Producer Price Indexes – January 2011

The Producer Price Index for finished goods rose 0.8 percent in January, seasonally adjusted. This advance followed increases of 0.9 percent in December and 0.7 percent in November and marks the seventh straight rise in finished goods prices. At the earlier stages of processing, prices received by manufacturers of intermediate goods moved up 1.1 percent, and the crude goods index rose 3.3 percent. On an unadjusted basis, prices for finished goods advanced 3.6 percent for the 12 months ended January 2011. (See table A.)

Stage-of-Processing Analysis

Finished goods

In January, leading the broad-based increase in the index for finished goods were higher prices for finished energy goods, which rose 1.8 percent. The indexes for both finished goods less foods and energy and for finished consumer foods also contributed to this increase, moving up 0.5 percent and 0.3 percent, respectively.

Finished ene rgy: The index for finished energy goods climbed 1.8 percent in January, the fourth consecutive monthly increase. Most of the January rise is attributable to a 6.9-percent advance in gasoline prices. Increases in the indexes for diesel fuel and home heating oil also contributed to higher finished energy goods prices. (See table 2.)

Finished core: Prices for finished goods other than foods and energy moved up 0.5 percent in January, the third straight increase. Nearly forty percent of the January advance can be traced to the index for pharmaceutical preparations, which moved up 1.4 percent. Higher prices for plastic products also contributed to the rise in the finished core index.

Finished food s: The index for finished consumer foods moved up 0.3 percent in January, the fifth consecutive monthly increase. A 13.7-percent advance in prices for fresh and dry vegetables was the main factor in the January rise in the finished consumer foods index.

Intermediate goods

The Producer Price Index for intermediate materials, supplies, and components rose 1.1 percent in January, the sixth straight monthly increase. Accounting for nearly two-thirds of the broad-based January advance, prices for intermediate goods other than foods and energy climbed 1.0 percent. The indexes for intermediate energy goods and for intermediate foods and feeds also contributed to this rise, moving up 1.8 percent and 0.4 percent, respectively. For the 12 months ended January 2011, prices for intermediate goods increased 6.0 percent, the smallest advance since rising 5.4 percent in September 2010. (See table B.)

Intermediate core: The index for intermediate goods less foods and energy climbed 1.0 percent in January, the largest increase since a 1.1-percent jump in April 2010. Roughly one-fourth of January's over-the-month advance can be traced to prices for industrial chemicals, which moved up 3.0 percent. Higher prices for steel mill products and for plastic resins and materials also were major factors in the January rise in the intermediate core index. (See table 2.)

Intermediate energy: Prices for intermediate energy goods increased 1.8 percent in January, the sixth straight monthly advance. A major factor in the January rise was the diesel fuel index, which jumped 7.2 percent. Higher prices for gasoline also contributed significantly to the increase in the intermediate energy goods index.

Intermediate foods: In January, the index for intermediate foods and feeds moved up 0.4 percent for the second consecutive month. A 2.7-percent rise in beef and veal prices accounted for about forty percent of the January increase in the intermediate foods index.

Crude goods

The Producer Price Index for crude materials for further processing increased 3.3 percent in January. For the 3-month period ended in January, crude material prices climbed 11.5 percent after moving up 8.8 percent from July to October. In January, about half of the broad-based monthly advance is attributable to a 4.3-percent rise in prices for crude foodstuffs and feedstuffs. Also contributing to this increase, the index for crude nonfood materials less energy moved up 4.0 percent and prices for crude energy materials rose 1.9 percent. (See table B.)

Crude foods: The index for crude foodstuffs and feedstuffs increased 4.3 percent in January. From October to January, prices for crude foodstuffs and feedstuffs moved up 5.6 percent after rising 11.8 percent in the 3 months ended October 2010. Nearly half of the January monthly advance can be traced to a 7.6-percent gain in the slaughter cattle index. Higher prices for hay, hayseeds, and oilseeds and for slaughter borrow and gilts also were factors in the increase in the crude foodstuffs and feedstuffs index. (See table 2.)

Crude c ore: The index for crude nonfood materials less energy moved up 4.0 percent in January. For the 3 months ended in January, crude core prices climbed 11.1 percent, subsequent to a 10.6-percent rise from July to October. Over eighty percent of January's over-the-month increase was driven by a 13.6-percent jump in the index for iron and steel scrap. Rising prices for nonferrous scrap also contributed to the advance in the crude core index.

Crude energy: The index for crude energy materials rose 1.9 percent in January. For the 3-month period ended in January, prices for crude energy materials jumped 17.3 percent after advancing 4.3 percent for the 3 months ended October 2010. A 3.7-percent increase in the index for crude petroleum led the January monthly advance in crude energy prices.

Services Analysis

Trade indus tries: The Producer Price Index for the net output of total trade industries moved down 0.7 percent in January, the largest decline since a 1.4-percent drop in June 2010. (Trade indexes measure changes in margins received by wholesalers and retailers.) Accounting for over forty percent of the January decrease, margins received by discount department stores fell 11.1 percent. Declines in the indexes for both family and women's clothing stores also contributed to the January drop in margins received by trade industries.

Transportation and warehousing industries: The Producer Price Index for the net output of transportation and warehousing industries moved up 1.8 percent in January, the largest increase since a 2.1-percent gain in June 2008. Accounting for over two-fifths of the January advance, prices received by the air transportation industry group rose 4.2 percent. Higher prices received by couriers and the water transportation industry group also were major factors in the January increase in the transportation and warehousing industries index.

Traditional service industries: The Producer Price Index for the net output of total traditional service industries advanced 0.7 percent in January, the largest increase since a similar 0.7-percent advance in April 2010. More than half of the January rise can be traced to a 4.3-percent increase in prices received by the depository credit intermediation industry group. Advances in the indexes for insurance carriers and offices of lawyers also contributed to higher prices received by total traditional service industries.

Recalculation of Seasonal Adjustment Factors

Effective with this report, seasonal adjustment factors have been recalculated to reflect price-movement patterns during 2010 for stage-of-processing (SOP) and commodity-grouping indexes. This routine annual recalculation may affect previously published seasonally adjusted indexes and percent changes for January 2006 through December 2010. Revised seasonally adjusted data for this period, as well as seasonal adjustment factors for commodity indexes to be used through December 2011, were released February 14, 2011. To obtain this information, contact the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information at *ppi-info@bls.gov* or (202) 691-7705, or visit the Producer Price Index homepage at **www.bls.gov/ppi.**

The table below provides monthly seasonally adjusted percent changes for the three major SOP categories during 2010, based on former and recalculated seasonal factors. These percent changes include final price data through August 2010 and may differ from values shown in tables A and B of this release, which include final price data through September 2010.

Resampling of Industries

Effective with this release, the Producer Price Index (PPI) includes data for 50 resampled industries and one newly introduced industry classified according to the North American Industry Classification System (NAICS). The Bureau of Labor Statistics periodically updates the sample of producers providing data for the PPI to reflect current conditions more accurately when the structure, membership, technology, or product mix of an industry shifts. The first results of this systematic process were published in July 1986. Subsequent efforts have been completed at 6-month intervals.

For information on specific index additions, deletions, and recodes that are effective with this semiannual update, see tables 16 through 21of this report, or contact the Division of Industrial Prices and Price Indexes, Section of Index Analysis and Public Information at *ppi-info@bls.gov* or (202) 691-7705.

Producer Price Index for Offices of Dentists—NAICS 621210

In January 2011, in its ongoing effort to expand coverage of the service sector in the Producer Price Index (PPI), the Bureau of Labor Statistics (BLS) introduced new price indexes for Offices of Dentists—North American Industry Classification System (NAICS) 621210. Data for these indexes, which date back to June 2010, appear in table 5 of this publication and are available online through the BLS Website.

This industry is part of NAICS sector 62, Health Care and Social Assistance, and is further classified in the subsector for Ambulatory Health Care Services, NAICS 621. Industries in this subsector provide health services directly or indirectly to ambulatory patients and usually do not provide inpatient services. Health practitioners in this subsector provide outpatient services, with the facilities and equipment usually not being the more significant part of the production process. NAICS 621210 includes establishments of health practitioners having the degree of D.M.D. (Doctor of Dental Medicine), D.D.S. (Doctor of Dental Surgery), or D.D.Sc. (Doctor of Dental Science) primarily engaged in the independent practice of general or specialized dentistry or dental surgery. These practitioners operate private or group practices in their own offices, centers, or clinics, or in the facilities of others, such as hospitals or HMO medical centers. They can provide either comprehensive preventive, cosmetic, or emergency care, or specialize in a single field of dentistry.

The service lines within NAICS 621210 for which indexes are available include:

- Dental visits and consultations
- Dental surgical intervention services
- Dental non-surgical intervention services

The PPI also is introducing a wherever provided service index, titled Dental Care, in table 6 of this publication and online, under commodity code 511105.

To measure changes in prices for any of the PPIs listed above, BLS asks dental providers to report the reimbursement amount they receive per visit for a representative snapshot of dental service delivery as it occurred in the base period. Most every dental procedure is represented by a Current Dental Terminology (CDT) code, which is the main price-determining characteristic. These codes assist the respondent with monthly price updating, as the CDT codes and descriptions are unique and mutually exclusive. The reimbursements reported for any given dental service can be from any combination of payers involved in the transaction: patients, private insurance companies, and, more rarely, public payers. For survey purposes, PPI tracks the change in price for the hypothetical patient treatment represented by the set of services on the initial patient bill. An actual treatment bundle is selected from the dentist's patient records. That exact bundle, in the form of a patient's bill, is the collection of inputs that will be priced by the PPI program in the future. This is important, as dentistry may generally be categorized as a field where custom services are provided. As a result, comparing different patients with similar diagnoses from month to month is difficult or impossible. To avoid these difficult comparisons and to accomplish the goal of pricing a constant quality service, the PPI requests that an estimated price (i.e., expected reimbursement) be provided for the exact collection of services listed on the original patient bill.

Price quotations primary to NAICS 621210 are classified in one of three service lines, by CDT code. Dental visits and consultations include CDT codes for diagnostic and preventative procedures. Dental surgical intervention services include CDT codes for surgical periodontal services, maxillofacial prosthetics, implant services, oral and maxillofacial surgery and surgical endodontic services. Dental non-surgical intervention services include CDT codes for restorative dental services, non-surgical endodontic services, removable prosthodontics, fixed prosthodontics, and orthodontics. If the initial patient bill selected has CDT codes which fall into more than one service line, the price quotation is classified into the service line according to the plurality of reimbursement.

Dentists may change the services they provide at any time. They may update or change the equipment they are using or they may change the services administered. Quality adjustment will be performed when the total procedure changes due to the introduction of new technology. The coding for dental procedures may also change at any time. The CDT manual is published every two years when coding and procedural changes are incorporated, and the PPI will continue to research if producer cost data can be obtained for such changes.

A New, Experimental System of Indexes from the PPI Program

In its monthly news releases of Producer Price Index (PPI) data, the Bureau of Labor Statistics currently highlights the stage-of-processing (SOP) system as its key structure for analyzing producer prices. The SOP system aggregates price indexes for processed and unprocessed goods. Over the past 20 years, PPI coverage has expanded to include price indexes for many service and construction activities, but the SOP system continues to include only goods. The PPI program recently developed an experimental aggregation system that includes goods price indexes as well as service and construction price indexes for products sold to all portions of final demand (personal consumption, capital investment, government use, and export) and to intermediate demand (business inputs, excluding capital investment). The experimental aggregation system was introduced with the release of January 2011 data in February 2011. This article presents the new, experimental index aggregation system.

Developing the experimental aggregation

Criteria for a potential PPI aggregation system. In developing the experimental aggregation system, two main criteria were considered. First, the system should be designed in such a way as to alleviate or minimize problems resulting from multiple counting. Second, the system should be analytically useful.

Multiple counting can lead to overstated or understated measures of inflation. Multiple counting occurs when the price for a specific commodity and the inputs to production for that same commodity are included in an aggregate index. Before 1978, for example, the PPI program highlighted the all commodities index as its primary aggregate index. This index aggregates prices for all goods sold in the economy, using weights that reflect sales to all portions of intermediate and final demand. The all commodities index was the subject of serious criticism when petroleum prices spiked in the 1970s. Price change, as measured by the all commodities index, was seen as exaggerated because the index included both gasoline sold for final demand and crude petroleum, the primary input used in the production of gasoline. Multiple counting was an important factor in the decision for the PPI program to move from highlighting the all commodities index to calculating, publishing, and highlighting SOP indexes.[1]

The SOP system substantially reduced multiple counting by separating goods into three stages: crude, intermediate, and finished. The system does, however, still have some multiple counting, specifically in its intermediate goods index.

The second criterion is that the aggregation system be analytically useful. The SOP system is more analytically useful than the all commodities index, as the system potentially allows price changes to be tracked through the various segments of the economy. In developing an aggregation system that incorporates prices for services and construction, the possible analytical functions of the system were considered.

The new PPI aggregation system was designed to satisfy the two criteria identified earlier. To avoid multiple counting, the system separates final-demand transactions from intermediate-demand transactions and, in some cases, voids instances of multiple counting. One of the reasons the system is useful for analysis is that it combines commodity indexes into meaningful final-demand and intermediate-demand aggregates. The aggregates convey information about the types of commodities contributing to inflation at both the final-demand level and at earlier stages of production, and can be used to track price change through the economy.

Experimental PPI aggregation system. The new PPI experimental aggregation system tracks price change for goods, services, and construction sold to all portions of final demand and intermediate demand. The final-demand portion of the experimental aggregation system is discussed first, followed by the intermediate-demand portion. It should be noted that the PPI program does not currently calculate price indexes for all domestically produced commodities because of incomplete coverage in some portions of the economy. The experimental aggregation system therefore does not include price indexes for commodities not currently covered by the PPI. The majority of commodities that the PPI program does not have price indexes for are services and construction commodities. Educational services, residential construction and rentals, restaurants, research and development services, and computer design services are among the commodities that the PPI does not cover.[2]

Final demand

The final-demand segment of the new PPI experimental aggregation system tracks price change for commodities sold for personal consumption, capital investment, government purchase, and export. The segment is composed of six main price indexes: final demand goods, final demand construction, final demand traditional services, final demand transportation services, final demand trade services, and overall final demand.

The final-demand segment of the system can be presented in terms of exhibit A, which is a simplified version of the actual input–output (I–O) "Use of Commodities by Industries" table constructed by the Bureau of Economic Analysis (BEA). The actual 2002 BEA I–O table includes a total of 423 commodities and indicates the segments of the economy in which the consumption of these 423 commodities occurs. Consumption of commodities can be by any of the 427 industries included in the table or within any of 14 separate categories of final demand. Although the BEA table includes 14 categories of final demand, all of these categories can be classified under one of four primary components of final demand: personal consumption, capital investment, government purchase, or net exports. Commodities and industries are both classified according to North American Industry Classification System code within the BEA I–O table.

The simplified version of the I–O table that appears as exhibit A contains only 12 commodities that can be consumed by any of 12 industries or within any of four segments of final demand. The leftmost column of exhibit A indicates the type of commodity being used. The commodity types are unprocessed goods, processed goods, construction, traditional services, transportation services, and trade services. Unprocessed goods are defined as goods that have not been altered or transformed from their original state. Fresh fruit is an example of an unprocessed good. Processed goods are goods that have undergone some fabrication. Examples of processed goods are motor vehicles and canned vegetables. Construction is the erection of buildings or the creation of other engineering products, such as highways and utility systems. Traditional services are defined as all services other than trade and transportation services, such as publishing, banking, accommodation, and health care. Transportation services involve providing transportation for passengers and cargo, warehousing and storage of goods, and scenic and sightseeing transportation. Trade services include retailing and wholesaling goods, generally without transformation. The column headed "detailed commodity" designates the specific commodity being used. Domestic commodities are numbered 1 through 12, and "imports" is the entry in the bottom cell of the column. (However, imports are currently considered out of scope for the PPI. Imports are therefore not included in any of the aggregation structures presented in this article.) In exhibit A, commodities are valued in terms of producer prices; hence, goods and traditional services are valued in terms of the actual commodity sold, but transportation services and trade services are valued in terms of margins, not the value of the commodity transported or sold. The sum of the producer's value, transportation costs, and trade margin is equal to the purchaser's value.

Spanning the headers "intermediate demand" and "final demand" is the header "consumed for." Commodities can be consumed for either intermediate demand or final demand. Consumption for intermediate demand occurs when a commodity is consumed by an industry as an input to production, whereas consumption for final demand occurs when a commodity is consumed as part of personal consumption, capital investment, government purchase, or exports. Also spanned by "consumed for" are the column heads denoting the specific industries within intermediate demand and the segments of final demand in which the commodity is consumed. Consuming industries (under the heading "intermediate demand") are numbered 1 through 12; the primary commodity produced by each industry corresponds to the commodity with the same number. For example, the primary production of industry 1 is commodity 1. The columns under the "final demand" header denote the four ways in which commodities can be used for final demand: personal consumption (PC), capital investment (CI), government purchase (Gov), and export (Exp). Cell E, for example, indicates the consumption of commodity 1 by industry 5, whereas cell M shows the personal consumption of commodity 1. The total consumption of commodity 1 includes cells A through P. The total consumption by industry 5 is represented by cells E through AB.

Final demand goods price index. The final demand goods price index measures price change for all processed and unprocessed goods consumed as part of personal consumption expenditures, capital investment, exports, or government purchases. Fresh fruits sold to consumers and computers sold as exports are examples of transactions included in the final demand goods price index. The index covers the same transactions as the current finished goods index in the SOP system but adds government purchases and exports of goods. In exhibit A, the coverage of the final demand goods index is represented by the dark-gray area.

Final demand construction price index. This index tracks prices for construction sold for personal consumption, capital investment, export, or government purchase. The orange area of the exhibit represents the transactions covered by the final demand construction price index. The majority of construction is consumed in the final-demand portion of the economy and would be included in the final demand construction index, given that BEA defines new construction as capital investment.

Final demand services price indexes. The new aggregation system includes final demand price indexes for three types of services—traditional services, transportation services, and trade services. These indexes track price changes for such services sold for personal consumption, capital investment, export, or government purchase.

The coverage of the index for final demand for traditional services is shown in purple in exhibit A. Medical care and accounting services purchased by consumers are examples of final demand traditional services. The index for final demand transportation services accounts for the blue area of the exhibit. Rail transportation for individuals and shipment of final-demand goods are examples of final-demand transportation services. The index for final demand trade services tracks prices of transactions represented by the dark-green portion of the exhibit. The service of selling groceries to consumers is an example of a final-demand trade service. It is important to note, however, that the type of prices used by the PPI program to construct its trade indexes is different from the type of prices typically included in PPIs. As explained earlier, the value of trade services is measured in terms of trade margins, which are calculated by subtracting the price paid by a trade establishment to acquire a specific good or set of goods from the price received by the establishment for selling the same good or set of goods. Thus, the indexes for trade should be interpreted as measuring changes in the price margins received by producers of trade services.

Overall final demand index. In addition to the detailed final demand indexes for goods, services, and construction described in this article, the experimental system also includes an index for overall final demand. That index comprises all goods, services, and construction sold for personal consumption, for capital investment, for export, or to government. The overall final demand index tracks price change for transactions shown in all the shaded areas of exhibit A.[3]

Intermediate demand

The intermediate-demand portion of the PPI experimental aggregation system tracks price change for goods, services, and construction products sold to businesses as inputs to production (excluding capital investment). In order to meet the needs of different data users, the experimental aggregation system includes two separate treatments of intermediate demand, each designed to address a different analytical use. The first approach organizes intermediate-demand commodities by commodity type just as the current PPI SOP system does but with more types of commodities included. The resulting intermediate demand indexes provide value to data users by supplying specific information pertaining to the type(s) of commodities creating inflationary pressure in the economy. The second approach organizes intermediate-demand commodities into stages by production flow with the explicit goal of developing a forward-flow model of production and price change. A forward-flow model assigns commodities to stages in such manner that the commodities included in each sequential stage are the inputs used to produce commodities in the next stage, with the last stage in the system composed of final-demand goods. The goal of the indexes of intermediate demand by production flow is to allow data users to better study price transmission through the various stages of the economy.

Intermediate demand by commodity type. The intermediate-demand-by-commodity-type organization of intermediate demand is similar in its underlying methods to the treatment of final demand in the experimental aggregation system. The relevant indexes track price change for intermediate-demand commodities grouped by type of commodity, where commodity types include unprocessed goods, processed goods, construction, traditional services, transportation services, and trade services. The indexes of intermediate demand by commodity type are presented in terms of the I–O table shown as exhibit B.

The intermediate demand by commodity type portion of the system includes two main goods price indexes: unprocessed goods for intermediate demand, and processed goods for intermediate demand. These indexes track price changes for the areas of the economy represented by the light-gray and medium-gray areas, respectively, of exhibit B. The unprocessed goods for intermediate demand index measures price change for unprocessed goods purchased by businesses as inputs to production, and the processed goods for intermediate demand index tracks price change for fully or partially processed goods purchased by firms as inputs to production. These two indexes are identical, respectively, to the crude and intermediate goods indexes in the current PPI SOP system.

The intermediate-demand-by-commodity portion of the system includes a price index for intermediate-demand construction; the index measures price change for construction purchased by firms as inputs to production. The light-orange area of the exhibit represents the transactions covered by the intermediate demand construction price index. Since BEA defines new construction as a part of the final-demand portion of the economy, this index tracks price change for maintenance and repair construction purchased by firms.

The experimental system includes intermediate demand price indexes for three types of services: traditional services, transportation services, and trade services. The intermediate traditional services index measures price change in traditional services purchased by firms as inputs to production. Legal and accounting services purchased by businesses are examples of intermediate-demand traditional services. This index measures price change for the transactions shown in the light-purple area of exhibit B. The intermediate demand transportation services index measures price change in transportation-related services sold to businesses. This index tracks prices for transactions depicted by the light-blue area of exhibit B. Trucking of intermediate-demand goods and business travel are examples of intermediate transportation services. The index for intermediate trade services measures price change in the service of retailing or wholesaling goods purchased by businesses as inputs to production. The index for intermediate-demand trade tracks prices from transactions depicted by the green portion of exhibit B. The service of selling car parts to an automobile manufacturer is an example of an intermediate trade service.

Although the experimental system contains an overall final demand index, it does not include an overall intermediate demand index. An overall intermediate demand index would have severe multiple counting problems and therefore would not accurately measure price change for intermediate demand.

Intermediate demand by production flow. The intermediate-demand-by-production-flow treatment of intermediate demand organizes commodities into a number of stages and measures price changes for the commodities in each stage. As stated earlier, the goal of the production-flow-based treatment is to assign commodities to sequential stages such that commodities in one intermediate stage are used as inputs to produce commodities in the next intermediate stage until the last intermediate-demand stage, which contains commodities used as inputs to the production of final-demand commodities.

The intermediate-demand stages were developed by using both BEA commodity-consumption and industry-production data. Although the PPI does not cover all industries in the economy, all the data included in the BEA tables were used to develop the stages. A four-step process was used by the PPI program to assign commodities to stages and develop the intermediate-demand-by-production-flow system.

The first step in the process of developing stages was to determine the total production of each industry in the economy. In general, industries are classified as primary producers of specific goods or services; however, industries may also be secondary producers of other goods or services. A

firm classified in the automobile industry, for example, produces primarily automobiles, but the same firm may also produce and sell additional commodities, such as car parts, scrap metal, or car rentals. These additional commodities are classified as secondary production. The first step therefore requires determining both the primary production and secondary production of each industry in the economy. The 2002 BEA "Make of Commodities by Industries" table was used for this purpose.[4]

The second step in developing stages was to ascertain where the total output of each industry is consumed. This step requires determining, for each industry, the portion of the industry output consumed as final demand and the portion consumed as intermediate demand. For the intermediate-demand portion, determining which specific industries are consuming the industry's output also is required. BEA 2002 "Use of Commodities by Industry" data were employed to make this determination.

The third step in developing stages was to assign industries to stages of production. Within a stage-based system, transactions can be classified as forward flow, backflow, or internal flow. Forward flow occurs when an industry sells its output to an industry classified in a forward stage of production (to be used as an input) or to final demand. Internal flow occurs when an industry sells its output to another industry classified within the same stage of production to be used as an input. Backflow occurs when an industry sells its output to an industry classified in an earlier stage of production in the system to be used as an input. In order to successfully develop a forward-flowing system of price change, industries should be assigned to stages in a manner that minimizes backflow and internal flow while maximizing forward flow within the system.

A simple way to minimize backflow and maximize forward flow would be to attempt to assign industries to stages such that industries assigned to the final stage produce commodities consumed for final demand, industries assigned to the next-to-last stage produce commodities consumed by last-stage industries, and so on, until the first stage of production is reached. For example, car manufacturers would be assigned to the final stage of production, as they sell their output to final demand. Automobile parts manufacturers would be assigned to the next-to-last stage, since their output is consumed by car manufacturers. Steel mills would be assigned to the stage before that one, since their output is used to make car parts, and, finally, iron-ore manufacturers would be assigned to the first stage, as their output is used to make steel products.

Unfortunately, the flow of transactions in the actual economy is considerably more complex than in the simple example just described. Even in the simple automobile example, it is easy to imagine how backflow or internal flow might occur. If, for example, the steel mill industry purchased car parts (to service automobiles that are used as part of the steel production process), backflow would result.

Because of the complexity of the U.S. economy, the PPI program chose the criterion of maximizing net forward flow within the system to assign industries to stages. Net forward flow is defined as (forward shipments of the industry stage + inputs received from previous stages of process) – (backward shipments of the industry stage + inputs received from forward stages of process).

The PPI program implemented a two-step procedure to attempt to maximize net forward flow. In the first step, a set of rules was used to assign industries to stages and select the appropriate number of stages for the system. The system that the PPI program eventually chose is a four-stage system. The set of rules used to assign industries to the four stages is summarized as follows:

- Assign industry to stage 4 if shipments sold to final demand $\geq$ 75 percent of industry production.

- Assign industry to stage 3 if shipments sold to final demand and to stage 4 $\geq$ 65 percent of industry production and shipments sold to final demand < 75 percent of production.

- Assign industry to stage 2 if shipments sold to final demand, to stage 4, and to stage 3 $\geq$ 65 percent of industry production; and shipments sold to final demand and to stage 4 < 65 percent of production; and shipments sold to final demand < 75 percent.

- Assign industry to stage 1 if it does not meet the conditions of stage 4, 3, or 2.

Before selecting the number of stages and set of rules just described, the PPI program examined many different sets of rules and numbers of stages. It eventually chose the aforementioned system because it performed very well in terms of maximizing net forward flow and minimizing internal flow.

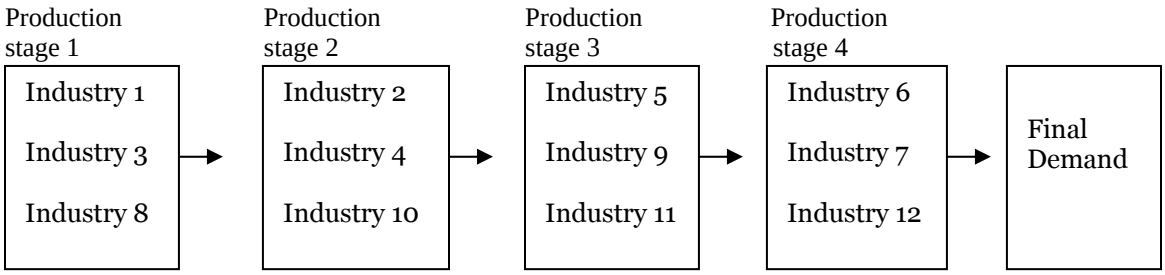
After the assignment of industries to stages by use of the aforementioned rules, the second step in the procedure to maximize net forward flow was to examine the effects on net forward flow of moving individual industries to stages to which they were not originally assigned. In cases in which there were substantial gains to net forward flow, industries were left in the new stage.

The PPI production-flow-based system exhibits strong forward flow and little backflow. After weighting, 83.6 percent of transactions in the system are forward flowing, 5.7 percent are back flowing, and 10.7 percent are internally flowing.[5]

The final step in constructing stages for the production-flow-based intermediate demand indexes was to determine the commodities to be included and weights to be used in the intermediate demand indexes. It is important to understand that these indexes track prices for inputs consumed by industries in each of the four stages of production, as opposed to prices for the output produced by industries in each of the four stages of production. These indexes also exclude prices for inputs both produced and consumed within an industry production stage, thereby eliminating any multiple counting of price change. The fourth intermediate demand index, for example, tracks price change for inputs consumed, but not produced, by industries included in the fourth stage of production. Recall that industries classified in the fourth stage

of production mostly produce goods sold to final demand. The stage 4 intermediate demand index therefore measures price change in the inputs to production of industries that produce primarily final-demand goods (stage 4 producers).

Exhibit B can be extended to clarify this procedure. Recall that in the exhibits the economy contains 12 commodities and 12 industries, and each industry produces primarily one commodity. Industry 1, for example, produces primarily commodity 1. Industry 1, however, may also produce any of the other 11 commodities as secondary production. According to the intermediate-demand-by-production-flow approach, each of the 12 industries would be assigned to one of the four stages of production. Hypothetically, the assignments may be as follows:



where the output of industries in production stage 4 is consumed primarily for final demand,
the output of industries in production stage 3 is consumed primarily by stage 4 industries as intermediate demand,
the output of industries in production stage 2 is consumed primarily by stage 3 industries as intermediate demand,
and the output of industries in production stage 1 is consumed primarily by stage 2 industries as intermediate demand.

Exhibit C presents the intermediate-demand-by-production-flow portion of the experimental aggregation system within an I–O framework. This I–O table is a modified version of the earlier tables that is virtually the same as the others except that it reorganizes the consuming industries into four stages. Cell "a," for example, represents the portion of commodity 1 consumed by industry 3, which is classified in the first stage of production. Cell "b" represents the portion of commodity 5 consumed by industry 4, which is classified in the second stage of production.

The intermediate demand by production flow portion of the system includes four main indexes: intermediate demand stage 1, intermediate demand stage 2, intermediate demand stage 3, and intermediate demand stage 4. These indexes track prices for inputs consumed by industries classified in each of the four stages of production, excluding inputs both produced and consumed within the same stage of production. The intermediate demand stage 1 index measures price change for transactions represented by the yellow boxes in exhibit C, the intermediate demand stage 2 index measures price change for transactions represented by the red area, the intermediate demand stage 3 index does the same for transactions indicated by the peach-colored area, and the intermediate demand stage 4 index does the same for transactions shown in the light-gray portion. As shown earlier, the intermediate demand indexes were constructed with the goal of being able to analyze forward price transmission through the stages of production and eventually to final demand.

With the release of data for January 2011, the PPI program introduced a new, experimental aggregation system. This system expands upon the current SOP system by including price indexes for services and construction as well as goods. The system covers both the final-demand and intermediate-demand portions of the economy. Indexes for the final-demand portion of the economy track price change for specific types of commodities sold for personal consumption, capital investment, government purchase, or export. Indexes in the intermediate-demand portion of the system track price change for commodities purchased by businesses as inputs to production. To meet differing needs of data users, the alternative aggregation system includes two separate treatments of intermediate demand. The first aggregates price indexes for intermediate-demand commodities on the basis of the type of commodity, where major commodity types include processed goods, unprocessed goods, traditional services, transportation services, and trade services. The second treatment aggregates intermediate-demand commodities into four stages with an emphasis on maximizing forward flow of commodities.

The PPI program is currently soliciting feedback from data users with respect to the experimental aggregation indexes presented in this article. To provide feedback, please contact Jonathan Weinhagen at weinhagen.jonathan@bls.gov.

Notes

[1] The PPI program continues to publish the all commodities index in spite of multiple counting problems because the index is referenced in many price escalation contracts. Despite this use of the all commodities index, the PPI program does not recommend using this index for contract escalation or data-analysis purposes.

1 Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

2 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

3 Includes crude petroleum.

4 Excludes crude petroleum.

5 Percent of total finished goods.

6 Percent of total intermediate materials.

7 Formerly titled ″Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco.″

8 Percent of total crude materials.

1 Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

2 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

1 Industry and product class indexes may include products not shown separately.

2 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

3 The special index for 924126, in which prices reflect premiums only, contrasts with the index shown elsewhere in this table for NAICS 524126, where prices reflect premiums plus the amount of investment income earned on the invested portion of the premium.

"-" Data not available.

n.e.c. = Not elsewhere classified.

NOTE: NAICS replaced the SIC system beginning with the release of PPI data for January 2004. See http://www.bls.gov/ppi/ppinaics.htm for details.

NOTE: Titles of some industries and products are not shown in this table because they fail to meet our publication criteria.

1 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

2 Due to incomplete coverage of the services sector, some services indexes in this table reflect only a portion of their wherever-provided output. These indexes are flagged using the term "partial" at the end of their titles. For more information regarding wherever-provided services indexes, go to www.bls.gov/ppi/wepnotice.htm. This webpage includes methodology documentation, a table identifying missing coverage areas for those indexes with incomplete coverage, and a concordance table between wherever-provided services indexes and Census product codes.

Table 8 commodity groupings include the following items:

All commodities except farm products: 02 through 15

All foods: 011, 017, and 02 less 0261, 0262, and 029

Apples: 01110208, 01110209, 01110211, 01110215, 01110216

Berries: 01110222, 01110224, 01110225, 01110226, 01110227

Processed foods: 02 less 0261, 0262, and 029

Industrial commodities less fuels: 03, 04, and 06 through 15

Selected textile mill products: 0327, 03370104, 034, 03810811, 03810821, 03810822, 03820312, 03830324, 03830325, and 1231

Hosiery: 03810821, 03810822, 03810823, 03810824, 03810825, 03810826

Underwear and nightwear: 03810641, 03810642, 03810643, 03810645, 03810653, 03810761, 03810811, 03810812

Chemicals and allied products, including synthetic rubber and synthetic fibers: 031, 06 less 064, and 071102

Pharmaceutical preparations for human and veterinary use: 0634 and 0638

Pharmaceuticals for human use, prescription: prescription pharmaceutical price quotes from 0638

Pharmaceuticals for human use, non-prescription: non-prescription pharmaceutical price quotes from 0638

Lumber and plywood: 081 and 083

Steel mill products, including fabricated wire products: 1017 and 1088

Finished steel mill products, excluding fabricated wire products: 1017 less 101702

Finished steel mill products, including fabricated wire products: 1017 and 1088 less 101702

Special metals and metal products: 10, 111, and 141

Fabricated metal products: 103 through 108

Copper and copper products: 10210201, 10220131, 102301, 102403, 102502, 10260314, and 10280305

Machinery and motive products: 11 and 14

Machinery and equipment except electrical: 111, 112, 113, 114, 115, 116, 118, and 119

Agriculture machinery, including tractors: 1114 less 111409

Metalworking machinery: 113A, 1132, 113304, 1137, and 1138

Total tractors: 111403 and 112A less 112A03

Construction materials: 062101, 0721, 081105, 081106, 081107, 081203, 081204, 082, 0831, 0835, 086, 092, 101502, 101703, 101704, 10250163, 104101, 105, 106, 1071, 10730131, 10730132, 10730133, 10730135, 10730136, 107404, 10740501, 107409, 10830225, 1142, 1147, 11490205, 11710143, 11710144, 11710147, 11710216, 11710217, 123101, 1232, 131105, 1321, 1322, 133, 134, 1361, 1362, 137, 1392, 1394, and 139501

Agricultural machinery and equipment, less parts (old commodity code 111): 111 less 111409

Farm and garden tractors, less parts (old commodity code 1111): 111403

Agricultural machinery, excluding tractors (old commodity code 1112): 1114 less 111403

Note: Weights for the above components are those used for the comprehensive All commodities index.

1 Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 2002 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy excluding capital equipment. Since they do not include labor and capital costs, these indexes should not be regarded as comprehensive measures of construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

2 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

1 Further information about these experimental producer price indexes is available online at http://www.bls.gov/ppi/experimentalaggregation.htm

2 Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

3 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

4 PPI defines finished goods, services, and construction indexes as including only the personal consumption and private capital investment portions of final demand.

5 Trade indexes measure changes in margins received by wholesalers and retailers.

6 The PPI definition of foods does not include food and beverage for immediate consumption. PPI defines food and beverage for immediate consumption as the service of preparing meals, snacks, and beverages to customer order for immediate on-premises and off-premises consumption.

7 Distributive services include transportation and trade of finished goods.

1 Further information about these experimental producer price indexes is available online at http://www.bls.gov/ppi/experimentalaggregation.htm

2 Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

3 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

1 Further information about these experimental producer price indexes is available online at http://www.bls.gov/ppi/experimentalaggregation.htm

2 The indexes for September 2010 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

3 Trade indexes measure changes in margins received by wholesalers and retailers.

Technical Note

Brief Explanation of Producer Price Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 9,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the construction, trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes, (2) commodity indexes, and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

Commodity Indexes

The commodity classification structure of the PPI organizes goods and services by similarity of material composition or end use, disregarding their industry of origin. Table 6 of the *PPI Detailed Repo rt* includes data for commodity indexes, organized in a hierarchal structure, including major commodity groupings (two-digit commodity codes), subgroups (three-digit codes), product classes (four-digit codes), subproduct classes (five- and six-digit codes), item groupings (seven-digit codes) and individual items (eight-, nine-, and ten-digit codes).

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Repo rt* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes), Census product classes (7- and 8-digit codes), products (9-digit codes), and more detailed subproducts (11-digit codes), and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product categories. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products make up a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products—for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms also are chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of actual prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 2002 values of shipments as reported in the *Census of Manufactures* and other sources. From January 2002 through December

2006, PPI weights were derived from 1997 shipment values. Industry indexes now are calculated with 2002 weights and net output ratios. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including values of shipments between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities (which is comprised of major commodity groupings 01 through 15), are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct for this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982 = 100. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at **www.bls.gov/opub/hom/homch14_itc.htm**. Reprints are available on request.

Calculating Index Changes

Each PPI measures price changes from a reference period that equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: prices received by domestic producers of a sample of finished goods have risen from $100 in 1982 to $105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change

Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5

Index percent change

Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. For more information, see *Escalation and Producer Price Indexes: A Guide for Contracting Parties,* BLS Report 807, September 1991, on the Web at **www.bls.gov/ppi/ppiescalation.htm**. Reprints are available on request.

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year, the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is reevaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or an aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than does the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-

processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (six-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if the pattern keeps shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products, but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of over 800 seasonally adjusted series, only 23 were subject to intervention in 2009.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS H andbook o f Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

Producer Price Index Data on the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, use of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 2.1 million instances of PPI series being downloaded from the Internet during the 12 months ended December 31, 2008.

Retrieving PPI data from the PPI Web site

PPI data can be obtained from the WWW address (**www.bls.gov/ppi**). Clicking on the "PPI Databases" link reveals the following methods of data retrieval:

- ***Top Picks*** is a form-based application for both Industry Data and Commodity Data that allows the user to quickly obtain PPI time series data by selecting the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.

- ***One-Screen Data Search*** *and* ***Multi-Screen Da ta Search*** are form-based query applications for both Industry Data and Commodity Data designed for users unfamiliar with the PPI coding structure. These applications guide a user through the PPI classification system by listing index titles and do not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple-screen, non-Java-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Users can modify the date range and output options after executing the query using the reformat button above the data output table.

- ***Series Report*** is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at a time.

  There are five alphabetic prefixes used to create unique PPI time series identifiers: WP, WD, PC, PD, and ND. Each provides the user access to a different PPI database. Adding either a "u" (not seasonally adjusted) or an "s" (seasonally adjusted) to the end of these prefixes further specifies the type of data needed.

EXAMPLES

For com modity and stage- of-processing i ndexes, series identifiers combine a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) with a commodity code.

Commodity code	*Provides data for:*
wps141101	Passenger cars, seasonally adjusted
wpu141101	Passenger cars, not seasonally adjusted
wpusop3000	Finished goods, not seasonally adjusted

For discontinued commodity indexes, series identifiers combine a "wdu" prefix (not seasonally adjusted) or a "wds" prefix (seasonally adjusted) with a commodity code.

Commodity code	*Provides data for:*
wds019	Other farm products, seasonally adjusted
wdu0635	Preparations, ethical (prescription), not seasonally adjusted
wdusi138011	Stainless steel mill products, not seasonally adjusted

Current price indexes grouped by industry according to NAICS have series identifiers that begin with the prefix "pcu." After the prefix, there are 12 digits (the 6-digit industry code is listed twice) followed by up to 7 alphanumeric characters identifying product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code, current NAICS series	*Provides data for:*
pcu325---325---	Chemical manufacturing, not seasonally adjusted
pcu336110336110	Automobile and light duty motor vehicle manufacturing
pcu621111621111411	Offices of physicians, one- and two-physician practices and single-specialty group practices, general/family practice
pcu325412325412A	Pharmaceutical preparation manufacturing, pharmaceuticals acting on the respiratory system

Discontinued industry-product codes based on SIC combine a "pdu" prefix and "#" between the fourth and fifth characters of the product code. Series identifiers for the discontinued dataset use underscores as placeholders to complete a reference to an SIC industry group code of fewer than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of NAICS.)

Industry-product code, discontinued SIC series	*Provides data for:*
pdu28__#	Chemicals and allied products, not seasonally adjusted
pdu331_#	Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted
pdu3711#111	Passenger cars

Price indexes for discontinued series grouped by industry according to NAICS have identifiers that begin with the prefix "ndu." After the prefix, there are 12 numeric digits (the 6-digit industry code is listed twice), and up to 7 additional alphanumeric characters that identify product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code, discontinued NAICS series	*Provides data for*
ndu212231212231	Lead ore and zinc ore mining
ndu2122312122312	Lead and zinc concentrates
ndu212231212231214	Lead concentrates

- ***Text Files (FTP)*** and the FTP server are best suited for users requiring access to either a large volume of time series data or other PPI-related documentation (such as seasonal factor and relative importance tables). The FTP sites can be accessed at **ftp://ftp.bls.gov** or directly from the links on the "PPI Databases" page or the PPI homepage. Data and documentation available for download include the following:

	Directory:
Industry Data	**/pub/time.series/pc**
Industry Data - Discontinued	
(NAICS basis)	**/pub/time.series/nd**
(SIC basis)	**/pub/time.series/pd**
Commodity Data	**/pub/time.series/wp**
Commodity Data - Discontinued Series	**/pub/time.series/wd**
Special requests	**/pub/special.requests/ppi**

The FTP site maintains files to help with searches and downloads. These files are centrally located in the **/pub/doc** directory. Within this directory, the **overview.txt** file contains an overview relating to all BLS data available through the FTP site. For current commodity-based PPI data, the program help file is **wp.txt;** for discontinued commodity series, **wd.txt;** for current industry-based PPI data based on NAICS, **pc.txt;** for industry-based SIC time series that have been discontinued, **pd.txt;** and for industry-based NAICS series that have been discontinued, **nd.txt**.

Users who prefer downloading PPI datasets as individual ZIP files should go to the directory labeled **/pub/time.series/compressed/tape.format/** on the FTP site. This directory includes six PPI-specific ZIP files, one for each of the PPI databases—WP, WD, PC, ND, and PD—and a ZIP file for the annual 5-year revision to historical seasonal PPIs.

Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (**www.bls.gov**). Clicking on the "Databases & Tables" tab at the top of the homepage calls up a listing all available BLS programs.

Additional information

The PPI homepage (**www.bls.gov/ppi**) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.
