 25th, 50th (median), 75th, and 90th percentile wages, which can be used to show the distribution of wages within an occupation or industry. OES data are produced by a cooperative effort between BLS and State Workforce Agencies, and are based on a sample of 1.2 million business establishments, collected in 6 semiannual panels over a 3-year period. Complete May 2007 Occupational Employment Statistics data are available on the OES Web site at <http://www.bls.gov/oes/>.

Upcoming Reduction in Sample Size of Occupational Employment Statistics Survey

Due to budget constraints, Occupational Employment Statistics has reduced the sample size of the May 2008 panel by 20 percent. Because OES estimates are produced from 3 years of pooled data, this one-time sample reduction will affect estimates for May 2008, May 2009, and May 2010. This reduction is expected to decrease the number of published employment estimates by at least 5 percent, or about 25,000 estimates, and will decrease the accuracy of the remaining estimates. The number and quality of wage estimates also are expected to decline. These cutbacks are being implemented in response to a reduction in funding to the BLS that resulted from The 2008 Consolidated Appropriations Act enacted on December 26, 2007.

Technical Note

Scope of the survey

The Occupational Employment Statistics (OES) survey is a semiannual mail survey measuring occupational employment and wage rates for wage and salary workers in nonfarm establishments in the United States. Guam, Puerto Rico, and the Virgin Islands also are surveyed, but their data are not included in this release. OES estimates are constructed from a sample of about 1.2 million establishments. Forms are mailed to approximately 200,000 establishments in May and November of each year for a 3-year period. The nationwide response rate for the May 2007 survey was 77.9 percent based on establishments and 73.5 percent based on employment. The survey included establishments sampled in the May 2007, November 2006, May 2006, November 2005, May 2005, and November 2004 semiannual panels.

The occupational coding system

The OES survey uses the Office of Management and Budget's (OMB) occupational classification system, the Standard Occupational Classification (SOC) system. The SOC system is the first OMB-required occupational classification system for federal agencies. The OES survey categorizes workers in 1 of 801 detailed occupations. Together, these detailed occupations make up 23 major occupational groups, one of which—military specific occupations—is not included in the OES survey. The major groups are as follows:

- Management occupations
- Business and financial operations occupations
- Computer and mathematical science occupations
- Architecture and engineering occupations
- Life, physical, and social science occupations
- Community and social services occupations
- Legal occupations
- Education, training, and library occupations
- Arts, design, entertainment, sports, and media occupations
- Healthcare practitioner and technical occupations
- Healthcare support occupations
- Protective service occupations
- Food preparation and serving related occupations
- Building and grounds cleaning and maintenance occupations
- Personal care and service occupations
- Sales and related occupations
- Office and administrative support occupations
- Farming, fishing, and forestry occupations
- Construction and extraction occupations
- Installation, maintenance, and repair occupations
- Production occupations
- Transportation and material moving occupations
- Military specific occupations (not surveyed in OES)

For more information about the SOC system, please see the Bureau of Labor Statistics (BLS) Web site at <http://www.bls.gov/soc/>.

The industry coding system

The OES survey uses the North American Industry Classification System (NAICS). For more information about NAICS, see the BLS Web site at <http://www.bls.gov/bls/naics.htm>.

The OES survey includes establishments in NAICS sectors 11 (logging and agricultural support activities only), 21, 22, 23, 31-33, 42, 44-45, 48-49, 51, 52, 53, 54, 55, 56, 61, 62, 71, 72, 81 (except private households), state government, and local government. The U.S. Postal Service and the executive branch of the federal government also are included. An establishment is defined as an economic unit that processes goods or provides services, such as a factory, mine, or store. The establishment is generally at a single physical location and is engaged primarily in one type of economic activity.

The OES survey covers all full- and part-time wage and salary workers in nonfarm industries. The survey does not include the self-employed, owners and partners in unincorporated firms, household workers, or unpaid family workers.

Survey sample

BLS funds the survey and provides the procedures and technical support, while the State Workforce Agencies (SWAs) collect most of the data. BLS produces cross-industry and industry-specific estimates for the nation, states, metropolitan statistical areas (MSAs), metropolitan divisions, and nonmetropolitan areas. Industry-specific estimates are produced at the NAICS sector, 3-digit, 4-digit, and selected 5-digit industry levels. BLS releases all cross-industry and national estimates; the SWAs release industry-specific estimates at the state and MSA levels.

State Unemployment Insurance (UI) files provide the universe from which the OES survey draws its sample. Employment benchmarks are obtained from reports submitted by employers to the UI program. Supplemental sources are used for rail transportation (NAICS 4821) and Guam because they do not report to the UI program. The OES survey sample is stratified by metropolitan and nonmetropolitan areas and industry. Samples selected in panels prior to May 2005 were stratified using MSA definitions based on the 1990 Metropolitan Statistical Area standards. Beginning with the May 2005 panel, the sample was stratified using new MSA definitions based on the 2000 Metropolitan Statistical Area standards.

An annual census is taken of the executive branch of the federal government, the U.S. Postal Service, state government,

and Hawaii's local government. In order to provide the most occupational coverage, larger employers are more likely to be selected than smaller employers. The unweighted employment of sampled establishments make up approximately 65 percent of total national employment.

Concepts

Occupational employment is the estimate of total wage and salary employment in an occupation across the industries surveyed. The OES survey defines employment as the number of workers who can be classified as full- or part-time employees, including workers on paid vacations or other types of paid leave; workers on unpaid short-term absences; salaried officers, executives, and staff members of incorporated firms; employees temporarily assigned to other units; and employees for whom the reporting unit is their permanent duty station regardless of whether that unit prepares their paycheck.

The OES survey form sent to establishments with more than 10 workers contains between 50 and 225 SOC occupations selected on the basis of the sampled establishment's industry classification. To reduce paperwork and respondent burden, no survey form contains every SOC occupation. Thus, data for specific occupations are collected primarily from establishments in industries that are the predominant employers of workers in those occupations. Each survey form is structured, however, to allow a respondent to provide detailed occupational information for each worker at the establishment; that is, unlisted occupations can be added to the survey form. Employers with 10 or fewer workers are sent a form with no occupations listed, and are instructed to fill in the occupations for their workers.

Wages for the OES survey are straight-time, gross pay, exclusive of premium pay. Base rate, cost-of-living allowances, guaranteed pay, hazardous-duty pay, incentive pay including commissions and production bonuses, tips, and on-call pay are

The OES survey collects wage data in 12 intervals. Employers report the number of employees in an occupation for each wage range. The wage intervals used for the May 2007 survey are as follows:

Mean hourly wage. The mean hourly wage rate for an occupation is the total wages that all workers in the occupation earn in an hour divided by the total employment of the occupation. To calculate the mean hourly wage of each occupation, total weighted hourly wages are summed across all intervals and divided by the occupation's weighted survey employment. The mean wage for each interval is based on occupational wage data collected by the BLS Office of Compensation and Working Conditions for the National Compensation Survey (NCS).

Beginning with the November 2005 panel the lower boundary of the highest wage interval was increased from \$70.00 to \$80.00. The mean hourly wage value for the highest wage interval was computed separately for NCS data from 2005 for \$80.00 and over, and from 2004 and 2003 for \$70.00 and over. The mean wage rate from 2006 was used for the \$80.00 and over interval for the May 2007, November 2006, May 2006, and November 2005 panels. The average of the 2004 and 2003 mean wage rates was used for the \$70.00 and over interval for the May 2005 and November 2004 panels.

Percentile wage. The p-th percentile wage rate for an occupation is the wage where p percent of all workers earn that amount or less and where (100-p) percent of all workers earn that amount or more. This statistic is calculated by uniformly distributing the workers inside each wage interval, ranking the workers from lowest paid to highest paid, and calculating the product of the total employment for the occupation and the

desired percentile to determine the worker that earns the p-th percentile wage rate.

Annual wage. Many employees are paid at an hourly rate by their employers and may work more than or less than 40 hours per week. Annual wage estimates for most occupations in this release are calculated by multiplying the mean hourly wage by a “year-round, full-time” figure of 2,080 hours (52 weeks by 40 hours). Thus, annual wage estimates may not represent the actual annual pay received by the employee if they work more or less than 2,080 hours per year. Workers in some occupations typically work less than full time, year round. For these occupations, the OES survey collects and reports either the annual salary or the hourly wage rate, depending on how the occupation is typically paid, but not both. For example, teachers, flight attendants, and pilots may be paid an annual salary, but do not work the usual 2,080 hours per year. In this case, an annual salary is reported. Other workers, such as entertainment workers, are paid hourly rates, but generally do not work full time, year round. For these workers, only an hourly wage is reported.

Hourly versus annual wage reporting. For each occupation, respondents are asked to report the number of employees paid within specific wage intervals. The intervals are defined both as hourly rates and the corresponding annual rates, where the annual rate for an occupation is calculated by multiplying the hourly wage rate by a typical work year of 2,080 hours. The responding establishment can reference either the hourly or the annual rate for full-time workers, but they are instructed to report the hourly rate for part-time workers.

Estimation methodology

Each OES panel includes approximately 200,000 establishments. The OES survey is designed to produce estimates using six panels (3 years) of data. The full six-panel sample of 1.2 million establishments allows the production of estimates at detailed levels of geography, industry, and occupation.

Wage updating. Significant reductions in sampling errors are obtained by combining six panels of data, particularly for small geographic areas and occupations. Wages for the current panel need no adjustment. However, wages in the five previous panels need to be updated to the current panel’s reference period.

The OES program uses the BLS Employment Cost Index (ECI) to adjust survey data from prior panels before combining them with the current panel’s data. The wage updating procedure adjusts each detailed occupation’s wage rate, as measured in the earlier panel, according to the average movement of its broader occupational division. The procedure assumes that there are no major differences by geography, industry, or detailed occupation within the occupational

division. The wage rates for the highest wage interval are not updated.

Imputation. About 20 percent of establishments do not respond for a given panel. A “nearest neighbor” hot deck imputation procedure is used to impute missing occupational employment totals. A variant of mean imputation is used to impute missing wage distributions. The variant of mean imputation for wage distributions also is applied to establishments that provide reports with occupational totals but partial or missing wage data.

Weighting and benchmarking. The sample establishments in each panel are weighted to represent all establishments that were part of the in-scope frame from which the panel was selected. Based on the sampled establishments, sampling weights are adjusted when six panels are combined. Sampling weights are further adjusted by the ratio of employment totals (the average of November 2006 and May 2007 employment) from the BLS Quarterly Census of Employment and Wages to employment totals from the OES survey.

May 2007 OES survey estimates. The May 2007 OES survey estimates are based on all data collected from establishments in the May 2007, November 2006, May 2006, November 2005, May 2005, and November 2004 semiannual samples.

Reliability of the estimates. Estimates calculated from a sample survey are subject to two types of error: sampling and nonsampling. *Sampling error* occurs when estimates are calculated from a subset (that is, a sample) of the population instead of the full population. When a sample of the population is surveyed, there is a chance that the sample estimate of the characteristic of interest may differ from the population value of that characteristic. Differences between the sample estimate and the population value will vary depending on the sample selected. This variability can be estimated by calculating the standard error (SE) of the sample estimate. If we were to repeat the sampling and estimation process countless times using the same survey design, approximately 90 percent of the intervals created by adding and subtracting 1.645 SEs from the sample estimate would include the population value. These intervals are called 90-percent confidence intervals. The OES survey, however, usually uses the relative standard error (RSE) of a sample estimate instead of its SE to measure sampling error. RSE is defined as the SE of a sample estimate divided by the sample estimate itself. This statistic provides the user with a measure of the relative precision of the sample estimate. RSEs are calculated for both occupational employment and mean wage rate estimates. Occupational employment RSEs are calculated using a subsample, random group replication technique called the jackknife. Mean wage rate RSEs are calculated using a variance components model that accounts for both the observed and unobserved components of the wage data. The variances of the unobserved components are

estimated using wage data from the BLS National Compensation Survey. In general, estimates based on many establishments have lower RSEs than estimates based on few establishments. If the distributional assumptions of the models are violated, the resulting confidence intervals may not reflect the prescribed level of confidence.

Nonsampling error occurs for a variety of reasons, none of which are directly connected to sampling. Examples of

nonsampling error include: nonresponse, data incorrectly reported by the respondent, errors in the administrative data used to create the sampling frame, mistakes made in entering collected data into the database, and mistakes made in editing and processing the collected data. Every attempt is made to minimize nonsampling error through survey methods such as data editing, imputation methods, and benchmarking of data to current employment totals.

¹ Annual wages have been calculated by multiplying the hourly mean wage by a "year-round, full-time" hours figure of 2,080 hours; for those occupations where there is not an hourly mean wage published, the annual wage has been directly calculated from the reported survey data.

² Wages for some occupations that do not generally work year round, full time, are reported either as hourly wages or annual salaries depending on how they are typically paid.

³ Represents a wage above \$70.00 per hour.

c = corrected.
