Research Tool 2009-100

Our Inventors Dr. John Schetz john.schetz@unthsc.edu

Application

- Compound UNT-TWU-22 is highly selective for the human serotonin 5-HT2C receptor subtype
- Useful for basic and applied pharmacological research studies of psychiatric, neurological, and other disorders including:
 - o Depression
 - o Anxiety
 - o Obsessive-compulsive disorder
 - o Schizophrenia
 - o Obesity
 - o Erectile Dysfunction
 - o Tardive Dyskinesia

Details

- Compound has an nanomolar affinity value (K_i = 46 nM) and is approximately 2000-fold selective for human serotonin 5HT2C receptor subtype over the 5-HT2A and 5-HT1A subtypes.
- > Synthetic aplysinopsin derivative:
