Answer. This project is a continuation of eight years of activity conducted to target specific applications, establish baseline performance data, develop formulations of additives and chemical modifications, administer laboratory and field tests, characterize, and build relationships for commercialization of industrial lubricants derived from U.S. grown vegetable base oils. Baseline performance data will be compiled to establish fatty acid compositions, guide genetic modifications, additive development, establish standards relative to toxicity and biodegradability, and characterize compatibility with specific metallic and non-metallic components. The grant has been peer reviewed internally at the University of Northern Iowa.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Primary local and regional need is related to expanding value-added applications of agricultural commodities in order to stimulate increased demand and raise crop prices paid to farmers. On a national level, the need is to provide renewable, safer, more environmentally-sound alternatives to petroleum based industrial lubricants. The principal investigator believes this research to be of local, regional, and national importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the program was sponsored by non-federal funding to develop a soybean-based hydraulic oil which was introduced to market in July of 1997, marketed by AGRI Industries of West Des Moines, Iowa as BioSOY hydraulic fluid. In part as a result of the product's availability, Iowa law SF2185 was unanimously passed that requires users of state owned equipment to demonstrate a preference for purchasing soybean-based hydraulic fluid when applicable. As of January 1999, and with the consensus of AGRI Industries, the original license was transferred to West Central Cooperative of Ralston, Iowa, which is in a better position than AGRI to market the product. Field testing of two grease formulations and a dielectric transformer coolant has begun, as well as development of a two-cycle engine lubricant and bar and chain oil. A large volume of technical data has been compiled specific to crop-based oil and lubricants. This program has identified and has begun servicing a broad array of market development requirements, including demonstrating specific performance features, expanding awareness, and supporting government purchase initiatives.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Federal funding for this project began with a 1998 appropriation of $200,000. The fiscal year 1999 appropriation is $250,000 for a total of $450,000 appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Since 1992 this research program has received cash grants from the Iowa Soybean Promotion Board, Carver Scientific Research Initiatives, in addition to several in-kind donations from industry to develop and coordinate commercialization of what has since become BioSOY hydraulic oil. Beginning in 1995, the state of Iowa began to support the program through its Wallace Technology Transfer Foundation. Beginning in 1996, state funding was provided by legislative appropriation through the Iowa Department of Economic Development. Additional funding has been provided by the Iowa Department of Agriculture and Land Stewardship. In fiscal year 1998, $150,000 was appropriated through the Iowa Department of Economic Development, $50,000 from the Iowa Soybean Promotion Board, $25,000 from Iowa Department of Agriculture and Land Stewardship, $32,500 from John Deere, and other awards and service revenues totaling approximately $60,000. State funding for the program in the amount of $250,000 has been requested through direct appropriation to the university.

Question. Where is the work being carried out?

Answer. Laboratory and literature studies are being carried out primarily at the Ag-based Industrial Lubricants Research Program facility in Waverly, Iowa, with minor portions of activity being conducted on the campus of the University of Northern Iowa in Cedar Falls, Iowa and the laboratories of various industrial affiliates located throughout the state and country. Field tests are being conducted at Sandia National Laboratories, U.S. Department of Army test sites, some municipalities, and in industrial equipment located throughout the nation.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Data collection, additive and modification research, characterization, and supplier development objective of the first year are ongoing. The development of the dielectric transformer coolant is an added objective and has been expedited through to field testing. Activities to expand public awareness and support government purchase initiatives have been added to the original objectives. This activity will be significant in implementing the lubricants section of Executive Order 13101. Field testing of some products is expected to be completed within a year, and additional lubricant applications are anticipated to be targeted within a year for development in subsequent periods.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist reviews quarterly reports and has determined that this research is conducted in accordance with the mission of the agency.

AGRICULTURAL DIVERSIFICATION AND SPECIALTY CROPS, HAWAII

Question. Please provide a description of the research that has been funded under the Agricultural Diversification and Specialty Crops grant.

Answer. With the resurgence of interest in Hawaiian culture and corresponding increased prevalence of Hawaiian dances, there is increased pressure on plant materials found in State and Federal forests in Hawaii. To this end, the University of Hawaii College of Tropical Agriculture and Human Resources has been working on the "lei project", involving about 20 members from the College and different organizations in the state working together to develop a handbook for the production and business of materials for Hawaiian lei. Efforts continue to find entrepreneurs to grow and process taro on a large scale for hypoallergenic products. Work is continuing with Maui onion growers who are potentially interested in obtaining a Federal Marketing Order for their unique onions. This effort has focused on researching market potential and giving informational talks. Work continues on kava, a root crop used as a non-addictive natural relaxant. Work continues on high pressure food processing of pineapple and other tropical fruits to eliminate quarantine problems and utilize cull fruits. This project is merit reviewed by the university.

Question. According to the research proposal, or the principal investigator, what is the national, regional or local need for this research?

Answer. Unfortunately, Hawaii's economy is not sharing the current growth and prosperity of the other states on the U.S. mainland. The small projects that are being undertaken under the umbrella of the Diversified Agriculture project are just one attempt to provide to some current and would-be entrepreneurs the tools they need to make business decisions about agricultural opportunities. The principal investigator believes this research to be of local and Pacific regional need, and, in some cases, national need.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the original proposal was to screen potential food and non-food crops for commercial development in Hawaii and then make earnest attempts to work with willing and able entrepreneurs to move the results of research into the private sector. As mentioned above, the lei project has been working with the people who know how to produce the 85 plants most likely to be made into a lei. That knowledge will be transferred to willing entrepreneurs so that they can take advantage of the opportunity created by the increased awareness of the Hawaiian culture. The taro project struggles with the reality of a tight economy and a lack of risk-taking, mass production-oriented entrepreneurs. The lessons learned from this work and the written outputs have been serving and will continue to serve as templates for other crops and opportunities in Hawaii. 'This Hawaii Product Went to Market' will continue to serve agricultural entrepreneurs needs for years past the end of this project. Expanding the market for Hawaii's agriculture, in this case Maui onions, is a goal that will be met if the growers decide they want to make the effort to self-regulate their industry with a Federal marketing order.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1988–1989, $156,000 per year; fiscal years 1990–1993, $154,000 per year; fiscal year 1994, $145,000; and fiscal years 1995–1999, $131,000 per year. A total of $1,728,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The University of Hawaii provides in-kind support in the form of laboratory and office facilities, equipment and equipment maintenance, and administrative support services: $68,503 in fiscal year 1992; $75,165 in fiscal year 1993; and $74,663 in each fiscal year 1994–1998. In addition, nearly $50,000 of in-kind support has come from private sector and state partners, $8,000 from the Office of Hawaiian Affairs, and $30,000 from the private sector on the high pressure minimal processing project.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Hawaii's College of Tropical Agriculture and Human Resources on the island of Oahu, and on the islands of Maui and Hawaii.

Question. What is the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. All taro work is complete. Work on the marketing book is also complete. Work continues on kava, high pressure processing, and other projects consistent

with the original goal. Work on kava agronomics is expected to continue through fiscal year 1999. High pressure processing for pineapple, papaya, and banana is expected to continue for another 1–2 years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency representative to this project meets with the investigators at least twice each year to review progress and plan subsequent activities. This close interaction has led the project though a progression of steps from research discovery to near-term commercialization of various products, and, in the case of high pressure processing, back to testing and development of a new technology for possible commercial use.

AGRICULTURAL DIVERSITY/RED RIVER, MN AND ND

Question. Please provide a description of the research that has been funded under the Agricultural Diversity/Red River Grant.

Answer. This multi-year, multi-phase project will have six specific components. They are:

—vegetable growing research, especially field and glasshouse-related research;

—vegetable collection and storage research and/or related storage or distribution business development;

—development of processing industries for the fresh market or research related to the fresh products for market; development of marketing and/or supply associations among vegetable producers; development of processing industries for the ready-to-eat salad market or research related to ready-to-eat products; and development of processing industries for the frozen vegetable products market or research related to frozen products. The first phase of this multi-phase project will concentrate its industry development and research activities in three areas: vegetable growing research, especially field and glasshouse-related research, development of marketing and/or supply associations among vegetable producers, and development of processing industries for the ready-to-eat salad market or research related to ready-to-eat products. The second phase of this multi-phase project will concentrate its activities in four areas: continued research on vegetable production, including commercial greenhouse production and field production using Missouri River water for irrigation; development of markets for fresh product; preparation of a business plan for a ready-to-eat delicatessen salad processing facility in the region; and analysis of the potential for adding higher value complementary crops to the rotation mix in vegetable producing areas.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Initially the growing of vegetables in the region was driven by an opportunity to meet increasing consumer demand for fresh vegetables and concerns over both the cost of water and the environmental impacts of the use of chemicals in the traditional vegetable-producing regions of the southern United States. This industry currently raises three crops of vegetables a year. This requires extensive irrigation in the hot summer months. Population growth and increased domestic and industrial demands for water have created significant pressures to shift water usage away from agriculture and toward other domestic and industrial needs. Additionally, use of chemicals to fight soil bacteria has raised environmental concerns in these states. These issues created a need to identify other regions to produce vegetables, especially in the summer months. The northern plains states of Minnesota, North Dakota, and South Dakota have been identified as one area that could meet this need. In addition, the opportunity to add a high-value crop to the rotation cycle for northern Great Plains farmers can help to decrease their dependence upon program crops. The shift in cropping patterns can have a positive effect on farm income and lessen the need for outside or Federal financial assistance. Interest in the potential for adding higher value crop to the rotation cycle, including vegetables, has increased significantly in the past year due to the poor farm economy. Research on the potential for adding new crops to the region's production base could help stabilize the farm economy in the region and lessen the need for outside financial assistance to farmers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project objectives include: (1) conduct three replicated field trials on growing of carrots; (2) continue study of vegetable growing techniques in Europe, and continue negotiations with vegetable growing research facilities/laboratories in Europe to transfer growing knowledge to the region; (3) review current and future

market opportunities for further development of the industry and identify strategies and partners for pursuing these opportunities and take appropriate organizing steps; (4) develop and maintain a WWW Webpage for this vegetable industry project; (5) conduct market research for establishment of a ready-to-eat delicatessen salad processing facility in the region; (6) conduct market research for establishment of a ready-to-eat fresh-bagged salad processing facility in the region; (7) continue business development planning for establishment of a ready-to-eat delicatessen salad processing facility in the region; and (8) continue business development planning for establishment of a ready-to-eat fresh-bagged salad processing facility in the region. Funding for this project was received July 1, 1998 at which time work on the project began. Accomplishments to date include: Establishment of an advisory task force of producers, researchers, and economic developers. Completion of a comprehensive search of the published literature in the northern Great Plains region regarding vegetable production. The data are now being catalogued by specific category, including vegetable types and type of research—i.e. production, processing, storage, etc. Maps are being prepared that will show soil types, precipitation, climate, and ground water. Overlays of these data are also being prepared in order to identify specific high potential areas for growing vegetables. A public information brochure titled "Growing and Processing Vegetables on the Northern Great Plains: Options and Opportunities" has been prepared. The USDA provided funding to prepare the report, and the Ford Foundation funds were used to print the report.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This work supported by this grant began in fiscal year 1998 with appropriations for fiscal year 1998 and 1999 for $250,000 per year for a total of $500,000 appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal support will come from private growers, state agri-development project funds, the Ford Foundation, and other local foundations. The amount of non-federal support since July 1, 1998 has been approximately $50,000.

Question. Where is the work being carried out?

Answer. The work is being carried out in Minnesota, North Dakota, and South Dakota.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this is a new project and has not yet started, any original objectives have not been met. It is expected that this will be a multi-year, multi-phase project. Work is expected to continue until June 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project will be evaluated by review of the proposal and the annual project reports.

AGRICULTURE WATER USAGE, GA

Question. Please provide a description of the research that has been funded under the Agriculture Water Usage, GA grant.

Answer. The Cooperative State Research, Education, and Extension Service has requested the university to submit a grant proposal that has not been completed to date, but it will be written to cover the period from June 1999 to June 2002.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Water has become a major issue in the southeast. The tri-state water "issue" between Florida, Georgia, and Alabama is seeking to allocate interstate waters in the primary river basins which begin in the Atlanta area. These allocation formulas were to be completed by December of 1998, but an extension has been granted to complete the development of the allocation formulas by December of 1999. The salt water intrusion problem associated with coastal Georgia and South Carolina is also a major issue. Both these problems suffer from the lack of data on agricultural water use across the state. This program seeks to develop a monitoring and modeling strategy to determine how much water is used by agricultural irrigation. The program is designed to begin with Georgia and then allow expansion into neighboring states for a better estimate of agricultural water use.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This is the first year of this particular grant program. However, the project has begun by hiring of strategic personnel for the monitoring program, and development of the equipment and the data base to be used for obtaining volunteers for the monitoring phase. This integrated project will involve the development of computer based models to take a monitoring sample and extrapolate that information for the entire state.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $300,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The scope of the project is of such magnitude and importance in Georgia that this appropriation is not sufficient to support the entire project effort. The state of Georgia through the Georgia Department of Natural Resources, Environmental Protection Division has appropriated $289,000 for fiscal year 1998–1999 and is expected to appropriate $250,000 per year for an additional four years to help support this project.

Question. Where is the work being carried out?

Answer. Research will be conducted from the University of Georgia, College of Agricultural and Environmental Sciences. The primary coordination of the program will be centered in the Biological and Agricultural Engineering Unit at Tifton, Georgia, but the program will involve input from personnel in Griffin and Athens, and researchers outside the University of Georgia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project, within the overall agricultural water use program, is anticipated to be completed within the original five-year time frame. Since this project is new, objectives have not been completed to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is new and has not been through an agency evaluation.

ALLIANCE FOR FOOD PROTECTION, NE, GA

Question. Please provide a description of the research that has been funded under the Alliance for Food Protection grant.

Answer. The fiscal year 1999 appropriation supports the continuation of a collaborative alliance between the University of Georgia Center for Food Safety and Quality Enhancement and the University of Nebraska Department of Food Science and Technology. Fiscal Year 1998 funds supported research at the University of Nebraska on the detection, identification, and characterization of food allergens, the effects of processing on peanut allergens, and investigation of the efficacy of using various types of thermal processes to reduce or destroy the toxicity and mutagenicity of certain Fusarium metabolites in corn and corn products. Research at the University of Georgia was directed toward determining the foodborne significance of Helicobacter pylori, determining the effect of antimicrobials to eliminate Arcobacter from pork, determining the survival of E. coli O157:H7 at reduced water activity, and using extrusion cooking to destroy peanut allergens. CSREES has requested, but has not yet received, proposals from the University of Georgia and the University of Nebraska in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the proposed research addresses emerging issues in food safety which have national, regional, and local significance. Specifically, research will address bacterial pathogens that can cause ulcers, cancer, and diarrheal illness, toxic fungal metabolites in corn products, and allergens in foods that cause serious reactions, including death, in sensitive people. These emerging issues affect consumers, the food industry, and food producers at all levels, national, state, and local.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of this research was to first, facilitate the development and modification of food processing and preservation technologies to enhance the microbiological and chemical safety of products as they reach the consumer; and second, develop new rapid and sensitive techniques for detecting pathogens and their toxins as well as toxic chemicals and allergens in foods. The University of Nebraska

developed assays for detection of peanut, milk, egg, and almond residues in processed foods, produced high-quality antibodies for these assays, identified a soybean allergen and two sunflower seed allergens, discovered clues as to the reason why Brazil nuts cause severe allergic reactions, discovered that certain types of Fusarium fungi do not produce mutagenic substances, developed a simple liquid chromatographic procedure for determination of moniliformin toxin, found that the corn flake manufacturing process can reduce levels of fungal toxins such as aflatoxin and fumonisins, and also found that low levels of carcinogenic aflatoxins in corn grits might be reduced to less than regulatory actions levels by the corn flake manufacturing process. The University of Georgia developed methods to culture Helicobacter pylori, and detect the pathogen in foods, the effect of antibiotics on the fate of E. coli O157:H7 in reduced water activity conditions, and found that extrusion cooking can greatly reduce allergens in peanuts.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1996, and $300,000 was appropriated in fiscal years 1996 through 1999, for a total appropriation of $1,200,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were $117,000 state funds and $250,000 industry and miscellaneous in fiscal year 1996 and were estimated to be a minimum of $111,000 state funds and $305,000 industry and miscellaneous in fiscal year 1997; $70,000 state funds and $295,000 industry and miscellaneous funds in fiscal year 1998; and are estimated to be a minimum of $25,000 state funds and $25,000 industry funds in fiscal year 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Georgia Center for Food Safety and Quality Enhancement in Griffin, Georgia and at the University of Nebraska Department of Food Science and Technology in Lincoln, Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not yet been met. The researchers anticipate that work will be completed on the original objectives in 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposals submitted in support of the appropriation on an annual basis. A review of the proposal from the University of Nebraska was conducted on January 16, 1998, and good progress was demonstrated on the objectives undertaken in 1997. A review of the proposal from the University of Georgia was conducted on January 21, 1998, and good progress was demonstrated on the objectives undertaken in 1997. In both cases, a CSREES scientist reviewed annual reports submitted by the cooperating institutions. These annual reports include the Principal Investigators' synopsis of their results, as well as listing public presentations of the funded research as scientific meetings and in peer-reviewed journals, which are other independent indicators of the progress made in the research.

ALTERNATIVE CROPS, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Alternative Crops, North Dakota program.

Answer. The alternative crops project has two main thrusts—development and utilization of alternative or novel crops and utilization of traditional crops. The goals of the project are to diversify income at the farm gate, reduce reliance on monoculture to help alleviate pest problems, while providing new agricultural and industrial products to society. Some of the new areas under investigation include feeding of co-products to livestock, development of white wheat as an alternative crop, production of certified dried bean seed, and borage—a perennial herb. Previous work continues with oilseed crops such as crambe, rapeseed, and safflower as a renewable supply of industrial oil, products from food crops for novel new uses in paints, coatings, food ingredients, and the development of new biochemical and enzymatic processes to refine oils for industrial uses. The projects funded in this appropriation are evaluated by a peer-panel chosen by the Associate Dean of Research at North Dakota State University. The internal peer review was conducted on the following criteria: (1) probability and extent of generating value-added agricultural

products, (2) technical and financial feasibility, (3) scientific merit, (4) innovation, (5) probability of rapid commercialization, and (6) interdisciplinary research efforts.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that nationally, developing new crops and new markets for agricultural products is critical for both environmental and economic reasons. Enhanced biodiversity that comes from the successful commercialization of new crops aids farmers in dealing with pests and reducing the dependency upon pesticides. New markets are needed to provide more economic stability for agricultural products, especially as Federal price supports are gradually withdrawn. Regionally, the temperate areas of the Midwest have the potential to grow a great number of different crops but are in need of publicly-sponsored research efforts to reveal the most practical, efficient, and economical crops and products to pursue. Potential national need for this research project could possibly be funded by the competitive grants provided under the Initiative for Future Food and Agricultural Systems or the National Research Initiative competitive grants.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was and still is to introduce, evaluate, and test new crops which will broaden the economic diversity of crops grown in North Dakota. The primary emphasis is to find new crops, new uses, and create value added products, such as crambe, lupin, canola, safflower, cool-season grain legumes, buckwheat, amaranth, field pea production and utilization, transgenic sugar beets to produce levan, utilization and processing lupin flower, confectionery sunflower production, growing and marketing of carrots, crop-derived red food dye and high quality pectin as food ingredients, innovative biochemical means of splitting crop oils, and other new uses of oilseed crops, development of markets for new crops as livestock and fish feeds. These efforts have forged a strong link with the private sector, and successfully spawned several crops and products into profitable private sector businesses

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Appropriations by fiscal year are as follows: 1990, $494,000; 1991, $497,000; 1992 and 1993, $700,000 per year; 1994, $658,000; 1995, $592,000; and in 1996 through 1999, $550,000 per year. A total of $5,841,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In fiscal year 1991, $10,170 was provided by state appropriations. In fiscal year 1992, $29,158, was also provided by state appropriations and self-generated funds. In fiscal year 1993, $30,084, was provided by state appropriations. In fiscal year 1994, $161,628 was provided by state funds, $3,189 provided by industry and $9,020 provided by other sources, totaling $173,837. In fiscal year 1995, $370,618 was provided by state appropriations, $1,496 provided by self-generated funds, $1,581 provided by industry, and $5,970 was provided in other non-federal funds, totaling $379,665 for fiscal year 1995. In fiscal year 1996, $285,042 was provided by state appropriation, $4,742 provided by industry, $14,247 provided from other non-federal funds totaling $304,031 for 1996. In fiscal year 1997, $462,012 was provided by state appropriations, $8,080 was provided by self-generated funds, $8,217 was provided by industry, and $103,063 was provided from other non-federal funds totaling $581,372 for fiscal year 1997.

Question. Where is this work being carried out?

Answer. The work is conducted on the campus of North Dakota State University and at the Carrington Research and Extension Center, Carrington, North Dakota, and the Williston Research Center, which are both in North Dakota. Work is also done in eastern Montana.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Fiscal year 1999 is the tenth year of activity under this grant. The primary emphasis has been to find new crops with non-food uses and create value added products. The original objectives have been met and continue to expand.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist annually reviews the project and has determined that the research is conducted in accordance with the mission of this agency.

ALTERNATIVE CROPS FOR ARID LANDS, TEXAS

Question. Please provide a description of the research that has been funded under the Alternative Crops for Arid Lands, Texas grant.

Answer. This grant is to develop the two most abundant plants in southwestern United States, i.e. mesquite and cactus, into commercial crops through a combination of applied research and market development. In Texas, New Mexico, Arizona, and California, these plants occupy 72,000,000 acres. This grant is peer reviewed internally and external reviewers include a private sector cactus breeder, the Texas Agricultural Extension Service, and a specialist in wood products marketing.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this goal?

Answer. The semi-arid regions of the United States that border with Mexico in Texas, New Mexico, Arizona, and California have some of the highest unemployment rates, lowest economic returns per acre, and lowest incomes in the United States. The two most abundant plant species in this region are prickly pear cactus and mesquite. By working with Mexican researchers, this grant will help to stabilize the economic situation of rural poor in Mexico and the United States. There are few crops capable of being grown sustainably in these regions. Due to the nitrogen fixing capability, and thus soil improving properties of mesquite and high water use efficiency of cactus, these plants contribute to sustainable agriculture and will diversify southwestern agriculture. This research group is the only center in the United States developing these plants as crops.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to dramatically improve the economic returns and year-to-year economic stability in the southwestern United States from arid and semi-aid lands. For cactus, the goal has been to provide improved varieties that can be harvested and processed into food and forage. Accomplishments include: established collection of 130 varieties; established procedures for improving breeding; establishment of a new cactus plantation in the Rio Grande Valley; retail sales of a new vegetable cactus variety through largest retail grocery in Texas. Mesquite accomplishments include: presentations to architects in all major cities in Texas; demonstrations of mesquite products at the World Trade Fair in Chicago, which resulted in a new manufacturing facility in Texas; a potential one hundred dollars per acre annual return from a ten-year field study of mesquite growth. Recent research has suggested that a sustainable system for mesquite management can avoid land clearing by bulldozers and aerial herbicides in fragile and sensitive semi-arid landscapes by creating markets for mesquite products and using the tree's natural drought tolerance and nitrogen fixing properties.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994 and the appropriation for fiscal year 1994 was $94,000. For fiscal years 1995 through 1997 the appropriation was $85,000 per year and for fiscal year 1999 is $100,000. A total of $449,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In fiscal year 1994, $43,215 was provided by the Texas legislature.

Question. Where is the work being carried out?

Answer. The work is being conducted by Texas A&M University, Kingsville, Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Significant but small Texas cactus and mesquite industries now exist. Transformation of these small industries into medium industries and transfer of the arid technologies to low rainfall areas of the Midwestern and southeastern United States will continue 10 years into the next century.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is conducted annually based on the annual progress report and discussions with the principal investigator, as appropriate. The review is conducted by the cognizant staff scientist who has determined that this research is in accordance with the mission of the agency.

ALTERNATIVE MARINE AND FRESHWATER SPECIES, MISSISSIPPI

Question. Please provide a description of the research that has been funded under the alternative marine and freshwater species grant.

Answer. The research has focused on the culture of hybrid striped bass, freshwater prawns, hybrid crappie, and crawfish. Nutritional and water quality requirements and alternative management and harvest strategies for these species have been evaluated and field tested. Applied knowledge from this research will improve production efficiency and facilitate commercialization of these alternative species and provide alternative management strategies. The project undergoes peer review by the university and is also reviewed by the CSREES Program Leader on an annual basis.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher indicates that it is essential that alternative species and production strategies be considered to help the industry diversify and expand while taking advantage of existing infrastructure. Diversification will benefit both the producer and consumer of aquaculture products. Research generated from this grant should lead to alternative production systems that can have national, regional, and local impact.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop and evaluate aquaculture production technologies that would lead to the use of alternative species and management strategies in commercial aquaculture production. Research evaluating stocking rates, feeding regimens, nutritional requirements, and methods to reduce stress in hybrid striped bass production systems has led to the development of improved production efficiency in these systems. Recent research has led to improved feed formulation and feeding strategies for hybrid striped bass. The effects of feeding frequency and temperature on growth have been evaluated. Researchers have also researched management strategies to improve production efficiency and cost effectiveness in non-forage based crawfish production systems.

Question. How long has the work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991–1993 has been $275,000 per year, $258,000 in 1994, and $308,000 each year in fiscal years 1995–1999. A total of $2,623,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university reports a total of $332,091 of non-federal funding to support research carried out under this program for fiscal years 1991–1994, $70,636 in fiscal year 1995, $79,935 in fiscal year 1996, $124,893 in fiscal year 1997, and $328,023 in fiscal year 1998. The primary source of the non-federal funding was from the state. Additional funding is provided from product sales, industry contributions, and other miscellaneous sources

Question. Where is the work being carried out?

Answer. Research is being conducted at Mississippi State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original specific research objectives were to be completed in 1994. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new grant proposal is submitted to CSREES for funding. The 1998 review indicated that the research addresses an important opportunity in the aquaculture industry, that research objectives were met, that progress on previous research was well documented, and that the proposed research builds on the previous work funded through this program. The research on hybrid striped bass and crawfish funded through this program complements research conducted through other USDA programs.

ALTERNATIVE SALMON PRODUCTS, AK

Question. Please provide a description of the research that has been funded under the Alternative Salmon Products grant.

Answer. This was a new grant in fiscal year 1998. Research was aimed at developing a commercial pin-bone removal machine to reduce production costs of salmon fillets and thus open markets for salmon fillet shatter packs. CSREES has requested, but has not yet received a proposal in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Alaska salmon industry has lost considerable market share worldwide to farmed salmon production. In 1994, the farmed salmon market share surpassed Alaska's market share of the world's salmon supply and has continued to climb every year since. In 1997, Norwegian farmed salmon production exceeded Alaska wild stock harvests. Also in 1997, Chilean coho salmon exports to Japan exceeded North American sockeye salmon exports to Japan. Japan has traditionally been Alaska's strongest and most lucrative export market. The current situation is an example of foreign competition undermining a traditional American industry. Federal support of product development in this area has dropped from $17,300,000 to $3,000,000 nationwide, largely through a significant reduction in Saltonstall-Kennedy funds. USDA traditionally has supported fish food research primarily from aquacultured fish. The Alaska salmon industry is a multi-state industry. Though the product is harvested in Alaska, the benefits are shared with fishermen residents in Washington state, Oregon, California and throughout the nation.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The research goal is the development of market-desired salmon products using wild-caught salmon. In 1998, researchers addressed the problem of deboning wild-caught fish so that they can be marketed frozen rather than canned, and thus compete effectively with pen-reared salmon. Researchers designed, built, and tested three prototype pinbone removal machines, making sequential improvements in design.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998, with appropriations in fiscal years 1998 and 1999 of $400,000 per year for a total of $800,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Industry will contribute approximately $200,000, based on an estimated cost of $50,000 per plant, times four plants, for commercial testing of the beta prototypes during the summer 1998 salmon season in Alaska.

Question. Where is this work being carried out?

Answer. The work with be conducted at the University of Alaska Fairbanks—Fishery Industrial Technology Center in Kodiak, Alaska, and at the Geophysical Institute of the University of Alaska Fairbanks, in Fairbanks, Alaska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional related objectives?

Answer. The anticipated completion of the full objectives of this research area, including original and related objectives, will require about five years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal received in support of the fiscal year 1998 appropriation was reviewed for merit by a CSREES specialist on January 21, 1998. At that time, the agency science specialist believed that the projects addressed needs and interests of the Alaskan salmon industry.

ANIMAL SCIENCE FOOD SAFETY CONSORTIUM

Question. Please provide a description of the research that has been funded under the animal science food safety consortium program.

Answer. The research goal of the Food Safety Consortium is to improve the safety of foods, specifically poultry and red meat products, consumed by humans. In order to accomplish this, the Consortium consists of three Universities that specialize in beef, poultry, and pork. In coordination, they have focused on accomplishing six objectives: (1) to develop techniques for rapid detection of infectious agents and toxins in meat and poultry; (2) to develop a statistical approach for evaluating potential health risks; (3) to identify effective intervention points to control microbiological or

chemical hazards; (4) to develop monitoring methodologies to detect these hazards in the distribution chain; (5) to develop technologies to complement the development of Hazard Analysis and Critical Control Point—HACCP—programs by USDA; and (6) to estimate costs and benefits associated with intervention alternatives.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. A safer meat product food supply would reduce the economic losses related to days away from work, medical treatment, and even human suffering and death as a result of foodborne illnesses. The costs are estimated at over $5,000,000,000 a year. The Consortium's participation in technology transfer to health departments and trade associations are helping on a regional and local level to help educate consumers and food handlers on safe handling procedures. Scientific-based testing that is being developed will help provide food that will be accepted in international markets and increase exports and sustainable rural economies at home. On a regional and local level, each of the institutions are involved in HACCP program training for industry and are holding seminars for industry to discuss food safety research findings. In addition, the University of Arkansas is teaching food safety programs to children in state elementary schools. Potential national need for this research project could possibly be funded by the competitive grants provided under the Initiative for Future Food and Agricultural Systems or the National Research Initiative competitive grants.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal was to bring together research and expertise of institutions in three states in order to best address the areas of poultry, beef, and pork meat production from the farm to the consumer's table. In coordination with each other, they seek to develop detection, monitoring, and prevention techniques to control or prevent the presence of infectious agents and chemical toxins in the food supply. Each year advisory and technical committees provide guidance and expertise in research planning. Major accomplishments occurred in 1998. Research at the University of Arkansas emphasized risk assessment and analysis, chemical interventions for raw poultry, control measures for cooked poultry, and rapid detection methods. Major projects included tests that showed up to 30 percent of surveyed households with Salmonella-infected children had significant levels of Salmonella traced to non-food sources in the homes. Risk assessment models were developed to predict the relative reductions in the incidence of Salmonella-positive poultry carcasses. Control of pathogens in poultry also centered on thermal processing and use of bacteriocins. Three new bacteriocins with the ability to inhibit foodborne pathogens were produced. Nucleic acid probes and polymerase chain reaction assays were developed to detect Arcobacter and Campylobacter jejuni. At Iowa State University, research concentrated on swine production, swine processing, irradiation, methodologies of detecting bacteria, and risk assessment. Projects included a study of the impact of modern livestock production practices on the incidence of Salmonella, the use of hot water rinses as a method of carcass decontamination, the effect of irradiation on lipid oxidation and off-flavor development in cooked pork, and the effects of HACCP procedures on the economic costs of pathogens in pork production. Work performed at Kansas State University emphasized sampling and testing for microorganisms and intervention strategies for pathogen control in beef. Research with sponge sampling of carcasses provided information required for microbiological testing at large and small plants and enabled the offering of hands-on training for processors and inspectors. Studies of steam pasteurization found that the process is a viable intervention technique for reducing bacteria on freshly slaughtered beef carcasses. The Kansas State investigators also continued refining and enhancing sampling and testing procedures for Hazard Analysis Critical Control Point implementation and verification.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $1,400,000; fiscal year 1990, $1,678,000; fiscal year 1991, $1,845,000; fiscal years 1992–1993, $1,942,000; fiscal year 1994, $1,825,000; fiscal years 1995–1996, $1,743,000 each year; fiscal year 1997, $1,690,000; fiscal years 1998–1999, $1,521,000 each year. A total of $18,850,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $1,313,653 State appropriations, $2,959 product sales, $35,600 industry, and $259,735 miscellaneous for a total of $1,611,947 in 1991; $1,270,835 State appropriations, $10,129 product sales, $90,505 industry, and $267,590 miscellaneous for

a total of $1,639,050 in 1992; $1,334,680 State appropriations, $1,365 product sales, $33,800 industry, and $356,308 miscellaneous for a total of $1,726,153 in 1993; $1,911,389 State appropriations, $192,834 industry, and $200,000 miscellaneous for a total of $2,304,223 in 1994; $1,761,290 State appropriations, $221,970 industry, and $91,885 miscellaneous for a total of $2,075,145 in 1995; $2,643,666 State appropriations and $152,431 industry, for a total of $2,796,097 in 1996; and $1,776,167 State appropriations and $824,378 industry, for a total of $2,600,545 in 1997; $612,000 State appropriations and $1,238,899 industry, for a total of $1,850,899 in 1998. Thus, from 1991 through 1998 a total of $16,604,068 in non-federal funds was provided.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University, Kansas State University, and University of Arkansas at Fayetteville, University of Arkansas for Medical Sciences at Little Rock, and Arkansas Children's Hospital.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The research projects from the Consortium continue to evolve and build on the original objectives first set out in 1989. Additional objectives are revised on an annual basis to enhance the original six objectives. For example, one of the original objectives was to look at risk assessment in the safety of animal food products. In 1998, the Consortium sent a principal investigator to work in USDA's Office of Risk Assessment and Cost Benefit Analysis. Another objective was the detection and surveillance of foodborne pathogens. Recently, the Consortium has participated in research projects that have made significant contributions to the establishment of scientific parameters used in HACCP programs. The principal investigators have developed patented tests that have significantly reduced the time necessary to detect pathogens in the processing plants. The Food Safety Consortium continues to use peer evaluated projects to address priority issues.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. There has never been a formal evaluation of the Food Safety Consortium but instead, a annual conference is organized where a designated representative from CSREES attends. The annual conference was held in October, 1998. Along with other invited agency representatives such as FSIS, ARS, and ERS, CSREES participates in a steering committee meeting which critiques projects and discusses research priorities. CSREES representatives were considered part of the Technical Advisory Committee as well as members of the Food Safety Consortium Steering Committee and fully participated in meetings and conference calls. The individual projects are also peer reviewed. The peer review results, by expert scientists who are not members of the Consortium, determine those projects selected for funding.

APPLE FIRE BLIGHT, MICHIGAN AND NEW YORK

Question. Please provide a description of the research that has been funded under the Controlling Fire Blight Disease of Apple Trees, Michigan and New York, grant.

Answer. This project studies fire blight in apple trees, which is a bacterial disease that can kill spurs, branches, and whole trees. The management of this disease is difficult because only one antibiotic treatment is available. The objectives of this research are to develop fire blight resistance varieties, evaluate biological and chemical control methodologies for disease management, and develop an education and extension component for disease management.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Fire blight is a destructive disease of apple trees that can kill the trees. This disease is caused by bacteria and effects apple trees in all apple growing areas of the nation. In the northeast, the disease is more prevalent because of humid weather conditions. The principal researcher believes this research to be of national, regional, and local need.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research are to develop transgenic apple trees through various molecular technologies, to develop new approaches to antibiotic treatments of disease, to develop an early screening technique for tree sensitivity to the disease, to evaluate biological and cultural controls, and to develop and improve education and extension components of disease management. The last objective involves using disease prediction models.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. fiscal year 1997 was the first year funds were appropriated for this grant at $325,000. For fiscal year 1998–1999, $500,000 was appropriated per year. A total of $1,325,000 has been appropriated.

Question. What are the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds for 1997 were $40,127 for Michigan and $104,166 for New York State. The funds for 1998 are state appropriated at $25,071, and $15,000 in funds from the Michigan Apple Research Committee for a total of $40,071 from Michigan whereas New York is estimating state appropriated funds at $104,166 for 1998. The state appropriated funds for 1999 are $49,771 for Michigan, and New York is estimating state appropriated funds at $106,689 for 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at Michigan State University and Cornell University, New York Experiment Station.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated date of completion for the original objectives was 1998. The objectives have not been met. It is estimated by the researchers that three to five years is need to complete this project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last merit review of this project was in January, 1998. In summary, the evaluation indicated that progress was demonstrated in all the objectives. In New York, rootstock transformation was successful in two commercially-important apple varieties and another transgenic line preformed well in field trails. The use of the hrpN gene for resistance to fire blight was used to produce transgenic lines in apple. Biological control agents, systemic acquired resistance inducers, and bactericides were evaluated for their use in integrated pest management of fire blight. Commercial orchards were mapped for tree loss due to fire blight rootstock infection, and the internal movement of fire blight through healthy apple scion tissue was investigated. In Michigan, bacteriophages were used as potential biological control agents for fire blight control on apple trees under field conditions. Management of fire blight was evaluated using chemical growth regulation and induced resistance strategies. The effects of hrpA genese on elicitation of the HR and causation of the fire blight was studied using Arabidopsis and immature pear as a model.

AQUACULTURE, LOUISIANA

Question. Please provide a description of the research that has been funded under the Aquaculture, Louisiana grant.

Answer. Research has focused on catfish, crawfish, and hybrid striped bass in commercial aquaculture. Research has included basic and applied research in the areas of production systems, genetics, aquatic animal health, nutrition, off flavor, water quality, and germplasm preservation. Grants are awarded to scientists within the university on a competitive peer review basis. The entire proposal is also reviewed by the CSREES Program Manager on an annual basis.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher indicates that improved production efficiency and product safety and quality for a number of important aquaculture species will enhance the profitability and sustainability of the aquaculture industry in the region. The research funded through this program focuses on the production of a number of important aquaculture species such as catfish, crawfish, and hybrid striped bass. Aquaculture research at national centers is supported through Regional Aquaculture Center grants.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to provide science-based information through a basic and applied research base that specifically addressed the needs of the aquaculture industry in Louisiana and the southern states. The university has completed studies in the area of fish nutrition, fish health, fish genetics, production management strategies, alternative species, seafood processing, product quality, and broodstock development. Research has led to improved channel catfish and hybrid striped bass feed formulations, production of new channel catfish vaccines, improved extraction and detection methods for the off-flavor compounds, production of

genetically-improved channel catfish with increased resistance to bacterial infection, developed procedures for production of gene maps for channel catfish, improved harvesting and production strategies for crawfish, and improved processing technologies for crawfish and other aquaculture products. Research continues to be directed at important opportunities to enhance production efficiency and the commercial viability of sustainable aquaculture systems in the region.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Research to be conducted under this program will continue as initiated under the Aquaculture General program in fiscal years 1988 through 1991. The work supported by this new grant category began in fiscal year 1992 and the appropriation for fiscal years 1992–1993 was $390,000 per year, $367,000 in fiscal year 1994, and $330,000 each year in fiscal years 1995–1999, for a total of $2,797,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates that non-federal funding for this program is as follows: in fiscal year 1991, $310,051; in fiscal year 1992, $266,857; in fiscal year 1993, $249,320; in fiscal year 1994, $188,816; in fiscal year 1995, $159,810; in fiscal year 1996, $150,104; in fiscal year 1997, $158,808; and in fiscal year 1998, $110,101. The primary source of this funding was from state sources and self-generated funds with minor contributions from industry and other non-federal sources.

Question. Where is this work being carried out?

Answer. Research is being conducted at Louisiana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original specific objectives were to be completed in 1990. These specific research objectives have been met, however, the broader objectives of the research program are still being addressed. The specific research outlined in the current proposal will be completed in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report each year when the new grant proposal is submitted to CSREES for funding. In addition, the CSREES program manager conducted site visits in 1996 and 1997 to meet with the scientists involved in the project and review the progress of the research. The 1998 review of the project indicated that the research is addressing important research needs of the aquaculture industry, that the facilities are excellent, that the principal investigators are well qualified, that the experimental design is sound, that the proposed research represented a logical progression of research previously funded through this program, and that the progress on previous research funded under this program is well documented. The 1999 CSREES review will be completed within three weeks of submission of the proposal. The researchers are asked to the develop a research proposal consistent with the National Science and Technology Council's Strategic Plans for Aquaculture Research and Development. Research results from this program have had a significant impact on the aquaculture industry in Louisiana and the region.

AQUACULTURE PRODUCT AND MARKETING DEVELOPMENT, WEST VIRGINIA

Question. Please provide a description of the research that has been funded under the Aquaculture Product and Marketing Development, West Virginia.

Answer. The proposed study is aimed at developing a viable and competitive aquaculture industry in West Virginia and Appalachia. Specific research strategies include the development of marketing strategies for trout producers and processors, increasing the economic efficiency and profitability of trout-based enterprises, improving the consistency and quality of fresh trout fillets, and of value-added smoked trout products. The proposal also contains a technology transfer component to disseminate information generated by the project. The proposal represents a significant investment for a new initiative under the Special Research Grants Authority. CSREES did not approve the original proposal and has requested a revised proposal.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The researchers indicate that there is a regional and national need to evaluate marketing and product development for small scale aquaculture systems in rural communities. In addition there is a need to improve the efficiency and sus-

tainability of these systems. The researchers also indicate that the proposed research is consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The proposed research represents a new initiative aimed at developing sound marketing strategies for aquaculture products in the region, improving the economic efficiency of aquaculture production systems, and improving the quality, and variety of aquaculture products in the region. CSREES has conducted an in-depth peer review of the proposal and has recommended that the university submit a revised proposal that addresses concern expressed by the reviewers and the CSREES Program manager.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. A grant has been awarded from funds appropriated as follows: fiscal year 1998, $600,000 and fiscal year 1999, $750,000. A total of $1,350,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates that significant non-federal funding will be provided in fiscal year 1998 primarily from state sources to cover the salaries of the principal investigators. As the program develops, additional non-federal funding is expected.

Question. Where is this work being carried out?

Answer. The research would be conducted at the University of West Virginia in Morgantown and at off campus sites with a variety of potential cooperators.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 2000. The project was initiated in fiscal year 1998.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES conducted an external and internal peer review of the original proposal. The proposal was peer reviewed by 10 external reviewers and the CSREES National Program leaders for Aquaculture, and the CSREES Aquaculture Program Specialist. Although the proposal was aimed at important issues facing the aquaculture industry in the region, a number of significant concerns were expressed by the reviewers and CSREES Program Leaders. These concerns with recommendations were presented to the University, and a revised proposal was requested. CSREES has withheld authority of the University to utilize funds until an acceptable proposal has been submitted and approved by the agency. CSREES is currently awaiting receipt of the revised proposal.

AQUACULTURE RESEARCH, STONEVILLE, MISSISSIPPI

Question. Please provide a description of the research funded under the aquaculture research Stoneville, Mississippi grant.

Answer. The primary objectives of this research have been to improve practical feeds and feeding strategies that enhance fish health and production efficiency in channel catfish ponds. Additionally, scientists are evaluating the application of acoustical instrumentation in commercial aquaculture. The project undergoes peer review by the university and by the CSREES Program Leader on an annual basis.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher indicates that the research findings from this project have a direct impact on the profitability and sustainability of a significant segment of the domestic aquaculture industry. The farmed-raised catfish industry accounts for over 55 percent of the total U.S. aquaculture industry. Research funded by this program is directed towards improved feeds and feeding strategies. In addition, research is directed towards acoustical monitoring and inventory of catfish in pond production systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to address the research needs of the catfish industry in the areas of water quality and nutrition. The research has led to improved water quality management practices in commercial catfish ponds. Research in the area of catfish nutrition has led to improved diet formulation and

feeding strategies that have been widely adopted by the industry. Scientists are currently evaluating vitamin supplementation in catfish feed formulations using conditions that closely reflect commercial production ponds. Research findings from this program have had a direct impact on least-cost feed formulations utilized by commercial feed mills resulting in reduced cost of commercial feeds without reducing performance and productivity. Scientists are also evaluating feed delivery techniques to improve feed conversion efficiency. Studies evaluating acoustical instrumentation have demonstrated possible applications in commercial aquaculture. Researchers are developing sonar electronics hardware and computer-generated graphics communications interface software for the application of monitoring count and size of channel catfish in the pond.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1980–1981, $150,000 per year; fiscal year 1982, $240,000; fiscal years 1983–1984, $270,000 per year; fiscal year 1985, $420,000; fiscal years 1986–1987, $400,000 per year; fiscal year 1988, $500,000; fiscal year 1989, $588,000; fiscal year 1990, $581,000; fiscal year 1991, $600,000; fiscal years 1992–1993, $700,000 per year; fiscal year 1994, $658,000; fiscal years 1995–1997, $592,000 each year; $642,000 in fiscal year 1998; and $592,000 in fiscal year 1999. A total of $9,637,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates a total of $2,101,508 in non-federal funding to support this research for fiscal years 1991–1994; $1,128,451 in fiscal year 1995; $601,473 in fiscal year 1996; $463,990 in fiscal year 1997; and $464,266 in fiscal year 1998. The primary source of non-federal funding is from the state. Additional funding is provided from product sales, industry contributions, and other miscellaneous sources.

Question. Where is this work being carried out?

Answer. The grants have been awarded to the Mississippi Agricultural Experiment Station. All research is conducted at the Delta Branch Experiment Station, Stoneville, Mississippi. The acoustical research in aquaculture is conducted in cooperation with the National Center for Physical Acoustics at the University of Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the specific original research objectives was 1984. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report when the new proposal is submitted to CSREES for funding. CSREES Program manager conducted a site visit in 1998. The 1998 review indicated that the research targets important opportunities in the farm-raised catfish industry. Significant progress has been reported on past research and the experimental and scientific design of the new project are sound. Scientists involved in the project are leading authorities in this area of research and linkages between the researchers and the catfish industry has lead to accelerated adoption of research findings. Adoption of improved feeds and feeding strategies developed through this program by the catfish industry has led to improved production efficiency in commercial catfish operations. CSREES is planning a comprehensive review of the catfish research program at Mississippi State University in late 1999.

AQUACULTURE, VIRGINIA

Question. Please provide a description of the research that has been funded under the Aquaculture, Virginia grant.

Answer. The proposal research will document and develop fish production parameters and culture methods, analyze management economics, and provide information on industry marketing and economic development of a recirculating aquaculture system-based industry.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The investigators indicate that there is a need to develop a highly competitive, sustainable aquaculture industry to meet consumer demand for cultivated aquatic foods that are of high quality, safe, competitively priced, nutritious, and are produced in an environmentally-responsible manner with maximum opportunity for profitability in all sectors of the industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Program objectives include research to identify commercially-viable aquaculture species utilizing recirculating aquaculture system technology, verify production and culture management protocols utilizing this technology, analyze production budgets providing information to build business plans, investigate marketing development strategies, and prepare scientific, technical, and popular publications to disseminate the results of this research. This is a new research initiative and the year one proposal is currently under review by CSREES.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This is a new research initiative and the appropriation for fiscal year 1999 is $100,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates a minimum of $90,000 of non-federal funding in fiscal year 1999 primarily from state sources. As the program develops, additional non-federal funding is expected.

Question. Where is this work being carried out?

Answer. The research will be conducted through the Virginia Agricultural Experiment Station, Virginia Polytechnic Institute and State University, Blacksburg, Virginia, and in collaboration with private aquaculture firms in Virginia.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This proposal seeks funding for year one of a proposed three year project. The anticipated completion date for the fiscal year 1999 component of the project is July 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new research initiative and the year one proposal is currently under review by CSREES. The agency will evaluate the progress of this project on an annual basis. The university will be required to submit an accomplishment report each year when the new proposal is submitted to CSREES for funding.

BABCOCK INSTITUTE FOR INTERNATIONAL DAIRY RESEARCH AND DEVELOPMENT

Question. Please provide a description of the research that has been funded under the Babcock Institute grant.

Answer. The Babcock Institute for International Dairy Research and Development was established with participation of the University of Wisconsin-Madison College of Agriculture and Life Sciences, School of Veterinary Medicine, and the Cooperative Extension Division. The objective of the Babcock Institute is to link the U.S. dairy industry with the rest of the world through degree training, continuing education, technology transfer, adaptive research, scientific collaboration, and market analysis.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the need is to strengthen dairy industries around the world, to enhance international commercial and scientific collaborative opportunities for the U.S. dairy industry, and to draw upon global perspectives to build insight into the strategic planning of the U.S. dairy industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the Institute remains the linkage of the U.S. dairy industry with the rest of the world through training, continuing education and outreach, technology transfer, adaptive research, scientific collaboration and market analysis. Initial efforts were focused on planning and staffing. An initial activity was, and continues to be, the development of multi-language extension materials about basic management techniques essential to optimize performance of U.S. dairy cattle overseas. This activity has grown to include manuals on Breeding and Genetics, Lactation and Milking, and Basic Dairy Farm Financial Management published in English, Spanish, French, Russian, and Chinese. Research on potential implications of NAFTA and GATT on the U.S. dairy industry was completed. A technical work-

shop on dairy grazing in New Zealand and the mid-west was organized and held in Madison during the fall of 1993. A technical workshop on Nutrient Management, Manure, and the Dairy Industry: European Perspectives and Wisconsin's Challenges was held in Madison, Wisconsin during September, 1994. A round table was held in January, 1995 addressing "World Dairy Markets in the Post-GATT Era". Sponsored the Great Lakes Dairy Sheep Symposium in 1995 and 1996. Created a World Wide Web site in 1996 for distribution of Babcock Institute technical dairy fact sheets in four languages. The first International Dairy Short Course for a group of producers and technicians from Argentina has been organized on the University of Wisconsin Campus. Scientist's are being supported in collaborative research with New Zealand primarily to gain a better understanding of grazing systems as related to dairy management. An analysis of the impact of changes in European dairy policies has been completed. The Institute sponsored a Minnesota-Wisconsin Dairy Policy Conference to provide insights into current agricultural programs and policy issues in the dairy sector of the U.S. economy.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1992 and 1993, $75,000 per year; fiscal year 1994, $250,000; fiscal years 1995–1998, $312,000 per year, and fiscal year 1999, $400,000. A total of $2,048,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. During fiscal year 1992, $13,145 of State funds were used to support this program and $19,745 of State funds in fiscal year 1993 for a total of $32,890 during the first two years of this research. Information is not available for fiscal years 1994–1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Wisconsin-Madison College of Agriculture and Life Sciences.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Babcock Institute's overarching mission has been to link the U.S. dairy industry and its trade potential with overseas dairy industries and markets. The original objectives of this project have remained consistent over the years. However, each year specific objectives were proposed to further the mission of the Institute and to build on previous accomplishments. The Institute has accomplished specific objectives each year in a timely manner. The Babcock Institute has remained true to its original objective of linking Wisconsin and the U.S. to dairy industries around the world. This objective remains of increasing importance with continued development of international markets for dairy products and technologies. The University researchers anticipate that work currently in progress will be completed by September, 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Babcock Institute undergoes two independent review processes each year. The first is done by a committee of university and industry representatives who review the annual research proposal and amend it prior to submission to the agency. The annual proposal is reviewed by agency technical staff prior to approval for fund release. In addition, the institute was included in a comprehensive review of the programs of the Department of Dairy Science at the University of Wisconsin in May, 1995. The agency project officer has conducted two on site reviews of the institute since it's formation in 1992. The most recent review has found that the approach proposed by the researchers is appropriate and that the researchers are well qualified to perform the objectives as stated. The objectives of the proposal are within the mission of the USDA and the Cooperative State Research, Education, and Extension Service.

BINATIONAL AGRICULTURAL RESEARCH AND DEVELOPMENT PROGRAM

Question. Please provide a description of the research that has been funded under the Binational Agricultural Research and Development Program—BARD—grant.

Answer. The Binational Agricultural Research and Development Program is a competitive grants program that supports agricultural research of importance to both the United States and Israel. The areas of research supported by the BARD program include plant and animal sciences, water and soil science, aquaculture, agricultural economics, and agricultural engineering. Research projects submitted for

funding must involve collaboration between U.S. scientists and Israeli scientists. The funds available through the BARD Special Research Grants Program are used to support Land-Grant university scientists in the U.S. portion of projects receiving BARD awards.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. All proposals receiving awards through the BARD Program have national, regional, and/or local significance to agriculture in both the United States and Israel. Thus, applicants must convince the review panel of the global significance of the proposed work in order to receive funding. The fundamental research supported by the BARD program provides the knowledge base needed to solve important agricultural problems in the U.S. and Israel as they arise.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the BARD program is to support fundamental research that is important to agriculture in both the U.S. and Israel. Many fundamental discoveries and accomplishments have been made in the research areas supported by BARD. These discoveries and accomplishments will lead to reduction of livestock diseases, increased livestock production, improved production of plants under harsh environmental conditions, and improved resistance of plants to disease. The scientific quality of BARD-supported research is reflected in its publication record. During the past decade, nearly 2,000 papers were published in more than 200 refereed scientific journals. More than 38 percent appeared in "high impact" journals, including prestigious scientific journals and another 30 percent appeared in the top agricultural research journals. On average, each project produced five refereed publications. In addition, there was an even larger number of presentations at the professional conferences, congresses, symposia, and workshops. In the period 1979 through 1998, a total of 820 grants were awarded, over 1,000 scientific articles were published, and 8 patents awarded.

Several examples of BARD projects include:

—Work supported by the BARD program at the University of Florida resulted in the DNA sequencing of the citrus tristeza virus. This virus has caused major economic losses to the citrus industry in both the U.S. and Israel. The sequencing information can now be used to develop effective methods to protect citrus trees by creating safe strains of the virus that project the trees from disease-causing strains.

—Bovine Genetics. Innovative statistical methods were developed to analyze variation and heritable traits in dairy cattle and to improve classical dairy breeding programs. In addition, continuation projects have initiated a shift from statistical analyses of heritability to genome mapping. This has directly contributed to the international bovine genome mapping program.

—Control of Fungal Diseases. Molecular approaches were employed to produce new commercial tomato varieties with resistance to several important fungal diseases. These new varieties are used commercially worldwide. The study helped explain the genetic diversity of the widespread pathogenic strains of the Fusarium fungus and identified unique DNA sequences that led to the development of diagnostic probes that enable precise identification of the virulent forms of the fungus.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. In 1977, an agreement was signed between the U.S. and Israeli governments which established BARD. An initial endowment fund of $80,000,000 was established through equal contributions from each country. Subsequently, that endowment was increased by $30,000,000 for a total of $110,000,000. Funds for BARD are available from the interest earned on that endowment. In the early part of this decade, a reduction in interest rates, combined with increased research costs, impeded the ability of the BARD program to adequately meet the agricultural research needs of each country's producers and consumers. In fiscal year 1994, the Department directed that $2,500,000 of funding, which had been appropriated for CSREES's National Research Initiative Competitive Grants Program, be used for the BARD Program to supplement the interest earned from the endowment. The supplementary funds were matched by Israel. In fiscal year 1995, Congressional language directed that CSREES again use $2,500,000 of the National Research Initiative's appropriation for BARD, and in fiscal year 1996, the Department directed that a third $2,500,000 increment of the National Research Initiative's appropriation be used for BARD. CSREES received a direct appropriation in the amount of $2,000,000 for BARD in fiscal year 1997, $500,000 in fiscal year 1998, and $400,000 in fiscal year 1999.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The supplemental funds provided by CSREES are matched each year by the Israeli government. Each BARD grant funded by CSREES is for supporting Land-Grant university scientists in the U.S. portion of a collaborative project between U.S. and Israeli scientists. The Israeli portion of the project is supported by supplemental funds from Israel or from interest on the endowment. Therefore, half of each project is supported by non-federal funds.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objective of BARD is to support fundamental science of importance to agriculture in the U.S. and Israel. The generation of knowledge and the need for scientific research was seen as an ongoing process. The trust fund was established to provide a long-term source of funding to conduct research of high priority to both the U.S. and Israel. The creators of the BARD program determined that a 10-year review should be conducted to ensure its relevance and impact. The 10-year external review panel strongly endorsed the success of BARD and recommended its continuance and enhancement. Due to the ongoing nature of scientific research, the annual funding of grant awards is focused on development and application of state-of-the-art science. Each grant project is funded for two or three years, and the results feed into the greater scientific body of knowledge generated by these and other scientists.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The USDA and the Israeli Ministry of Agriculture conducted a 10-year External Review of the BARD program and published the report in September of 1988. The objective of that external review was to evaluate the effectiveness of BARD and the suitability of its concept for bi-national collaborative research. The report concluded that the BARD program had achieved its objectives. The Report of the Review Committee concluded that "BARD is working very well, with extremely high efficiency." "Its organization is robust and its scientific, technological, and economical achievements are outstanding." "The project evaluation and management infrastructure has been paramount in allowing BARD's programs to evolve and flourish." The Report made recommendations relative to operational procedures for managing the grant proposals and emphasized the need for increasing the corpus of the endowment. BARD is now undergoing a 20-year external review. The review will evaluate the scientific and economic impact of the program's funded research as well as its general operations.

BIODIESEL RESEARCH, MISSOURI

Question. Please provide a description of the research that has been funded under the biodiesel research grant.

Answer. Research on biodiesel involves examining the feasibility of producing biodiesel and other higher value products from oilseed crops including soybeans, canola, sunflower, and industrial rapeseed. The project is also evaluating local processing plants whereby farmers could produce crops and process the crops locally and use the fuel and high protein feed coproducts on their farms or locally. This project undergoes merit review at the College of Agriculture.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The initial work is being conducted in Missouri. The results may provide the agricultural community with alternative crops and more diverse markets, additional marketable products, and a locally grown source of fuel. This will result in increased investment in local communities, additional jobs, and increased value added in the farm and rural community sectors.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals were to examine the feasibility of producing biodiesel and other higher value products from oilseed crops, plus to increase the value of coproducts. Results indicate that biodiesel can be produced most economically from soybeans, primarily because of the high value of soybean meal. Since small quantities of biodiesel regularly sell for at least $4.00 per gallon, the structure of the production, marketing, and transportation is currently under evaluation to identify more efficient and less costly ways to produce and market biodiesel. Also, a study of which markets might provide the best opportunity to use increased levels of biodiesel is underway. Such markets might include underground mining and the marine industry in addition to urban mass transit systems and cities having problems meeting

more stringent air quality mandates. Research results indicate that for each one million gallons of biodiesel used by the Kansas City, Missouri, transit fleet in a B20 blend consisting of 20 percent biodiesel and 80 percent petroleum-based diesel, the estimated impacts would be: almost 100 additional jobs; increased investment of $500,000; net increase in personal income of $3,200,000; and increase in total economic activity in the region of $9,600,000. Research has also identified that rapeseed meal compares favorably to soybean meal and blood meal as an animal feed. It has a higher escape protein value than soybean meal. This research is carried out in close cooperation and coordination with other state and Federal agencies, plus trade associations such as the National Biodiesel Board, the United Soybean Board, American Soybean Association, and others.

Question. How long has this work been underway, and how much has been appropriated by fiscal year, through fiscal year 1999?

Answer. The work for this program began in fiscal 1993, and the appropriation for that year was $50,000. The appropriation for fiscal year 1994 was $141,000; and for fiscal years 1995 through 1999, $152,000 annually. A total of $951,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The source of non-federal funds is state appropriated funds. The level in 1994 was $7,310. The funding level for 1995 was $74,854. Cost sharing by the University of Missouri each year for fiscal year 96 and fiscal year 97 was $80,000 and $86,000, respectively. Total cost sharing for the project by the University of Missouri has been $242,224. Additionally, some work funded by this grant has been conducted in cooperation with the National Biodiesel Board, plus the Missouri Soybean Merchandising Council.

Question. Where is this work being carried out?

Answer. The work is being carried out at the University of Missouri-Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principals estimate that the work with biodiesel will require an additional two years to complete. Additionally, the work on higher value products, such as solvents from biodiesel, is expected to be ongoing. Successes with the higher value products will result in more value added opportunities for farmers and rural communities. Also, much of the work in commercializing biodiesel has been with the B20, 20 percent blend, with petroleum-based diesel. This biodiesel research is evaluating the use of biodiesel in much smaller blends, such as one percent or one-half percent. At this use level, biodiesel would be considered an additive rather than as a fuel extender. With this scenario, the primary benefit would be a cost-competitive lubricant with superior performance characteristics, thereby making the product more valuable as a lubricant that as a fuel.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The evaluation of using biodiesel as a complete fuel and in a blend has been met. This project is evaluated on an annual basis based on the annual progress report, discussions with the principal investigator as appropriate, and agency participation in collaborative activities related to this project. The review is conducted by the cognizant staff scientist, and it has been determined that the research is performed in accordance with the mission of this agency.

BRUCELLOSIS VACCINE, MONTANA

Question. Please provide a description of the research that has been conducted under the Brucellosis Vaccines, Montana grant.

Answer. This project will study the immune response of bison to Brucella abortus bacteria and then develop a vaccine that will be effective in stimulating an immune response in bison. The second part of the project will be to incorporate the appropriate antigens in a novel delivery system utilizing the binding of bacteria carrying these antigens to forage type grasses.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The research project is intended to develop a strategy for vaccinating or immunizing cattle against brucellosis by incorporation of Brucella abortus genes into forage plants. The cattle eat the plants containing the bacterial proteins and then develop an immunity against the bacteria, thus preventing any infection following exposure to the bacteria.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the project will be to accomplish incorporation of Brucella genes which code for specific antigens into forage plants and have the genes expressed so that the desired proteins are produced. The project is expected to be funded and started in May, 1999.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work is just being initiated in fiscal year 1999 and the appropriation for fiscal year 1999 is $150,000.

Question. What is the source and amount of non-federal funds by fiscal year?

Answer. The source and amount of non-federal funds for fiscal year 1999 can not be determined until after the end of the fiscal year.

Question. Where is this work being performed?

Answer. The work is being performed at Montana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was May, 2002 or three years from the initiation of the project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As the project is just being started, there has been no evaluation as yet.

CENTER FOR ANIMAL HEALTH AND PRODUCTIVITY, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Center for Animal Health and Productivity grant.

Answer. This research is designed to reduce nutrient transfer to the environment surrounding dairy farms in the Chesapeake Bay watershed. Progress to date includes the development of an individual dairy cow model which will predict absorbed amino acids and the loss of nitrogen in manure. This model has been developed into user friendly software so that trained farm advisors can evaluate herd nutrient management status while on a farm site. A whole farm model has been developed which integrates feeding and agronomic practices to predict utilization of nitrogen and farm surpluses. Using these tools, a survey of dairy farms in the region has been done to assess nitrogen status on dairy farms and potential management practices to reduce nitrogen excesses on dairy farms. Refinement of the model tools and research to refine estimates of the environmental fate of excess nitrogen from dairy farms is in progress. Two on-site reviews of the program have been conducted by the CSREES Project Officer and a third is planned during 1999. The animal and farm models have been published in peer reviewed scientific journals.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that reducing non-point pollution of ground and surface water by nitrogen from intensive livestock production units is of concern nationally, and especially in sensitive ecosystems like the Chesapeake Bay. This research is designed to find alternative feeding and cropping systems which will reduce net nutrient flux on Pennsylvania dairy farms to near zero.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research remains the development of whole farm management systems which will reduce nutrient losses to the external environment to near zero. To date the researchers have developed their own models to more accurately formulate rations for individual dairy cows which permit the comparison of alternative feeding programs based upon both maximal animal performance and minimal nutrient losses in animal waste. This model is being tested on select commercial dairy farms to evaluate the extent to which total nitrogen losses in manure can be reduced without impacting economic performance of the farm. At the same time, whole farm nutrient models have been developed to evaluate alternative cropping systems which will make maximum use of nutrients from animal waste and minimize nutrient flux from the total farm system. These tools are currently being used to survey the current status of nutrient balance on farms in the area and efforts to fine tune the tools are in progress.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. A grant has been awarded from funds appropriated in fiscal year 1993 for $134,000 and in fiscal year 1994 for $126,000. In fiscal years 1995–1999,

$113,000 has been appropriated each year. A total of $825,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This information is not available at the present time.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Pennsylvania, College of Veterinary Medicine.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The University researchers anticipate that work currently underway will be completed by September, 1999. This will complete the original objectives of the research. The principal researcher indicates that consideration has been given to the broadening of objectives to include additional nutrients in the model system, but this has been dropped because technical expertise required is currently not readily available.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Center for Animal Health and Productivity project was last reviewed in June, 1997. An on-site review by agency technical staff was conducted in June, 1995. It was concluded that project objectives are within the goals of the program, are within the mission of both the USDA and CSREES, and the institution is well equipped and qualified to carry out the research project. The institution has made excellent progress towards the completion of the original goals of the project, but still must evaluate the effectiveness of the use of the new tools developed in reducing nutrient runoff from commercial dairy farms in the watershed of the Chesapeake Bay.

CENTER FOR INNOVATIVE FOOD TECHNOLOGY, OHIO

Question. Please provide a description of the research that has been funded under the Center for Innovative Food Technology grant.

Answer. Funds from the fiscal year 1998 grant are supporting research projects on using neural network/fuzzy logic tools to develop a model of a growing and processing cycle for canning tomatoes, using electrostatic coating for snack foods and baked goods, combining several non-thermal processing techniques to sterilize low acid liquid foods, using Near Infrared reflectance systems to measure protein and ash content in wheat flour, using membrane separation systems to produce extended shelf life milk products, and developing a protocol for testing the microbial load of ingredients in meat processing facilities. fiscal year 1998 funds are supporting research from March 1, 1998, through February 28, 1999. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the value-added food processing industry is the largest industry in Midwestern states, including Ohio where the industry contributes over $17,000,000,000 to the annual economy. From an economic development point of view, processing and adding value to crops grown within a region is the largest possible stimulus to that region's total economic product. This program aims to partner with and encourage small and medium-sized companies to undertake innovative research that might otherwise not be undertaken due to risk aversion and limited financial resources for research and development in these companies. The principal researcher believes that, although the initial impact of this research will be regional, the recipient organization of this grant is part of a technology transfer network and proactively seeks opportunities to deploy technologies developed through this research to the food industry on a national basis. Research on value added products of national significance could potentially be supported by competitive grants awarded under the National Research Initiative or under the Initiative for Food and Agricultural Systems.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of the research was to develop innovative processing techniques to increase food safety and quality or reduce processing costs. The neural network project has developed a model for predicting the harvesting time that will optimize product quality and economic return to the grower, processor, and consumer. The coating project has demonstrated the shelf life, sanitation, and product cost advantages available through the use of this technology. The filtration project

will allow fluid milk processors to lower their costs and increase water quality by removing high Biological Oxygen Demand materials from municipal treatment systems. The sterilization project will lower processing costs by increasing the shelf life of liquid products. The extended shelf life project has resulted in the marketing of single serving, long shelf life milk products, and the Near Infrared project will allow flour millers to develop improved process control systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1995. The project received appropriations of $181,000 in fiscal years 1995 through 1997, $281,000 in fiscal year 1998, and $381,000 in fiscal year 1999. A total of $1,205,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In fiscal year 1995, non-federal funds included $26,000 from state funds and $70,000 from industry memberships. In fiscal year 1996, non-federal funds included $26,000 in state funds and $80,000 in industry funds. In fiscal year 1997, non-federal funds included $35,000 in state funds and $95,000 in industry memberships. In 1998, $35,000 in state funds and $105,000 in private industry memberships contributed to the support of the project.

Question. Where is this work being carried out?

Answer. Research is being conducted in the laboratories of the Ohio State University and at various participating companies in Ohio, Illinois, and Pennsylvania.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator anticipates that some projects supported by the fiscal year 1996 grant will be completed by February 28, 1998. At the current funding level, it is anticipated that funding will be required through fiscal year 2000 to achieve the goal of self-sufficiency.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The last review of the proposal was conducted on January 28, 1998. At that time, the agency science specialist believed that the projects addressed issues relevant to food manufacturing, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

CENTER FOR RURAL STUDIES, VERMONT

Question. Please provide a description of the program that has been funded under the Center for Rural Studies Project in Vermont.

Answer. The Center for Rural Studies Project involves applied research focused on developing and refining social and economic indicators used to evaluate the impact of economic development programming and activities. They are perfecting a delivery format for technical assistance for community and small business development. A major component of current research relates to utilization of the world wide web as a delivery vehicle. Project proposal undergoes a merit review within the agency.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to rural development. The grant has addressed methodology and strategies for assessing rural development program impacts.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to create a database and analytical capability for rural development programming in Vermont. Examples of past accomplishments include maps presented to target child hunger programs, targeted areas for other types of rural development program intervention, analytical reports to guide the development of retail shopping areas, an "Economic Handbook for Vermont Counties", and strategies for using the world wide web to disseminate information.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The grant was initiated in fiscal year 1992. Appropriated amounts are: fiscal years 1992–93, $37,000 per year; fiscal year 1994, $35,000; fiscal years 1995–98, $32,000 per year; fiscal year 1999, $200,000 for total appropriations of $437,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Fiscal year 1991 included $91,130 in state matching funds. fiscal years 1993, $143,124; 1994–96, $3,547 state matching funds. fiscal years 1997–98 state dollars were $2,931 plus researcher's salary. 1999 dollars are not known at this time.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through the University of Vermont.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1993. The original objectives of this research have been met. The additional objectives being presented for the current year will be completed by September 30, 2000. Proposal for current has not been received to date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes.

CHESAPEAKE BAY AGROECOLOGY, MD

Question. Please provide a description of the research that has been funded under the Chesapeake Bay Agroecology, Maryland, special grant.

Answer. The Chesapeake Bay Agroecology grant focuses on increasing our understanding of nutrient cycling, retention, and utilization by vital agricultural industries located within vulnerable Chesapeake Bay watershed ecosystems that have been impacted by outbreaks of the toxic microorganisms Pfiesteria. There is a specific focus on Maryland's Eastern Shore. This research focus has been identified as a priority by the State of Maryland's Blue Ribbon Pfiesteria Action Commission Report—1997—and by a Research, Education, and Economics—REE—strategic plan emphasis—Greater Harmony Between Agriculture and the Environment—that calls for "a better understanding of the linkages between agricultural production, water and soil quality, range and forest land health, and habitat protection." Requested funds in fiscal year 1999 will support interdisciplinary projects that bring together the expertise of numerous scientists located at institutions throughout the University System of Maryland. These scientists continue to generate technical and scientific advances that guide Federal, state, and local policy responses to Pfiesteria outbreaks.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The continued viability of Maryland's important coastal agricultural economy, and the protection of Chesapeake Bay and Atlantic Coastal aquatic and agricultural resources from future Pfiesteria outbreaks, depends upon our ability to prevent future toxic algal blooms by stemming the flow of nitrogen, phosphorus, and other agricultural nutrients into estuarine waterways.

Maryland is an acknowledged leader in implementing agricultural nutrient management, soil conservation, conservation reserve, Chesapeake Bay tributary team, and other cooperative planning strategies. However, non-point sources of nutrients remain a major source of pollution into Atlantic Coastal waterways, and farmland remains the largest controllable source of non-point nutrient loading into Chesapeake Bay. Thus, its essential that we continue to increase our efforts to stem nutrient losses into waterways while preserving and enhancing important agricultural industries.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to increase our understanding of nutrient—nitrogen and phosphorus—cycling, retention, and utilization by vital agricultural industries located in coastal regions of Chesapeake Bay, and to develop new technologies and strategies that limit nutrient losses while enhancing vital agricultural industries. This project was initiated in fiscal year 1999.

Question. How long has this work been underway and how much as been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $150,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The project is in its first year. The state of Maryland has pledged to match 100 percent of the Federal funds provided in fiscal year 1999 and in future years for the Chesapeake Bay Agroecology Project.

Question. Where is the work being carried out?

Answer. This research will be conducted at University System of Maryland institutions and field research stations located throughout the state, with an emphasis on the Eastern Shore of Maryland which experienced significant Pfiesteria outbreaks.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project begins in fiscal year 1999. There will be a need for additional Federal, state, and private investment in research to develop new approaches for agricultural nutrient control in estuarine systems for the foreseeable future.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project begins in fiscal year 1999. The projects supported by this special grant will be peer reviewed by an independent, external scientific panel and will be competitively awarded to qualified scientists located throughout the University System of Maryland.

CHESAPEAKE BAY AQUACULTURE, MARYLAND

Question. Please provide a description of the research funded under the Chesapeake Bay Aquaculture grant.

Answer. The objective of this research is to improve the culture of striped bass and its hybrids through genetic improvement, reproductive biology, nutrition, health management, waste management, and product quality. The research provides a good balance between basic and applied research. The university awards grants based on an internal competitive peer review, and the CSREES Program Manager reviews the proposal each year.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the Mid-Atlantic region of the country has significant opportunities to contribute to the overall development of the domestic aquaculture industry. Research supported through this program should have broad application and enhance production efficiency and the sustainability of aquaculture as a form of production agriculture.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original research goal was to generate new knowledge that can be utilized by the aquaculture industry to address serious problems limiting the expansion of the industry in Maryland and the Mid-Atlantic region. The program focuses on closing the life cycle of the striped bass and its hybrids, enhancing production efficiency, decreasing effluents, and improving product quality under aquaculture conditions. Research is conducted in the areas of growth, reproduction and development, aquacultural systems, product quality, and aquatic animal health. Progress has been made in developing controlled artificial spawning techniques and refining the nutritional requirements of striped bass. Scientists continue studies to optimize water quality in closed systems. Water calcium levels above 250 ppm were shown to increase survival in striped bass. Researchers indicate that increased environmental calcium may improve survival and that intermediate salinity levels may improve the feed conversion efficiency in juvenile striped bass. Researchers have developed improved techniques for storing striped bass sperm. Growth hormone administration was shown to increase body length in striped bass. The aquatic animal health component of the research is aimed at the prediction and management of dinoflagellate blooms in estuarine hybrid striped bass ponds

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported under this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was $370,000. The appropriation for fiscal years 1991–1993 was $437,000 per year; fiscal year 1994, $411,000; fiscal years 1995–

1998, $370,000 each year; and fiscal year 1999, $385,000. A total of $3,957,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university reports the amount of non-federal funding for this program is as follows: in fiscal years 1991 and 1992, $200,000; in fiscal years 1993 and 1994, $175,000; in fiscal year 1995, $400,000; in fiscal year 1996 $536,000; in fiscal year 1997 approximately $400,000; in fiscal year 1998, $360,000. The university reports that these funds are from direct state appropriations and other non-federal funding sources.

Question. Where is the work being carried out?

Answer. Research is being conducted at the University of Maryland.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original specific research objectives were to completed in 1993. These specific research objectives have been met, however, the broader research objectives of the program are still being addressed. The specific research outlined in the current proposal will be completed in fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new proposal is submitted to CSREES for funding. The 1998 review indicated the proposal was well written with objectives clearly stated; that excellent progress is reported on previous work; that scientific and technical expertise is excellent; and that the proposal addresses high priority research needs. The 1999 CSREES review will be completed within three weeks of submission of the proposal. The researchers are asked to the develop a research proposal consistent with the National Science and Technology Council's Strategic Plans for Aquaculture Research and Development. The proposal does address high priority research needs for the aquaculture industry at the state, regional, and national level.

CITRUS TRISTEZA

Question. Please provide a description of the research that has been funded under the citrus tristeza research program grant.

Answer. CSREES has developed a RCA with input from industry and researchers for a competitive grant program for this program.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Citrus Tristeza virus is a problem in all citrus growing areas of the United States. The recent introduction of a new vector, the brown citrus aphid, into Florida has allowed for another pathotype of the virus to be introduced. This is a more destructive pathotype of the virus that is more devasting that than those already in the citrus producing areas.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to reduce losses in citrus through research, characterization, and detection of citrus tristeza virus strains, biology, and control of the brown citrus aphid; host plant resistance; epidemiology and crop loss assessment; development of cross-protecting citrus tristeza virus strains; and research to enhance virus free budwood programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $500,000.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. There are no non-federal funds provided for this grant.

Question. Where is this work being carried out?

Answer. Research is being carried out at land grant universities and research centers in the United States, primarily Florida, Texas, California, and Arizona.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this is a new program, the original objectives have not yet been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project will under peer review at the University level and agency merit review.

COMPETITIVENESS OF AGRICULTURE PRODUCTS, WASHINGTON

Question. Please provide a description of the research that has been done under the Competitiveness of Agriculture Products research grant?

Answer. This research improves opportunities for Northwest firms to export forest products and food products.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. Shipping forest products from the Pacific Northwest to Asian markets costs less than shipping them to the eastern population centers in the United States. Research has focused on opening Asian markets including the more complete transfer of U.S. light frame construction building technology primarily to Japan in direct support of the efforts to deregulate the Japanese housing sector, thereby providing large opportunities to export higher valued secondary manufactured products to Japan. The Asian economic crisis has temporarily lowered demand requiring market research on how to protect the export gains that have been made. Research has also been focused on forest management alternatives that can better satisfy environmental goals with less negative impacts on timber-dependent communities. Priorities are set by an outside Executive Board, and they review progress quarterly. Faculty review the technical merits of each project proposal.

Export of foods—specifically produced to meet Asian tastes—improves the global competitiveness of the Pacific Northwest. Research focuses on foreign market assessments, product development, and policy and trade barriers. The focus is on technology that can add value to U.S. agricultural products while meeting changes brought by international trade agreements. This grant is awarded competitively at the state level.

There is a very large opportunity to increase the export of materials and building systems to Asian markets. Northwest companies that could export are generally small and are not able to provide their own research. Construction technologies used in Asian markets are inferior to U.S. technology, yet there is a long history of use and cultural appreciation of traditional methods. Deregulation and change in these markets has required extensive research on comparability of alternative product and building standards, quality and service needs, training in the U.S. technology, and customization to foreign consumer values. The Pacific Northwest can grow more wood with higher quality using more advanced technologies while reducing the impact on timber-dependent communities from harvest constraints to protect certain species. The Northwest agricultural economy is highly dependent upon being able to export given that food production in the region greatly exceeds food consumption.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research in both wood products and food is to provide the information on markets and product technologies that can open higher-valued international markets to U.S. exporters. Foreign purchasers need information on the advantages of U.S. products and U.S. exporters need information on the substantially different quality and service requirements for serving foreign markets. Value added wood product exports had increased over 200 percent prior to the Asian crisis, but still remain 100 percent above earlier levels. If the United States can remain competitive and retain its presence in these markets in the face of a stronger dollar, exports should return to a high growth path once their economies begin to recover.

The food production research has focused on finding new market opportunities for Pacific Northwest producers, solving technical impediments to exports and developing new products and new processes that will enhance exports. It has pinpointed emerging market opportunities in Southeast Asia, China, Mexico, and Latin America. It has improved the export quality of diverse products such as asparagus, apples, grass-seed, and wheat, and it has helped commercialize high-value products such as Wagyu beef, azuki beans, wasabi radish, and burdock and pioneered new food processing technologies that produce fresh-like, shelf-stable products and save energy and reduce waste.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work began in fiscal year 1992. The appropriation for fiscal years 1992–1993 was $800,000 each year; fiscal year 1994, $752,000; fiscal years 1995–

1998, $677,000 each year; and $680,000 in fiscal year 1999. A total of $5,740,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $716,986 State appropriations, $209,622 product sales, $114,000 industry, and $661,119 miscellaneous, for a total of $1,701,727 in 1991; $727,345 State appropriations, $114,581 product sales, $299,000 industry, and $347,425 miscellaneous for a total of $1,488,351 in 1992; $1,259,437 State appropriations, $55,089 product sales, $131,000 industry, and $3,000 miscellaneous, for a total of $1,448,526 in 1993; $801,000 State appropriations, $1,055,000 product sales, $1,040,000 industry, and $244,000 miscellaneous, for a total of $3,140,000 in 1994; $810,000 State appropriations, $42,970 product sales, $785,000 industry, and $2,000,000 gift of a ranch due to the International Marketing Program for Agricultural commodities and Trade Center's research on Wagyu cattle, for a total of $3,637,970 in 1995; $844,000 State appropriations, $45,000 product sales $900,000 industry, and $45,000 miscellaneous, for a total of $1,834,000 in 1996; $876,000 State appropriations, $1,606,000 industry, for a total of $2,482,000 in 1997, and $1,180,000 State appropriations, $604,000 industry, for a total of $1,784,000 in 1998.

Question. Where is the work being carried out?

Answer. The food research is being carried out by the International Marketing Program for Agricultural Commodities and Trade at Washington State University, Pullman, and the forest products research is carried out at the Center for International Trade in Forest Products at the University of Washington, Seattle.

Question. What was the anticipated completion date of the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was projected for 3 years duration to be completed following fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide the summary of the last evaluation conducted.

Answer. Two evaluations of the Washington State University component of the project were conducted in 1992 by the U.S. Department of Agriculture. The State of Washington Legislative Budget Committee gave the Washington State Center exemplary marks for meeting its objectives. On-site reviews are conducted annually of the University of Washington component of the project through annual meetings of the project's executive board attended by the agency's staff. Both components are reviewed annually by the agency. The project is meeting the key objective of trade expansion through innovative research. The University of Washington project was formally reviewed by the agency in 1991. State reviews were completed in 1992 and 1994. A formal review by the University was completed in 1997. A broad survey of constituents impacted by the research was completed, resulting in a very favorable review of the Center's activities and a recommendation to continue this research. In 1998, State of Washington legislation eliminated the requirement for state reviews of the center, including one scheduled for 1999, based on hearings that focused on the other favorable reviews and the continuous oversight by the Executive Board.

CONTAGIOUS EQUINE METRITIS, KENTUCKY

Question. Please provide a description of the research that has been conducted under the Contagious Equine Metritis, Kentucky grant.

Answer. The research being conducted is focusing on a new variant of the original equine metritis agent, and CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The need for this research is national in scope. Several years ago, contagious equine metritis caused serious problems and caused embargoes on importation of horses from other countries. The original organism is currently being controlled, but a new variant has caused concern that it may not respond to current control measures.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal is planned to be a study of the economic impact that this may have on the equine industry, including both racing and performance horses. Also, work will be done to ensure that adequate control measures are in place to prevent widespread infection with this new variant.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This work will be initiated in fiscal year 1999 and the appropriation for fiscal year 1999 is $250,000.

Question. What is the source and amount of non-federal funds by fiscal year?

Answer. No information is presently available as to the probable amounts or sources of non-federal fund in fiscal year 1999 for this project.

Question. Where is this work being performed?

Answer. The research is being performed at the Department of Veterinary Science, University of Kentucky.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original project will be about one year after initiation of the project or May, 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As the project is just being started, no agency evaluation has been done at this time.

COOL SEASON LEGUME RESEARCH

Question. Please provide a description of the research that has been funded under the Cool Season Legume Research grant.

Answer. The Cool Season Legume Research Program involves projects to improve efficiency and sustainability of pea, lentil, chickpea, and fava bean cropping systems collaborative research. Scientist from seven states where these crops are grown have developed cooperative research projects directed toward crop improvement, crop protection, crop management, and human nutrition/product development. CSREES has requested the universities to sub grant proposals for 1999 funding.

Question. According to the research proposal, or principal researcher, what is the national, regional or local need for this research?

Answer. The multi-state region covered by this program represents most of the nation's production of cool season food legumes. These minor crops are very important economically to the region, are the primary source of these important food items, and contribute significantly to U.S. agricultural exports. The growers face a number of production problems that need research if this industry is to compete with international competition. In addition, use of these crops in rotation with wheat is critical to the production of wheat, the major cash crop for the region. National research in the area of crop genetics could potentially be supported by competitive grants awarded under the National Research Initiative and the Initiative for Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The principal researcher believes the original goal of this project was to improve efficiency and sustainability of cool season food legumes through an integrated collaborative research program and genetic resistance to important virus diseases in peas and lentils. Evaluation studies of biocontrol agents for root disease organisms on peas are underway. Other studies are evaluating integration of genetic resistance and chemical control. Considerable progress has been made using biotechnology to facilitate gene identification and transfer. Management system studies have addressed tillage and weed control issues.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 with appropriations for fiscal year 1991 of $375,000; fiscal year 1992 and 1993 $387,000 per year; fiscal year 1994, $364,000; fiscal year 1995, $103,000; fiscal years 1996 and 1999, $329,000 per year. A total of $2,932,000 has been appropriated.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. The non-federal funds provided for this grant were as follows: 1991. $304,761 state appropriations, $14,000 industry, and $18,071 other nonfederal; 1992, $364,851 state appropriations, $15,000 industry, and $14,000 other non-federal; 1993, $400,191 state appropriations, $19,725 industry, and $10,063, other nonfederal; and 1994, $147,607 non-federal support. Non-federal support for 1995 was $150,607; for 1996 it was $386,887; for 1997 $384,628; and for 1998, $392,000.

Question. Where is this work being carried out?

Answer. Research has been conducted at agricultural experiment stations in Idaho, Oregon, Washington, Wisconsin, Minnesota, New York, and New Hampshire. The funds have been awarded competitively among participating states and not all states receive funds each year.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The projected duration of the initial project was five years. Revised objectives are expected to be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation?

Answer. The project is evaluated annually by a university/industry advisory panel. Proposals are peer reviewed at the universities and by CSREES National Program Leaders. This research has provided vital information which is already being used to improve production management. However, a number of critical issues related to insect and disease control as well as crop quality remain to be addressed. Breeding for insect and disease resistance is given the highest priority, while crop management alternatives to help reduce disease and insect pest problems will continue to be studied.

COTTON RESEARCH, TEXAS

Question. Please provide a description of the research that has been funded under the Cotton Research, Texas, grant.

Answer. CSREES has requested the university to submit a grant proposal for fiscal year 1999, that has not yet been received. Texas A&M and Texas Tech Universities have developed an integrated research effort to address cotton production issues using a comprehensive approach in order to strengthen the cotton industry in the high plains. Priority productions and marketing issues will be studied.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The proposed project is expected to help support a broad based program to address priority research needs of cotton grown on the Texas high plain. The specific issues will include production, processing, marketing, and utilization.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to improve cotton production in West Texas and expand the demand for cotton grown in the area.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998. The appropriation for fiscal years 1998–1999 was $200,000. A total of $400,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds supporting the project were $156,000 in fiscal year 1998.

Question. Where is this work being carried out?

Answer. The work will be conducted at the Texas A&M University Research and Extension Center, Lubbock and Texas Technical University Campus.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipate the developmental phase of this project which will establish priorities and provide planning for a long-term comprehensive program should be completed in fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project received a comprehensive review and evaluation at its inseption by Texas A&M and Texas Tech Universities and the CSREES National Program Leader. It will be evaluated annually throughout its lifetime.

CRANBERRY-BLUEBERRY DISEASE AND BREEDING, NEW JERSEY

Question. Please provide a description of the research that has been funded under the Cranberry-Blueberry Disease and Breeding, New Jersey grant.

Answer. The work has focused on identification and monitoring of insect pests on blueberries and cranberries; the identification, breeding, and incorporation of superior germplasm into horticulturally-desirable genotypes; identification and deter-

mination of several fungal fruit-rotting species; and identification of root-rot resistant cranberry genotypes. Overall, research has focused on the attainment of cultural management methods that are environmentally compatible, while reducing blueberry and cranberry crop losses. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. This project involves diseases having major impacts on New Jersey's cranberry and blueberry industries, but the findings here are being shared with experts in Wisconsin, Michigan, and New England.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was the development of cranberry and blueberry cultivars compatible with new disease and production management strategies. Over 75 blueberry selections with wild blueberry accessions resistant to secondary mummy berry infections have been moved into advanced testing identified. The biology and seasonal life history of spotted fireworm on cranberries has been determined. A pheromone trap-based monitoring system for cranberry fruitworm was developed and further refined for commercialization in 1997. Blueberry fruit volatiles attractive to blueberry maggots were identified and tested in the field. Seven major fungal fruit-rotting species were identified, and their incidence in 10 major cultivars of blueberry and cranberry were determined. It is likely that resistance to fruit rot is specific to fungal species. Researchers have planted over 4,500 cranberry progeny for evaluation.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, $100,000; fiscal years 1986–1987, $95,000 per year; fiscal years 1988–1989, $260,000 per year; fiscal year 1990, $275,000; fiscal years 1991–1993, $260,000 per year; fiscal year 1994, $244,000; and fiscal years 1995–1999, $220,000 each year. A total of $3,209,000 has been appropriated

Question. What is the source and amount of non-federal funds provided by fiscal?

Answer. State and non-federal sources are providing funds in the amount of 250,000 each year.

Question. Where is this work being carried out?

Answer. This research is being conducted at the New Jersey Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original objectives was 1995. Those objectives have not been met. To complete the breeding, disease, and insect management and provision of new management guidelines for extension and crop consultants, it estimated that an additional five to nine years will be required.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The last agency evaluation of this project occurred in January, 1998. In summary, the evaluation stated that the effort has continued to be highly productive, with various improved management strategies, plant materials, and environmentally-balanced pesticides being areas of major impact. Some specific accomplishments included continued evaluation of blueberry and cranberry germplasm for yield, color, fruit rot, and flavor; and development of an efficient plant regeneration system for cranberry for genetic transformation. Other research includes trap and lure development for monitoring the cranberry fruitworm and evaluation of several aphicides in blueberries. The discovery of an antisporulant in a registered fungicide provide for a novel use patent for blueberry anthracnose control.

CRANBERRY AND BLUEBERRY, MASSACHUSETTS

Question. Please provide a description of the research that has been funded under the cranberry/blueberry research program grant.

Answer. This is a new research project that will aid in the reduction of pesticide dependence in cranberry and blueberry production in Massachusetts. The main target pests are dodder, weeds, and fungi. This research will provide an integrated pest management approach to cranberry and blueberry production. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. The research is a new approach to managing pests associated with cranberries and blueberries in Massachusetts. The program will focus on the use of molecular genetics to reduce pesticide dependency in cranberry production. The research will be applicable to all cranberry research in states where cranberries are produced. Ongoing regional research in this area is supported by grants awarded under the Minor Crop Pest Management Program.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research are to determine whether early emerging and late emerging dodder populations can be differentiated using molecular markers; to determine the relationships among several isolates of a fungus which might be used in biological control; to screen various plant pathogen fungi isolates for infectivity and virulence and determine the presence of genes in these isolates; and develop an in vitro assay system for root rot and induce resistance in cranberry plants caused by different isotypes of the fungus.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $150,000.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. There are no non-federal funds provided for this grant in 1999.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Massachusetts Cranberry Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this is a new program, the original objectives have not yet been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project will under peer review at the University level and agency merit review.

CRITICAL ISSUES

Question. Please provide a description of the research that has been funded under the Critical Issues grant.

Answer. These funds support research on critical issues related to new or emerging pests and diseases of animals and plants. The program is expected to initiate research in a short time period until other resources can be secured to address the issue. The program began in fiscal year 1996 when potato late blight and vesicular stomatitis in animals were the two targeted emerging problems chosen for funding. Funding for vesicular stomatitis research was continued through fiscal year 1997 in an effort to identify either insect carriers of the virus that could transmit the disease among animals or the wildlife reservoirs of the virus which could contribute to initiation of future outbreaks. In fiscal year 1997, the critical issues funding continued to support research on potato late blight so that growers will be able to manage disease outbreaks more effectively with integrated pest management programs. During fiscal year 1998, these funds were used for support of a project on a newly emerging corona virus strain that is considered to be a probable cause of severe outbreaks of shipping fever or pneumonia in shipped beef cattle. For plant diseases, fiscal year 1998 funds were used to support two major research projects on a new disease of sorghum, Sorghum Ergot. The two projects were Epidemiology and Life History of Ergot and Development of Integrated Control of Sorghum Ergot.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Vesicular stomatitis was of national impact due to its similarity to foot and mouth disease and the negative effect on movement of horses, cattle, and swine during an outbreak. Since 1992 new, highly virulent strains of the potato late blight fungus Phytophthora infestans caused severe losses in potato and tomato production throughout the United States, resulting in what some experts term a national crisis. From 1993 to 1995, a series of meetings involving growers, consultants, industry, academia, and government assessed the growing problem, and participants concluded that extraordinary steps were needed to mobilize research efforts that would

help address the problem in the near term. Bovine shipping fever causes heavy economic losses to the beef industry in cattle being shipped to feedlots and vaccines for currently recognized viruses seem to be ineffective in certain settings in preventing outbreaks. The isolation of a probable new virus, bovine respiratory corona virus, represents an opportunity to contribute to the reduction of this disease complex in cattle. Sorghum Ergot is a serious disease of sorghum which was first detected in Texas in March, 1997. It rapidly spread to almost all sorghum growing regions of the U.S. by September 1997. Decisions on specific research needs and focus of research projects is decided after consultation with a variety of commodity stakeholders, other USDA agencies, especially the Animal and Plant Health Inspection Service, scientists in land grant system, and other public input.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. In animals, the goal was to discover natural reservoirs of the vesicular stomatitis virus and insects which are capable of transmitting the disease among animals. At this time, we have been unable to find significant wild life hosts which could serve as a reservoir for the virus during periods between outbreaks nor have the researchers been able to isolate the virus from insects in areas affected during the most recent outbreak. The bovine respiratory disease work on the apparently new respiratory corona virus is expected to validate the role of this virus in outbreaks of pneumonia in cattle vaccinated for other known causes of shipping fever. Confirmation of such a fact will provide a basis for development of control measures including vaccine development. Research was initiated to provide growers with the knowledge and technologies they need to reduce economic losses resulting from potato late blight with less reliance on pesticides. Research initiated with fiscal year 1996 funds is making progress in developing modeling tools and management approaches that are an important step towards reducing the devastating effects of late blight. The National Late Blight Fungicide Trial provided important information on the efficacy of an array of fungicide programs. A World Wide Web site was established to provide growers, researchers and industry with the latest information on management of potato late blight. The research projects on Sorghum Ergot were intended to develop information about the history and epidemiology of the disease which would lead to studies on development of integrated control programs for this fungus.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. $200,000 per year were appropriated in fiscal years 1996–1999 for a total appropriation of $800,000 to date.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This information is not currently available.

Question. Where is this work being carried out?

Answer. The vesicular stomatitis work was conducted at the University of Arizona and Colorado State University. The potato late blight work has been conducted at Washington State University, Oregon State University, University of Idaho, University of Wisconsin, Pennsylvania State University, and North Carolina State University. The bovine respiratory disease work is being performed at Louisiana State University. The Sorghum Ergot work is being done at the University of Nebraska and Texas A&M University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Critical Issues funds are intended to support the initiation of research on issues requiring immediate attention until other, longer-term resources are available. The objectives of the projects are short-term and are expected to be completed within a 1–2 year period. This has been true for the vesicular stomatitis and potato late blight work. These projects have been reviewed to ensure compliance with the original goals during fiscal year 1997. The subsequent project grants for potato blight in 1997 and for Sorghum Ergot and bovine respiratory disease in 1998 have short term goals and are expected to be completed by the end of their project years which will occur in late spring 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. All projects were reviewed for scientific merit before funding decisions were made. Also, scientists being supported with these funds are in close contact with CSREES' National Program Leaders in these areas so that the agency is kept abreast of developments as they occur. In addition, site visits are arranged when convenient to include as part of other official travel to that state. The vesicular sto-

matitis research has received one site visit review in early 1998 and will be reviewed as a completed project in March, 1999. It is expected that the final results of the bovine respiratory work will be reviewed during early July, 1999. The plant related projects have received similar reviews as the projects have moved forward, and the results are being reported at regional and national meetings.

DAIRY AND MEAT GOAT RESEARCH, PRAIRIE VIEW A&M, TEXAS

Question. Please provide a description of the research that has been funded under the dairy goat research grant?

Answer. The program has addressed a range of issues associated with goat production. Research by scientists at the International Dairy Goat Center, Prairie View A&M University, focuses on problems affecting goat production in the United States. Issues included are the study of nutritional requirements of goats, disease problems, methods to improve reproductive efficiency in the doe, the use of gene transfer to improve caprine genetics, and the evaluation of breeding schemes to improve meat and milk production. Currently, research is in progress to assess the economics of alternative breeding and rearing systems for goats in the southeastern region of the U.S., to study the incidence and impact of intestinal parasites, and to develop least-cost health management strategies for parasite control.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that nationally, most of the farm enterprises that include goats are diverse and maintain a relatively small number of animals. Responding to disease, nutrition, breeding, and management problems will improve efficiency of production and economic returns to the enterprise.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to conduct research that will lead to improvement in goat production among the many small producers in the United States. Research has been conducted to develop and improve nutritional standards, improve genetic lines for meat and milk production, and to define mechanisms that impede reproductive efficiency in goats. Current efforts focus on the development of enterprise budget management tools for goat producers in the Texas gulf coast region.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded through appropriated funds as follows: $100,000 per year for fiscal years 1983–1985; $95,000 per year for fiscal years 1986–1988; no funds were appropriated in fiscal year 1989; $74,000 for fiscal year 1990; $75,000 per year for fiscal years 1991–1993; $70,000 for fiscal year 1994; and $63,000 per year for fiscal years 1995–1999. A total of $1,269,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The University reports no non-federal funds expended on this program.

Question. Where is this work being carried out?

Answer. Research is being conducted at Prairie View A&M University in Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The overall objective of this research is to support the needs of small farms engaged in the production of meat and milk from goats along the Texas Gulf Coast. The university researchers continue to address those needs on an annual basis and anticipate that work currently in progress will be completed by the end of fiscal year 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Dairy/Meat Goat Research grant was reviewed last in June, 1997. The project objectives are within the goals of the program, are within the mission of both USDA and CSREES, and the institution is well equipped and qualified to carry out the research project.

DELTA RURAL REVITALIZATION, MISSISSIPPI

Question. Please provide a description of the program that has been funded under the Delta Rural Revitalization, Mississippi Project?

Answer. The Delta Rural Revitalization, Mississippi Project involves applied research and outreach focused on creating new and expanded economic development

opportunities for the Mississippi Delta region. The project has gone through several phases in the delineation of a strategy for long range development within the region. Phase I was completed with the delivery of a baseline assessment of the economic, social, and political factors that enhance or impede the advancement of the region. Phase II of the project evaluated the potential for entrepreneurship and small business creation as mechanisms to improve economic conditions. Phase III is now focusing on technical assistance to Delta region manufacturing firms to strengthen their ability to provide employment and incomes and includes to development and refinement of data bases and development statistics. The proposals are submitted for internal review and evaluation within the agency. Recommendations are presented to enhance impact on regional and national agendas and provide greater impact on targeted region.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to job and business development as a development strategy. The principal researcher believes that the databases, technical assistance, and analytical capability will increase the effectiveness of economic development and entrepreneurial activity in the region.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The applied research and outreach project was designed to increase ability to strategically guide economic development through target industry attraction. They developed an analytical baseline for the Delta region to benchmark economic development progress and to profile potential arenas of opportunity. An entrepreneurial forum was established to help new business ventures with start-up advice and assistance. A venture capital association was formed to help both inventors and businessmen find capital resources to carry out development initiatives. The emphasis of the project is now shifted to technical assistance for existing industries.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from appropriated funds in the following amounts per year: fiscal year 1989, $175,000; fiscal year 1990, $173,000; fiscal years 1991–93, $175,000 per year; fiscal year 1994, $164,000; fiscal years 1995–99, $148,000 per year. A total of $1,777,000 has been appropriated and awarded.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Total non-federal funds directed to this project, as reported by Mississippi State University, are: fiscal year 1991, $117,866; fiscal year 1992, $84,402; fiscal year 1993, $68,961; fiscal year 1998, $57,404. Reports for other years are incomplete at this time.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through Mississippi State University and sub-contractors.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1990. The original objectives of this research have been met. The additional objectives being presented for the current year should be completed by September 30, 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit periodic reports to the agency to document impact of the project. Significant suggestions have been offered to improve the relevance and impact of this project. Time lines tend to lag on targeted accomplishments. An assessment of the project was conducted by the Social Science Research Center at Mississippi State University and a report compiled in November, 1996.

DESIGNING FOODS FOR HEALTH, TEXAS

Question. Please provide a description of the research that has been funded under the Designing Foods for Health, Texas grant.

Answer. Designing fruits and vegetables for improved health and nutrition will be the over all goal. Health scientists have documented that naturally-occurring compounds such as flavonoids, carotenoids, and antioxidants, have health benefits

to prevent heart disease, stroke, and some forms of cancer. The goal of Texas A&M researchers is to develop fruits and vegetables that have uniform, high levels of these compounds so all consumers can prevent disease through their diet. CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to improve the quality of fruits and vegetables. Fruits and vegetables have naturally-occurring compounds that promote health and prevent disease. Health scientists have documented these compounds and have evidence that they do prevent certain diseases. The medical community is stating that preventing disease is more advantageous than trying to cure it.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research will be to design fruits and vegetables that assist in preventing diseases through diet.

Question. How long has this work been underway and how much has been appropriated by fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $250,000.

Question. What are the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are estimated to be as follows: $146,449 state appropriations and $200,000 miscellaneous in fiscal year 1999.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Vegetable and Fruit Improvement Center and other locations within the Texas A&M University System.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is projected to be 2003. This research is a long-term project and must be continued as health scientists continue to document the compounds in foods that promote disease prevention.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Texas A&M researchers will conduct a peer review prior to submitting the proposal for fiscal year 1999.

DROUGHT MITIGATION, NEBRASKA

Question. Please provide a description of the research that has been funded under the Drought Mitigation grant.

Answer. The National Drought Mitigation Center in the School of Natural Resource Sciences at the University of Nebraska has a comprehensive program aimed at lessening societal vulnerability to drought by promoting and conducting research on drought mitigation and preparedness technologies, improving coordination of drought-related activities and actions within and between levels of government, and assisting in the development, dissemination, and implementation of appropriate mitigation and preparedness technologies in the public and private sectors. Emphasis is directed toward research and outreach projects and mitigation/management strategies and programs that stress risk minimization measures rather than reactive actions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Federal Emergency Management Agency has recently estimated that annual losses attributable to drought in the United States are between $6,000,000,000–8,000,000,000. Drought impacts are escalating in response to increasing demands for water and other natural resources, increasing and shifting population, new technologies, and social behavior. These impacts are diverse and affect the economic, environmental, and social sectors of society. This fact was reinforced dramatically in 1996 in the Southwestern United States. Impacts in Texas alone were estimated to be more than $5,000,000,000.

The Center is receiving non-federal funds in support of this research from the University of Nebraska. In addition, the Center is attracting support for specific projects that are an integral part of its mission from federal and state sources.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to create a National Drought Mitigation Center and develop a comprehensive program aimed at lessening societal vulnerability to drought. The Center has created an information clearinghouse and is delivering information to a diverse audience of users through its home page. Over 50,000 users now access the Center's home page each month. The Center's award winning home page was used extensively by state and federal agencies during the 1996 drought to assist in the evaluation and response process. This home page networks users of drought-related information in the United States and elsewhere with information that would otherwise be unavailable or inaccessible to users.

The National Drought Mitigation Center played an important role in the response of federal and state government to the 1996 severe drought in the Southwest and southern Great Plains states. In addition to providing timely and relevant information on drought severity and alternative response, mitigation, and planning measures, the Center participated in the Multi-state Drought Task Force workshop organized at the request of President Clinton and helped formulate long-term recommendations to improve the way this Nation prepares for and responds to drought. The Center is also a member of the Western Governors' Association Drought Task Force. This Task Force made recommendations to reduce the risks associated with drought in the western United States.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant received an appropriation of $200,000 in fiscal years 1995 through 1999, for a total appropriation of $1,000,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The University of Nebraska contributed $75,737 of non-federal funds in support of this research in fiscal year 1995, $58,977 in fiscal year 1996, and $61,545 in fiscal year 1997. The University of Nebraska contributed $67,819 in fiscal year 1998.

Question. Where is this work being carried out?

Answer. The research will be conducted at the University of Nebraska-Lincoln.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The research conducted under this project is being undertaken under a series of nine tasks. Significant progress on each of these tasks has been made, but these activities are ongoing. The information clearinghouse has been created, but new information and documents are continuously added to the home page in response to users' needs and requests. In addition, the drought watch section is updated monthly to assist users in evaluating current climate and water supply conditions. Research on new climatic indices to monitor drought and water supply conditions are being tested and mitigation technologies and existing state drought plans are continuously evaluated. New activities are also being initiated in response to the growing interest and awareness in drought mitigation in the United States and elsewhere. For example, the activities of the Western Drought Coordination Council provides the Center with a broadening range of activities on an annual basis.

Question. When was the last evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer-reviewed at the time the proposal was prepared in 1998. Each year when the new proposal is prepared, it is reviewed at the university and again at CSREES. The project is evaluated for progress toward completion of objectives, new activities proposed, and accomplishments.

ECOSYSTEMS, ALABAMA

Question. Please provide a description of the research that has been funded under the Ecosystems, Alabama, grant.

Answer. In 1998, CSREES approved a proposal from Auburn University to support projects at two Community Colleges in Alabama—Faulkner State Community College and Alabama Southern Community College. The Faulkner State Community College's project is intended to (1) fund the development of distance education classrooms for estuarine-and marine-related education, and (2) to establish an aquaculture-related veterinary technician education program. The Alabama Southern Community College project will purchase and install laboratory equipment to further the educational capacity of the Center for Excellence in Forestry, Paper, and Chemical Technology.

Question. According to the research proposal, or the principal researcher, what is the local, regional, or national need for this project?

Answer. Faulkner State Community College asserts that their veterinary technician program will be the only such program in the country, providing the first two years of the degree program leading to an A.A. degree at Faulkner State, and the second two years leading to a bachelor's degree at Auburn University. The distance education capacity is intended to better integrate marine and estuary research into educational activities.

The Center for Excellence in Forestry, Paper, and Chemical Technology at Alabama Southern Community College is believed to be a unique educational opportunity in the Southeastern United States due to the merging of four individual technology training programs. These programs are: (1) Industrial Maintenance, (2) Electronics and Instrumentation, (3) Paper Process, and (4) Chemical Process training.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals for these projects include the development of a veterinary technician training program and integration of marine and estuary research into classrooms at Faulkner State Community College; and to establish a state-of-the-art wood paper process and chemical process laboratory at Alabama Southern Community College.

These projects were initiated during the late summer of 1998, and no progress has yet been reported.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. These projects were initiated September 1, 1998, and have received a total of $1,000,000 to date with $500,000 appropriated per year in fiscal years 1998 and 1999.

Question. What is the source and amount of non-federal funds provided to support this project?

Answer. No non-federal funds have been identified to support this project.

Question. Where is this work to be carried out?

Answer. The project will be conducted at the Faulkner State Community College Aquaculture Center in Alabama and at the Alabama Southern Community College Center for Forestry, Paper, and Chemical Technology.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Alabama Southern Community College project proposal indicates a two year budget for project completion. The Faulkner State Community College proposal was for one year only. The objectives have not yet been met but are well underway.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project began in fiscal year 1998 and has not had a formal, onsite review to date. It received a merit review at the time the project proposal was submitted.

ENVIRONMENTAL RESEARCH, NEW YORK

Question. Please provide a description of the research that has been funded under the environmental research grant.

Answer. The environmental research in New York has several major goals. These are: (1) to better understand the impacts of nutrient flows, principally nitrogen, from agriculture on non-agricultural ecosystems, forests, wetlands, and water resources in mixed ecosystem landscapes; (2) to improve knowledge of agricultural contributions to greenhouse gas emissions and effects of projected climate change on crop production; and (3) to develop innovative approaches and technologies for improving the efficiency of agricultural production and/or reducing environmental impacts of agriculture. New thrusts for the coming year include: 1) to improve understanding of the impacts of land application of biosolids on the sustainability of New York agriculture and on water quality, and to develop management practices and guidelines for sustainable use of biosolids in New York agriculture; and 2) to evaluate spatial and temporal variability of crop yields within fields and to develop management practices that increase productivity, increase the efficiency of use of inputs, and reduce environmental impacts of agriculture.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Interactions between agriculture and the environment are many and complex and require multi-disciplinary efforts to both understand the interactions and to develop effective management strategies. Programs supported by the special grant are multi-disciplinary in nature, involving technical scientists from a range of disciplines, together with social scientists and economists. Additionally, translation of knowledge from plot or field studies to larger scales, such as landscape to regional and global, is needed to provide information that is useful to policy makers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. One goal of the program is to identify impacts of nitrogen flows from agricultural lands on adjacent natural ecosystems, forests and wetlands, and water resources, and to devise management strategies to minimize these impacts.

Nitrogen leaching from maize-based cropping systems has been shown to be higher when organic sources of nitrogen, manures, and plow-down alfalfa are used as nitrogen sources for crop growth compared to use of inorganic fertilizers. Attempts to use an interseeded cover crop to capture and recycle excess nitrogen left over after the cropping season were only marginally successful due to limited growth of the cover crop following maize harvest in New York's climate. A computer-based nitrogen decision support system to improve recommendations for on-farm nitrogen management was developed and implemented in New York.

A second goal of the program is to investigate several interactions between agriculture and climate change. Studies of methane fluxes to/from soils showed that northern hardwood forests are both a source and a sink for this powerful greenhouse gas and overall may be a net source of methane. In contrast, upland agricultural systems were consistently found to be a sink for methane. Use of legume green manures to supply nitrogen in an organic production system increased methane emissions two-fold, creating a conflict between a sustainable agriculture practice and the environment.

No-tillage agriculture was shown to increase preservation of existing soil organic carbon, but accumulation of carbon derived from crop inputs was higher with conventional tillage. Inputs of carbon to soils from root exudates and residues were found to be more important to carbon sequestration in soils than were residues from the tops of plants.

A third goal of developing innovative approaches to management systems and technologies has the following components:

—Whole farm analysis and planning

—Soil quality changes in the Chesapeake farms sustainable agriculture project

—Use of constructed wetlands to mitigate phosphorus run-off from barnyards Assessments of nutrient use and management on farms have been carried out in Cayuga County, New York and in Pennsylvania, in conjunction with Rodale Institute. In New York, mass nutrient balance data on dairy farms has shown that, because of nutrient imports in feed and inadequate cropland area, nutrients excreted in manure exceed crop requirements. Coupling of models for nutrient management and animal diets was used to develop improved management practices. On one farm, production of nitrogen in manure was reduced 25 percent by more accurate balancing of animal diets and on a second farm modification of the cropping pattern reduced the imported nitrogen in feed by 13 percent.

Soil quality assessments at the Chesapeake farms sustainable agriculture project on Maryland's Eastern shore, where various cropping systems are being compared with the conventional corn-soybean rotation, have shown that soil quality improves as the cropping system becomes more complex, involves less tillage, and has more organic inputs.

Mitigation of phosphorus in runoff from barnlots by a constructed wetland system is being evaluated on a 500 head dairy farm in New York. Different substrates in the wetland beds are being evaluated, including soil, limestone, norlite, and wollastonite. To date, the soil and norlite materials are proving to be the most effective at phosphorus removal.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of $297,000. The fiscal years 1992–1993 appropriation was $575,000 per year; $540,000 in fiscal year 1994; and fiscal years 1995 through 1999, $486,000 each year. A total of $4,417,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In fiscal year 1991, Cornell University provided $27,893 and the State of New York provided $118,014. In fiscal year 1992, Cornell University provided

$37,476 and the State of New York $188,915. In fiscal year 1993, Cornell University provided $13,650 and the State of New York $243,251. In fiscal year 1994, the State of New York provided $214,989. In fiscal year 1995, the State of New York provided $233,085. In fiscal year 1996, the State of New York provided $388,301.

Question. Where is this work being carried out?

Answer. This research is being conducted at Cornell University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original estimate was for a five-year program, and many of the initial objectives in the nitrogen and climate change areas have been met. New objectives evolved from the original, work and the program was also oriented to consider broader dimensions of environmental management, particularly strategies for community-based watershed management, involving linkage of technical knowledge with social and local governmental perspectives and needs. Estimated completion dates for current program elements are:

1998–1999 program year:

—Nutrient processing in wetlands

—Use of weather forecasts in weed management

—Use of constructed wetlands to remediate barnyard run-off

—Effect of climate variability on crop production

—Carbon storage in soils

Completion beyond 1999:

—Watershed science and management

—Effects of elevated CO_2 on crop yield potential

—Remington farms sustainable agriculture project—a 10-year project

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer reviewed in 1997 and 1998. Overall, the project was rated very high. Specific ratings included the following:

—Outstanding scientific merit.

—Appropriate methodology.

—Excellent previous accomplishments.

—The project has potential for significant impact concerning the relationship of agriculture to global change.

—The proposal is well conceived and well written.

ENVIRONMENTAL RISK FACTORS/CANCER, NEW YORK

Question. Please provide a description of the work that has been funded under the Environmental Risk Factors/Cancer, New York, grant.

Answer. The agency has requested the University to submit a renewal grant proposal that is currently being reviewed.

Question. According to the research proposal, or the principal researcher, what is the national, regional, and local need for this research?

Answer. The American Cancer Society estimated that over 178,000 women in the United States were diagnosed with breast cancer in 1998. The role of environmental risk factors, such as pesticides, is of concern to women, the agricultural community, and policymakers. This project, emphasizing risk reduction prevention information, will work at filling that void.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original and continuing goals of this research are:

—To establish and maintain a database of critical evaluations on the current scientific evidence of breast carcinogenicity and effects on breast cancer risk for selected pesticides.

—To effectively communicate database information to the scientific community, federal agencies, pubic health professionals, the agricultural community, and the general public using innovative electronic methods of communication, in-service training sessions, printed materials, and exhibits.

—To further develop the Breast Cancer Environmental Risk Factors—BCERF—World Wide Web to improve ease of use, add informational materials and hyperlinks, and determine the feasibility of developing an online, searchable bibliography on pesticides and breast cancer risk accessible through this Web site.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1997, and appropriations were as follow: fiscal years 1997, 1998, and 1999, $100,000 per year for a total of $300,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $150,000 state appropriations for fiscal year 1996; $250,000 per year in state funds—New York—were requested for fiscal years 1997, 1998, and 1999.

Question. Where is this work being carried out?

Answer. This research is conducted at the Cornell University, Ithaca, New York.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This was a new project which began in April 1997. The anticipated completion date is March 31, 1999.

Objectives met: Database was established during year one and is updated and expanded each year. It currently has over 2,400 entries with over 200 added each quarter. Also, it includes full bibliographies of all pesticide and dietary/lifestyle scientific critical reviews. Scientific Critical Evaluation of seven pesticides—four in fiscal year 1997; three in fiscal year 1998—have been completed or are nearing completion. Two pesticides and/or non-pesticide agrochemical will be developed in fiscal year 1999. Science-based information material—fact sheets—have been developed not only for the seven pesticides, but also for four diet/lifestyle breast cancer risk factors, plus two on water contaminants and cancer, two on food safety, and two general fact sheets on breast cancer. Nine additional fact sheets are to be developed in fiscal year 1999. Two video teleconferences and an in-service have been held and evaluated. Followup telephone surveys of 1997 facilitators at BCERF satellite video conference downlink sites and participants at the June 1997 on-campus training program was completed, and an analysis of response data was initiated. The Farm Exhibit is expected to be completed in Spring 1999 and evaluated during Summer 1999. The BCERF website was revamped in 1997–1998 and relaunched in September 1998. The number of browsers accessing the BCERF home page has risen from 380 to 450 hits per month during the summer of 1998 to 1,053 hits in November and 3,490 hits in December.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. As a relatively new project, a complete evaluation has not been conducted, although the proposal is currently under review. Periodic progress reports have been made throughout the year. The project is moving towards achieving its desired goals. A final evaluation will be made after March 31, 2000.

BCERF has done an evaluation of the video teleconferences and in-service and have had the pesticide fact sheets reviewed by several focus groups—breast cancer survivors and women not having breast cancer.

The participants brought a variety of perspectives to the discussion, providing BCERF with a wealth of important feedback on our fact sheets and educational approach. Some of the conclusions we have drawn from this evaluation have already resulted in simple changes made in the preparation of current fact sheets. Other feedback from this evaluation will inform our planning efforts for the education component in general.

EXPANDED WHEAT PASTURE, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Expanded Wheat Pasture, Oklahoma grant.

Answer. This project was designed to develop improved supplementation programs and new systems for technology delivery to reduce production risk of raising cattle on wheat pasture. The work involves evaluation of grazing termination date on grain and beef production, assess the impact of wheat cultural practices, and develop an economic model to evaluate alternative decisions on grain/beef production. Additional effort is directed toward development of cool season perennial forage grasses to complement wheat pasture. The proposal for fiscal year 1999 has been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that this work addresses the needs of wheat/cattle producers of Oklahoma as a primary focus. However, it would appear to have application regionally in adjacent wheat growing states.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop economically-viable management systems for use of wheat for supplemental pasture for beef cattle before the crop starts making grain. This work has already shown how the use of feed supplements can increase net profit from cattle grazing on wheat pasture. The study has identified management practices, e.g. date of planting, cultivar selection, grazing intensity, and date of cattle removal that produce the optimum grain yield and cattle gain. A Wheat/Stocker Management Model has been developed as a decision aid to help producers assess income risk in the operation. Work is underway on a Wheat Grazing Systems simulation model.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1989 and appropriations were as follows: fiscal year 1989, $400,000; fiscal year 1990, $148,000; fiscal year 1991, $275,000; fiscal years 1992–1993, $337,000 per year; fiscal year 1994, $317,000; and fiscal years 1995–1999, $285,000 each year. A total of $3,239,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $175,796 state appropriations in 1991; $174,074 state appropriations in 1992; and $236,584 state appropriations in 1993. The non-federal support for 1994 was $238,058 for state appropriations. Funds for fiscal year 1995 were $275,426, for 1996 were $120,000, for 1997 were $190,510, and for 1998 $224,500.

Question. Where is this work being carried out?

Answer. The research is being done at Oklahoma State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project started in 1989 with a projection of 10 years to complete the research objectives. Some objectives are nearing completion while others will require further study. A number of wheat cultivars have been identified which will tolerate grazing and still produce economic grain yields. The grazing cut off date for grain production has been established. However, year to year variation need additional study in order to develop a reliable decision support system.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This program is reviewed annually. Each year's funding cycle is peer reviewed internally and by CSREES National Program Leaders for scientific merit and relevance. Results from this project are currently being used by ranchers to help with management decisions concerning stocker cattle grazed on wheat that will be harvested for grain. Current work is designed to refine the current information and identify wheat cultivars and grazing management for optimum economic return.

EXPERT IPM DECISION SUPPORT SYSTEM

Question. Please provide a description of the research that has been funded under the Expert IPM Decision Support System grant.

Answer. A prototype information and decision support system was developed in collaboration with Purdue University and the Department of Energy's Argonne National Laboratory that integrates and manages information from multiple data sources. Development of this system now continues with the collaboration of the Office of Pest Management Policy—OPMP—and the National Science Foundation Center for Integrated Pest Management—CIPM—at North Carolina State University—NCSU. Components of the Pest Management Information Decision Support System—PMIDSS—include information on the U.S. Environmental Protection Agency—EPA—review status of pesticides, crop losses caused by pests, status of minor use registrations—IR–4—current research in progress, and priorities of IPM implementation teams. The PMIDSS data, along with OPMP/Pesticide Impact Assessment Program—PIAP—crop profiles, provide the background information that is critical to the development of commodity-specific transition strategies in response to the Food Quality Protection Act—FQPA—driven regulatory decisions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. When fully operational, the PMIDSS will serve national, regional, and local needs for research and extension activities. At the national level, the system supports the USDA/EPA Memorandum of Understanding—MOU—to identify crop

protection gaps and to find alternatives to pesticides either under FQPA regulatory review or those being lost due to pest resistance. The system will assist in the identification of priorities for the Pest Management Alternatives Program and regional IPM Special Grants and Special Projects. It will provide a mechanism for decision transparency and for all stakeholders to interact with the priority setting process. The ultimate result will be to help insure that farmers have adequate alternatives for managing pests at the specific local level.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the PMIDSS was to refine the process of identification for IPM needs of USDA, EPA, and the states. This goal reinforces the state and Federal partnerships to disseminate important pest management information for improved decision making and environmental quality, and to address future needs. In 1996 and 1997, the program addressed priority commodity pest management needs resulting from voluntary pesticide cancellations and regulatory cancellations, responding to the MOU and a supplemental MOU between EPA and USDA. The supplemental MOU was signed in April 1996, at which time there were 58 pesticides and 374 uses identified and prioritized. The process included information on cancellations furnished by EPA. Selected uses were sent to the states' PIAP and IPM networks. Impacts of cancellations affecting individual states were reported for inclusion in the decision support system. Twenty-five minor use crops on which 40 specific pests were identified in the 1997 Request For Proposals. Results were also used by the regional IPM grants program Request For Proposals. The Pest Management Alternatives Program WorkBench prototype—a major component of PMIDSS—was made accessible on a test basis through a web-based server maintained by the CIPM at North Carolina State University and the software has been delivered. A web-based pest management information system that allows concurrent multiple database searches of four key databases—Crop Profiles, National Council for Food and Agricultural Policy—NCFAP—Pesticide Use Data, OPMP Pipeline, and the Reregistration Notification Network—is presently available through a secure web server maintained by CIPM.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This work began in 1994 with development of the concept and design, and has proceeded through steps including database identification and specific development of a prototype and software. Current development is to bring the product to the web and provide multiple database search capabilities for ease of data access. In fiscal year 1994, we expended $40,000 of CSREES administrative funds and $90,000 from Science and Education Evaluation Funds to initiate collaborative work with the Argonne National Laboratory. In fiscal year 1995, we expended $172,000 as a Cooperative Agreement with Purdue University and Argonne National Laboratory from the Pest Management Alternative Special Grant Funds and $5,000 from PIAP funds. In fiscal year 1996, we expended $177,000 in a cooperative agreement with Purdue University and Argonne National Laboratory from Pest Management Alternative Special Grant Funds, $21,000 from Research, Extension, and Education Evaluation Funds, and $40,000 from PIAP funds—for development of PIAP data fields. In fiscal years 1997 and 1998, we expended $165,425 and $177,000 to Purdue University and Argonne National Laboratory. In fiscal year 1999 we are expending $177,000 to NCSU–CIPM, to make the system web-based and provide access to multiple databases.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. It is difficult for us to estimate the amount of non-federal funds supporting the PMIDSS. Purdue University, Cornell University, and NCSU have contributed non-federal resources in the form of dollars and personnel time. The CIPM at NCSU is supported in large part by corporate funds, part of which have underwritten Center personnel salaries. A number of states have provided information that is part of the information base. Many program areas are contributing databases that are part of the Pest Management Information Decision Support System.

Question. Where is this work being carried out?

Answer. Presently, the bulk of the work is carried out in Washington, D.C. and in Raleigh, North Carolina. CSREES has National Program Leaders in IPM, PIAP, and IR–4 program areas working on PMIDSS. The CIPM at NCSU manages the web server where the prototype and a pest management information system is located and is developing the multiple concurrent database search and decision support capability. Interaction and information is provided by every state in our system. We are in the process of strengthening the role of Land Grant partners in this

program and additional database access is being developed through CIPM at NCSU and through a sub-contract with George Mason University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Our original estimate was two to three years with adequate resources to complete the developmental work. However, the design considerations became more complex with the 1996 passage of the FQPA. Program needs dictated an expansion and change in information bases. In addition, technology that was unavailable in 1994—the web—is now a major and needed part of the program strategy. We feel we are reasonably addressing FQPA objectives with available resources to become an ongoing activity of the USDA. Utility of the system to the Agency, Land Grant partners, and the private sector stakeholders will increase as additional databases are added to both the data access and decision support aspects of the project. It is critical that the data sources be maintained as part of an interconnected system. Toward that end, the PMIDSS team is now working directly with many data providers—IR–4, NASS, NCFAP—and users—CSREES, OPMP, EPA, commodity groups, and agribusiness—to assure that needed data are available, consistent, current, and searchable. The PMIDSS program is a key component for transparent data access and decision support for FQPA responses by OPMP and CSREES.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. PMIDSS underwent a formal review in June 1997, and a major piece of the system, the Pest Management Alternatives Program WorkBench, was reviewed by regionally-selected land grant scientists and others in November 1997. In August 1998, a progress review evaluated the engineered software product and determined the need for a web-accessible multiple database search and look-up function for the system. A concept review held in September 1998 demonstrated the functionality of a web-based decision support system. The June review recommendations included: focus the system on the needs of the Pest Management Alternatives Program, timely delivery of the software product to USDA, and development of a plan to sustain the system in a user-friendly, widely available format. The November evaluation of the WorkBench brought the following comments and recommendations: the WorkBench provides good linkages to relevant databases and brings together essential information on pest management issues; the system should be placed on the World Wide Web for greater access and utility; tell potential users that it is available; and invest in high quality databases to support and enhance data integrity of the WorkBench. Development now focuses on the needs of the Pest Management Alternatives Program, the requirements of FQPA, and an easy-to-use interface for data search and access. Data access is focused on current and transparent databases to address critical FQPA needs.

FARM AND RURAL BUSINESS FINANCE: ILLINOIS AND ARKANSAS

Question. Please provide a description of the research that has been funded under the farm and rural business finance program.

Answer. Federal funding for this project provides partial support for the Center for Farm and Rural Business Finance which conducts a program of research and information on the financing of farms and rural businesses in the United States. The plan of work focuses on the financial management performance of farm and rural businesses, evaluation of financial markets and credit institutions serving rural America, and the impacts of public policies and regulations on the structure and performance of rural financial markets. This project addresses some of the same issues included in the RRF Project NC–221, Financing Agriculture and Rural America: Issues of Policy, Structure, and Technical Change. Professional staff at the two institutions are engaged in both projects. Proposals for the grant funds for this special project are peer reviewed at the performing institutions and are reviewed for merit within the CSREES when received. Additional peer review occurs with the Hatch project included in NC–221.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The need is national in scope in that the shifting policy environment, the changing structure within the agricultural sector, and managerial responses to technical change and changes in tax regulations have nationwide impacts. Regional and local needs vary with the commodity mix in the agricultural sector and the availability of financial institutions and services to meet local needs. The new agricultural policies that have altered the "safety net" significantly increase the financial risk for farmers, ranchers, and agribusinesses. Changes to the Federal income tax,

capital gains tax, and estate tax provisions can have significant impacts on owners of agricultural assets. Consolidations are occurring within the Farm Credit System, and increased integration and coordination at the farm level within hog and other concentrated enterprises are providing access to additional sources of capital.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal is to assist farmers, ranchers, and rural businesses with research-based information on financial management as they face increasingly complex financial markets. The project is completing projects on the post-acquisition performance of banks resulting from recent mergers, levels and trends in small farm and small business lending across different types of commercial banks, and the measurement and classification of the financial performance of agribusiness firms. Additional projects have developed a model of working capital management applicable to a wide variety of selected agribusiness firms and have identified primary risks associated with lending to integrated farm production units. Other projects are measuring the longer term impacts of changes in the Federal tax laws on the financial performance of Illinois farms, evaluating the financial characteristics of rural banks and assessing their competitiveness in rural financial markets, and identifying the financial characteristics of high performing agricultural banks. A project at the University of Arkansas is analyzing the effects of financing in accelerating the cattle cycle.

Question. How long has the work been underway, and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work has been underway since 1992. Appropriations were $125,000 in fiscal year 1992, $125,000 in fiscal year 1993, $118,000 in fiscal year 1994, $106,000 per year in fiscal year 1995 through fiscal year 1997, $87,000 per year in fiscal year 1998 and fiscal year 1999. Appropriations through fiscal year 1999 total $860,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal sources and funds provided for this program in fiscal year 1992 totaled $259,427 with $58,427 in State appropriations, $189,000 from industry and $12,000 from miscellaneous sources. In fiscal year 1993, the total was $287,890 with $94,588 in State appropriations, $133,000 from industry, and $25,000 from miscellaneous sources. In fiscal year 1994, the total was $391,000 with $221,000 coming from State appropriations, $45,000 from industry, and $125,000 from the National Research Initiative competitive grants programs. In fiscal year 1995 the total was $185,000 where $46,000 came from State appropriations, $62,500 from industry and $76,500 from miscellaneous sources. In fiscal year 1996, the total was $344,000 where $294,000 was appropriated from State sources and $50,000 from private sources. In fiscal year 1997, $125,000 was appropriated from State sources, $103,000 was received through a National Research Initiative grant, and $130,876 was received from the Council on Food and Agricultural Research. In fiscal year 1998, $176,250 was received from a Fund for Rural America grant, $65,000 from a CSREES Special Research Grant, and $20,000 from miscellaneous sources. Non-federal support for fiscal year 1999 has not been identified.

Question. Where is the work being carried out?

Answer. Researchers and professional staff conducting this program are located at the University of Illinois and the University of Arkansas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the program, as amended with additional funding and new termination dates, now extend to fiscal year 1999. Although initial objectives have been met, new developments in the rural finance environment call for continuing work to address new dimensions of the objectives. Anticipated completion dates of these amended objectives extend through fiscal year 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the latest evaluation conducted.

Answer. The project is evaluated periodically during the year through direct contact with the Director of the Center and the project leaders, as reports are received, and annually when proposals are submitted. Internal agency criteria are used to evaluate the program in terms of whether objectives are being met, appropriate methods are being used, and timelines are being met to a reasonable extent. The general objectives of this program continue to be met and results from specific projects are evaluated as they evolve. The latest evaluation shows 16 separate projects underway that have or are nearing completion. Results are applicable to issues within the rural finance community. A National Symposium for Agricultural

Finance Executives provides a valuable service and visibility for the Center. The program has led to an impressive number of publications by the Project Director and the project leaders. Articles have been published in leading U.S. agricultural and finance journals and in international journals addressing the same topics.

FEED BARLEY FOR RANGELAND CATTLE, MONTANA

Question. Please provide a description of the research that has been funded under the Feed Barley for Rangeland Cattle, Montana grant.

Answer. This project will support research on the nutritional value of barley cultivars as feed for beef cattle. This effort will assist with the breeding and selection of superior types that can be more competitive with other feed grains and improve farmer income from barley crops grown in rotational systems in the Northern Great Plains. The project was subjected to a merit review.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Barley as a feed grain is grown extensively in the United States. Based on chemical analyses and the experience of some cattle feeders, the principal researcher believes it should have a feed value on par with corn and wheat. However, it is listed as inferior to both in feeds hand books and is, therefore, discounted in the market. Comprehensive feeding studies of various barley types will be conducted to document the value as a feed grain for beef cattle.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to determine the true feed value of barley for feeder cattle, and thereby improve the economic return to barley production.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal year 1996 was $250,000, for fiscal year 1997, $500,000, and in fiscal years 1998 and 1999, $600,000 per year. The total appropriation is $1,950,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds for this project were $160,000 in 1996, $174,500 in 1997, and $168,000 in 1998.

Question. Where is this work being carried out?

Answer. Research will be conducted at Montana State University.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion of the original objective is fiscal year 2001. Integrating of findings into management systems is expected by 2005 with outreach and information dissemination completed by 2010.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The project is evaluated annually. It undergoes a scientific merit review by two Department Heads and three peer faculty members. It is reviewed again by a CSREES scientist upon submission.

FLORICULTURE, HAWAII

Question. Please provide a description of the research that has been funded under the floriculture program grant.

Answer. The research carried out with these funds involves wholesale and retail U.S. and Japan market research, development of new varieties for aesthetic values and pest resistance, and pest management strategies to meet quarantine needs and consumer expectations.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The researcher believes the tropical cut flower and foliage industry in Hawaii, which includes anthurium, orchids, flowering gingers, bird of paradise, heliconia, protea, and cut foliage is worth over $50,000,000 primarily in out-of-state sales. Development of disease resistant cultivars and quarantine pest management strategies that reduce pesticide usage are high priority issues at the national level.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was to develop superior Hawaii anthuriums, orchids, protea, and exotic tropical flower varieties with disease resistance, particularly to anthurium blight which devastated the Hawaii anthurium industry through the mid-1980's and reduced Hawaii's market share. Additionally, research focused on development of post-harvest handling practices and quarantine pest control. To date, a new anthurium cultivar has been patented and released. Additional blight resistant cultivars are being propagated and tested by the anthurium industry. Disease resistant protea germplasm has been obtained from South Africa and is being used in the protea breeding program. A post-harvest hot water dip treatment has been developed and is being used commercially on tolerant cutflower species to meet quarantine requirements.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $300,000; fiscal years 1990–1993, $296,000 per year; fiscal year 1994, $278,000; and fiscal years 1995–1999, $250,000 each year. A total of $3,012,000 has been appropriated since 1989.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: State appropriations of $87,937 in 1995, $56,680 in 1997, and $62,600 in 1998 for a total of $207,217 since 1995.

Question. Where is this work being carried out?

Answer. Research is being conducted by the University of Hawaii at Manoa and Hilo.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives in the original project were to maintain Hawaii floricultural industry competitive. This objective continues to be the principal direction for the projects. Because the industry and the markets are changing pests are becoming either resistant or newer strains. And quarantines are changing with technology the objective remains valid.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The individual projects funded under this Special Research Grant are evaluated through merit review to ensure that good science is being used. This evaluation is the major tool used to award funds to the projects.

FOOD AND AGRICULTURE POLICY INSTITUTE, IOWA AND MISSOURI

Question. Please provide a description of the research that has been done at the food and agriculture policy institute program.

Answer. The Food and Agriculture Policy Research Institute—FAPRI—was established by Iowa State University and the University of Missouri, Columbia, in 1984. The purpose of the institute is to conduct comprehensive analyses and disseminate results about the economic impacts of U.S. food, farm, and trade policies to agricultural producers, agribusinessmen, and public policymakers. Iowa State conducts research on the economic interrelationships within and between domestic and foreign food and agricultural markets from the farm gate to market destinations; develops and maintains databases and analytical support systems to facilitate the analysis of agricultural and trade policy issues; and evaluates the impacts of U.S. and foreign commodity supply, demand, and public policy programs on agricultural trade. The University of Missouri maintains models of the domestic agricultural economy and directs its efforts primarily to the analysis of domestic policy issues. The two universities maintain linkages with a number of other universities who provide data and analytical support to the system.

The universities maintain a comprehensive analytical modeling system of the U.S. and international food and agricultural sectors to evaluate near-and long-term economic implications of alternative farm policies for the basic commodities. Each year, and more often if conditions require, the system is used to provide economic information on potential impacts out to 10 years in the future of farm policies on farm prices, income, output, government program cost and means to enhance the management of farm programs at the national level.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The Nation's agricultural sector and its components are subject to numerous Federal policies and programs. FAPRI is the only publicly-supported, non-fed-

eral organization with the analytical capability to assess and evaluate the numerous public policies and programs affecting the agricultural sector and report results to a broad constituency including farmers, agribusinessmen, and Federal and State policymakers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to develop the analytical capability to assess and evaluate U.S. farm policies on the U.S. agricultural sector and disseminate this information to farmers, farm and other agricultural organizations, and public policymakers. The mission has been expanded to include assessment of trade and environmental policy impacts and their interaction with the agricultural sector at national, regional, and farm levels. The models in place are also used to assess fiscal and monetary policy implications and impacts of new technologies such as biotechnological innovations on the agricultural sector.

Both institutions maintain large econometric models and data sets which are regularly updated to analyze farm and trade policy alternatives and the impacts of various programs on the several sub sectors of the agricultural economy. This update was especially valuable for conducting analyses to assess policy options for the 1996 farm bill. During the past year, the FAPRI completed 35–40 studies addressing policy issues such as assessments of the 1996 Farm Bill, alternative ethanol programs, USDA's proposed milk market order reform, U.S.-Canada agricultural trade, the importance of fast track to U.S. agriculture of economic recession in the Middle East and the economic meltdown in Russia. Numerous studies were completed addressing improvements made to the empirical modeling system to improve domestic and international policy capabilities. The FAPRI staff has made numerous public appearances throughout the U.S. to agricultural groups and Congressional committees and Executive branch groups addressing policy issues.

Question. How long has the work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1984–1985, $450,000 per year; fiscal years 1986–1987, $357,000 per year; fiscal year 1988, $425,000; fiscal year 1989, $463,000; fiscal year 1990, $714,000; fiscal years 1991–1993, $750,000 per year; fiscal year 1994, $705,000; fiscal years 1995–1996, $850,000 each year; and fiscal years 1997–1999, $800,000 each year. The total amount appropriated is $10,271,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $260,355 State appropriations, $113,565 industry, and $37,913 miscellaneous for a total of $411,833 in 1991; $321,074 State appropriations, $51,500 industry, and $35,100 miscellaneous for a total of $407,674 in 1992; $234,796 State appropriations and $70,378 industry for a total of $305,174 in 1993; $78,286 State appropriations, $43,925 industry, and $29,750 miscellaneous in 1994 for a total of $151,961 in 1994; $80,155 State appropriations, $37,128 industry, and $42,236 miscellaneous for a total of $159,519 for 1995; $124,123 in State appropriations with no other funding for 1996; and $79,000 in State appropriations, $50,000 industry, and $25,000 miscellaneous for a total of $154,000 in 1997; and $88,800 State appropriations, $75,200 industry, and $34,687 miscellaneous for a total of $198,687 in 1998.

Question. Where is this work being carried out?

Answer. The program is carried out at the Center for Agriculture and Rural Development, Iowa State University and the Center for National Food and Agricultural Policy, University of Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is a continuing program of research and analysis for the purpose of assessing farm and related policy actions and proposed actions likely to affect the agricultural sector and its components.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The annual proposal is carefully reviewed for adherence to stated objectives and progress before the special research grant in awarded. It is also peer reviewed prior to its submission. No formal evaluation of this program has been conducted.

FOOD IRRADIATION, IOWA

Question. Please provide a description of the research that has been funded under the food irradiation grant.

Answer. Since the Linear Accelerator Facility was placed in operation in March 1993, studies on the effect of irradiation on shelf-life extension, safety, and quality of ground beef, beef steaks, ham, pork chops from loins, chicken breasts, and turkey have been conducted. Studies combining irradiation with high hydrostatic pressure and cooking, using whole chicken breasts, turkey, and ham, have been conducted to determine the combination of these treatments that will yield a shelf-stable product while maintaining high eating quality. Several studies were conducted to determine whether consumers can detect a difference between irradiated and non-irradiated ground beef patties. Experiments were also conducted to investigate consumer acceptance of pork products irradiated to prevent trichinosis. Test markets of irradiated chicken breasts were conducted to determine consumers' willingness to pay for irradiated products. Research on the effect of packaging materials on quality of irradiated meat is in progress. The fiscal year 1998 funds are supporting research from May 1, 1998 through June 30, 1999. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes consumers' attention and concern about the safety of fresh meat and poultry has increased with recent outbreaks of foodborne illness from E. coli 0157:H7. The meat industry has also expressed interest regarding the quality of irradiated products and how this process can be used to yield high quality fresh meats that are free of pathogens. The recent massive recall of over 25,000,000 pounds of ground beef due to illness caused by E. coli 0157:H7 contamination has resulted in huge economic losses. With the recent Food and Drug Administration—FDA—clearance of irradiation of red meat, research needs leading to commercialization of this technology have been enhanced. Additionally, researchers from eight other research institutes have used the irradiation facility for research projects. Thus, the principal researcher believes this research to be of national, regional, and local need.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of the research was to generate knowledge necessary to develop a research and technology transfer program leading to commercial use of irradiation of foods, whereby consumers would be provided with food products with enhanced safety. The effectiveness of irradiation, using an electron beam accelerator, in destroying known pathogenic bacteria in pork and beef has been determined. Mathematical models have been developed to predict the growth of bacteria in low-dose irradiated ground pork. Demonstration of irradiation technology has been presented to some commercial firms, and plans are being developed for some large scale test markets.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 when $100,000 was appropriated for this project. The appropriations for fiscal years 1992 and 1993 were $237,000 per year; fiscal year 1994, $223,000; fiscal years 1995–1997, $201,000 each year; and fiscal years 1998 and 1999, $200,000 per year. A total of $1,800,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The project received $1,037,270 in State of Iowa funds—$1,000,000 of which was for capital construction—in fiscal year 1991; $37,942 in state funds and $67,800 in industry grants in fiscal year 1992; $68,897 in state funds, $78,300 in industry grants, and $9,666 in user fees in fiscal year 1993; $70,652 in state funds, $35,420 in industry grants, and $47,788 in user fees in fiscal year 1994; $72,772 in state funds, $100,000 in industry grants, and $55,211 in user fees in fiscal year 1995; $81,540 in state funds, $115,300 in industry grants, and $50,963 in user fees in fiscal year 1996; $77,963 in state funds, $253,450 in industry grants, and $46,550 in user fees in fiscal year 1997; and $100,200 in state funds, $205,900 in industry grants, and $36,200 in user fees in fiscal year 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator anticipates that the project's original objectives will be met within a few years after the USDA final rules are issued.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A review of the proposal supporting the fiscal year 1998 appropriation was conducted on January 16, 1998. Previous studies funded under this project have provided useful information toward understanding how irradiation can be useful in eliminating or reducing foodborne pathogens in meat products. It is anticipated that the proposed research will continue to further the understanding of how irradiation can be used to improve shelf-life and enhance safety of meats and meat products.

FOOD MARKETING POLICY CENTER, CONNECTICUT

Question. Please provide a description of the research done under the Food Marketing Policy Center grant.

Answer. The Food Marketing Policy Center was established in 1988 at the University of Connecticut at Storrs. The Center conducts research on food and agricultural marketing and related policy questions. The intent is to provide information that contributes to improved performance of the food production and marketing system. The Policy Center is primarily an economic research organization, but it conducts interdisciplinary research as appropriate and it communicates results to the public. Key users include farm and consumer organizations, agricultural business firms, public agencies, state legislatures, and the U.S. Congress. The Center facilitates research at cooperating institutions by organizing research workshops twice annually, furnishing common data bases, preparing research publications, and providing leadership for joint research efforts including the sponsorship of research conferences.

This grant is not competitively awarded at the state or regional level, but the proposal is reviewed by the Experiment Station Director and the Department Head, and is subject to internal merit review.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The research proposal identifies an ongoing national need to continually improve the economic efficiency and operation of the U.S. food marketing system to benefit farmers, merchants, processors, and consumers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The ongoing research goal is to identify marketing problems and assess alternatives that improve economic performance of the U.S. agricultural and food marketing sector. The Center serves as a core research group for Regional Research Project NE–165, Private Strategies, Public Policies, and Food System Performance. The research agenda includes industrial organization, strategic marketing, economics of food safety, cooperatives, and public policy including antitrust and regulation. The Food Marketing Policy Center conducts economic research on food marketing, including descriptions of food quality issues and enhancement policies, private label branding, advertising strategies for cooperatives, assessment of food retail mergers and competition, evaluation of dairy regulations, branded product marketing, supermarket chain entry, oligopsony in agricultural markets, and impacts of cooperatives on food market performance.

The Center has prepared and distributed over 45 working papers, 35 policy research reports, 16 policy issue papers, 8 books, and it has reprinted and distributed over 65 important journal articles to researchers, industry, and Federal and State legislators, and decision makers.

This grant will support work on nine projects with two targeted research problem areas: impacts of changes in strategies, technologies, consumer behavior and policies on the economic performance of the food system, and economic analysis of private and public strategies to assess their impacts on improvements in food safety and quality. Projects include competitive strategy analysis of cooperatives and investor-owned firms; firm dominance in food manufacturing; advertising; mergers, product relatedness and performance outcomes; effects of market structure and concentration on promotional activity; testing theories of oligopoly conduct; relationships between market structure, firm position, and price levels; strategic responses to food safety and nutritional regulation; and trade agreement effects on food quality and trade.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1988, $150,000; fiscal year 1989, $285,000; fiscal year 1990, $373,000; fiscal years

1991–1993, $393,000 per year; fiscal year 1994, $369,000; fiscal years 1995–1998, $332,000 each year; and fiscal year 1999, $400,000. A total of $4,084,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are State appropriations as follows: $234,259 in fiscal year 1991; $231,741 in fiscal year 1992; $201,288 in fiscal year 1993; $234,557 in fiscal year 1994; $219,380 in fiscal year 1995; $134,399 in fiscal year 1996; $135,490 in fiscal year 1997; and in fiscal year 1998, $164,772 at the University of Connecticut and $30,000 at the University of Massachusetts. The decline reflects a change in reporting only salary and related fringe benefits and excludes overhead for facilities and utilities.

Question. Where is the work being carried out?

Answer. The research is being carried out by the Agricultural Experiment Station at Storrs and at the University of Massachusetts.

Question. What was the anticipated completion date for the original objectives of the projects? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1987 was for 24 months. According to the principal researcher, the objective of conducting policy-oriented research on food manufacturing and distribution industries to assist state and Federal policy makers in improving the performance of the food system is still an ongoing public concern, given increasing levels of concentration in food processing. The current phase, initially funded in fiscal year 1997, will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES annually reviews project reports, succeeding annual project proposals, research studies, and educational programs. A merit review of the fiscal year 1998 proposal was conducted in February 1998, and a similar review of the fiscal year 1999 proposal will be conducted. A comprehensive outside review was conducted in April 1998. Assessment criteria include peer review of results and publications, administrative review and approval of proposals, and reports by external sources.

FOOD PROCESSING CENTER, NEBRASKA

Question. Please provide a description of the research that has been funded under the food processing center grant.

Answer. The University of Nebraska Food Processing Center has been conducting short-term, highly-applied research projects to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Projects were selected based on the estimated economic impact of the technical assistance or the criticality of the technical assistance to the future of the firm or venture. Priorities were placed on projects relating to the safety of the food product or process and to the fulfillment of regulatory mandates such as nutrition labeling, use of approved and effective ingredients, and adherence to regulations imposed by foreign governments. In addition, several research projects were conducted to improve or assess the quality, extend the shelf-life, or assess or improve the processing efficiency of specialty food products which impacted several processors or used alternative agricultural products. fiscal year 1998 funds are supporting research from July 1, 1998 through June 30, 1999. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the primary impact of this project will be statewide. Small and mid-sized food processing companies and entrepreneurs have limited technological capabilities for addressing issues related to product development, process development, product and process evaluation, food safety, quality assurance, and regulatory mandates. The short-term research and technology transfer projects conducted as part of this overall project will aid these companies in appropriately addressing these oftentimes complicated issues.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research, as stated previously, is to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Technological evaluations were conducted for 120 individuals or companies interested in developing new

food processing businesses. These evaluations included formulations, processes, processing equipment, packaging, shelf-life, sensory, nutritional attributes, microbiological quality, regulatory considerations, and other factors. Additionally, microbiological analyses, shelf-life assessments, sanitation audits, and nutritional analyses were conducted for numerous Nebraska food companies.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1992. The appropriations were $50,000 per year for fiscal years 1992–1993 ; $47,000 for fiscal year 1994; and $42,000 per year for fiscal years 1995–1999. A total of $357,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The Food Processing Center received $402,389 in State funds and $1,771,856 in food industry grants and miscellaneous sources from 1992 through 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at the University of Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Because this project supports ongoing technical assistance to clients, the objectives are ongoing.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on January 12, 1998. Progress under previous grants for this project appears to be satisfactory, with numerous examples of assistance cited and summaries of short-term projects provided by the principal investigator.

FOOD QUALITY, AK

Question. Please provide a description of the research that has been funded under the Food Quality, Alaska grant.

Answer. This is a new grant in fiscal year 1999. Research will be aimed at establishing the Salmon Quality Implementation Project. The project has two parts. The first part is the evaluation, design, and implementation of a voluntary quality seal that can be attached to salmon that meet the existing standards for premium and number one grade. The second part is a series of workshops and training sessions on salmon quality handling and maintenance for workers at all levels of the industry, from harvesting to retail.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The seafood industry is Alaska's largest employer and main source of revenue in many communities along its 38,000 miles of coastline. The salmon fishery is second only to groundfish in providing the most value in the industry. It is the mainstay of many traditional, family-owned businesses. The salmon industry is regional, involving thousands of fishermen and processing workers from Washington State, Oregon, California, and throughout the nation that come to Alaska to participate in the fishery. In recent years, the Alaska salmon industry has suffered economically from increased competition from international salmon farmers, mainly in Norway and Chile. They have made great inroads in many traditional markets, surpassed Alaska in salmon production, and now set the product standard in the marketplace. One key for American businesses to recapture and strengthen their salmon markets is to guarantee and promote the quality of wild Alaska salmon. This project will provide the industry with the research and information needed to accomplish this.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goal of this research was to ensure a consistent and predictable level of handling and quality for Alaska seafood. In doing so, the project will help Alaska seafood processors strengthen or maintain their place in domestic and international markets. Because this is a new grant, no progress has yet been reported.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $350,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The State of Alaska, the Alaska Seafood Marketing Institute, and the industry will contribute considerable personnel hours to perform the work described in the application. The state will contribute the time of several staff people to research and help establish the voluntary quality seal program. Staff time would account for approximately $10,000. The Alaska Seafood Marketing Institute will have a staff person set up training workshops throughout Alaska.

Question. Where is this work being carried out?

Answer. The work will be administered at the University of Alaska Fairbanks. Field work will be carried out in numerous Alaska fishing communities.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the quality and handling training portion of the project is July 1, 2000. The anticipated completion date for the voluntary quality seal portion of the project is December 31, 2000. The project managers will able to report at that time on their success at meeting project objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. It is anticipated that the proposal received in support of the fiscal year 1999 appropriation will be reviewed for merit by a CSREES specialist shortly after it is received by the agency.

FOOD SAFETY

Question. Please provide a description of the research that has been funded under the Food Safety grant.

Answer. This program is to provide funding for competitively-awarded research grants. The focus of the program is on very high priority issues each year and it reflects areas of major importance under the Food Safety Initiative. The request for proposals for fiscal year 1998 focused on major issues related to the safety of fresh and minimally processed fruits and vegetable which is an area of concern to the public. For fiscal year 1999, we will request proposals that again address the safety of fresh fruits and vegetables, and request proposals in two additional areas of food safety of major importance: the scientific basis for critical control points in food processing and handling and risk assessments on bacterial pathogens in foods. For fiscal year 2000, the focus will continue to be on current and emerging National issues in food safety. The input of stakeholders and other Federal agencies will again be used to determine the focus. It is expected that risk assessments related to foodborne pathogens, the scientific basis for critical control points and critical limits, and the development of safe and efficacious techniques to enhance or ensure microbiological safety will continue to be important. The specific food groups targeted will be chosen to respond to high priority issues, and it is also anticipated that minimally-processed and ready to eat foods—which can include fruits, vegetables, meat, and dairy products—will continue to be viewed as important.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. As part of the needed research effort under the President's Food Safety Initiative, this program addresses gaps in information available to support control measures in food safety in food production, processing, handling, and regulation. Several agencies and stakeholder meetings have combined to establish priorities for research for consumer protection and in support of regulatory actions in food safety. The request for proposals reflects these priorities.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this grant program is to support problem-solving food safety research that addresses current and emerging National issues in food safety. It is intended to respond to high-priority issues with information and interventions that will have applications in the near term. For this reason, the program stresses established or documented linkage with industry partner(s), and clear and effective plans for technology transfer to end users.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998. The appropriation for fiscal year 1998 was $2,000,000 and for fiscal year 1999 is $5,000,000.

A total of $7,000,000 has been appropriated for this program. The fiscal year 2000 budget proposes $15,000,000 for an integrated program for food safety research and education.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Because this is a new program with the first awards being made in fiscal year 1998, we are unable to report contributions to this work from other funding sources.

Question. Where is the work being carried out?

Answer. Research funded through this program is being conducted at Cornell University, Rutgers University, North Dakota State University, Purdue University, Ag Innovations LLC, Pennsylvania State University, University of Delaware, University of Arkansas, University of Tennessee, Oregon State University, University of Florida, and Auburn University in 1998. All institutions will be able to compete for funding in 1999.

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program first received funding for fiscal year 1998 and again in fiscal year 1999. Current and evolving concerns about food safety are expected to prompt continued funding of this program.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The research proposals for this program were evaluated by a peer panel of 13 scientists from universities, government, and industry. Of 40 proposals submitted to the peer review panel, 12 were selected for funding. The criteria used in evaluating the soundness of the proposed research were: conceptual adequacy of the hypothesis or approach as related to the program objectives; clarity and delineation of proposed project objectives as related to National issues and objectives; adequacy of the description of the proposed work; suitability and feasibility of the methodology for conducting the work; probability of success of the project; novelty, uniqueness, and originality; qualifications of the proposed project personnel, partnerships, and adequacy of the facilities; established or documented linkage with industry partner(s); and a clear and effective plan for educational outreach and technology transfer to end users.

FOOD SAFETY, ALABAMA

Question. Please provide a description of the research that has been funded under the Food Safety, Alabama, grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. Auburn Research Center's Food Safety Program will develop a method of food inspection that involves the placement of a sensor chip on food items. The goal is for these chips to automatically inventory and assess the safety at any point from source to consumption on every food product sold in the U.S.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Most food-borne illness can be attributed to bacteria. The sensor chips developed at Auburn University will target the bacteria that causes most of these illnesses. This technology could result in financial savings nationally, regionally, and locally through the prevention of food-borne illness and its related costs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project will be to reduce the incidence of food-borne illness through the use of a sensor chip that will assess the safety of food items as they move through the food chain. Since a grant proposal from Auburn University has not yet been received, there are no accomplishments to report to date.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant will begin in fiscal year 1999 and the appropriation for fiscal year 1999 is $300,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Since a grant proposal from Auburn University has not yet been received, the source and amount of non-federal funds for this research is not yet known.

Question. Where is the work being carried out?

Answer. Research will be conducted at Auburn University, in Auburn Research Center's Food Safety Program.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives will be one year following the date of the award. The anticipated award date will be in April or May of fiscal year 1999. Since a grant proposal from Auburn University has not yet been received, related additional objectives are not yet known.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Since a grant proposal from Auburn University has not yet been received, this research has not yet been evaluated by the agency.

FOOD SYSTEMS RESEARCH GROUP, WISCONSIN

Question. Please provide a description of the research that has been done under the Food Systems Research Group program.

Answer. The Group conducts research on contemporary issues affecting the organization and competitiveness of the U.S. food system in domestic and international markets. The issues include new technologies, market structure, and government policies and programs. Studies have been completed on pricing of cheddar cheese, fed cattle, and hogs; changes in private label product markets; causes of structural change in the flour milling, soybean oil milling, wet corn milling, cottonseed milling, beef packing, and broiler processing industries; competition in U.S. food markets; and the relationship between U.S. food market structure and the industry's performance in global markets. The research proposal was subject to an administrative review and a peer review by the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that the U.S. food system is changing rapidly in response to a large number of global economic, social, and technological changes. Research is needed to determine the effects of these changes on the system's organization and performance, and to ascertain needed adjustments in public policies based upon sound research. There is a national need to assess and evaluate the organization and performance of the Nation's food industry to ensure that it continues to satisfy performance expectations of farmers and consumers and adheres to acceptable standards of conduct. In spite of the growing concentration in food production-processing and increasing public policy questions concerning the performance of this industry, few organizations like the Food Systems Research Group are providing research needed for public and private decision making.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The original goal was to assess and evaluate the organization and performance of the U.S. food industry and provide recommendations for improvements. Recent work in the broiler industry shows that increased productivity and reduced real feed costs have significantly increased the competitiveness of the sector and stimulated market growth. Other empirical studies show that strong antitrust policies result in improved international competitiveness of U.S. firms, and that competition is essential for achieving greater efficiency and technological progress. A few years ago the Group completed a study of the National Cheese Exchange which resulted in a major public report, Congressional hearings, and a Wisconsin task force. Alternative pricing mechanisms were developed to avoid the problems of a very thin market which is used to price a large volume of off-market sales. The Group has completed numerous studies on economic structure and performance issues of the U.S. food manufacturing and distribution system. Basic research is conducted on market theories; effects of mergers, new technologies, and firm conduct on industry structure and organization; factors affecting industry prices, profits, efficiency, and progressiveness; and impact of public policies and regulations on food system organization and performance.

Question. How long has this work been underway, and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1976–1981, $150,000 per year; fiscal years 1982–1985, $156,000 per year; fiscal years 1986–1989, $148,000 per year; fiscal year 1990, $219,000; fiscal years 1991–1993, $261,000 per year; fiscal year 1994, $245,000; fiscal years 1995–1998, $221,000 per year; and fiscal year 1999, $225,000. A total of $4,472,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: State appropriations of $120,304 in 1991; $119,448 in 1992; $85,188 in 1993; $96,838 in 1994; $59,435 in 1995; $50,636 in 1996; $56,421 in 1997; and $64,004 in 1998.

Question. Where is the work being carried out?

Answer. The grant supports research at the University of Wisconsin, Madison.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1976 was for a period of 36 months. The current phase of the program will be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1998, as it evaluated the 1998 project proposal, and concluded that the Food Systems Research Group at the University of Wisconsin does excellent research on structure, conduct, and performance of selected segments of the food industry, and has won many professional awards. Much of the work provides empirical tests of competing theories. In spite of the growing concentration in food production-processing and increasing public policy questions concerning the performance of this industry, few organizations like the Food Systems Research Group are providing research needed for public and private decision making. Research results appear in several peer reviewed professional journals and the popular press, and researchers have ongoing dialog with private and public decision makers.

FORESTRY RESEARCH, ARKANSAS

Question. Please provide a description of the research that has been done under the Forestry Research grant.

Answer. The Arkansas Forest Resources Center offers programs of research, education, and outreach to the landowners of Arkansas and the surrounding region. This has been accomplished through continuing education events for landowners, the development of a series of distance-learning tutorials, and the funding of 20 assistantships for the first two classes of graduate students in the new forest resources master's program. A partial list of workshops includes: Uneven-aged Silviculture of Loblolly and Shortleaf Pine Forest Types, Environmental Law & Policy, Timber Income Tax Update, Thinning Methods and Operations, Introduction to ArcView 3.0, Estate Planning, Forest Finance Applications: Basic Tools for Daily Practice, and Opportunities in Forest Regeneration. The educational thrust has combined Center and private dollars to establish one of only three of the country's ArcView Learning Centers for natural resources. To better provide the highly educated professionals needed in the natural resources professions, educational tutorials are being developed in dendrology—tree ID, plant morphology, silvics—that aid in the (1) transfer of students in community colleges to institutions with forest resources offerings, and (2) forest resources education of non-majors at institutions without forest resources faculty. Furthermore, the University of Arkansas activated a new Master of Science program in the Fall 1998.

Research projects address issues of species diversity, richness, redundance, and the resilience of disturbed and undisturbed hardwood stands of the Mississippi River floodplain. Furthermore, research has indicated that neotropical migratory birds are indicators of ecosystem health. Factors influencing their breeding range include habitat destruction/alteration and forest fragmentation. Thus, issues of reestablishment and structure of hardwood stands are important for timber, non-timber values, and the quality of life enjoyed regionally, nationally, and internationally. Also, other projects are contributing to the development of (1) a biological control agent for the southern pine beetle, (2) alternative forest crops for the economically-depressed Delta region, and (3) technologies for enhanced fiber and wood production from nonindustrial and industrial lands. Newer projects include an important regional social science study of the ethical values held by people of the southern United States. These issues will grow in importance as southern forests assume greater proportions of the national demand for fiber and wood.

Question. According to the research proposal, or the principal researchers, what is the national, regional, and local need for this research?

Answer. With the reduced levels of production of wood products from the Northwest, southern forests are increasingly having to produce a major portion of wood products for the United States. This increased demand and production make it crit-

ical that the forestry community understand the possible environment effects of forestry practice. Social implications of the conflicts between forest production and environmental quality will become more and more important.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The thrust of goal one is developing alternative forest management strategies of achieving multi-resource objectives; i.e., production of timber, wildlife, recreation and other values of the forest on private industrial and non-industrial forest lands and pubic lands. Significant progress has been made in several areas. Some examples include: developing intensive fiber farming systems as alternatives to soybeans for Mississippi Delta farmers, taking the first step toward biological control of the southern pine beetle by discovering the nutrient needs of predators of the beetle so predators can be grown and studied in artificial cultures. The first survey of nonindustrial landowners in Arkansas for 15 years has been conducted. The survey shows that because of the average age of landowners—60+ years—there will be a massive change in ownership in the next 10–20 years. Landowners continue to not be aware of assistance programs. The survey also indicated a concern about government programs and possible intervention on private land. This information will be useful in understanding future timber supply trends from private holdings and in the design of assistance and educational programs.

Ongoing projects include a broad array of topics, competitively awarded within the Center. These include best management practices, ecological characteristics, effects of different forest management regimes, stream-sided buffer zone effectiveness, effects of winter logging, and secondary processing efficiency.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows:

Fiscal year	*Funds Appropriated*
1994	$470,000
1995	523,000
1996	523,000
1997	523,000
1998	523,000
1999	523,000
Total	3,085,000

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funding and its source provided to this grant in 1994 was $411,726 State appropriations and $380,000 industry for a total of $791,726; $491,301 State appropriations and $785,262 industry for a total of $1,276,563 for 1995; a total of $695,204 from State and industry sources for 1996; a total of $1,115,341 from these sources in 1997; and an estimated total of $1,000,000 for 1998. For 1999, the State legislature appropriated approximately $850,000 above the 1998 level.

Question. Where is this work being carried out?

Answer. The Arkansas Forest Resources Center is administered from the School of Forest Resources on the campus of the University of Arkansas at Monticello. Individual studies are being conducted at the University of Arkansas at Fayetteville and several locations across the State.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Grants were received in 1994–1999 with funds distributed for use over the 3 to 5 years following the activation year. Projects are on schedule; work from 1994 funding is nearing completion. Forestry research is long term. Center objectives and selected projects will be continued beyond the life of individual grants, using the infrastructure and capacity developed with these Special Research Grants.

Question. When was the last agency evaluation of the project? Provide a summary of the last evaluation conducted.

Answer. In 1991, an agency team visited Monticello and reviewed faculty qualifications, supporting sources, and the feasibility of the proposal. The team exit report indicated the faculty was highly capable, the infrastructure needed strengthening, and the proposal concepts were feasible. Since 1991, there has not been a formal program review; however, a review is planned for the year 2000, pending fund availability.

FRUIT AND VEGETABLE MARKET ANALYSIS, ARIZONA AND MISSOURI

Question. Please provide a description of the research that has been funded under the fruit and vegetable market analysis program.

Answer. The purpose is to provide timely knowledge and analysis of the impacts of trade, environmental, monetary, and other public policies and programs upon the Nation's fruit and vegetable industry to farmers, agribusinessmen, and policymakers through a program of empirical assessment and evaluation.

Question. According to the research proposal, or the principal researchers, what is the national, regional or local need for this research?

Answer. The U.S. fruit and vegetable sector is experiencing increased growth from greater domestic and export demand. However, the growth of this sector depends upon its ability to compete domestically and internationally and to conform with the regulatory environment in which it operates. This program of research provides increasingly critical information to farmers and policymakers on the implications and impacts of various policies and programs such as environmental, trade, labor, and food safety. It is the only such program providing analysis of the total U.S. sector.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to develop the analytical capability to assess and evaluate public policies and programs impacting the U.S. fruit and vegetable industry and disseminate the results to policy makers, industry organizations, producers, and other users. Proposals have been submitted that outline long-range plans and specific projects for funding. Models have been developed for 18 major, as measured in production, consumption, and trade, U.S. fruits and vegetables representing 80 percent of the farm value of the U.S. fruit and vegetable industry. Trade models for those commodities with a significant import and/or export sector will also be developed. These models feed into a larger food and agricultural sector model to support analyses of cross commodity and policy effects.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was $329,000; for fiscal years 1995–1998, $296,000 each year; and for fiscal year 1999, $320,000. A total of $1,833,000, has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funding and its source provided to this grant in 1994 was $50,073 State appropriations and $11,000 industry for a total of $61,073; $21,876 State appropriations and $36,624 industry for a total of $58,500 for 1995; a total of $62,400 from State and industry sources expected for 1996; and $50,000 each year from these sources in 1997 and 1998.

Question. Where is the work being carried out?

Answer. The work is being carried out at Arizona State University and the University of Missouri.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The university researchers anticipate that work is an ongoing project to look at the impact of various public policy proposals on the U.S. fruit and vegetable industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluation. However annual proposals are peer reviewed for scientific merit and relevance; also each annual budget proposal is carefully reviewed and work progress is compared with prior year's objectives. Informal discussions with congressional staff indicate that analyses are extremely useful.

GENERIC COMMODITY PROMOTION, NEW YORK

Question. Please provide a description of the research that has been done under the generic commodity promotion program.

Answer. The grant supports, in part, the National Institute on Commodity Promotion Research and Evaluation which provides objective analyses of national and state commodity checkoff programs designed to enhance domestic and export demand. The overall project proposal was merit reviewed at the university level. A competitive peer review process is used to select specific research projects.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher states that producers are contributing about $1,000,000 annually to commodity research and promotion funds designed to expand the domestic and export markets for their products. The number of commodity groups participating and the size of the funds available could continue to grow. The 1996 Federal Agriculture Improvement and Reform Act—FAIR—requires all Federally-constituted research and promotion boards to evaluate their programs at least every five years. Accurate evaluations require the development of sophisticated techniques that differentiate the impact of research and promotion expenditures from several other market influencing factors.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to determine the economic effectiveness of generic promotion programs designed to increase the sales of agricultural commodities in domestic and international markets. Recent accomplishments of this project include: access to a commodity advertising database for researchers; methodologies for using retail scanner data, estimating advertising wearout, and testing sensitivity of results based on various estimating procedures; relative effectiveness of advertising versus other kinds of promotion activities; and understanding of factors affecting producer attitudes toward checkoff programs. In addition, the Institute has sponsored educational workshops and conferences for directors and Chief Executive Officers of commodity research and promotion boards to help them comply with the FAIR Act requirements for evaluating promotion and research activities.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by the grant began in fiscal year 1994. The appropriation for fiscal year 1994 was $235,000 and for fiscal years 1995–1999, $212,000 each year. A total of $1,295,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal matching funds and sources allocated to this grant by Cornell University are as follows: $97,333 a year in State appropriations for 1994–96; $125,650 for 1997; and $130,430 for 1998. Collaborating institutions performing work under subcontract also contribute non-federal matching funds.

Question. Where is this work being carried out?

Answer. The work is being carried out at Cornell University in collaboration with eight other land-grant universities.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 21 months, however, the need to evaluate the benefits of commodity promotion and research programs is a growing regional and national concern as producers take on greater responsibility for marketing their products. An increasing number of promotion and research programs are being evaluated. The current phase of the program will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1998, as it evaluated the 1998 project proposal, and determined that "the project has sound objectives and procedures that are helping private and public decision makers effectively expand markets for U.S. agricultural products leading to a highly competitive agricultural production system and enhanced economic opportunity for Americans." The principal investigator is well recognized for his leadership in this area of research. Research results appear in several peer reviewed professional journals and popular press, and researchers have ongoing dialog with private and public decision makers.

GLOBAL CHANGE

Question. Please provide a description of the research that has been funded under the global change grant.

Answer. Radiation from the sun occurs in a spectrum of wavelengths with a majority of wavelengths being beneficial to humans and other living organisms. A small portion of the short wavelength radiation, what is known as the Ultraviolet or UV–B Region of the spectrum, is harmful to many biological organisms. Fortunately, most of the UV–B radiation from the sun is absorbed by ozone located in

the stratosphere and does not reach the surface of the earth. The discovery of a deterioration of the stratospheric ozone layer and the ozone hole over polar regions has raised concern about the real potential for increased UV–B irradiance reaching the surface of the earth and the significant negative impact this could have on all biological systems including man, animals, and plants of agricultural importance. There is an urgent need to determine the amount of UV–B radiation reaching the earth's surface and to learn more about the effect of this changing environmental force. The Cooperative State Research, Education and Extension Service, CSREES, is in the process of establishing a network for monitoring surface UV–B radiation which will meet the needs of the science community of the United States, and which will be compatible with similar networks being developed throughout the world. The fiscal year 1998 grant supports work through September, 1999.

This grant is part of a government-wide initiative. The research is closely coordinated with other Federal agencies involved in the U. S. Global Change Research Program Inter-agency UV-Monitoring Network Plan.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes destruction of the stratospheric ozone layer, our shield from the full intensity of solar radiation, continues to increase. This creates a high priority need for information to document not only the levels of UV–B radiation reaching the earth's surface, but the climatology of that radiation. The United States, and the rest of the world, needs to know the strength of the UV–B radiation reaching the earth and the potential impact on all forms of life, especially animal and plant life of agriculturally-important species. The principal researcher believes this research to be of national as well as regional and local importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The USDA UV–B Network is to provide accurate, geographically-dispersed data on UV–B radiation reaching the surface of the earth and to detect trends over time in this type of radiation. A primary problem which had to be overcome in order to reach this goal is the development of instrumentation adequate to make the measurements required for the monitoring network. A major advance occurred during 1996 with the availability to the network of a new multi-band instrument which will provide the spectral information needed to support both biological and atmospheric science research and to serve as ground-truth for satellite measurements. These instruments have been deployed and are currently in operation at twenty-six monitoring sites across the United States, including Hawaii. The researchers plan to have additional sites in Alaska, Puerto Rico, Oregon, North Carolina, and Oklahoma operational by the summer of 1999.

Two grants to design and build advanced spectroradiometers have been awarded under the National Research Initiative Competitive Grants Program. These instruments are to be used in a research network to make precise measurements of the total UV–B spectra at selected sites. The first of these instruments failed to meet spectral performance standards when tested and calibrated by the National Institute of Science and Technology. An alternative design which resulted in a much larger and more difficult instrument to deploy has been developed. The first of two advanced instruments was deployed at Table Mountain near Boulder, Colorado during the fall of 1998. The second will be installed at Beltsville, Maryland during the spring of 1999.

To gain experience in network operation, broadband instruments along with ancillary instruments were installed at ten sites and have been in operation for the last 52–60 months. These sites are now equipped with a full compliment of instruments including the new multi-band instrument. Additional sites developed during the last 12 months are similarly equipped with broadband and the new multi-band UV instrument. Data from each site is transmitted daily to Colorado State University for preliminary analysis, distribution, and archiving. These data are available, within 24 hours of collection, on the Internet via a World Wide Web Site located in the Natural Resources Research Laboratory at Colorado State University. The Department of Agriculture is also a participant in the development of a central calibration facility at Department of Commerce facilities in Boulder, Colorado. The purpose of the central calibration facility is to ensure uniform and acceptable calibration and characterization of all instruments used in interagency UV–B monitoring programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1992, and the appropriation for fiscal years 1992–1993 was $2,000,000 per year; fiscal year 1994 was $1,175,000; fiscal year 1995 was $1,625,000; fiscal year 1996 was $1,615,000; fiscal

year 1997 was $1,567,000; and fiscal years 1998 and 1999 was $1,000,000 per year. A total of $11,982,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $162,000 state appropriations in 1993; $183,106 state appropriations in 1994; and $285,430 provided by Colorado State University in 1995.

Question. Where is this work being carried out?

Answer. Colorado State University is managing the operating network, which when completed will include all regions of the country. At least 30 sites are planned for the climatological network including sites in Hawaii, Alaska, and Puerto Rico in order to provide broad geographic coverage. Ten sites have been operational with broad band instruments for up to five years and 26 sites are now operational with new generation instruments. The research level network began with the first instrument installed at the Table Mountain, Colorado instrument intercomparison site and the second to be installed at the Department of Agriculture Plant Stress Laboratory at Beltsville, Maryland. Negotiations are underway with the Department of Energy Solar Radiation site near Ponca City, Oklahoma as part of the Atmospheric Radiation Measurements field network as a potential site for the third instrument to be deployed later in 1999.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. As with other weather and climate observations, this network will be an ongoing need for the predictable future. These measurements will provide information on the nature and seriousness of UV–B radiation in the United States and will provide ground truth validation to other predictions of UV–B irradiance. The project has now met it's first objective of the establishment of a climatological network to monitor UV–B radiation at the surface of the earth. Years of operation will be required to measure trends in UV–B radiation and to develop models to predict the climatology of UV–B radiation.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency has assigned two technical staff to continuously monitor activities in the global change research program. A team of three experts in UV–B radiation measurement technology reviewed specifications for the development of the advanced spectroradiometers in July, 1996 prior to the procurement of major components of the instrument. A panel of radiation spectra scientists was brought in to review data derived from the new multi-band instruments in December, 1996 to advise on the interpretation and analysis of data derived from these instruments. Agency staff is in contact with program management on a weekly basis and has visited the program headquarters six times during the last year. A review of the UV–B Monitoring Program by a panel of technical experts from outside the Department is planned for 1999.

GLOBAL MARKETING SUPPORT SERVICES, ARKANSAS

Question. Please provide a description of the research that has been done under the global marketing support services program.

Answer. This grant supports the University of Arkansas Global Marketing Support Services program to provide research and service to agribusinesses. The objective of the university research is to identify potential foreign markets for Arkansas products and to conduct and disseminate foreign market assessment and evaluation studies to agribusiness firms. The research proposal received a merit review at the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes the emerging importance of global trade to the nation's economy and the reduction of trade barriers world-wide present unprecedented opportunities for cooperative public-private-university research to develop expertise in world markets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to develop a university research and service organization to support international trade development activities by local area businesses. Research is conducted to determine the demand for specific Arkansas products in selected countries. In the past year, four export training workshops were held. Twelve Industry Opportunity Reports were completed and, as a result of these reports and

one-on-one technical assistance, six firms entered the export market for the first time. Seven factsheets were completed and distributed and a peer-reviewed publication on international joint ventures was published. An Internet website has been established to distribute information, and an Internet international market is being developed. Case studies of firms engaged in international market development are being developed as an educational tool. A new market analysis of Slovakia is underway.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was $47,000; for fiscal years 1995 through 1997, $92,000 per year; and for fiscal years 1998 and 1999, $127,000 per year. A total of $577,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were $90,000 per year in State appropriations for 1994 through 1996; $51,700 for 1997; and $80,000 for 1998.

Question. Where is this work being carried out?

Answer. This research is being conducted at the University of Arkansas, Fayetteville.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 12 months, but the objective of expanding the export capacity of small to medium-sized agribusiness firms will not be met until 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in February 1998, as it evaluated the 1998 proposal and determined that the "Global Marketing Support project provides leadership for a comprehensive program to integrate Arkansas into the global economy. It provides workshops, educational materials, technical assistance that help mostly small and moderate-size businesses understand and enter the export market. It provides market analyses and other research to back-up its educational programs."

GRAIN SORGHUM

Question. Please provide a description of the research that has been funded under the Grain Sorghum grant.

Answer. This project was designed to improve the yield improvement of grain sorghum cultivars by developing early maturing hybrids with a longer grain filling period. The research focuses on identification of sorghum germplasm, which have a longer grain filling period or earlier maturation date. These traits may be used to shift more of the production to grain and less to vegetative growth, thus enabling more efficient use of the limited water supply. These funds are awarded to scientists working on sorghum at Kansas State University.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The focus of this research is toward the non-irrigated lands of Kansas where sorghum can produce a grain crop under conditions that would not be possible with corn and is, therefore, very important in the rotation with wheat. While the research is directed toward Kansas conditions, it would also apply to adjoining states. Germplasm research of national significance could potentially be supported by the competitive grants awarded under the National Research Initiative or the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to identify germplasm and use it to develop grain sorghum cultivars that mature earlier and produce more grain. Initial studies have identified genetic characteristics controlling grain yield under a range of climatic conditions. Researchers have identified several sorghum lines, which have a grain-filling period as much as one-third longer than U.S. adapted parent lines. Analyses show that variability exists, the trait is genetically controlled, and incorporation into adapted germplasm can be accomplished. Simulation of expected production gains has been initiated.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal years 1997 through 1999 was $106,000 per year for a total of $318,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In 1998, Kansas State provided support via salaries and associated fringe benefits of $31,852, associated indirect costs of $14,652, and in-kind costs of $45,580, for a total of $92,084.

Question. Where is this work being carried out?

Answer. These funds are awarded to Kansas State University, which allocates the money to Kansas State University scientists working on sorghum.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives of this project, which began in 1997, are to develop sorghum parental lines with genetically longer grain fill duration and identify changes in management necessary to optimize grain production in these lines. Five years or more are required to accomplish the objectives. The first objective has been completed. The researchers expect to complete the next three original objectives by 2004 and subsequent objectives by 2006. Preliminary results have contributed toward the understanding of factors controlling grain yield and the development of higher yielding sorghum cultivars for Kansas.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is subjected to the institutional review and approval process, as well as review by a CSREES scientist. In addition, stakeholder input was obtained through formal and informal methods. The institutional review of the project confirmed that high priority issues of the sorghum industry in Kansas and other sorghum producing states were being addressed.

GRASS SEED CROPPING SYSTEMS FOR SUSTAINABLE AGRICULTURE

Question. Please provide a description of the research that has been funded under the Grass Seed Cropping Systems for Sustainable Agriculture grant.

Answer. This program was developed to provide management systems for sustainable grass seed production without field burning of the straw residue following harvest which results in adverse air quality problems. Grass seed yields are often significantly reduced the following season if the residue is not burned. The fiscal year 1999 grant proposal has been requested.

Funds from this grant are awarded competitively to scientists at Oregon State University, the University of Idaho, and Washington State University engaged in research on grass seed production. Each award is been passed a merit review by peer scientist.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that according to information provided by technical committees representing researchers and the grass seed industry, the need for this research is to develop sustainable systems of seed production that do not depend on field burning of straw residue. Much of the grass seed for the United States, including lawn grasses, is produced in the area. Field burning of straw residue creates unacceptable levels of air pollution and yields of some cultivar decline without burning.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal for this project is to develop grass seed production systems that do not depend on field burning of straw residue. To date, joint planning by state experiment station administrators and researchers from the three states with industry input have developed an integrated regional research effort to solve the problem.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was $470,000, and for fiscal years 1995–1999, $423,000 each year. A total of $2,585,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal support for this project in fiscal year 1994 was $266,055, $298,052 for fiscal year 1995, $282,053 in 1996, $301,650 in 1997, and 310,700 in 1998.

Question. Where is this work being carried out?

Answer. The research will be conducted by the three state agricultural experiment stations in Idaho, Oregon, and Washington.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion of the initial objectives was anticipated to take five years and, therefore, should be completed in 1999. Revised goals leading to application of new management systems will require additional time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The entire project is reviewed annually by a steering committee for focus and relevance. The combined proposal is reviewed by CSREES before funds are awarded.

Considerable progress has been made toward identifying the consequences of phased out field burning of straw residue on grass seed production. Current and future effort are directed toward development of sustainable systems without field burning. This program is subject to annual comprehensive evaluation by a team of peer scientist, industry representatives, and farmers. The results are used to guide research for the next year. Each proposal is subjected to the institution project approval process and reviewed by the CSREES National Program Leader.

HUMAN NUTRITION, IOWA

Question. Please provide a description of the work that has been funded under the Human Nutrition, Iowa grant.

Answer. This research aims to develop animal and plant foods with nutritionally-optimal fat content and to improve utilization of foods containing non-nutrient health protectants, components that may reduce health risks. The research includes human and animal nutrient utilization, consumer food choices, and economic impacts of designed food to support optimal nutrition. The fiscal year 1998 grant supports research efforts of 35 investigators from six disciplines through June 1999. CSREES requested that the university submit a grant proposal for fiscal year 1999 which is now under CSREES merit review.

Question. Cipal researcher, what is the national, regional or local need for this research?

Answer. The research addresses food quality, nutrition, and optimal health. Much of the research focuses on improving the nutritional quality of foods important to the economy of the Midwest, while making those improvements economically feasible. Ongoing research focuses on increasing health protective lipids and plant chemicals in human foods. Such foods have recently been called functional foods and the development of functional foods is of high priority to the food industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the Center for Designing Foods to Improve Nutrition, the administrative unit for this grant, is to improve human nutrition and health maintenance by determining how to improve animal and plant food fat content and how to increase availability of health-protectant factors in the human food supply. The research includes food production, processing, consumer choices, biological utilization, and economic impacts.

The researchers have developed milk, eggs, and pork enriched in the fatty acid called conjugated linoleic acid. This compound has unique cancer preventive properties derived from animal fats. Studies suggest that pork enriched with conjugated linoleic acid may be highly acceptable to consumers. Several studies have demonstrated the modifying key enzymes that are important for lipid synthesis in plants impact oil accumulation in the seeds. The Center's research group on soybean health effects assessed the ability of soybean isoflavones during menopause to maintain bone density and reduce menopausal symptoms. They found that soybean isolate with isoflavones reduced bone loss in postmenopausal women. Several studies have demonstrated that research with cultured cells showed that oxidants can cause damage to a gene that is important in the development of many cancers and that antioxidants, including glutathione, may be able to prevent this damage. Additional research was aimed at identification and characterization of novel iron compounds from milk that will improve iron absorption and utilization. Researchers observed

that low molecular weight proteins found in human milk are responsible for high iron bioavailability.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of $300,000. The fiscal years 1992–1993 appropriation was $500,000 per year; $470,000 in fiscal year 1994; $473,000 per year in fiscal years 1995 through 1999. A total of $4,135,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $293,000 university, $312,869 industry, and $14,000 miscellaneous in 1991; $90,000 state appropriations, $473,608 university, $131,160 industry, and $116,560 miscellaneous in 1992; $307,500 state appropriations, $472,081 university, and $222,267 industry in 1993; $486,000 university and $254,000 private in 1994; $210,000 university and $200,000 private in 1995; $613,770 university and $207,811 private in 1996; $690,736 university and $458,000 private in 1997; and $502,124 university and $700,000 private in 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at the Center for Designing Foods to Improve Nutrition, Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective to design foods to improve nutrition is continuing to be addressed. A new set of related objectives will be completed in 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The grant proposals for fiscal years 1998 and 1999 have undergone extensive scientific peer review by the grantee. Progress and objectives will be further reviewed by the Center's newly formed External Advisory Council.

HUMAN NUTRITION, LOUISIANA

Question. Please provide a description of the work that has been funded under the Human Nutrition, Louisiana grant.

Answer. Obesity is a growing problem in the United States and world wide. This grant entitled, Dietary Fat and Obesity, will help answer three issues about this important problem. First, is there a mechanism for tasting fat which can be used to reduce its preference? Second, does exercise enhance the ability to use fat? And third, are there genetic factors which can influence the response to dietary fats? The fiscal year 1998 grant supports research through July 2000. The University has submitted a revised comprehensive proposal for fiscal year 1999.

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. Obesity is an epidemic in the United States and the role of dietary fat as a cause of this epidemic is hotly debated. This grant is currently supporting a project which is studying the preventive effects of a sugar and soybean oil commodity-derived fat substitute on the development of obesity and associated problems. It is also partly funded by industry.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The overall goal of this grant is to identify the basis for the susceptibility to obesity of some people who eat high fat diets and to understand how they differ from those people who are resistant to becoming obese when eating a high fat diet. The researchers have identified that some people can taste selected polyunsaturated fatty acids but others cannot. The relation of this taste to other tastes, and its influence on food preferences are the current line of study in this project. In a second project, they have shown marked differences between individuals in their response to an increase in dietary fat intake. When exercise is added, the adaptation to a high fat diet is much more rapid, suggesting the importance for public policy of increasing efforts to encourage Americans to become more active. In a third project they found that the dietary intakes of total fat, saturated and monounsaturated fats were associated with insulin resistance. A single circulating fatty acid—20 carbons long with three cis double bonds—was the strongest independent predicator of fasting insulin. Surprisingly, and contrary to this hypothesis, trans fatty acids in the serum were not markers of insulin resistance.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991–1993 was $800,000 per year; for fiscal years 1994–1999 was $752,000 per year. A total of $6,912,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $523,100 state appropriations in 1991; $515,100 state appropriations and $2,216,606 private in 1992; $536,100 state appropriations and $940,000 private in 1993; $627,000 state appropriations and $3,775,000 private in 1994; $546,100 state appropriations and $3,100,000 private in 1995; $1,471,000 state appropriations and $2,488,000 private in 1996; $1,998,000 state appropriations and $2,104,000 private in 1997; and $987,000 state appropriations and $1,892,000 private in 1998.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Pennington Biomedical Research Center, Louisiana State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal 2000. The objectives to be completed over the remaining time of the grant will be reviewed by an external advisory team.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. In March 1999 an on-site panel of researchers evaluated the proposed objectives and experimental protocols. On the basis of the critiques from the reviewers, the proposal for fiscal year 1999 was revised. Another review will be conducted in March 1999, allowing for implementation of the research projects to fulfill these objectives.

HUMAN NUTRITION, NEW YORK

Question. Please provide a description of the work that has been funded under the Human Nutrition, New York grant.

Answer. The focus of this work remained unchanged during the last fiscal year. The general objective was improving the knowledge base needed to evaluate and, when appropriate, implement the increased reliance on plant-based foods that is at the core of current Federal dietary guidelines. Current dietary guidelines use this approach as a principal strategy to control energy consumption, reduce fat intake, modify the composition of ingested lipids, enhance the consumption of foods associated with reduced cancer risk, and simultaneously insure that macro-and micronutrient needs are met. The grant has brought together investigators whose expertise ranges from basic nutritional molecular biology to the behavioral sciences that are key in enabling consumers to adopt newly discovered knowledge easily and effectively. The fiscal year 1998 grant supports research through September 1999.

CSREES has requested that the university submit a comprehensive grant proposal for the next grant period. The university plans to change the focus to basic, human, and social science food and nutrition issues that complement the university's initiative in genomics. Opportunities exist on those aspects of mammalian and plant genomics that relate most directly to dietary guidelines and to the international acceptance of genetically-engineered foods.

Question. According to the principal researcher, what is the national, regional or local need for this research?

Answer. Inappropriate diets and physical activity patterns are the second leading etiology of preventable morbidity and mortality in this country. As greater emphasis is given to strategies that permit individuals to take increasing responsibility for their health and identify genetic and environmental risk factors, the knowledge gained by research sponsored by this grant becomes increasingly valuable. This knowledge is used by consumers in making informed food choices, by food producers and processors in anticipating consumer demands, and by public health professionals in designing health promotion and disease prevention strategies.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The newly revised dietary guidelines reemphasize expected health benefits from the increased consumption of fruits, vegetables, and grain products. As pointed out in the response to the first question, investigations are carried out at the molecular, behavioral and community levels.

Changes in fat levels and composition of the American diet are expected to alter lipid metabolism. Lipoprotein lipase is a pivotal enzyme that regulates lipid metabolism. A novel technique to tag an immunologically portion of the enzyme was developed. The researchers expect that this will enable the identification of key domains of this enzyme and thus lead to a better understanding of the handling of dietary fat. Other work focusing on fat led to the development of the first system for high precision analysis of stable isotope ratios from organic compounds separated by gas chromatography. This methodology has led to improved detection of lipid metabolites in human blood.

Scientific and public health understanding of the role of preformed vitamin A and its precursors in health has grown markedly in the last few years. Researchers discovered a novel regulatory mechanism of one of the nuclear receptors that is responsive to vitamin A or its metabolites. Related work has led to the development of methodology to assess the vitamin A content of plant foods and better methods for assessing the absorption and conversion of vitamin A precursors to active metabolites.

Selenium's role in the prevention of selected cancers is receiving national attention. Forty accessions from the brassica collection in Plant Genetic Resources Laboratory were raised under field and greenhouse conditions. A ten-fold range in selenium content was discovered which was related to the sulfur content, but not the total protein content of the material. It is expected that this work will enhance future plant breeding techniques that have enhanced nutritional outcome as a major goal.

The university's community work included an assessment of the opportunities and constraints for increasing plant food consumption in five counties with findings indicating the need for closer links between producers and consumers. This led to a descriptive analysis which documented the major features of a county area that contains a metropolitan concentration surrounded with highly productive and varied agriculture production. In a separate effort, a community decision-making approach for improving food and nutrition was developed and subsequently implemented in six counties. A university community partnership model for integrating nutrition research and intervention was also developed and tested by community stakeholders.

In addition, researchers completed studies on the consumption of low-fat foods by children. Detailed food records of children attending day-care centers were collected. They observed that the majority of the children's calories were consumed in the centers, the majority of calories were consumed from snacks, and that carbohydrates were the major determinant of total caloric intake. In another study dietary risk factors among Hispanic/Latino families were assessed in a sample of 575 households. Major findings suggested that consumption of calories from saturated fat and the degree of obesity were significantly higher among migrant Hispanic women compared to non-migrants.

Question. How long has this work been underway, and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $450,000; fiscal years 1990–1991, $556,000 per year; fiscal years 1992–1993, $735,000 per year; fiscal year 1994, $691,000; fiscal years 1995–1999, $622,000 each year. A total of $6,833,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $154,056 state appropriations and $2,456 private in 1991; $238,430 state appropriations and $60,746 private in 1992; $19,401 state appropriations and $22,083 private in 1993; $202,441 state appropriations and $1,175 private in 1994; $296,794 state appropriations in 1995; $348,127 in state appropriations and $39,593 private in 1996; $133,162 state appropriations in 1997; and $8,185 university appropriations, $166,752 state appropriations, and $7,905 private in 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at Cornell University, New York.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original overall objective to integrate nutrition goals and food systems is continuing to be addressed. A set of new related objectives was submitted in 1997 and will be the research focus through 1999. The university plans to change the focus to basic, human and social science food and nutrition issues that complement the university's initiative in genomics.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The grant proposal for fiscal year 1997 was subjected to extensive peer review, and the recommendations were incorporated into the ensuing experimental designs.

HYDROPONIC TOMATO PRODUCTION, OH

Question. Please provide a description of the research that has been funded under the Hydroponic Tomato Production, OH grant.

Answer. CSREES has requested the university to submit a grant proposal that has been not yet been received. Cultural practices, greenhouse design, and economics will be evaluated for the areas. Tomato production will be evaluated as an alternative enterprise.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The research is needed to develop and evaluate management protocols for economical production of greenhouse tomatoes as an alternative crop for that area.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of the research is to provide recommendations for management systems for successful operation of greenhouse tomatoes as an alterative crop.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal year 1998 was $140,000, and for fiscal year 1999 is $200,000. A total of $340,000, has been appropriated.

Question. What is the source and amount of non-federal provided by fiscal year?

Answer. The non-federal funds provided for support of the project are from State funds totaling $19,400 for fiscal year 1998.

Question. Where is this work being carried out?

Answer. The research will be conducted by the Ohio State Agricultural Experiment Station at selected locations in Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigator for this project anticipates completion of the original objectives in fiscal year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was subjected to a peer review in the institution and again reviewed by the CSREES National Program Leader when initiated in 1998.

ILLINOIS-MISSOURI ALLIANCE FOR BIOTECHNOLOGY

Question. Please provide a description of the research that has been funded under the Illinois-Missouri Alliance grant.

Answer. The Illinois-Missouri Alliance has initiated a competitive grants program in agricultural biotechnology for research in targeted priority areas of need related to corn and soybeans. The scope of interest includes production, processing, marketing, utilization, inputs, and support services, along with economic, social, environmental, and natural resource concerns. The Alliance has solicited research project proposals from scientists at Illinois and Missouri and other midwestern institutions, and has conducted peer reviews for science quality, commercial feasibility and potential economic impact to select the proposals that will be funded. In 1998 the Alliance awarded four research grants at four institutions totaling $1,013,000.

In 1998 the Alliance also started an on-line magazine called AgBioForum devoted to the economics and management of agricultural biotechnology. The purpose of AgBioForum is to provide unbiased timely information and new ideas leading to socially-responsible and economically-efficient decisions in science, public policy, and private strategies pertaining to agricultural biotechnology. In its first four months, AgBioForum experienced over 23,000 hits from individuals in universities, industry, government, and international organizations.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal investigator has indicated that the goal of the Alliance is the pre-commercial development of emerging biotechnology discoveries for agriculture. The midwestern region produces more than half of the nation's output of corn and soybean crops, and is critical to domestic food security and United States

competitiveness in global agricultural markets. Alliance grants are awarded on a regional basis to advance corn and soybean production in the Midwest. The Alliance is implementing a research strategy that it hopes will generate important biotechnological developments that are rapidly adaptable to unique local soil, climatic, and socioeconomic conditions of the region. Alliance grants are awarded to projects with a clearly defined marketable product or service derived from biotechnology research. Biotechnology research of national significance could potentially be supported by competitive grants awarded under the National Research Initiative or the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. fiscal year 1998 was the fourth year of funding for the Alliance. The research program focuses on the two major commodity crops, corn and soybeans, as produced, processed, and marketed in the midwest. The goal of this biotechnology program is to fund integrated research and development projects that will lead to specifically-defined practical technologies for commercialization. The projects funded in fiscal year 1998 include efforts to: (1) engineer maize to produce genistein, a possible anti-cancer agent, (2) detect and select superior resistance to soybean sudden death syndrome, (3) isolation of specialized seed-forming genes in grassy relatives of maize, and (4) development of high oil maize hybrids.

Question. How long has this work been underway and how much has been appropriated by fiscal year through 1999?

Answer. The work supported by this grant began in fiscal year 1995. The appropriations for fiscal years 1995 and 1996 were $1,357,000 each year, for fiscal year 1997, $1,316,000, and for fiscal years 1998 and 1999, $1,184,000 per year, bringing the total appropriations to date to $6,398,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The Alliance has not specified a required amount of matching funds, but it is expected that most projects will have commitments for significant direct and in-kind non-federal support. Since Alliance projects are still underway, the exact amount of the non-federal contribution is still unknown. The non-federal contribution is expected to be substantial, and a system for accounting for future non-federal contributions is in place.

Question. Where is this work being carried out?

Answer. The research projects identified for funding in fiscal years 1995 through 1998 are being conducted at the University of Illinois, the University of Missouri, Iowa State University, Northwestern University, Southern Illinois University, and the Agricultural Research Service.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Each project proposal for Alliance funding has a target date for completion. The four initial projects were three-year studies with anticipated completions at the end of fiscal year 1998. Most of the second and third rounds of projects are also three-year studies with anticipated completions at the end of fiscal years 1999 and 2000, respectively.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Illinois-Missouri Biotechnology Alliance was evaluated for scientific merit by an agency peer review panel on January 29, 1998. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The supplemental information was received, and we are satisfied that the program is being administered in compliance with the purpose of the grant. A peer review panel of scientists was scheduled to re-evaluate the project for scientific merit on February 9, 1999.

IMPROVED DAIRY MANAGEMENT PRACTICES, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Improved Dairy Management Practices grant.

Answer. The research focuses on developing methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. Individual research projects funded by the grant are determined by a competitive peer review process administered by the Institution using peers from other Institutions located primarily in other States.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the local need is the identification and implementation of profit enhancing management strategies for Pennsylvania dairy farms in response to changing market conditions and emerging technologies. The current focus is to develop economically-viable solutions to issues confronting Pennsylvania dairy farmers such as dealing with animal waste in an environmentally-friendly manner, reducing the cost of forage production systems, including grazing systems, and to develop a better understanding of decision processes by dairy farmers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research remains the same, which is the development of methods to help dairy farmers in the adoption of new technology and management practices which lead to improved dairy farm profitability. A farm management survey is complete and analysis of results is in progress. Farm financial models have been developed and are undergoing field tests on selected farms. Workshops to teach elements of business management to dairy farmers have been conducted, and survey instruments are in place to monitor effectiveness of workshops. Research is currently underway to develop improved models for nutrient management on northeastern dairy farms, to evaluate the potential role of intensive grazing systems to replace harvested forage, and to better understand how decisions are made by dairy farm families. Refinements of an expert computer based system to assist dairy farmers in controlling the udder disease, mastitis, is underway. A study to evaluate the induction of lactation on dairy profitability is underway. An additional study to evaluate the impact of improved protein nutrition during late gestation on dairy cow performance has been initiated.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was $335,000 per year. The fiscal year 1994 appropriation was $329,000 and $296,000 each year in fiscal years 1995–1999. A total of $2,479,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. During fiscal year 1992, $354,917 were from State funds, and $16,000 from Industry, for a total of $370,417. During fiscal year 1993, $360,374 were from State funds and $16,000 from Industry for a total of $376,374. Information is not available for fiscal years 1994–1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at Pennsylvania State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal researcher anticipated completion of the original objectives by March, 1994. The original objectives were met. Availability of continued funding has permitted the institution to develop a competitively awarded grant program within the institution to address priority issues related to management of dairy farms. Proposals are reviewed and ranked by peers in other institutions prior to award. It is anticipated that awards from the fiscal year 1999 appropriation will be complete in September, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency accepts technical review of specific proposals funded by this grant on an annual basis. The overall proposal is review by the agency on an annual basis. In addition, technical staff has conducted on-site review of the program in 1993 and in 1995. The overall objectives of the work funded by this grant has direct relationship to the development of Integrated Management System as well as to aspects of animal production systems on animal well-being and impact on the environment.

IMPROVED FRUIT PRACTICES, MICHIGAN

Question. Please provide a description of the work that has been done under the improved fruit practices grant.

Answer. The request for proposal for fiscal year 1999 has been issued. Funds from this grant will be awarded competitively to scientists at Michigan State University working with these crops. This research will involve a multidisciplinary approach to reduce chemical use on apple, blueberry, and sour cherry, three important Michigan fruit crops, and improve the management of dry edible beans and sugar beets.

Research will be conducted on crop management techniques and reduced chemical use.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes Michigan's need for this research is to develop and maintain/expand their tree fruit and small fruits industry. There is a need to improve the culture and management of dry edible beans and sugar beets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The planned objectives of the research are to reduce the chemical contamination of the environment from fruit production and improve production practices for beans and beets through multidisciplinary research, including pesticides, and the development of new nonchemical production methods.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was $494,000, and for fiscal years 1995–1999, $445,000 each year. A total of $2,719,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant in fiscal year 1994 were $437,338 from state appropriations and $135,000 from industry, for fiscal year 1995 were $574,494 from state appropriations and $127,000 from industry, and a total of $908,969 for 1996. The non-federal funds for 1997 totaled $752,500. The non-federal funds for 1998 total $729,145.

Question. Where is this work being carried out?

Answer. Research will be conducted at Michigan State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Principal Investigators have reported significant progress toward improved cultural practices for these speciality crops which is expected to reduce the need for chemical pesticides, and expect to complete the original objective by the end of fiscal year 1999. Long-term goals are expected to take an additional five years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has not been subjected to a comprehensive review. The annual proposals including all of its sub projects are subjected to peer review before submission to CSREES before they are approved. The project has progress toward the objective of developing management practices and strategies for economical production of specialty crops in Michigan with reduced chemical pesticide use. This program is evaluated at the end of each research cycle and priorities adjusted for the next years funding. The evaluation is performed by scientists at Michigan State University.

INFECTIOUS DISEASE RESEARCH, COLORADO

Question. Please provide a description of the research that has been conducted under the Infectious Disease Research, Colorado grant.

Answer. This center will be focused on the development of a multidisciplinary structure to address such diseases and disseminate critical information on trade issues. The Center will utilize a network of related research and services programs at collaborating universities and state and Federal agencies. All activities will be reviewed and evaluated by an interdisciplinary group which will include scientists and livestock commodity representatives. Finally, a core laboratory facility will be established to provide diagnostic support of the program.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The need for this research is to provide valid risk assessment models for diseases which affect international trade and animal and public health. Livestock producers and the industry need this type of information to enable them to make correct disease management decisions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to establish a regional center that will foster interactive work on risk assessment, disease control, and minimize the economic impact of disease outbreaks in livestock.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant will begin in fiscal year 1999 and the appropriation for fiscal year 1999 is $250,000.

Question. What is the source and amount of non-federal funds by fiscal year?

Answer. Currently there is no information on non-federal contributions to the project.

Question. Where is this work being performed?

Answer. The research will be conducted at the College of Veterinary Medicine, Colorado State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date is 2003.

Question. When was the last agency evaluation of this project? Provide a summary of it.

Answer. Because the project is just being initiated, no evaluation has been done.

INSTITUTE FOR FOOD SCIENCE AND ENGINEERING, ARKANSAS

Question. Please provide a description of the research that has been funded under the Institute for Food Science and Engineering grant.

Answer. As the flagship center for the Institute of Food Science and Engineering, the Center for Food Processing and Engineering has as its objectives to facilitate and encourage value-added research and improve the processing of agricultural products. The Center requires researchers to obtain matching funds from industry to support their research. Research projects have been funded by 39 different companies from 17 states and 4 countries. The next request for proposals to the Institute will be issued in February 1999. The Center for Food Safety and Quality, with a mission to conduct research on the safety and quality of foods relative to microbiological and chemical hazards, was activated on January 1, 1997. Center researchers are presently receiving funding through the Food Safety Consortium. The Institute has also received funding from the United Nations Food and Agriculture Organization to establish a Center of Excellence for Food Quality and Safety. fiscal year 1998 funds are supporting research from March 1, 1998, through February 28, 1999. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the Institute will provide technical support and expertise to small and mid-sized food processors that usually do not possess adequate expertise in-house. The economy of the southern region will be improved through the creation of new jobs and a high multiplier effect from the research. The Institute will develop and disseminate scientific information and provide educational programs related to value-added further processing, storage, and marketing of food products. These efforts will assure food safety, improve the sensory and nutritional quality of food, and meet the nutritional requirements and food preferences of a changing society. Value added research of national significance could potentially be supported by competitive grants awarded under the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to establish an Institute of Food Science and Engineering at the University of Arkansas-Fayetteville. The Institute for Food Science and Engineering and the Center for Food Processing and Engineering are operating. Research projects at the Center include: postharvest management practices for rice, such as studies of physicochemical properties, bacterial load of rice products, and milling systems, and development of methods to improve the texture and dill flavor of pickles, and the color of acidified pickled vegetables, with estimated impact to the pickle industry of $500,000 annually. Researchers have developed 12 mechanized systems for total vineyard mechanization which maintain or improve juice and wine quality. Research on physicochemical properties of potatoes and bitterness in carrots and have had estimated economic impacts of several million dollars. Research on elecrochemical flow-through systems for chicken processing water and near infrared, mid-infrared imaging for large scale fruit processing have important applications in industry. Institute staff, including the Descriptive Sensory Panel, have assisted both national food processing companies and small commercial kitchens in process development, with an impact of up to 2,000,000 annually on the

Arkansas vegetable processing industry. The Institute's FAO Center of Excellence presents workshops in the United States as well as planning train the trainer courses in Mexico and Central America to improve the safety of imported fresh fruit and vegetables. To date, 70 publications, two IMPACT reports, and a quarterly newsletter have served to keep the industry and fellow scientists informed of research and technology transfer activities.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was $750,000 each year, $950,000 for fiscal year 1998, and $1,250,000 for fiscal year 1999. A total of $3,700,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant include $184,700 in state funds and $93,000 from industry in fiscal year 1996, and $187,357 in state funds and $320,403 in industry funds in fiscal year 1997. Thus far in fiscal year 1998, industry has provided $93,599, with firm commitments of an additional $55,000. The state has also provided facilities and administrative and clerical support estimated at $303,694 through June 30, 1998. The Institute has also received $48,000 to establish the FAO Center of Excellence.

Question. Where is this work being carried out?

Answer. Research will be conducted at the University of Arkansas at Fayetteville.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal researcher anticipates that work will be completed on the original goals in fiscal year 2002. The goals of this project related to establishing the centers of the Institute have not been fully met. The Center for Food Processing and Engineering and the Center for Food Safety and Quality are in operation; activation of the Center for Human Nutrition is scheduled for 1999. The objectives related to research and service to industry, food entrepreneurs, and the general public would continue to be ongoing.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. In a review of the proposal on January 8, 1998, the assessment was that satisfactory progress was demonstrated in meeting the goals of the Institute.

INTEGRATED PEST MANAGEMENT

Question. Please provide a description of the research that has been funded under the Integrated Pest Management special grant.

Answer. This special research grant develops new pest management tools to address critical pest problems identified by farmers and others in a crop production region. Funds are distributed though the Regional Integrated Pest Management—IPM—Grants Program, which provides competitively awarded grants to develop new pest management tactics to replace management tools lost to the Food Quality Protection Act—FQPA—issues, validate the effectiveness of new tactics in a production setting, and help producers implement these tactics by providing educational training programs. Proposals submitted to the Regional IPM Grants program undergo technical and merit review at the regional levels.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The ability of the Nation's agricultural production system to keep pace with domestic and global demand for food and fiber is dependant on access to safe, profitable, and reliable pest management systems. For a variety of reasons, many of the chemical control alternatives that farmers and other pest managers have relied on for many years are no longer available. The loss of these important tools is likely to continue at an accelerated rate over the next several years. The FQPA will have significant impacts on pest management systems in the United States over the next decade, and the "minor use"—high value crops grown on relatively few acres—will be particularly hard hit. Regulatory decisions under FQPA are focused on organophosphate insecticides, which are widely used tools in IPM and Resistance Management programs. For these reasons and others, it is essential that farmers be provided with new pest management tools and better information so they can remain competitive in today's global marketplace. These special IPM research grant

funds address important issues via a request for proposals distributed to applied agricultural scientists throughout the United States. This request for proposals focuses on the development and testing of practical alternatives for IPM and Resistance Management Systems to replace organophosphate insecticides which likely will be lost due to FQPA.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to provide farmers with new pest management options that allow them to reduce dependence on chemical pesticides, improve their profitability, and protect vital natural resources. The research supported by this special grant has made an important contribution to increasing knowledge about new approaches to pest management, but the need for continued investment in this area of research is greater than ever.

Question. How long has this work been underway and how much as been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1981, $1,500,000; fiscal years 1982 through 1985, $3,091,000 per year; fiscal years 1986 through 1989, $2,940,000; fiscal year 1990, $2,903,000; fiscal year 1991, $4,000,000; fiscal years 1992 and 1993, $4,457,000 per year, fiscal year 1994, $3,034,000; and fiscal years 1995–1999, $2,731,000 each year. A total of $58,130,000 has been appropriated since fiscal year 1981.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. A study of the sources of non-federal funds which contribute to this research effort was conducted in 1993 and 1994 and the results are as follows. In fiscal year 1993, state appropriations, $841,017, product sales, $33,987, industry grants, $17,081, and other, $31,737, which totaled $923,822. For fiscal year 1994, state appropriations, $2,303,458, product sales, $77,157, industry grants, $210,110, and other, $216,552 which totaled $2,807,277. These studies, which have not been repeated since 1994, have demonstrated a trend toward greater annual state investments in Integrated Pest Management research.

Question. Where is the work being carried out?

Answer. Scientists in all states are eligible to compete for this funding on a competitive basis. This research is currently being carried out by State Agricultural Experiment Stations in more than 40 states.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Due to the passage of FQPA in 1996, the economic and environmental pressures facing U.S. agriculture today are greater than they were in 1981 when Federal funds were first appropriated for this special research grant. It is important for government to address agricultural producers' needs by participation in the development and implementation of new approaches to pest management with the emergence or introduction of new pests, as existing pests become resistant to current control methods, as new pesticide regulations are implemented, and as national and international markets shift.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of this project is a continuous process. Projects funded by this research grant are awarded through a competitive process that includes relevance, technical, and merit reviews by multi-disciplinary panels of peers. Progress reports are reviewed to evaluate accomplishments, and special scrutiny and interest is given to studies involving new control strategies relating to at-risk sites with pest management usage patterns impacted by FQPA implementation.

INTEGRATED PRODUCTION SYSTEMS, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Integrated Production Systems, Oklahoma grant.

Answer. This grant focuses on the development of efficient management systems for production of watermelons and blackberries under intensively-managed conditions. The work will address biotic and abiotic production components under Southeastern Oklahoma conditions for use in production guidelines. This will include planting densities, fertilizer studies, weed management and insect and disease control. The request for the fiscal year 1999 proposal has been issued, the grant will be competitively awarded to scientists working at the West Watkins Agricultural Research Center—WWAR—based on a merit review conducted by Oklahoma State University personnel.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for the research.

Answer. The principal researcher believes the need for this research is focused on the local area of Southeastern Oklahoma, an area that is economically-depressed and in need of alternative crops to diversify the dominant cow/calf livestock production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop new and alternative crops to supplement and diversify the cow/calf livestock agriculture of Southeastern Oklahoma with emphasis on horticultural crops. Work to date has shown promise for strawberries, blackberries, cabbage, melons, and blueberries. CD–ROM technology transfer to research results to support an expert system will be developed for grower use.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Work supported by this grant started in fiscal year 1984 and the appropriations were: fiscal year 1984, $200,000; fiscal year 1985, $250,000; fiscal year 1986, $238,000; fiscal years 1987–1989, $188,000 per year; fiscal years 1990–1991, $186,000 per year; fiscal year 1992, $193,000; fiscal year 1993, $190,000; fiscal year 1994, $179,000; fiscal years 1995–1998, $161,000 each year; and fiscal year 1999, $180,000. A total of $3,010,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year through fiscal year 1999?

Answer. The non-federal funds and sources provided for this grant were as follows: $165,989 state appropriations in 1991; $160,421 state appropriations in 1992; and $164,278 state appropriations in 1993. Non-federal support for 1994 was $141,850 for state appropriations. Funds for fiscal year 1995 were $129,552; for 1996, $146,000; for 1997, $152,000; and for 1998, $148,000.

Question. Where is this work being carried out?

Answer. This research is being done at the West Watkins Agricultural Research and Extension Center at Lane, Oklahoma, a branch of the Oklahoma State Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of this project were to develop production systems for alternative crops with economic potential for southeastern Oklahoma. Each year's funding cycle has addressed specific crop and management objectives to be completed over two years time. These short term objectives have been met for each of the completed two year projects. However the original objective of developing alternative cropping systems is very long term and have not been completed.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each of the annual project proposals has been put through the institutions review and is reviewed by a CSREES scientist before approval. In addition to the annual review of individual proposals, a comprehensive review of the Lane Agricultural Center, where this research is conducted, was conducted in 1993. This review reviled that work supported by this grant is central to the mission of that station and represents an important contribution to the agriculture of the area. This work has provided practical management information for farmers of southeastern Oklahoma that has improved their ability to economically-produce small fruit and vegetable crops. This project is evaluated internally at the end of each year in order to set priorities for the next year.

INTERNATIONAL AGRICULTURAL MARKET STRUCTURES AND INSTITUTIONS, KENTUCKY

Question. Please provide a description of the research that has been done under the international agricultural market structures and institutions program.

Answer. This is a new project and the University of Kentucky is submitting its first grant proposal in fiscal year 1999. The research will identify a variety of market factors that affect the success of American firms in international agricultural markets, estimate the impact of such factors, and make recommendations to policy makers and business firms.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. U.S. firms need to become more aggressive in international markets, but these markets are unfamiliar to many firms. The structure of international markets

and the institutions that serve them are often different than in domestic markets. Furthermore, the structures and institutions are continuously changing.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to increase the international marketing success of American farmers and agribusinesses by increasing their understanding of how international markets work.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by the grant begins in fiscal year 1999 and the appropriation is $250,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal matching funds and sources will be identified in the grant proposal when it is completed.

Question. Where is this work being carried out?

Answer. The work will be carried out at University of Kentucky in Lexington.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives and duration of the project will be specified in the grant proposal.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project. CSREES will carefully review the proposal when it is received.

INTERNATIONAL ARID LANDS CONSORTIUM

Question. Please provide a description of the research that has been funded under the International Arid Lands consortium.

Answer. fiscal year 1998 was the fifth year that Cooperative State Research, Education, and Extension Service funded the International Arid Lands Consortium. The Forest Service supported the program during fiscal year 1993 to develop an ecological approach to multiple-use management and sustainable use of arid and semi-arid lands. Projects that began in 1994–1997 will continue to be funded to address issues of land reclamation, land use, water resources development and conservation, water quality, and inventory technology and remote sensing. All proposals are peer reviewed and awarded competitively, whereby the principal investigator must be from a Consortium member institution.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the consortium is devoted to the development, management, and reclamation of arid and semi-arid lands in the United States, Israel, and elsewhere in the world. The International Arid Lands Consortium will work to achieve research and development, educational and training initiatives, and demonstration projects. The current member institutions are the University of Arizona, The University of Illinois, Jewish National Fund, New Mexico State University, South Dakota State University, Texas A&M University, Kingsville, and Nevada's Desert Research Institute. The United States Department of Agriculture's Forest Service works very closely with The International Arid Lands Consortium through a service-wide memorandum of understanding. The Consortium's affiliate members include Egypt's Ministry of Agriculture and Land Reclamation Undersecretarial for Afforestation and Jordan's Higher Council for Science and Technology.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the Consortium was and continues to be acknowledged as the leading international organization supporting ecological sustainability of arid and semi-arid lands. To date, 56 projects have been funded, 37 of which are to conduct research and development, 14 for demonstration projects, and 5 for international workshops. Funds approximating $3,390,000 have been used to fund these projects.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The International Arid Lands Consortium was incorporated in 1991. Funds were appropriated to the Forest Service in 1993. Additional funds were received during each of the years that followed. $329,000 has been appropriated from

CSREES for fiscal years 1994 through 1998, and $400,000 for fiscal year 1999 for total appropriations of $2,045,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Members of the International Arid Lands Consortium have provided funds to support the Consortium office in Tucson, Arizona, and for printed materials as needed. Each member has provided travel and operations support for semi-annual meetings, teleconferences, and other related activities. In fiscal years 1993–1996, $60,000 in state appropriations were provided. Industry provided $84,083 and $100,000 in fiscal years 1993 and 1995, respectively. Additional funds of $34,000 were received during 1996 from the Egyptian affiliate member to enhance future collaboration. Funds of $25,000 from industry were received in 1998.

Question. Where is this work being carried out?

Answer. Research is currently being conducted at the University of Arizona, South Dakota State University, Texas A&M University, Kingsville, New Mexico State University, University of Illinois, and several research and education institutions in Israel.

Question. What was the anticipated completion date for the original objectives of the projects? Have those objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. Almost all research and demonstration projects that started during 1993 and 1994 have been completed. The projects started in 1995–1997 are expected to be completed within 15 months depending upon the nature of the project. Projects started during 1998 will be completed within 2 years. Several demonstration projects were completed and 5 international workshops were held during 1994 through 1998. The International Arid Lands Consortium is an organization with long-term goals.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The cognizant staff scientist reviews the project semi-annually and has determined that the research is conducted is in accordance with the mission of the agency.

IOWA BIOTECHNOLOGY CONSORTIUM

Question. Please provide a description of the work that has been funded under the Iowa Biotechnology Consortium grant.

Answer. This Consortium formed between Iowa State University, the University of Iowa, and the City of Cedar Rapids, Iowa, has served as the focal point for cooperative biotechnology research studies to recover and utilize byproduct materials arising from new and emerging industries in biotechnology with an emphasis on fermentation wastes and agribusiness. Both fundamental and applied research studies are being conducted to reduce the burden of agricultural bioprocessing wastes on municipal waste management systems and to transform components of these agricultural wastes into commercially-viable products. The overall project involves a coordinated approach by a diverse group of investigators, and funding decisions for individual studies within each participating institution are based on a competitive process with a peer panel review and evaluation. The overall project proposal submitted to us, which combines the selected individual studies, is also peer reviewed for scientific merit by a biotechnology panel designated by our agency.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Developments in biotechnology have added to the national need for improved management systems that increase the capacity and sophistication of agricultural waste processing. These researchers believe that technological breakthroughs are possible to deal effectively with the increasing burden of agricultural wastes and that useful byproduct materials can be recovered and recycled through the bioprocessing of wastes. The principal investigators consider this research to be of national, regional, and local importance. While they are working with wastes that are generated in and problematic for the State of Iowa, these waste streams are similar to those generated by agricultural industries across the United States.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this project were aimed at enhancing the recovery and utilization of by-product materials arising from industries using biotechnology. Recycling agricultural wastes, isolating useful byproducts, and developing value added processing remain the primary thrusts of the project. The Consortium has utilized a multi-disciplinary, multi-faceted research approach and has brought to-

gether a cadre of active scientists to assist in finding uses for the by-product waste streams generated by agricultural processing. The Consortium is making significant scientific progress related to the bioconversion, biocatalysis, membrane concentration, and bioseparation of by-products. Recent new studies have been initiated on value-added products related to culture of polysaccharide-producing bacteria, screening of agricultural seed processing fractions for biocatalysts, conversion of lignocellulose to lactic acid, the use of waste by-products as feeds for livestock and aquacultural species, composting strategies for waste streams, and exploitation of micro-organisms that colonize extreme environments found in food processing plants..

Question. How long has this work been under way and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $1,225,000; fiscal year 1990, $1,593,000; fiscal year 1991, $1,756,000; fiscal year 1992, $1,953,000; fiscal year 1993, $2,000,000; fiscal year 1994, $1,880,000; fiscal years 1995–1996 $1,792,000 each year; fiscal year 1997, $1,738,000; and $1,564,000 per year in fiscal years 1998 and 1999. A total of $18,857,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds and sources provided for this grant were as follows: $623,803 from the State of Iowa and $42,813 from the city of Cedar Rapids in 1991; $768,287 from the State of Iowa and $365,813 from the city of Cedar Rapids in 1992; $858,113 from the State of Iowa and $170,000 from the city of Cedar Rapids in 1993; $841,689 from the State of Iowa and $36,000 from the City of Cedar Rapids in 1994; $1,016,505 from the State of Iowa and $36,000 from the city of Cedar Rapids in 1995; $862,558 from the State of Iowa and $40,000 from the City of Cedar Rapids in 1996; $1,044,864 from the State of Iowa and $50,000 from the City of Cedar Rapids in 1997; and $303,549 from the State of Iowa and $50,000 from the City of Cedar Rapids in 1998.

In addition, leveraging of Federal grant monies has been obtained in the form of industrial matching funds or contracts for related projects. Some of the more noteworthy awards are as follows: $20,000 from Archer Daniels Midland; $342,720 from Ajinomoto; $40,000 from BASF; $18,000 from Bluestem Solid Waste Agency; $1,748,975 from Cargill; $177,200 from Heartland Lysine, Inc.; $48,000 from Horizon Technology, Inc.; $75,274 from Iowa Corn Promotion Board; $65,200 from Iowa Energy Center; $80,273 from National Corn Growers Association, $25,000 from National Pork Producers Council; and $11,500 from PathoGenesis Corporation.

Question. Where is this work being carried out?

Answer. Research is being conducted at Iowa State University and the University of Iowa, in collaboration with the City of Cedar Rapids.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Consortium was originally formed between the City of Cedar Rapids and the participating universities to assist the City in dealing with wastes associated with corn and oat processing and milling, biocatalysis to produce high-fructose syrups, and one of the largest fermentation facilities in the world. More recently, the diversified economic base of the Cedar Rapids area has attracted new biotechnology industries, which have added greatly to the volume of industrial waste streams. Since its inception, the Consortium has worked closely with the City and the industries producing these agricultural wastes. Because the studies continue to make progress in analyzing waste streams and in devising laboratory procedures for extracting useful products, no date has been established for the completion of this research. The City of Cedar Rapids is investing funds from other sources in special waste treatment facilities to conduct large scale tests of new treatment methods. Several years will be required to complete these tests and to refine separation technologies.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The fiscal year 1998 project proposal was evaluated for scientific merit on January 29,1998, by an agency peer panel that recommended its approval for the award. The Iowa Biotechnology Consortium proposal for fiscal year 1999 will be evaluated for scientific merit by a biotechnology peer review panel designated by the agency on February 9, 1999. The panel will review and evaluate the future studies that are proposed in the grant application and will make recommendations regarding overall approval of the project. In addition, the peer panel will assess past progress as a part of the approval process and of post-award management. A visit

by the Program Manager to the research facilities of the cooperating institutions to conduct an on-site assessment is scheduled to occur during October, 1999.

IR–4 MINOR CROP PEST MANAGEMENT

Question. Please provide a description of the research that has been funded under the IR–4 Minor Crop Pest Management grant.

Answer. The Minor Crop Pest Management Program—IR–4—formerly the IR–4 Pesticide Clearance Program, is a joint effort between the State Agricultural Experiment Stations, CSREES, and the Agricultural Research Service—ARS. IR–4 provides the national leadership, coordination, and focal point for obtaining data to support the regulatory clearance through the U.S. Environmental Protection Agency—EPA—for pesticides and biological control agents for specialty food crops such as fruits and vegetables as well as non-food crops like turf and ornamentals. In many cases, the agricultural chemical industry cannot economically justify the time and expense required to conduct the necessary research for products with limited market potential. With assistance from IR–4, registration-related costs are manageable, and producers of a large number of small acreage crops such as vegetables, fruits, nuts, herbs, and other specialized crops have access to necessary pest control products. In order to accomplish the above, a four-step process has been developed. Step one involves research prioritization. Because of limited resources, IR–4 requests and receives input from stakeholders on potential research projects. Yearly workshops are conducted that involve growers, commodity organizations, university research and extension specialists, EPA staff, and industry representatives to determine which projects are the most critical to minor crop agriculture. Step two is research planning. Research protocols are written after careful review and comments from stakeholders. Step three is research implementation. A typical IR–4 program consists of both field and laboratory phases. For the field work, researchers apply the crop protection chemical to the target crop per directions from the protocol. The crop is harvested and transferred to the laboratories where the amount of chemical remaining, if any, in the crop is determined. All field and laboratory research is conducted under EPA Good Laboratory Practices—GLP's. Step four is data submission and approval. The data are critically reviewed and formatted into a regulatory package and submitted to the EPA for their review. If appropriate, the EPA will approve the submission and grant a tolerance to use the chemical on the target minor crop.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The basic mission of IR–4 is to aid producers of minor food crops and ornamentals in obtaining needed crop protection products. IR–4 is the principal public effort supporting the registration of pesticides and biological pest control agents for the $35,000,000,000 plus minor crop industry. This is a national effort which identifies needs by a network of users, commodity groups and state university and Federal researchers. This research is highly significant to national and regional as well as local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to obtain minor use and specialty use pesticide registrations, assist in the maintenance of current registrations and to assist with the development and registration of biopesticides and safer or Reduced Risk chemicals useful in Integrated Pest Management—IPM—systems for minor crops. During the past two years, over 650 new minor food use clearance requests were submitted to IR–4 from growers, state, and Federal scientists and extension specialists. After evaluation and prioritization, over 300 studies consisting of over 1,100 field trials throughout the U.S. have been conducted in 1997 and 1998 alone. Accomplishments included the recent clearance of the herbicide pyridate on the ultra-minor crop garbanzo beans—chick pea—grown on only 15,000 acres in the Pacific Northwest, which will have an estimated economic impact of increasing net revenue by over $3,300,000. This crop has become an important rotational crop due to changes in the government farm programs in that region. In 1998, EPA approved 55 new uses based on IR–4 data. In addition, EPA approved 43 Section 18 Emergency Exemptions which were supported with IR–4 data. IR–4 has recently developed and submitted data to EPA for the insect growth regulator tebufenozide on blueberry, caneberries, canola, cranberry, mint and turnip. IR–4 expects EPA to register these reduced risk uses in early 1999. This chemical is extremely effective, and it has the potential to replace many high risk organophosphate and carbamate insecticides. The Cranberry Institute has estimated the use of tebufenozide can provide economic benefits from $17,000,000 to $35,000,000 annually depending on the severity of the target pest infestations. Because of its unique ability to control problem pests with-

out damaging non-target pests and the environment, tebufenozide received the 1998 EPA Green Chemistry award. IR–4 has also worked with the vegetable herbicide clomazone to develop data that supported 24C registrations in Delaware, Virginia, and Maryland providing over $4,000,000 in benefits to snapbean, summer squash, and cucumber growers in those states.

IR–4 provided residue data to support the FIFRA 88-mandated reregistration of more than 700 minor uses identified by growers as critical needs. Without IR–4, these uses would have been cancelled and not allowed for crop protection by minor crop growers. One of these IR–4 defenses was streptomycin for the treatment of edible dry beans grown for seed on 15,000 acres in California and valued at $4,000,000 annually. California seed is sold to growers in Colorado, Nebraska, Minnesota, the Dakotas, Wisconsin, Michigan, and New York where a disease known as halo blight can devastate untreated bean plantings. For this reason, growers will not purchase seed that is not treated with streptomycin.

Registrations for the control of insect, disease and weed pests of commercially grown ornamental crops continues to be an important objective of the IR–4 Project. Since 1977, IR–4 has assisted with the registration of over 5,100 pesticides and biological pest control agents on woody nursery stock, flowers, and turf grass. Recently, IR–4 developed data to allow the use of a herbicide for the control of yellow nutsedge and other grassy weeds in woody and perennial ornamental crops. In California alone, over 100,000 acres are treated with this herbicide, thereby saving growers $1,600,000 compared to hand weeding. IR–4 also continues to work closely with nurserymen and growers to develop pesticides such as azadiractin, a naturally-occurring insecticide, for IPM programs.

Biopesticides have been an important IR–4 thrust since 1982. IR–4 conducts a competitive grants program to develop research data to support the registration of microbial and biochemical pest control products on minor crops. Equally important, IR–4 interacts with public guidance on EPA registration procedures. EPA granted 65 IR–4 supported biopesticide clearances in 1998 including one for Kaolin for insect, fungal, and bacteria control on 48 crops.

The Food Use part of the IR–4 Program continues to have a high productivity which, according to EPA, supports 40 percent of all EPA pesticide registrations. Since the programs inception in 1963, IR–4 has been granted over 4,700 food use clearances—over 1,400 since 1984.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from appropriated funds as follows: Program redirection in fiscal year 1975, $250,000; fiscal year 1976, $500,000; fiscal years 1977–1980, $1,000,000 per year; fiscal year 1981, $1,250,000; fiscal years 1982–1985, $1,400,000 per year; fiscal years 1986–1989, $1,369,000 per year; fiscal year 1990, $1,975,000; fiscal year 1991, $3,000,000; fiscal years 1992–1993, $3,500,000; fiscal year 1994, $6,345,000; fiscal year 1995 through 1997, $5,711,000 per year; and fiscal years 1998 and 1999, $8,990,000. A total of $70,509,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $891,856 state appropriations and $65,402 industry in 1991; $1,002,834 state appropriations and $104,292 industry in 1992; $1,086,876 state appropriations and $310,133 industry in 1993; $550,160 state appropriations, $408,600 industry, and $924,169 miscellaneous in 1994; $775,432 state appropriations, $266,714 industry, and $751,375 miscellaneous in 1995; and an estimated $800,000 state appropriations, $250,000 industry, and $800,000 miscellaneous in each year of 1996, 1997, 1998, and 1999.

Question. Where is this work being carried out?

Answer. Field work is performed at the State and Territorial Experiment Stations. Laboratory analysis is conducted primarily at the California, New York, Florida, and Michigan Agricultural Experiment Stations with assistance by the Oregon, Hawaii, North Dakota, North Carolina, Washington, Virginia, and Idaho Agricultural Experiment Stations. Field Research Centers located in Hawaii, Oregon, Washington, California, Wisconsin, Michigan, North Dakota, South Dakota, North Carolina, Florida, Tennessee, Texas, New Jersey, New York, Maryland, and New Hampshire conduct the field residue program. Protocol development, data assimilation, writing petitions, and registration processing are coordinated through the New Jersey Agricultural Experiment Station. ARS is conducting minor use pesticide studies at field locations in California, Georgia, Ohio, South Carolina, Texas, and Washington. ARS laboratories in Georgia, Maryland, and Washington are cooperating with analyzes.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Selected categories of the Special Research Grants Program address important national and regional research initiatives. IR–4 is involved in research on biological systems that by their nature are ever changing and presenting new challenges to agriculture. The IR–4 workload is anticipated to be long term because of the sensitivities about food safety and the environment, and the eventual loss of a large number of conventional pesticide registrations for minor crops because of the 1996 Food Quality Protection Act—FQPA. The FQPA presents a serious challenge to minor crop pest management. It is estimated that there will be significant loss of conventional pesticide registrations for minor crops. IR–4 has developed a strategy to minimize the impact of loss of the critical pest control tools needed by our domestic minor crop growers. The IR–4 strategy involves the following factors: first, facilitating regulatory clearance of "Reduced Risk" pesticides for minor crops; second, when appropriate, develop risk mitigation measures for existing minor use registrations; third, assist with the registration of biologically-based pest control products for minor crops; and fourth, register and maintain pesticides essential to IPM systems

This strategy has been in place since April 1997 and has helped IR–4 achieve significant accomplishments. Since 1996, IR–4 has expedited research efforts on over 150 studies relating to reduced risk pesticides, biopesticides, and conventional pesticides critical to IPM programs. Several of these uses are referenced as "Reduced Risk" or "BioBased" alternatives in the Consumer Union's "Worse First" report. For example, IR–4 has developed and submitted data to EPA for the biobased pesticide Spinosad on potato. This use has the potential to replace or reduce many of the high risk organophosphate and carbamate insecticide uses on potato. The FQPA program thrust will be carried out along with the traditional minor crop pesticide clearance program. Since FQPA requires that the EPA review all of the almost 10,000 tolerances by 2006, it is anticipated that the IR–4 program will have a significant challenge to help bring new crop protection solutions to minor crop growers well into the next century.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the program is peer reviewed and reviewed by CSREES' senior scientific staff. A summary of those reviews indicate excellent progress in achieving the objective of providing safe pest controls for minor uses. In December 1997, CSREES sponsored a Peer Review of the Project by a panel of representatives from USDA, EPA, commodity groups, the food processing industry, the crop protection industry, and the land grant university system with a final report issued January 1998. The report covered the areas of response to FQPA, Project operations, accomplishments, good laboratory practices—GLP—the ARS companion program, and future outlook with specific recommendations for each area. Most of those recommendations have been implemented in 1998 programs or will be implemented in 1999. The panel was in unanimous agreement that IR–4 is a very successful program which serves an important need to producers of agricultural products for ultimate consumption by the American public. The program is effectively and efficiently administered by a dedicated professional staff. The goal in 1999 and beyond will be to build on this basis and fully implement the recommendations of the panel. This review and previous reviews have resulted in significant improvement in the IR–4 programs productivity and quality of research. Additionally, the customers served by IR–4 have provided input to the program to enhance its effectiveness.

JOINTED GOATGRASS

Question. Please provide a description of the research that has been funded under the Jointed Goatgrass grant.

Answer. Research is conducted as sub-projects by more than 30 scientists in 10 western and mid-western states on systems for suppression of jointed goatgrass in winter wheat production systems. Research includes integrated cultural management, reduction of seed in the soil, identification of more competitive wheat varieties and crop rotations, and modeling to predict economic outcomes of changing management practices. The premier research projects continue to be four regional, long-term integrated management studies conducted across nine states. In these studies, various cultural control practices such as seeding rates, row spacing, planting dates, seed size, competitive varieties, fertilizer placement, crop rotations, and tillage practices are being evaluated as an integrated management system for the suppression of jointed goatgrass. Research is also being conducted on genetic diversity in the

jointed goatgrass population, soil conditions responsible for persistence of jointed goatgrass seedbank, timing and intensity of tillage on seed persistence in the soil, gene flow between wheat and jointed goatgrass, identification of crop traits that make wheat more competitive against jointed goatgrass, and making the bioeconomic model more user friendly. All funded projects have a technology transfer component, and a national extension coordinator insures that growers and extension personnel are fully informed about all options for the managing this devastating weed. The National Extension Coordinator is housed at Colorado State University.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research?

Answer. Jointed goatgrass infests nearly 5,000,000 acres of winter wheat lands in the west and mid-west. Through the efforts of the national program, the rate of spread of this weed has decreased significantly in the past 5 years. However, jointed goatgrass still costs U.S. wheat producers an estimated $145,000,000 annually in lost yield, reduced quality, production of less profitable crops, increased management costs, and reduced land values. Control of jointed goatgrass in a standing wheat crop is impossible with currently available technology because seed survives in the soil for five years or more, and because jointed goatgrass is genetically related to wheat. Jointed goatgrass has increased rapidly in the past 25 years in part because of the widespread adoption of conservation tillage systems. Jointed goatgrass proliferated in such systems, and it greatly impedes the universal adoption of such practices. The principal investigator and the National Association of Wheat Growers believe this research is of high national and regional importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this project is to reduce the devastating effect of jointed goatgrass on winter wheat production and quality, and to prevent the spread of this weed into new, non-infested areas. Numerous individual cultural control practices have been evaluated in several states as to their effectiveness for the suppression of jointed goatgrass and on the growth and yield of wheat. Four regional, long-term integrated management projects have been established where three or more individual cultural control practices have been combined into an integrated management system for the suppression of jointed goatgrass in winter wheat. Early results from these projects show promising results for the management of jointed goatgrass. A bioeconomic model has been constructed that combines jointed goatgrass population biology information, weather data, and responses of jointed goatgrass and wheat to various cultural control practices, and predicts wheat yields, response of jointed goatgrass, and economic outcomes from changing production practices. Six regional symposia have been held to transfer to producers and extension personnel the latest information on the identification, biology and management of jointed goatgrass in winter wheat. A World Wide Web site has been established to further enhance information transfer. Also, a videotape and a slide set have been produced to assist extension personnel in transferring information on jointed goatgrass biology and management.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was $329,000; for fiscal years 1995–1997, $296,000, each year; $346,000 for fiscal year 1998; and $360,000 in fiscal year 1999 bringing the total appropriations to $1,923,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: for 1994, $82,198 state appropriations, $82,256 from industry, and $14,871 miscellaneous; for fiscal year 1995, $67,442 state appropriations, $38,496 from industry, and $13,304 miscellaneous; for each fiscal year 1996–1997, an estimated $70,000 state appropriations, $50,000 from industry, and $14,000 miscellaneous; and for 1998, $231,335 state appropriations and $42,570 from State wheat commissions.

Question. Where is this work being carried out?

Answer. The research is being conducted by University scientists in the states with serious infestations including Washington State University, who are the principal coordinating institution and receive the grant, Colorado, Kansas, Nebraska, Oklahoma, Utah, Oregon, Idaho, Montana, Wyoming, and South Dakota.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated to accomplish significant results in five years, and significant accomplishments have been made. However, the jointed goatgrass problem will require an additional five more years to accomplish all of the objectives and to have effective management practices available for producers to control jointed goatgrass in winter wheat.

Question. When was the agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the grant is peer reviewed and reviewed by CSREES's senior scientific staff. Grants are awarded on a competitive basis using a peer review process by Washington State University.

LIVESTOCK AND DAIRY POLICY, NEW YORK AND TEXAS

Question. Please provide a description of the research that has been done under the livestock and dairy policy program grant?

Answer. The purpose of this grant is to assess the possible economic impacts on the U.S. livestock and dairy sectors from various macroeconomic, farm, environmental, and trade policies and new technologies. Both Cornell University and Texas A&M University conduct analyses of these policies and disseminate the information to policymakers, farmers, and agribusinessmen. Cornell focuses on sector-level dairy policies, and Texas A&M focuses on policies affecting livestock and dairy at the farm level.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Information on the implications of new and alternative farm, trade, and macroeconomic policies affecting the livestock and dairy sectors is of special interest to policy-making officials, farmers, and others. Such information enables farmers and agribusinessmen to make necessary adjustments to their operations to enhance profitability and for national public officials to consider alternatives to sustain adequate supplies and minimize costs. The principal researchers believe this research to be of national, regional, and local significance.

Question. What was the original goal of this research and what has been done to date?

Answer. The original goal was to establish a specialized research program that could provide timely and comprehensive analyses of numerous policy and technological changes affecting livestock and dairy farmers and agribusinessmen and advise them and policymakers promptly of possible outcomes. This goal has been achieved and the program continues to provide timely assessments and evaluations of provisions and proposed changes in agricultural policies, the General Agreement on Tariffs and Trade, and the North American Free Trade Agreement; various income and excise tax measures; and alternative pricing measures for milk. The institutions were integrally involved in several current studies relating to dairy provisions in the 1996 farm legislation. These studies contributed significantly to the development of proposed regulations called for in this legislation. Both institutions maintain extension outreach programs to disseminate results of their analyses throughout the United States. They have organized a national Dairy Markets and Policy Extension committee to advise and assist them in this effort. This latter committee was especially helpful to USDA in educating farmers about proposed milk marketing order changes last year.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $450,000; fiscal year 1990, $518,000; fiscal years 1991–1993, $525,000 per year; fiscal year 1994, $494,000; fiscal years 1995–1998, $445,000 each year; and fiscal year 1999, $475,000. A total of $5,292,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $37,420 State appropriations in 1991; $162,086 State appropriations and $133,278 product sales for a total of $295,364 in 1992; and $301,817 State appropriations, $1,412 industry, and $7,121 miscellaneous for a total of $310,350 in 1993; $24,702 State appropriations and $5,961 industry for a total of $30,663 in 1994; $235,526 State appropriations for 1995; $250,000 in State appropriations for 1996; and approximately $245,000 in State funding for 1997 and 1998.

Question. Where is this work being carried out?

Answer. The research is being conducted at Cornell University and Texas A&M University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program is of a continuing nature for the purpose of assessing existing issues and proposed policy changes affecting the livestock and dairy industries.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluations of this project. Annual proposals for funding, however, are peer reviewed for relevance and scientific merit. Our agency contact is also in regular contact with principal researchers at each institution to discuss progress toward project objectives. Discussions with congressional staff and USDA policy makers support the usefulness of policy analyses provided by this project.

LOWBUSH BLUEBERRY RESEARCH, MAINE

Question. Please provide a description of the research that has been funded under the lowbush blueberry research program grant.

Answer. Interdisciplinary research is being conducted on many aspects of lowbush blueberry culture and processing including investigations into factors affecting processing quality, biological control of insect pest, sustainable pollination, weed, disease, and fertility management, cold heartiness, and group water protection.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Maine produces 99 percent of all lowbush blueberries or 33 percent of all blueberries in the United States. This work is of major local interest and helps maintain the continued availability and high quality of the native fruit commodity.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original research goal was to provide answers to unique lowbush blueberry production, pest, and processing problems. Research to date indicates that the field sanitizer was able to use heat to control insect pests without adversely affecting plant growth, while providing a non-chemical alternative for pest management. Biological control agents were sued to control fireworms. Lowbush blueberry yields were increased by use of native leafcutter and alfalfa leafcutter bees. Mechanical harvesting was found to be effective and had yields and fruit quality comparable to hand harvest, providing growers with a more efficient tool to harvest blueberries. Productes for the use in food industry are being extracted from cull berries, therefore, improving utilization and reducing waste.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, $170,000; fiscal year 1991, $202,000; fiscal years 1992–1993, $185,000 per year; fiscal year 1994, $208,000; and fiscal years 1995–1999, $220,000 per year. A total of $2,050,000 has been appropriated to date.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. Direct industry support was about $65,000 from 1996–1998, per year. The 1999 nonfederal support is $205,832 from industry.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Maine.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not yet been met. The University of Maine researchers estimate that the project will be concluded at the end of fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency merit review of this project was January, 1998. Research accomplishments included investigations of post emergence, grass-specific herbicides to control weeds rather than the use of broad spectrum; timing of fertilization treatments; and comparisons of various fertilizer combinations have indicated that fertilizers containing nitrogen increase yields. Other research accomplishments include the insect management of blueberry maggots through behavioral control and the use of less toxic chemicals from control of blueberry flea beetles.

MAPLE RESEARCH, VERMONT

Question. Please provide a description of the research that has been funded under the Maple Research grant?

Answer. The research is designed to increase understanding of the sources of heavy metal contamination in maple sap and syrup and explore methods of reducing or eliminating lead and other heavy metal contaminant levels in the finished product through alteration of manufacturing equipment and processes. The project is annually subjected to the University's merit review process.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local focus for this research?

Answer. Maple products are an important cultural heritage, and a source of seasonal income in maple growing areas of rural America. Identifying sources of heavy metal contaminants during processing and methods to remove contaminants from products is important in assuring consumers that these food products are not harmful.

Question. What was the original goal of this research and what has been accomplished?

Answer. The goal of this research is to conduct research on maple tree physiology, management of maple stands, and related aspects of the maple syrup industry in Vermont and the Northeast. The primary goal of this work has been to identify and eliminate sources of lead and other heavy metal contaminants in maple syrup.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Work under this project began in fiscal year 1985. Annual appropriations in support of this project are as follows: fiscal year 1985—$100,000; fiscal years 1986 and 1987—$95,000 per year; fiscal years 1988 and 1989—$100,000 per year; fiscal years 1990 through 1993—$99,000 per year; fiscal year 1994—$93,000; fiscal years 1995 through 1997—$84,000 each year; and fiscal years 1998 and 1999—$100,000 per year. A total of $1,431,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal fiscal support for this project is provided by two primary sources and one secondary source. The primary sources are state appropriations and product sales. The secondary source is local support, but that support is not available each year. The total non-federal contribution from these sources provides an average ratio of .86 to 1. The low ratio was .6 to 1 early in the project. More recently the ratio has been 1.1 to 1.

Question. Where is this work being carried out?

Answer. This research is being conducted at the Vermont Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The work from this project, relative to maple tree physiology and management of maple stands has been completed. The objective of identifying sources of heavy metals in maple syrup products and, subsequently, reducing them is underway. The anticipated completion date is 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Project proposals and progress reports are reviewed and evaluated annually by the U.S. Department of Agriculture. Satisfactory progress has been made on tree physiology and maple tree management. Progressive work on identifying sources and controlling maple syrup contaminants is in place and is being monitored by the Department.

MEADOWFOAM, OREGON

Question. Please provide a description of the research that has been funded under the Meadowfoam, Oregon grant.

Answer. This funding will be used to: develop meadowfoam cultivars with increased seed yield, lodging resistance, oil concentration, and insect resistance; increase seed, field test, and deploy several new experimental cultivars; enhance the genome map of meadowfoam; develop DNA markers for molecular breeding and genetic analysis in meadowfoam; and map genes affecting self-pollination, seed yield, oil content, and insect resistance. The proposal will be internally and externally reviewed for scientific merit. This research will be reviewed by state and Federal scientists and administrators for merit and progress.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. This research is needed to increase the productivity of meadowfoam as an edible and industrial oilseed crop. Meadowfoam oil is a basic feedstock for lubricants, cosmetics, and personal care products. Oregon State University has recently developed a food grade meadowfoam oil that should open edible oil markets for this crop. This research is needed to expand the range of production of meadowfoam and to supply U.S. farmers with competitive cultivars—varieties—for commercial production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to increase the productivity of meadowfoam as an oilseed crop for U.S. farmers. This work continues with the new appropriation in 1999.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $300,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds have not been provided.

Question. Where is this work being carried out?

Answer. The breeding research is being conducted at Corvallis, Oregon. Cultivars are being field tested at four sites in the western United States including Corvallis and Medford, Oregon, Mt. Vernon, Washington, and Davis, California, and three sites in the eastern United States including Blacksburg, Virginia, and two as yet unspecified sites.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives of the project sponsored by Cooperative State Research, Education, Extension Service have not yet been met, however, these objectives are anticipated to be complete within the first year of the project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is the first year of this project.

MICHIGAN BIOTECHNOLOGY CONSORTIUM

Question. Please provide a description of the work that has been funded under the Michigan Biotechnology Consortium grant.

Answer. The objective of the Consortium's research program is to develop bioprocessing technology to manufacture products from agricultural raw materials; to increase the utilization of agricultural raw materials; reduce agricultural surpluses; degrade agricultural and associated wastes, thereby decreasing environmental costs of agricultural products and processes; and to reduce the need to import foreign petroleum. Using the tools of bioprocessing, agricultural resources can be transformed into products equal in function and value to those currently made from petroleum.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes results from the research will help to develop bioprocessing technologies to manufacture value-added products from agricultural raw materials, which increases their utilization, reduces commodity surpluses, reduces environmental costs, and decreases the need for foreign petroleum thus contributing significantly to local, regional, and national priorities. Biotechnology research of national significance could potentially be supported by competitive grants awarded under the National Research Initiative or the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to select and develop market-viable technologies that form the basis for new companies, new jobs, and additional tax revenues for local, state, and Federal governments. During the past several years, the Consortium has used funding from the Special Grants program to develop technologies that are now in the marketplace. Examples include: Production of lactic acid using corn as the feedstock resulting in a polymer for biodegradable plastics and a disinfectant. A $200,000,000 plant has been built in Nebraska to produce lactic acid by this process for domestic and foreign markets. Corn was used as a feed-

stock to develop plant growth formulations to enhance plant growth and productivity and to reduce plant stress. Growth promoters are being introduced to the marketplace on a nationwide basis. Biodegradable plastic resins developed from cornstarch were made to produce compostable films for lawn and leaf litter bags, agricultural mulch films, and other soluble films. Biodegradable plastic resins from cornstarch were also developed for moldable products such as disposable cutlery, plastic containers, and toys and toothbrushes. The market for resins is in excess of $2,000,000,000 annually. Corn was also used for the development of all-natural flavors and derivatives including a salty-flavored compound that can replace monosodium glutamate in low sodium foods. Low-cost, readily-available carbohydrates—from whey—were used to produce high-quality, high-value optically-pure chiral intermediates for the pharmaceutical and agrochemical industries.

A sand/manure separation system for dairy farms was developed to cost-effectively separate manure from sand and recycle both components. Biodegradable adhesives have been developed from agricultural resources. Numerous enzymes have been characterized and are now in use to provide value added modifications in the processing of agricultural products. A stabilized phytase enzyme has been developed to improve digestibility of forage-based animal feeds and reduce animal wastes. Improved methods to clean up herbicides, pesticides, and other agriculturally-important materials have been developed. Many of these products have been commercialized through licensing agreements with industrial partners or new company start-ups. Special grant funding in fiscal year 1998 allowed the Consortium to develop several new agri-based products including: paint removers; calcium magnesium acetate deicer; biobased membrane polymers for liquid crystals, metals recovery, and other uses; improved specialty enzymes; and high value animal feed from rice straw. Funding also supported a technology transfer program that brought researchers from almost 30 land grant universities, Federal laboratories, and USDA, together with Consortium researchers to review numerous commercially-promising agriculturally-based technologies. A cooperative research and development agreement was signed with the USDA's Northern Regional Laboratories to develop technology for an oxidant-stable protease for laundry detergents, household cleaners, body cleaners, and dehairing and leather tanning agents.

Question. How long has this work been under way and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $1,750,000; fiscal year 1990, $2,160,000; fiscal year 1991, $2,246,000; fiscal years 1992–1993, $2,358,000 per year; fiscal year 1994, $2,217,000; fiscal year 1995, $1,995,000; fiscal years 1996 and 1997, $750,000 per year; and fiscal years 1998 and 1999, $675,000 per year. A total of $17,934,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $1,750,000 in State of Michigan appropriations, $160,000 from industry, and $1,000,000 from miscellaneous in 1991; $1,750,000 in State of Michigan appropriations, $175,000 from industry, and $1,000,000 from miscellaneous in 1992; $1,750,000 in State of Michigan appropriations and $100,000 from industry in 1993; $1,750,000 in State of Michigan appropriations, $175,000 from industry, and $100,000 from miscellaneous in 1994; $200,000 in State of Michigan appropriations and $2,035,000 from industry in 1995; $1,250,000 in State of Michigan appropriations, $350,000 from industry, and $6,000,000 from miscellaneous in 1996; $402,500 from industry and $10,000,000 from miscellaneous in 1997; and $500,000 in State of Michigan appropriations, $90,000 from the North Central Biotechnical Program, $150,000 from the Illinois Corn Marketing Board, and $820,000 from the California Air Resources Board in 1998. A total of $31,507,500 has been provided to support this work by non-federal sources.

Question. Where is this work being carried out?

Answer. The research is being conducted on the campus of Michigan State University and at the Michigan Biotechnology Institute International. Demonstrations of technology occur throughout the United States.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Consortium reports specific milestones for technology development over a five year period. Specific milestones for technologies which will be commercialized in fiscal year 1999 were established in fiscal year 1995 and updated annually. The Consortium has been successful in effectively closing the gap between research and commercialization in the five-year period.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Michigan Biotechnology Institute was evaluated for scientific merit by an agency peer review panel on January 29, 1998. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. A peer panel of scientists is scheduled to re-evaluate the scientific merit of the project on February 9, 1999.

MIDWEST ADVANCED FOOD MANUFACTURING ALLIANCE, NEBRASKA

Question. Please provide a description of the research that has been funded under the Midwest Advanced Food Manufacturing Alliance grant.

Answer. The stated purpose of the Midwest Advanced Food Manufacturing Alliance is to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. The Alliance involves research scientists in food science and technology, food engineering, nutrition, microbiology, computer science, and other relevant areas from 12 leading Midwestern universities and private sector researchers from numerous United States food processing companies. Specific research projects are awarded on a competitive basis to university scientists with matching funds from non-federal sources for research involving the processing, packaging, storage, and transportation of food products. Projects selected for funding are merit reviewed by non-participating university scientists, industry scientists, and scientists from professional organizations. Close cooperation between corporate and university researchers assure that the latest scientific advances are applied to the most relevant problems and that solutions are efficiently transferred and used by the private sector. fiscal year 1998 funds are supporting research from June 1, 1998 through May 31, 1999. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this project?

Answer. The principal researcher believes the food manufacturing industry is the number one manufacturing industry in the Midwestern region and that opportunities for trade in high value processed food products will grow exponentially on a worldwide basis. The Alliance is positioned to fill the void in longer range research and development for the food industry. Though the focus is regional, it is anticipated that impacts may also be local and national.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal, as stated previously, was to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. This is accomplished by conducting a research proposal competition among faculty from the 12 participating universities to fund research projects where matching funds are available from industry. Fourteen projects were funded from fiscal year 1994 funds with completion and final reports due by May 1, 1996. Ten projects were funded from fiscal year 1995 funds with anticipated completion and final reports due by August 31, 1997. Ten projects were also funded from fiscal year 1996 funds with anticipated completion and final reports due by May 31, 1998. Eleven projects were funded from fiscal year 1997 funds with anticipated completion and final reports due by May 31, 1999. Nine projects were funded from fiscal year 1998 funds with anticipated completion and final reports due by May 31, 2000. Proposals are reviewed for scientific merit by independent scientists, and final selection of projects includes consideration of industrial interest and commitment on non-Federal matching funds.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994. The appropriation for fiscal year 1994 was $470,000, and for fiscal years 1995–1999, $423,000 each year. A total of $2,585,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Industry matching funds were $823,148 in fiscal year 1994, $414,164 in fiscal year 1995, $576,600 in fiscal year 1996, $429,579 in fiscal year 1997, and $557,549 in fiscal year 1998.

Question. Where is this work being carried out?

Answer. The work is being coordinated by the Nebraska Agricultural Experiment Station at Lincoln. Specific research projects are also being conducted at 10 other universities that are part of the Alliance.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The overall objectives of the Alliance are ongoing. Funding supports the continuing and evolving needs and opportunities for foods manufactured and processed from United States produced crops and livestock.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal was conducted on January 12, 1998. The principal investigator has provided descriptions of projects funded by this grant. Scientifically sound, industry-relevant projects appear to be the basis of the project, with impactful results expected.

MIDWEST AGRICULTURAL PRODUCTS, IOWA

Question. Please provide a description of the research that has been done under the Midwest Agricultural Products program.

Answer. The Midwest Agribusiness Trade Research and Information Center does applied research to improve the global competitiveness and marketability of agricultural products produced in the Midwest and disseminates the results to small and medium-sized agribusinesses. Projects include analyses of potential markets for U.S. agricultural products and equipment/technology in several countries; attitudes of foreign consumers; development of new/improved U.S. products to meet foreign needs. The overall project proposal received a merit review at the university level and individual research activities are reviewed by the principal investigator and other faculty.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that agribusiness firms in the United States, especially small to medium-sized firms, have a large unrealized potential to expand export sales and foreign business ventures. These untapped opportunities exist in the Pacific Rim and in emerging markets such as Mexico, China, and Eastern Europe. The reluctance of small to medium-sized firms to explore these market opportunities is, in part, due to the high cost of market information and analysis and the perceived high risk of doing business in new markets. This project meets the needs of these firms at the local, regional, and national level.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The goal is to enhance the exports of agricultural commodities, value-added products, and equipment produced by Midwestern agribusiness firms through research and education programs involving close-working relationships with those firms. Recent results include analyses of the markets in selected countries—Hungary, Poland, Lithuania, Egypt and Morocco—to identify opportunities for U.S. food products, processes, and equipment; Mexican consumer response to U.S. pork products; comparative advantage of U.S. pork in North American markets; impact of the North American Free Trade Agreement on Midwest beef industry; evaluation of 60 varieties of corn for dry milling for the Mexican market; forums that link international leaders visiting Iowa State University with agribusiness leaders; linkages between international and Midwest business interests; and profiles on several overseas companies suitable as trading partners. Several business agreements and a considerable amount of trade has resulted from these activities. The primary audience is small to medium-sized agribusiness firms because they often lack the resources to conduct studies or acquire sufficient marketing information to engage in international trade. As a result of much work to establish trading relationships with China, the Des Moines sister-city of Shijiazhuang, China established a trade office in Des Moines.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1992. The appropriation for fiscal years 1992–1993 was $700,000 per year; fiscal year 1994, $658,000; and fiscal years 1995–1999, $592,000 per year. A total of $5,018,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $185,495 State appropriations and $373,897 industry for a total of $559,392 in 1992; $183,192 State appropriations and $318,966 industry for a total of $502,158 in 1993;

$127,948 State appropriations and $500,394 industry for a total of $628,342 in 1994; $258,053 State appropriations and $389,834 industry for a total of $647,887 for 1995; $165,425 State appropriations for 1996; $162,883 State appropriations for 1997; and $143,850 State appropriations and $51,384 industry for a total of $195,234 in 1998. Industry contributions were not reported for 1996–1997.

Question. Where is the work being carried out?

Answer. The program is carried out by Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1992 was for a period of 24 months, however, the objective of expanding the export capacity of small to medium-sized agribusiness firms is an ongoing regional and national concern. The current phase of the program will be completed in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in January 1998, as it evaluated the project proposal for 1998, and concluded that "the project has sound objectives and procedures that are helping agribusiness effectively expand markets for U.S. agricultural products leading to a highly competitive agricultural production system and enhanced economic opportunity for Americans". Research results appear in several peer-reviewed professional journals and the popular press.

MILK SAFETY, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the milk safety grant.

Answer. The overall goal of the milk safety program is to provide insight into factors that help ensure an adequate and safe milk supply. Toward that end, the research has focused on factors that affect milk production, processing, manufacturing, and consumption. Special attention has been given to ways of preventing and/or treating pathogens that enter the milk supply. Projects are selected for funding each year based on competitive, peer reviews by scientists outside the recipient institution. The fiscal year 1999 grant will support research through June 30, 2000. CSREES has requested the University to submit a proposal in support of fiscal year 1999 funds, but the proposal has not yet been received due to the University's merit review process to select projects for funding.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that the question of microbial safety is of paramount interest to the milk/dairy industry at all levels—national, regional and local. Dairy products have been associated with several large outbreaks of staphylococcal food poisoning. Coagulase negative Staphylococcus infections are one of the most common intramammary infections of dairy cattle, and bovine mastitis, the most important infectious disease affecting the quality and quantity of milk produced in the nation, costs producers an average $180 per cow per year. Listeria monocytogenes is present in about 4 percent of raw milk and has the potential to grow to dangerous levels during refrigerated storage making pasteurization critical in preventing foodborne illnesses from this organism. The population of infants, elderly, and immunosuppressed individuals at risk for Listeriosis in the United States continues to grow rapidly. Understanding the growth of Listeria will provide pathways to minimize the occurrence of food poisoning related to milk and dairy products. Pathogenic E. coli species, including E. coli O157:H7, are of public health concern. For products which receive minimal thermal processing or which may be preserved primarily by acidification, development of additional means of controlling the growth of these foodborne pathogens is of critical importance in guaranteeing a safe milk supply. Ensuring safety of dairy products impacts not only consumer health and confidence in the safety of the food supply, but economic viability as well.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research is aimed at minimizing or eliminating future foodborne disease outbreaks from milk and dairy products. Researchers demonstrated that when subjected to a sublethal heat shock prior to pasteurization, Listeria monocytogenes becomes much more heat-resistant than previously thought, likely requiring the design of new pasteurization guidelines to ensure the safety of dairy products. They also developed a simple, fast, sensitive, specific, and inexpensive method for the detection of Listeria monocytogenes in dairy products that will allow dairy processors to rapidly and easily screen for the presence of this pathogen in their products and

in the processing environment. A computer model of Listeria monocytogenes growth in dairy foods under dynamic refrigeration conditions and during extended storage is under development to provide producers and processors a technology for further enhancing the safety of fluid milk and related products. Researchers have identified potential approaches for enhancing natural defense mechanisms of the bovine mammary gland through vaccination and immunoregulation. Discoveries of factors influencing growth of Staphylococcus aureus could be used to prevent or contain growth of this pathogen in foods. Researchers have identified and sequenced a gene from this bacterium that is essential for growth under stressful conditions. Consumer research has identified characteristics of consumers most likely to have a high general concern about milk and dairy product safety and nutrition.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded for milk consumption and milk safety from funds appropriated as follows: fiscal years 1986 through 1989, $285,000 per year; fiscal year 1990, $281,000; fiscal year 1991, $283,000; fiscal year 1992, $284,000; fiscal year 1993, $184,000; fiscal years 1994–1998, $268,000 per year; and fiscal year 1999, $250,000. A total of $3,762,000 has been appropriated for milk safety and milk consumption.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The University estimates that non-federal funds contributed to this project include the following costs and salaries: $265,000 for fiscal year 1991; $224,700 for fiscal year 1992; $142,600 for fiscal year 1993; and $252,168 for fiscal year 1995. No data are currently available for other fiscal years.

Question. Where is the work being carried out?

Answer. The research is being conducted at the Pennsylvania State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The researchers anticipate that research supported by this grant should be concluded in 1999. Continuing and evolving needs related to the safety of milk and dairy products are expected to reveal new related objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The proposal supporting the fiscal year 1998 appropriation was reviewed on April 23, 1998, and the agency science specialist concluded that the projects addressed important issues related to safety of milk and dairy products, were scientifically sound, and that satisfactory progress was being demonstrated using previously awarded grant funds.

MINOR USE ANIMAL DRUGS

Question. Please provide a description of the research that has been funded under the minor use animal drug program grant.

Answer. The National Agricultural Program to Approve Animal Drugs for Minor Species and Uses—NRSP–7—was established to obtain the Food and Drug Administration approval of animal drugs intended for use in minor species and for minor uses in major species. The objectives of the program are to identify the animal drug needs for minor species and minor uses in major species; generate and disseminate data for the safe, effective, and legal use of drugs used primarily in therapy or reproductive management of minor animal species; and facilitate the Food and Drug Administration—FDA—in obtaining approvals for minor uses. Studies are conducted to determine efficacy, target animal safety, human food safety, and environmental safety. The shortage of drugs for minor food animal uses is a concern well recognized by animal producers, veterinarians, animal scientists, and regulators. The funds for the special research grant are divided between the four regional animal drug coordinators and the headquarters at Cornell University for support of the drug approval program. The NRSP–7 funds are being utilized by the State Agricultural Experiment Stations where the regional animal drug coordinators are located as well as by other stations to develop data required for meeting approval requirements. Participants in the research program consist of the regional coordinators, State Agricultural Experiment Stations, USDA's Agricultural Research Service, schools of veterinary medicine, and the pharmaceutical companies. Research priorities are continually updated through workshops and meetings with producer groups representing species categories such as small ruminants, game birds, fur-bearing animals, and aquaculture species. Each request for drug approval is evaluated by

the technical committee according to established criteria which include significance to the animal industry, cost of developing the necessary data, availability of a pharmaceutical sponsor, and food safety implications. The fiscal year 1998 research grants terminate in April 2000. The 1999 grant proposals have been requested by the agency. All grants are reviewed for relevance to industry needs and undergo scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Animal agriculture throughout the United States has relied on chemical and pharmaceutical companies to provide their industry safe and efficacious drugs to combat diseases and parasites. The high cost incurred to obtain data to approve these drugs, when coupled with limited economic returns, has limited the availability of approved drugs for minor uses and minor species. The economic losses due to the unavailability of drugs to producers for minor species and minor uses threatens the economic viability of some segments of the animal industry. The need for approved drugs to control diseases in minor species and for minor uses in major species has increased with intensified production units and consumer demand for residue-free meat and animal products. The program provides research needed to develop and ultimately culminate in drug approval by FDA for the above purposes. The goals are accomplished through the use of regional animal drug coordinators as well as a national coordinator to prioritize the need, secure investigators at Federal, state and private institutions, and oversee the research and data compilation necessary to meet Federal regulations for approval. All drug approvals are national, although industry use may be regional. For example, certain aquaculture and the game bird industries are concentrated in specific geographic sections of the country. The administration believes this research to be of national, regional, or local need.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original NRSP–7 goal to obtain approval by the Food and Drug Administration for animal drugs intended for use in minor species and for minor uses in major species remains as the dominant goal of the program. In recent years, the research program has expanded or given additional emphasis to aquaculture species, veal calves, and sheep. In addition, several new animal drug requests were recently received for game birds. The importance of environmental assessment, residue withdrawals, and occupational safety have increasingly been given more attention during the approval process to help assure consumer protection. To date, 299 drug requests have been submitted to the Minor Use Animal Drug Program for the development of data in support of the submission of a New Animal Drug Approval. Working in conjunction with many universities, 25 public master files have been published in the Federal Register providing approval for drug use in minor species. Currently, 24 active research projects are being conducted in 15 states involving 18 animal species and 17 different drugs. Whereas a total of 299 animal drug requests have been submitted to the program since 1983, program funding has been available for only about one out of every five requests. In 1998, four FDA reviews were completed and will be published as Public Master Files. They were tilmicosin for the treatment of chronic respiratory disease in sheep; clorsulon for the treatment of hepatic disease caused by Fasciola hepatica; long-acting oxytetracycline in sheep for bacterial pneumonia; and ivermectin injection for the treatment of Ostertagia ostertagia in American bison. Through this safe and efficient process, consumers can be assured that human health is not jeopardized in any way. Moreover, the Minor Use Animal Drug Program has averaged only $200,000 in Federal funding for each of the drugs that have been approved for minor species. The Center for Veterinary Medicine of the Food and Drug Administration is cooperating and supporting this program to the fullest extent. The program is a prime example of Federal interagency cooperation in coordination with academic institutions, pharmaceutical industries, and commodity interests to effectively meet an urgent need.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from appropriated funds in the amount of $240,000 per year for fiscal years 1982–1985; $229,000 per year for fiscal years 1986–1989; $226,000 for fiscal year 1990; $450,000 for fiscal year 1991; $464,000 per year for fiscal years 1992 and 1993; $611,000 for fiscal year 1994; and $550,000 per year for fiscal years 1995–1999. A total of $6,841,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $156,099 state appropriations, $29,409 industry contributions and $11,365 miscellaneous in 1991; $265,523 state appropriations, $1,182 product sales, $10,805

industry contributions, and $59 miscellaneous in 1992; $212,004 state appropriations, $315 industry contributions, and $103 miscellaneous in 1993; $157,690 state appropriations and $7,103 miscellaneous in 1994; $84,359 state appropriations in 1995; $191,835 non-federal support in 1996; $357,099 non-federal support in 1997; and $104,596 state appropriations and $97,375 industry contributions in 1998.

Question. Where is this work being carried out?

Answer. The grants have been awarded to the four regional animal drug coordinators located at Cornell University, the University of Florida, Michigan State University, and the University of California-Davis, and to program Headquarters at Cornell University. Research is conducted at these universities and through allocation of these funds for specific experiments at the State Agricultural Experiment Stations, the Agricultural Research Service, the U.S. Department of Interior, and in conjunction with several pharmaceutical companies.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Selected categories of the Special Research Grants program address important national/regional research initiatives. The overall objectives established cooperatively with FDA and industry remain valid. However, specific objectives continually are met and revised to reflect the changing priorities for FDA, industry, and consumers. Research projects for this program have involved 20 different animal and aquaculture species with emphasis given in recent years to research on drugs for the expanding aquaculture industry and increasing number of requests from the sheep, veal calf, and game bird industries. The program involves research on biological systems that by their nature are ever changing and presenting new challenges and/or threats to agriculture. Especially with the new sensitivities about food safety and environment protection, there is a high priority for continuation of these ongoing projects.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency conducted a formal review of the Minor Use Animal Drug Program in 1997. An external review team of experts representing animal drug research and development, the veterinary profession, the pharmaceutical industry, and academia found the program to be very productive. Recommendations from the review included: (a) improve the visibility of the Minor Use Animal Drug Program, (b) improve working relationships with the veterinary and pharmaceutical communities, and (c) acquire additional support for the program by pharmaceutical companies, universities, and the Federal government to meet the identified national needs with emphasis on responsiveness to industry needs and food and environmental safety. Annually, grant proposals are scientifically peer reviewed, and twice a year the agency and program representatives meet with the Food and Drug Administration representatives to evaluate progress and to prioritize research requests. Workshops are held periodically to identify priorities for the program whereby producers, pharmaceutical companies, FDA, and researchers participate.

MOLLUSCAN SHELLFISH, OREGON

Question. Please provide a description of the research that has been funded under the Molluscan Shellfish grant.

Answer. The research under this program was initiated in fiscal year 1995. A germplasm repository for molluscan shellfish was established and is serving as a source of genetic material for genetic improvement of cultured shellfish stocks. A broodstock selection program was implemented in partnership with industry and is currently evaluating selected families for commercial production. This repository was also used to establish a population of tetraploid pacific oysters for use in the production in triploid oysters and has established a population of Kumamoto oysters. The proposal is put though the university's peer review process and is reviewed by the CSREES Program Manager.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The researchers indicate that there is a national need for a molluscan broodstock development program to benefit the commercial industry through conservation, genetic manipulation, and wise management of the genetic resources of molluscan shellfish.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of this research program are to establish a repository for molluscan shellfish germplasm, to establish breeding programs for commercial pro-

duction of molluscan shellfish, and to establish a resource center for the industry researchers and other interested parties in the U.S. and abroad. The oyster broodstock selection program was implemented in partnership with industry and performance trials of selected stocks continue at commercial sites. Tetraploid oysters are being produced for use in the production of triploid seedstock to be used in commercial production trials. A temperature-controlled algae culture facility has been constructed to provide adequate nutrition to the oysters used in the studies. Oyster broodstock conditioning systems have been developed. Approximately 150 families have been produced from wild broodstock, and these are currently being evaluated at commercial grow-out sites in Alaska, Oregon, California, and Washington.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1995 with an appropriation of $250,000; fiscal year 1996 was $300,000; and fiscal years 1997 through 1999 was $400,000. A total of $1,750,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates a total of $135,454 of non-federal funding in fiscal year 1995 primarily from state sources; in fiscal year 1996, 1997, and 1998 no cost sharing was provided.

Question. Where is this work being carried out?

Answer. Research will be conducted at Oregon State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Although the specific research objectives outlined in the original proposal were to be completed in 1996, researchers anticipated that the original broad objectives would be completed in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES Program manager evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report when the new proposal is submitted to CSREES for funding. The 1998 review indicated that the researchers were well qualified to conduct the research and work in close cooperation with the private sector. The research addresses an important opportunity for the industry, and the work complements other research being funded though USDA on molluscan shellfish. The 1999 CSREES review will be completed within three weeks of submission of the proposal. The researchers are asked to the develop a research proposal consistent with the National Science and Technology Council's Strategic Plans for Aquaculture Research and Development.

MULTI-COMMODITY RESEARCH, OREGON

Question. Please provide a description of the research done under the multi-commodity research program?

Answer. This research provides agricultural market research and analysis to support Pacific Northwest producers and agribusiness in penetrating new and expanding Pacific Rim markets for value-added products. It examines the potential for increasing the competitiveness and economic value-added by Pacific Northwest agriculture through improvements in food production, processing, and trade by assisting decision makers in developing economic and business strategies. The grant is not competitively awarded at the state or regional level, but the proposal is merit reviewed at the Experiment Station and the departmental levels.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher states that Oregon and other Pacific Northwest States produce a wide variety of agricultural commodities and products with commercial potential for export to Pacific Rim countries. Research and analysis are necessary to guide agricultural producers and processors in assessing markets and developing market strategies and value-added products, and in developing marketing strategics tailored to specific Pacific Rim markets. The principal researcher believes this research to be of national, regional and local need.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This research is to gain better specific understanding of the technical, economic, and social relationships that define Oregon's value-added agricultural sector, and examine how these factors affect the economic performance of the sector. This project investigates and develops innovations in value-added agriculture to im-

prove the economic performance of the agricultural and food manufacturing sectors in the Pacific Northwest. The current research plan examines the economic variables that underlie competition in food production, processing, and marketing in the Pacific Rim; addresses technological challenges in transportation, storage, and quality maintenance; assists in testing and evaluating new product ideas; and monitors economic performance of the Oregon value-added agricultural industry. Work in progress has resulted in research output in four topic areas: market research, packaging research, sensory research, and food processing industry strategic planning. Output includes development of a World Wide Web site for Pacific Northwest exports, data bases, survey work, and collaborative research activity with industry and with institute and university researchers in selected Asian countries. Manuscripts, working papers, journal articles, and graduate theses are outputs to date.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The research began in fiscal year 1993 with an appropriation of $300,000. The fiscal year 1994 appropriation was $282,000, and fiscal years 1995 through 1999 appropriations were $364,000 for each year. The total amount appropriated is $2,402,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funding for this grant was $168,824 in State appropriations in fiscal year 1991, $177,574 in State appropriations in 1993, and $162,394 in State appropriations in fiscal year 1994. This project involves the use of Oregon State University administrative personnel, equipment, utilities and facilities that are indirect costs to the project. These costs constitute an Oregon State University contribution to this project which is not allowable as a reimbursable expense. Due to a change in university policy regarding indirect costs, the university has not reported the amount of non-federal funds appropriated for fiscal years 1995–1999.

Question. Where is the work being carried out?

Answer. The research is carried out at Oregon State University in Corvallis and at the Northwest Food Innovation Center in Portland, Oregon.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This Special Grant is awarded on a year-by-year basis. Oregon State University traditionally requests funds for this project on an annual basis and has budgeted the funds to individual sub-projects on that basis. Progress on the original objectives is as follows: baseline data have been accumulated; an economic growth assessment model is being refined; global competitiveness is being assessed for value-added Pacific Northwest agricultural products; targets for performance are being worked out with agricultural industries; and trade teams have been involved in assessing the ability of U.S. based industries to meet the demands for noodle production for Asian markets. The anticipated completion date is 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES reviews project reports, succeeding annual project proposals, research studies, and educational programs. A CSREES merit review was dated August 1998. The work was found to be scientifically sound and of high priority to the region.

MULTI-CROPPING STRATEGIES FOR AQUACULTURE, HAWAII

Question. Please provide a description of the research funded under the multi-cropping strategies for aquaculture research grant in Hawaii.

Answer. The original goal of this program was to identify and develop the sustainable and commercial opportunities inherent in the Molokai aquaculture community while maintaining the cultural and physical environment unique to Molokai. In fiscal year 1993, the university redirected this research program to address the opportunities of alternative aquaculture production systems, including the ancient Hawaiian fish ponds on the island of Molokai. A community-based research identification process has been used to identify and develop specific research projects and prioritize objectives in this program. Current research includes work in the area of water quality characterization to accelerate permitting of aquaculture systems. Field testing of alternative species is underway. The proposal is placed through the university's peer review process and is reviewed by the CSREES Program Manager.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researchers indicate that the primary need for this research is to assist the native Hawaiians in improving the profitability and sustainability of the ancient Hawaiian fish ponds and other appropriate aquaculture systems as part of a total community development program.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this program was to develop technology for the coproduction of shrimp and oysters in aquacultural production systems. Research led to the development of oyster production systems that have been field tested under commercial conditions. The overall goal of the current project is to identify and develop sustainable and commercial opportunities inherent in the Molokai aquaculture community while maintaining the cultural and physical environment unique to Molokai. Multidimensional field testing and evaluation of existing and restored ancient Hawaiian fish ponds is currently underway. Hatchery techniques have been developed for the culture of the Pacific threadfin, Moi, and seaweed. Techniques for the culture of two edible aquatic plants have been refined. Researchers are currently characterizing differences in water quality in fish ponds to establish criteria for fish pond permitting and management. Current studies involve shrimp and ornamental fish production and integration of agriculture and aquaculture systems.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. This research was initiated in fiscal year 1987 and $152,000 per year was appropriated in fiscal years 1987 through 1989. The fiscal year 1990–1993 appropriations were $150,000 per year; $141,000 in fiscal year 1994; and $127,000 per year in fiscal years 1995–1999. A total of $1,832,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university reports a total of $137,286 of non-federal funding for this program in fiscal years 1991–1994, $318,468 in fiscal years 1995–1996, $116,730 in fiscal year 1997, and $197,000 in fiscal year 1998. The primary source of non-federal funding was from state, county, and private sources.

Question. Where is this work being carried out?

Answer. Research is being conducted through the University of Hawaii on the island of Molokai.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original project was 1993. The original objectives were met. The specific research outlined in the current proposal will be completed in fiscal year 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The university is required to provide an accomplishment report when the new grant proposal is submitted to CSREES for funding. The 1998 review indicated that progress has been made in the implementation of the program despite the challenges of developing a community-based program in such a unique social and cultural environment. Progress in the implementation of the program is well documented. The 1999 CSREES review will be completed within two weeks of submission of the proposal. The researchers are asked to the develop a research proposal consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development.

NATIONAL BIOLOGICAL IMPACT ASSESSMENT PROGRAM

Question. Please provide a description of the work that has been funded under the National Biological Impact Assessment Program grant.

Answer. The National Biological Impact Assessment Program supports the environmentally-responsible use of biotechnology products to benefit agriculture and the environment. This grant supports the Information Systems for Biotechnology which is a national resource in agricultural biotechnology information. This system serves the research community by providing information about biotechnology regulations and the environmental issues associated with small-and large-scale releases of genetically-modified organisms. It provides searchable databases, documents, and resource lists on the internet, a monthly News Report, custom software to assist in risk assessment and risk management, and printed reference materials.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. During the last decade there has been an explosion of new information produced by rapid advances in biotechnology and its beneficial application to agriculture and the environment. This program fulfills an important national need to provide scientists easy access to relevant information that will facilitate conducting research that complies with the oversight and regulatory requirements for testing biotechnology products, and foster the safe application of biotechnology to benefit agriculture and the environment. The Information System for Biotechnology was the first on-line system to address the information needs of the national agricultural biotechnology research community, and it continues to be one of the most comprehensive sources of information on this topic.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the Program remains in force today: to facilitate and assess the safe application of new techniques for the genetic modification of plants, animals, and microorganisms to benefit agriculture and the environment. Since its inception in 1989, the Program has developed tools and resources to provide scientists, regulators, teachers, administrators, and the interested public with value-added information in a readily-accessible form. It has fostered the development of a computer-based information system that has grown into an internet site serving more than 4,200 requests per month from over 40 countries. The site carries documents pertaining to regulatory oversight of biotechnology products, policy statements, and risk assessment and risk management information. Searchable databases include records of all environmental releases of genetically-engineered organisms conducted under authority of the Department of Agriculture, institutional biosafety committees, state regulatory contacts, and biotechnology research centers and companies. A monthly News Report, covering research, regulatory, legal, and international issues, is distributed to 1,500 e-mail and 500 print subscribers. In previous years, biosafety training workshops were conducted for public and private sector scientists and state regulatory officials. Major activities now underway include a risk assessment workshop on Ecological Effects of Pest Resistance Genes in Managed Ecosystems, to be held January 31-February 3, 1999, and publication of "Greenhouse Research with Transgenic Plants and Microbes: A Common Sense Guide to Containment," a guidebook for safely conducting research in greenhouses.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $125,000; fiscal year 1990, $123,000; fiscal years 1991–1993, $300,000 per year; fiscal year 1994, $282,000; and fiscal years 1995–1999, $254,000 per year. A total of $2,700,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This program is administered through the Department of Biochemistry at Virginia Polytechnic Institute and State University—VPISU. The university contributes administrative and clerical support which amounts to approximately $5,000 per year.

Question. Where is this work being carried out?

Answer. The grant award is with VPISU. Former and current partners in the program include the Pennsylvania State University, Louisiana State University, North Carolina Biotechnology Center, Michigan State University, Arizona State University, National Agricultural Library, and Institute for Biotechnology Information.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. There remains a continuing critical need to address the safety of genetically-modified organisms to benefit agriculture and the environment. Application of Biotechnology is expanding rapidly. Increasing amounts of new information needs to be properly integrated into the computerized information system each year. This program has been very successful in providing essential, updated information on the conduct of safe field experiments. Thus, the program remains a high priority and needs to be continued.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An external panel of scientists reviewed this program in 1994. The review report was highly complimentary of this project and recommended continuation of the program. Another external review and site visit is being planned for the year 2000. The current proposal was peer-reviewed at VPISU prior to submission.

NEMATODE RESISTANCE GENETIC ENGINEERING, NEW MEXICO

Question. Please provide a description of the work that has been funded under the Nematode Resistance Genetic Engineering Project grant.

Answer. This research is designed to investigate naturally-occurring compounds from diverse sources that may confer pesticidal resistance if introduced into agronomic plants. The main target pests are plant parasitic nematodes. The work is using molecular biological techniques to incorporate genes into agronomic plants which will shorten the time frame to produce transgenic plants. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that the successful development of these techniques and subsequence transfer of nematode resistant genes into agronomic plants will provide an environmentally-sound system for all plants susceptible to plant parasitic nematodes. The principal researcher believes that this project has the potential for both regional and national application.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to provide an alternative approach for the control of plant parasitic nematodes through the use of molecular biological technologies to transfer pesticide resistance to plants. A nematode-stimulated promoter element was engineered for insertion in front of a bacteria toxin. A unique technique utilizing insect intestinal membrane vesicles were used as tools for detection of specific protein binding domains. The synthetic gene, CRY3A Bt, has been successful in field trails on potato and eggplants.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 and the appropriations for fiscal years 1991–1993 were $150,000 per year; $141,000 in 1994; and $127,000 per year in fiscal years 1995–1999. A total of $1,226,000 has been appropriated thus far.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $65,000 state appropriations in 1991; $62,000 in state appropriations in 1992; $75,000 in state appropriations in 1994; and $75,000 state appropriations in 1995. For 1996, the University and the Plant Genetic Engineering Laboratory provided matching contributions in faculty and staff salaries, facilities, equipment maintenance and replacement, and administrative support. In 1997, there were no matching non-federal funds. In 1998, $48,000 state appropriated funds were provided. In 1999, $62,747 is being appropriated in non-federal funds.

Question. Where is the work being carried out?

Answer. Research is being conducted at the New Mexico State University, and at collaborating universities in the region.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives have not as yet been met. The estimated completion date for this project is in 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last evaluation of this project was a merit review conducted in January, 1998. In summary, the overall goal of this project is to use molecular technology to develop pesticide capability in plants of agronomic importance. A plant transformation system was developed to improve the historically difficult transformation efficiently of monocots. In field trails of transformed eggplants and potatoes, high levels of effectiveness against insects have been found. Several potato and alfalfa lines have been transformed and established in field plots and are being tested at this time. Other constructs are being used in many crops to determine resistance to nematodes and other crop pests.

NONFOOD AGRICULTURAL PRODUCTS PROGRAM, NEBRASKA

Question. Please provide a description of the research that has been funded under the Nonfood Agricultural Products Program grant.

Answer. This work focuses on the identification of specific market niches that can be filled by products produced from agricultural materials, developing the needed

technology to produce the product, and working with the private sector to transfer the technology into commercial practice. Major areas of application include starch-based polymers, use of tallow as diesel fuel, improvements in ethanol production, use of vegetable oil as drip oil for irrigation wells, production of levulinic acid, the extraction of wax from grain sorghum, and production of microcrystalline cellulose from crop biomass. The Dean and Director of Agricultural Research has initiated a review process that parallels the process used for Experiment Station projects. Two to three faculty member are asked to critically review the proposal using criteria as described by Cooperative State Research, Education and Extension Service in the letter soliciting proposals for 1999.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes our ability to produce agricultural commodities exceeds our needs for food and feed. These commodities are environmentally-friendly feedstocks which can be used in the production of many biochemicals and biomaterials that have traditionally been produced from petroleum. The production of the commodities and the value-added processing of these commodities is regional in scope.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The objectives are to identify niche markets for industrial utilization of agricultural products; improve and develop conversion processes as needed for specific product isolation and utilization; provide technical, marketing, and business assistance to industries; and coordinate agricultural industrial materials research at the University of Nebraska, Lincoln. Accomplishments include commercialization of soybean-based drip oil for irrigation wells. Bruning Grain Co. Is marketing "Soy Bio Drip." MCC Technologies, Inc. continues to refine the processing requirement and develop a business plan for production of microcrystalline cellulose from crop residues such as corn cobs, wheat straw, and cellulose via a reactive extrusion process developed by the university's Industrial Agricultural Products Center. Commercialization activities continue in the area of printable plastics. The Center is currently negotiating a royalty position with a major producer of smart cards. There are continuing activities with the areas of phone cards and credit cards. The Center also is currently negotiating a royalty position with a company for the use of biodegradable loose-fill packaging technology developed at the Center. Various hardness grades of plastic particle media blast using a combination of commercially-available biodegradable polymers have been produced, and two formulations are currently being tested by U.S. Technology Corporation. All of these commercialization projects are the result of research efforts, most of which have been supported by the Nonfood Agricultural Products Program.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The funding levels for this project are $109,000 in 1990; $110,000 per year in fiscal years 1991–1993; $103,000 in fiscal year 1994; $93,000 in fiscal year 1995; and $64,000 in fiscal years 1996–1999 per year. A total of $891,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-Federal funding for this project is: in fiscal year 1992, $315,000; fiscal year 1993, $330,000; fiscal year 1994, $330,000; fiscal year 1995, $309,000; fiscal year 1996, $251,000; fiscal year 1997, $250,000; and fiscal year 1998, $340,000. These funds were from Nebraska Corn, Soybean, Wheat, Sorghum, and Beef Boards, World Wildlife Fund, Nebraska Bankers Association, United Soybean Board and National Corn Growers Association, Bioplastics, Inc., Biofoam, Inc. and M.C.C. Technologies, Inc.

Question. Where is this work being carried out?

Answer. This work is being conducted at the Industrial Agricultural Products Center, L.W. Chase Hall, University of Nebraska, East Campus, Lincoln, Nebraska.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The objectives of the original projects have been completed. Specific objectives have been identified in each renewal request.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is evaluated based on the annual progress report. The cognizant staff scientist has reviewed the project and determined that the research is conducted in accordance with the mission of this agency.

OIL RESOURCES FROM DESERT PLANTS, NEW MEXICO

Question. Please provide a description of the research that has been done under the Oil Resources from Desert Plants, New Mexico.

Answer. The Plant Genetic Engineering Laboratory has been exploring the potential for the production of high value industrial oils from agricultural products. The effort has been focused on transferring the unique oil producing capability of jojoba into oilseed rape and soybean. With the development of technology to both isolate the enzyme components of oil biosynthesis and successfully transform the target plants, significant advances have been made with jojoba. In addition, oil enzymes have been studied in castor, oilseed rape, desert primrose, cyanobacteria, and meadowfoam. A panel of scientists is scheduled to re-evaluate the scientific merit of the project on February 9, 1999.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes desert plant sources of valuable oils for industrial applications are typically low yielding and limited in climatic areas for farm production. Genetic engineering offers an opportunity to move genetic capability to high yielding major crops. Many of the oils and their derivative acids, waxes, and others can directly substitute for imports of similar polymer materials, especially petroleum.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research is to transfer the unique oil producing capability of jojoba and other native shrubs into higher yielding crops such as oilseed rape and soybean. This is a form of metabolic engineering, and it requires the transfer of coordinated groups of genes and enzymes into the host plant to catalyze the necessary biochemical reactions. Recent progress includes successful transformation of tobacco and alfalfa plants with oil metabolism genes from the meadowfoam plant and a cyanobacterium.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. This research began in fiscal year 1989 with a $100,000 grant under the Supplemental and Alternative Crops program. Grants have been awarded under the Special Research Grants program as follows: fiscal year 1990, $148,000; fiscal years 1991–1993, $200,000 per year; fiscal year 1994, $188,000; fiscal years 1995–1996, $169,000 each year; and fiscal years 1997 through 1999, $175,000 per year. A total of $1,899,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Matching funds in the amount of $27,747 from State and private sources were used to help fund this project in fiscal year 1998. New Mexico State University and the Plant Genetic Engineering Laboratory also provide $90,000 for in-kind support per year including faculty salaries, graduate student stipends, facilities, equipment maintenance, and administrative support services.

Question. Where is this work being carried out?

Answer. The research is being conducted by the Plant Genetics Engineering Laboratory at New Mexico State University, Las Cruces, New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. An estimate of the total time in Federal funds required to complete all phases of the project is 3–4 years. The application of this research for improved management of natural resources will evolve and expand as technology in the area advances .

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Oil Resources from Desert Plants, New Mexico project was evaluated for scientific merit by an agency peer review panel on January 29, 1998. The panel recommended approval of the project pending receipt of supplemental information on administrative aspects of the project. The Institution conducts an internal peer review of this project by scientists with expertise in this area of research. A panel of scientists is scheduled to re-evaluate the scientific merit of the project for the agency on February 9, 1999.

ORGANIC WASTE UTILIZATION, NEW MEXICO

Question. Please provide a description of the research that has been funded under the Organic Waste Utilization, New Mexico grant.

Answer. Composted dairy waste is utilized as a pretreatment to land application. Composting dairy waste before land application may alleviate many of the potential problems associated with dairy waste use in agronomic production systems. Composting may also add value to the dairy waste as a potential landscape or potting medium. High temperatures maintained in the composting process may be sufficient for killing enteric pathogens and weed seeds in dairy waste. Noxious odors and water content may be reduced via composting. Composted dairy waste may be easier to apply, produce better seed beds, and not increase soil salinity as much as uncomposted dairy waste. Changes in the physical structure of the soil are being monitored for the effects of composted vs uncomposted amendments. This project undergoes annual peer review from academic institutions and experts from government and state agencies, and industrial partners.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the research will address the utilization of dairy waste combined with other high-carbon waste from agriculture and industry, including potash and paper waste, for composting. This approach to waste management will have high impact for states where dairy and agriculture are important industry sectors. This is especially true for New Mexico and the southwest United States where the dairy business is growing rapidly. This research will also provide an additional pollution prevention tool for the industrial sectors dealing with potash and paper waste. The principal investigator believes this research to be of local, regional and national importance.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was and continues to determine the feasibility of simultaneously composting dairy waste from agriculture and industry. The research will determine effects of utilizing composted waste, as opposed to raw waste, as a soil amendment on plant growth, irrigation requirements, and nutrient and heavy metal uptake. Phase I, to determine the feasibility of simultaneous composting dairy waste with available high carbon wastes from agriculture and industry, has been completed. Phase II, to determine the appropriate ratios of waste to carbon substrate for successful composting is completed. Phase III, to determine the kinetics of nutrient release and effects of composted material on heavy metal uptake will be completed this year.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1996 and the appropriation for fiscal year 1996 was $150,000, and for fiscal years 1997 through 1999, $100,000 per year. A total of $450,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds for the duration of this grant from the state appropriation is $75,000. There is another $50,000 in-kind support from the industrial partners. Additionally, a sum of $15,000 from the New Mexico State Highway Department has been leveraged by this project.

Question. Where is this work being carried out?

Answer. This work is being carried out in New Mexico under the direction of the Waste-Management Education and Research Consortium in collaboration with The Composting Council and industrial partners, such as Envio in Ohio, Plains Electric, and McKinley Paper in New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Completion date of the initial phases will be March 2000. Objectives are being met as the project continues. The project has been progressing according to the specified targets. Phases I and II have been completed. Phase IV has been added in order to evaluate the multi-year compost application on parameters such as plant growth, soil water retention, and soil salinity.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has been evaluated based on the semi-annual progress report and research findings presented at conferences. The cognizant staff scientist has reviewed the project and determined that this research is conducted in accordance with the mission of this agency.

PASTURE & FORAGE RESEARCH, UTAH

Question. Please provide a description of the research that has been funded under the Pasture and Forage Research, Utah grant.

Answer. This is a multidisciplinary effort to develop profitable and sustainable pasture and forage management systems. CSREES has requested the university to submit a grant proposal that has not yet been received.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The proposed research under this Special Research Grant will address issues related to forage production and utilization in Utah.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project is to develop a comprehensive guide for the management of irrigated pastures to assist livestock producers reduce cost and increase net returns.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was $200,000, and for fiscal years 1998 and 1999, $225,000 per year. A total of $650,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds in support of this project and related activities were $360,200 for 1997 and $356,000 for 1998.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Utah Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipate the completion date for these objectives to be in 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The grant is peer reviewed annually through the institutions project approval process as well as by CSREES National Program Leader.

PEACH TREE SHORT LIFE IN SOUTH CAROLINA

Question. Please provide a description of the research that has been funded under the Peach Tree Short Life in South Carolina grant.

Answer. Progress continued in 1998 with focus on the evaluation and longevity and productivity of Guardian rootstocks on peach tree short life sites in the southeast and replant sites throughout North America. More fundamental work has involved the biochemical characterization of the egg-kill factor produced by a bacteria on nematode eggs. Other basic studies involved the cloning of genes associated with production and expression of toxins from bacteria. New studies were initiated on the use of solarization to reduce nematode populations for peach tree replant. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the principal researcher, the problem of disease on peach, nectarine, and plum trees in the southeastern United States effects is very great. More than 70 percent of peach acreage in the southeast is effected. Research continued on the improvement of rootstocks and the use of the cultivar Guardian BY520–9 which has now been released in 22 states including California, New Jersey, and Michigan where bacterial canker is a problem.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research was the continued evaluation of productivity of peach Guardian BY520–9 rootstocks on peach tree short life and investigations into novel management for ring nematodes by bacteria. Recent accomplishments include the increase in bulk commercial production of Guardian seed while two new Guardian selections have had very good nursery trails. Guardian rootstock continues to be tested in 22 states and is performing well. A marker for a gene for rootstock resistance to two root-knot nematode species was sequenced and successfully use to correctly sort current commercial rootstocks according to their known nematode re-

sistance or susceptibility. A major find is that the egg-kill factor produced by the bacteria kill root-knot nematode eggs as well as ring nematode eggs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1981, $100,000; fiscal years 1982–1985, $192,000 per year; fiscal years 1986–1988, $183,000 per year; fiscal year 1989, $192,000; fiscal year 1990, $190,000; fiscal years 1991–1993, $192,000 per year; fiscal year 1994, $180,000; fiscal years 1995–1999, $162,000 per year. A total of $3,365,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources for this grant were as follows: $149,281 state appropriations in 1991; $153,276 state appropriations in 1992; $149,918 state appropriations in 1993; $211,090 state appropriations in 1994; $193,976 in state appropriations in 1995; $169,806 in state appropriations in 1996 and 1997; $150,693 in state appropriations in 1998; and $92,099 in state appropriations in 1999.

Question. Where is this work being carried out?

Answer. This research is being conducted at South Carolina Agricultural Experiment Station.

Question. What as the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The researchers anticipate that the work may be completed in fiscal year 2000. Adequate progress has been made to assure that the objectives will be met before the completion date.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last agency evaluation of this project was a merit review completed January, 1998. In summary, the evaluation of peach rootstocks with resistance to peach tree short life is of continued importance in managing this disease. The use of biological control strategies in suppression of plant parasitic nematodes are a complementary area of research in that it can enhance disease management by protecting the peach rootstocks. Solarization of orchard sites prior to peach tree replanting significantly altered the microbial community and suppressed nematode multiplication in the rhizosphere. Some accomplishments were the increased production and release of commercial Guardian seed and continued evaluation of rootstock in 22 states and provinces. A molecular techniques that separates resistant and susceptible peach rootstocks was validated.

PEST CONTROL ALTERNATIVES, SOUTH CAROLINA

Question. Please provide a description of the research that has been funded under the Pest Control Alternatives grant.

Answer. This grant supports research and technology transfer to provide growers with alternatives for managing pests and to implement the use of new alternatives reducing the sole reliance on chemical pesticides.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The investigators contributing to the research and technology transfer at South Carolina believe that need for the development of alternatives for managing pests on vegetables is a regional and national problem. Contributions from the South Carolina work are projected by South Carolina to impact vegetable production in the Southern region and consumers of vegetable production from the Southern region. Research on pest management alternatives of national significance could potentially be supported by competitive grants awarded under the Pest Management Alternatives Program.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this program is to investigate alternative methods of managing insects, plant diseases, and nematodes in vegetable crops as complements to or as substitutes for conventional chemical sprays. The role of indigenous predators, parasites, and pathogens in controlling insect pests are being evaluated. Technology transfer to conventional and Integrated Pest Management—IPM—systems has resulted in modified thresholds for caterpillar pests in collards and tomatoes which incorporate the impact of beneficial insects in the system and a sampling plan for tomato fruitworm which considers numbers of parasitized eggs used to schedule insecticide sprays. Several vegetable crops have been successfully grown without

chemical insecticides. Refinements in field scouting techniques for insect pests of cole crops has translated into reliable treatment decisions—using microbial materials—with substantial savings in time required for field scouting. Biological control agents have been isolated, identified, and used in tests to demonstrate their potential in reducing dependence on chemical insecticides. The value of indigenous biological control agents has been demonstrated. The impacts of these against target pests have been shown along with the adverse effects of chemical insecticides on these natural control agents—especially predators and parasites. There are now crops—cole crops, for example—for which the use of chemical insecticides is avoided altogether, with no loss in yield and quality. However, other crops—e.g. tomato, peas, beans—still require chemicals for pest control, until alternatives can be found.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This work supported by this grant began in fiscal year 1992 and the appropriation for fiscal years 1992 and 1993 was $125,000 per year. In fiscal year 1994 the appropriation was $118,000 and in fiscal years 1995 through 1999, $106,000 per year. A total of $898,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. South Carolina has provided approximately $200,000 in personnel support and operating dollars per year from State appropriations based on the Principal Investigator's estimate.

Question. Where is the work being carried out?

Answer. This research and technology transfer program is being conducted at the South Carolina Agricultural Experiment Station, Clemson University at Clemson, Florence, and Charleston, South Carolina.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the project were for five years. The project has been revised in 1998. Research on objective A: Develop and evaluate microbial pest control agents for control of plant pathogens and insect pests of vegetables, is defuse and non-conclusive. It would be far superior for continued work in this area to be submitted to competitive peer review programs where the investigators would need to clearly focus specific activities and receive the benefit of the comments of peer scientists. Objective B: Determine the efficacy of innovative cultural practices for vegetable production systems in South Carolina. Objective C: Assess the role of indigenous predators, parasites, and pathogens in controlling insect pests; determine environmental and biological factors that influence the abundance and distribution of these indigenous beneficials; and consider the presence of natural enemies, as well as pests, in management decisions, is the area where the most progress appears evident and has been cited in the accomplishments. We feel that the base of information and orientation of the research in this area is adequate and of quality that the investigators could compete well in competitive grant programs such as sustainable agriculture or regional IPM grant programs, and would benefit from the peer review process. Progress in this area is an ongoing process as explanations are sought for the results being obtained. Objectives D: Evaluate and develop germplasm, breeding lines and cultivars for resistance to major pathogens of commercially important vegetables. Objective E: Transfer new technology to user groups, has not demonstrated any progress that would not be anticipated from ongoing conventional sources of funds.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We evaluate this project annually when we process the grant and plan to evaluate this project through a site visit during early summer of 1999.

PESTICIDE IMPACT ASSESSMENT PROGRAM

Question. Please provide a description of the research that has been funded under the Pesticide Impact Assessment grant?

Answer. Research funded by the Pesticide Impact Assessment Program—PIAP—discovers, gathers, publishes, and distributes crop and livestock profiles which address the information needs for implementation of the Food Quality Protection Act—FQPA. These data include the use and effectiveness of pest management alternatives which is essential to the maintenance of economically competitive U.S. crops and livestock production systems. This program produces and publishes crop and livestock production profiles which are documents that evaluate the biologic and economic impact, implications and consequences of replacing existing pest management

options with alternatives. By coordinating PIAP data collections in conjunction with the survey activities of the National Agricultural Statistic Service—NASS—and the Agricultural Marketing Service's—AMS—Pesticide Data Program, special pest management information needs of small acreage and minor crop farmers are better served.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This program provides the U. S. Environmental Protection Agency—EPA—and USDA with information on the use, importance, and effectiveness of pest management alternatives essential to U.S. agricultural crops and livestock production. This program, in responding to the information needs of the EPA, is supporting the national implementation of the FQPA. In recent years, a special focus of the PIAP has been directed into minor crop production systems. To ensure relevance and focus on minor crops, this program solicits pest management needs assessments from producers, gathered by the NASS, Land-Grant University System scientists, and the Department's Office of Pest Management Policy—OPMP. The EPA uses these data in making environmentally-sound regulatory decisions. The USDA uses scientists from the Land-Grant University System to identify commodities where critical pests threaten the production system, for FQPA risk assessments, and for identification of risk management options for specific production systems. Through this cooperative interaction, USDA and EPA receive state-generated agricultural information needed for sound regulatory decisionmaking. The state partner receives Federal funds, participatory input into the regulatory process, and direct access to timely regulatory information.

Question. What was the original and current goal of this research and what has been accomplished to date?

Answer. The PIAP has been an on-going research effort whose original goal in 1977 was to gather data to provide comprehensive assessments documenting the probable impact on agriculture if certain pesticides would no longer be available. A Federally-coordinated network of state scientist contacts has been established in the intervening years as broader and more environmentally-enlightened goals evolved within this program. Today the PIAP goals are defined as: (1) to focus on the collection and delivery of high quality science-based pest management information for use in the regulatory process; and (2) to maintain and enhance a strong partnership between USDA and the Land Grant System in order to continue the positive interactive flow of vital pest management information between USDA, the regulatory community, and production agriculture.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1977–1981, $1,810,000 per year; fiscal years 1982–1985, $2,069,000 per year; fiscal years 1986–1988, $1,968,000 per year; fiscal year 1989, $2,218,000; fiscal year 1990, $2,437,000; fiscal years 1991–1993, $2,968,000 per year; fiscal year 1994, $1,474,000; and fiscal years l995–1999, $1,327,000 per year. A total of $44,898,000 has been appropriated since fiscal year 1977.

Question. What is the source and amount of the non-federal funds provided by fiscal year?

Answer. The majority of the cost of the state scientist and the PIAP program is born by the state partner. The exact contribution of each state is not known, nor has this information been requested to be reported by the states to the Federal partner during the duration of this program. The Federal program funds provided to the states by CSREES have been used by state partners to partially defray their costs of staffing a PIAP State Liaison Representative on their Land Grant campus. The remaining program expenses, above the Federal contribution, are born by each state and include the cost of program participant salaries, facility/clerical expenditures, travel, and supplies. These costs, several times beyond the Federal contribution, are considered the non-federal support for this program. The size of the state contribution varies from state to state, but estimates of matching support for this program range from 3 to 6 times the Federal dollar investment.

Question. Where is this work being carried out?

Answer. Work on the PIAP is underway at State Agricultural Experiment Stations in 50 states and 5 Territories. The distribution of competitively-awarded PIAP Regional Grants is coordinated through the Agricultural Experiment Station in a lead state in each of the four regions of the United States: namely, California in the western region; Michigan in the north central region; Pennsylvania in the northeastern region; and Florida in the southern region.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The PIAP has been an on-going research effort which gathers relevant pest management information necessary for the changing regulatory scene. A Federally-coordinated network of state scientist contacts has been developed to address the information needs of the regulatory community. With leadership from OPMP, this multi-agency program coordinates the gathering of high quality pest management information from our State partners. The combined data needs of FQPA, EPA, and The Government Performance and Results Act—GPRA—have resulted in a growing need for accurate and timely pest management information in 1999. Thus, the original 1977 objectives of the PIAP have been met but the information needs of production agriculture and U. S. citizen's continue to grow with the empowering regulations of new legislation which require the continuation of these activities to demonstrate responsible and responsive federal engagement on pesticide issues.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A comprehensive evaluation and review of the PIAP was conducted in February 1995. The review panel's report was published in June 1995. The review team was composed of 10 scientists representing EPA, Industry, agricultural commodity groups, the Federal government, and the Land Grant System. This thorough review directed the program to focus on data collection relating to pesticide usage on minor crops, the efficacy of pest management alternatives, and issues responsive to stakeholder's needs. In response to these recommendations, CSREES brought together the programmatic and budgetary components of the program into a single coordinated PIAP effort. During fiscal year 1999, OPMP enhanced it's leadership input to this program focusing on information which supports the timely and rational implementation FQPA.

PEST MANAGEMENT ALTERNATIVES

Question. Please provide a description of the research that has been funded under the Pest Management Alternatives special grant.

Answer. This special research grant supports projects that help farmers respond to the environmental and regulatory issues confronting agriculture. These special grant funds support research that provides farmers with replacement technologies for pesticides that are under consideration for regulatory action by the Environmental Protection Agency—EPA—and for which producers do not have effective alternatives. The passage of the Food Quality Protection Act of 1996—FQPA—makes this special research grant of critical importance to the Nation's farmers.

New pest management tools are being developed to address critical pest problems identified by farmers and others in a crop production region, and to identify new approaches to managing pests without some of the most widely used pesticides. Farmers have identified the lack of effective alternative pest management tactics as a primary reason for not implementing Integrated Pest Management—IPM—on their farms. Where effective alternative tactics have been developed, they are widely and rapidly implemented by farmers. These special research grant funds are distributed on a competitive basis to all eligible research institutions through the Pest Management Alternatives Program or PMAP. Research priorities for PMAP are established with the help of a database analysis system, which draws upon the expertise of the land-grant university system, commodity groups, and others.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The ability of the Nation's agricultural production system to keep pace with domestic and global demand for food and fiber is dependant on access to safe, profitable and reliable pest management systems. For a variety of factors, farmers and other pest managers have fewer chemical control options available to them than they did at the beginning of the decade, and this trend is likely to continue at an accelerated rate. The FQPA will have significant impacts on pest management systems in the United States over the next decade, and the "minor use"—high value crops grown on relatively few acres—will be particularly hard hit. For these reasons and others, it is essential that farmers be provided with new pest management tools and better information so they can remain competitive in today's global marketplace.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This research is conducted to help farmers respond to the environmental and regulatory issues confronting agriculture by providing them with new options

for managing pests. The research supported by this special grant is identifying new ways to manage pests without key pesticides that may no longer be available as FQPA is implemented. Some highlights of the research funded through PMAP include progress on surface amendments to reduce air pollution by Telone, a fumigant; latent infection assessment and fungicide mixtures for brown rot control; development of a pesticide use/pesticide recommendation database; implementation of alternatives to carbofuran for control of rice water weevil; substitution of behavioral control for organophosphate sprays against apple maggot; pheromone mating disruption in orchards; application technology; and integration of natural enemy thresholds for greenbug management in wheat. Progress on additional research has been made to collect data on alternatives for pest management in watermelon insects and diseases of cucurbit crops in the South Central States; on developing IPM and monitoring networks in Northeastern vegetation crops; assessment of insecticide and IPM usage in alfalfa and small grains; and alternative management practices for minor tree fruit crops.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1996 through 1999, $1,623,000 each year. A total of $6,492,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds are not required by this grants program.

Question. Where is the work being carried out?

Answer. All State Agricultural Experiment Stations, all colleges and universities, other research institutions and organizations, Federal agencies, private organizations or corporations, and individuals are eligible to compete for this funding. This research is currently being carried out by State Agricultural Experiment Stations and other research organizations located in 20 states.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The economic and environmental pressures facing U.S. agriculture today are greater today than in 1996 when Federal funds were first appropriated for this special research grant. There will be a need for continued investment in research to develop new approaches to managing pests for the foreseeable future as the FQPA is implemented.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each new draft of Request for Proposals—RFP—and all project proposals are evaluated annually by multi-disciplinary relevancy and merit review panels. A joint USDA/EPA workshop to evaluate the progress and scope of PMAP is planned for May 1999. The projects supported by this special research grant have consistently provided key knowledge needed in developing new approaches to pest management. The focus on pesticides targeted by FQPA assures that critical pest management alternatives are being addressed. PMAP has supported 57 projects in 25 States since it started four years ago—just enough time for the first cycle of projects to be completed. Promising results could soon be put into practice in the field.

PHYTOPHTHORA ROOT ROT, NEW MEXICO

Question. Please provide a description of the research that has been funded under the Phytophthora Root Rot grant.

Answer. Work has continued to focus in general on the development of strategies for sustainable vegetable production in irrigated lands. Work has continued on the search for Phytophthora root rot resistance in chilies, identification of molecular markers for rot tolerant genes, investigation on irrigation modification as a means to manage root rot, and soil bed temperature control as a means to manage disease. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that since Phytophthora disease threatens chili production in west Texas, New Mexico, and Eastern Arizona, this problem is of state-and regional significance.

Question. What is the original goal of this research and what has been accomplished to date?

Answer. The original goal was to improve chile production through genetically-superior cultivars, combined with new improved cultural practices. Researchers have developed a highly effective disease screen that selects resistant seedlings, found that genes for resistance to root rot do not provide protection against Phytophthora foliar blight, that a wild species of Capsicum is immune to the fungus, and that molecular markers are useful to introgress genes for tolerance. They also found that alternate row irrigation and drip irrigation significantly reduce Phytophthora root rot. Control of soil temperature with soil mulches can greatly impede the progression of root rot in the irrigated field.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991 with an appropriation of $125,000 for that year. The fiscal years 1992–1993 appropriation was $150,000 per year; $141,000 in fiscal year 1994; and $127,000 per year in fiscal years 1995–1999. A total of $1,201,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds from state appropriations and the California Pepper Commission were $255,614 in 1997; $253,614 in 1998; and state appropriations in 1999 are $260,682.

Question. Where is this work being carried out?

Answer. Research is being conducted at New Mexico State University. be to develop educational and outreach material

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was 1995. These objectives have not been met. Related programs deal with research and development efforts designed to prevent or manage diseases impacting vegetable production in irrigated areas, and cooperators estimate that the objectives of these programs should be met by 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last merit review was made in January, 1998. In summary, the development of resistant cultivars and research on interactions of Capsicum and Phytophthora for developing strategies for irrigated crop growers to be competitive in the international economic arena continued. More than 30,050 seedlings were screened for resistance to root rot and/or foliar blight in the greenhouse. This technique allows the resistant plants to be saved and used in the breeding program. Field evaluations of advanced lines continued with 11 green chile lines, 11 red chile lines, 18 advanced paprika lines, and 8 jalapeno lines were evaluated for released by this program.

PLANT, DROUGHT, AND DISEASE RESISTANCE GENE CATALOGING

Question. Please provide a description of the research that has been funded under the Plant, Drought, and Disease Resistance Gene Cataloging grant.

Answer. The purpose of this work is to identify, characterize, and catalog important genes in crop plants that result in the ability to resist stress caused by drought and disease organisms. The specific objectives are: construct, curate, and distribute cDNA libraries for genes that are differentially expressed in response to drought or disease pressure; sequence DNA of these genes; characterize the pattern of expression; and develop databases to share information with other scientists.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The long term goal of this research is to improve plant resistant to drought and disease for New Mexico and U.S. crops. This information has application throughout the nation, especially in the arid/semi-arid regions. The principal researchers believe this research to be of national, regional, and local need. Genetic research of national significance could potentially be supported by competitive grants awarded under the National Research Initiative or the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The long term goal of this research is to produce better adapted crops for New Mexico and the U.S. In year one, New Mexico State University established the facility, developed a database to catalogue cDNAs, and began the initial work of sequencing and cataloging genes into biologically informative groups. To date,

they have isolated the appropriate DNA to construct libraries of drought-stress induced transcripts from three different chile genotypes, one grass, and one clover. Additionally, they have selected the germplasm to characterize for other species.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal years 1998 and 1999 is $150,000 per year for a total of $300,000.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. In fiscal year 1998, New Mexico Agricultural Experiment Station provided $8,444 in nonfederal funds. The funds covered a portion of the salary for the two principle investigators.

Question. Where is this work being carried out?

Answer. The research is primarily conducted at New Mexico State University. Collaborations with Los Alamos National Lab, Los Alamos, New Mexico, and the National Center for Genome Resources, Santa Fe, New Mexico, have been established.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project, which began in 1998, was designed to demonstrate significant accomplishments within a five-year time frame. The principle investigators report significant progress on year one objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project began in fiscal year 1998 and the head of the Department of Agronomy and Horticulture has established a scientific peer review process for this project based on the review tool used for Hatch projects at New Mexico State University.

POSTHARVEST RICE STRAW, CALIFORNIA

Question. Please provide a description of the research that has been funded under the Postharvest Rice Straw, California grant.

Answer. The postharvest rice straw special grant was initiated in May 1997 and has two main objectives: first, characterize current capabilities, costs, and constraints in harvesting and handling rice straw as a renewable material for commercial products; and second, investigate alternative harvest and handling systems and evaluate their specialized equipment and system designs.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. California legislation mandates reduction in the amount of open rice straw burning, the principal method of rice straw disposal. Efficient harvest and handling may make rice straw a suitable raw material for user businesses while meeting straw burning regulations and improving air quality. The principal researcher believes this research to be of regional and local need.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to demonstrate efficient and economic rice straw harvest and handling, thereby establishing rice straw as a feedstock for value-added manufacturing and other uses. This project is only recently initiated and is fully organized, including outreach to the rice industry.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1997. The appropriation for fiscal year 1997 was $100,000 and in fiscal years 1998 and 1999 was $300,000 per year. A total of $700,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The California Rice Industry Association and the California Rice Research Board are potential supporters. The University of California at Davis is cost sharing on salary of the investigators.

Question. Where is this work being carried out?

Answer. Research will be conducted at the Department of Biological and Agricultural Engineering, University of California-Davis, California and at field sites in the rice growing region

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated by the University of California-Davis that the postharvest rice straw project will be complete in 2002. The project is on track for the objectives pertaining to current equipment assessment, economic and systems modeling including geographical information systems, and environmental issues.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The evaluation of the projected was completed at the end of January 1999 based on the 1998 summary of accomplishments.

POTATO RESEARCH

Question. Please provide a description of the research that has been funded under the Potato Research grant.

Answer. Scientists at several of the State Agricultural Experiment Stations in the Northeast, Northwest, and North Central States are breeding new potato varieties, high yielding, disease and insect resistant potato cultivars adapted to the growing conditions in their particular areas, both for the fresh market and processing. Research is being conducted in such areas as protoplast regeneration, somoclonal variation, storage, propagation, germplasm preservation, and cultural practices. Congressional language for fiscal years 1997, 1998, and 1999 has directed CSREES to award these funds on a competitive basis. In 1997 and 1998, CSREES published a request for proposals in the Federal Register and awarded grants competitively based on a scientific peer review; the number of grants were eight in 1997 and ten in 1998.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes this research effort addresses needs of the potato producers and processors. Research areas being studied include storage and postharvest handling of potatoes and their effect on potato quality. Potato producer and processor needs are breeding and genetics, culture factors, and pest control on potato production.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to improve potato production through genetics and cultural practices as well as improve storage for quality potatoes for processing and fresh market. This research has resulted in a number of new high yielding, good quality, disease and insect resistant cultivars, which are now being used in the processing industry and in the fresh market. Regional comprehensive breeding programs have been developed to produce cultivars targeted to the specific growing conditions of that region. A number of the new cultivars have also been adaptable to other regions. These programs have also had success in identifying resistance to pests and pathogens in wild germplasm and are developing expertise to incorporate genetic engineering approaches as traditional components of the program.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1983, $200,000; fiscal year 1984, $400,000; fiscal year 1985, $600,000; fiscal years 1986–1987, $761,000 per year; fiscal year 1988, $997,000; fiscal year 1989, $1,177,000; fiscal year 1990, $1,310,000; fiscal year 1991, $1,371,000; fiscal years 1992 and 1993, $1,435,000 per year; fiscal year 1994, $1,349,000; fiscal years 1995 through 1998, $1,214,000; and fiscal year 1999, $1,300,000. A total of $17,952,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $401,424 state appropriations, $4,897 product sales, $249,830 industry, and $30,092 miscellaneous in 1991; $567,626 state appropriations, $6,182 product sales, $334,478 industry, and $44,323 miscellaneous in 1992; $556,291 state appropriations, $9,341 product sales, $409,541 industry, and $44,859 miscellaneous in 1993; $696,079 state appropriations, $21,467 product sales, $321,214 industry, and $226,363 miscellaneous in 1994; $935,702 state appropriations, $35,376 product sales, $494,891 industry, and $230,080 miscellaneous in 1995; and an estimated $900,000 state appropriations, $10,000 product sales, $400,000 industry, and $200,000 miscellaneous in each of 1996, 1997 and 1998.

Question. Where is this work being carried out?

Answer. The research work is being carried out at the Cornell, Idaho, Maine, Maryland, Michigan, North Dakota, Oregon, Pennsylvania, and Washington State Agricultural Experiment Stations.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated to accomplish significant results in about five years. Because the research is based on genetic varietal development, progress is developing new potato varieties takes from 5 to 10 years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Beginning in fiscal year 1997, these funds have been awarded on a competitive basis using a scientific peer review. In addition, the agency conducts a formal meeting with representatives from the potato industry to review research needs and provide input to the agency on the merits of the proposals.

PRECISION AGRICULTURE, KENTUCKY

Question. Please provide a description of the research that has been funded under the Precision Agriculture, KY grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. Research will evaluate site-specific practices for production of corn and soy beans under field conditions. The work will compare various combinations of management practices using site-specific technology and evaluate economics of its application.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to provide objective information about precision agriculture technologies to assist farmers in the development of management systems that are productive, economical, and environmentally benign.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to evaluate site specified technologies and develop recommendations for their use in crop management systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $500,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This is a new project which has not yet begun and, therefore, no non-federal funds have been used.

Question. Where is this work being carried out?

Answer. The research will be conducted at the Kentucky Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for this project is 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project will be evaluated upon receipt of the required grant proposal.

PRECISION AGRICULTURE, MISSISSIPPI

Question. Please provide a description of the research that has been funded under the Precision Agriculture, MS grant.

Answer. CSREES has requested the university to submit a grant proposal that has not yet been received. This research will evaluate the use of site-specific technology and assess the economics of its application. Cultural practices will be studied and integrated into a management system using site-specific technology to monitor yield and variable rate application. This project will expand on work conducted under the Special Technology Special Research Grant funded at $350,000 in fiscal year 1997 and $600,000 in 1998.

Question. According to the research proposal, or the principal researcher, why national, regional or local need for this research?

Answer. The need for this research is to provide farmers with unbiased information on the application and economics of site specific technologies for cotton production in the mid-south.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to evaluate site specific technologies and develop recommendations for management decisions related to fertilization, pest control, and other cultural practices.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $1,000,000.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. The non-federal funds provided for this grant are $620,300.

Question. Where is this work being carried out?

Answer. The research will be conducted on various Mississippi Agricultural Experiment Station branch locations around the state.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The Principle Investigators anticipated the completion date for the original objective to be in fiscal year 2004.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was subject to an initial evaluation at its start in fiscal year 1998.

PRE-HARVEST FOOD SAFETY, KANSAS

Question. Please provide a description of the research that has been conducted under the Pre-Harvest Food Safety, Kansas grant.

Answer. Longitudinal studies on the fecal shedding of Escherichia coli 0157:H7 by cattle on beef cow-calf ranches are being done to determine the impact of various routine management practices on the shedding rate. The purpose of the research is to develop an understanding of the management factors that contribute to the incidence of E. coli 0157:H7 in beef cattle. The project also allows for a comparison of large vs small cow-calf operations.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. The presence of E. coli in beef animals sent to slaughter can contribute to the contamination of meat products produced from such animals. This has increased the need for control measures that could reduce the incidence of such foodborne human pathogens in food animals during the production cycle. This type of research has been identified as critical by all food animal commodity groups as well as public health officials and consumers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to determine the incidence of E. coli 0157:H7 in large vs small beef cow-calf operations and describe the management factors that contribute to or affect the rate of shedding of organisms in the feces of such animals. E. coli 0157:H7 has been detected in 3.11 percent of monthly fecal samples—n=3152—, with 4.57 percent of the 2,058 animals having at least one positive sample. Fecal shedding was normally transient; only one animal was positive on more than one sampling date. In addition, there was a difference in prevalence between farms. Sources of drinking water were also examined and 3.5 percent of 199 water samples were positive. Management practices on the ten farms are being examined to determine if there are specific risk factors that can be identified.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1996. The appropriations for fiscal years 1996 through 1999 was $212,000 per year. A total of $848,000 has been appropriated.

Question. What is the source and amount of non-federal funds by fiscal year?

Answer. Non-Federal funds have been contributed to this project as follows: In fiscal year 1996 non-federal funds provided to this project were $150,000 in state appropriations and $91,450 in contributed indirect costs; 1997 non-federal funds provided to this project were $165,000 in state appropriated funds and $90,300 in contributed indirect costs; 1998 non-federal funds provided to this project were $175,000 in state funds and 91,500 in contributed indirect costs.

Question. Where is this work being performed?

Answer. This research is being conducted at Kansas State University, University of Nebraska-Lincoln, and at ranches in Kansas, Nebraska, and Colorado.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date was October 1, 1998, for the original objectives. However, the project was not initiated until several months after the expected date of October 1995 so they should finish the original objectives in late spring of 1999. As the project has progressed, the Principal Investigator has added other important questions to the original research plan and has planned to look more closely at management interventions that could help reduce the incidence of E. coli shedding in beef cattle. Thus, the project should continue for some time after the original expected period of time.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was evaluated by an on-site visit on October 28–29, 1997 by CSREES. The project team was doing an excellent job and the interactive collaboration was outstanding. The research team has also been successful in bringing other participants into the program. Also, the project leader provided a very comprehensive written report on November 1998, including manuscripts currently under review for publication, which has permitted a further assessment of the continued progress on this important project.

PRESERVATION AND PROCESSING RESEARCH, OKLAHOMA

Question. Please provide a description of the research that has been funded under the preservation and processing grant.

Answer. Research has focused on the effects of preharvest and postharvest factors on the market quality of fresh and minimally processed horticultural products, including marigolds, pecans, watermelons, and peaches. Researchers are developing harvester prototypes for marigold flowers and drying and threshing systems for marigold petal drying and separation. A fruit orienting mechanism is being developed for incorporation into an on-line grading system. An integrated harvesting and postharvest handling system is being developed for fresh market and processing market horticultural products. Research continues on methods to determine textural properties of pecans, determine optimum operating parameters for supercritical carbon dioxide and other alternative partial oil extraction, and develop and optimize modified atmosphere packaging techniques for pecan shelf life extension. fiscal year 1998 funds are supporting research through June 30, 2000. CSREES has requested, but not yet received, a proposal in support of the fiscal year 1999 appropriation.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that technological improvements in fruit, nut, and vegetable handling systems are needed to supply domestic markets and support continued participation in international commerce, which is a national need. New environmentally-friendly processing systems have been developed and are being commercialized in Oklahoma, with broad application to numerous crops with international marketing potential. Processing systems under development for commercial adaptation will support market expansion of pecans, affecting product market potential and value regionally. Improvements in postharvest handling and processing are necessary to support growth of the industry and ensure competitive involvement in national and international commerce of horticultural commodities uniquely suited for production in Oklahoma. New extraction facilities will also have a positive impact on local economies, incorporating a new value added processing industry and providing local employment opportunities.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the research has been to define the major limitations for maintaining quality of harvested fruits, vegetables and tree nuts and prescribe appropriate harvesting, handling, and processing protocols to extend shelf life and marketability of harvested horticultural commodities, thus maintaining profitability of production systems and assuring an economic market niche for Oklahoma producers and food processors. A systems approach to develop complementary cropping, harvesting, handling, and processing operations has resulted in development of improved handling systems for cucurbit and tree fruit crops. Nondestructive processing systems for partial oil reduction of tree nuts have been developed to extend shelf life and lower the calorie content for the raw or processed product. Funding has been secured for construction of a commercial nut extraction facility in Oklahoma,

pending successful pilot testing which is underway. Technologies and procedures previously developed for cucurbit and tree fruit systems are being applied to development of okra, pepper, sage, basil, tree nut, sweet corn, and marigold cropping, handling, and light processing systems, with a targeted completion date of 2001. Research from this project provided the basis for commercial high relative humidity storage of peaches and to attract companies to the state to construct new value added food processing facilities.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, $100,000; fiscal year 1986, $142,000; fiscal year 1987, $242,000; fiscal years 1988 and 1989, $267,000 per year; fiscal year 1990, $264,000; fiscal year 1991, $265,000; fiscal year 1992, $282,000; fiscal year 1993, $267,000; fiscal year 1994, $251,000; and fiscal years 1995–1999, $226,000 each year. A total of $3,477,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. State funds have been provided as follows: fiscal year 1991, $126,900; fiscal year 1992, $209,783; fiscal year 1993, $219,243; fiscal year 1994, $308,421; fiscal year 1995, $229,489; year 1996, $366,570; fiscal year 1997, $397,881; and fiscal year 1998, $205,662. The State also provided $16,100,000 for development of an Agricultural Products and Food Processing Center and approximately $2,000,000 to staff the facility.

Question. Where is the work being carried out?

Answer. This work is being conducted at the Oklahoma State Agricultural Experiment Station, in conjunction with ongoing production research at the Wes Watkins Agricultural Research and Extension Center and the South Central Agricultural Research Laboratories.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is expected that ongoing research will be completed in 2002. Additional related objectives beyond this date would address further opportunities for horticulture industry growth and economic development.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. A review of the proposal supporting the fiscal year 1998 appropriation was conducted on January 16, 1998. The project was evaluated as part of a comprehensive CSREES program site review in the fall of 1995, with a recommendation by the review team to continue the value-added product development.

RANGELAND ECOSYSTEMS, NM

Question. Please provide a description of the research that has been funded under the Rangeland Ecosystems, NM grant?

Answer. Current research is focused on the ecology of noxious and invasive weeds that are endemic to New Mexico's rangelands. Competitive research grants have been awarded that deal with studying the physiological and toxicological effects of these weeds on livestock.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local focus for this research?

Answer. Noxious weeds are a serious problem in the southwestern United States. About one-fifth of the rangeland in Texas and more than one-half in New Mexico is infested to some degree. Under this program, researchers are working to develop an integrated weed management approach.

Question. What was the original goal of this research and what has been accomplished?

Answer. Accomplished research led to understanding of broom snakeweed and other noxious weeds including a better understanding of plant's strategy for invasion and persistence. The primary focus of research at this time is addressing the need for an integrated weed management approach for noxious weeds, especially broom snakeweed.

Research is addressing three general areas which are ecology and management, biological control, and toxicology and animal health. One specific accomplishment is the biological control arena; several plant pathogens and insects are proving to be effective in broom snakeweed's control.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $100,000; fiscal year 1990, $148,000; fiscal year 1991, $150,000; fiscal years 1992 and 1993, $200,000 per year; fiscal year 1994, $188,000; fiscal years 1995 and 1996, $169,000 each year; fiscal year 1997, $175,000; fiscal year 1998, $185,000; and fiscal year 1999, $200,000. A total of $1,884,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $249,251 state appropriations in 1991; $200,110 state appropriations in 1992; $334,779 state appropriations in 1993; $302,793 state appropriations in 1994; $294,451 state appropriations in 1995; and an estimated $300,000 in state appropriations in each fiscal year of 1996, 1997, and 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at New Mexico State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in 1989. Currently, additional and related objectives have evolved and anticipated completion date for these is 2000. Considerable progress has been made on many of the objectives. Anticipated completion date of the additional and related objectives that have resulted based on the current work would indicate another 5 years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Each year the grant is peer reviewed with oversight by an administrative executive committee within the College of Agriculture and Home Economics at New Mexico State University. Additionally, CSREES' senior scientific staff review the progress of the grant. Those reviews indicated progress in achieving the objectives.

REGIONAL BARLEY GENE MAPPING PROJECT

Question. Please provide a description of the work that has been funded under the Regional Barley Gene Mapping Project grant.

Answer. The Regional Barley Genome Mapping Project is a multi-disciplinary, multi-institutional project to develop a genome map of barley. Specific objectives are to: construct a publicly-available medium resolution barley genome map; use the map to identify and locate loci, especially quantitative trait loci controlling economically-important traits such as yield, maturity, adaptation, resistance to biotic and abiotic stresses, malting quality, and feed value; provide the framework for efficient molecular marker-assisted selection strategies in barley varietal development; identify chromosome regions for further, higher resolution mapping with the objective of characterizing and utilizing genes of interest; and establish a cooperative mapping project ranging from molecular genetics to breeding that will be an organizational model for cereals and other crop plants. All funds are awarded on a competitive basis.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes barley breeders nationwide need information about the location of agriculturally-important genes controlling resistance to biotic and abiotic stresses, yield, and quality factors in order to rapidly develop new, improved cultivars and respond to disease and pest threats. This project provides that information along with appropriate molecular markers to track these traits through the breeding and selection process.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this project was to develop a restriction fragment length polymorphism map for barley and associated important genetic traits to provide closely linked molecular markers for barley breeders. The project has developed comprehensive linkage maps defining the entire barley genome in three experimental populations and determined the location, number, effect, and interaction of genes determining a range of economically-important traits. Additionally, the project has supported the development and use of an array of genomics tools that are publicly available. Technical papers have been published to report results to the scientific community.

Question. How long has this work been under way and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, $153,000; fiscal year 1991, $262,000; fiscal years 1992–1993, $412,000 per year; fiscal year 1994, $387,000; fiscal years 1995–1998, $348,000 each year; and fiscal year 1999, $400,000. A total of $3,418,000 has been appropriated.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. The nonfederal funds and sources provided for this grant were as follows: $203,760 from industry in 1991; $212,750 from industry in 1992; $115,000 from industry in 1993; $89,000 from industry in 1994; and $35,000 from the State of Washington and $108,000 in other nonfederal funding, for a total of $143,000 in 1995. Nonfederal funds were $163,000 for 1996 and $178,240 in 1997. In 1998, the project received $35,000 from industry.

Question. Where is this work being carried out?

Answer. Research is being conducted in the state agricultural experiment stations of Oregon, Colorado, Washington, Montana, Idaho, North Dakota, Minnesota, New York, Virginia, and California.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to produce a genetic map of agronomically-important traits of the barley genome. The anticipated time to complete this task was estimated at 10 years with completion in 1999. The initial goals have been exceeded; however, maps are never "done". The next step will be physical mapping of gene rich regions in order to study the genes and understand pathways. Researchers will focus on quality and disease resistance.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. In 1998, the special grant proposal was subjected to the project approval process at Oregon State University, which is the lead university, and reviewed by a CSREES scientist. This project is made up of many competitively-awarded mini-grants. A subgroup of the National Barley Improvement Committee, which is composed of elected representatives of research, growers, and industry, serves as the peer panel to review and select proposals based on relevance to the original objectives and scientific merit. Multi-disciplinary, multi-institutional, and continuing projects are given the highest priority. The overall project and its mini-grants have been judged to be scientifically sound and appropriate for the stated objectives, based on comments and rating from peer scientists which is done on each support prior to selection.

REGIONALIZED IMPLICATIONS OF FARM PROGRAMS

Question. Please provide a description of the research that has been done under the program on regionalized implications of farm programs grant.

Answer. The purpose of this research is to estimate the impacts of farm, trade, fiscal policies and monetary programs, and assess their alternatives on the economic viability of typical crop and livestock production operations located in different regions of the United States.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. There is a national need for research that provides an assessment and evaluation of the potential impacts of Federal farm, trade, and fiscal policies on the economic viability and competitiveness of farmers located in different regions of the United States. Policy impacts vary regionally because of differences in farm productivity, input costs, climate, farm enterprises, and size. The research results are widely used by farmers and public policymakers concerned about minimizing policy and program inequities between regions and farm sizes.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original, as well as current, goal was and continues to be to provide the farm community, agribusiness groups, and public officials information about farm, trade, and fiscal policy implications by developing regionalized models that reflect farming characteristics for major production regions of the United States. The researchers have developed a farm level policy analysis system encompassing major U.S. farm production regions. This system interfaces with existing agricultural sector models used for farm, macroeconomic, and trade policy analysis. The universities have expanded the number and types of representative farms to 80. Typical farm models also are being developed for Mexico and Canada under a collaborative agreement for use in analyzing impacts of the North American Free Trade Agreement.

Policy studies completed this past year at the request of policymakers and farm groups included analyses of the impacts of marketing loan provisions on farmers' economic viability; drought on farm income and farm viability; early provision of market transition payments, risk management accounts; and other crop insurance and disaster assistance alternatives.

Results of these analyses were presented to more than 60 different groups across the U.S., including, of course, both congressional agriculture committees. The Agricultural Food Policy Center web site, which contains copies of all Working and Briefing Papers, was visited more than 345,000 times during May-November, 1998 and more than 2,000,000,000 bytes of information was transferred.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1990 and the appropriation for fiscal year 1990 was $346,000. The fiscal years 1991–1993 appropriations were $348,000 per year; $327,000 in fiscal year 1994; and $294,000 in each of the fiscal years 1995 through 1999. A total of $3,187,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $288,843 State appropriations and $46,773 industry for a total of $335,616 in 1991; $45,661 State appropriations in 1992; $33,979 State appropriations in 1993; $40,967 State appropriations in 1994; $161,876 State appropriations in 1995; $187,717 State appropriations for 1996; $137,100 for 1997; and $161,400 for 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted by the Texas A&M University and University of Missouri at Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This program is of a continuing nature for the purpose of assessing the impacts of existing policies and issues and proposed policy and program changes at the individual firm level for feed grain, wheat, cotton, rice, oilseed, and livestock producers. In addition, the representative farms are constantly being updated as farming practices change. Currently the researchers are making adjustments for the increasing use of Bt and Round-Up Ready seeds.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. No formal evaluation of this project has been carried out; however, the CSREES representative is in frequent communication with the principal investigator concerning policy analyses procedures and studies.

RICE MODELING

Question. Please provide a description of the research that has been funded under the Rice Modeling grant.

Answer. The purpose of this research project is to develop a regional, national, and global rice industry model for use in analyzing the impact of changes in domestic and foreign public policies on production, trade, stocks, substitute crops, farm prices, and domestic as well as global consumption.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Research is needed to assist both the U.S. rice industry and national policymakers in assessing the impact of existing and proposed changes in public policies for rice. This research enables improved analysis of both international and domestic policy changes on rice production, stocks, prices of substitute crops, and consumption. It has been, and is being used to analyze the impacts of farm policy proposals on the U.S. rice industry, to analyze the impact of the World Trade Organization and the Uruguay Round agreements on U.S. trade, to analyze the impact of emerging rice importing and exporting countries on U.S. rice exports, and to analyze the market for different rice types—qualities—and seasonal demand and supply factors that affect the global rice market. The principal researcher believes this research addresses national, regional, and local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop international, national, and regional models to analyze the impact of foreign and domestic policy changes and forecast changes in production, trade, stocks, prices of substitute crops, farm prices, and consumption.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work actually began about four years ago and federal research grants from various sources have totaled roughly $2,000,000 prior to this year. The work supported by this grant began in fiscal year 1996. The appropriation for fiscal years 1996 and 1997 was $395,000 per year; for fiscal years 1998 and 1999, $296,000 per year, for a total of $1,382,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds over the 4 years prior to this year totaled approximately $500,000. For the 1996 fiscal year, state appropriations were $178,000; and for 1997 and 1998, $150,000.

Question. Where is the work being carried out?

Answer. The research is being carried out at the University of Arkansas-Fayetteville and the University of Missouri-Columbia.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The domestic portion of the rice model has been completed. The international modeling research is a little over half completed, and the researchers estimate another five years is required. The purpose of constructing the models, however, is to provide on-going analyses of the impact of various policy proposals on the U.S. rice industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluation of this project. However, annual proposals are peer reviewed for relevance and scientific merit. Also, each annual budget proposal is carefully reviewed for adherence to stated objectives and annual progress is discussed with the principal investigators.

RURAL DEVELOPMENT CENTERS

Question. Please provide a description of the research that has been funded under the Rural Development Centers Program grant.

Answer. The overall objectives of the research agenda of the five rural development centers are to: Improve economic competitiveness and diversification in rural areas; support management and strategic planning for economic development; create community capacity through leadership; assist in family and community adjustments to stress and change; and promote constructive use of the environment. The function of the Centers is to increase the productivity of regional faculty both in doing research on rural issues and in using that research to do effective outreach with rural communities. These projects have undergone a merit review.

Question. According to the research proposal, or one of the principal investigators, what is the national, regional or local need for this research?

Answer. The number of research faculty who are addressing broader rural issues is declining in many places. The multi-disciplinary, multi-state work supported by the Centers becomes even more crucial in a period of reduced research emphasis. Critical needs are being met by Center support including public lands policy, changing rural migration patterns, fiscal alternatives for local-governments, and forest stewardship education. Specific needs for regional research are reviewed annually by the Centers. The focus of proposals varies from year-to-year depending on the shifting priorities of rural clients.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The Rural Development Center mission is to strengthen rural families, communities, and businesses by facilitating collaborative socio-economic research and extension through higher education institutions in the various regions. Research programs are undertaken after evaluating broader regional and national priorities. Following are some accomplishments of selected research activities conducted under the auspices of various centers.

Industrial recruitment is one of the most popular methods of economic development in the northeast U.S. But increasingly the cost effectiveness of this strategy is being questioned. More and more, communities are capitalizing on an alternative strategy called Business Retention and Expansion—BR&E. BR&E seeks to catalyze on local economic development efforts by creating a team of local leaders to help the community improve its business climate, identify and address impediments to growth, and retention of existing businesses. The Northeast Center supported the development of BR&E materials that have been used in training workshops across

the country. Business Retention and Expansion International sponsored the workshops. Economic development professionals in 31 states in the U.S. and in Canada have purchased these BR&E materials to develop programs in their local communities to retain and expand existing businesses, and reduce the high costs associated with industrial recruitment strategies. The materials also have been translated into French and Polish and shared internationally.

A research study funded by the Northeast Rural Development Center assessed the consumer credit knowledge of rural poor and ethnic minorities and determined their use and management practices. An educational program that focuses on the wise use of consumer credit was developed and offered to a diverse extension audience. In-service workshops also were offered to extension educators in several states in the Northeast. Two additional Northeastern states, New York and New Jersey, have duplicated the curriculum for distribution to all counties. This program was coordinated with and contributed to the development of a short video that promotes the MONEY 2000 program, a program that encourages participants to save and/or reduce debt by $2,000 by the end of the year 2000. The video was distributed widely to extension personnel within the region and nation and to financial counselors at several military bases.

University of Rhode Island teamed up to perform a mid-term assessment of the MONEY 2000 program that has been operating successfully in New Jersey and New York for several years. MONEY 2000 was created to help families who are living paycheck-to-paycheck and struggling with low savings or high household debt. The goal of the program is to help participants either reduce debt or increase savings by $2,000 by the year 2,000. The analysis will focus on participants' behavioral changes and be used to suggest ways extension educators could improve the program. Results will be disseminated to state project leaders through the national MONEY 2000 listserv. Since it was launched in 1996, MONEY 2000 has helped over 7,000 people in more than 30 states increase their net worth by more that $3,000,000.

The Southern Rural Development Center partially funded and provided all logistical support for a National Conference, "Linking Family and Community Strengths." The conference was also supported by CSREES, W. K. Kellogg Foundation, Farm Foundation, National 4–H Council and the other regional rural development centers. The conference was funded to support 12 mini-grant, $1,000 projects that would transform learning at the conference to action. One example of outcomes is noted by the Virginia report. The grantee used her funding to support the cost of providing "Life in the State of Poverty" simulation exercise in her state. Five social service agencies partnered to present the exercise in Fauquier County. Within a week after the activity, people began discussing ways "to repair the community safety net." The County Administrator took seriously the dialogue of the training. He requested the Cooperative Extension Service staff to investigate creation of a volunteer coordinator position to track the resources available for families dropped from welfare roles. He even pledged county money. Word of this activity spread to the Governor's office requesting information abut what was happening in the county. A member of the U.S. House of Representatives has asked about a visit to Faquier County to observe the positive changes taking place. The Virginia Cooperative Extension Service, because of involvement in this training, continues to take the lead in educating limited resource families to move from self-sufficiency and to move the community toward support of all families.

Workers who commute can make important economic, fiscal, and social differences in both the county of their residence and the one where they work. When people cross state as well as county lines to get to work, these impacts can be multiplied. The Western Rural Development Center—WRDC—has funded a project to evaluate the effects of workers commuting across the Idaho/Wyoming and Nevada/Arizona state lines. The Idaho/Wyoming work is further along at this point. In the Idaho community 20 percent of the total personal income comes from the neighboring Teton county in Wyoming. And the Idaho commuters account for 75 percent of the commuters coming into the Jackson, Wyoming community. These workers are crossing a very tough mountain pass that is frequently closed with slides in the winter. The school, day care, housing, and other services are a difficult issue on the Idaho communities with very limited tax bases to support the needed services. The research is serving as a basis for discussions between the communities.

Using a Western Rural Development Center supported Business R&E retention and expansion program, New Mexico State University Extension has assisted seven communities expand their economic base by saving and creating local jobs. Seven jobs were saved in Silver City when task force members facilitated a propane company's move to a new location. The Clovis task force intervened with city officials to save a $1,000,000 business complex. The R&E staff in Torrance County created

75 jobs by helping a commercial greenhouse find suitable land. BC Hydro in Burnaby, British Columbia recently requested and received permission to adapt the Business R&E program materials for use in rural Canada.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1971, $75,000; fiscal year 1972, $225,000; fiscal year 1973, $317,000; fiscal years 1974–1981, $300,000 per year; fiscal years 1982–1985, $311,000 per year; fiscal years 1986–1987, $363,000 per year; fiscal year 1988, $475,000; fiscal year 1989, $500,000; fiscal year 1990, $494,000; fiscal years 1991–1993, $500,000 per year; fiscal year 1994, $470,000; fiscal years 1995–1998, $423,000 per year; and fiscal year 1999, $523,000. A total of $10,641,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds available to the four Regional Centers for Rural Development were: fiscal year 1991, $1,117,000; fiscal year 1992, $790,000; fiscal year 1993, $900,000; fiscal year 1994, $776,591; and fiscal year 1995, $710,0050; for a total of $4,293,641 across the five years for which there are complete data.

Question. Where is this work being carried out?

Answer. The regional rural development centers include the following. Northeast Regional Center for Rural Development, Pennsylvania State University; North Central Regional Center for Rural Development at Iowa State University; Southern Rural Development Center at Mississippi State University; and Western Rural Development Center at Oregon State University. There is also a rural development project at North Dakota State University which receives funding from the annual Rural Development Centers appropriation. Most of the research sponsored by the four regional centers is actually performed by resident faculty at land-grant universities in the respective region through subcontracts from that center's grant.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives.

Answer. The regional rural development centers were established to provide an on-going "value added" component to link research and extension and by doing so to increase rural development under the special conditions in each region. The work of the Centers is being carried out in all 50 states and in some territories. The Centers compile a report of annual accomplishments and share those with the states in the region. The list of needs is constantly evolving and is being addressed through projects that are matched to the constantly shifting local agenda. The current phase of the program will be completed in 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Centers enlist the help of academic and private/public foundations personnel on advisory committees and boards of directors to help establish operating rules and provide professional, technical counsel and peer evaluation of Center projects and the principal investigators. The projects are evaluated annually by the advisory committees and the boards of directors against the five key issue areas and the objectives of each project for relevance, achievement, and initial impacts. Follow-up evaluation is carried out by the Center staffs in order to assess long-term impacts of these projects on local communities.

RURAL POLICIES INSTITUTE

Question. Please provide a description of the research that has been funded under the Rural Policies Institute grant.

Answer. The Rural Policy Research Institute—RUPRI—is a consortium of three universities designed to create a comprehensive approach to rural policy analysis. The Institute conducts research and facilitates public dialogue to increase public understanding of the rural impacts of national, regional, state, and local policies on rural areas of the United States.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. There is a need to estimate the impacts of changing state and national programs and policies on rural people and places. Objective public policy analysis can provide timely and accurate estimates of the impacts of proposed policy changes to allow more reasoned policy discussions and decisions. The principal researcher believes this research meets national, regional, and local needs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the Rural Policy Research Institute was to create a new model to provide timely, accurate, and unbiased estimates of the impacts of policies and new policy initiatives on rural people and places. The Institute has completed a number of successful policy research projects and developed three analytic models central to its mission. These projects focus on the rural implications of devolution, health care, education, housing, rural development, welfare reform, tax and telecommunications policy proposals. In addition, the Institute uses expert panels to provide policy decision support to a number of policy making groups at national and State levels. The expert panels and other collaborative research have, over the life of RUPRI, involved 150 scientists representing 16 different disciplines in 60 universities, 40 states, and three foreign countries. Currently, 50 nationally-recognized scientists and policy practitioners from 38 institutions and organizations serve on RUPRI panels, task forces, or work groups.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by these grants began in fiscal year 1991, and the appropriation for fiscal year 1991 was $375,000. The fiscal year 1992 appropriation was $525,000; for fiscal year 1993, $692,000; for fiscal year 1994, $494,000; and fiscal years 1995–1999, $644,000 each year. A total of $5,306,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Aggregated non-federal funds to support the Rural Policy Research Institute across the three universities involved include unrecovered indirect costs, salary support from university and other non-federal sources, and various other grants, contracts, and reimbursable agreements. They amounted to $316,458 for fiscal year 1991; $417,456 in fiscal year 1992; $605,302 in fiscal year 1993; $537,834 in fiscal year 1994; $584,516 in fiscal year 1995; for fiscal year 1996, $576,782; $186,859 in 1997; $153,614 for 1998; and an estimated $168,450 for 1999. Total to date including the 1999 estimate, is $3,547,271.

Question. Where is this work being carried out?

Answer. The Institute's member universities are: the University of Missouri-Columbia; the University of Nebraska-Lincoln; and Iowa State University, Ames.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Current funding will sustain activity through January 1998; however the original objectives were directed at building a permanent policy analytical capability.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluation, however, annual project proposals are peer reviewed for relevance and scientific merit.

RUSSIAN WHEAT APHID, COLORADO

Question. Please provide a description of the research that has been funded under the Russian Wheat Aphid, Colorado grant.

Answer. Funding will support two key areas of research that are needed to assure long-term and sustainable Russian wheat aphid management. These are: (1) discovering new crop genes which provide resistance to the Russian wheat aphid—RWA—and incorporating them into commercially-acceptable wheat varieties, and (2) integrating the available control tactics into the most effective, efficient, and environmentally-sound production systems for the Great Plains.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The Russian wheat aphid is an exotic pest that entered the western United States without its normal complement of biological control agents. This insect has rapidly become the most important insect pest of wheat in the western United States. From 1986–1991 the total economic impact was estimated to be in excess of $657,000,000. In the same period, some 17,500,000 pounds of insecticides were used nationally for Russian wheat aphid control. The cost to American farmers of insecticide treatments was over $70,000,000. In addition, the intense use of insecticides on a crop that previously received little insecticide treatment raised concerns about the impact on water quality, human health, food safety, non-target organisms, and general environmental quality. Direct losses in Colorado have been as high as $27,000,000 in a single year with an average direct loss of above $11,000,000 per

year, since 1987. Pest management research of national significance is supported by competitive grants awarded under the Integrated Pest Management program.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of the research are to: (1) discover new crop genes which provide resistance to the Russian wheat aphid and incorporate them into commercially-acceptable wheat varieties, and (2) integrate the available control tactics into the most effective, efficient, and environmentally-sound production systems for the Great Plains. The techniques of molecular genetics are being employed to reach the goal of identifying new genes for resistance to RWA and incorporating them into commercially-acceptable wheat varieties. Several DNA marker technologies used in other plant species have been successfully adapted for mapping RWA resistance genes in wheat. These include restriction fragment length polymorphism—RFLP—and amplified fragment length polymorphism—AFLP—techniques as well as microsatellite markers. RFLP markers were initially used to map two RWA resistance genes—Dn4, the one used in the resistant cultivar 'Halt' and Dn2, an additional resistance gene that might be suitable for inclusion in a cultivar containing two resistance genes. Using AFLP, researchers have identified a DNA marker that is more tightly linked to DN4 than the previously identified closest RFLP marker. Recently, a microsatellite marker was identified that is tightly linked to Dn2. A combination of several DNA marker technologies is essential for finding DNA markers tightly linked to RWA resistance genes in wheat. Finding and identifying tightly linked markers are important achievements because tight linkages are critical to using this technology to expedite the development of RWA resistant wheat cultivars and are required for cloning the genes via positional cloning—an essential goal of the project. A new RWA resistance gene—Dn7—was identified by other researchers in South Africa. The gene comes from rye and is contained in a wheat/rye translocation that is carried in a wheat background. This material has been obtained and has been crossed with susceptible wheat to generate materials for use in molecular genetic analysis of Dn7 and to incorporate the gene into wheat. Dn7 is one of the resistance genes that is being targeted for molecular cloning in the Colorado State University program. Progress has also been made in Integrating Tactics for Management of RWA. In 1998, experimental dryland cropping systems were established in eastern Colorado. Two of these are located in growers fields and have been designed with grower input and are managed jointly with the grower-cooperator. Long-term studies were initiated to compare the experimental systems with typical wheat production systems in the area. The experimental systems were designed to optimize the effects of environmentally-sound pest management tactics—particularly resistant cultivars, the effects of cultural practices [such as planting date, harvesting date, grazing, etc.—, and biological control—reducing RWA numbers through the actions of predators and parasites. In addition, the experimental systems were designed to optimize water use efficiency and other agronomic and profitability factors. At each location, wheat and other adapted dryland crops are grown in proximity to each other so that interactions among various crops and various production practices can be studied. Rotations over time of wheat with other crops also are being investigated. These large-scale experimental systems will be ideal arenas in which to determine the best way to apply the knowledge already gained about specific aspects of RWA biology and ecology, production practices, and the effectiveness of naturally occurring RWA parasites and predators. These large-scale experimental cropping systems also will provide valuable information on RWA management to wheat growers who are considering adding additional crops to their dryland cropping systems.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal years 1998 and 1999 is $200,000 per year for a total of $400,000.

Question. What is the source and amount of non-federal funds provided by fiscal year.

Answer. State appropriations and the Colorado Wheat Administrative Committee have demonstrated strong support for this effort. The total per year is approximately $775,000 in new funding from the state of Colorado and redirected funds from within the university.

Question. Where is the work being carried out?

Answer. Research will be conducted on the campus of Colorado State University, at Colorado State University research stations, and on the farms of cooperators throughout Colorado. Outreach and extension activities will be focused on wheat

growers in Colorado, Nebraska, Wyoming, Kansas, New Mexico, Texas, and Oklahoma.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This is a new project. It is anticipated to continue for a total of five years with a completion date of July 2003.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project will be evaluated by a CSREES site visit on February 4 and 5, 1999.

SEAFOOD HARVESTING, PROCESSING, AND MARKETING, MISSISSIPPI

Question. Please provide a description of the research that has been funded under the seafood harvesting, processing, and marketing grant.

Answer. Research related to seafood safety, quality, and by-product utilization has been supported by this grant. Funds from the fiscal year 1998 grant are supporting research through September 30, 1999. CSREES has requested the University to submit a proposal, which has not yet been received, in support of fiscal year 1999 funds. For fiscal 1999, funds will support research on: microbial population changes during retail display of shrimp; development of an impedance-based method to rapidly detect microorganisms on shrimp; determine physical, chemical, microbiological, and sensory differences between pond and tank aquaculture tilapia; and evaluate processes for utilization of uncooked shrimp processing by-products for production of flavor extracts.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes that national needs reflected in the project include providing consumers with affordable alternative seafood products. Alternative sources of seafood protein are needed because of a drastic decline in natural harvests due to overexploitation. Other national needs addressed in this project include reducing pollution during seafood and aquaculture food processing by converting byproducts into value-added food ingredients or materials. Regionally, much is unknown about the short-and long-term effects of the new seafood Hazard Analysis Critical Control Point—HACCP—regulations on the livelihood of Mississippi seafood and aquaculture food producers and processors who are typically small and lack sufficient resources to remain competitive. Continuation of this project will provide continued assistance to Gulf-Coast seafood processors in meeting new U.S. regulations as well as new international regulations that are important for Mississippi export products. Locally, catfish processors are a major employer of the severely economically depressed Delta region of Mississippi. By further enhancing the value of catfish products, this project seeks to improve the livelihood of individuals both on the Gulf coast and in the aquaculture region of the state.

Question. What was the original goal of the research and what has been accomplished to date?

Answer. The original goals of the research were to improve the quality and safety of catfish and improve the utilization of catfish byproducts and underutilized marine species. Due to successes of the original project, subsequent efforts are focusing on additional uses of seafood and aquaculture foods by improving processing strategies and providing alternative products from waste materials. The project has thus expanded to include crab, shrimp, oysters, freshwater prawns, hybrid striped bass, tilapia, and crawfish. The Food and Drug Administration has passed rulings affecting the potential viability of Mississippi seafood and aquaculture harvesters and processors; emphasis is thus being placed on addressing possible adverse consequences resulting from these changes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1990 when $368,000 was appropriated for this project. The appropriations for fiscal years 1991–1993 were $361,000 per year; fiscal year 1994, $339,000; and fiscal years 1995–1999, $305,000 each year. A total of $3,315,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The State of Mississippi contributed $1,949 to this project in fiscal year 1991; $41,286 in fiscal year 1992; $67,072 in fiscal year 1993; $91,215 in fiscal year 1994; $147,911 in fiscal year 1995; and $61,848 in fiscal year 1996. Product sales contributed $7,044 in 1991, $13,481 in 1992, $13,704 in 1993, and $5,901 in 1994.

Industry grants contributed $14 in 1992 and $31,796 in 1993. Other non-federal funds contributed $80 in fiscal year 1991, $838 in 1992, and $17,823 in 1993. The total non-federal funds contributed to this project from 1991 through 1996 was $501,962. In fiscal year 1998, $151,286 in state funds, $8,790 in self-generated funds, and $23,877 in other non-federal funds were obtained.

Question. Where is this work being carried out?

Answer. Research is being conducted by scientists in the Departments of Food Science and Technology and Agricultural Economics of the Mississippi Agricultural and Forestry Experiment Station at Mississippi State University and at the Coastal Research and Extension Center, Seafood Processing Laboratory, in Pascagoula, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The principal investigators anticipate that research on the original objectives will be completed in 1999. Continuing needs by Mississippi seafood and aquaculture harvesters and processors related to improved quality, safety, and utilization will require research and development of new technologies to expand this industry.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An agency science specialist conducts a merit review of the proposal submitted in support of the appropriation on an annual basis. The last review of the proposal was conducted on April 13, 1998. At that time, the agency science specialist believed that the projects addressed needs and interests of the regional seafood and aquaculture industries.

SMALL FRUIT RESEARCH

Question. Please provide a description of the research that has been funded under the Small Fruit Research grant.

Answer. Funding for this special grant has been used to enhance the production and quality of small fruits—blackberry, blueberry, caneberry, cranberry, marionberry, raspberry, strawberry, and grape in the Pacific Northwestern states of Idaho, Oregon, and Washington. Research has been focused on crop genetics, production/physiology, pest management, berry/grape processing, marketing, and wine production. Proposals are selected after examination of their relevance to priorities identified within the region.

Question. According the research proposal, or the principal researcher, what is the national, regional and local need for this research?

Answer. There is a considerable demand for fresh and processed berry products in the United States. The demand is also high in urban Asian markets where consumer interest for berry products is strong. Currently, international marketing of Northwest small fruit commodities involves the sale of traditional products. Research on international consumer preferences, packaging, and products continues to be essential. The importance of berry and grape crops to the region has long been recognized by the three Northwest states: Washington, Idaho, and Oregon. These crops are mainstays of high-value, specialty horticulture. The universities and small fruits industry have made a strong commitment to the improvement of these crops as evidenced by the high level of internally-developed resources for research and marketing. Thus, the Northwest Center for Small Fruit Research has developed effectively over the last 8–10 years into its present fully established form.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. Genetic improvement of small fruit cultivars continues to be a powerful tool using germplasm collection and identification, field evaluation of new germplasm, and advanced selections from breeding programs, virus identification and elimination, and approaches that utilize genetic engineering. Research is identifying cultivars and developing cultural practices that growers can utilize to reduce crop losses. Research is evaluating and investigating nutritional factors, cultural management, temperature stress, effects of pruning, micro propagation, cold hardiness/low temperature injury, and effects of viticulture practices on wine quality of winery processing on wine quality. Small fruit research continues to reap acclaim for its components involving industry-driven cooperation between industry, state, and Federal research. Its genesis as a small-fruits program reflects the contributions of plant biology, the commitment to facilitating the efficiency of research and the coordination of marketing throughout a multi-state region. The Center represents an innovative organization which has created a cooperative strategy for uni-

versity, USDA's Agricultural Research Service—ARS—and industry small fruit programs.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999.

Answer. The initial support for this grant was an appropriation in fiscal year 1991 for $125,000. The appropriation for fiscal years 1992 and 1993 was $187,000 per year; fiscal year 1994 was $235,000; fiscal years 1995–1998, $212,000 each year; and fiscal year 1999, $300,000. A total of $1,882,000 has been appropriated.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This project involves the use of Oregon State University—OSU—administrative personnel, equipment, utilities and facilities that are indirect costs to the project. These costs constitute an OSU contribution to this research project, which is not allowable as a reimbursable expense under this project. The recent passage of Oregon's tax limitation laws reduce revenues that restrict our ability to cost share. Thus, our policy is that we do not provide any cost sharing or matching funds for this or other agreements in which we receive no indirect costs. We are committed to providing the required collaborative efforts by Oregon State University scientists and administrators to complete the work described in this proposal. And in an effort to satisfy the request for a dollar amount for non-Federal funds, an approximation could be found by applying CPI values to estimate expenditures on this program since 1996.

Question. Where is the work being carried out?

Answer. The research is being conducted at Oregon State University, Washington State University, and the University of Idaho. Oregon State University is the lead institution for this project.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives are still valid researchable issues, therefore this is a continuing process with priorities annually re-evaluated to appropriately adjust research direction within the project objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project evaluation process is accomplished annually by peer reviewers whom are chosen and organized by expertise according to the five technical working groups with input from the designated Agricultural Experiment Station Representatives in Washington, Oregon, and Idaho. The Program Administrator in each state contacts possible reviewers for each proposal. The chair of the review process annually rotate between the Agricultural Experiment Station representatives. Each submitted proposal is peer-reviewed by a panel of five individuals—three scientists and two industry representatives—and is grouped into one of the Center Technical Working Groups, namely genetics, pest management, production/physiology, processing/packaging, and marketing. Proposals are evaluated on the following criteria: (1) the nature of the proposed research and its relevance to the needs of the small fruit industries; (2) the relevance of the proposal to current small fruit research designated priorities; (3) the scientific expertise of the scientists involved—training, experience, and accomplishments relative to specific areas of small fruit research; (4) the appropriateness of the level of funding requested, vis-a-vis, availability of funds; and (5) the likelihood of success. Reviewers complete an evaluation sheet for each proposal, rating the five criteria on a scale of one to ten, with ten being the best. Previously awarded projects are given special consideration in order to allow for funding for up to three years—when appropriate progress is demonstrated. Compilation of evaluations are distributed to the three Agricultural Experiment Station Directors and the USDA–ARS Horticultural Crops Research Laboratory Research Leader, who make the final determination of funding for each proposed project. Notification of awards are made in December. The peer review of all proposals is coordinated and processed through the Northwest Center for Small Fruit.

SOUTHWEST CONSORTIUM FOR PLANT GENETICS AND WATER RESOURCES

Question. Please provide a description of the work that has been funded under the Southwest Consortium for Plant Genetics and Water Resources Program grant.

Answer. New Mexico State University, Los Alamos National Laboratory, Texas Tech University, the University of Arizona, and the University of California at Riverside entered into a cooperative interdisciplinary research agreement constituted as the Southwest Consortium for Plant Genetics and Water Resources to facilitate re-

search relevant to crop adaptation to arid and semi-arid regions. The overall goal of the Consortium is to bring together multi-disciplinary scientific teams to develop innovative advances in plant biotechnology and related areas to bear on agriculture and water use in and semi-arid regions. All grants made to the participating Institutions are awarded competitively by a scientific peer review process.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Consortium is addressing the need for an integrated program that identifies specific problems of southwest agriculture, coordinates water and biotechnology research aimed at solving these problems, and facilitates the transfer of this information for commercialization. The specific research objectives of the Consortium include the development of crops with resistance to: drought and temperature extremes; adverse soil conditions; and pests and parasites. This research is highly significant to national, regional, and local needs. Biotechnology research of national significance is supported by competitive grants under the National Research Initiative and the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this Consortium is to facilitate research to provide solutions for arid and semi-arid crop adaptation. Five participating institutions have developed research plans consistent with the Consortium's goals. Mini-grants to support research that would solve problems unique to southwest agriculture are awarded competitively following peer review. Specific attention is given to interdisciplinary agricultural research. Since its inception in 1985, the Consortium has provided essential support for the establishment of baseline data on new, forward thinking research relevant to the improvement of arid lands agriculture. Accomplishments include: identification of chromosome regions conferring water use and transpiration efficiency in wheat; analysis of the impact of water stress on host plant resistance to aphids and whiteflies on melon; and evaluation of genetic variation of water-soluble carbohydrates in spring wheat and salt-tolerance mechanisms.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1986, $285,000; fiscal years 1987–1989, $385,000 per year; fiscal year 1990, $380,000; fiscal years 1991–1993, $400,000 per year; fiscal year 1994, $376,000; and fiscal years 1995–1999, $338,000 each year. A total of $5,086,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The Consortium's lead institution, New Mexico State University, reports matching non-federal funds of $80,000 in state appropriations in 1992 and $100,000 in 1993–1998. Nonfederal funds spent on this project originate from the five institutions that participate in the Consortium and support researchers' salaries, facilities, equipment maintenance, and administrative assistance.

Question. Where is this work being carried out?

Answer. Research is being conducted by the member institutions of the consortium: New Mexico State University; Los Alamos National Laboratory; Texas Tech University; the University of Arizona; and the University of California at Riverside.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initiated in 1986 and accomplished significant results in the first five years. Additional and related objectives have been developed and anticipated completion date for these is 2001. The Consortium is successfully achieving its objectives through the funding of new interdisciplinary projects each year.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Mini-grants are awarded competitively to support research that would solve problems unique to southwest agriculture. The mini-grant selection process is competitive. Proposals are evaluated by external peer reviewers, the Consortium Steering Committee, and the Consortium Scientific Committee. The review process includes: (1) preproposal screening by the Consortium Steering and Scientific committees; (2) request for proposals sent to those projects with preproposals that best meet the Consortium goals; and (3) external and internal review of all new proposals. After external and internal reviews, awards of up to $50,000 for up to two years of funding per project are made. An internal review of a progress report on each project is completed before the second year of funding is released.

SOYBEAN CYST NEMATODE, MISSOURI

Question. Please provide a description of the research that has been funded under the Soybean Cyst Nematode grant.

Answer. The research being funded by this grant is crucial to the development of effective management strategies to understand host parasite relationships of the pathosystems and each of its components. Work has dealt mainly with identifying Heterodera glycines-resistant genes and incorporating them into agronomically-superior cultivars. Basic studies elucidate the fundamental biology of the cyst nematode in regard to new management strategies. Applied work dealt with evaluating production systems and to new management strategies. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to the research proposal, or the principal investigator, what is the national, regional, or local need for the research?

Answer. The principal researcher believes that although this research is focused on the soybean cyst nematodes in Missouri, the problems are of regional and national significance. The soybean cyst nematode, Heterodera glycines is the most serious pest of soybean in the United States. The problems continue to increase in the Midwest where 12 states have yield reductions in soybean because of this nematode. Due to the nematodes ability to adapt to resistant varieties over time, new varieties are continually needed. Genetic research of national significance could potentially be supported by competitive grants awarded under the National Research Initiative or the Initiative for Future Food and Agricultural Systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is managing soybean cyst nematode through the various management strategies including the development of new resistant soybean varieties. To date, several nematode resistant soybean lines have been or will be released. The need for breeding soybean lines to develop resistant varieties with a broad spectrum of resistance continues. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. Other aspects of the work relates to field management strategies for these nematodes.

Question. How long has work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1979, $150,000; fiscal years 1980–1981, $250,000 per year; fiscal year 1982, $240,000; fiscal years 1983–1985, $300,000 per year; fiscal years 1986–1989, $285,000 per year; fiscal year 1990, $281,000, fiscal year 1991, $330,000; fiscal years 1992–1993, $359,000; fiscal year 1994, $337,000; fiscal years 1995–1997, $303,000 per year; fiscal year 1998, $450,000; and fiscal year 1999, $475,000. A total of $6,430,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $105,012 state appropriations in 1991; $84,368 state appropriations in 1992; $168.017 state appropriations in 1993; $118,725 state appropriations in 1994; $33,498 in 1995 and 1996; $33,723 in state appropriations in 1997; $37,445 in state appropriations in 1998; and $201,994 in 1999.

Question. Where is this work carried out?

Answer. This research is being conducted at the Missouri Agriculture Experiment Station and the University of Missouri.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Many objectives are being met, but genetic interaction of the soybean cyst nematode/soybean is extremely complex. The anticipated completion date of the continuing research is in 2000.

Question. What was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last evaluation of this project was a merit review in January, 1998, and the renewal project will be evaluated in 1999. In summary, continued development of new management strategies for the soybean cyst nematode is extremely important. Progress in meeting the objectives in each goal continues with new varieties with nematode resistance being released yearly as well as excellent progress in other management strategies. The released lines include Delsoy 5710 and MPV437–NRR, while another nematode resistant strain is being evaluated in the

uniform tests. More fundamental research involves the utilization of new molecular technologies to identify genes responsible for resistance. Over 118 PI lines have been fingerprinted to identify genetically diverse sources of nematode resistance. Gene fusion was utilized to monitor changes in soybean to determine effects on nodulation and nematodes. Other aspects of the works relates to field management strategies for these nematodes including effects of nutrient uptake on nematode development. Environmental effects on race development in nematodes has indicated that it is not soybean genotype driven but dependent on time of sampling and other factors not reflected in conventional nematode tests.

STEEP III-WATER QUALITY IN THE PACIFIC NORTHWEST

Question. Please provide a description of the research that has been funded under the STEEP III—Water Quality in the Pacific Northwest grant.

Answer. The STEEP III study was established in 1996 as the third phase of the tristate STEEP Program entitled "Solutions to Environmental and Economic Problems," to meet the needs of farmers and ranchers in the Pacific Northwest in solving severe problems with soil erosion and water quality, while maintaining economically and environmentally sustainable agricultural production. An open call for research proposals is held by three cooperating states, Idaho, Oregon, and Washington. Awards are made competitively after both internal and external peer reviews within the states, and merit review by the agency.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. According to the research proposal, the soils of the Pacific Northwest wheat region are subject to severe wind and water erosion, which has taken a heavy toll of the topsoil in a little more than 100 years of farming. Due to the hilly terrain, water erosion has reduced potential soil productivity in the high rainfall areas of the region by about 50 percent. Wind erosion has reduced productivity on the sandy soils in the lower rainfall areas. Also, off-site environmental costs of water erosion are large. Although many of these are difficult to measure, they include damage from sediment to recreational areas, roadways, and other areas which costs taxpayers millions of dollars annually. Wind erosion, which occurs mostly in the spring and fall, also can be costly and environmentally damaging to air quality, and causes increasing concerns for human health and safety from blowing dusts. Water quality degradation is of increasing concern in the agricultural areas of this region, since sediment is a major pollutant of surface water runoff which may also carry potential chemical contaminants. The complex hydrology of the region's landscape has made it difficult to identify the sources of these chemicals in surface and ground waters. Water quality research of national significance could potentially be supported by competitive grants under the Water Quality Program.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The primary goals are: to obtain and integrate new technical/scientific information on soils, crop plants, pests, energy, and farm profitability into sustainable, management systems; to develop tools for assessing the impacts of farming practices on soil erosion and water quality; and to disseminate conservation technology to the farm.

The original STEEP and following STEEP II and STEEP III projects for erosion and water quality control, have provided growers a steady flow of information and technologies that have helped them meet economic, environmental, and resource conservation goals. Through the adoption of these technologies, the researchers believe that growers of wheat, barley, and other alternative crops have been able to reduce soil and wind erosion, improve water quality, and maintain or increase farm profitability. This has been accomplished through a tri-state, multi-disciplinary, multi-agency approach of basic and applied research, along with technology transfer and on-farm testing to assist growers with applying these research findings on their farms. The on-farm testing program has directly involved growers and stakeholders in the planning and conduct of the research and educational efforts—and has helped growers evaluate conservation options, such as residue management, to meet conservation compliance requirements.

STEEP programs have helped position farmers with new conservation technologies, such as direct seeding management systems, well in advance of deadlines to meet current and anticipated policy requirements. This preparation protects farmers against potential penalties and loss of government program benefits.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1991, and the appropriations for fiscal years 1991–1993 were $980,000 per year; in fiscal year 1994, $921,000; in fiscal year 1995, $829,000; and in fiscal years 1996–1999, $500,000 per year. A total of $6,690,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $938,812 state appropriations, $63,954 product sales, $156,656 industry, and $16,994 miscellaneous in 1991; $1,025,534 state appropriations, $75,795 product sales, $124,919 industry, and $88,696 miscellaneous in 1992; $962,921 state appropriations, $62,776 product sales, $177,109 industry and $11,028 miscellaneous in 1993; $1,069,396 state appropriations, $46,582 product sales, $169,628 industry, and $22,697 miscellaneous in 1994; and $1,013,562 state appropriations, $31,314 industry, and $107,151 miscellaneous in 1995. In 1996, Washington received $231,724 state appropriations; Oregon passed Measure 5 which reduced revenues and imposed funding restrictions so they were unable to provide any non-federal cost-sharing or matching funds; and Idaho contributed $81,525 state support, and $86,242 in estimated non-federal grant support, for a total non-federal contribution of $167,767. In 1997, Washington received $197,234 state appropriations; Oregon continues to have Measure 5 as law and continues to be unable to provide any non-federal cost-sharing or matching funds; and Idaho contributed $27,235 state support and $24,525 in estimated non-federal grant support for a total non-federal contribution of $51,760. In 1998, these same general levels of support have been continued.

Question. Where is this work being carried out?

Answer. The work under STEEP III will be done at laboratories and field research sites at the University of Idaho, Oregon State University, and Washington State University. Cooperative on-farm testing will be conducted in cooperation with growers on their fields in Idaho, Oregon and Washington.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The STEEP II project was completed in 1995, and the results were compiled in a final, five-year report in January 1997 showing that the original objectives have largely been met. The STEEP III project started in 1996 and will continue through the year 2000 as a five-year project.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's program manager annually reviews progress reports, proposes new research on the STEEP Program, and attends the annual meetings to assess progress. The program is evaluated within the states each year by three committees: grower, technical, and administrative. Annual progress is reported at an annual meeting and compiled into written reports. These reports and the meeting are reviewed annually. Grower and industry input is solicited at the annual meeting on research objectives and accomplishments. The most recent evaluation was made at the January 1999 annual meeting which highlighted direct-seeding technology. This highly successful meeting attracted over 900 growers, scientists, and agricultural experts from the tri-state region. Farmer surveys are also distributed at each annual meeting, and results compiled to assess whether objectives are being successfully achieved.

SUSTAINABLE AGRICULTURE, MICHIGAN

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture, Michigan program grant.

Answer. This project is intended to develop agricultural production systems that are highly productive and profitable as well as being environmentally sustainable. More specifically, this project examines how to achieve a high nutrient flow from soil to crops and animals, and back to soil, with low loss to ground and surface waters. Pesticide application rates are also reduced. The grant is allocated by the Michigan Agricultural Experiment Station to priority areas within the general area of sustainable agriculture. Within each of those areas, grants are awarded based on research merit and proposal submission. The projects and proposals undergo annual formal review within the Michigan System prior to submission to CSREES, and then review within CSREES.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research.

Answer. The principal researcher believes there is a need to better understand the biological processes occurring in Michigan's high-nutrient-flow crop and animal sys-

tems. With high water tables, networks of lakes and slow-moving streams, and concern about environmental standards, field contamination by agricultural production materials is a high priority.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The specific goals of this research are to develop an agroecological framework for decision-making, develop crop and cover crop rotations, develop water table management strategies, and develop rotational grazing systems. Accomplishments to date include an extension publication on field crop ecology, development of on-farm compost demonstration sites, collection of research data and computer software models on water table management, completion of initial research trials on rotational grazing at three sites in Michigan, widespread testing of cover crops in several crop rotation systems, and tests of the use of nematology community structure as a method of detecting difference among farming systems. Findings from this project have demonstrated that rotational grazing reduces production costs and increases net profits, compared to traditional cow management. This project has also shown that composting is an effective way of stabilizing livestock waste, controlling odor, and improving nutrient composition for later land application. The computer modeling done with this project has shown reduced contamination of groundwater through alternative management practices employed in the project.

Question. How long has this work been underway and how much as been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1994 with an appropriation of $494,000; $445,000 were appropriated in fiscal years 1995 through 1999, bringing total appropriations to $2,719,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Matching funds were provided at the state level for $511,900 in fiscal year 1994, $372,319 for fiscal year 1995, and $359,679 in fiscal year 1996. Matching support was not reported in fiscal years 1997 or 1998.

Question. Where is this work being carried out?

Answer. This work is being carried out in Michigan at several locations by Michigan State University. Locations include the Kellogg Biological Station, the Upper Peninsula Experiment Station, and farms around the state.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project, begun in 1994, was proposed through April of 1997. Its specific objectives were met, with additional objectives addressed in subsequent related proposals. The current project is currently scheduled to go through September 30, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. A formal evaluation of the Principal Investigator's program was concluded in 1997, commissioned by the C. S. Mott Foundation through an independent consultant. The project continues to have annual peer review. According to the Principal Investigator, the proposal has gone through the normal Michigan State University review process. First, all teams and collaborators of the project have met and reviewed the entire proposal with several suggestions and changes being incorporated. Secondly, research administrators in the fields of agronomy/soil science and entomology/pest management covering the major dimensions of the proposal have reviewed it for scientific appropriateness and accuracy as well as for overall balance and likelihood of achieving objectives. Their comments have been included as revisions to the proposal.

SUSTAINABLE AGRICULTURE SYSTEMS FOR NEBRASKA

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture Systems for Nebraska grant.

Answer. This project is aimed at integration of field crops, animal production, agroforestry, livestock waste management, and diversified enterprises to meet production, economic, and environmental quality goals. The grant was awarded competitively within the University of Nebraska, and the integrated farm project has been reviewed annually for technical merit and progress toward goals by the internal review process of the university.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Farmers and ranchers in Nebraska and throughout the Midwest face increasing difficulties in maintaining profitable operations that are sustainable under increased production costs and more stringent environmental regulations. They continue to seek alternative production systems, integration of crop and animal enterprises, value-added products, including those from woody perennials, and new marketing approaches to secure more of the food dollar. Work on crop residue utilization is highly important to assess the loss of erosion mitigation when grazing occurs as well as the benefits of winter forage to production of lean beef. Erosion is still a major problem with monoculture cropping, and work with contour strips, residue management, and animal grazing is essential to provide good recommendations to farmers for how to manage fragile lands.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. This project has involved several components, with a number of results to date. In improving erosion control through grazing, calves were fed cornstalks from October through March, and fed some supplements. The calves had lower costs of production and reduced need for grain feed. The researcher's work on integrative cropping and agroforestry has shown that diversifying rotations centered around soybeans has provided increased economic returns. In the objective dealing with compost utilization, compost has provided increased sources of nitrogen and improved soil quality. Reports from this project have been disseminated through extension and through a sustainable agriculture newsletter.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. This project began in fiscal year 1992 with an appropriation of $70,000; subsequent appropriations are as follows: $70,000 in fiscal year 1993; $66,000 in fiscal year 1994; and $59,000 per year in fiscal years 1995 through 1999. Total appropriations to date are $501,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Matching funds provided for this research include state funds in the amount of $25,313 for fiscal year 1992; $26,384 for fiscal year 1993; $27,306 for fiscal year 1994; $36,091 in fiscal year 1995, and $24,267 in fiscal year 1996. Matching funds were not reported in fiscal year 1997 or fiscal year 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted by the University of Nebraska at several locations in Nebraska, with the major part of the project at the Agricultural Research and Development Center near Mead, Nebraska.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original project proposed work through March of 1994. The current project proposes work addressing additional related objectives through March 31, 1999. It is expected that current objectives of the project will be met by this time period.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff. There are no plans to do a performance evaluation in the future.

SUSTAINABLE AND NATURAL RESOURCES, PENNSYLVANIA

Question. Please provide a description of the research that has been funded under the Sustainable Agriculture and Natural Resources, Pennsylvania, project?

Answer. This project studies the cycling of nutrients in soil and crops with special emphasis on the development of indices for measurement of soil health. The project undergoes regular internal evaluation and assessment as part of Pennsylvania State University's major effort in soil quality and nutrient management research.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Degradation of soil health/quality is a most serious problem for agriculture both in the mid-Atlantic region and throughout the nation. State governments, both regionally and nationally, are attempting to address the issue of soil and water degradation in cropping systems and in intensive animal agriculture. Traditional soil test results are not providing the needed answers for effective nutrient management.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to understand the cycling of nutrients from animal agricultural production systems through soil and water into crops and back to food for animals or directly to humans in the case of vegetable production, and to use that knowledge to develop practical indicators of soil quality and health. If farmers are to manage their farm lands properly, indicators of soil quality and health must be developed that can be used by agricultural producers and consultants. Efforts under this project have been devoted to this goal with significant accomplishments to date. Management practices have been found to affect soil microbiology, and the fate of nutrients from crop residues and legume cover crops is being elucidated. A significant indicator of soil quality has been identified: measurement of the decomposition of filter paper has been shown to be an effective indicator of plant residue decomposition, which in turn has been shown to be highly correlated to nitrogen mineralization and also shows promise as an indicator of soil biological activity.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported under this grant began in fiscal year 1993. The appropriation for fiscal year 1993 was $100,000; $94,000 per year in fiscal years 1994 through 1998; and $95,000 in fiscal year 1999 for a total of $665,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. A total of $369,574 in matching support from university, state, and private industry sources was provided in fiscal year 1997. Matching support was not reported in fiscal year 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted by the Pennsylvania State University with cooperators throughout the state including the Rodale Institute Research Center and farms around the state.

Question. What was the anticipated completion date for the original objectives of this project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project has met the specific objectives set forth in the original project which began in 1993 with an ending date in 1995. The continuing project addresses additional objectives related to the overall goal. The ending date for the current project objectives is June 30, 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last agency evaluation conducted.

Answer. There has not been a formal evaluation of this project, but progress reports have been submitted to the agency and reviewed by our scientific staff. There are no plans to do a performance evaluation in the future.

SUSTAINABLE BEEF SUPPLY, MT

Question. Please provide a description of the research that has been funded under the Sustainable Beef Supply, Montana grant.

Answer. This is a new project. Its purpose is to develop, implement, and evaluate a Montana Beef Quality Assurance Program for beef producers. It will center on training beef producers with regard to the best management practices to ensure food safety, feeder calf quality, and consistency.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is to develop a reliable and predictable supply of safe, consumer-friendly beef of high quality. A National Beef Quality audit conducted by the National Cattlemen's Beef Association revealed that lack of proper quality control resulted in a loss of $103.16 per head slaughtered. Research will be used to develop a verifiable and certifiable beef supply that has been produced through a beef quality and assurance program.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this project are: develop a Beef Quality Assurance program for beef producers, implement a feeder calf certification program for Beef Quality Assurance-trained producers, implement an electronic identification and trucking system to document productivity of calves through various production schemes, and conduct producer educational programs focused on ranch financial management.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $500,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The State of Montana will contribute approximately $189,000 in fiscal year 1999 to cover the salary of faculty at Montana State University involved with this project. In addition, the Montana Stockgrowers Association has contributed $15,000 this year to the project and will likely contribute additional funding.

Question. Where is this work being carried out?

Answer. Research will be conducted at Montana State University and on cooperating Montana ranches.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. This project will be initiated in fiscal year 1999 and will likely require three years to complete the objectives.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project. It will undergo a peer-review at the University before submission. The proposal, when received, will also be reviewed for merit prior to funding.

SUSTAINABLE PEST MANAGEMENT FOR DRYLAND WHEAT, MONTANA

Question. Please provide a description of the research that has been funded under the Sustainable Pest Management for Dryland Wheat, Montana grant.

Answer. Montana State University researchers are studying the influence of four cropping sequences and two tillage systems on insects, weeds, plant pathogens, nutrient management, physical and biological properties of soil, economic profitability, and environmental benefits. The research is being conducted on large experimental blocks in three different dryland farming regions—northern, central, and eastern—in Montana. Each site differs climatologically and agronomically from one another yet represents a significant production area within the state.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. This project addresses pest management issues under different cropping sequences and tillage practices utilized in the Northern Great Plains for dryland wheat production. The wheat-fallow-wheat system used by many farmers in the region favors the build up of many pests. Dollar losses due to insects, competitive weeds, and plant pathogens in dryland wheat production in Montana alone are staggering. For example, annual losses attributed to wheat stem sawfly exceeds $25,000,000; wild oat infestations causes an estimated $50,000,000 in harvest losses and management costs; and wheat streak mosaic has a monetary loss of $37,500,000. These and other pests also increase reliance on pesticides for crop protection which impacts environmental quality, increases production costs, and causes secondary pest outbreaks and resistance. The agronomic, environmental, and economical benefits of diversified crop rotations are numerous, but these benefits are largely unknown or not documented in dryland wheat production. As a result of this multi-disciplinary project, we can significantly reduce the economic impact of agriculturally important pests, improve soil health, reduce production costs, and improve production efficiency.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goals of the research are to investigate the physical, chemical, and biological interactions of cropping sequences, and tillage systems on soil attributes, water and nutrient use, weed species composition, presence of plant pathogens, and above and below ground insect populations. Profitability, marketing, and environmental benefits of diversified cropping systems will be examined so farmers can realize the risks and benefits of adopting these systems. Study results will be assimilated and transferred into practical solutions to farmers' problems relative to the constraints of dryland wheat production.

The first cropping season has been completed. Data were collected on 26 different cropping sequences. Crops grown included spring wheat, pulses—pea, chickpea, and lentil—cool oilseed—mustard—warm oilseed—safflower—and sunflower. Numerous physical and chemical attributes of the soil were measured including available nutrients, soil aggregate characteristics, pH, forms of N, bulk density, salinity, water

flow rates, and water holding capacity. Plant diseases were documented and soil samples taken for common root rot inoculum. Crop data taken included dates of plant emergence, vegetative dry matter, yield components, and straw residue. Insects in different crop rotations were estimated by sweep samples, sticky traps and pheromone traps. These results will be a valuable tool in assisting producers in understanding the interactions of cropping sequences and tillage systems as they impact pests and soil health. This work will also provide producers with a better opportunity to consider producing alternate crops under the Federal Agriculture Improvement Reform Act.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was $200,000, and fiscal years 1998 and 1999, $400,000 per year. A total of $1,000,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds of $42,000 from the Montana Wheat and Barley Committee were provided for project support during 1997. Non-federal funds of $80,000 from the Montana Wheat and Barley Committee were provided for project support during 1998.

Question. Where is the work being carried out?

Answer. Research is being conducted in three distinct dryland areas of Montana—north, central, and northeast—located on producer owned land. Each field site is within 45 miles of a Montana State University Agricultural Experiment Station research center.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The project was initially proposed for a duration of 3 years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Yearly progress reports will be used to track the effectiveness of the program of research. Assessment of the precision of biological control organisms and estimates of profitability, marketability, and risk will be used to assess progress.

SWINE WASTE MANAGEMENT, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Swine Waste Management, North Carolina, grant.

Answer. During the past year, this multi-disciplinary project has expanded existing university efforts that have included plans to develop a prototype system for the treatment of animal waste which will be used to study and optimize new and innovative swine waste treatment processes. Specifically, the current project is focusing on the following topics: biological safety and nutrient quality of phosphoric acid-preserved animal mortality products processed by rendering, extrusion, and fluidized-bed cooking/dehydration; beneficial effects of swine manure biosolids on plant disease suppression; evaluation of alternative compost products; use of processed animal waste as a nitrogen and phosphorus source for Fraser Fir Christmas trees; production of a commercially-viable feed ingredient from animal wastes, cull sweet potatoes, and soybean hulls; routine techniques for monitoring the nutritional value of processed animal waste; and residual dietary phytase activity and phosphorus, calcium, and nitrogen content in fresh and composted manure.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The urgency for addressing environmental concerns relative to the intensive production of livestock and poultry continues to intensify in the United States. This is currently being reflected by strategies jointly proposed be U. S. Environmental Protection Agency and U. S. Department of Agriculture. In North Carolina, where livestock and poultry production account for approximately $5,000,000,000 in farm gate income annually, issues of adequate land area for recycling animal manures for crop uptake of nitrogen and phosphorus in some counties of intensive animal agriculture is especially sensitive. North Carolina is also currently in the process of implementing odor rules that will impact animal agriculture. Several other states and local regions are facing the same concerns. It is anticipated that deliverables from this research project will have a local, state and national impact.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The specific goals for this project include the following: utilize the North Carolina State University Animal Poultry Waste Management Center waste processing facility to develop optimum methods of screening, blending, fermenting, pelleting, extruding, and further processing animal waste-based nutrients for use as value-added products; installation of solid separation system at university swine research facility proximate to the Animal Poultry Waste Management Center waste processing facility; collect samples and establish supply sources of various types of animal waste by-products for conducting commercial scale processing and end-product evaluations; evaluate for targeted nutrient content and nutrient availability of processed materials targeted for use as plant nutrients; and evaluate materials processed for feedstuffs for targeted nutrient content and anti-nutritional factors.

These goals required assimilation of a multi-disciplinary research team, and completion of facilities that are able to heat treat, dehydrate, blend, extrude, compost, and pelletize the by-products to produce potentially valuable organic fertilizers or feed supplements. These tasks have been completed and the individual projects described previously are underway.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1997 and the appropriation for fiscal year 1997 was $215,000; fiscal year 1998 was $300,000; and fiscal year 1999 is $500,000. A total of $1,015,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. During fiscal year 1998 there were $244,622 in state funds provided in contract to North Carolina State University—NSCU—from North Carolina Department of Natural Resources and $80,460 in industry funds provided by membership monies from the members of the NCSU Animal and Poultry Waste Management Center in support of objectives related to this project.

Question. Where is this work being carried out?

Answer. This work is being conducted at North Carolina State University in Raleigh, North Carolina.

Question. What was the anticipated date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original anticipated completion date was February 28, 1999. Project objectives will not be completed by this date. The time to complete processes associated with equipment, facilities, and safety plans required for this project, coupled with unavoidable administrative delays in the secondary award process from Federal and university levels for this project, required a request for extension of the completion date to 2/29/00.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The Cooperative State Research, Education, and Extension Service conducted an evaluation of the progress of this work during January, 1999.

TILLAGE, SILVICULTURE, AND WASTE MANAGEMENT, LOUISIANA

Question. Please provide a description of the research that has been funded under the Tillage, Silviculture, and Waste Management Research Grant?

Answer. This research has five components: Rice and Cotton Tillage, Bald Cypress and Water Tupelo Silviculture, and Dairy and Poultry Waste Management. More specifically, the Rice Scientist are looking for ways to improve stand establishment; the Cotton Scientists are focusing on the use of tillage systems to combat harmful insect populations; the Waste Management Scientist are quantifying the environmental and economic effectiveness of approved dairy and poultry waste disposal systems; and the Silviculturists are conducting a problem analysis on factors affecting Bald Cypress and Water Tupelo regeneration. The project is annually subjected to the university's merit review process.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researchers hypothesize that the crops, forests, and waste issues addressed by this project extend beyond the state borders, thus this research has, at a minimum, multi-state to regional application.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals were to: improve conservation tillage in rice and cotton farming; determine the effectiveness of no-discharge dairy waste treatment facilities; determine acceptable land treatment levels for poultry waste disposal; and to

evaluate wetland forest regeneration processes. All components of the project have established research studies and are monitoring progress. For fiscal year 1998 the silviculture component was placed on hold and a sweet potato project was added. This decision was prompted by a staffing change in the Department of Forestry and Wildlife. Prior to this decision, an annotated bibliography of Bald Cypress Silviculture was completed and the responsible scientists had begun work on Water Tupelo regeneration. Louisiana State University's Agriculture Experiment Station Director remains actively engaged in the project by participating in the development and delivery of the annual proposal. Moreover, through his annual review process he fosters collegiality and professional discourse across Departments.

Question. How long has the project been underway, and how much has been appropriated, by fiscal year, through fiscal year 1999?

Answer. The work began in fiscal year 1994. The appropriation for fiscal year 1994 was $235,000. For fiscal years 1995–1999 the appropriation was $212,000 per year. This sums $1,295,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. State funding in support of these areas of research exceeds $750,000 annually.

Question. Where is the work being carried out?

Answer. Investigations are being conducted on the main campus at Louisiana State University as well as the Experiment Stations at Calhoun, Crowley, Chase, Winnsboro, St. Joseph, and Washington Parish, Louisiana.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related projects?

Answer. The original work was scheduled for completion in 1999. Early term objectives have been met. The added experiments have closing dates ranging from 1999 to 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted?

Answer. The last field evaluation was completed on December 12, 1995. The evaluation summary complimented the scientists on the interdisciplinary components associated with this project, along with their investigative procedures, report writing, and external networking.

TOMATO WILT VIRUS, GEORGIA

Question. Please provide a description of the research that has been funded under the tomato wilt virus research program grant.

Answer. This is a new project that will provide the research to help in the reduction of major crop losses in the southeastern United Sates due to tomato spotted wilt disease. Research will focus on the vector biology and the virus transmitted by the vector. This project was not awarded competitively but has undergone peer review at the university level and merit review at CSREES.

Question. According to this research proposal, or the principal investigator, what is the national, regional, or local need for this research?

Answer. Tomato Wilt Virus has become a major yield-limiting constraint on a number of very important food crops. This is a problem world-wide, but in the last ten years has spread throughout the Southeastern states. Since this virus was first observed in Georgia in 1986, it has caused an estimated $100,000,000 crop loss to the state. The wide host range of the virus and its vector make this a disease that is difficult to manage. The new strategies to manage this virus in Georgia will be applicable to all states where it occurs.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research is to reduce losses in the major crops grown in the Southwest due to spotted wilt. This requires identifying the sources of virus and vectors, determining the dynamics of the thrips species that transmit the virus, elucidating how the virus is acquired by thrips to identify possible genes to enhance virus resistance in plants, and adapting to crops in the Southeast the Risk Assessment Index for spotted wilt that is currently in implementation and refinement at the University of Georgia for peanut.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $200,000.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. The non-federal funds provided for this grant are $84,736 for 1999.

Question. Where is this work being carried out?

Answer. Research is being carried out at the University of Georgia and The Coastal Plain Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this is a new program, the original objectives have not yet been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project is under peer review at the University level and agency merit review.

TROPICAL AND SUBTROPICAL RESEARCH

Question. Please provide a description of the research that has been funded under the tropical and subtropical research program grant.

Answer. The Tropical and Subtropical Research—T STAR—Program is operating in coordination with the T STAR Caribbean and the T STAR Pacific Administrative Groups. State Agricultural Experiment Stations that are members of the Caribbean group are Florida, Puerto Rico, and the Virgin Islands; members of the Pacific group are Hawaii and Guam. The proposals are peer reviewed and are then selected for funding by the administrative groups.

Non-member institutional interests are represented by the Executive Director of the Southern Region Agricultural Experiment Station Directors, who is a member of the Caribbean group, and the Executive Director of the Western Region Agricultural Experiment Station Directors, who is a member of the Pacific group. The Agricultural Research Service also has representation on the two groups, as does the CSREES scientist who manages the T STAR grant program.

Funds for the program are divided equally between the two Basin Administrative Groups. The research objective of the program developed by the principal is to improve the agricultural productivity of many of the subtropical and tropical parts of the United States. Special research grants have been awarded for research on controlling insect, disease, and weed pests of crops; increasing the production and quality of tropical fruits, vegetables, and agronomic crops; promoting increased beef production through development of superior pastures; detection of heartwater disease of cattle and the influence of heat stress on dairy cattle reproduction; better use of land and water resources; developing computer models for efficient crop production systems and animal feeding systems; developing computer models for land-use decisions; using biotechnology methodologies for improving plant resistance to viral and bacterial diseases; using biotechnology to develop non-chemical, or biological, strategies for controlling insect pests; and potential for growing new speciality crops. fiscal year 1999 proposals have been requested.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes there is a need for the T STAR program to provide research-generated knowledge that enables informed choices in the responsible use of natural resources, facilitates the health and well being of American citizens through improved food safety and nutrition, provides frontline protection for the rest of the nation's farms and ranches from serious plant and animal diseases and pests, and enhances the ability of U.S. farmers to produce crops efficiently and economically and/or to introduce new crops and agricultural products with export potential to gain market share abroad. On a regional basis, the T STAR program addresses the unique challenges of practicing tropical agriculture, that is presence of pests year-round, heat stress, post-harvest processing to meet regulatory requirements for export, etc. The local need of Americans living in tropical regions of the nation for T STAR knowledge-based products to design and implement sustainable agricultural development within fragile tropical agroecosystems—particularly on tropical islands—and to develop new crops and niche markets.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to increase the production and quality of tropical crops; control pests and diseases of plants and animals; promote increased beef production; and conserve land and water resources. Grants have supported research on control strategies for Melon thrips; the biochemical nature of re-

sistance to rust in nutsedge; development of bioherbicides for nutsedges; development of tomato cultivars with resistance to the spotted wilt virus; development of pheromones for monitoring and controlling the citrus root weevil; reducing the effects of heat stress in dairy cattle; development of a decision support system for vegetable production; finding cucurbits with resistance to silverleaf; developing a computer program for optimal supplementation strategies for beef and dairy cattle on tropical pastures; characterizing new strains of citrus tristeza virus in the Caribbean basin; determining the economic threshold for the citrus leaf miner on limes; using viral replicase genes to engineer rapid detection methods for geminiviruses; developing makers of bacterial spot resistance genes in tomato; breeding snap and kidney beans for resistance to golden mosaic virus and for heat tolerance; searching for resistance to papaya bunchy top disease; developing weed control for yam production; and bioengineering ringspot virus resistance in papaya.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The operation of the tropical and subtropical research program was transferred from ARS to CSREES, with CSREES funding being first provided in fiscal year 1983. Funds in the amount of $2,980,000 per year were appropriated in fiscal years 1983 and 1984. In fiscal year 1985, $3,250,000 was appropriated. In fiscal years 1986, 1987, and 1988, $3,091,000 was appropriated each year. $3,341,000 was appropriated in fiscal year 1989. The fiscal year 1990 appropriation was $3,299,000. The fiscal years 1991–1993 appropriations were $3,320,000 per year; $3,121,000 in fiscal year 1994; $2,809,000 in fiscal years 1995–1996; and $2,724,000 per year in fiscal years 1997 through 1999. A total of $51,994,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. For fiscal year 1997, more than $1,000,000 of nonfederal were provided to the T STAR program from state appropriations, and for 1998 $85,600. These state funds were in the form of faculty salary time commitments and indirect costs covered by the institutions.

Question. Where is this work being carried out?

Answer. This research is being conducted in Florida, Puerto Rico, Virgin Islands, Hawaii, and Guam. Work is also being done in other Pacific and Caribbean countries through agreements between institutions but not using Federal funds.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Research on tropical crop and animal agriculture is to increase productivity net profits, decrease harmful environmental impacts, conserve water, and natural resources. The need to continue with this project has been expressed by producers in the area, importers in the U.S. mainland and the institutions involved.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The projects that are funded by the T STAR Special Research Grant have been peer reviewed by panels of scientists in the U.S. to assure that good science is undertaken. Also, as part of the grant renewal process, progress reports are reviewed by the two Administrative Groups and by the grant manager at the national level. Workshops in which research results and their application for agricultural production are developed every two years. Research papers are published in the appropriate regional, national, and international forums available.

The development in 1995 of the Strategic Plan for T STAR provided a mechanism to define priorities, examine program direction, and recommend operational changes. One of the principal points considered was to bring the Caribbean and Pacific Basin components closer and better coordinated. T STAR and the coordination which it implies was an outcome that will make this program better. Each sub project is peer reviewed annually at the initiating institution by the T STAR panel and by CSREES National Program Leaders.

TURKEY CORONAVIRUS, INDIANA

Question. Please provide a description of the research that has been funded under the Turkey Coronavirus, Indiana, grant.

Answer. This is a new grant in fiscal year 1999. CSREES has requested the university to submit a grant proposal that has not yet been received. The objectives of the research will be to: (1) develop enzyme-linked immunosorbent assays for detecting antibody to turkey coronavirus and turkey coronavirus antigen in turkey flocks, (2) elucidate immune responses in turkey poults infected with turkey coronavirus, and (3) determine which immunity, humoral and /or cellular, will pro-

vide the most effective protection for turkey poults against turkey coronavirus infection.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The need for this research is that the turkey industry plays a major role in animal agriculture in the U.S. This enteric disease of young turkey poults, called turkey poult enteritis or poult enteritis mortality syndrome, has contributed to significant economic losses by producers in Indiana, North Carolina, South Carolina, Virginia and other states. The cost to the industry is in the millions. Currently, no effective medication or vaccination is available for control and prevention of the disease. Although turkey poults that recover from the coronaviral enteritis may develop long-term immunity, little is known about the specific immunity. The proposed research will lead to further study on the understanding of immunological interaction between turkey poults and individual turkey coronaviral proteins and subsequent development of recombinant or a deoxyribonucleic acid vaccine for effective prevention of the disease. The enzyme-linked immunosorbent assays that will be developed in this research will provide an efficient tool for diagnosis and control of turkey poult enteritis.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research is a new proposal so nothing has been accomplished to date. The goal of the research will be to develop enzyme-linked immunosorbent assays for monitoring antibody to turkey coronavirus and turkey coronavirus antigen in turkey flocks during acute outbreaks or recovery and in routine health monitoring and to develop effective vaccines to protect turkey poults against turkey coronavirus infection.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $200,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. This is a new proposal for fiscal year 1999. No non-federal funds will be provided in this fiscal year.

Question. Where is this work being carried out?

Answer. Research will be conducted at Purdue University in the Department of Veterinary Pathobiology and the Animal Disease Diagnostic Laboratory.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is December 31, 2001.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Since this is a new proposal, no evaluation has been conducted. However, it is anticipated that it will be reviewed by a CSREES specialist shortly after it is received by the agency.

URBAN PESTS, GEORGIA

Question. Please provide a description of the research that has been funded under the Urban Pests, Georgia grant.

Answer. This research is focused on urban pests with specific emphasis on termites and ants. This project has been evaluated annually by CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes subterranean termites and ants are significant economic pests in the Southeastern United States. Damage and control costs for termites in Georgia were estimated at $44,500,000 in 1993. It is estimated that professional pest control operators apply over 23,000,000 pounds of active ingredients in and around homes each year. Chemicals currently registered for controlling these pests are less efficacious than desired and applied at an intensity that exceeds most agricultural settings.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of the termite research is to better understand the biology of subterranean termites and their responses to selected environmental cues in order to design monitoring, risk assessment, and precision-targeting control strategies

using conventional and alternative methods. Additionally, an objective is to improve the identification of subterranean termites to the species level through studies of the termite genome, cuticular chemistry, morphometric characteristics, and termite behavior. Specific accomplishments in the termite research are as follows: Collection of three full years of data on over 80 different subterranean termite colonies in four of the major soil provinces in Georgia was completed in 1997. This data set has been compiled and is currently being analyzed using spacial analysis to assist in developing risk assessment models and precision-targeting of treatment options. Research with reduced-risk insecticides have provided data that will assist in registration of several novel chemistries within the next few years. Work with biological control agents has suggested that application of a naturally-occurring fungus to the structural components involved in a subterranean termite infestation should be efficacious in removing that infestation. Research continues to raise questions concerning the concept of baits as a termite control tactic. Recent data from termite behavior and genome studies indicate that the conventional concept of the monogyne—one pair of parents—social structure of a termite colony is not valid raising questions about the real-world composition of subterranean termite societies.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This work supported by this grant began in fiscal year 1991 and the appropriation for fiscal years 1991—1993 was $76,000 per year. In fiscal year 1994 the appropriation was $71,000 and in fiscal years 1995 through 1999 the appropriation was $64,000 each year. A total of $619,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant by fiscal year were as follows: 1991—none, 1992—$26,000, 1993—$18,000, 1994—$59,530, 1995—$59,539, 1996—$30,000, 1997-$80,00, 1998-$50,000.

Question. Where is the work being carried out?

Answer. This research and technology transfer program is being conducted at the University of Georgia, Department of Entomology, Athens, Georgia..

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The grants have been processed on a year to year basis pending the availability of funds, however, the original objectives were essentially a five-to eight-year plan of work. CSREES entomologists judge that progress has been made on foraging behavior and the identification and development of termite baits. There has also been a publication of the research results.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project has been evaluated on an annual basis by CSREES, through the progress reports. Progress has been excellent.

VIDALIA ONIONS

Question. Please provide a description of the research that has been funded under the Vidalia Onion Grant.

Answer. The research has concentrated on developing pungency testing procedures to improve quality and sensory consistency of Vidalia onions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for the research?

Answer. Vidalia onions are a specialty crop of extreme importance to the economy of certain areas of Georgia. The project is directed toward improving product quality and the nationally-and internationally-economic competitiveness of this production system.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research has demonstrated that chemical tests can be used to accurately predict the pungency of onions prior to harvest, and perhaps flavor categorization, to consumers. The results have also indicated that several diseases affecting onions are the most serious problem in regard to quality and production.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The project began in fiscal year 1998 with an appropriation of $84,000 and for $100,000 in fiscal year 1999. A total of $184,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year.

Answer. The non-federal funding for this project for the last two years was $193,137 from the state of Georgia and $251,427 in private funding.

Question. Where is the work being carried out?

Answer. The work is being conducted at the Coastal Plain Experiment Station in Tifton, Georgia and in test plots in several commercial field sites.

Question. What was the anticipated completion date for the original objections of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated duration for the original project was five years. The initial objective of establishing procedures for pungency testing has proceeded ahead of schedule. The plant disease problems that have emerged will likely require several additional years, although the incidence and severity of these diseases are highly variable from year to year.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project is in it's second year, and the emphasis and objectives have changed from pungency research in fiscal year 1998 to onion disease research in fiscal year 1999. A CSREES review or evaluation has not yet been done on this project with plans to postpone the review until the end of the 1999 growing season when both aspects of the research project could be evaluated.

VITICULTURE CONSORTIUM, NEW YORK & CALIFORNIA

Question. Please provide a description of the research that has been funded under the Viticulture Consortium grant.

Answer. The University of California and Cornell University in New York conducted research on varietal responses of grapes, modeling of water requirements, management of diseases including Phyloxera, and other cultural aspects of grape production. Funds were used by the lead institutions to fund projects in the various grape-producing states within their region. Grants were made based on peer reviewed proposals and selected competitively by regional groups based on priorities developed by researchers, extension, and industry personnel.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The research being carried out is designed to help the viticulture and wine industries remain competitive in the U.S. and in the global market. Further, disease and insect problems are a concern of the industry, especially in new strains of phyloxera while overall improvement in all cultural management approaches to grape production need to continue.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research is to maintain or enhance the competitiveness of the U. S. Viticulture and wine industry in the global market.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal years 1996–1997, $500,000 per year; fiscal year 1998, $800,000; and fiscal year 1999, $1,000,000. A total of $2,800,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Each year the viticulture industry provides matching contributions in excess of the appropriated federal funds.

Question. Where is the work being carried out?

Answer. Research is being carried out in nine eastern states and California.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The research priorities set by the guidance group have not been met. The research is varied and complex and will take many years to complete.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project underwent merit review in January, 1998. The research proposals are peer-reviewed in both regions before selection. The review group is composed on industry, research, and extension personnel that are experts in viticulture.

WATER CONSERVATION, KANSAS

Question. Please provide a description of the research that has been funded under the water conservation program grant.

Answer. This research program is designed to develop and disseminate technical and economic information on the efficient use of water for irrigated crop production in western Kansas. The program has the following objectives:

—Develop regression models to estimate the longevity of subsurface drip irrigation systems using calculations of annual system performance deterioration based on 13 years of operating pressures and flow rates;

—Evaluate utilization of livestock effluent with subsurface drip irrigation and its effect on water redistribution and corn water use patterns;

—Develop best management practices for nitrogen fertigation using subsurface drip irrigation systems for corn;

—Estimate the long run economic impacts of irrigation efficiency improvements for irrigated corn, wheat, and grain sorghum in the farm sector and affiliated sectors of the High Plains economy;

—Disseminate irrigation research information and best management practice recommendations to Kansas irrigators through a series of extension bulletins and updates based on research-based information.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher indicates that corn is the principal irrigated crop in Kansas and throughout the Great Plains. The principal researcher believes any realistic attempt to address overdraft of the High Plains Aquifer must address improvements in irrigation efficiency in corn production. The most common irrigation methods are furrow and sprinkler irrigation. The need to conserve water has focused attention on more efficient alternatives such as subsurface drip irrigation. This research will be of particular significance within the state and region. However, it also has national and international applications as advanced irrigation systems, such as subsurface drip irrigation, will be needed to improve irrigation water use efficiency in the next century.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The research goal is to determine the feasibility of subsurface drip irrigation and other alternative irrigation systems in western Kansas to sustain irrigated corn production to support the beef feedlot industry. The project also supports an educational effort through collection and dissemination of information on efficient irrigation methods. Subsurface drip irrigation acreage is increasing in Kansas and farmers are obtaining results on their own farms.

The computer program Irrigation Economies Evaluation Svstem—IEES—is complete and is being distributed by the Kansas State University Cooperative Extension Service. A report has been published which documents the data requirements and algorithms used in the model. A users guide is also available.

Education poster sessions have been presented at three meetings. These posters were designed to inform potential users about the advantages of using the IEES software to evaluate irrigation options for farms in the Great Plains.

A report entitled "Economic Analysis of Alternative Irrigation Systems for Continuous Corn and Grain Sorghum in Western Kansas," has been completed. The results of this study indicate that a low drift nozzle center pivot system is the most profitable center pivot system to use for irrigation of corn and grain sorghum. Overall, a surge flood system was the most profitable because of its relatively low ownership costs. Although the subsurface drip system shows some potential, it is only economically feasible when above-average crop yield and price conditions exist.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1993 with an appropriation of $94,000; $88,000 in fiscal year 1994; and $79,000 in fiscal years 1995–1999 each year. The total funds appropriated are $577,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $781,232 state appropriations, $55,205 product sales, $60,907 industry and miscellaneous in 1991; $868,408 state appropriations, $37,543 product sales, $35,484 industry and miscellaneous in 1992; $833,324 state appropriations, $54,964 product sales, $144,225 industry and miscellaneous in 1993. Amounts for other years should be similar.

Question. Where is this work being carried out?

Answer. The research is being conducted at Kansas State University. The field portion of the research is being conducted on Research Centers at Colby and Garden City, Kansas. Additional work is being carried out on campus at the Departments of Agronomy and Agricultural Economics in Manhattan, Kansas.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original anticipated completion date for the project was 1998. One of the most important objectives of the study is to evaluate longevity of the subsurface drip irrigation systems. These sites are unique to the region and very little information is available on system longevity. Pressing water quality problems of a regional and national scope has necessitated a change in the objectives to developing nutrient management practices under subsurface drip irrigation and utilization of livestock wastewater with subsurface drip irrigation. Additionally, changes in the federal farm program which allow greater planting flexibility has an effect on how irrigators make water/land allocation decisions. Field and economic studies related to allocation strategies, nutrient management, and wastewater utilization should be completed in three years.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project has been peer reviewed. The reviewers felt the project concept to be valid and the timetable for accomplishments to be on target.

WATER QUALITY

Question. Please provide a description of the research that has been funded under the Water Quality special research grant.

Answer. The agency continues support of the national, competitively-awarded grants program as part of the Department's Water Quality Initiative. This program supports research to investigate the impacts of non-point source pollution from agriculture on water quality, and to develop improved, sustainable agricultural practices and systems that protect the environment and are economically profitable. This program is conducted jointly with the State Agricultural Experiment Stations, the U.S. Department of Agriculture's Agricultural Research Service and Natural Resources Conservation Service, the U.S. Environmental Protection Agency, the U.S. Geological Survey, extension specialists and other Federal, State, and local agencies. The water quality grants have supported more than 300 research projects across the country. In fiscal years 1996 and 1997, funds were awarded to the five Management Systems Evaluation Areas projects in the Midwest to continue the water quality systems research started in 1990. In 1996, new projects were initiated as Agricultural Systems for Environmental Quality. The new projects focus on watershed-scale agriculture production systems that reduce pollution of soil and water while maintaining productivity and profitability.

In 1998, the U.S. Department of Agriculture joined with the Environmental Protection Agency and the National Science Foundation in the national Water and Watersheds program which focuses on watershed-scale systems to improve water quality. Three projects have been funded under this new program.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The public is concerned about the possible risks to the environment, to soil quality, and to water quality resulting from the use of agricultural chemicals. Improved methods of detection of very minor amounts of chemicals in water have made the public, farmers, and policymakers more concerned about the use and management of these agricultural chemicals and wastes, while meeting the challenge of maintaining the efficiency and productivity of agricultural production systems. Water quality continues to be of high priority at local, regional and national levels. Results from the research are providing technologies to reduce pollutants, guidelines for site-specific farming, and improved farming systems.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of the program were to determine the extent to which agriculture has impacted groundwater quality, and to develop new and improved, cost effective agricultural systems that enhance ground water quality. During the past three years, focus and allocation of resources have increased for surface water quality. Major progress has already been made on these goals. Examples of some of the results of recently completed research include the following:

—Nebraska's water quality research indicates that irrigated corn can be produced profitability with less water and nitrogen than most farmers apply.

—Ohio's Lake Erie Agricultural Systems for Environmental Quality project, along with other State and Federal projects, is making excellent progress in reducing phosphorus loading in two major watersheds that discharge into Lake Erie. Watershed phosphorus budgets indicate that the net annual accumulation of phos-

phorus in the Maumee watershed has dropped from 23,000 metric tons to 2,600 metric tons. Farmers are no longer applying "buildup" levels of phosphorus to their fields—a major cultural change.

—In North Carolina, a 7-acre wetland is effectively removing nitrates from the runoff and drainage of a 950-acre watershed during the warm season; a Site-Specific Farming workshop was held at Greensboro, North Carolina, and attracted some 200 participants; and several industrial and educational displays have been developed for the Agricultural Systems for Environmental Quality project.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work under the Water Quality Program began in fiscal year 1990 with an appropriation of $6,615,000. The subsequent appropriations were as follows: $8,000,000 in fiscal year 1991; $9,000,000 in fiscal year 1992; $8,950,000 in fiscal year 1993; $4,230,000 in fiscal year 1994; $2,757,000 in fiscal years 1995–1997; $2,461,000 in fiscal year 1998; and $3,461,000 in fiscal year 1999. A total of $50,988,000 has been appropriated for the Special Research Grants Water Quality Program.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds in support of the Water Quality program, provided by state appropriations, industry, product sales and other local sources, have averaged approximately $1,000,000 per year since the program began in 1990.

Question. Where is this work being carried out?

Answer. Funds provided under the Water Quality Program have been awarded to institutions in virtually every state, so work is being carried out in all parts of the country. The Management System Evaluation Area projects of the Midwest Initiative on Water Quality are headquartered in Iowa, Minnesota, Missouri, Nebraska, and Ohio, with satellite locations in North Dakota, South Dakota, and Wisconsin. Three new projects located in Indiana, North Carolina, and Ohio were initiated in fiscal year 1995. Three new projects located in Illinois, North Carolina, and Utah were initiated in 1998.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original goals of the Department's Water Quality Research Plan were to: (1) assess the seriousness and extent of agriculture's impact on groundwater quality, and (2) develop new and improved agricultural systems that are cost effective and enhance ground water quality. These original goals have been met; however, water quality programs need to have a long-term focus. The physical processes that link production practices to water quality and the socioeconomic processes that characterize adoption can both be of long duration. The adoption process, from first learning about a practice through implementation, can take years. While assistance is designed to speed up this process, overall progress can still be slow. Therefore, adequate resources must be made available for an extended period of time to ensure successful completion of the project.

The original project was developed for five years with the expectation that it would be reviewed and possibly extended beyond the five-year period if warranted. The 1995 review of the program identified a need for increased attention to surface water quality problems. In 1996 and 1997, new water quality problems emerged; hypoxia, pfiesteria, etc.—which required renewed efforts. The research funded under the Special Research Grants Program has produced significant progress in understanding the impacts of agricultural practices on surface and groundwater pollution and in developing improved agricultural systems that are economically and environmentally sustainable. Implementation of some of these improved agricultural systems is already underway in a number of states. The focus over the next five years will be on developing and implementing agricultural systems that reduce the nutrient and contaminant loadings in our waters and watersheds.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An external review team evaluated the Management System Evaluation Areas and associated component projects in 1995. All Management System Evaluation Area projects have an impressive record of successfully implemented interdisciplinary teams to study water quality problems. A major conference on Management System Evaluation Area and Agricultural Systems for Environmental Quality results is scheduled in June 1999. Criteria used to evaluate the success of the Midwest Management System Evaluation Areas project included:

—The relationship of the program to national and regional priorities.

—Contributions of the program to rural communities, to education of scientists, and to the quality of life in rural communities.
Methods used to transfer the project results to the customers and clients.
—Future opportunities and needs for environmental programs.
—Progress toward accomplishing objectives.

WEED CONTROL, NORTH DAKOTA

Question. Please provide a description of the research that has been funded under the Weed Control, North Dakota grant.

Answer. A major focus has been developing and evaluating systems to reduce herbicide use in crop production. The experiments of longest duration are field evaluations of sustainable, reduced tillage, and conventional crop rotation systems to ascertain changes in weed species and densities and in economic returns over time when weed management is reduced. Another emphasis has been weed biology, particularly understanding the unique physiological and genetic traits of herbicide-resistant kochia and wild oat in an effort to recommend the most cost-effective management alternatives. Another goal has been to improve the efficiency of postemergent herbicide use by utilizing additives that maximize weed control with reduced amounts of herbicide and by reducing spray volume and adapting new nozzle designs that improve application techniques.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The research address new methods to control weeds using systems control. The principles concerning effective use of additives with postemergent herbicides are being applied to improving the efficiency of postemergent herbicide use across the nation. Similarly, adaptation of herbicide application technology that allows reduced spray volumes while sustaining herbicide effectiveness is of nationwide benefit. The increased understanding of the inheritance and management of herbicide resistance in kochia and wild oat will be beneficial to management of these weeds in the central and northern regions of the United States where these weeds are abundant and cause major losses annually. The long-term field experiments should provide useful information on the positive and negative impacts of reduced weed management systems wherever spring-sown small grains are the primary crop.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The initial major activity was a long-term series of experiments to evaluate changes in weed species and populations and the economic returns in conventional, sustainable, and reduced tillage systems with rotations that are up to four years long. The research was initiated in 1993, but atypical wet conditions occurred for the first three years. It is felt that at least two complete cycles of crop rotations—eight years—will be necessary to accurately assess what farmers can expect from adopting new management systems.

The research to improve the efficiency of herbicides lead to development of the principle that effectiveness of many postemergent herbicides can be improved by using additives that dissolve the herbicide. And this principle was utilized to develop a basic pH adjuvant that improves the effectiveness of several postemergent herbicides.

The research with genetics of herbicide-resistant kochia has determined that inbreeding depression occurs when this naturally cross-pollinated plant is self-pollinated to develop genetically uniform plants, which are desirable for many research objectives related to inheritance of genetic traits. However, this discovery also demonstrates that cross-pollination must be maintained in kochia for research intended to accurately simulate genetic changes and competition with crops that may occur in a field.

Resistance of wild oat to many of the major herbicides used for its control in the United States has been documented, including resistance to imazamethabenz which has not been reported previously. Molecular biology and physiological studies have been initiated to better understand the cause of imazamethabenz resistance in wild oat, so management strategies can be recommended. Initial research has demonstrated that weed control by herbicides applied to weeds of recommended size has been equally effective when spray-drift-reducing or conventional nozzles are used. Because drift-reducing nozzles produce large droplets, the next step of evaluation is being initiated to determine whether small weeds are treated and controlled effectively when drift-reducing nozzles are used.

Question. How long has this work been underway and how much has been appropriated by fiscal year through year 1999?

Answer. The support by this grant began in fiscal year 1992 and appropriation for fiscal years 1992 and 1993 was $500,000 per year; $470,000 in fiscal year 1994; and $423,000 per year in fiscal years 1995 through 1999. A total of $3,585,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $27,030 state appropriations in 1992; $48,472 state appropriations in 1993; $41,969 state appropriations in 1994; $71,847 state appropriations in 1995; $62,134 state appropriations in 1996; $78,579 state appropriations in 1997; and an estimated $70,000 state appropriations in 1998.

Question. Where is this work being carried out?

Answer. Research is being conducted at the North Dakota State University.

Question. What was the anticipated completion date for the original objective of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date for the long-term rotation experiment, utilizing the conventional, reduced tillage and sustainable management systems, was anticipated to be a minimum of 5 years, but the experience with atypically environmental conditions suggest that 8 to 10 years will be necessary to attain a relatively steady state or logical end of the research. The current intent is to continue the research until at least 2002. The problems encountered due to the inbreeding depression in kochia suggests that it will be difficult to determine the true genetic nature of inheritance of herbicide resistance in this weed as quickly as projected. And due to the discovery of herbicide resistance of wild oat to imazamethabenz, the genetic and molecular biology research to characterize the nature of this resistance is just getting a good start. It is anticipated that the genetic and biology research with kochia and wild oat will need to continue until at least 2002.

Question. When was the last Agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A scientific peer review of the written proposal was conducted in fiscal year 1998 by CSREES prior to awarding the grant. Based on comments from the reviewers, CSREES required that the university revise and resubmit the proposal. The resubmitted proposal was approved with the caveat that within one year a scientific peer, onsite, progress review would be conducted by CSREES. That progress review has not yet been completed.

WETLAND PLANTS, LA

Question. Please provide a description of the research that has been funded under the Wetland Plants, Louisiana, grant.

Answer. CSREES has requested the university to submit a grant proposal that is currently in preparation.

Question. According to the principal researcher, what is the national, regional, or local need for this research?

Answer. There is local, regional, and national need for this research. Coastal wetlands erosion is a serious environmental problem in many coastal locations around the United States. The problem is particularly severe in Louisiana where an acre of coastal wetlands is lost to erosion every 20 minutes. Current technologies, even at great expense, can only slightly reduce these losses. The research this grant is funding has the potential to provide a significant improvement with respect to both the magnitude and expense of future coastal erosion control efforts.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to develop an economically-feasible approach to controlling coastal wetlands erosion that would utilize vegetation to retain areas threatened by erosion and to rebuild lost land. To accomplish this, a system that incorporates agricultural principles involved in crop production is required. Specifically, a seed-based system utilizing appropriate planting material is required. While this is the first year of funding for this project from CSREES, progress has been rapid in developing this seed-based system, and field trials in the marsh are already planned for 1999.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999, and the appropriation for fiscal year 1999 is $600,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $18,391 state appropriations, $5,319 industry grants, and $8,691 miscellaneous in 1999.

Question. Where is this work being carried out?

Answer. Research is being conducted at the Louisiana Agricultural Experiment Station.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Since this is a new program, the original objectives have not yet been met.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This is a new project, and there has been no prior agency evaluation. An agency evaluation is planned for fiscal year 2000 following one year of project operation.

WHEAT GENETICS

Question. Please provide a description of the research that has been funded under the Wheat Genetics grant.

Answer. This project provides partial support for the Wheat Genetics Resource Center at the University of Kansas. The Center focuses on collection, evaluation, maintenance, and distribution of exotic wheat-related germplasm needed to develop new wheat cultivars resistant to disease, insects, and environmental stress.

Question. According to the research proposal or the principal research, what is the national, regional or local need for this research?

Answer. The principal researcher believes most cultivated varieties of wheat are derived from common sources. They lack the rich genetic diversity needed to develop resistance to diseases, insects, and environmental stress. The replacement of genetically-rich primitive cultivar and land races by modern, more uniform cultivars all over the world is causing erosion of wheat germplasm resources. New pests or those that have overcome varietal resistance pose a constant threat to the Nation's wheat production. Genetic resistance often resides in wild relatives of wheat. The researchers believe this program, which was established in Kansas, is providing service to wheat breeders nationally and internationally.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this research was to enhance the genetic diversity available to wheat breeders nationally and internationally by collecting, evaluating, maintaining, and distributing germplasm derived from wild relatives of wheat. To date, 39 germplasm releases have been made containing new genes for resistance to such pests as Hessian fly, greenbug, leaf rust, soil-borne mosaic virus and Russian wheat aphid. Germplasm stocks with resistance to leaf rust and powdery mildew are under development. Evaluation of germplasm for important resistance genes was carried out by Center scientists and cooperating institutions. Center scientists have introduced antifungal protein genes into the wheat plant to enhance its survival against pathogen attacks. One transgenic wheat line gave enhanced resistance to wheat scab, a devastating disease of wheat. In 1998, the Center filled 20 requests from U.S. wheat breeders for seed from the germplasm collection and 10 requests for seed of germplasm releases, as well as 34 requests from international breeders.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. Work supported by this grant began in fiscal year 1989. Appropriations were for fiscal year 1989, $100,000; fiscal year 1990, $99,000; fiscal year 1991, $149,000; fiscal years 1992–1993, $159,000 per year; fiscal year 1994, $196,000; fiscal years 1995–1997, $176,000 each year, and $261,000 each year in fiscal years 1998 and 1999. A total of $1,912,000 has been appropriated.

Question. What is the source and amount of nonfederal funds provided by fiscal year?

Answer. The nonfederal funds provided for this grant were as follows: $609,309 in 1991; $531,167 in 1992; and $730,082 in 1993, $468,960 in 1994; $563,671 in 1995; $457,840 in 1996; $495,820 in 1997; and $155,279 in 1998. Sources include state appropriations, product sales, and other organizations, such as state commodity associations.

Question. Where is this work being carried out?

Answer. This research is being conducted at Kansas State University at the Wheat Genetics Resource Center. The principle investigator also reports collaborative projects with other departments at Kansas State University, as well as other institutions in the U.S.

Question. When was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The collection, evaluation, and enhancement of wheat germplasm is a continual process. Therefore, this project does not have a defined completion date.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The project was peer reviewed by the institution, Kansas Agricultural Experiment Station, and was found to address critically-important issues in the winter wheat industry in Kansas and other states. As an ongoing project, the research has been productive based on germplasm releases and peer-reviewed journal articles and other publications. Additionally, each annual proposal is reviewed by a CSREES scientist.

WOOD UTILIZATION RESEARCH

Question. Please provide a description of the research that has been done under the wood utilization grant.

Answer. The research includes: developing processes to upgrade low quality wood so it is suitable for higher value structural applications; catalyzing the formation of new business enterprises; and reducing environmental impact while improving systems for timber harvesting and forest products manufacturing.

Question. According to the research proposal, or the principal researchers, what is the national, regional, or local need for this research?

Answer. The forest products industry is very fragmented with many small firms which need publicly-sponsored research in order to remain economically viable. Research provides the woodworking machinery and tooling industry with technology to be more competitive in the global economy. Most of the companies helped through this research are too small to afford in-house research groups.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal is to generate new knowledge that will benefit the wood industry and the environment. New scientists are trained. Consumers benefit from better and more environmentally-sound products. Among the major accomplishments of the six centers are (1) design of glued-laminated beams that are reinforced with plastics to save 25–40 percent of the wood fiber that would otherwise be needed, (2) technology to apply wood preservatives using super fluids to reduce environmental problems associated with present commercial treatments, (3) better harvesting systems that are efficient and environmentally acceptable, (4) increase of wood machining speeds and reduction of saw blade width to increase productivity and save raw material, (5) a patented system to apply pressure and vibration to prevent enzymatic sapstain which degrades hardwood lumber by $70,000,000 to $200,000,000 per year, (6) reduction of quantity of wood bleaching chemicals needed by wood pulp producers, (7) design and strength of wood furniture frames to minimize wood requirements, and (8) adoption of European frame saw technology to composite lumber to provide a new raw material source for industry.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, $3,000,000; fiscal years 1986 through 1989, $2,852,000 per year; fiscal year 1990, $2,816,000; fiscal years 1991 and 1992, $2,852,000 per year; fiscal year 1993, $4,153,000; fiscal year 1994, $4,176,000; fiscal years 1995 and 1996, $3,758,000 per year; fiscal years 1997 and 1998, $3,536,000 per year; and $5,136,000 in fiscal year 1999, which provided a $500,000 increase for the six existing centers, and $1,000,000 for two new centers. A total of $50,981,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Mississippi State University non-federal funds were: State appropriations, $2,498,800, $2,178,725, $2,353,225, 2,331,691, $2,650,230, $2,778,535, $2,582,617, and 2,543,017 for 1991, 1992, 1993, 1994, 1995, 1996, 1997, and 1998, respectively. In addition, industrial funds averaged $783,458 for the 5 years from 1994 to 1998 in support of the Mississippi Forest Products Laboratory. Oregon State University state appropriations were: $1,337,962, $1,394,304, $1,256,750, $1,252,750, $1,417,755, $1,117,000, $1,100,000, $1,352,000 for 1991, 1992, 1993,

1994, 1995, 1996, 1997, and 1998, respectively. Estimated non-public support was $670,000 this year. Michigan State University non-federal contributions for 1997 totaled $605,000. Three new locations were added in 1994: University of Minnesota-Duluth non-federal match was $590,000, $550,000, $560,000, $371,930, and $307,532 for 1994, 1995, 1996, 1997, and 1998; North Carolina State University was $126,000, $165,000, $135,000, $163,216, and $323,134 for 1994, 1995, 1996, 1997, and 1998; University of Maine was $600,000, $445,723, $459,100, $477,464, and $526,210 for 1994, 1995, 1996, 1997, and 1998.

Question. Where is the work being carried out?

Answer. There are six locations. The initial three—Oregon State University, Mississippi State University, and Michigan State University—were joined by the University of Minnesota-Duluth, North Carolina State University, and the University of Maine in fiscal year 1994. For 1999, they will be joined by a center at the University of Tennessee, and a second center at the University of Idaho, which will include a consortium of Idaho, Montana, and Washington State.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to build and maintain three strong regional centers of wood utilization research. These centers have been established, and five more centers have been added. Projects begun in 1998 will be completed by 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. On site reviews of centers are conducted on a rotating basis. Each center's plans are reviewed yearly or more frequently. Progress reports are reviewed yearly. Center directors last met together for joint planning in June 1996 and will be meeting again in February 1999. Centers all have advisory committees or research committees which meet periodically. We conduct informal on-site reviews periodically. The Minnesota and Oregon sites were visited in 1996, and the North Carolina site was visited in 1997. Oregon State was visited in 1998. A Departmental panel reviewed the original three centers in 1992 and 1993. At that time, the original objectives were broadened to include more consideration for environmental concerns. The centers have increased their focus on helping industry meet environmental objectives by conducting research leading to sustained timber production; extending the timber supply through improved processing; developing new structural applications for wood; and developing wood extractives to substitute for pesticides, preservatives, and adhesives.

WOOL RESEARCH

Question. Please provide a description of the research that has been funded under the wool research grant.

Answer. The overall goals for this research are to develop objective measures of wool, mohair, cashmere, and other animal fibers to improve the quality of wool products while enhancing the profitability of the U.S. sheep and Angora goat industries. Specific objectives include: develop and evaluate measurement techniques for rapid objective evaluation of wool, mohair, cashmere, and other animal fibers; increase the use of objective measurements to increase fiber production, quality, and income to producers; and increase consumer acceptance of fabrics made from these fibers. The fiscal year 1998 grants terminate between August 1999 and April 2000. The 1999 grant proposals have been requested by the agency. All grants are reviewed for relevance to industry needs and undergo scientific peer review.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. Collaboration exists among researchers in Texas, Wyoming, and Montana associated with this grant and other Federal, university, and industry scientists to assure responsiveness to the needs of those involved in wool and mohair production, marketing, and processing. The sheep and goat industries and the principal researchers believe that this research to be of national, regional, and local need. The research on wool, conducted by means of this grant, represents the only research efforts in the U.S. focused on improving the efficiency of measuring and assuring wool, mohair, and cashmere quality for garments made from these fibers.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The overall goal for this research is to develop objective measures of wool, mohair, cashmere, and other animal fibers with a focus on improving the efficiency of determining the quality of products made from these fibers while enhancing the profitability of the sheep and Angora goat industries. Research accomplish-

ments included the development of rapid and inexpensive measurements of fiber diameter, distribution of animal fibers, and other fiber properties such as fiber length and color. Each of these properties are very important for grading and processing to determine ultimate softness, durability, dye characteristics, comfort, and garment price. Laser and near-infrared spectroscopy techniques were evaluated cooperatively with industry for the purpose of determining mohair yield, fiber diameter, and medullation. Research data from the program contributed to national and international programs designed to accelerate the use of the new technology by sheep and goat industries. The scientists also cooperated on several experiments by providing measured fiber data to improve selection, nutrition, management, and marketing studies with sheep, Angora, and Cashmere goats. Textiles manufacturers have expressed a willingness to pay premium prices for the improved preparation of U.S. wool. Investigators in the program found that the classing of raw wool, skirting, and the removal of belly wood provides a more desirable product to the textile manufacturer providing greater profits to the producer. These measurements impact the efficiency of the sheep and Angora goat industries, the effectiveness of monitoring the quality and consistency of imported products, and the satisfaction of buyers of wool, mohair and cashmere textiles. Historically, wool products were considered a strategic commodity in the United States for military use. It is important that the U.S. producers of wool, mohair, and cashmere are competitive in the world market and that consumers are assured high quality textiles.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from appropriated funds in the amount of $150,000 per year for fiscal years 1984–1985; $142,000 per year for fiscal years 1986–1989; $144,000 for fiscal year 1990; $198,000 for fiscal year 1991; $250,000 per year for fiscal years 1992–1993; $235,000 for fiscal year 1994; $212,000 per year for fiscal years 1995–1997; and $300,000 per year for fiscal years 1998–1999. A total of $3,181,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $150,913 state appropriations, $11,800 product sales, $5,817 industry, and $3,556 miscellaneous in 1991; $111,394 state appropriations, $25,451 product sales, $41,442 industry contributions and $3,068 miscellaneous in 1992; $152,699 state appropriations, $39,443 product sales, $40,804 industry contributions, and $3,556 miscellaneous in 1993; $150,094 state appropriations, $35,284 product sales, $36,484 industry contributions, and $3,556 miscellaneous in 1994; $67,345 state appropriations, $10,000 product sales, and $34,325 industry contributions in 1995; $39,033 non-federal support in 1996; $174,486 non-federal support in 1997; and $200,307 state appropriations and $13,000 industry contributions in 1998.

Question. Where is this work being carried out?

Answer. The research is in progress at the Texas A&M University, Texas Agricultural Experiment Station at San Angelo, the University of Wyoming at Laramie, and Montana State University at Bozeman.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives to improve the efficiency and profitability of wool, mohair, and cashmere production and marketing are still valid. Specific objectives for individual laboratories and experiments are continually revised to reflect the changing research priorities for the wool, mohair, and cashmere industries and to satisfy consumer demands for products from these fibers. It is anticipated that five years will be required to complete the current research.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An external review of the overall wool research program was conducted in 1998 in Las Cruces, New Mexico by a team consisting of industry experts and peers from the scientific community. The review team concluded that the program was very productive and beneficial to the United States wool, mohair, and cashmere producers as well as the allied fiber industries. Research achievements, noted by the review team, included program input for testing methods and standards used to buy and sell wool for international trade. This has been very important in advancing issues important to domestic producers and maintaining competitiveness in the world market. World-wide acceptance of standards for the objective measurement of natural animal fibers due, in part, to the program has set the stage for the electronic marketing of wool and other fibers to aid the United States fiber industries in remaining competitive in the world market. Viable sheep and goat industries will

support jobs for people in rural areas, supply alternative foods for public consumption, use natural means of brush control to abate fire on rangeland and inhabited areas, and provide alternative uses of land unsuitable for cultivation and cattle grazing.

In addition to the program review, grant proposals are annually reviewed and the research facilities are periodically visited. The most recent visit and program assessment was in 1994 whereby it was determined that the stated objectives were being addressed and that they were consistent with industry needs. The principal investigators meet annually to evaluate progress and re-evaluate research priorities according to industry needs. Because the research encompassed in this grant is a component of a regional research project, accomplishments are reported annually to scientific peers and representatives from the sheep, goat, wool, mohair, and cashmere industries. In addition, the overall regional research project is peer reviewed every third year.

AGRICULTURAL DEVELOPMENT IN THE AMERICAN PACIFIC

Question. Please provide a description of the research that has been funded under the Agricultural Development in the American Pacific program.

Answer. The Agricultural Development in the American Pacific project called ADAP is a primary means for Land Grant research, extension, and instruction programs of the five participating institutions of American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and University of Hawaii, to collaborate and cooperate to enhance their impact on Pacific tropical agriculture and communities. ADAP is a mechanism to address common regional client-based issues while maintaining cultural, rural, economic, and environmental integrity. This special research grant is awarded noncompetitively to a program planned and approved by the five involved land grant institutions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The principal researcher believes the five participating institutions are geographically dispersed yet facing many similar issues which can best be served through extensive networking and communication. ADAP facilitates communications and seeks to raise levels of academic achievement and improve the quality of education. ADAP's most unique feature is that twice each year it brings together the five Deans/Directors to discuss agriculture and human resources issues facing isolated, tropical ecosystems in the Pacific, and to plan and implement activities to address those issues. Priorities are categorized in three areas: sustainable systems, collaborations/partnerships, and communication systems. Activities range from joint and collaborative efforts to overcome taro leaf blight in the Pacific, to seeking recognition of Pacific tropical agriculture by the National Association of State Universities and Land-Grant Colleges.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. ADAP's goals are to develop human resources within the institutions, to more effectively manage agricultural programs within and among the institutions, and to focus available resources on critical agricultural issues of the Pacific. Ongoing projects include animal health surveys, livestock waste management, dietary guidelines for Pacific foods, youth-at-risk assessment, artificial insemination demonstration/education, and market information collaboration with "state" Departments of Agriculture. ADAP is now working jointly with the 22-nation Secretariat of the Pacific in developing a paraveterinary program. This program will use distance learning and site visits to train students from the cooperating nations and territories in animal health. This is a critical need for the Pacific region. Both ADAP and the Secretariat of the Pacific will contribute money as well as skilled personnel to assist in this project. In another regional cooperative effort, ADAP is planning a retreat for strategic planning among the "state" and national Departments of Agriculture in the Pacific region, to be held in July 1999.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 1999?

Answer. This work was funded for seven years with an annual appropriation of $650,000 to the former Extension Service. In fiscal year 1994, an appropriation of $608,000 was made to CSREES to continue the ADAP program. The fiscal years 1996 through 1999 appropriations were $564,000 each year. The appropriation total to CSREES is $2,864,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funds are not provided. Unspecified in-kind support, such as facilities, equipment, and administrative support, are provided by each institution and, in some specific projects, by non-ADAP collaborating institutions.

Question. Where is this work being carried out?

Answer. This work is being carried out by American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and the University of Hawaii.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The ADAP program has been achieving original program objectives, particularly in the areas of improvement in institutional capacity and communications. It is anticipated that an additional 5 to 10 years will be needed to fully achieve collaborative integration of the American Pacific land grant programs.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A formal review of the ADAP program was conducted July 1–10, 1997, and included visits by review team members to American Samoa Community College, College of Micronesia, Northern Marianas College, University of Guam, and University of Hawaii. ADAP incorporated review recommendations in preparing and adopting a new five-year 1997 strategic plan. An agency specialist conducts a merit review of the proposals submitted in support of the appropriation annually. In a review of the proposal on April 23, 1998, progress was judged satisfactory.

AGRICULTURAL WASTE UTILIZATION, WEST VIRGINIA

Question. Please provide a description of the research that has been funded under the Agricultural Waste Management, West Virginia grant.

Answer. The West Virginia Department of Agriculture is conducting a project to validate the applicability and effectiveness of anaerobic filtration for treating municipal and agricultural wastes. POWER anaerobic filtration is a leading-edge technology specifically developed to biologically recover nutrients and energy from organic waste streams and produce an effluent which meets discharge permit requirements.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The current need for this technology is local, national, and international. The beneficiaries of this technology will be both the people and the environment anywhere in the world where problems of food, fertilizer, and energy shortages are currently in conflict with the preservation of environmental quality. The direct benefits include enhanced and expanded waste water treatment capacity, creation of new jobs, and revenue from by-products and water quality improvement.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal will go beyond the testing of waste materials in the digester and proceed with a program to compare the microbiological loading of rivers, where known environmental pollution is measurable, and where the total bacterial concentration in the rivers could be determined in real-time with a bioprobe. Specific microbial analysis may be able to correlate with farming activities.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for fiscal year 1998 was $360,000 and for fiscal year 1999 is $250,000. A total of $610,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-Federal funds are not being expended.

Question. Where is this work being carried out?

Answer. Research will be conducted at Moorefield, West Virginia

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives is approximately two years. These objectives are within the original schedule.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The evaluation of the project was conducted at the end of January 1999 when the 1998 summary report was submitted.

ANIMAL WASTE MANAGEMENT, OKLAHOMA

Question. Please provide a description of the research that has been funded under the Animal Waste Management, Oklahoma grant.

Answer. This research project is designed to develop sustainable, environmentally-safe, and ecologically-sound best management principles and practices for beneficial animal waste applications for "High Plains Agriculture" in support of rural economic development through a Federal-state-local partnership. Emphasis will be placed on the rapidly expanding hog industry in the semiarid region, but information gained will also be applicable to the beef and dairy industries.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The Oklahoma Panhandle is the most productive agricultural region in the state with agricultural receipts in excess of $800,000,000. Nationally, Texas County in the Oklahoma Panhandle ranks number one in the state and in the top 15 of all counties in the United States relative to cash receipts. The rapid expansion of the hog industry in this semiarid region will only strengthen that position. The rapidly expanding swine industry was projected to add $650,000,000 in pork and value added products in Oklahoma in 1997 with the slaughter and processing of over 4,000,000 hogs per year. Information gained from this study will provide the data base to develop best management practices to maximize beneficial nutrient use and minimize nuisance odor in semiarid and rangeland production systems. Practices developed will have significant implications regionally, nationally, and internationally. The semiarid agro-ecosystem is unique with climatic conditions consisting of low rainfall that promotes both dryland and irrigated agricultural practices; extremes in high and low temperatures; and soils characterized with alkaline pH, low in organic matter and high in calcium carbonate. This unique agro-ecosystem makes information gained from more humid environments inapplicable.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. Field work has been initiated and initial work shows a positive response to animal waste applications. Initial studies of ammonia loss from applications indicate there can be significant losses following land applications. The original goal of this research is to develop best management practices that will protect ground water supplies from pollution of nutrients, salts, and pathogens; maintain air quality; and minimize odors derived from the entire hog-house, lagoon, land-application, and or rangeland production system, thus maintaining the quality of life in the rural sector.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998 and the appropriation for the fiscal years 1998 and 1999 is $250,000 per year. A total of $500,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The research is matched by $554,000 non-federal funding. Other sources include state and industry.

Question. Where is this work being carried out?

Answer. This work has been initiated at The Oklahoma Panhandle Research and Extension Center located in Goodwell, Oklahoma. Further work will continue to be done at this site. The Center will provide the land area and a portion of the facilities and equipment necessary to conduct the major portion of the study. Other study sites will be developed on private land in cooperation with hog operations in the panhandle region.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was February 29, 2000. To document the results for these objectives more than one growing season will be needed. Completion of these objectives and additional objectives related to these will be February 28, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This project was evaluated at the end of January 1999 when the summary report of the 1998 accomplishments was submitted. Results showed that a significant amount of ammonia will be volatilized almost immediately when the swine effluent is surface applied to crop land. Field plots have been established in order to receive various rates and methods of swine effluent applications. Plans have been

made for a regional meeting titled, High Plains Animal Water Management Conference.

CENTER FOR AGRICULTURE AND RURAL DEVELOPMENT

Question. Please provide a description of the research that has been done under the Center for Agriculture and Rural Development program.

Answer. The research provides current economic information on international trade in agriculture and analyses of the implications of trade policy alternatives on the agricultural sector of the United States and other countries.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. According to the proposal, trade negotiations and agreements are of national concern to policymakers, farmers, and agribusiness industries because of the implications for maintaining or opening markets and establishing improved terms of trade and prices. Typical agreements are extremely complex, requiring analysis by specialists to determine outcomes and to provide objective and accurate information to those impacted by such agreements. The specific research done under this project directly addresses national needs but has national, regional, and local implications.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The goal is to assess and evaluate various proposals affecting agricultural trade, to provide analytical support to the Office of the U.S. Trade Representative, and to provide information to farmers and agribusiness firms on the competitive implications of trade agreements. Theoretical studies and empirical and descriptive analyses of policy issues and technical problems pertaining to the Uruguay round of negotiations were completed and provided to negotiators and the agribusiness community. Knowledge developed in this phase is now being used to monitor the effects of the Uruguay Round Agricultural Agreement—URAA.

This grant supports six projects focusing on URAA and the World Trade Organization—WTO—monitoring and implementation problems; implications of the URAA and WTO for Eastern Europe, Baltic, and the Newly Independent States; development of a model to assess the North American Free Trade Agreement and its linkages with the General Agreement on Tariffs and Trade; trade implications of U.S. food and development aid in developing countries; integration of China into world agricultural markets; and special projects as requested for the U.S. Trade Representative's office. Major emphasis is placed on developing and improving international livestock and grain sector models.

This grant supports six projects focusing on the General Agreement on Tariffs and Trade monitoring and implementation problems; implications of the General Agreement on Tariffs and Trade for Eastern Europe, Baltic, and the Newly Independent States; development of a model to assess the North American Free Trade Agreement and its linkages with the General Agreement on Tariffs and Trade; trade implications of U.S. food and development aid in developing countries; integration of China into world agricultural markets; and special projects as requested for the U.S. Trade Representative's office.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 1999?

Answer. This research program was initiated in fiscal year 1989. Grants have been awarded from funds appropriated as follows: fiscal year 1989, $750,000; fiscal years 1990 and 1991, $74l,000 per year; fiscal years 1992–1993, $750,000 per year; fiscal year 1994, $705,000; fiscal year 1995, $612,000; fiscal year 1996, $655,000; and fiscal years 1997 through 1999 $355,000. A total of $6,769,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $111,210 State appropriations and $175,616 miscellaneous for a total of $286,826 in 1991; $113,779 State appropriations and $173,117 miscellaneous for a total of $286,896 in 1992; $120,138 State appropriations and $164,707 miscellaneous for a total of $284,845 in 1993; $161,673 State appropriations and $32,000 miscellaneous for a total of $193,673 in 1994; $161,000 State and $30,000 miscellaneous for a total of $191,000 in 1995; $70,000 State appropriations and $44,000 miscellaneous for a total of $114,000 in 1996; $60,325 in State appropriations and $61,500 in miscellaneous funds for a total of $121,825 in 1997; and $72,000 in State appropriations and $75,000 in miscellaneous funds for a total of $147,000 in 1998.

Question. Where is the work being carried out?

Answer. The research program is carried out by the Center for Agriculture and Rural Development at Iowa State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives of the project envisioned the development of models capable of providing guidance to policymakers, researchers, and farmers and others of the impact of agricultural trade proposals on the U.S. agricultural sector. As such the objectives are on-going.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. We have conducted no formal evaluations; however, each annual proposal is peer reviewed for relevance and scientific merit. Also, an informal evaluation of this project takes place as a part of each annual project review and approval process.

CENTER FOR NORTH AMERICAN STUDIES, TEXAS

Question. Please provide a description of the research that has been done under the Center for North American Studies program.

Answer. The purpose of this grant is to develop linkages with educational and other institutions in Mexico and Canada in order to share data and faculty, conduct research identifying trade opportunities and marketing problems, conduct policy analysis, and develop a broad range of training programs preparing agricultural/agribusiness firms for international marketing opportunities. The research proposal received a merit review at the university prior to submission to CSREES.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The program director believes that citizens of the United States, Mexico, and Canada have some similar concerns about the impact of the North American Free Trade Agreement—NAFTA—and that new, innovative approaches involving international cooperation are needed to assess and evaluate these issues. Research and training are needed to provide information to evaluate alternatives for expanding U.S. exports and to resolve potential social, economic, and environmental conflicts.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The goal is to promote strong agricultural ties among the three North American countries, foster greater cooperation in resolving critical agricultural issues of common interest, and ensure the continued competitiveness of U.S. agriculture. Institutional linkages with Mexican and Canadian universities continued to be developed and joint research and educational programs conducted. An international agribusiness information system, AGRINET, was created on the Internet and is accessible by firms from all three countries. A compilation of 6,600 articles on agricultural issues is available electronically throughout the region. An international video conference enabled U.S. faculty to make presentations at a Mexican trade conference. Research focused on potential markets in Mexico for U.S. products, such as rice, dairy, livestock, meat, feed, fresh fruits, and vegetables. A new model is being developed to analyze the impact of international trade agreements on farm and trade policy of NAFTA countries. Training programs included several seminars and conferences to increase the international capacity of U.S. firms; over 2,800 people attended in 1997. New international agribusiness courses were offered at several Texas institutions. Some of these educational programs were developed with faculty from Mexican and Canadian institutions and used with audiences in those countries.

Question. How long has this work been underway, and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Work supported by this grant began with an appropriation of $94,000 in fiscal year 1994; $81,000 in fiscal year 1995; and $87,000 per year for fiscal years 1996 through 1999. A total of $523,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant are as follows: $39,000 State appropriations in fiscal year 1994; $54,000 in 1995; $60,000 in 1996 and 1997; and $84,500 in 1998.

Question. Where is the work being carried out?

Answer. The program is being carried out at Texas A&M University through the Texas Agricultural Experiment Station in collaboration with other segments of the Texas A&M University System and Louisiana State University Agricultural Center.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1994 was for a period of 12 months. The current phase of the program will be completed in the year 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. CSREES performed a merit review of the project in February 1998, as it evaluated the 1998 project proposal, and concluded that the project has sound objectives and procedures for helping U.S. firms to be successful in North American markets for agricultural products, thereby achieving CSREES goals of a highly competitive agricultural production system and enhanced economic opportunity for Americans. The principal investigator is well recognized for his leadership in the area of international trade.

DATA INFORMATION SYSTEM

Question. Please provide a description of system development activities that have been funded.

Answer. Cooperative State Research, Education, and Extension Service—CSREES—continues to fund activities under contract with a major information technology firm for the design and development of the Research, Education, and Economics Information System—REEIS. Previously-funded tasks that have been completed include the conduct of an inventory of databases targeted for inclusion in REEIS, the conduct of a comprehensive needs assessment focusing on information needs and practices within the Research, Education, and Economics mission agencies and State partner institutions, the design and development of a Web accessible catalog of databases identified in the inventory, and specifications for a retrieval language—a controlled vocabulary—for assisting users in accessing and searching REEIS databases. An additional task was completed under a separate contract that provided for an outside expert to conduct a review and evaluation of Web interfaces to the REEIS Database Catalog. A cooperative agreement with the University of Arkansas was also established to provide national leadership in coordinating the efforts of a National Steering Committee charged with guiding the development of the system. The Committee has met on three previous occasions, and a fourth meeting is planned in June, 1999. Currently underway, and critical to the development of REEIS, is a comprehensive review of state-of-the-art information technology systems that are available for use in developing the system. This will provide information needed by REEIS decision makers, systems staff, and other stakeholders to review the available information systems and technology options, and it will identify a representative set of tools and technologies that will serve as the basis for conducting benchmark studies and development of system prototypes. Funding is also provided under the REEIS initiative for enhancement of the Cooperative Extension System Plan of Work and Reporting System which has been targeted for ultimate inclusion in REEIS.

Question. What is the national, regional or local need for this activity?

Answer. At present, USDA's Research, Education, and Economics—REE—mission agencies and their university partners lack a central, integrated, user-friendly electronic information system capable of providing access to thousands of programs and projects for which they are responsible that focus on food, agriculture, natural resources, and rural development. Such an information system is increasingly needed to enable the Department and its partners to readily conduct baseline and ongoing assessments and evaluations of research, education, extension, and economic programs and projects. In recent years, this need has become more urgent for several reasons. First, the United States needs a visionary publicly-funded research and development program to produce essential knowledge and innovations for meeting growing competition in a global market—which is largely attributable to the expanding research and development efforts of foreign nations. Second, a comprehensive information system is needed to serve as a primary reference source for development of new research and education projects on such diverse issues as increasing productivity in agriculture and processing, improving the safety and quality of food, and enhancing the sustainability of the environment and rural communities. Third, Federal/State policy makers and administrators are requiring empirical analyses to account for historical, current, and future use of public funds to provide a basis for redirecting funds to higher priority issues. Fourth, the Government Performance

and Results Act—GPRA—has imposed reporting demands which current databases and decentralized information systems are not prepared to adequately satisfy. It is also envisioned that REEIS will play a key role in implementation of the Agricultural Research, Extension, and Education Reform Act—AREERA—of 1998. In this regard, REEIS would be well positioned to: Provide linkages for decision making among REE agencies, enable consistent reporting on identical or similar issues, provide the public with understanding of the role and mission of REE agencies,Expand REE's outreach to a broader base of constituencies, Provide a better vehicle to facilitate interaction among REE agencies and their university partners, Link commonalities of research, extension, and teaching projects and programs through a single interface, and foster global interactions.

Additionally, REEIS would serve to expand the Federal partnership by facilitating coalition-building with other Federal agencies.

Question. What was the original goal of this initiative and what has been accomplished to date?

Answer. The original goal of this initiative was to develop an information system that provides real-time tracking of research, extension, and education projects and programs; has the capability to communicate vertically between field, State, and Federal locations; enables the REE agencies and their partners to conduct rapid and comprehensive policy assessments and program evaluation analysis; facilitates assessment of technologies and practices employed in extension, education, economics, and research activities at the field and/or regional levels; provides clear and transparent public access to relevant parts of the information; and provides information management tools to enhance the timeliness and accuracy of REE-wide responses to inquiries about program objectives and expenditures.

Over the last year-and-a-half, substantial system planning and development work has been completed. Work accomplished under five multi-task contracts awarded during this period was instrumental in meeting major milestones considered to be critical components and a prerequisite to the design, development, and implementation of REEIS. Major tasks included the conduct of a comprehensive strategic information audit of information practices and needs within the REE agencies and partner institutions; the identification and inventory of major research, extension, education, and economics/statistics databases maintained or supported by the REE mission agencies; the design, development, and preparation of the REEIS Database Catalog Prototype that affords Web access to the inventory of 38 databases initially identified as candidates for inclusion in REEIS; and the design and evaluation of the Web interface to the REEIS Database Catalog.

The Needs Assessment, the main component of the strategic information audit, was recently completed. The purpose of the study was to identify system requirements as a prerequisite to development of detailed system specifications for a functional and physical design for REEIS. Over 130 system requirements are identified in the study which was undertaken with broad participation by REE agency personnel, State partners, and key stakeholders. A review and prioritization of the set of requirements by REE agency national program leaders, commodity specialists, and senior managers is currently underway.

In further response to Congressional legislation, a comprehensive review is underway to identify state-of-the-art information systems that are available for use in developing REEIS. The first report resulting from the review provides a set of criteria for product selection and evaluation and an initial data warehousing product suite list. The final set of system products and tools will be included in an updated and maintained Information Systems Technology database for subsequent use in REEIS system development activity.

Plans in fiscal year 1999 include the development of functional and physical specifications for REEIS, technical assessments of candidate databases for inclusion in REEIS, development and assessment of alternative system architectures, development and testing of a REEIS prototype, and updating and maintenance of the Information Systems Technology database and the REEIS Database Catalog. Implementation of the REEIS system, including training of REEIS users and technical system operators, is targeted for fiscal year 2000. The President's fiscal year 2000 budget requests $2,000,000 to support these efforts.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Congress first appropriated $400,000 REEIS in fiscal year 1997 to begin planning its design and development. An additional $800,000 was appropriated in fiscal year 1998 and $1,000,000 was appropriated in fiscal year 1999 for a total of $2,200,000 in fiscal year 1997 the REEIS National Steering Committee was established to provide advice and guidance throughout the development and implementation process. Since its inception, the Committee has met three times, first recom-

mending a plan of action and work specifications for conducting a strategic information audit and comprehensive needs assessment, and at its second and third meetings to review and evaluate contract deliverables, develop recommendations, and participate in assessing progress and plans for REEIS. The Committee will meet again this year in Washington, D.C. in June. Also in fiscal year 1997, a private information technology firm was engaged to conduct Phase I of a two-phase strategic information audit. Phase I resulted in a project management plan and specifications for the needs assessment, a REEIS database catalog, and controlled vocabulary.

In fiscal year 1998 Phase II was launched with full-scale implementation of the needs assessment. Phase II has resulted in a comprehensive list of more than 130 system requirements and a detailed analysis of information needs and practices of potential REEIS users. Findings of the study are based on responses from administrators, budget, and GPRA staff, senior managers, and program leaders within REE as well as administrators, policy officials, and faculty from State partner institutions, and other stakeholders. Results of the needs assessment were formally presented in February, 1999 in Washington, D.C. Also funded in fiscal year 1998 was work to enhance the REEIS database catalog; advisory services for conducting an outside review of Web interfaces to the REEIS database catalog prototype; and cooperative agreements for constructing a Web site for Human Sciences Research and enhancement of the Cooperative Extension System Plan of Work and Reporting System. Funds were also provided in fiscal year 1998 for conducting a comprehensive review of state-of-the-art information technology systems. The first deliverable from this contract is a list of evaluation criteria for software systems and system product selection and an initial data warehousing product suite list. A final report from this effort will provide information needed by REEIS decision makers, system staff, and other stakeholders to review information systems and technology options that are available for use in developing the REEIS system. Additionally, the identification of a representative set of tools and technologies resulting from this effort will serve as the basis for conducting benchmark studies and prototypes in subsequent REEIS design and development activities.

Projects to be funded in fiscal year 1999 include development of functional and physical specifications for REEIS, detailed technical assessments of candidate databases for inclusion in REEIS, assessments of alternative system architectures, development and testing of a REEIS prototype, and updating and maintenance of the Information Systems Technology database and the REEIS Database Catalog and its Web interface.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Non-federal funding does not apply at this time.

Question. Where is this work being carried out?

Answer. Leadership responsibility for REEIS resides within the CSREES Science and Education Resources Development division in Washington, DC. This provides for effective linkage within the REEIS platform of the Current Research Information System, the Food and Agricultural Education Information System, and appropriate extension databases. CSREES is working closely with all REE mission agencies and with the university system via a cooperative agreement with the University of Arkansas. We hope also to use the Intergovernmental Personnel Act to secure an IPA from another university to carry out REEIS essential management responsibilities. One staff person is assigned full time to manage and coordinate agency contracting activities and serves as the REEIS technical information program manager.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It is anticipated that REEIS will become operational during the year 2000. The fiscal year 1997 appropriation of $400,000 covered start-up costs such as establishment of a National Steering Committee, preparation and specifications for contracting with an outside firm, contractor selection, project planning, and pre-design analyses conducted under contract with a major private sector information technology firm. Contract work completed included preparation of an inventory and prototype catalog of REE mission agency databases, a World Wide Web user interface to the catalog, specifications for a comprehensive needs assessment, and specifications for a controlled vocabulary for assisting user access to REEIS databases.

The fiscal year 1998 appropriation of $800,000 allowed for the conduct of a comprehensive needs assessment within the REE mission agencies and partner institutions; implementation, testing, refining, and maintaining the catalog prototype and its Web interface; funding of cooperative agreements for enhancing the Cooperative Extension System Plan of Work and Reporting System and developing a Human Sciences Research Web site; and contract work, currently underway for conducting

a review of information technology systems for use in developing the REEIS system. A portion of fiscal year 1998 funds is also targeted for creation of a data dictionary of core REEIS databases and the development of detailed specifications for a system design.

The fiscal year 1999 appropriation of $1,000,000 will allow for the preparation of a REEIS system foundation and REEIS prototype. This includes the preparation of detailed technical descriptions of core REEIS databases; expansion, updating and maintenance of the data dictionary; preparation of REEIS architectural alternatives; completion of functional and physical system specifications for a system design; and development of prototypes.

The requested increase for fiscal year 2000 is required to achieve broad implementation. REEIS will undertake system design, conduct benchmark tests of alternative architectures, continue development and testing of the REEIS prototype, and launch the operating system. Included is the need to conduct ongoing, iterative needs assessments within the agency and with its partners to align information system products and services with strategic information requirements necessary for meeting agency mission and goals and satisfying GPRA reporting requirements. Updating and maintenance of technical system assessments, conducting ongoing information technology evaluations, and enhancements of REEIS user interfaces will be needed to ensure currency and responsiveness over the life of the system. This entails the enlistment, training, and retention of essential personnel and staff and the purchase of computer hardware and software and related computer programming and technical services. Additionally, several current databases must be enhanced to distinguish the basis of investment—county, State, or Federal funds—to provide information on planned expenditures, and to link investments to accomplishments and impact. Initial implementation is expected to be completed by the end of the year 2000.

The strategic information audit, with participation of the REE mission agencies and university partners, has been completed and has resulted in a comprehensive list of system requirements that will serve as input to the development of detailed system specifications for REEIS. Currently underway is a comprehensive review of information technology systems which will identify a representative set of tools and technologies for REEIS development and serve as the basis for conducting benchmark studies and developing prototypes.

The Research, Education, and Economics Information System meets a high priority national need for an operational, up-to-date and continually responsive national information system. REEIS is being designed to meet the data information needs of all REE agencies and their university and private sector cooperators. It will link data systems on research, education, extension, and economics. To achieve effective response for it users, annual maintenance costs will be ongoing.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Progress and accomplishments from the REEIS initiative have undergone and continue to undergo review and evaluation by the REE mission agencies, the REEIS National Steering Committee, our State partner institutions, and outside sources. The most recent evaluation of this project was conducted at the September, 1998, meeting of the REEIS National Steering Committee, comprised of representatives of the REE mission agencies, university partners, and other stakeholders. The evaluation specifically targeted preliminary findings from the REEIS Needs Assessment that were based on responses from a series of focus groups and interview sessions of policy officials, senior managers, and other stakeholders within the USDA/State university land-grant system. In addition, three work groups comprised of members of the Committee were charged with evaluating and critiquing a detailed questionnaire for use in completing the final segment of the needs assessment, serving as participants in an actual focus group session and critiquing its methodology, and reviewing and critiquing the Web version of the REEIS Database Catalog. Both oral and written reports from these work groups were presented and several of the work groups' recommendations are being implemented. Evaluations by REE agency policy officials, budget and GPRA staff, national program leaders, and senior managers of the final set of system requirements resulting from the needs assessment have been scheduled for completion by spring of 1999.

GEOGRAPHIC INFORMATION SYSTEM

Question. Please provide a description of the research that has been funded under the geographic information system program.

Answer. The purpose of this program is to promote collaborative and innovative transfer of systems technologies to state and local governments and others in the public and private sectors. The current program is being carried out by the non-prof-

it National Center for Resource Innovations. The directors and participants of the Center are the sub-contractors who are carrying out the program by working on agro-environmental problems at the national, regional, state, and neighborhood levels. They represent a wide spectrum of site-based expertise including four academic institutions, one regional development authority, one non-profit corporation, and the Southwest Indian Polytechnic Institute site added by Congress in 1997. This institutional arrangement has helped fill a role in linking some of the otherwise disparate efforts of agencies and academic institutions to apply them in the now seven regions of the country.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher believes that local officials are facing increasingly complex land management issues that require rapid access to resource knowledge and databases for decisionmaking. This project is needed to transfer relevant technology to state and local governments, including Native American communities, whose limited training budgets and sometimes-isolated location make it difficult to use the latest technology. The technology developed in the Center program is useful in improving the management of natural resources. While concentrating on issues related to agriculture, the independent, non-profit nature of the National Center for Resource Innovations facilitates linkages across disciplinary and institutional barriers and makes it possible to use analyses at the state and local levels which were initiated at the Federal level. While the early phases of the geographic information system concentrated on building information systems related to rural, physical, and natural resources, the current challenge is to integrate human economic, social, and demographic information in order to better understand the relationship of human communities to the landscape. At the other end of the spatial scale, the role of the public sector in geographic information system-based precision farming technologies, data capture, and information synthesis is the subject of a current study group.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of this work was to serve as a pilot project for the transfer of geographic information systems technology related to natural resources to local governments.

The Center has carried out this function. Economic and biological data are being presented in various formats to state and local governments and individuals. Through its seven regionally distributed sites, including the new Southwest Indian Polytechnic Institute site in New Mexico, the Center has implemented a variety of geographic systems technologies to local governments—both rural and urban. These include the recent expansion of transfer of geographic information technology through various distance education and Internet technologies.

It is anticipated that the fiscal year 1999 grant will support work under this program through March 2000. The proposal for this work in 1999 has been received and reviewed.

Question. How long has this work been under way and how much has been appropriated through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, $494,000; fiscal year 1991, $747,000; fiscal years 1992 and 1993, $1,000,000 per year; fiscal year 1994, $1,011,000; fiscal year 1995, $877,000; fiscal year 1996, $939,000; and fiscal years 1997 through 1999, $844,000 per year. A total of $8,600,000 has been appropriated since the beginning of the program.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. To date, the work in this program for fiscal year 1990 through fiscal year 1997, had $5,009,834 in non-federal support. In fiscal year 1990, non-federal support was $714,940 consisting of equipment, databases, and other miscellaneous contributions from foundations, city, and state governments. In fiscal year 1991, non-federal support was $25,000 from county government. In fiscal year 1992, non-federal support was $366,016 from county government, computer companies, and state governments consisting of equipment, software, facilities, and miscellaneous support. In fiscal year 1993, non-Federal support was $713,900 consisting of financial and miscellaneous support from foundations, county and state governments. In fiscal year 1994, the non-federal support was $713,643. In fiscal year 1995, the non-federal support was $987,000. In fiscal year 1996, it was $567,173. It was $456,582 in fiscal year 1997. In 1998, non-federal dollars exceeded $1,000,000, and it is anticipated that they will again in 1999.

Question. Where is this work being carried out?

Answer. The National Center for Resource Innovation-Chesapeake Bay is located in Rosslyn, Virginia. This group is working under a cooperative agreement with the

U.S. Department of Agriculture's Natural Resources Conservation Service to work with 13 northeastern states. The southeastern center in Valdosta, Georgia, in affiliation with the South Georgia Regional Development Center, has developed a comprehensive plan of the City of Adel as a model for other urban centers in the ten-county region. The southwestern center, in Fayetteville-Arkansas, serves several local governments through its training facilities at the University of Arkansas, basing its technical approach on expertise and past experiences with the Federally-developed system known as GRASS. They have developed pilot projects for some local jurisdictions and state level databases, which they have provided online. Central Washington University focuses on training for state planning and on three local governments and the Yakima Nation in the Yakima watershed. The north central center in Grand Forks, North Dakota, in affiliation with the University of North Dakota, focuses on relating real time weather data to other spatial attributes. The University of Wisconsin-Madison, functioning as the Great Lakes center, continues a long history of involvement in the application of this technology at the local level with strong focus on soils/land-use and the institutional aspects of the integration of a new technology. Native American communities are being reached through the newly-developed Southwestern Indian Polytechnic Institute facilities in Albuquerque, New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives to build institutional frameworks for developing and disseminating geographic and related information to local decisionmakers is constantly evolving. Each site has developed approaches to addressing regional needs for modern technologies, and many innovative applications have been implemented. Technologies, including Internet-based educational and information exchange, have been developed to respond to the Center's customers. The Center has been asked to include these new technologies in order to bring its primarily rural users into new eras of public education and information management.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Proposals have been internally reviewed by Departmental personnel in different agencies. Beginning in 1995, the program has also been externally reviewed by local advisory committees and qualified professionals inside and outside of government. Their various comments and suggestions are sent to the agency for merit reviews.

GULF COAST SHRIMP AQUACULTURE

Question. Please provide a description of the research that has been funded under the Gulf Coast Shrimp Aquaculture grant.

Answer. Research funded under this program has provided much of the required information necessary for a viable U.S. marine shrimp farming industry. Studies have been conducted on biosecurity and environmental protection in shrimp production systems, prevention and detection of diseases via molecular biological techniques, and the development of high health and genetically-improved stocks for seed production. Performance trials on selected stocks in various production systems have been conducted, and seed production systems have reached commercial feasibility. A number of important viral pathogens of marine shrimp have been identified and protocols have been established for the detection of these viral pathogens that have decimated the shrimp industry world-wide. Improved viral detection techniques have led to the development of specific pathogen-free stocks of commercial importance. Researchers have responded rapidly to viral infections that have impacted the U.S. shrimp farming industry. Researchers will intensify efforts aimed at preventing new introductions of exotic viral pathogens.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. The principal researcher indicates that there is potential to enhance domestic production of marine shrimp through aquaculture in order to reduce the approximately $2,000,000,000 annual trade deficit in marine shrimp. Research should result in improving the supply of high quality seed, improved shrimp health management, improved biosecurity and environmental protection, and enhanced production efficiency in shrimp culture systems. The U.S. has the opportunity to become a major exporter of shrimp seed and broodstock and disease control and biosecurity technologies, products, and services.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal was to increase domestic production of marine shrimp through aquaculture. Recent studies have focused on the prevention and detection of diseases, production of specific-pathogen free and specific-pathogen resistant seed and broodstock, biosecure and environmentally-compatible productions systems, and improved feeds and feeding strategies for broodstock maturation and larval production. Researchers have responded to severe disease outbreaks caused by the introduction of exotic viral pathogens into U.S. shrimp farms. Diagnostic and disinfection techniques for a number of important viral pathogens have been developed. In addition, scientists are currently addressing this problem by developing high health genetically-improved stocks and evaluating these animals under commercial production conditions. Biosecurity protocols and biosecure system technologies have been developed to prevent additional introductions of viral disease agents and escape of non-native species of shrimp.

Question. How long has this work been underway and how much has been appropriated by fiscal year, through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1985, $1,050,000; fiscal year 1986, $1,236,000; fiscal year 1987, $2,026,000; fiscal year 1988, $2,236,000; fiscal year 1989, $2,736,000; fiscal year 1990, $3,195,000; fiscal year 1991, $3,365,000; fiscal years 1992–1993, $3,500,000 per year; fiscal year 1994, $3,290,000; fiscal year 1995, $2,852,000; fiscal year 1996, $3,054,000; and fiscal years 1997 through 1999, $3,354,000. A total of $42,102,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The U.S. Marine Shrimp Farming Consortium—USMSFC—estimates that non-federal funding for this program approaches 50 percent of the Federal funding for fiscal years 1991–1997 and $1,240,297 in fiscal year 1998. The source of non-federal funding is primarily from state and miscellaneous sources.

Question. Where is this work being carried out?

Answer. The work is being carried out through grants awarded to the Oceanic Institute, Hawaii, and the Gulf Coast Research Laboratory in Mississippi. In addition, research is conducted through subcontracts at the University of Southern Mississippi, Tufts University, the Waddell Mariculture Center in South Carolina, the Texas Agricultural Experiment Station, and the University of Arizona.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original specific research objectives was 1987. The original specific objectives have been met, however broader research goals have not been met. Researchers anticipate that the specific research outlined in the current proposal will be completed in fiscal year 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. This program is reviewed annually by CSREES Program Managers. Participating institutions are required to submit a detailed accomplishment report with the submission of each new grant proposal. In addition, the agency conducts an in-depth on site review of the program every four years. The 1999 review of the program found that the progress during the last twelve months has been well documented and the proposal is well written. Research objectives are being met and the proposed research is consistent with the National Science and Technology Council's Strategic Plan for Aquaculture Research and Development. Facilities and expertise are very good and the close linkages between the researchers involved and the U.S. shrimp farming industry has greatly enhanced the commercialization of the research findings from this project. The USMSFC continues to address important research needs of the industry and has played a critical role in developing management strategies for protecting both wild and cultured stocks from the introduction of viral pathogens.

MARICULTURE, NORTH CAROLINA

Question. Please provide a description of the research that has been funded under the Mariculture, North Carolina grant.

Answer. The proposal represents a new research and development initiative in marine finfish species for commercial aquaculture in the U.S. The long-term goal of the project is to develop methods for mass propagation of marine finfish for commercial cultivation and possible stock enhancement. Specific objectives include: development of captive sexually-mature snapper broodstock; control of maturation and reproduction; standardize methods for induced and natural spawning of conditioned

fish; and establish environmental conditions for rearing of larvae. The proposal is put through the university's peer review process and is reviewed by the CSREES Program Manager.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. The researchers indicate that there is a regional and national need to develop aquacultural production systems for a variety of marine finfish. The researchers also indicate that the proposed research is consistent with the National Science and Technology Council's—NSTC—Strategic Plan for Aquaculture Research and Development.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The goal of this research program is to develop sustainable aquaculture production systems for marine finfish. The researchers are developing culture technologies and evaluating marine finfish species that have potential for commercial aquaculture production. Captive snapper were successfully matured and spawned and larvae reared through juvenile stages. Juveniles were supplied to commercial and governmental organizations for grow-out trials. Initial results appear promising with good survival rates and excellent feed conversion ratios.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998. The appropriation for fiscal year 1998 was $150,000, and for fiscal year 1999 is $250,000. A total of $400,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The university estimates a minimum of $115,000 of non-federal funding in fiscal year 1998 primarily from state and private sources.

Question. Where is this work being carried out?

Answer. The research will be conducted at the Center for Marine Science Research at the University of North Carolina at Wilmington.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is fiscal year 1999. The project was initiated in fiscal year 1998.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the progress of this project on an annual basis. The university is required to submit an accomplishment report each year when the new proposal is submitted to CSREES for funding. The researchers have been asked to develop a research proposal consistent with the NSTC's Strategic Plans for Aquaculture Research and Development. The proposal is well-written and the objectives are clearly stated. The methodology and experimental design are generally sound. The research is relevant and addresses a potential opportunity for the aquaculture industry. The feasibility of attaining the objectives of the proposed research is good. The researcher is well qualified and has the appropriate background to conduct the research. Facilities are adequate and would be enhanced through this grant.

MISSISSIPPI VALLEY STATE UNIVERSITY

Question. Please provide a description of the project that has been funded under the Curriculum Development and Strengthening-Mississippi Valley State University grant.

Answer. Academic programs have been broadened to include more agriculture-related courses consistent with the needs of students from the Mississippi Delta. Funds were used for curriculum development and to generally strengthen academic programs, including accreditation and reaccreditation efforts. Of the ten programs eligible for accreditation, nine have been accredited. Courses continue to be modified to reflect the needs of graduates as well as employers in the Mississippi Delta, with particular emphasis on those areas that employers have the greatest need. The funds continue to provide enhancements related to other program and administrative responsibilities support areas that positively impact program delivery and administration at Mississippi Valley State University. Curriculum additions have had a positive impact on student enrollment. The project has been merit reviewed.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this proposal?

Answer. The primary need for this project is to satisfy a state and local need. The need is for strengthening university capacity and curriculum development at Mississippi Valley State University. Emphasis has been on degree programs that produce graduates with potential for improving the quality of life in rural areas. The Criminal Justice program has been developed and administered in a departmental unit with social work to provide for improved administration and academic counseling. A master's degree program in Criminal Justice is now offered. The baccalaureate major in Elementary education has been reinstated.

Question. What was the original goal of this project and what has been accomplished to date?

Answer. The original goal was to provide funding to strengthen the academic programs of the university. The academic programs have been strengthened as evidenced by student recruitment, which has improved to show a positive ratio between applications received and students admitted. Approximately one half of the applicants are enrolled. Increased quality of instruction and programs have benefitted students. This is reflected in the higher graduation rate, increased student enrollment, enriched faculty, and improved community relationship.

Question. How long has this work been underway and how much has been appropriated, by fiscal year, through fiscal year 1999?

Answer. This program was initiated in fiscal year 1987. Grants have been awarded from funds appropriated as follows: fiscal year 1987, $750,000; fiscal years 1988 and 1989, $625,000 per year; fiscal year 1990, $617,000; fiscal year 1991, $642,000; fiscal years 1992 and 1993, $668,000 per year; fiscal year 1994, $593,000; fiscal year 1995, $544,000; fiscal years 1996–1999, $583,000 per year. A total of $8,064,000 was appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Mississippi Valley State University provided reports to document State and private funding during the period of this grant. The State figures provided here are for enhancement funds gained above the University's standard formula generated funds. The sources and amounts are as listed:

SOURCE

Fiscal year	State	Private	Total
1987	.....	$168,640	$168,640
1988	.....	186,036	186,036
1989	$68,658	190,258	258,916
1990	207,879	369,358	577,237
1991	333,263	337,700	670,963
1992	349,427	470,220	819,647
1993	35,750	358,680	394,430
1994	590,890	568,970	1,159,860
1995	841,654	530,300	1,371,954
1996	1,197,917	590,824	1,788,741
1997	309,717	755,629	1,065,346
1998	313,738	538,423	852,161

Question. Where is this work being carried out?

Answer. The program has been carried out on the campus at Itta Bena and at off-campus sites in Anguilla and Greenville and the Greenwood Center since the Spring Semester of 1996.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objectives completion date was June 1992, and the primary objective of erasing the financial deficit was accomplished at that time. The university has been operating on a sound financial basis as of July 1993. Curriculum and strengthening objectives are progressing very well. The objective of the current grant will be completed by September 30, 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The program has been evaluated on an annual basis by the agency. The annual progress report for fiscal year 1998 revealed progress in the academic programs. For example, the Social Work Department had significant positive changes

in the quantity and quality of the faculty. The Business Department offered a component dealing with Agricultural land lease in the business law classes, and the other classes had topics on input and output analysis, agricultural stimulations, and initial farm planning. The major objectives of this project have been met. The funds are now used to maintain the level attained since receiving these funds. The fiscal year 1999 proposal will be peer reviewed. The last on-site visit was conducted on April 21–23, 1993. Mississippi Valley State University has responded positively to recommendations of the on-site review team. The university has implemented a time and effort reporting system. Funds are requested on a reimbursable basis and are deposited in interest bearing accounts. The payment method for receiving USDA funds was changed to the electronic transfer system. Property acquired through Federal Grants are identified as such in the university property records, and the Drug-Free Workplace Policy had been implemented.

NATIONAL ALTERNATIVE FUELS LABORATORY

Question. Please provide a description of the research that has been funded under the National Alternative Fuels Laboratory—NAFL—grant.

Answer. Through a nationally-marketed collaboration program in which the NAFL matches about half of its USDA funding with non-federal money to work on industry-relevant projects, NAFL researchers have (1) resolved ethanol-in-gasoline performance and environmental issues to accelerate the use of ethanol, (2) developed a lead-free ethanol-and biodiesel-containing alternative to leaded aviation gasoline, (3) initiated new biomass fuel technologies including an agricultural co-products-to-ethanol process and an ethanol extraction process for removing contamination from fungus-infected wheat and barley, (4) initiated a program to increase E85—85 percent ethanol–15 percent gasoline—fuel economy and evaluate automobile exhaust emissions, (5) initiated and coordinated the 27-member Red River Valley Clean Cities—RRVCC—Coalition to increase the number of alternative fuel vehicles in regional public and private fleets, and (6) built E85 refueling sites in North Dakota.

Question. According to the research proposal or the principal researcher, what is the national, regional, or local need for this research.

Answer. Our Nation needs to develop commercially-viable alternatives to fossil fuels to ensure energy security, improve air quality, and provide employment. It is crucial to national security and economic development that these new fuels are accurately represented in the marketplace and given an opportunity to compete fairly with traditional fossil fuels. The NAFL provides unbiased scientific data on fuel performance and environmental effects. Regional need for the research derives from the need to support regional agriculture and associated industries through (1) development of economic uses for agricultural co-products and (2) development of economic uses for mycotoxin-contaminated grains.

Question. What was the original goal of this research, and what has been accomplished to date?

Answer. The primary original goal was to develop a database of at-the-pump-sampled conventional, reformulated, and alternative transportation fuels sold in the upper Midwest and throughout the U.S. to enable comparison of current and historical fuels on the basis of chemical and physical properties. The database is being expanded to include how gasoline chemistry affects air quality and fuel performance. Another original goal was to provide information on conversion of crop residues, agriculture processing wastes, high-cellulose content municipal wastes, and other biomass materials to alternative fuels. The NAFL program supported North Dakota's first two public E85 refueling sites, an ongoing industry-supported effort to develop and build a new ethanol plant in the Grand Forks region, and resolved ethanol blend fuel economy and tailpipe emissions issues, and E85 engine cold-start problems.

Question. How long has this work been underway, and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The NAFL work began in fiscal year 1991 and was, in part, sponsored by this grant. USDA appropriations in fiscal year 1991 through fiscal year 1993 were $250,000 per year. Later awards were $235,000 in fiscal year 1994, $204,000 in fiscal year 1995, and $218,000 per year in fiscal years 1996 through 1999. A total of $2,061,000 has been appropriated over 9 years.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. To date, in fiscal year 1998, more than $60,000 in non-federal collaborative funding has been secured from corn grower organizations, a state public service department, alternative fuels technology companies, the city of Winnipeg, and Ford Motor Company. An additional $40,000 in fiscal year 1998 non-federal funding

is anticipated through projects proposed to the Kraus Group—an alternative fuels technology provider—and the Minnesota Chamber of Commerce. A total of $1,045,000 in non-federal funds has been secured for performance of NAFL program objectives over the duration of this grant. During fiscal year 1991 through fiscal year 1993, non-federal funding from the State of Illinois totaled $630,000. For fiscal year 1994, non-federal funding of $105,000 was secured from the American Corn Growers' Association, the Renewable Fuels Association, and others. fiscal years 1995, 1996, and 1997 non-federal funding totals of $50,000, $60,000, and $140,000, respectively, were secured from corn grower organizations, state agriculture departments, alternative fuels technology companies, and regional economic development agencies.

Question. Where is this work being carried out?

Answer. The University of North Dakota Energy and Environmental Research Center—EERC—located in Grand Forks performs this work. The EERC is a research, development, demonstration, and commercialization facility that employs about 200 scientists, technicians, and support personnel.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The completion date for the original objectives was April 30, 1992. The objectives were met. The work was then expanded to include partnerships with industry and agriculture. NAFL has been established as a center of expertise for development and demonstration of bio-based fuels, investigating fuel chemistry effects on engine performance and air quality, dissemination of accurate and objective information regarding ethanol in gasoline, and ethanol feedstock assessment and process development. Additional tasks which have been added include: the Red River Valley Clean Cities Coalition, implementing agricultural co-product-to-ethanol plant project, and commercializing an ethanol-based aviation fuel. These tasks should be completed by 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation.

Answer. In June of 1998, the U.S. Department of Agriculture conducted an onsite evaluation, and the NAFL program was given a very favorable review. The program continues to be a model for Federal-private sector collaborations. Personnel have continued to meet or exceed program objectives detailed at the initiation of each annual performance period.

NATIONAL CENTER FOR PEANUT COMPETITIVENESS

Question. Please provide a description of the research that has been funded under the National Center for Peanut Competitiveness.

Answer. The grant supports an interdisciplinary research and education program to enhance the competitiveness of the U.S. peanut industry by examining alternative production systems, developing new products and new markets, and improving product safety.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for this research?

Answer. Peanuts are a very important crop in several southern states. In many counties, peanuts provide more than 50 percent of all crop income. Peanut producers have been major beneficiaries of government income protection programs, but Federal farm and trade policies are changing and producers must become more competitive and market oriented.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The project helps peanut producers be more competitive in the global market. In the first year of the project—1998—a computerized expert system was adapted for hand-held computers that were used to help farmers reduce pest control costs. In addition, economic factors were added to a computerized disease risk management system which includes a large number of factors involved in the onset of a very destructive wilt. For every one-point improvement in the "wilt index," a farmer's net income is increased $9–14 an acre. USDA funds were used to leverage an additional $124,000 for research by the Center for Peanut Competitiveness.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998 with an appropriation of $150,000. The appropriation for fiscal year 1999 is $300,000, making a total of $450,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In fiscal year 1998, the state of Georgia contributed $141,181 and the state of Alabama, $15,000.

Question. Where is this work being carried out?

Answer. The Center is located at the University of Georgia at Griffen and involves cooperators from nearby peanut producing states, such as Auburn University in Alabama.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1998 was for a period of 36 months, however, the need to improve the competitiveness of U.S. peanut growers continues to grow. The fiscal year 1999 proposal extends the project until 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES reviewed and approved the project proposal in February 1998. We believe its scientific objectives and procedures will enable the Center to improve the competitiveness of U.S. peanut producers.

PM–10 STUDY, CALIFORNIA AND WASHINGTON

Question. Please provide a description of the research that has been funded under the PM–10 study, California and Washington research grant.

Answer. The PM–10 study in California and Washington addresses the effects of emissions of PM–10 and PM–2.5 sized particulates, or dust, from agricultural land on air quality and development of control strategies. These studies are being conducted by scientists at the University of California-Davis and the Washington State University, in cooperation with Federal, state, and local agricultural, environmental, and health agencies, and farmers and growers in both states. The California program has focused on developing and refining methods to accurately measure and detect the sources of PM–10 and PM–2.5 emissions from various agricultural practices and to investigate alternative practices for reducing potential air pollution on susceptible California crops and soils. In addition, the California research has been expanded to include dust and gaseous emissions from cattle feedlots, dairies, and the poultry industry. This is in direct response to the increased public concern with odors and air quality problems possibly related to livestock operations. The Washington State University scientists are using refined instruments on field sites to measure and predict the effects of wind erosion and agricultural practices in the Columbia River Basin region on PM–10 and PM–2.5 emissions, under both natural wind erosion and with portable wind tunnel studies. Alternative cropping and tillage practices, residue management, and weed control practices are being developed and compared for control of PM–10 and PM–2.5 emission pollution under Columbia River Basin conditions.

Question. According to the research proposal, or the principal researcher, what is the national, regional or local need for this research?

Answer. There has been growing national concern over the potential health and safety aspects of air pollution from dusts and suspended particulate matter resulting in passage of the 1990 Clean Air Act, as well as state air quality laws in both California and Washington. Because of particular problems from PM–10 and PM–2.5 emission in the arid regions of the Western United States, research on the role of agricultural operations in intensively cultivated soils in California and the Columbia River Basin, as sources of PM–10 and PM–2.5 pollution, will assist growers to develop alternative agricultural management practices to control PM–10 and PM–2.5 emissions.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goals of this research were to measure the PM–10 emission rates from significant crop and tillage practices, to determine the source of PM–10 emissions on soils in agricultural regions of central and southern California and the Columbia River Basin in the Pacific Northwest, and to explore cost-effective alternative agricultural practices to control these emissions. More recently, studies of finer PM–2.5 particulates have been included because of their recognized potential health risks. In California, field measurements are being continued on both PM–2.5 and PM–10 emissions on production practices on almonds, figs, walnuts, cotton, wheat, and on ammonia emissions from dairy farms and feedlots. Similar studies in the Columbia River Basin are being conducted in Washington on a number of agricultural practices in the rain-fed and dryland croplands. Susceptible climatic

and soil conditions and tillage and cropping practices have been identified and are being used to develop prediction tools to assist growers to adopt alternative practices to reduce potential air pollution by PM–10 and PM–2.5 particulate emissions.

A Light Detection and Ranging system has been developed at the University of California at Davis that makes it possible to take a snapshot of the shape of an emission plume from a source such as a harvester, and to make estimates on the amount of particulate material emitted into the atmosphere and its subsequent transport.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant began in March 1994. The appropriation for fiscal year 1994 was $940,000; fiscal year 1995, $815,000; and for fiscal years 1996 through 1999, $873,000 per year. A total of $5,247,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. In California, the program is matched by State funds in the form of salaries, benefits, and operating costs. In Washington, there were no state or non-Federal funds in support of the PM–10 project in 1994 and 1995. In 1996, state support was $22,566, and in 1997, state support was $102,364. Similar funding was continued in 1998.

Question. Where is this work being carried out?

Answer. This work is being directed by participating scientists at the University of California-Davis and at the Washington State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives of this project is 2000. The first four objectives of the project on soil particle characterization are anticipated to be completed in 1999. The objectives on field control will continue. In 1998, a manual for practices was developed and circulated for use by growers in Washington State to reduce wind erosion on agricultural land. Implementation and development of these management practices will be a major role of this project in the future. Quarterly and annual reports on the Washington State project to date are available.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency's Program Manager annually reviews the research progress reports and proposed new research and attends the annual meetings of the program to assess progress. The program is also evaluated each year by technical, administrative, and agency personnel. Progress is reported at research review meetings three times a year, with the November 1998 meeting in Washington involving strong participation of a large number of growers and public advisory committee members. A formal on-site review by a panel of experts was conducted of the Washington program in November 1997, and a similar review of the California program is planned in the near future.

AG IN THE CLASSROOM

Question. Please provide a description of the research that has been funded under the Ag in the Classroom grant.

Answer. Ag in the Classroom is an extension outreach program designed to promote agricultural literacy among pre K–12 students. Funds appropriated for this program are used to leverage agricultural literacy activities in all 50 states, the District of Columbia, and U.S. territories by providing national leadership and guidance to the agricultural education community. This community serves the educational needs of more than 5,000,000 students through a network of more than 120,000 teachers.

Question. What is the national, regional, or local need for this project?

Answer. This extension outreach program is directed toward the youth of America. In the Federal Agriculture Improvement and Reform Act of 1996—Public Law 104–127—Congress stated the importance of increasing the number of young Americans pursuing a baccalaureate or higher degrees in the food and agricultural sciences—section 805d. Agricultural literacy is a first step in creating both an interest and awareness of career opportunities in the food and agricultural sciences.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original purpose of this extension outreach program was to promote agricultural literacy among this nation's youth. The Secretary of Agriculture established the Ag in the Classroom Program in 1981 to help ensure that future generations are agriculturally literate. The mission of Ag in the Classroom is to help K–12 students understand the complexity of the total food and fiber system, appreciate its impact on our economy and society, and become citizens who are able to support wise agricultural policies. The Program encourages educators to integrate the critical role of agriculture in our economy and society into their teaching. The Program helps coordinate programs in all 50 states, the District of Columbia, and the U.S. territories. It provides leadership, counsel, and educational materials, and maintains a nationwide network of individual farmers, educators, agribusinesses, and local government officials who actively support the Ag in the Classroom mission.

Question. How long has this work been underway and how much has been appropriated by fiscal years to date?

Answer. A total of $2,253,880 has been appropriated for this program as follows: fiscal year 1986, $76,000; fiscal years 1987 and 1988, $74,000 per year; fiscal year 1989 $87,000; fiscal year 1990, $135,000; fiscal year 1991, $170,000; fiscal years 1992 and 1993, $208,000 per year; fiscal year 1994, $185,000; fiscal year 1995, $208,000; fiscal year 1996, $204,880; and fiscal years 1997 through 1999, $208,000 per year.

Question. What is the source and amount of non-Federal funds provided by fiscal year?

Answer. This is not a grants program and does not require matching funds. However, the original intent was to have an Ag in the Classroom Program in all 50 states, the District of Columbia, and in the U.S. territories. This has been accomplished. These state programs receive no Federal dollars. Thus, the Federal Ag in the Classroom Program is highly leveraged, albeit indirectly, because the states support their own activities.

Question. Where is the work being carried out?

Answer. The work of Ag in the Classroom is being carried out in all 50 states, the District of Columbia, and in the U.S. territories. The national program impacts an estimated 120,000 teachers and over 5,000,000 students in grades K–12.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related activities?

Answer. Ag in the Classroom is an extension outreach program. Given the original goals of the program were to promote agricultural literacy among America's youth and that we do not have a population fixed in time, this is a continuing effort. Indeed, as each generation becomes further removed from the agricultural heritage of this Nation, the need for Ag in the Classroom becomes more paramount.

Current plans include the development of cooperative support agreements to develop a high quality web site to coordinate activities and curriculum modules among each of the Ag in the Classroom state coordinators, sponsor national teaching awards at the K–12 level, and to streamline the development and dissemination of materials. Ag in the Classroom will also continue its role in sponsoring the coordination of a national, annual conference, for the purpose of bringing the Ag in the Classroom community together to share experiences, ideas, materials, information, and techniques among state programs, educators, governmental agencies, agribusinesses and agricultural organizations.

The state Ag in the Classroom Program coordinators—including the District of Columbia and the U.S. territories—have formed a National Ag in the Classroom Consortium.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Several efforts have been made to evaluate various aspects of the Ag in the Classroom program. A survey was conducted of constituents through the Ag in the Classroom newsletter evaluating the population affiliation to and involvement with Ag in the Classroom and topics that would affect the future direction of projects within the program. Findings from this survey indicated that readers wanted to know specific information about successful projects/program in the Ag in the Classroom community, access to age-specific lesson plans, updates on resource guides, and information on specific agricultural topics. The respondents were highly supportive of Ag in the Classroom.

During the annual national conference, formal evaluations were conducted regarding the conference and future projects. Findings from these conferences indicated that the target audience found the conference extremely valuable for sharing ideas on local Ag in the Classroom projects/programs. In addition, they found the conference very useful for obtaining resource materials. Conference attendees indicated

that they would like to see attention focused at the national level to develop a "teacher friendly" web site. They also indicated an interest in materials associated with agricultures' environmentalism role. A third issue that arose is the need for the national level to continue its role in the dissemination of resource guides and materials.

The National Ag in the Classroom Consortium provides USDA with another source of stakeholder input for assistance in identifying and setting priorities. Evaluations have been conducted in several states by the state coordinator on different projects such as: newsletters, videos, and various other products/activities. Many of these findings are brought forward to the Executive Committee of the National Ag in the Classroom Consortium. Comments are then brought forward from the Executive Committee to the attention of the National Program Leader through a monthly conference call. This provides a model for continuous process improvement.

BEEF IMPROVEMENT—ARKANSAS

Question. Please provide a description of the program that has been funded as the Arkansas Beef Improvement Program.

Answer. The Arkansas Beef Improvement Program uses three educational methods to demonstrate the decision making process and cost-effective management practices. The educational methods include demonstration farms that are enrolled in the program for five years, county workshops conducted over three evenings for two hours each evening, and five Beef Improvement special projects that were implemented this past year. An Arkansas Beef Improvement Executive Committee provides the overall direction for the program.

Question. What is the national, regional or local need for this program?

Answer. The implementation of specific cost-effective management practices vary from year to year, region to region, and state to state. The primary teaching objective of the Arkansas Beef Improvement Program is the decisionmaking process rather than specific management practices. Goal setting, evaluation of resources, and the process of selecting cost-effective management practices are emphasized in the decisionmaking process.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The overall goal of the Arkansas Beef Improvement Program was to enhance the efficiency and profitability of the Arkansas cattle producer. The program is still using demonstration farms to implement and evaluate cost-effective management practices, but during this past year, Beef Improvement Special Projects were implemented. There are five special projects. They are calving and breeding seasons; pasture renovation; hay quality and supplemental feeding; stocker cattle; and cow herd performance. Each project has its own requirements and objectives. Thirteen counties were selected to participate in the projects. Only one project per county was allowed. The objectives for the special projects were to concentrate on specific production problems and allow a means for more county agents and producers to become involved with the Arkansas Beef Improvement Program.

Additional accomplishments for the Beef Improvement Program.

—In 1997, four farms completed the five-year Arkansas Beef Improvement program. Their accomplishments included: Mature cow calf crop increased from 85 to 92 percent,Farms increased the average number of mature cows by 68 percent,Total pounds of beef sold per animal unit was 38 pounds higher the fifth year of the program compared to the first year; The average gross margin per farm increased by 138 percent—$28,664 vs. $12,423,If the farms received the same selling price in 1997 as they did in 1993, the average gross margin per animal unit would be 12 percent higher—$129.72 vs. $145.4 andPounds weaned per cow exposed increased 7.1 percent

—Benchmark data for the four new farms added to the program in 1997 were collected. Data included beef cattle production information, cow-calf budgets, soil test, forage test, cow herd performance information, and forage inventory.

—Arkansas Beef Improvement Workshops were delivered through county Extension offices. Overall, the participants found the workshop to be very meaningful to their operation and planned to implement many of the production practices discussed.

Question. How long has the program been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. $200,000 has been devoted to this project from Fiscal Years 1993 through 1995 and in fiscal years 1996 through 1999, $197,000 was appropriated for a total of $1,388,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. $95,000 has been provided annually from 1993 to 1997 from state funds. Arkansas provided $118,154 this past fiscal year.

Question. Where is the work being carried out?

Answer. Since the initiation of the Arkansas Beef Improvement Program, ten demonstration farms in Arkansas—from ten different counties—completed their fifth year. Currently, there are four demonstration farms in the second year of the program. Thirteen Special Projects were implemented this past year. Arkansas Beef Improvement Workshops were conducted in 17 counties. Therefore, 44 counties have participated in the Arkansas Beef Improvement Program. By involving more counties, a better representation of the Arkansas cattle industry was obtained.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. Currently there are four demonstration farms enrolled in the program. These farms are on their second year. It was agreed the Extension team would work with these farms for five years. Data from the final year as well as an Arkansas Beef Improvement Producer Survey and County Agent Survey will be collected and summarized for evaluation. Commitments to the Arkansas Beef Improvement Special Projects vary in length, depending on the project and farm situation. Most Special Projects will last 3 to 5 years. The first year of the Special Projects is primarily devoted to collection of benchmark data. In the second year, management practices are implemented and the impact measured. The Arkansas Beef Improvement Workshops are an ongoing program in the counties.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES review of the project is conducted annually. The 1998 review noted the project is taking a sound approach to improving beef production efficiency and profitability in Arkansas. The review advised that project results and materials be widely disseminated through publications and educational programs for the benefit of other producers in Arkansas and beyond.

DELTA TEACHERS ACADEMY

Question. Please provide a description of the program that has been funded under the Delta Teachers Academy project.

Answer. The National Academy proposes to continue its Delta Teachers Academy in the Lower Mississippi Delta Region—a region of 219 counties and parishes clustered around the Mississippi River encompassing portions of Arkansas, Illinois, Kentucky, Louisiana, Mississippi, Missouri, and Tennessee—focusing on educational improvement in the core subject areas. Specifically, the program will provide long-term academic enrichment to approximately 525 elementary and secondary school teachers at 35 sites by teaming them with university scholars for in-service training sessions during the school year and continuing with summer institutes. Through its Fellows Program the Delta Teachers Academy will also sustain the professional development of over 650 Academy graduates throughout the region. The Delta Teachers Academy grant is not awarded competitively; however, we require annual applications reporting the previous year's accomplishments and describing activities and expenditures planned for the upcoming year. These applications undergo merit review by at least three of our Ph.D. level staff before grant awards are made.

Question. What is the national, regional, or local need for this project?

Answer. According to the grant recipient, 33 percent of the children in the 219-county area comprising the Lower Mississippi Delta region live below the poverty line compared to 20.5 percent nationally. In 1996 the Children's Defense Fund stated that seven out of ten poor Southern families with children had at least one working family member. In 1996, 60 percent of Louisiana's public schools sampled ranked "below basic" on the National Assessment of Education Progress test for eighth-graders. Poor educational performance, rural poverty, and limited economic development are strongly correlated as depicted in a 1995 report from USDA's Economic Research Service. In its report to Congress in 1990, the Delta Development Commission cited serious educational problems including poor student performance in core content areas, demoralized teachers with little or no opportunity for academic development, and region-wide difficulty in recruiting and retaining qualified teachers. The Commission also stressed the links between these problems and the pervasive poverty and depressed economic conditions that characterize much of the seven-state Delta region. The Commission's report also cited that 75 percent of the region's workforce lacks the basic reading skills necessary for technical training and

specifically cites the need for improved teacher training as one means for breaking the cycle of poverty and economic non-competitiveness.

Question. What was the original goal of the program and what has been accomplished to date?

Answer. The original and continuing goal of the project is to address the problem of insufficient professional development opportunities for the elementary and secondary teachers of the seven-state region. The Academy project has focused on the core subjects of English, geography, history, mathematics, and science. Humanities, language arts, social studies, reading, civics, and interdisciplinary subjects are also covered by some sites. The Delta Teachers Academy began by offering educational development activities for 100 teachers from approximately 50 rural districts at 10 sites. Training has now been expanded to include 525 teachers at 35 new sites across the entire seven-state region. In addition, there are over 650 graduates of the program whose professional development is sustained through the Academy's Fellows Program and who are leading teacher in-service training back at their home schools. The project has helped improve student performance and teacher training, morale, recruitment, and retention in the region.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. A total of $20,661,000 dollars has been appropriated to the Department of Agriculture for this project, including $2,000,000 dollars in fiscal year 1994, $3,935,000 dollars in fiscal year 1995, $3,876,000 dollars in fiscal year 1996, $3,850,000 dollars in fiscal year 1997, and $3,500,000 dollars per year in fiscal years 1998 and 1999.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. There are no non-federal funds identified for this project.

Question. Where is the work being carried out?

Answer. The Delta Teachers Academy project is coordinated out of The National Faculty's Southern Region office in New Orleans, Louisiana. The project is being conducted at 35 sites selected from within the seven-state Lower Mississippi Delta region including the states of Arkansas, Kentucky, Illinois, Louisiana, Mississippi, Missouri, and Tennessee.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original objective was to provide three full years of training to each faculty team established by the Delta Teachers Academy program. Training consists of four two-day academic sessions and one two-week summer institute for each team. This objective has been met for the original 24 faculty teams first funded under the Fiscal Year 1994 Department of Agriculture grant, for the 15 additional teams established in 1995, and for the one new team established in fiscal year 1996. The 20 new teams established in fiscal year 1997 have received two years of training, and the 14 new teams established in fiscal year 1998 have received one year of training. As of the end of the Fiscal Year 1997 grant, 40 of the 41 faculty teams established by the Delta Teachers Academy will have met the original objective of the program. Objectives for the fiscal year 1999 grant include providing ongoing professional development of 33 teams consisting of 600 participants; add two additional teams to maintain their general level of service to 35 teams throughout the region; instituting several new procedures for better meeting their clienteles needs based on the independent review completed by Westat; intensify its individual and field-based approach; and draft individual work plans for each site. The anticipated project completion date for the 35 current sites is September 30, 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. An assessment of the short-term impact of the Delta Teachers Academy by Westat, Inc. of Rockville, Maryland was completed in August 1997. Westat's study found that the vast majority of participants reported that the Academy had met their personal and professional needs by renewing their enthusiasm for teaching, improving their self-confidence, increasing their sense of professionalism, improving their knowledge of specific content areas, enhancing their teaching methods, and providing opportunities to interact with peers. The study also provided considerable evidence that teachers are applying what they have learned from the Academy in their own classrooms. For example:

—90 percent reported applying academic content from the program in their classrooms.

—78 percent reported incorporating skills and strategies learned developed at the Academy into their classroom teaching.

—83 percent reported that their teaching approaches have become more effective in improving student learning.
—88 percent said the Academy had prepared them to assume leadership roles in their schools.
—89 percent noted changes in their students' work habits, attitudes, aspirations, and achievements.

A United States General Accounting Office review of the Academy's programs was also conducted in fiscal year 1995. The General Accounting Office report—GAO/RCED–95–208 included summary statistics on over 1,000 teacher evaluations of Academy sessions as well as the General Accounting Office's own survey of participants. The General Accounting Office found that on average, participants reported that the Academy was more effective than any other teacher development program they had participated in, was very effective in renewing or enhancing knowledge in one or more academic subjects, and was generally effective in enhancing the teaching skills and strategies required for teaching challenging academic content.

In addition, a site visit of the Delta Teachers Academy offices in New Orleans, Louisiana and of the National Faculty's Summer Institute at Tulane University was conducted by the Cooperative State Research, Education, and Extension Service's National Program Leader for Higher Education and Evaluation, during July 1996. The site visit confirmed that participating teachers are very enthusiastic about the Delta Teachers Academy program, that the instruction provided by The National Faculty's university scholars is on target and appropriate to the K–12 teachers' needs, and that the facilities are very well suited to program requirements. The site visit further confirmed that the Delta Teachers Academy has strengthened the participating teachers' ability to teach by improving their content knowledge base, helped them become leaders of other teachers by requiring them to conduct staff development back at their home schools, and had a positive impact on student learning. School superintendents report greater student enthusiasm, more homework, and higher test scores for students whose teachers were in the Delta Teachers Academy program. As determined by such sources as reports from school superintendents, an outside expert evaluation, a GAO review, and site visits and merit reviews by Federal program staff, it appears that the project has met its original objective of providing increased teacher professional development opportunities in the seven-state Lower Mississippi Delta Region.

DIABETES DETECTION AND PREVENTION, WASHINGTON AND HAWAII

Question. Please provide a description of the extension activity that has been funded under the Diabetes Detection and Prevention, Washington and Hawaii grant.

Answer. CSREES has met with representatives of the Joslin Diabetes Centers and conversed with representatives of its State Cooperative Extension Partners in Washington and Hawaii. The grant will support demonstration and outreach activities designed to detect undiagnosed diabetes through use of a non-invasive ocular fluorescence technique. CSREES has requested that a revised proposal be submitted from the Joslin Diabetes Center.

Question. According to the proposal, or the project director, what is the national, regional or local need for this extension program?

Answer. The need for this demonstration program grows out of a need to reach more of the millions of Americans who have undiagnosed diabetes. Diabetes is currently one of the leading causes of death and disability in the U.S. adult population, and is highest among certain racial and ethnic populations, especially Native Americans, African Americans, Hispanic Americans, and Asians and Pacific Islanders.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The goal of this extension outreach project will be to provide (1) screening for diabetes among selected rural minority patient populations in Washington and Hawaii using innovative detection technology and blood glucose measures; (2) diabetes education prevention and care materials; and (3) case management support and follow-up services for patient referrals.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The work supported by this grant begins in fiscal year 1999 and the appropriation for fiscal year 1999 is $550,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. There are no non-federal funds and sources expected for this grant.

Question. Where is this work being carried out?

Answer. The program will be conducted at Joslin Diabetes Centers at Swedish Hospital in Seattle, Washington, and Straub Medical Center in Hawaii. In addition, the Cooperative Extension offices in selected counties in Hawaii and Washington will be involved in program implementation.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives is 2002.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Because this is the first year of the project's funding, and it is in fact just getting underway, the Agency evaluation has not yet occurred. A mid-year evaluation of program outputs and the delivery process to date will occur in July 1999.

EXTENSION SPECIALIST, ARKANSAS (SMALL FARM MANAGEMENT AND MARKETING EDUCATION PROJECT)

Question. Please provide a description of the program that has been funded under the Small Farm Management and Marketing Education Project.

Answer. The Small Family Farm Management and Marketing Education program provides farm financial education and support materials that are necessary for family farm enterprises to develop and maintain an effective financial management system for their operations. The program is located at the Dale Bumpers Small Farms Research Center located at Booneville, Arkansas, in a transition zone where horticultural crops, both warm and cool season forages, and ruminant animal issues may be researched. It relates to 151,000,000 acres of major land resource area in the United States and is specifically representative of 72,000,000 acres in the upper mid-South. This program extends research on technical and efficiency issues to the limited resource hill-land family farmers located in the area. The program promotes the use of land resources, labor, and capital in a whole-farm context intended to sustain small family farms.

Question. What is the national, regional or local need for this program?

Answer. This program fills the need to evaluate the economic applicability of research conducted at the Center and to transfer the applicable results to operators of small family farms. This research considers the limitations and potentials faced by farmers as they decide how to improve their operations through the use of new technologies, minimize risk when risk capital is limited, combine enterprises on limited acreages to make better use of labor, and select and use equipment for multiple enterprises. Within the region and in local situations, feasible alternative enterprises are identified and methods to improve biological and economic efficiency are advanced. Value-added markets are being explored as a means of enhancing incomes and promoting the sustainability of small family farms.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The goal of the project continues to be to develop a small/family farm management and marketing education program based upon the Center's mission, extend the research information to family farmers in the mid-South, provide support to county and state Extension professionals providing education on alternative agricultural management and marketing, and be a resource to faculty, agency personnel, and the public in farm management and marketing. An ambitious set of objectives include identifying niche marketing for alternative enterprises, encouraging use of computerized farm record systems, provide guidance on the development of whole-farm management systems, and conduct in-service and other training for relevant groups. In fiscal year 1998, the record keeping system was updated to include soil tests, fertilizer and chemical use, manure analyses, and other measures in addition to financial information. Tested programs and procedures in alternative agriculture have been disseminated to more than 13,000 producers through Extension publications, newspapers, and other media. Assistance has been provided to more than 17,500 stakeholders in Arkansas, 27 other states, and two foreign countries. Program faculty have provided in-depth training on production practices and record keeping to 785 producers and worked with an extensive group of private and public organizations to form networks that provide programming to enhance production, profitability, and longevity in family farm enterprises.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The project has been underway since 1992. Appropriations of $100,000 have been made in each of the fiscal years 1992 through 1995. Appropriations in

fiscal year 1996 through fiscal year 1999 were $99,000 for each year. A total of $796,000 has been appropriated.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. State matching funds have been provided through the Arkansas Cooperative Extension Service in fiscal year 1992 through fiscal year 1999. The amounts are $59,040 in fiscal year 1992, $55,680 in fiscal year 1993, $54,250 in fiscal year 1994, $54,446 in fiscal year 1995, $54,446 in fiscal year 1996, $46,347 in fiscal year 1997 and $40,467 in fiscal year 1998. The total is $364,676.

Question. Where is the work being carried out?

Answer. The central location is the Dale Bumpers Small Farms Research Center at Booneville, Arkansas. It is being carried out primarily in the 10-state area served by the Center. These states are Alabama, Arkansas, Georgia, Kentucky, Louisiana, Mississippi, Missouri, Oklahoma, Tennessee and Texas.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal, one year in length, was extended as the research results continued to evolve and the educational needs of the target audience increased. During the coming year, the emphasis is on alternative enterprises, niche marketing, market reporting, farm management information, and record keeping. Contact is maintained with Extension personnel and other organizations.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A merit review of the current proposal is conducted each year when it is received using internal criteria that examine objectives, procedures, timelines, anticipated product, and the competency and experience of the project directors. The evaluation indicates that this is a productive project, especially in terms of its outreach. It complements the ongoing research at the Center, assessing economic feasibility, and developing farm management applications. The value of the work is evident in the growing number of stakeholders which are involved and in the expanded networking with private sector organizations.

EXTENSION SPECIALIST, MISSISSIPPI

(BASIC WEATHER SERVICE FOR RESEARCH AND EXTENSION PROJECT)

Question. Please provide a description of the program that has been funded as the Basic Weather Service for Research and Extension Project.

Answer. The Basic Weather Service and Extension project is designed to fill a void in weather data due to closure of the Ag Weather Service facility in Stoneville, Mississippi. The funding will be used to gather and disseminate critical agricultural weather data for producers and researchers in Mississippi and surrounding states.

Question. What is the national, regional or local need for this program?

Answer. The grant proposal states that the Ag Weather Service facility was closed at Stoneville, Mississippi. This action has created a void in the availability of and access to critical weather data that producers and researchers use to make management decisions and to formulate work plans within the state and region.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The goal of the project is to collect, maintain, and disseminate weather information for producers and researchers in Mississippi and surrounding states. Electronic weather stations and links with other web sites to deliver weather data have been installed and developed. The project is providing timely data to producers in the Delta.

Question. How long has the program been underway and how much has been appropriated by fiscal year through 1999?

Answer. The funding for fiscal years 1997 and 1998 was $50,000 each year and for 1999 $100,000 was appropriated for a total of $200,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The State of Mississippi, through the Mississippi Cooperative Extension Service and Delta Research and Extension Center, provided $41,350 in state appropriated funds to support this project in 1997 and 1998.

Question. Where is the work being carried out?

Answer. The project will be conducted at the Delta Research and Extension Center in Stoneville, Mississippi.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of the additional or related objectives?

Answer. One of the original objectives, installation of equipment to collect weather data and establishment of a website, has been completed. The agriculture community—producers, markets, supplier of goods and services, and financial institutions—depend upon weather information as a guide for business planning and decision making. The National Weather Service has eliminated certain critical services to rural areas and to agriculture clientele. As agriculture implements new programs in pest management, crop production, and site-specific farming, near real-time weather data is critical to success of these programs. Weather services provided by the Stoneville project will be in cooperation with and complementary to services provided by the National Weather Service. Additional objectives relating to the continuing need to collect, process, and disseminate timely weather data are critical to the Delta Region. Current funding supports the objectives to ensure these weather services are available to the region.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Evaluation of the project and Internet website is being conducted with an on-line survey instrument and through e-mail responses about the site. An advisory group has been identified and is functioning to provide evaluative feedback on the weather center's current status as well as assessing needs for future plans for the project's continued mission.

INCOME ENHANCEMENT DEMONSTRATION, OHIO

Question. Please provide a description of the program that has been funded under the Income Enhancement Demonstration Project for Northwest Ohio.

Answer. The Federal funds support the Agricultural Business Enhancement Center which plays a major role in the development of the agricultural sector of Northwest Ohio. The Center provides a variety of management training programs, helps farmers and other agribusinesses develop comprehensive business plans, and facilitates business networking. CSREES performs an annual merit review of this project.

Question. What is the national, regional, or local need for this program?

Answer. The Center seeks to enhance the competitiveness for agricultural firms in Northwest Ohio and create greater economic opportunity for local residents. To be successful in business, farmers and other agribusiness firms must be able to adapt to a large number of major changes affecting the entire food system from the farmer to the consumer. These include changes in farm programs, globalization of markets, new technologies, information systems, consumers' concerns for food safety and nutrition, and society's concern for protecting the environment. Individuals, families, firms, and communities in Northwest Ohio need to understand the changes, and develop and implement effective strategies for dealing with change.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal of the project was to help people develop new businesses and restructure and expand existing businesses in order to enhance incomes in Northwest Ohio. The Agricultural Business Enhancement Center conducts economic research on market opportunities, provides a variety of management training programs, helps individual farms and other agribusinesses develop comprehensive business plans, and facilitates networking with businesses in other regions of the United States and around the world. During 1997, for example, six business plans were completed—three firms decided to pursue financing and startup, and three firms decided to abandon their idea. Seven additional plans were in various stages of development. Out of 150 women attending "Women in Agriculture" workshop, 85 percent said workshop participation would improve management of the family farm, 80 percent said it would improve family relationships, and 22 percent said it would improve farm income. The Center completed its tomato processing plant feasibility study and accompanying business plan but was unsuccessful in finding a sufficient number of producers to invest in a cooperative or to find a private investor. A new study is underway to determine the feasibility of farmers markets at Ohio Turnpike plazas.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. The project began in 1991. Appropriations have been as follows:$145,000 in fiscal year 1991; $250,000 per year in fiscal years 1992 through 1995; and

$246,000 per year in fiscal years 1996 through 1999. Appropriations to date total $2,129,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The State of Ohio has appropriated the following funds: $35,100 in fiscal year 1991; $72,368 in 1992; $56,930 in 1993; $30,547 in 1994; $49,935 in 1995; $51,432 in 1996; $48,664 in 1997; and $53,736 in 1998.

Question. Where is the work being carried out?

Answer. The Agricultural Business Enhancement Center is located in Bowling Green, Ohio and serves eight counties in the Toledo Metropolitan Area. Project leadership is being provided by the Department of Agricultural Economics, Ohio State University, Columbus, Ohio.

Question. What was the anticipated completion date for the original objectives of the project? Have these objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1991 was for a period of 12 months, however, the ongoing needs of producers and agribusinesses to adjust to major changes in the agricultural sector continues to provide the Center with many challenges. The current phase of the program will be completed in September 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. CSREES performed a merit review of the project in March 1998 as it evaluated the proposal for that year, and concluded that the project has a good track record of providing relevant and useful management and marketing education to local farmers and agribusinesses. However, the project leader was asked to submit plans for evaluating the impact of the project before funds would be released. The evaluation plan was approved in July 1998 and funds released in August.

INTEGRATED COW-CALF MANAGEMENT—IOWA

Question. Please provide a description of the program that has been funded as "CHIPS: Cow-Calf Integrated Resource Management Program."

Answer. The CHIPS program is a grass roots, technical assistance program designed to provide management assistance services to Iowa cow-calf producers. This integrated resource management—IRM—program was developed to impact the area's rural economy by maximizing the profit potential of individual livestock producers. Participating cooperators work one-on-one with trained technicians, utilizing a variety of management services designed to assist these producers as enterprise decisions are finalized. The CHIPS program was originally targeted in an 11-county area of southeast Iowa. The program has systematically grown to extend services to over 190 beef producers in over 60 Iowa counties.

Question. What is the national, regional or local need for this program?

Answer. The agricultural economy of Iowa has experienced significant changes over the past several years. These changes have impacted the economic structure and health of local and regional agricultural entities. Weather conditions, floods, depressed market prices, and industry changes have all contributed to these economic and industry changes.

CHIPS has adjusted program focus and direction to respond to the economic conditions existing in the volatile cattle industry. This approach provides CHIPS cooperators with individualized alternatives to address the situation at hand. Technicians work with cooperators to address industry issues, including grain substitution options during high corn/soybean prices, management recommendations as the Conservation Reserve Program—CRP—acres are released, and updates regarding market programs. These examples reflect CHIPS long-term sustainable approach as sound management and economic decisions are finalized by cooperators. Through the CHIPS program, producers will have a performance and economic perspective of their beef operation. Decisions made from data collection and management recommendations are imperative as producers address these economic challenges. This approach supports both individual economic survival as well as strengthening the local and regional economic community.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The overall goal of CHIPS is to have a positive effect on the area's economy by improving the long-term profit potential of the local cattle industry. To address this broad project goal, CHIPS has established the following objectives:

—Improve profit potential of cooperator farms.

—Identify issues and trends in management data.

—Raise awareness and understanding of over 2,000 agricultural producers in Iowa about cow-calf production on highly erosive land and integrated resource management.
—Provide CHIPS cooperators intensive technical assistance to develop goals and individualized farm recommendations, including management areas such as pasture and forage production, rations, utilization of resources, record systems, and government farm program compliance. Over 190 cow-calf operations were involved in this technical assistance program during 1998.
—Assist producers as they develop management skills to improve efficiency and reduce costs of production as CHIPS recommendations are implemented.

During 1998, over 190 cooperators, involving approximately 16,000 beef cows, participated in CHIPS. This program has expanded in cooperator numbers and geographical area. CHIPS has grown from one technician and 11 counties in 1992 to seven FTE technicians servicing 60 counties in Iowa. The infrastructure has also changed. This expansion includes formation of CHIPS, Inc., a CHIPS Employee Handbook, administrative interaction with Iowa State University, Pathfinders RC&D, and Southern Iowa RC&D.

During 1997–98, CHIPS technicians conducted 1,189 one-on-one farm consultations. Numerous management areas were reviewed, with over 9,900 calves weighed, 3,500 beef cows weighed, and more than 4,100 head permanently identified. This information was utilized by the technicians to complete and analyze 69 Cow Herd Appraisal of Performance Software—CHAPS—and 19 Standardized Performance Analysis—SPA—records. These contacts involve a wide variety of technical assistance, with primary emphasis on nutrition, cost-effective ration development, genetic evaluation, value-added practices, and cow production concerns. Included were more than 300 forage samples, with over 250 specific rations and projections distributed. Over 77 pasture consultations were conducted, 8 newsletters distributed to over 1,300 agribusiness producers and representatives, and 44 soil samples collected. An educational Beef Value Added Tour to Kansas was coordinated by CHIPS, with 54 people attending the two-day event. Over 650 people participated in 44 educational programs and presentations involving CHIPS technicians and support staff.

Question. How long has the program been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. $138,000 was approved for fiscal year 1992; $138,000 for fiscal year 1993; $276,000 for fiscal year 1994; $350,000 for fiscal year 1995; $345,000 for fiscal year 1996; $345,000 for fiscal year 1997; and $300,000 per year in fiscal years 1998 and 1999. Federal funding through fiscal year 1999 totals $2,192,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. CHIPS cooperators pay client fees of approximately $3.00 per cow. This fee structure is on a sliding scale that adjusts for cow herd size. Approximately $45,000 client fees were collected from cooperators during fiscal year 1998.

Question. Where is the work being carried out?

Answer. The CHIPS program is being operated in six designated technician areas in Iowa. These include approximately 60 counties in the following Iowa areas: southeast—16 counties; south central—8 counties; southwest—8 counties; northwest—8 counties; east central—8 counties; and central—12 counties.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The CHIPS program was initially projected to address the goals and objectives of the project in a three-year time frame. As the program expanded, new services were extended to new geographical areas. As this expansion progressed, CHIPS adjusted the focus and direction of services to meet the rapidly changing needs of the cattle industry. The level of technical assistance and program delivery will require continued adaptation to emerging issues. Over the past several years, producers have been challenged by low forage quality and quantity due to excessive moisture and flooding, record high grain prices, closure of the Monfort beef packing plant in Des Moines, and depressed prices. As this occurred, CHIPS responded by adapting services and technical assistance to cooperators.

The objectives and goals of CHIPS will continue to be modified and adapted to meet needs of the cooperators. CHIPS is developing an agreement with the Iowa Cattlemen's Association—ICA. The goal is to expand services to CHIPS clientele and support the value added Iowa Quality Beef program. This relationship is the direct result of discussions with the ICA, the Iowa Beef Center at Iowa State University, Precision Beef Alliance, and CHIPS. Cooperating beef groups will determine the services and administrative structure of CHIPS in the future.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES review of this project is conducted annually. In addition, three Iowa State University Extension personnel have been requested to conduct a CHIPS program evaluation. Included in this request is a review of CHAPS and SPA records to evaluate short-and long-term impacts, identification of production and management changes incorporated by cooperators due to CHIPS, and future services needed by clientele. This information will be essential to determine the financial and production impact of the program, and to determine what services and technical assistance should be supported. Preliminary information from the record evaluation indicates changes in production have had a positive impact on the operations involved in the CHIPS program. This evaluation process is to be completed by June, 1999.

NATIONAL EDUCATION CENTER FOR AGRICULTURAL SAFETY

Question. Please provide a description of the extension project that has been funded under the National Education Center for Agricultural Safety grant.

Answer. The National Education Center for Agricultural Safety is dedicated to reducing the level of preventable illnesses, injuries, and fatalities among farmers, ranchers, their families, and employees. The National Education Center for Agricultural Safety translates current research into training programs on the safety and health hazards that impact the agricultural workplace. Training methods include the use of real-life scenarios and simulations for the purpose of enhancing trainee knowledge and positively changing work behaviors so that unsafe work practices can be reduced and eliminated among the at-risk audiences. An 11,000 square foot training center developed with a $1,000,000 grant from Iowa houses the resources and simulators used in the hands-on training.

Question. According to the extension proposal, or the project director, what is the national, regional or local need for this project?

Answer. The project director believes this training to be of national, regional, and local need. Farming continues to be one of the most dangerous occupations in the United States. 1998 data provided by the National Safety Council showed that 830 farmers, ranchers, family members, and farm employees suffered fatal injuries while performing farm work. Most of these incidents were classified as preventable. The adoption of safe work habits is dependent upon the relevance, affordability and availability of safety training for at-risk and underserved agricultural audiences. It is the mission of the National Education Center for Agricultural Safety to make practical, hands-on training available in order to reduce the level of preventable illnesses, injuries, and fatalities in production agriculture.

Question. What was the original goal of this training center and what has been accomplished to date?

Answer. The original, and continuing goal of this project was to test the efficacy of adapting practical, hands-on training methods for reducing the level of preventable farm work incidents in the United States. Research indicates that trainees and students will positively respond to agricultural safety training if it simulates real life conditions of farming hazards. The National Education Center for Agricultural Safety is offering practical training initiatives concentrating on the hazards that negatively impact farm work, including hazards associated with the farm machinery, agrichemicals, livestock, confined spaces, and grain.

During fiscal year 1998, over 400 individuals received training coordinated by National Education Center for Agricultural Safety. Among these trainees were emergency medical service personnel, farm cooperative patrons, agricultural youth, and high school agriculture teachers. Mail and phone follow-ups with many of these trainees have shown that most are sharing critical safety and health information with their peers, parents, and other at-risk audiences. For example, one Montana family trained during the National Education Center for Agricultural Safety AG Families—USA program, have conducted seven community-based programs for adults and children in Western Montana. Another dairy farm family from the Milwaukee, Wisconsin, area, planned and conducted a comprehensive farm safety day camp for over 100 farm youth in eastern Wisconsin.

Question. How long has this work been underway and how much has been appropriated by fiscal years through fiscal year 1999?

Answer. The work supported by this grant began in fiscal year 1998, and the appropriation for fiscal years 1998 and 1999 is $195,000 per year for a total of $390,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. The non-federal funds and sources provided for this grant were as follows: $450,000 state appropriations dedicated for construction of the Phase II training sites at the National Education Center for Agricultural Safety, and $75,000 miscellaneous cash and in-kind donations during fiscal year 1998. Non-federal funds were provided by Deere & Company, DuPont Corp., Double L Group, Ltd., Melroe Company, Dubuque Racing Association, and the Theisens' Farm, Home and Auto Company.

Question. Where is this work being carried out?

Answer. Training under this grant will be conducted at the National Education Center for Agricultural Safety, located on the campus of Northeast Iowa Community College in Peosta, Iowa.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date of the original objectives is approximately March 31, 1999. Many of these objectives have already been met. Anticipated completion date of additional objectives is March 31, 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. A CSREES merit review of the project application was conducted in the spring of 1998. The project will be completing its first year March 31, 1999. The National Education Center for Agricultural Safety will utilize multiple evaluation tools such as pre and post testing, follow-up surveys to determine knowledge gain and behavior change, external evaluators, and an advisory committee.

PILOT TECHNOLOGY PROJECT, WISCONSIN

Question. Please provide a description of the program that has been funded under the Wisconsin Pilot Technology Project.

Answer. Primary industrial extension activity of the Manufacturing Technology Transfer program is the delivery of technical assistance to manufacturing companies. Executive direction in determining the assistance required will be provided by the University of Wisconsin—Stout's Northwest Wisconsin Manufacturing Outreach Center—NWMOC—with direct consultation and long-term in-plant assistance delivered primarily through the efforts of university Project Managers and Co-op students. Direct assistance may be delivered through staff of the University of Wisconsin System, both two-and four-year institutions, and Extension services; the Wisconsin Technical college System; secondary schools; the private sector, professional societies, and private consultants, or attendance at state or national seminars. The project also draws on many other state resources to add expertise and capacity to network facilitation and in-plant extension activities. The project has undergone a merit review.

Question. What is the national, regional, or local need for this program?

Answer. America's manufacturers continue to face tremendous global competition. There are enormous pressures to improve the quality of products; reduce the time consumed to bring new products to market; and there remains an ever increasing demand to reduce the costs of products. Currently there is a strong movement in manufacturing to use speed-to-market combined with new product introduction as a tool to obtain a competitive advantage. While high quality and cost efficiencies continue to be mandatory commitments for today's manufacturers, great value is now being placed on speed-to-market. Large companies are not the only ones influenced by these trends. Small-and medium-size manufacturers often supply larger firms. Hence, they must be able to quickly process large amounts of information and solve complex problems.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The Manufacturing Technology Transfer program's principal objective is the development of a competitive, secure manufacturing base through the mechanism of industrial extension. The program principally targets small and medium-size manufacturers in rural Wisconsin. This funding will: continue to provide valuable industrial extension service to the target audience; support the continued empirical development of an industrial extension model; and investigate the use of new manufacturing technologies to support global competitiveness of manufacturers. Productivity improvements were reported by the companies showing impressive economic impact to the region through implementation of:

—Client operations assessment/plant evaluation and strategy development

—Opportunities for productivity improvements.

—Implement new organizational and operational methods

—Investigate new manufacturing technologies.
—Establish quality assurance/total quality systems.
—Establish ongoing training programs.
—Deliver on-site instruction in new technologies, improved methods and processes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This project has been underway since fiscal year 1992 and was funded for $165,000 per year in fiscal years 1992 through 1995, and for $163,000 in fiscal years 1996 through 1999 for a total of $1,312,000.

Question. What is the source of and amount of non-federal funds provided by fiscal year?

Answer. No non-federal funds have been provided for this project.

Question. Where is this work being carried out?

Answer. The work will be carried out by the University of Wisconsin-Stout.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1992 was for a period of 12 months. However, the Manufacturing Technology Transfer Program was developed as a continuously evolving industrial extension strategy for serving the needs of the manufacturing community. The Manufacturing Technology Transfer Program is measured by success in meeting the objectives of the past five years' proposals, including the delivery of modernization assistance and development of an industrial extension model. The current phase of the program will be completed in 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. To measure the success of the project, a client evaluation process has been developed which includes an evaluation questionnaire. Evaluations indicate significant forward strides in job creation, new businesses, expanded productivity, and enhanced international competitiveness. An agency evaluation of this project was last performed by the Department of Commerce in 1997.

RANGE POLICY DEVELOPMENT, NEW MEXICO

Question. Please provide a description of the program that has been funded under the Range Policy Development research grant.

Answer. The Range Policy Development project has collected local economic data throughout the State. Local data have been used to develop an economic model to help explain the relationships among local economies and primary industries. The model is intended to enable policymakers to better understand how local and State economies are tied to primary industries, especially those industries that use public lands. The initial focus of the project has been on the livestock grazing industry. The project has undergone merit review within CSREES, and funds have been awarded to the institution following recommendations by the review panel.

Question. What is the local, regional, or national need for this program?

Answer. In New Mexico and throughout the western states, many local economies are dependent on the use and management of public range and forest lands. However, there exists a great deal of disagreement about the true level of dependence of individual communities on these public land-based industries, and, consequently, disagreement about the local, statewide, and regional impacts of public policies that alter the use and management of these lands. Through better understanding of how public lands impact local and regional economies, we may be better able to predict the outcomes of potential legislation or amended land use policies, resulting in policies that enhance, rather that detract from, local economies.

Early results from this project have been encouraging and have spawned a six-state collaboration to design a regional economic model based on the New Mexico prototype. This regional coalition has been seeking funds from multiple sources, including the Fund for Rural America.

Question. What is the goal of this program and what has been accomplished to date?

Answer. New Mexico is in the process of developing detailed input-output models for each county from local and state tax revenue data. The economists are following up with workshops across the state to present information from economic forecasts to local decisionmakers. Further, the project calls for increasing the utility of the models by expanding the scope of the database to include industries in addition to the grazing enterprises.

Question. How long has this work been under way and how much has been appropriated through fiscal year 1999?

Answer. This project was initiated in December 1994. It has been funded year-to-year to accomplish annual objectives. The first tier of objectives were met in 2 years. The second phase is currently scheduled for completion during 1999. The total appropriation for the project has been $964,240. Of that total, $197,000 appropriated for fiscal year 1998 has been extended through November 1999. The 1999 appropriation of $197,000 has yet to be awarded, as we have yet to receive and review a request from the institution.

Question. What is the source and amount of non-federal funds to support this project?

Answer. The project budget does not indicate any non-federal support. However, Agricultural Research Stations in five other States have economists currently working together on a Regional Research Project, with the intent of improving and expanding upon the New Mexico project.

Question. Where is this work being carried out?

Answer. Research is being conducted statewide based from New Mexico State University in Las Cruces, New Mexico.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. According to the project director, most of the original objectives have been accomplished. In this second phase of the project, the investigators are collecting data to allow incorporation of other industry and government sectors into the model. Objectives for this phase should be completed near the end of 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The proposal for continued funding most recently underwent merit review by a team of CSREES National Program Staff in May 1998, and a review of progress-to-date was conducted by the project liaison in September 1997. The reviews focused on criteria including the relevance of the project goals, the suitability of the proposed research methods, and the extent of progress made toward addressing the goals of the project. Both reviews found that phase one objectives had been met and that adequate progress had been made toward the objectives of the second phase of the project. A more comprehensive evaluation of the project, originally scheduled for Fall 1998, has been rescheduled for December 1999 to coincide with the no-cost extension requested by the project managers at New Mexico State.

RURAL DEVELOPMENT, OKLAHOMA

Question. Please provide a description of the program that has been funded under the Rural Development, Oklahoma Project.

Answer. This program provides financial and technical assistance to small business to create and retain jobs in rural Oklahoma and to stimulate the local economies. The program is carried out through financial services, business incubators, problem-solving assistance to small-and medium-sized manufacturers, and technical assistance to rural small businesses. The program is expanding to include assistance to rural small businesses to enter international trade. The program continues to evaluate new products and processes that may result in new industries or be applied to improve existing manufacturing processes. The project has undergone a merit review.

Question. What is the national, regional, or local need for this program?

Answer. The increased demand for small business financing and technical assistance verifies the need for the program. Each year financing secured for small businesses has significantly increased. The demand for business incubators is also on the rise. Last year, Rural Enterprises—REI—agreed to mange two more business incubators bringing the total REI-managed facilities to thirteen. Also, small businesses continue to need access to technical and business management assistance, worker training, and international trade assistance in order to stay competitive in domestic and world markets.

Question. What was the original goal of this program and what has been accomplished?

Answer. The original goal of the program was to create jobs in rural Oklahoma by providing systematic access to improved technology, training, financial, and business management assistance. REI is a Certified Development Corporation for the small Business Administration as well as a designated Certified Development Financial Institution. As a result, REI has been successful in obtaining financing for entrepreneurs and rural small businesses totaling $119,060,129. Special technical

assistance efforts have included problem-solving assistance to small manufacturers; training and dissemination of information on ISO9000 to assist rural businesses compete with a global market; providing manufacturers with a "Quick View Assessment" program which enables manufacturers to compare their facilities and operations with other companies across the United States; and working one-on-one with small businesses providing on-site assistance with inventory control, cash flow management, and marketing.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Appropriations to date are as follows: $433,000 per year in fiscal years 1988–89; $430,000 in fiscal year 1990; $431,000 in fiscal year 1991, $300,000 per year in fiscal years 1992–95; $296,000 per year in fiscal years 1996–97; $150,000 per year in fiscal years 1998–1999. Appropriations total $3,819,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. No non-federal funds have been provided for this project.

Question. Where is this work being carried out?

Answer. The work is being carried out at Rural Enterprises, Inc., REI, in Durant, Oklahoma.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1988 was for a period of 12 months. However, the objectives of Rural Enterprises, Inc. are on-going because of the nature of the activity. The clientele is diverse and decentralized. The engineering and management consultation model being pursued with individual clients results in a situation where hundreds of problems are being pursued simultaneously and when solved are replaced by new issues resulting from international competition, regulations, training needs, and changeover costs. The next phase of the program will be completed in 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. REI itself conducts an on-going evaluation process to measure the organization's effectiveness and efficiency in accomplishing its objectives, and this is documented on a quarterly basis through our reporting system. Over 6,000 jobs have been created and retained for new and expanding businesses as a result of this program. While the program has met its key objective of job creation in rural Oklahoma, the nature of its outreach effort continues to evolve and change as business sustainability and profitably confront new challenges within small and rural communities. CSREES has not conducted an evaluation of the Rural Enterprises, Inc. project.

RURAL DEVELOPMENT THROUGH TOURISM, NEW MEXICO

Question. Please provide a description of the program that has been funded under the Rural Economic Development Through Tourism—REDTT—Project in New Mexico.

Answer. The Rural Economic Development Through Tourism Project involves applied research and outreach focused on locally-based tourism development strategies to enhance economic opportunity in small and rural communities in New Mexico. Components of the agenda support training of local leadership and tourism professionals, strategic planning and market development, and technical assistance to communities. The proposals submitted are submitted for internal review and evaluation within the agency. Recommendations are presented to enhance impact on regional and national agendas.

Question. What is the national, regional or local need for this program?

Answer. This is an on-going pilot to demonstrate the effective development and implementation of applied research, training, education, and technical assistance related to rural tourism as a development strategy. The grant has demonstrated that a long-term commitment of resources and activity can lead to effective development of tourism resources and build new market opportunities and tourism products for small communities. This project would provide an excellent proposal for the Fund for Rural America.

Question. What was the original goal of this program and what has been accomplished?

Answer. The applied research and outreach project was designed by the State Cooperative Extension Organization to increase the ability of the public sector to enhance economic opportunity for rural communities through tourism development. A

regional task force composed of Extension professionals and community leaders from business, industry, education, and government—local, state, and Federal—was developed to guide and advise the development and implementation of locally-based programming and research. The results include video training materials, a public relations package, image studies and profiles, regional tourism guides, development of tourism bus packages, festival planning workshops, development of regional tours, and a mini-grants program for tourism development.

Question. How long has this work been underway and how much has been appropriated through fiscal year 1999?

Answer. In fiscal years 1992 through 1995 the amount of $230,000 was appropriated. The appropriation for fiscal years 1996 and 1977 was $227,000 per year; for fiscal year 1998 was $247,000; and for fiscal year 1999 was $280,000. Total appropriated funds to date is $1,901,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. fiscal year 1992 included $38,764 in state matching funds. fiscal years 1993,1994, 1995, and 1996 included $39,360 of state matching funds. fiscal years 1997 and 1998 include $39,040 state matching funds.

Question. Where is this work being carried out?

Answer. Applied research and outreach is being carried out through New Mexico State University.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original completion date was September 30, 1993. The original objectives of this research have been met. The additional objectives being presented for the current year will be completed by September 30, 2000.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency evaluates the merit of research proposals as they are submitted. No formal evaluation of this project has been conducted. The principal investigators and project managers submit annual reports to the agency to document impact of the project. Each year, the project has demonstrated significant accomplishment in the reports submitted. Impacts include significant increases in attendance of local festivals, increase in number of tour bus visits to New Mexico, training to over 700 tourism employees in the region, and establishment of a number of new businesses. Agency evaluation of the project includes peer review of accomplishments and proposal objectives and targeted outcomes.

RURAL REHABILITATION, GEORGIA

Question. Please provide a description of the program that has been funded under the Rural Rehabilitation project in Georgia.

Answer. The program has tested the feasibility of providing satellite-based adult literacy education, in association with vocational rehabilitation services, to handicapped adults in rural Georgia. The program has developed curriculum, tested and adapted technology, established student recruitment and retention strategies, expanded to Statewide coverage, and provided successful adult literacy education.

Question. What is the national, regional, or local need for this program?

Answer. A state task force has estimated that 25 percent of Georgia's adult population is functionally illiterate. Functional illiteracy is regarded in Georgia as a form of disability. The extent of adult functional illiteracy is similar throughout much of rural America.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The original goal of this program was to prove that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. This program has demonstrated that satellite-based literacy training, in cooperation with vocational rehabilitation services, can successfully provide adult literacy education designed to improve critical reading, writing, and thinking skills, for handicapped rural adults. Over the past 9 years, test scores and attendance and completion rates of students in the satellite-based program have shown that distance learning is an effective delivery system for instructing low-level readers and non-readers. Test scores and attendance rates of students in this program have been comparable to those of students in traditional, urban classes.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Funding for this program was initially appropriated in fiscal year 1989, and the program has been in operation since March 1989. Through fiscal year 1998, appropriations for this program have been as follows: $129,000 in fiscal year 1989; $256,000 per year in fiscal years 1990, 1991, and 1992; $250,000 per year in fiscal years 1993, 1994, and 1995; and $246,000 per year in fiscal years 1996, 1997, 1998 and 1999. Funds appropriated to date total $2,631,000. These Federal funds are typically used for program innovation and quality improvement.

Question. What is the source of and amount of non-federal funds provided by fiscal year?

Answer. The fiscal year 1998 source of non-federal funds provided for this program are state appropriated funds from the Georgia Department of Adult Education. Prior years sources also included private contributions from the Woodruff Foundation and other local foundations. Through fiscal year 1998, the total amount of non-federal funds provided the project has been $8,006,901. The breakdown by fiscal year is: $164,000 in fiscal year 1988; $270,500 in fiscal year 1989; $809,675 in fiscal year 1990; $656,765 in fiscal year 1991; $65,000 in fiscal year 1992; $1,019,821 in fiscal year 1993; $20,000 in fiscal year 1994; $872,500 in fiscal year 1995; $1,500,000 in fiscal year 1996; $1,319,320 in fiscal year 1997; and $1,309,320 in fiscal year 1998.

Question. Where is this work being carried out?

Answer. The Georgia Tech Satellite Literacy Project is sponsored and operated by four organizations: Georgia Institute of Technology's Center for Rehabilitation Technology, the Center for Rehabilitation Technology, Inc., Literacy Action, Inc., and the Georgia Department of Technical and Adult Education. The program grantee is CRT, Inc., a private, not-for-profit business advisory board to the Center for Rehabilitation Technology, College of Architecture, Georgia Institute of Technology, from which the literacy instruction has been provided.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. It was anticipated that it would take three years to demonstrate that distance learning can be an effective tool for reaching and teaching functionally illiterate adults in rural areas. That original objective was met in Fiscal 1991. Additional objectives since fiscal year 1991 have been to expand the outreach of the satellite based adult literacy program to enough additional sites throughout the State of Georgia so that all potential participants have reasonable access to the program, and to continually upgrade the quality of class programming and the technical capacities of the system. The fiscal year 1997 technological upgrades expanded the capacity of the program more than 25-fold, from 77 to over 2,000 downlink sites, and a 6-fold increase in broadcast hours, and made materials available as supplemental tools to all Georgia literacy classes. As of December 1997, the Georgia Tech Satellite Literacy Program is in a period of transition from that of providing literacy instruction via direct television broadcasts to classrooms to that of development and dissemination of technology-based instructional aids. The project has been renamed the Lifelong Learning Network, or LNN. This change is being made based upon the request of the major sponsor, the Georgia Department of Technical and Adult Education, Office of Adult Literacy. The LNN will develop and produce video-based instructional supplements, technology-based curriculum and training for adult literacy practitioners, and multi-media projects for literacy students.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The agency receives annual reports on the project that are used, together with agency merit review, to assess its progress. Based on these reports, the agency has found that the project has made steady progress in demonstrating the feasibility of utilizing distance learning technology and teaching methods to provide adult literacy education programs to handicapped adults throughout the State of Georgia. The project has been successful in applying the latest distance education technology to both control the program cost per participant and, most recently, to expand the availability of the program.

TECHNOLOGY TRANSFER PROJECTS, OKLAHOMA AND MISSISSIPPI

Question. Please provide a description of the program that has been funded under the Oklahoma and Mississippi Technology Transfer Projects.

Answer. The original work involved the transfer of uncommercialized technologies from Federal laboratories and universities to rural businesses and communities. The objectives have evolved to providing more one-on-one assistance to small manufacturers. This type of assistance responds to the stated needs of the small manufac-

turing community and fills a recognized gap in the existing service provider community. This project has undergone a merit review.

Question. What is the national, regional, or local need for this program?

Answer. Manufacturing extension programs throughout the country have identified one-on-one engineering technology assistance as a need for small manufacturers as they attempt to become more competitive and profitable.

Question. What is the original goal of this program and what has been accomplished to date?

Answer. The primary goal of these programs is to contribute to an increase in business productivity, employment opportunities, and per capita income by utilizing technology and information from Federal laboratories; Rural Enterprises Development Corporation and Industrial Technology Research and Development Center in Durant, Oklahoma; Mississippi State Food and Fiber Center; Vocational-Technical Education System; Center for Local Government Technology; Cooperative Extension Service; and other university departments and non-campus agencies. Specific program objectives are to:

—Develop greater profitability of existing enterprises.

—Aid in the acquisition, creation, or expansion of business and industry in the area.

—Establish an effective response process for technological and industrial-related inquires.

—Devise effective communication procedures regarding the program for the relevant audiences.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Funding appropriated to date is as follows: $350,000 per year in fiscal years 1984 and 1985; $335,000 in fiscal year 1986; $333,000 per year in fiscal years 1987 through 1990; $331,000 per year in fiscal years 1991 through 1995; and $326,000 per year in fiscal years 1996 through 1999. Appropriations to date total $5,326,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Oklahoma State University and Mississippi State University have provided considerable amounts of matching support from state funds over the life of the project. Over the past four years, support has included a significant portion of engineering faculty salaries as well as the administrative support of county and district extension staff.

Question. Where is this work being carried out?

Answer. The work is being carried out at Mississippi State University and Oklahoma Sate University.

Question. What is the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The original proposal in 1984 was for 12 months. The original objectives have been, and continue to be met. Although individual client projects have a beginning and end, the technology transfer process is continuous. Over the past years, specific and measurable annual objectives and the achievement of objectives have been documented in annual reports. The objectives of both programs have been to: continue the delivery of high-quality engineering assistance and technology transfer services to small manufactures: conduct joint workshops, client referral, and joint research and application projects; and demonstrate a value of service to clients many times project operating costs. The current phase of the program will be completed in 1999.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. Site visits and merit reviews have been conducted annually on these projects as well as client surveys by project staff themselves. Survey results have documented job creation, productivity enhancement, and local community economic activity. The Technology Transfer program has impacted the integration of emerging technologies that are benefitting the citizens, ranging from assisting small businesses and industries in integrating new computer hardware and software for conducting electronic commerce, to providing extensive online information resources. The Technology Transfer Funds have served as a catalyst for the development of a long range telecommunications network plan for the total extension service to link all county extension offices and research centers directly to the Mississippi data/video backbone and provide access to the Internet.

WOOD BIOMASS, NEW YORK

Question. Please provide a description of the program that has been funded under the Wood Biomass Grant?

Answer. The objective of this project is to expand, implement, and gain acceptance of wood biomass as a sustainable, renewable and environmentally-affable fuel source. In addition, the project is deemed to support the promotion of alternative forest products for the Nation's Central and Northern Hardwood forests regions.

Question. What is the national, regional, or local need for this program?

Answer. The principal researchers hypothesize that the project is of national interest. Biomass research studies through the U.S. Departments of Agriculture and Energy span 20 or more years. This work clearly demonstrates that the nation is in a position to scientifically produce environmentally-affable fuels for power generation systems. Except for co-generation plants the current cost of conventional power supply fuels currently precludes the wholesale adoption of this technology. Complementing the planned fuel supply are many sidebar benefits including carbon sequestration, rural economic development, wildlife habitat, and soil erosion and sedimentation associated with conventional agriculture.

Question. What was the original goal of this program and what has been accomplished to date?

Answer. The goal of this project is to promote, through applied research and technology transfer, wood biomass as a sustainable wood supply for (1) power generation, (2) alternative farm products, (3) wise stewardship of land resources, and (4) enhanced farm profitability.

To accommodate these goals, scientists at the State University of New York are planting willow trials on several sites and under several conditions. Site preparation and planting has occurred on several locations, and more are planned. Cornell University, a partner institution in the project, has hired a technology transfer specialist to coordinate educational activities resulting from this work. Common events include field days, news articles, videos, and exhibits.

Question. How long has the work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. This aspect of the program began with an appropriation of $200,000 in fiscal year 1995. An additional $197,000 was appropriated by the Congress for fiscal years 1996 through 1999. This sums $988,000.

Question. What is the source and amount of non-federal funds provided by fiscal year?

Answer. Four state partners and approximately 18 private partners contribute resources at a ratio of nearly 1.5 to 1 for this project.

Question. Where is the work being carried out?

Answer. The field work is being conducted on private and state land near Syracuse, New York. Electronic and print media allows Cornell's technology transfer activities to extend far beyond that point.

Question. What was the anticipated completion date for the original objectives of the project. Have those objectives been met? What is the completion date of additional or related objectives?

Answer. The completion date for the original objectives of the project, willow cultivar planting, was September 30, 1996. With the addition of some new dimensions to the project, the completion date is now 2003. Because of the timing of one of the fiscal awards, some weather related problems and some land contract problems all of the original objectives have not been met. Most of the unmet objectives should be completed in 2000.

Question. When was the last agency evaluation of the project? Provide a summary of the last evaluation conducted.

Answer. A field review of the project was conducted on August 20–21, 1997. Excerpts from the review report include (1) positive accolades for their quarterly progress reports, (2) positive accolades for the outreach program being conducted by Cornell University, (3) praise for the scientific outreach by the principal investigators, (4) praise for connecting the willow biomass program to the poultry waste and riparian issues in New York state, and (5) praise for gaining the acceptance of willow biomass as an agricultural crop for state property tax purposes. On the concern side, CSREES' project administrator flagged the delay in establishing the demonstration farm and requested diligence in bringing this aspect of the project to fruition. Subsequent reports from the project reveal that this aspect has been satisfactorily addressed.

SUBMITTED QUESTIONS ON GOVERNMENT PERFORMANCE AND RESULTS ACT

QUESTIONS SUBMITTED BY SENATOR COCHRAN

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. In accordance with the Act, AARCC has developed a strategic plan and annual performance plans for fiscal year 1999 and fiscal year 2000.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The performance goals and objectives contained in AARCC's strategic and annual performance plans were taken from AARCC's business plan, which, together with the by-laws, is the operational framework for the corporation. The business plan was approved by the AARCC board of directors and is the basis by which the board measures the performance of the corporation. As the Executive Director, I am evaluated, in part, on my ability to have the corporation meet its annual and strategic goals.

Question. How is performance information being used to manage the agency?

Answer. Performance against AARCC's business plan targets is a major consideration in establishing a value for AARCC's portfolio and preparing the corporation for privatization. Since the business plan also anticipates a certain level of repayments to the revolving fund each year, performance information is also used to anticipate the necessary level of future appropriations. AARCC's budget requests are developed accordingly.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. AARCC developed its fiscal year 2000 budget request with the expectation that two to three of its portfolio companies would complete initial public offerings (IPOs) during the fiscal year. If these companies complete successful IPOs and become publicly traded, then their capacity for job creation and growth increases. Returns to the AARCC revolving fund are also realized through the sale of AARCC's stock in the company. This contributes to the attainment of all four objectives in AARCC's annual performance plan: increased economic development and job creation in rural areas, profitable and efficient uses of limited natural resources, development of profitable U.S. companies that manufacture products from renewable agricultural, forestry, and or animal-based raw materials, and a reduced need for appropriated funding for AARCC.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. AARCC has not found it necessary to significantly alter its program in order to accomplish its GPRA goals and objectives. The GPRA goals and objectives are already expressed as short- and long-term milestones in the AARCC business plan. In some instances, timetables for accomplishing these milestones have been extended due to unusual budget constraints during fiscal year 1999. Nevertheless, AARCC has still been able to pursue a number of initiatives to support the accomplishment of its performance targets.

With respect to its performance goal to increase public awareness of AARCC and its mission, AARCC has recently introduced of the Industrial Agriculture Clearinghouse, an internet-based service designed to assist in commercializing new uses for agricultural products. To date, the Clearinghouse has been visited 3,864 times; AARCC's fiscal year 1999 performance indicator was 2,800 hits.

Additionally, AARCC has been instrumental in organizing USDA's Bio-based Products Coordination Council. A primary responsibility of the Council is the semiannual publication in the Federal Register of a bio-based products list. This list provides Federal agencies with a variety of product alternatives that comply with the environmentally preferable purchasing requirements of Executive Order 13101, Greening the Government Through Recycling, Waste Prevention, and Federal Acquisition. This Executive Order, signed on September 14, 1998, strengthens and expands the Federal government's commitment to recycling and buying recycled-content and environmentally preferable products.

Finally, in an effort to increase awareness of AARCC and bio-based products within the investment community, AARCC co-sponsored an investment forum last October and is co-sponsoring another one in June. These events are targeted to investors with an interest in environmental technologies. They have been organized to show-

case products and technologies from the bio-based products industry generally, and AARCC-funded companies specifically.

Another performance goal is to obtain a clean and timely audit opinion on AARCC's audited financial statements. To this end, AARCC is working with an outside contractor and USDA's Office of Inspector General (OIG) to develop a new system of internal controls. These controls are still being developed and will be implemented later this fiscal year. Consequently, AARCC's performance goal of obtaining a clean audit opinion in fiscal year 1999 has been delayed until fiscal year 2000.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. AARCC's budget structure is dictated by statute—16 percent of amounts in the revolving fund (appropriated funds plus return on investment) are reserved for administrative expenses; 84 percent must be used to fund new projects. The administrative portion of the budget supports the salaries, benefits, travel and related expenses of the AARCC staff and board of directors. This part of the budget also funds the public education, information technology, and financial management activities included as management initiatives in AARCC's annual performance plan. It is by financing new investments, the activity funded by 84 percent of AARCC's overall budget, that AARCC attempts to accomplish the performance goals identified in its annual performance plan.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. Currently, the Federal Agriculture Improvement and Reform (FAIR) Act requires that a full one percent of AARCC's annual appropriation be spent to conduct due diligence reviews of prospective investment projects. Because the size of AARCC's portfolio has grown considerably since this legislation was enacted, the funds sequestered by this provision would be better spent to enhance the performance of the existing portfolio investments. This could be accomplished by redirecting the one percent to be used for follow-on investments in existing portfolio companies, or for expenses associated with project monitoring activity, or both. Making this change, however, would require an amendment to the FAIR Act.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. We anticipate that a reporting of reliable data regarding AARCC's net present value and the annual rate of return on its portfolio investments will be delayed by a year. AARCC's performance plan submitted as part of its fiscal year 2000 budget request showed hard data as being available at the end of fiscal year 1999. Due to an unexpected reduction of 50 percent in AARCC's fiscal year 1999 appropriation, funds were not available during fiscal year 1999 to let the RFP required to secure an outside valuation of the AARCC portfolio. This activity has been postponed until fiscal year 2000 and will not be complete in time to meet the March 2000 deadline for issuing AARCC's first annual performance report.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. AARCC's funding requests are specified in its business plan, which ties future requests to anticipated returns on the investment portfolio. AARCC has identified a 20 percent annual rate of return as a performance goal for fiscal year 2000. This translates into anticipated cumulative repayments of $1.7 million and a subsequent appropriation request of $15 million.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. AARCC has only one performance goal, to accelerate commercialization of industrial and consumer products made from renewable agricultural, forestry, and animal by-product raw materials. Consequently, all resources available to AARCC in a given fiscal year are dedicated to accomplishing that goal.

AGRICULTURAL MARKETING SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. We have developed a strategic plan that includes goals and objectives that are linked to each budget activity within AMS. Internal semi-annual and external annual performance reporting ensure the agency's compliance.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Every AMS senior executive's performance standards include an element requiring effective leadership and timely action in implementing established program goals and objectives.

Question. How is performance information being used to manage the agency?

Answer. Through effective leadership, adapting to changing priorities, and the ability to develop and carry out goals and objectives, the agency's senior executive staff manage their respective programs by utilizing performance data information.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. AMS funding requests for fiscal year 2000 reflect both program performance and the changing agricultural market structure. For example, the marketing of U.S. products is increasingly influenced by changes in the international marketplace. The fiscal year 2000 budget request includes funding to expand reporting in foreign markets and development of organic certification to enhance the international trading of U.S. agricultural products.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. AMS' Strategic Plan and fiscal year 2000 Annual Performance Plan include specific objectives to improve performance. Two examples are the implementation of the organic standards program and the restructuring of the dairy marketing agreements and orders program. AMS plans to implement national organic production and labeling standards, and implement an accreditation and certification program using those standards to achieve its goal of facilitating the strategic marketing of U.S. agricultural products in domestic and international markets. Through reorganization and streamlining, AMS continues to reform the Milk Marketing Order Program to achieve its goal of ensuring fair and competitive agricultural marketing through marketing tools and regulations.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The performance plan includes a performance goal for each AMS budget activity.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. Since the linkage is direct, no changes are necessary to the account and activity structure in the budget justification.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. AMS expects to have reliable data for the first performance report.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. As in the past, future funding decisions will be based on both program performance and changing marketing structure.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Each of AMS' budget requests are associated with goals in the performance plan and reflect the full agency costs in carrying out that goal, including overhead.

AGRICULTURAL RESEARCH SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act? Answer. As Administrator, I have supported the development of the Agency's outcome oriented strategic plan and streamlined the National Program Staff in order to more effectively manage the research program. Also, I have strongly supported the GPRA workgroup recommendation to aggregate the Agency's more than 1,100 research projects into a National Program structure. These changes have helped to reinforce the attention of ARS scientists and managers on producing research outcomes that directly address issues and problems confronting American agriculture. In addition, the creation of National Programs has greatly strengthened the interactions between ARS and its customers, partners, and stakeholders. While many aspects of research do not lend themselves to a strict performance-based management regime, the changes that have been made in the

management of ARS' research program will move the Agency in that general direction.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The principal tool for moving the agency towards a greater focus on performance management is the development and full implementation of the National Programs. The National Program Staff is the component primarily responsible for managing the ARS research program. Each National Program Leader has an element in his/her performance standards that require him/her to plan, organize, and hold customer workshops that are essential to shaping each National Program. The Annual Performance Plan and the Annual CRIS Project Report, were just completely revised to make them more responsive to performance-based management.

Question. How is performance information being used to manage the agency?

Answer. The 23 new National Programs are the principal components of the Agency's approach to programmatic accountability. The National Programs support the ARS Strategic Plan 1997–2002 and each is focused on specific short- and long-term outcomes. Performance information (both current and projected up to two years) is the basis of the Annual Performance Plan and the Annual Performance Report. The National Program Staff is currently developing a brief annual report for each of the 23 National Programs which will be available on the ARS home page this summer. NPS also plans to comprehensively review its performance information data gathering efforts (both substance and process) before it begins to collect information on fiscal year 1999 performance.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. In the ARS Annual Performance Plan covering fiscal years 1999 and 2000, the Agency specifically identified performance measures that will be achieved if Congress concurs with the budget request. While research does not lend itself easily to the use of numerical metrics, the enactment of GPRA has begun to change the culture of ARS by strengthening the Agency's focus on the ultimate outcome of its work.

As an example of how ARS displays fiscal year 2000 requests for new or additional funding in its Annual Performance Plan, under Performance Goal 2.1.2.1, "Demonstrate new integrated technologies to protect plants, animals, and ecosystems," ARS is requesting increases of:

—$1,667,000 for areawide integrated pest management programs, and IPM component technology for fruits and vegetables treated with organophosphates and carbamates and pests under large-scale action agency eradication.

—$1,500,000 for the Office of Pest Management Policy.

—$900,000 for wheat and barley scab research.

—$1,000,000 for research on brucellosis vaccines for wildlife.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. In response to the enactment of GPRA, ARS completely changed the way it manages its research program. Traditionally, the Agency managed its research through 1100 plus individual CRIS projects. A workgroup was established in 1994 to develop recommendations on how best to implement GPRA in a research agency. Based on its recommendations the various research projects were organized into National Programs. The National Program Staff with considerable input from ARS scientists, customers, stakeholders, and partners, developed 23 National Programs which are now being refined and implemented through a series of workshops. The National Program structure will far more effectively focus the work of the Agency on achieving the goals and objectives identified in the 5-year Strategic Plan and the AnnualPerformance Plans than would the previous approach.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The performance goals are directly linked between the Strategic Plan and the Annual Performance Plans. The Performance Plan is linked, at the level of the five General Goals, to the traditional budget accounts by a crosswalk.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. No specific changes in the appropriation account and activity structure are anticipated at this time. However, if the new National program structure proves to be a useful framework for setting forth annual program goals for research activities in ways that improve results and accountability, then the appropriations committees and the Department may consider changes in the budget activity structure. The Department would consult with the committees to ensure any changes would

improve the budget appropriation process from both the executive branch and Congressional perspectives.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. After considerable internal study and wide-ranging informal discussions with other Federal research agencies, ARS concluded that it could not meaningfully display its accomplishments of its research program using numerical metrics as envisioned in GPRA. In the Explanatory Notes that accompanied the Agency's fiscal year 1997 budget request, ARS provided a preliminary performance plan that counted scientific publications, new CRADAs, patent applications, and so forth. The information generated by that approach did not even remotely address the intent of GPRA. As a result, ARS requested a waiver under GPRA to use a narrative approach. OMB concurred. Following the structure of the ARS Strategic Plan 1997–2002, the Annual Performance Plan for fiscal years 1999 and 2000 identifies approximately 150 specific anticipated accomplishments for each year that, if achieved, will enable the Agency to meet its performance goals. Even though GPRA does not require a performance report until March of 2000, ARS decided to complete its first report covering over 150 milestones that had been identified in last year's Annual Performance Plan. Each fiscal year 1998 indicator of progress (anticipated accomplishment that demonstrates progress towards a longer term goal) has a narrative description of what was actually accomplished and a description of the outcome or impact of that work. ARS demonstrated its commitment to programmatic accountability by developing a combined document containing the Annual Performance Report for fiscal year 1998 and the Annual Performance Plan for fiscal years 1999 and 2000 a year ahead of the statutory requirement.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. As mentioned earlier, since it was not possible to meaningfully track research with numerical measures, ARS requested a waiver under GPRA to use a narrative approach concurred to by OMB. Following the structure of the ARS Strategic Plan 1997–2002, the Annual Performance Plan for fiscal years 1999 and 2000 identifies approximately 150 specific accomplishments or milestones that the Agency anticipates achieving in each fiscal year. Successful achievement of these milestones will indicate progress towards the broader goals and objectives contained in the strategic plan. If the agency successfully meets most of these milestones, the Congress can have confidence that steady progress is being made towards the General Goals.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Because of the ongoing nature of research, the Annual Performance Plan anticipates milestones and outcomes which the Agency anticipates accomplishing in fiscal years 1999 and 2000. The Plan does not associate specific funding to these anticipated accomplishments. Where the Plan does directly link specific levels of resources with research activities is in areas where the fiscal year 2000 budget requests "new" money. In the most recent Plan, ARS has identified over 45 anticipated accomplishments that would occur if Congress approves the budget request.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. The APHIS Administrator will incorporate elements into all senior managers performance standards which help focus management on desired program results, consistent with Government Performance and Results Act (GPRA) requirements. He has also involved managers throughout APHIS programs in revisiting their Annual Performance Plan goals, indicators, and targets; by doing so, they have clarified and refined the Agency's fiscal year 2000 plans.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The performance of senior managers will be reviewed and judged based on their attainment of GPRA goals.

Question. How is performance information being used to manage the agency?

Answer. One of the major benefits of focusing on GPRA requirements has been the establishment of baseline data to determine where our programs currently stand

in terms of results. This information will enable us to track progress and trends, set more accurate targets, communicate results to our stakeholders and customers, and make management decisions based on actual performance information.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. Program performance was a key factor in the resource allocation decision process in APHIS. For instance, the success of the Brucellosis Program as measured by the reduction in the number of infected herds resulted in the decision to request a reduction in funding for that line item in fiscal year 2000. APHIS requested additional funding in the Horse Protection line item to improve program performance by allocating the additional resources to increase the number of audits and monitored horse shows, and to expand training for inspectors.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. Programs in APHIS have established strategic and operational plans at lower levels in the organization, including field levels, to ensure that program managers throughout the agency are able to prioritize their work so that GPRA goals are met and so that Agency activities are aligned in such a way as to enable successful accomplishment of targets.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. They are directly linked. The five functional components of the agency's budget structure (Pest and Disease Exclusion, Plant and Animal Health Monitoring, Pest and Disease Management, Animal Care, and Scientific and Technical Services) correspond to the five general goals of the APHIS strategic plan. In the annual performance plan, APHIS has developed a set of annual performance targets for each goal of its strategic plan. The objectives listed under each goal in the annual performance plan correspond directly to funded pest and disease programs under each functional component.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. We do not believe that changes to the budget account and activity structure would significantly improve the linkage between resource amounts and performance goals.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. There may be measures for which the reliability of the data used to assess performance could be improved. In other cases, other measures may be better served by alternative data sources other than the original data sources identified.

APHIS benefits from focusing Agency attention on performance data because we can help ensure that as information systems are designed and implemented, they take into consideration the need for reliable program performance data. Similarly, as APHIS interacts with other agencies, with other levels of government (e.g., States), with academia and private industry, we can focus on identifying other sources of data outside of APHIS which can help improve our data. We believe that the reliability of our data sources can be tested and enhanced through the use of related and supplemental data sources housed elsewhere.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. APHIS will compare projected versus actual accomplishments and determine the causal factors for differences between the two. This analysis will be driven by the questions, Are we measuring the right things? Are we using the right targets/indicators to show the true results of the program? Are we operating efficiently and effectively? Have the benefits truly outweighed the costs? There may be times when unpredicted or external factors may cause us to have to revise or redefine targets and indicators. These factors, which are difficult to anticipate, may ultimately have a direct and significant impact on future funding requests. We intend to constantly monitor and compare actual performance to target performance, analyze the gaps, and use this information when considering future funding. There is no doubt that some changes will occur along the way, to both targets and indicators, but APHIS challenge will be to keep enough of our measures constant to be able to truly gauge progress.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The dollars associated with specific agency performance goals are limited by total available funding which consists of appropriated funds and projected funding from other sources. In the current budget era, APHIS has had to turn more frequently to its partners either at other levels of government, in other agencies, or in private industry to help support its goals. Increases in cooperative agreements, user fees, and other fee for service opportunities have helped narrow the gap between diminishing federal funds and true costs to run agency programs, but there are times when the gap still exists.

Opportunity costs are often incurred by the agricultural community as well, and they are not necessarily captured in the dollar amounts reported by APHIS for each performance goal. APHIS may have goals geared toward eliminating diseases of farm animals, for instance, and may track APHIS activities focused on assisting farmers in preventing/managing diseases. However, it is difficult to determine what it really costs a farmer to have to destroy part of a herd because it was diseased, even though it helped APHIS to prevent further spread of the disease. On the other side, it is difficult to gauge the economic effects of farmers no longer requiring loans from USDA if APHIS has helped them to enhance their financial solvency through pest and disease management.

Still other opportunity costs exist. For instance, because most Americans are disconnected with agriculture, they lose sight of the difficulties inherent in a system with few producers to provide food and fiber to a great many consumers. Each time a farmer or rancher goes out of business because of bad weather conditions or lack of methods (such as chemicals for crop protection or tools for livestock depradation control) to protect their agricultural inventories the agricultural community suffers. Greater responsibility falls upon fewer producers to supply an increasing population with greater varieties and quantities of food.

APHIS does not have a separate line item for overhead costs. The dollars associated with specific performance goals include overhead costs.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. Programs managed by the Cooperative State Research, Education, and Extension Service (CSREES) are based on five GPRA goals that were developed over a period of 18 months in consultation with the land-grant university partners. The allocation of program funds by CSREES are based on an appropriate response to the goal(s). It becomes the responsibility of each Director/Administrator receiving funds from CSREES to develop a performance plan that covers at least 5 years. The performance plan describes objectives, performance goals, performance indicators along with outcome and outcome indicators. To assess the appropriateness and relevance of the performance plan submitted by each State, a review is conducted of each plan by CSREES National Program Leaders and Deputy Administrators. This merit review forms the basis for the allocation of formula funds. Each year, the same institutions submit an annual performance report to the agency to describe accomplishments made against the performance plan. Reviews of these submissions provide the basis for the agency performance plan and report. Using this procedure, the agency is in a strong position to eliminate program duplication and recommend the use of funds to address issues of national importance where Federal research and education can generate the greatest impact.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The agency strategic and performance plans form the basis for evaluating agency and executive accomplishments. Each agency executive is held accountable for his/her influence in setting goals for the agency and leadership in influencing the development of agency program priorities. Progress is assessed during regular meetings and in CSREES executives' mid-year and annual performance reviews.

Question. How is performance information being used to manage the agency?

Answer. Performance information is being used to frame the agency performance plan and provide guidance in the USDA budget priority setting process. The success of this effort is best demonstrated in joint development and publication of annual impact statements that highlight significant system achievements in research and education. The impact statements have focused on issues that are important to the Nation, and have had a positive impact in helping stakeholders understand the value added by the investment made in Federal funding and the need to redirect resources to address relevant issues, particularly when gaps in information are identified.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answers. Agency performance is assessed based on how well it allocates resources and support project needs that are relevant to the U.S. Department of Agriculture. This was reflected in decisions made in the President's Budget for fiscal year 2000. The following are examples of issues that can be addressed by CSREES: Development of new surveillance methods for foodborne diseases; deliver information to at-risk populations to improve nutrient intake; focus on animal waste management to prevent the pollution of air, soil and water resources; enhance child care programs in targeted communities; develop program delivery strategies for Native American communities to improve health, enterprise management and community development and nutrition; improve entrepreneurial business skills for small farmers to establish viable farm operations and enterprises; integrate production, processing and distribution systems for generation of high value products; study how pathogens are introduced into the production environment, how they survive to contaminate foods, including fresh fruits and vegetables; develop alternatives needed for safe substitutes for commonly used pesticides; etc.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. Developing a comprehensive strategic plan with annual performance plans has encouraged the agency to focus on things that are important to the accomplishment of specific goals. It has changed from a previous organizational culture that tried to "be all things to all people". The agency strategy has created an environment that recognizes the value of focusing on a few issues that are relevant and can be accomplished within the resources provided.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The agency budget structure links all mechanisms of support (or budget line items) to the five goals outlined in the strategic plan through use of a crosswalk budget table. This allows performance goals and measures to be developed that support the budget and respond to the Congressional accountability mandate of GPRA. This will result in output and outcome measures that will be documented in future annual performance reports prepared by CSREES.

Question. What, if any changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. No specific changes in the appropriation account and activity structure are anticipated at this time. However, if a different program structure proves to be a useful framework for setting forth annual program goals for research activities in ways that improve results and accountability, then the appropriations committees and the Department may consider changes in the budget activity structure to reduce the complexity of crosswalks that we use at the present time. The Department would consult with the committees to ensure any changes would improve the budget appropriation process from both the executive branch and Congressional perspectives.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improved the reliability of these measures?

Answer. The agency believes that it will have reliable data in time for the first performance report in March 2000. We have used the annual performance report experiences over the past two years to refine performance measures based on the agency strategic and performance plans.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. We believe that the Government Performance and Results Act will require us to document actual performance compared to expected targeted performance. This lets us learn from past experiences and become better at projecting targeted performance as an estimate of resources needed to conduct programs.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The dollars associated with the performance goals represent the total amount appropriated for CSREES programs including federal administration funds retained by the agency to administer the programs. In addition, estimated reimbursable funds and mandatory funds for programs administered by CSREES are included.

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. In 1998, the Acting Assistant Secretary, began a re-examination of how the performance goals and objectives were affecting operations and customer service within Departmental Administration (DA). New streamlined goals were identified which could better guide performance to the essential business roles of the DA Staff Offices. These new goals and objectives stress the two essential elements of DA business responsibility: Leadership, oversight and coordination to improve management of program and administrative systems throughout the Department; and the delivery of timely, reliable and efficient services to Department agencies.

Last Fall, DA managers met in consultation with the staff of the House Committee on Government Operations and other staff from the Congress to explain this change and seek their guidance. A Strategic Plan was initially drafted and Performance Plans were developed for the fiscal year 2000 Budget. We are now operating under this Performance Plan, which was developed by DA senior leadership.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The fiscal year 2000 Budget contains a Performance Plan for fiscal year 1999 and 2000 which relates the DA goals and objectives directly to accomplishments in each Staff Office area. The new Plan identifies key elements of accomplishment in areas that can be directly related to performance in each Staff Office and progress is reviewed on a regular basis.

Question. How is performance information being used to manage the agency?

Answer. Under the restricted budget situation in which all DA operations find themselves today, there are constant questions on how to best use scarce resources. The Performance Plan provides an index of progress/accomplishment across the spectrum of DA program activity. Although the performance factors are relatively new, there is a potential to manage the allocation of resources by prioritizing program accomplishments and shifting resources to meet critical program needs.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. In the budget years immediately preceding the fiscal year 2000 Budget, DA operated under strong program priorities aimed at reversing the negative trends which had been identified in the Department's civil rights record. Budget decisions followed these priorities. In the development of the current budget, DA re-examined other policy support and service responsibilities as well. A new Strategic Plan and performance goals and objectives were identified in internal workshops and in consultation with the Congress. The heart of the current budget proposal is the focus on these performance elements which reflect the new Strategic Plan focus on customer service.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. As a continuation of the development of the focus on service to customers, DA is currently engaged in an examination of its service responsibilities and whether its functions are supported by the current organizational structure. Some realignment of functions and organizations may be needed. The objective is to have the program assignments and organization in place by September 30, 1999.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The current Performance Plan and the performance measures reflect the budget structure. Key performance measures have been identified in each major area so that the accomplishments can be measured against the resources used.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. As previously stated, DA is currently undergoing an examination of its functions and organization. Changes will be implemented by the end of this fiscal year and will be reflected in the next budget cycle (fiscal year 2001). As part of the organizational planning, the budget structure will be adjusted to closely reflect the key operations and responsibilities of DA.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. The current Performance Plan contains measures which can be tracked and should not present any problems in developing the first performance report next

year. As adjustments are made, the availability of data to support key measures will continue to be an important criterium.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The development of future budgets will assess the priorities and cost of achieving the performance elements identified in the Performance Plan. Unproductive or extremely inefficient program objectives will be de-emphasized in favor of more critical and more productive program elements. Experience with the performance measures will be used in assessing the critical budget criteria of: whether the program/activity should be continued, identifying the appropriate roll for DA, and determining whether the DA operating plan for the program/activity is efficient and productive.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The current resource costs identified in the Performance Plan by goal reflect the total amount of full time equivalent (FTE) employment and dollars used by DA in each area. This includes directly appropriated funds, reimbursements from customers and working capital funds. Overhead, such as management, training and facilities costs are allocated to the goals on a pro rata basis.

ECONOMIC RESEARCH SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. The ERS Administrator has taken a number of significant steps toward achieving performance-based management. The most ambitious activities relate to evaluating the effectiveness of ERS research and analysis in achieving the agency mission and goals. They are providing useful insights into program strengths and weaknesses. Stakeholders and customers have played a central role in these evaluation efforts, which include:

—A major 2-year review of the ERS program by the National Academy of Sciences National Research Council, which is now complete and will be released in final form very shortly. The report addresses key aspects of ERS operations, including the need for formal instruments that allow clients to assess the suitability of ERS to perform any given analytical task and the need for peer review of individual scientists. A new process for accomplishing the latter is already underway. The report also provides recommendations on means of assessing the balance between intramural and extramural research, particularly focusing on ways to expand the extramural program. ERS has already taken some steps in this direction in its extramural program in support of the Food and Nutrition Research Program.

—A review of the market for economic information on commodity markets. The need for, availability of, and access to economic information on agricultural markets has changed significantly during the last decade. In response, ERS has undertaken a study to determine the value placed on different types of agricultural market information by decisionmakers in the public and private sectors. The first phase, now nearly complete, focused on public sector information users, soliciting information from USDA agencies, the Congress, and other Government agencies. The second phase will focus on private sector information users.

The ERS Administrator played a valuable role as a member of the management advisory team overseeing an assessment of USDA's Interagency Commodity Estimates Committee process. This cross-cutting review is aimed at improving the efficiency and efficacy of the Department's process for developing commodity estimates. ERS not only provided funding, but is also providing major staff support for implementation. In addition, in the last year, ERS has begun development of a single comprehensive tracking system for its products to replace the multiple tracking systems currently in place, and a system to more systematically ensure that customers are getting the products and services they need. Finally, the Administrator has assigned a senior staff member the responsibility of investigating and developing evaluation methods and approaches to assure the relevance and quality of ERS research. Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Responsibility for achieving program goals is written into the performance elements and standards of all senior executives and branch chiefs. To make those standards concrete, ERS senior executives and branch chiefs prepare an inte-

grated set of division plans of work, articulating expected results that will contribute to achievement of agency goals. They provide an effective means of linking day-to-day activities to strategic and performance goals. In addition, the assessment by the National Research Council, the market information study, and the systems being developed to track products and customers all are providing means of evaluating success in achieving results.

Question. How is performance information being used to manage the agency?

Answer. The recommendations from the National Research Council report and information from the other assessments currently underway will provide significant guidance for ERS managers. For example, the market information study, by examining how the need for and the availability of economic information on agricultural markets has changed over the last decade, is assisting ERS in designing a market outlook program to meet the needs of a dramatically changed U.S. agriculture. As another example, in 1998, ERS created its first-ever "inventory" of all the work underway for each USDA mission area and then used it to initiate discussions within USDA on how to achieve more effective collaboration.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. In considering potential budget requests, ERS has always analyzed its program for gaps that could be filled by additional or different research and analysis. In deciding on fiscal year 2000 funding requests, that analysis was aided by the framework provided by ERS strategic and performance plans. Also helpful were increased efforts to incorporate customer feedback into discussion and decisions on programs.

For example, ERS has an ongoing program of work in commodity market analysis. This program provides the analytical underpinning for the Department and Agency situation and outlook programs. ERS requested additional funds for this program for fiscal year 2000 after ongoing and intensive program reviews, along with consultation with other USDA agencies, and feedback from outside users. It was clear that changes in the policy and trade environment made it vital for ERS to ensure sufficient capacity to analyze the structure and performance of commodity markets and to augment the analytical expertise on which Department forecasting is based. User feedback also made it clear that better and quicker access to ERS information was essential. All of these needs were encompassed in the ERS funding request.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. Within the context provided by the agency's strategic and annual plans, the need for planning and organizing some types of research across organizational units of ERS was clarified. As a result, the agency moved to initiate cross-unit activities where appropriate. The best example is creation of the Structural Change in Agriculture Organizing Team. The team, which is composed of researchers from all three ERS program divisions, is developing a major new agency program of work. Their efforts promise to provide critical insights that will significantly contribute to meeting ERS's goal of providing policymakers and others with quality analyses on issues related to structural change in agricultural industries. Other groups reflecting the priorities set in the ERS plans and utilizing cross-agency expertise are working on revenue insurance, trade and the environment, biotechnology, and rural amenities.

Since ERS's program is one of research and analysis, a key performance indicator used for every goal is the percentage of published research that meets peer review standards. Peer review of ERS products is a basic tenet of the ERS program. To ensure that the rewards system for staff reflects the agency's goal of developing high quality, relevant research, ERS has recently initiated another kind of peer review—of the positions of individual analysts. The new Economist Position Classification System is helping to ensure that economists are recognized for the impacts of their achievements.

Each of the ERS performance goals indicates that information will be provided to "policy makers, regulators, program managers, and organizations shaping public debate" in a timely fashion. In fiscal year 1998 and fiscal year 1999, the agency took steps to more systematically identify ERS customers and manage the information flow to them. These efforts, which are moving toward implementation, include the development of an automated system for managing customer services. The system will provide an economical means of ensuring that customers have ERS information when they need it and in the form they find most useful.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. ERS's budget has one appropriation item, economic analysis and research. The Performance Plan's five goals are linked and dependent on funding levels allocated within the agency.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. ERS does not propose any changes to its account structure.

Question. Does the agency's fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000. If so, what steps are planned to improve the reliability of these measures?

Answer. ERS will have sufficient and reliable data to complete its March 2000 performance report.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. If actual performance does not reach the target performance levels, ERS will review the goal to ensure that it is attainable and the indicators to ensure that they are appropriate. If both are realistic, the agency will assess the possibility of achieving the targets by management or programmatic changes. If neither of these non-budget approaches is likely to attain the desired results, reallocation of current funds or a request for additional funds will have to be considered.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The dollars associated with agency performance goals fully reflect the full costs of associated activities in support of the goals, including overhead costs.

FOREIGN AGRICULTURAL SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. FAS has adopted the philosophy that, in order to achieve true performance-based management within the agency, as required by GPRA, we must institutionalize it at every level of the organization. To that end, beginning in fiscal year 1997 and continuing in fiscal year 1998, FAS conducted strategic planning workshops with every division in the agency.

FAS is currently conducting weekly half-day conferences with a core group of key agency officials to move the process forward another step this year. FAS's ultimate goal is to link what every employee is doing to support the organization-wide goal. Through the business processes we are implementing, we are building the organizational capacity to achieve performance-based management within the agency.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Effective October 1, 1998, FAS implemented a performance reporting system, where each key manager is required to report on a quarterly basis his or her accomplishments relative to his or her assigned primary and support responsibilities. The primary and support responsibilities come directly from the agency's annual performance plan. All senior executives and managers in the agency have a critical performance element in their standards of performance which holds them accountable for this reporting requirement.

Question. How is performance information being used to manage your agency?

Answer. The performance information currently being reported on a quarterly basis by executives and managers is being used to make mid-course adjustments as necessary to help the agency accomplish its goals and outcome targets. Additionally, FAS is currently in the process of adding a second stage to its performance reporting system that will significantly enhance the agency's ability to track performance in a way that it can be related to results and used to manage the agency more efficiently and effectively.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples?

Answer. Program performance factored heavily into FAS's budget request for discretionary spending in fiscal year 2000. For instance, two new initiatives for fiscal year 2000 determined by FAS to be highly beneficial to U.S. export promotion are the South African Agricultural Trade Office (ATO) and the Reverse Trade Missions. The South African ATO proposal supports the President's Africa Initiative which recognizes the potential market for U.S. agricultural products. South Africa is the hub of southern Africa's trade, finance, and transportation infrastructure. The Commerce Department agrees with FAS' assessment of U.S. trade potential in southern

Africa as it too has proposed nearly a dozen new Commercial Service positions in the region for fiscal year 2000. Reverse Trade Missions, that is, bringing foreign buyers to U.S. trade shows to orient their focus on the quality and diversity of U.S. agricultural products, is an established and well utilized program by our competitors. This approach has higher sales potential per cost, especially for small and medium-sized U.S. firms without the ability to participate in foreign trade promotion activities.

Question. What specific program changes has the agency made to improve performance and achieve goals established in the strategic and annual performance plan?

Answer. Two major changes have been made to improve performance and achieve FAS's strategic goals and objectives. Both focused on improving customer service. FAS is scheduled to receive the Vice President's Hammer Award for one of the changes, and the other is being nominated for a Hammer Award.

The change that resulted in a Hammer Award was focused on improving the administration of the Food for Progress (FFP) program. FAS administers the FFP, which provides commodities for donation through Private Voluntary Organizations (PVOs) to support developing countries that have made commitments to expand free enterprise in their agricultural economies. The overall processes of the program had been layered one on top of each other over the years. This resulted in PVOs' requests for funds not being turned around in a timely fashion—administrative delays of up to forty (40) business days were common.

The management team of FAS recognized that something had to be done to improve efficiency. A management team was organized to tackle the problem. Over a period of 18 months, the team made tremendous gains in operational efficiency by eliminating numerous and redundant reviews, re-evaluating the current tasks and making them more cohesive, providing more accountability to their customers (in this case the PVOs), and reducing the average cycle time of transferring administrative support funds to a particular PVO from forty-one (41) to seven (7) business days.

The other major program change the agency has made over the past two years has been the implementation of a Unified Export Strategy (UES), designed to provide industry partners with the opportunity for one-stop customer service. The philosophy is that FAS has a suite of program tools funded by Congress to effect changes in behavior in markets around the world, which in turn positively influence the ability of exporters to sell U.S. farm products in foreign markets around the world. The UES is designed to help FAS deploy its suite of program tools in a highly integrated manner to maximize the return on public investment for its services.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. Strategic objectives in the annual performance plan are a mirror image of the program activities reported in the agency budget structure. The stated performance goals underneath each objective in the performance plan link directly to budgeted resource amounts in the current fiscal year 1999 budget and the proposed fiscal year 2000 budget.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. A core team of senior managers within the agency is currently in the process of evaluating alternative options to improve this linkage. Additionally, as FAS learns more about institutionalizing performance-based management processes, the potential need may arise for further changes to adjust the agency's budget and planning structure to accommodate changes in legislation, international trade, and technology.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are being planned to improve reliability of these measures?

Answer. It is possible that the fiscal year 2000 Results Act performance plan may include performance measures for which reliable data will not be available in time for the first performance report due to Congress in March 2000. The process of making GPRA a reality in FAS is still ongoing. FAS is working to refine its performance measurement criteria and its performance reporting system to ensure that reliable data and measures are available in the future to track performance. FAS believes a more realistic time frame target for ensuring reliable data is available to it and other government agencies it works with in achieving its goals would be by the end of fiscal year 2000, not mid-year.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. Once the agency has a track record to reference, the agency plans to use actual performance compared to targeted performance, combined with external factors that may have inhibited reaching a targeted goal, to set priorities in its future funding requests.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The dollars associated with specific agency performance goals generally reflect the cost of all associated activities performed in support of that goal. Overhead costs are proportionately distributed, with approximately 75 percent allocated to General Goal #1, "Expand export opportunities," and approximately 25 percent allocated to General Goal #2, "Promote world food security."

FARM SERVICE AGENCY

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. In order to achieve performance-based management, as required by the Results Act, Farm Service Agency (FSA) has:

—Established a Senior Management Planning and Controls Committee (SMPC). The SMPC's strategic management functions include: providing leadership, commitment, and guidance to the Agency strategic planning program; providing strategic direction for the Agency by establishing strategic goals; overseeing development and implementation of Agency strategic plans and annual performance plans required by GPRA; and communicating GPRA results to Congress, the Administration, customers, and other stakeholders.

—Established the Strategic Management and Corporate Operations Staff within the Office of the Administrator, which works closely with the SMPC to carry out the Agency's strategic management initiatives.

—Established key contacts in each program/administrative area that are responsible for developing, implementing, and monitoring performance goals and measures.

—Developed a strategic plan for fiscal years 1997–2002 and annual performance plans for fiscal year 1999 and fiscal year 1999/2000.

Specific examples of efforts to implement performance based management include the following.

—The farm loan program annual performance goals and measures are reflected in the goals for each State. These goals and measures were developed to achieve the desired results outlined in the strategic plan. The State Executive Director for each State is held responsible for achieving these goals.

—The Deputy Administrator for Commodity Operations (DACO) is conducting a complete review of the Agency's commodity procurement and warehouse licensing and examination procedures. This review involves industry and customer interviews, development and analysis of alternative ways of conducting these functions, and cost analysis of such alternatives. This review will result in recommendations to improve the efficiency and performance of the licensing and procurement operations. The review team is learning the importance of knowing what customers want and being pro-active in meeting customers needs.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Performance plans for Agency senior executives contain performance standards related to achieving Agency goals and objectives, improving management, and reducing program and administrative costs.

Additionally, FSA's Administrator has a separate performance agreement on Equal Employment Opportunity/Civil Rights (EEO/CR) which includes specific goals and measures by which the Administrator will be rated. The Agency's Deputy Administrators' performance plans contain a performance element and standards directly linked to accomplishment of the Administrator's EEO/CR goals.

Question. How is performance information being used to manage the agency?

Answer. Starting in June 1999, program managers will be responsible for monitoring performance data and submitting quarterly reports to the Strategic Management and Corporate Operations Staff. Monitoring performance on a quarterly basis will allow the Agency to make adjustments in a timely manner, helping to ensure achievement of performance goals.

Examples of how the Agency is currently using performance information include:

Farm Loan Programs

Field office goal accomplishment is monitored at least monthly by both State and National Offices. This monitoring process reveals trends and problems as they develop, resulting in FSA revising policies and redirecting resources, as appropriate.

Commodity Operations

FSA is closely monitoring the timeliness of commodity shipping. FSA no longer accepts bids from contractors that ship late at bid opening. Such bids are treated as non-responsive.

DACO is evaluating the possibility of establishing licensing and examination criteria and fees based on the warehouse operators' past performance rather than solely on capacity.

DACO is moving to implement Total Quality System Audits (TQSA) for commodities purchased for feeding programs. Under TQSA, the manufacturer of such products is responsible for maintaining the quality of the product.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. Funding decisions for fiscal year 2000 were primarily based on Agency priorities relative to carrying out the Agency's mission. However, program performance was considered in developing funding requests from the standpoint of whether sufficient funds were being requested to operate a viable program.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual performance plans?

Answer. The following are specific examples of program changes implemented by FSA.

Goal 1, Farm Programs

Noninsured Crop Disaster Assistance Program (NAP).—During fiscal year 1998, FSA authorized seven pilot FSA State Offices to approve NAP areas and supporting market price and crop yield data. Review of the pilot, assessing increases in timely processing of NAP area requests and claim payments, will be made in fiscal year 1999. Assuming expected improvements in processing NAP areas and producer claims, authorization can be granted to additional States in fiscal year 1999 and fiscal year 2000.

Loan Deficiency Payments (LDPs).—Significant policy changes to help farmers who are experiencing low commodity prices were announced by Secretary Glickman on September 11, 1998. These policy changes make producers who harvest eligible wheat, feed grains, or oilseeds in forms other than whole kernel, such as silage and cobbage, eligible for marketing assistance loans or LDP's. High moisture commodities, commodities containing contaminants, such as aflatoxin, and low quality commodities will also be eligible. It is expected that these program changes will result in increased producer participation in the marketing assistance loan and LDP programs in 1999 and future years, as economic conditions warrant.

Livestock Assistance Program.—Compared to previous livestock feed assistance programs, the application process for this program was streamlined and the reporting burden on producers was reduced by relying heavily on producer certification of losses and not requiring the producer to purchase feed in order to be eligible for assistance.

Crop Loss Disaster Assistance Program.—Compared to previous ad hoc disaster programs, the application process was streamlined and the reporting burden on producers was reduced by using existing information from losses previously reported to FSA and RMA.

Tobacco Program.—A preliminary BPR package has been completed for the tobacco program as part of a pilot program to automate the marketing process for all kinds of tobacco. A pilot project is planned for the 1999 burley tobacco marketing season to determine the feasibility of national deployment of the new piloted marketing system. As funds become available, additional segments of the tobacco program will be reengineered. Automating the marketing process will result in a less labor intensive, more efficient program.

Peanut Program.—In an effort to streamline the collection of peanut marketing assessments (PMAs), the responsibility for day-to-day reconciliations and oversight of deposits has been assigned to the three area peanut loan associations. Moving this function, previously performed by the Tobacco and Peanuts Division (TPD) at headquarters, to the associations allows the reconciliations to be performed closer to the buying point and also reduces the workload for TPD personnel. TPD maintains overall responsibility for the accurate collection of the PMAs.

Goal 3, Farm Loan Programs

The guaranteed loan program regulation has been totally rewritten to streamline the process and make it more user friendly. Particular emphasis was placed on streamlining small loan packaging, adding program flexibility and developing the Preferred Lender Program. These changes should reduce processing time frames, maintain a low loss history, speed delinquency resolution, move direct loans into the guarantee program, and help the agency target minority farmers. In addition, the Agency will soon more fully implement the Debt Collection Improvement Act which will permit the Department of the Treasury to assist us in the collection of seriously delinquent direct loan accounts through offset.

Goal 4, Commodity Operations (Warehouse Examination Operations)

DACO has increased the use of available technology to increase the efficiency of the warehouse examination workforce. Increasing the efficiency of the examination workforce permits the Agency to conduct necessary examinations with a reduced workforce.

DACO is expanding the services that warehouse examiners provide in order to increase sources of revenue for examination operations. By adding services that are needed and requested by the warehouse industry, we expect to increase the value of overall United States Warehouse Act (USWA) functions, which in turn will increase the number of warehouse operators that elect to be federally licensed.

DACO submitted a draft rewrite of the USWA to the Office of Management and Budget (OMB) for their review in April 1998. OMB has not commented on the proposed draft. The rewrite will, among other things, allow the warehouse industry to increase performance and productivity through the use of electronic documents of title (i.e., warehouse receipts, bills of lading, shipping certificates, etc.) for agricultural commodities.

Goal 4, Commodity Operations (Commodity Procurement Activities)

All domestic distribution program contracts have been changed to a delivery basis versus shipping period basis. This should improve timely deliveries since contractors are not paid until products have been delivered.

The rate of liquidated damages for late shipment was increased to be commensurate with the value of the commodity.

Several commodities are now purchased for a longer time period than one month. Certain contracts are now made quarterly or on an annual basis. This ensures an adequate commodity supply and more of a partnership relationship with suppliers resulting in better, more timely performance.

FSA is purchasing more commercial products with brand labels rather than special USDA labels. This should improve the quality and timeliness of deliveries.

FSA now purchases peanut butter with specifications equivalent to national brands. All peanut butter suppliers must have the product tested prior to FSA allowing the firm to participate in the procurement program. This qualified product list has resulted in a better quality product for recipients.

Management Initiative 1, Equal Employment Opportunity and Civil Rights

Civil Rights and Small Business Utilization Staff (CR&SBUS) is piloting and implementing a new standard operating procedure to perform CR State and Service Center Management Reviews. A greater emphasis is placed on the farm loan programs, reviewing fewer Service Center offices, but focusing more on specific problems in each office. By fiscal year 2000, we plan to review some of the Headquarter and Kansas City complexes for EEO problems.

CR&SBUS has instituted tracking systems which will help to quickly and accurately track the status of settlement cases, program complaints, EEO informal complaints, formal backlog complaints, and our EEO informal Early Resolution Program. In addition, these systems provide the data needed to analyze and identify areas for improvement. This system was needed because the volume of cases and settlements has greatly increased since 1997. The Administrator is provided a weekly update on each of these items.

CR&SBUS has established and trained 15 fact finding employees in Montgomery, Alabama, who work full-time on gathering the facts of program complaints and send them to the Headquarters office for analysis. This new system guarantees independent and fair treatment to customers, and improves the number of cases processed on-time as stated in the FSA Annual Performance Plan.

CR&SBUS established an EEO informal Early Resolution Program which brings complainants and supervisors together early in the process to resolve differences before they go formal. This has reduced the number of formal EEO complaints registered as stated in the FSA Annual Performance Plan. It also helps employee mo-

rale by quickly resolving management/employee differences and is a cost savings to the Agency.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The FSA fiscal year 1999/2000 Annual Performance Plan and Budget discuss the level of resources needed to achieve program performance goals. The annual performance plan encompasses all program activities included in the agency's budget request, and reflects the program activities associated with identified goals. This linkage enables decision-makers to assess the FTEs and funding requirements of achieving annual performance goals. Performance goals were developed for each FSA budget account. These measures are incorporated in budget material to indicate expected performance to be achieved based on available funding.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. Currently, there are no plans to change the FSA account structure for fiscal year 2001, since there is direct linkage between the account and activity structure in the budget and the associated GPRA program activities for which performance goals have been established.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. As reflected in the FSA fiscal year 1999/2000 Annual Performance Plan, some performance measures exist for which resulting data may not be available for inclusion in the March 2000 Annual Performance Report. Instances in which data is not available will be reflected in the Annual Performance Report accompanied by an explanation supporting the reason data is unavailable and anticipated time frames to obtain the data. However, prior to preparation of the March 2000 Annual Performance Report, FSA will diligently strive to develop systems facilitating the collection and evaluation of all required data.

Question. How will future funding requests take into consideration actual performance compared to expected or targeted performance?

Answer. The primary reason for requesting funding is to achieve expected or targeted performance, given certain assumptions. Uncertainties, however, in developing budget requests and later actual execution, include unexpected changes in the agricultural economy which have an impact on results. Given this reality, future funding requests will continue to reflect agency priorities with consideration given to performance in the prior year relative to expected or targeted performance. Although actual performance will be a factor in deciding on funding requests in future years, it is and will continue to be only one of many factors considered in determining appropriate funding levels.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Performance goals in the Agency's budgets are not reflective of the full costs of all associated activities performed in support of that goal. However, performance goals and program activities in the budget are linked to the four Agency goals in the annual performance plan, which are presented on a full cost basis. For example, each Agency goal, i.e. Farm Programs, includes the salaries and expenses needed to support that goal. Specific Agency performance goals in the annual performance plan are not reflective of the full costs. A basis for determining full cost at this level has not been developed.

FOOD SAFETY AND INSPECTION SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. The FSIS Pathogen Reduction/Hazard Analysis and Critical Control Point (HACCP) system regulation, finalized in 1996, is a scientifically based system designed to reduce pathogens on raw products. The regulation requires meat and poultry slaughter and processing plants to adopt a HACCP system of process controls to prevent chemical, physical, and biological food safety hazards. The regulation contains specific requirements for sanitation and microbiological testing. By the beginning of this year, 92 percent of all Federally inspected meat and poultry products have been produced under a HACCP system. The HACCP regulation is a fundamental shift in meat and poultry inspection from prescriptive oversight of the regulated industry to performance-based standards for that industry's products. As part

of HACCP implementation, FSIS is rewriting its regulations to reflect this shift from prescriptive oversight to performance-based management. The Agency is also breaking new ground in establishing performance standards for pathogens. Product samples taken under the regulation for almonella and E. coli testing will also be under performance-based standards for the future. At this stage, the focus is on determining baselines and monitoring prevalence. Future baseline data gathering and performance-based pathogen testing are projected for Campylobacter and Listeria as well.

Question. How are your agency's senior executive and other key managers being held accountable for achieving results?

Answer. Senior Agency managers have traditionally been involved in developing an FSIS strategic planning process resulting in a strategic plan. To strengthen managers' accountability for achieving results of initiatives contained in the plan, in 1996 the Administrator established specific levels of performance for a performance rating of "outstanding" and "superior" in senior executives' performance standards. Annual reviews of upper level managers include an evaluation of how well they have satisfied these agreed-upon performance levels.

Question. How is performance information being used to manage the agency?

Answer. Through the requirements of sanitation and pathogen testing contained in the HACCP regulation, the Agency is monitoring the degree of success of plant performance as indicated by performance-based data. Plant data generated in E. coli testing, for example, will provide trend analysis that will enable Agency managers to determine the appropriateness of critical control points in a plant's HACCP plan. Performance-based data provide objective monitoring of a plant's compliance with the regulatory requirements and permit the Agency to redirect resources to noncompliant plants as necessary. The Performance-Based Inspection System (PBIS) database is also useful in helping Agency managers in directing resources to those areas where the resources are most needed. The Agency believes that the HACCP system along with performance-based results from micro testing will improve food safety and reduce foodborne illness.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. The decisions about funding requests for the 2000 budget reflect support for priority areas of performance both within the Agency and in cooperative work with the Agency's State partners to improve food safety on a seamless national basis.

The largest single funding increase is requested for mandatory pay raises estimated at $21.3 million, which are essential to maintaining inspection coverage nationwide. Without this increase, FSIS would have to reduce staffing—primarily in the inspection workforce—and this would compromise our ability to perform our statutory mission of food safety inspection oversight.

The program initiatives included in the budget request target key performance areas to meet the anticipated challenges of new program demands. Once HACCP is implemented in all inspected establishments, FSIS must be able to transition its workforce to perform the redefined regulatory tasks and procedures required by the HACCP final rule. The requested increase of $10.8 million will effect the proposed salary upgrades, redeployment, and recruitment to develop a more highly skilled, better educated, and more versatile workforce that will enable FSIS to maximize the performance of its inspection workforce.

To strengthen the food safety partnership with the States, $2.9 million is requested through the President's Food Safety Initiative. This highlights the increasing importance of our cooperative work with States in performing our food safety mission with both State Departments of Health and Agriculture in outbreak and recall investigations and in the Cooperative State Inspection Program.

An additional increase of $1.0 million is requested to carry out Department-mandated civil rights training and to improve Agency civil rights programs. This request reflects the importance of civil rights in our food safety performance day in and day out throughout every area of FSIS, from the most remote establishment to headquarters program offices.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. The Agency underwent an organizational restructuring as it went about implementing HACCP in 1996. FSIS restructured from a region-area-circuit organization to districts which would provide more comprehensive service to its customers and improve communications between the field and headquarters.

FSIS involved all stakeholders and constituencies from the outset to gain valuable information about the Pathogen Reduction/HACCP regulation, a core component of the Agency's goal. Through more than 100 public meetings to date, the Agency has

sought public comment on its policies and future direction, resulting in changes in the HACCP regulation and, ultimately, in program changes for HACCP implementation.

Question. Could you describe the process used to link your performance goals to your budget activities? What difficulties, if any, did you encounter and how did you solve them?

Answer. The Agency recognized the importance early on of linking the performance goals and the budget activities through the Agency mission. The goals represent Agency mission objectives, while the budget activities represent mission activities. On a preliminary basis, the Agency evaluated the relationship between the budget activities and the performance goals to determine whether or not changes were needed in budget activities, and found that the complementary linkage of performance goals and budget activities to the Agency mission indicated no immediate need for change.

FSIS is undergoing a transformation in its inspection program from traditional organoleptic inspection to HACCP-based inspection. The performance goals are specific to achieving a reduction in foodborne illness through HACCP and other inspection changes, and primarily focus on new and anticipated food safety developments. The budget activities capture all costs for both the traditional inspection program and the new HACCP-based inspection system now being implemented. The linkage of performance goals and budget activities will evolve through many stages as transformation of the inspection program takes place, but the Agency does not anticipate any further changes in its budget activities at this time.

Question. To what extent does your performance planning structure differ from the account and activity structure in your budget justification? Do you plan to propose any changes to your account and/or program activity structure for fiscal year 2000?

Answer. The FSIS performance planning structure is built around specific steps that must be carried out to achieve the strategic goal of minimizing foodborne illness in meat, poultry, and egg products. The account and activity structure used in the budget submission is organized along program activity lines that capture the range of infrastructure and support activities necessary to build a total inspection program.

At this point in time, it is too early to discuss with any certainty the likelihood of changes to the account structure. The proposed program activity structure is broad and flexible enough to permit linkage with strategic and annual performance goals, especially as these are fine-tuned or change over time.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. During the performance measure design process, FSIS created measures that would utilize information that is both available and reliable. The Agency does not anticipate performance-reporting difficulties in preparing the March 2000 report.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The Agency's performance measures are designed to measure performance in areas where performance has never been measured before. This is clearly a learning period for the Agency and adjustments will be made as lessons are learned.

FSIS has established performance measures that it believes relate to each performance goal in question. That is, the measures used correlate directly to the targeted performance. However, the Agency believes that it needs more experience before it is able to confidently predict future budget requirements based on projected performance.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Full program cost is captured in the six budgetary Program Activities (Federal Food Inspection, Import/Export Inspection, Laboratory Services, Field Automation and Information Management (FAIM), Grants-to-States, and Special Assistance for State Programs) which encompass all activities of the Agency's meat, poultry, and egg inspection mission. The dollar amounts associated with the performance goals reflect the full Agency cost in carrying out those goals, including overhead.

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. Beginning with fiscal year 1999, each of the agency's senior managers will be evaluated on how well they perform in two new areas, best business practices and outreach. Senior managers will be expected to identify and use best business practices to deliver quality service to American agriculture. They must demonstrate innovative and creative thinking to promote good business that achieves the agency's mission while being sensitive to customer concerns. Senior managers must also foster an understanding of the agency's mission, goals, and objectives and demonstrate empathy for customers' concerns. The end result is that each senior executive's performance will be directly linked to the agency's performance and to our customers' needs—both of which are key aspects of performance-based management.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The agency's senior executives are held accountable for achieving results. As part of the performance review process, the agency's senior executives are evaluated on their key accomplishments for the fiscal year. Furthermore, all senior executives are evaluated on how well they take affirmative steps to support, promote, and carry out Administration and Department policy, of which the GPRA is a key component.

Question. How is performance information being used to manage the agency?

Answer. The following examples indicate how performance information is being used to manage the agency's programs. GIPSA plans to increase the time devoted to analyzing issues involving competitive practices, financial protection, and trade practices to ensure a fair, open, and competitive marketplace for livestock, meat, and poultry. Timely resolution of investigative issues is critical to marketplace efficiency. The percentage of investigative issues resolved in a year's time is a critical measure of program performance. The agency, will, therefore, strive to increase the percentage of investigative issues resolved within the span of one year with an overall improvement in marketplace efficiency.

Faster resolution of issues will also result in an increase in the amount of money recovered for the benefit of livestock producers suffering economic losses in the marketplace. Using fiscal year 1998 as the established baseline, GIPSA will continually monitor loss recovery and focus on those issues having the greatest impact on the producer.

GIPSA has also implemented an enhanced quality assurance and quality control program to ensure the quality and accuracy of inspection results nationwide. The program includes a balance of national and localized monitoring. A greater emphasis is placed on proactive actions to prevent problems from occurring rather than reacting to problems once they have occurred. Results from the quality assurance and quality control program provide the data to monitor the statistical accuracy of original inspection results and the statistical accuracy of Official Agency inspection results-two key performance indicators.

In the near future, GIPSA will complete a telecommunications network that will allow electronic mail and daily data sharing between all offices within the official inspection and weighing system. Among other things, the network will allow GIPSA to create a national grain quality database that will have many uses, such as providing a dynamic picture of nationwide grain trends and allowing timely responses to potential problem areas. The database will also allow GIPSA to monitor and measure the consistency of grain inspection results—something in which our customers have a keen interest.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. Program performance factored directly into decisions about the agency's funding requests for fiscal year 2000. As provided in the agency's annual performance plan, GIPSA recognizes that a funding level less than that requested for fiscal year 2000 would restrict the agency's ability to meet its goals, objectives, and performance measures for the Packers and Stockyards Programs. Available resources would be focused on conducting investigations involving competitive issues and on those issues having the greatest financial impact on the industry. Reduced funding would result in fewer investigations and could expand the time frame to complete investigations.

The agency also provided an explanation in its budget request and performance plan for fiscal year 2000 of why additional funding is needed for mycotoxin detection, varietal identification, and the study of future market needs. All three relate

directly to the agency's ability to provide the technology to measure grain quality and quantity so that the market has ready access to reliable information which, in turn, reduces market risk and increases market efficiency.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. GIPSA's ability to achieve Goal 1 of its strategic and annual plans is improved by the Agency's recent restructuring of the Packers and Stockyards Programs. The restructuring has strengthened GIPSA's capability to investigate possible unfair and anticompetitive practices and provides greater flexibility and efficiency in enforcing the trade practice and payment protection provisions of the Packers and Stockyards Act. Additional economic, statistical, and legal expertise have been added to the field offices, thereby increasing the efficiency and effectiveness of the Packers and Stockyards staff in investigating anticompetitive practices. The larger field offices will give GIPSA the critical mass of personnel needed to address complex anticompetitive issues.

As indicated in a previous response, GIPSA has also implemented an enhanced quality assurance and quality control program to ensure the quality and accuracy of inspection results nationwide. Results from the quality assurance and quality control program provide the data to monitor the statistical accuracy of original inspection results and the statistical accuracy of Official Agency inspection results—two key performance indicators.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. Each of the agency's budget activities, the Packers and Stockyards Programs and the Grain Program, is directly linked to a strategic goal and supporting performance goals and indicators. The Packers and Stockyards Programs are represented in Goal 1 of the agency's strategic and annual plans, and the Grain Program is represented in Goal 2. The end result is that the agency's budget structure directly links resource amounts to goals.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. No changes are needed at this time.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. The agency may not have data for one of the performance indicators supporting Objective 2.3. As given in the agency performance plan for fiscal year 2000, the agency projects that that the percentage of satisfied customers will increase to 88.5 percent in fiscal year 1999. The agency's ability to measure levels of customer satisfaction is dependent upon approval by the Office of Management and Budget to conduct customer surveys.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The agency's senior managers compare actual and expected performance as they prepare their funding requests. Such comparison is an integral part of the budgeting process.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. There is a direct linkage between the agency's strategic goals and the agency's two program areas, the Packers and Stockyards Programs and the Grain Program. The goals, in turn, are directly linked to the agency's budget activities. The end result is that the dollars associated with specific goals reflect the full cost of all associated activities performed in support of that goal.

NATIONAL AGRICULTURAL STATISTICS SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. NASS has taken a number of measures to promote performance-based management. One major tool is the internal NASS Action Plan, developed from the Agency's GPRA Strategic Plan, which provides employees with a more detailed blueprint for achievement of the NASS goals and objectives. This document contains internal performance targets, strategies, and measures which were developed at the grassroots level by NASS employees. The NASS Action Plan also includes the specific performance measures reported in the Agency's Annual Performance Plan.

To help measure the success of management initiatives, an organizational climate survey of NASS employees is taken every 2 years, and the results shared with all employees. Following the most recent climate survey, the Administrator of NASS appointed an employee committee to study the survey results and make specific recommendations to NASS senior managers on areas identified as needing improvement. In addition, a tailored organizational climate survey was administered to NASS computer analysts to provide useful information for an April 1999 data processing workshop attended by key data processing staff. The status of all NASS initiatives and accompanying performance measures are frequently included on the agenda for senior and middle manager workshops, meetings, and conferences.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The responsibility for reporting the needed data for the performance measures reside within the individual NASS work units. These measures are updated in the Agency's Action Plan, available to all employees. NASS's senior executive decisionmaking body, the Strategic Planning Council, reviews specific performance measures in semi-annual meetings and requests more information from individual units, as needed. The senior executives' performance standards include elements related to providing leadership in establishing and implementing program goals and objectives, and managing the human, financial, and property resources effectively and efficiently to accomplish program goals.

Question. How is performance information being used to manage the agency?

Answer. NASS performance measures represent a mix of internal measures, such as organizational climate survey results and measures of the accuracy and timeliness of reports, and external measures, such as customers' assessments of the usefulness and importance of NASS data. Managers utilize this information to help them determine how to allocate resources and shift priorities, modify procedures, develop new products, and perform strategic planning.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. Customer feedback is a critical part of NASS's annual performance plan. The NASS fiscal year 2000 budget request includes initiatives to expand NASS's environmental work, such as the collection of additional pesticide use data. This is in direct response to requests from customers, stakeholders, and partners who are pleased with the current NASS chemical use data set, but want more information about certain commodities and sectors of agriculture not covered in the current program. NASS has worked extensively with customers and stakeholders to receive input into the prioritization of commodities without usage data, review States involved in the program, and to discuss the use of commodity rotation in NASS pesticide use data collection plans. In 1997, NASS implemented an annual postharvest pesticide use survey to address levels of pesticide residues on specific commodities that are treated following harvest. To date, four commodities have been surveyed: apples, potatoes, corn, and wheat. Plans for 1999 are to collect postharvest application data on soybeans and oats.

NASS's involvement in Puerto Rico for the census of agriculture program was directly responsible for the formulation of a budget initiative for fiscal year 2000. Because USDA is now responsible for conducting the census of agriculture in Puerto Rico, the Puerto Rico Department of Agriculture, for the first time, had a lead coordination role in the conduct of the 1997 Census of Agriculture. It became obvious after successfully working together on this census that the same cooperation on other agricultural statistics programs would be very beneficial to both parties. This prompted a request from the Secretary of the Puerto Rico Department of Agriculture to establish a NASS office in Puerto Rico which ultimately resulted in the budget initiative included in the fiscal year 2000 budget request for NASS.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. NASS has made measurable progress in increasing the percent of total national agricultural production included in the NASS annual program, which is a key performance measure in both the GPRA strategic plan and the annual performance plan. This has been accomplished by providing agricultural statistics for the equine and aquaculture sectors and expanded data for the nursery and greenhouse industries.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The Annual Performance Plan links the budget and performance goals by showing the Agency's funding and FTE's allocated by the five Research, Education, and Economics (REE) Mission Area general goals. The last page of the NASS

Annual Performance Plan includes a Resource Table matrix displaying the three NASS program activities according to the REE goals.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. NASS does not anticipate any needed changes at this time. NASS's present budget accounting structure cross-walked with the REE general goals allows for the development of meaningful performance indicators and resource allocations.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. No. NASS anticipates having performance data available for each measure in time for the first performance report.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The improved accuracy afforded by actual performance data versus estimated information will allow better decisions to be made regarding Agency program changes, new initiative requests, reallocation of resources, and targeting of areas needing improvement.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Yes, overhead costs are fully reflected since the total NASS budget is divided among the five general goals.

NATIONAL APPEALS DIVISION

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. The National Appeals Division (NAD) has one mission and that is to conduct evidentiary administrative appeal hearings and reviews arising from program operations of assigned agencies. NAD has one goal: Conduct timely hearings and issue timely and well reasoned determinations which correctly apply laws and regulations. NAD has developed performance-based measures using statutory and regulatory requirements. These measures include: timeliness of appeal hearings; timeliness for issuing appeal hearing determinations; timeliness for issuing appeal review determinations; and percent of hearing officer determinations upheld on review. NAD has implemented NADTrack, a management information system, which tracks data for these performance measures. NADTrack data is used to measure and refine priorities while ensuring that NAD is maximizing its resources.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. NADTrack data will be reported on a quarterly basis to key managers. Reports will be in a standardized format, and will use data from the GPRA-based NADTrack Subsystem. The report will conform with the Strategic Plan, Annual Performance Plan and the Annual Performance Report. These Quarterly Performance Evaluations will be the product of NAD's internal analysis. The performance goals and indicators for these objectives have been identified by the key managers.

Question. How is performance information being used to manage the agency?

Answer. NAD uses its NADTrack system to determine whether performance meets stated goals and objectives. This information is used to ensure organizational efficiency and effectiveness are achieved. Performance information from NADTrack, budget formulation, and other management tools are used to: identify strategies for allocating resources, design customized training, prioritize performance objectives, and (4) measure results of management decisions.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. In the fiscal year 2000 request, NAD asked for additional money to fund a customized training program. This increase in training funds was based upon a review of NAD performance factors.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. In fiscal year 1999, NADTrack evolved into a system which uses consistent and reliable data to maintain and update statistics. All performance information is measured using identical statistical methodologies.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. NAD's budget structure directly links resource amounts to program goals. The entire appropriation is assigned to a single performance goal.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. No changes are needed at this time.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are likely available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. The agency's fiscal year 2000 Results Act performance plan does not include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. Actual performance will be compared to the expected performance and budget request adjustments made as required. Adjustments, when required, will be made using current resources to the maximum extent possible.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Because of NAD's single mission, all costs are assigned to its single performance goal.

NATURAL RESOURCES CONSERVATION SERVICE

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. First, I have ensured that there is a clear focus on performance-based management at the highest level. I realigned the headquarters structure, consolidating responsibility for strategic planning, performance planning and measurement, budget allocation, and oversight and evaluation under a Deputy Chief for Strategic Planning and Accountability. I directed the new Deputy Chief to develop and implement a new accountability system that would provide a balanced, reliable, and timely picture of the agency's performance. The system will enable agency managers to estimate the effect of programs on the condition of natural resources systems, assess the cost-effectiveness of service delivery, identify opportunities for process improvement, and respond to customers' needs with strategies and assistance tailored to local conditions.

Second, I have taken action to ensure that reliable high-quality information is available to achieve performance based management within NRCS. In fiscal year 1999, we have begun implementation of the new accountability system, which includes data in three major categories.

The system provides detailed data on how we spend our time. The Time and Attendance Report each employee submits every 2 weeks will report the hours spent for each of 27 programs or initiatives (Watershed Surveys and Planning, Grazing Lands Conservation Initiative, etc.) and for each of nine major activities (providing assistance in developing conservation plans, conducting resource inventories, etc.). The system was further enhanced in fiscal year 1999 to include a web-based report database that summarizes NRCS program and activity hours.

The system also provides data on the annual workload and long-term conservation needs of NRCS and the conservation partnership in each field office area. We have developed procedures to conduct nationally consistent analyses of our workload. An initial workload assessment was completed October 1, 1998. It identifies conservation needs based on local knowledge and goals, natural resources information from NRCS inventories, and information from other sources. The analysis develops estimates of the time, by technical discipline, required to produce the agency's core work products.

The system also provides complete and consistent data on a limited number of key performance measures. We have identified key measures that are adequate indicators of annual progress toward strategic goals. These indicators are conservation practices and systems that are defined in NRCS field office technical guides. Basic demographic data necessary to ensure programs are delivered fairly and equitably will be reported for all services delivered. In addition to the conservation practices and systems, which are indicators of outcomes, the new system will collect data on selected output and input indicators, including program management items (such as number and acres in contracts, etc.), on resource inventory and technology development, and on other NRCS state and national office outputs.

The performance reporting system is being developed and implemented in phases. The first phase, essentially completed in fiscal year 1998, permits collection of data on performance measures that are easily quantifiable activities, such as acres on which erosion control practices were applied. Beginning in October 1998, a sample of field offices began entering data. Other offices will be added to the system later in the year. Throughout this transition year, the effectiveness of the system will be evaluated and needed adjustments made.

Third, I have strengthened management of performance evaluation and oversight activities. On October 1, 1999, Oversight and Evaluation Staffs were realigned to the Operations Management and Oversight Division, under the Deputy Chief for Strategic Planning and Accountability, to conduct oversight activities to ensure that NRCS employees comply with all laws, regulations, and agency policies and procedures and evaluations to improve the quality and delivery of services.

Finally, I have taken action to ensure that funding is linked to performance. New procedures are being implemented to define performance expectations when budgets are allocated to managers.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Agency-wide goals for key performance measures are set in the agency performance plan, based on the long-term goals in the strategic plan. In addition, goals for program-specific activities or outputs are established. As the performance measurement system becomes fully operational, specific state goals will be established for each performance measure. An appropriate element will be included in state and regional conservationists' individual performance appraisals. The Regional Conservationists will monitor the progress of states for which they are responsible and hold state conservationists accountable for meeting goals. The Deputy Chief for Strategic Planning and Accountability will monitor performance nationally and report to the Associate Chief, who will hold Deputy Chiefs and Regional Conservationists accountable.

Question. How is performance information being used to manage the agency?

Answer. Measurable long-term outcome strategic objectives that support the agency's mission are established in the strategic plan. Annual performance goals are set to move toward achievement of the strategic goals and objectives. Line managers will be assigned responsibility for specific portions of each agency goal when they receive their allocation for a fiscal year. They will develop operating budgets that use their funds and staff to meet the established goals and conduct all activities needed to achieve the goals. Employees will report their accomplishments on key performance measures on a continuous basis and will report how their time was spent, by program and major activity. Data will be available on a real-time basis so that employees and first-line supervisors can monitor progress. Senior managers will review performance and financial data periodically to ensure efficient and effective use of resources and to take corrective action when necessary.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. fiscal year 1998 and fiscal year 1999 are transitional years in our use of performance information. In fiscal year 1998, we determined that the level of quality of performance data reported through the existing reporting system was not adequate to meet GPRA requirements and could not be improved to the necessary degree at an acceptable cost in field staff time. The systems then in use required so much time that they actually hampered achievement of service delivery goals. Therefore, we suspended use of the reporting system then in use and began development of a new system that would provide more consistent reporting of key measures with less burden on the field staff. Fiscal year 1998 performance data for many of the cross-cutting measures of natural resources improvement were, therefore, not available for use in developing fiscal year 2000 budget requests. However, program output data was available and was considered in formulating the budget requests. In addition, historical performance data was also available and was considered where appropriate.

For example, the 1996 Act set an acreage goal of 975,000 acres to be enrolled in the program by the end of 2002. Actual acreage enrolled through the end of fiscal year 1998 was 665,447 acres. The fiscal year 1999 budget supports a goal of 120,000 acres. For the fiscal year 2000 budget, program manager's information was used to determine that a goal of 199,826 acres was achievable, which would bring the total enrolled to the fiscal year 2002 goal. The program manager's information on cost of enrollment was used to establish a request to support the goal.

In formulating the request for the Environmental Quality Incentives Program, several kinds of performance-related data were considered. Program performance data, including program participation, the extent of the resource concerns to be ad-

dressed, and the special needs of historically underserved customers were considered. Because addressing concerns about potential problems associated with animal feeding operations was identified as a major goal of the program, data on the level of historical performance and the time and cost required for completing waste management systems was used to estimate the level of performance that could be anticipated with various levels of funding.

With the new Performance and Results Measurement System, output and outcome performance data will be used much more extensively in the future.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. We have made the changes in the headquarters management structure and in our management information systems described earlier.

In addition, we have established a team to analyze field office operations and identify internally-imposed requirements and procedures that add little value and reduce the time that front line staff can devote to direct services to customers. We are implementing the team's recommendations, thus allowing employees to focus more attention on directly serving customers and completing high priority conservation work.

We are developing plans to ensure that all agency personnel maintain the level of technical expertise essential to meeting goals. An interdisciplinary team conducted a review of how we deliver appropriate conservation technology to field personnel and made recommendations for improvement, which we are implementing. A separate review of training for the field offices has resulted in a comprehensive catalog of training, including self-paced, satellite, agency-provided formal coursework, and non-agency training available. The review made further recommendations for improving technical training. The Technical Guide Committee is continuing to update conservation practice standards. All practice standards are available on the World Wide Web so that all technical staff have immediate access to current technology. We will also shortly begin a focused effort to develop the Field Office Technical Guide of the Future.

And of course we are continuing to work with the other Service Center agencies in the ongoing business reengineering process to reduce duplicative administrative tasks and free up the field to work with customers.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The performance goals established in the agency performance plan are cross-cutting goals that are supported by multiple activities in the budget structure. The performance goals provide a way for managers and the public to see the outcome on the landscape that results from the agency's services that are funded through separate accounts. This comprehensive view of agency performance is not possible when performance is measured program-by-program.

The agency performance plans for fiscal year 1999 and fiscal year 2000 include a summary table that quantifies the relationship between each program and resource objective in the agency strategic plan. For programs that support multiple objectives, however, allocation among objectives is only estimated. The combined data that will be available from the new time and attendance reporting system and performance measurement system and the workload analysis activity will provide information for planning and will be the basis for allocation of funds to outcomes, enabling managers to ensure that funds and time are expended on the objectives that were intended.

In addition to the cross-cutting goals, each program in the budget structure continues to set program-specific goals for activities and outputs that must be achieved in order to achieve the higher-level performance measures.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. We are not yet prepared to propose changes to our account and activity structure. As more detailed information becomes available through our new performance reporting systems, we will conduct analyses to evaluate the benefits and identify unintended consequences of changes in the budget structure.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. We expect to have available data that are reliable at the national level for the key natural resources outcome-related performance measures in the revised fiscal year 1999 performance plan that was included in our fiscal year 2000 plan.

The new reporting systems include built-in edit checks to provide a first level data validation function and help ensure the accuracy of the data. Internal reviews are

conducted to ensure that activities meet all applicable program, technical, and quality standards and are properly recorded. Additional data validation/verification plans are being developed to ensure data are nationally consistent and comparable.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. When our accountability system is fully implemented, we will have more detailed information on results achieved and the time required to achieve them, by geographic area. We will be able to more accurately estimate expected performance at alternative levels of funding than was possible with information available earlier, which generally supported only generalized national estimates. We will be able to identify the causes of any shortfall in expected performance and to determine corrective action needed. We will hold managers accountable for performance goals. Where reliable information demonstrates that performance shortfalls result from insufficient resources directed to a problem, we will provide the Congress with a firm basis for making its decisions on future funding.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The fiscal year 1999 and fiscal year 2000 performance plans include a summary table that attempts to allocate all agency funds among the natural resources objectives established in the strategic plan, thereby indicating the full costs associated with the objective. Our time and financial systems in the past have not been designed to track costs by resource outcome. Therefore, at present we can only estimate full costs of objectives.

Our new time reporting system is designed to provide detailed information of the time actually spent in supporting each program's activities and the time spent in certain major activities, such as conservation planning or application. Data from the time reporting system and the financial systems will feed the Actual Cost Recovery and Evaluation System (ACRES), which will provide data on direct, indirect, and full cost of programs and of the work activities in the time reporting system.

We made program time the focus of the initial phase in implementing our new time reporting system because time funded through the Conservation Technical Assistance (CTA) account is used to assist planning, and to a lesser degree, application, of conservation systems that are implemented with cost-share funds from some other source. Oversight entities and the Congress have expressed interest in having a clearer view of this interaction between programs. While program and activity data will be adequate to explain the use of funds for programs, such as the Wetlands Reserve Program, that primarily address a single resource goal, it may not permit us to track all costs associated with all resource outcomes for programs such as CTA that address multiple goals. Further refinement of the workload analysis effort may be needed in some cases to allocate time to specific natural resources goals rather than to work activities. A team has been established to complete an analysis and develop needed mechanisms to fully integrate the elements of the accountability system.

OFFICE OF BUDGET AND PROGRAM ANALYSIS

Question. What specific steps have you taken as the head of the agency to achieve performance based management within your agency, as required by the Government Performance and Results Act?

Answer. Employee performance standards for OBPA staff establish the job performance requirements that have to be met in order to accomplish the performance goals specified in OBPA's Strategic Plan and Annual Performance Plan.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Accountability for achieving results is ongoing based on the nature of the work the office carries out on a day-to-day basis throughout the year. In addition, senior executives performance ratings are based on whether the desired level of performance is achieved based on feedback from Departmental policy officials.

Question. How is performance information being used to manage the agency?

Answer. Managers and staff are aware of what they are expected to accomplish based on their annual individual performance standards and elements. During the year, this performance is closely monitored and remedial actions are taken as necessary to enhance performance.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. It has become apparent that the desired level of program performance is becoming increasingly difficult to maintain as staff resources have decreased and

program and budget complexity has increased. To meet these needs the OBPA budget requests increases for an additional staff year, as well as funds to replace the office's outdated information technology system. It is expected that these increased resources will allow the office to maintain and enhance its performance.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic plan?

Answer. OBPA has not found it necessary to make any program changes. The goals we have set out in our GPRA documents are those we would strive to achieve whether or not there is a requirement to formally acknowledge such efforts.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The OBPA budget structure consists of a single appropriation for the office. That appropriation encompasses all of the performance goals based on staff and other resources dedicated to accomplishing the goals.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. No changes are needed.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance for which reliable data are expected to be available in time for the first performance report in March 2000.

Answer. We expect reliable data to be available in time for the 2000 performance report.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. If expected performance is not achieved we will try to determine the causes for reduced performance and tailor budget requests, as appropriate. As mentioned previously, the fiscal year 2000 budget request includes increases necessary to achievement of the performance goals. In addition, we will look for opportunities for improved performance within existing resources.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal. For example, are overhead costs fully allocated to the goals?

Answer. All costs are fully allocated to the goals.

OFFICE OF COMMUNICATIONS

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. I asked the Office of Communications'—OC—management team to refine the focus of our Performance Plan. During that process we acknowledged that as a communications support agency, our only goal is to enhance and assist in accomplishing the Department's three goals; expand economic and trade opportunities for agricultural producers an other rural residents; ensure food for the hungry, and a safe, affordable, nutritious and accessible food supply; and promote sensible management of our natural resources. To fully assure our success in meeting OC's goal, we reviewed and added to our means and strategies section. OC managers contributed to this revision so they understand the linkage of our plan to their performance and to the staff. Managers will rank their employees' performance according to their accomplishment of means and strategies and in recognition of their contributions toward achieving our goal. We have realigned and strengthened our performance plan to assure that OC provides high quality and timely support that will contribute significantly toward USDA meeting its goals.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Weekly reports are used by these managers, the Director and Deputy Director of OC to monitor the agency'sperformance. In the case of specific information initiatives, special meetings will be held to assess OC's performance in meeting those initiatives. Also, the Director and Deputy Director evaluate and measure the performance of OC's senior executives and key managers on an annual basis. The individual performance plans for senior executives and other key managers used in this process include performance elements that are tied to OC's means and strategies for accomplishing its performance goal.

Question. How is performance information being used to manage the agency?

Answer. OC uses feedback from the media and the public to evaluate our performance. Positive or negative performance indicators will be used in evaluating individual performance. Work accountability will also be measured by weekly activity

and management reports. Remedies and additional actions will be established should performance fall below the plan.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. The Office of Communications' staff level has been reduced by more than 20 per cent since 1993. During this time, little or no funds have been appropriated to expand communications activities, improve OC's information technology, or to measure USDA and OC performance in achieving stated communications goals and objectives. The increases proposed in the fiscal year 2000 budget will be used to add technological enhancements that allow measurement of communications performance (e.g., Internet counters or feedback on use of radio and TV products); train OC staff in the use of the latest technologies; effectively and efficiently provide information to under served client populations; and to obtain a limited amount of consulting assistance to gain specialized skills not currently available. Our requested funding for fiscal year 2000 is directly related to our annual performance plan.

The proposed budget includes $588,000 in fiscal year 2000 for OC to upgrade its technology and provide staff the training necessary to make use of advances in communications products, technologies, and techniques so that all segments of the American public may take full advantage of USDA programs, initiatives, services and data. For example, upgraded capabilities would include making teleconferences, publications, and radio and television recordingsprepared for media use directly available to the general public via the Internet. This will dramatically transform the general public's access to USDA materials. Products which were previously available only through the media outlets at specified times or were available to a limited number of participants, will be available at the public's convenience and in a form that will allow for more effective use. Members of the public can save materials on their own home computers, making them available for not only current, but future reference. USDA staff around the country as well as the public can access teleconferences on a variety of topics such as, informational programs, policy discussions, technical guidance, and training. If the requested funds are not provided, OC will not be able to take full advantage of these technological advances, which will restrict OC's ability to provide information in the most effective, timely and cost-efficient manner.

The proposed budget also includes $70,000 in fiscal year 2000 for OC to improve communications efforts to reach groups working with citizens in under served communities and geographic areas. Funds will be used to design, produce, distribute and analyze under served client population surveys and fund audio and video teleconferences with target populations and organizations.

The proposed budget also includes $201,000 in fiscal year 2000 for OC to cover the increased cost of critical Department-level communications coordination and dissemination. Through thisfunding, OC will use available communications products, technology and techniques that reach all segments of the American public, regarding food supply concerns raised by Year 2000 compliance by the agricultural industry. OC will use radio and television special programs and the printed media to alert the consumer that food supplies will be delivered as regularly scheduled.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. The Office of Communications does not manage programs, but rather supports the programs of the Department's agencies, therefore there are no changes to report. However, OC continually modifies its performance based on internal assessments, weekly staff meetings and feedback from USDA agencies and other customers. In the fiscal year 2000 budget request OC proposes to enhance its evaluation mechanisms and upgrade the technology usedto disseminate information to the public.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. OC's budget structure is a single line item that fully supports its one performance goal.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. No change is needed to the OC account and activity structure in the budget justification to improve this linkage.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. The fiscal year 2000 budget request includes a request for additional funding to expand or enhance the evaluation mechanisms used. If the requested

funding is not provided, OC will use existing feedback and evaluation techniques. If the Electronic Access initiative is not funded, this will seriously jeopardize OC's ability to achieve its goal of expanded and enhanced support of USDA's performance goals.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. Office of Communications will meet its targeted performance if it receives the additional funds appropriated from the fiscal year 2000 budget request. The Office of Communications has not received a budget increase in the last three years, which required absorbing pay raises and increased operating expenses.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Since OC has only one performance goal, all of its funding resources, including overhead costs are devoted to this goal.

OFFICE OF THE CHIEF ECONOMIST

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. Strategic and performance goals have been developed to achieve performance-based management within the Office of the Chief Economist—OCE. As head of the agency, I worked with the managers to identify achievable goals and indicators for measuring and validating OCE accomplishment. Throughout this process, I have emphasized to all OCE personnel that annual performance appraisals will be based on achievement of plan criteria.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Senior executives and other key managers are being held accountable for achieving results by the fact that their performance ratings and eligibility for bonuses depend on accomplishment of plan goals and indicators. Their degree of success in achieving these goals and indicators is related to the degree to which they achieve the target quantitative and qualitative indicators specified in the strategic and performance plans.

Question. How is performance information being used to manage the agency?

Answer. The managers of each element have been made aware of the specific goals which they are responsible for accomplishing. As managers provide feedback based on preliminary indicators, progress is monitored and, if necessary, remedial steps are initiated to ensure accomplishment of their assigned goals.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. OCE provides analysis and information critical for effective Department program performance. Examples are: OCE provides crop and weather information that is essential for accomplishment of USDA Strategic Plan Goal 1: Expand Economics and Trade Opportunities for Agricultural Producers and Other Rural Residents. OCE requested funding for an initiative to modernize weather and climate data requisition in fiscal year 2000 to provide the Secretary and other stakeholders with timely, objective, and accurate information and analyses required to accomplish this Strategic Goal. This initiative was required to mitigate data gaps caused by the National Weather Service's decision to redefine its mission and by USDA's need to operate a modern world meteorological service.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. OCE has not found it necessary to significantly modify its program to achieve the goals established in its strategic and performance plans. However, OCE has implemented a variety of program adjustments to better achieve goals. For example, OCE received increased funding in fiscal year 1999 to improve food safety risk assessment in support of the President's Food Safety Initiative. OCE also organized coordination activities for USDA efforts in the area of global climate change and small farms.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The agency budget is designed to prioritize limited resources consistent with GPRA goals. Budget requests and FTE levels are linked to specific performance goals.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. There is no need for changes in the account and activity structure to improve this linkage.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. OCE's fiscal year 2000 Results Act Performance Plan includes performance measures for which reliable data are expected to be available in time for the first performance report in March 2000.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. OCE assumes that actual performance will achieve targeted performance levels unless externalities present obstacles that cannot be overcome. OCE makes this assumption because its strategic and performance goals are compatible with the program activity structure contained in the President's Budget. Because the strategic plan covers a five-year period, OCE recognizes the possibility that changes or modifications in its activities may occur, especially, if funding levels are insufficient or support from other agencies is inadequate.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. All costs are fully allocated to the goals of OCE. On a goal by goal basis, costs are allocated in direct proportion to the number of FTEs required to achieve performance results.

OFFICE OF THE CHIEF FINANCIAL OFFICER

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. During the year I have served as Chief Financial Officer, I have undertaken a major revision of our strategic plan that reevaluated who we are, who we serve, and what definitions others would apply to us. I have emphasized that while compliance with regulations and standards make for good business practices, we are here to provide a more productive work environment that results in cost savings and access to better financial information for decision making purposes.

Individual performance plans of OCFO managers and employees are linked to and measured against the performance goals contained in our strategic and annual performance plans.

To institutionalize performance-based management, my Directors participated in developing the fiscal year 1999 and fiscal year 2000 annual performance plans and determining the objectives and measures that would indicate success in meeting those objectives. In coordination with agency contacts and plans, the Directors determined the Department-wide financial management goals USDA must achieve to provide the financial information that USDA decision-makers need to overcome long standing deficiencies in financial management.

Much of OCFO's efforts are currently directed at the modification or creation of processes that will enable establishment of performance information (i.e., baselines, targets). These processes include, but are not limited to, implementation of cost accounting systems, audit tracking systems, and integrated financial information systems, and customer satisfaction levels. Accomplishment of these activities is necessary to monitor Department-wide progress and conduct performance-based management activities. To some extent, implementation activities to modify or create these processes are serving as interim measures.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Each Division Director develops an annual operating plan that supports the annual performance plan. The annual operating plan lays out the specifics of what their division intends to accomplish for the year. This serves as a performance contract that is used in their individual performance ratings. Accountability is determined based on the level of performance achieved in line with their plan.

Question. How is performance information being used to manage the agency?

Answer. We are taking advantage of all available information in managing the Officethis includes time keeping data on hours of effort spent on projects and activities that relate to the Annual Performance Plan, as well as special reports on progress for those larger items such as the Foundation Financial Information System—FFIS implementation. We are tracking the available data on our Department-

wide goals, e.g., audit closure statistics, corrections of internal control weaknesses, and progress toward achieving an unqualified opinion of financial statements.

As stated earlier, there are weekly reports and periodic retreats where information is used to assess where we are and what steps are needed for mid-course correction.

Another source of performance information is the USDA Office of Inspector General and the General Accounting Office. These two organizations give us continual feedback information regarding our performance in the area of Departmental leadership for financial management via a host of audits, management alerts, and reports.

Also, our staff is in touch with the Congressional staff and the GAO GPRA plan evaluators, collecting information and using it to focus our performance management activities.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. As part of our fiscal year 2000 Budget and Program development process, we recognized deficiencies brought to our attention by GAO (e.g., Major Management Challenges and Programs Risks, Performance and Accountability Series), our Inspector General, OMB and the central guidance agencies. The major areas of these deficiencies included financial management, systems, and reporting timeliness.

In order to overcome these deficiencies OCFO has analyzed these deficiencies and determined that additional resources of $2 million and 14 staff years are necessary to accomplish the following: (1) releasing financial statements on time, (2) correcting the material deficiencies cited in the recent report of the Inspector General on the Audit of the 1997 Consolidated Financial Statement, (3) adequately implementing Congressionally mandated debt collection provisions, (4) properly implementing a financial information architecture that fully complies with Federal requirements, (5) maintaining guidelines for cost distribution processes to include guidelines for establishment of fees, (6) assuring compliance with the Single Audit Act and nonprocurement debarment and suspension/drug-free workplace requirements, (7) participating as a key player in Government-wide efforts to continually define and refine financial information requirements, (8) complying with new reporting requirements such as the accountability report, (9) developing and retaining a level of financial management expertise in the USDA agencies that ensures effective use of financial management information, (10) conducting oversight and guidance of USDA agencies GPRA planning and reporting requirements.

These planned accomplishments are reflected in the performance goals contained in our annual performance plans.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. Our biggest program change was the restructuring of the Foundation Financial Information System (FFIS) project, which was undertaken in response to an independent evaluation of that project. FFIS is the cornerstone of our efforts to implement over the next five years the integrated financial management mandated for each federal agency by the CFO Act. With the Secretary's support and guidance, we obtained a waiver from the Office of Personnel Management to bring an experienced project management team from another Federal agency that had successfully implemented a central financial system similar to what we are using at USDA.

Question. How does the agency budget structure link resources to performance goals?

Answer. The appropriated budget structure for OCFO is a single line item. There is a table showing by fiscal year the resources needed to accomplish each strategic goal in terms of source of funding, e.g, Appropriated, Working Capital Fund, and reimbursements. The sum of resources by type of fund needed to meet the strategic goals is shown in tables at the end of the fiscal year 1999 and fiscal year 2000 annual performance plans.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. No change is needed to the OCFO account and activity structure in the budget justifications.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. Our performance goals are based on information we either have available or will have available for the performance report. The verification and validation process will tell us whether or not performance targets for fiscal year 1999 were reached.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The development of future budgets will assess the priorities and cost of achieving the performance elements identified in the Performance Plan. As a result of the assessment, unproductive or extremely inefficient program objectives will be de-emphasized in favor of more critical and more productive program elements. Experience with the performance measures will be used to determine whether or not a program/activity should be continued, and determine whether the OCFO operating plan for the program/activity is efficient and producing the desired outcomes.

Question. To what extent do the dollars associated with specific performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The OCFO appropriated overhead costs are fully allocated among Strategic Goals 1 and 2 in the Annual Performance Plans. Goal 3 includes our WCF funded activities which operate on a full cost recovery basis with overhead built into the fee for service charged to our customers.

OFFICE OF CHIEF INFORMATION OFFICER

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within you agency, as required by the Government Performance and Results Act?

Answer. During the fiscal year 2000 budget development process, OCIO staff made certain that all increases were aligned with the Strategic plan and with the Annual Performance Plan. OCIO developed specific performance measures for each increase requested in an effort to track the progress of OCIO program objectives. Project Management with specific measures and milestones will be instituted in the way OCIO manages its work in the coming fiscal year.

In November 1998 and April 1999 the OCIO management team met to track our progress; look at lessons learned; and develop a tactical plan (in November 1998) to meet our mission. A full session of the meeting was devoted to determining "How OCIO Measured up to its 1999 Annual Performance Plan." Findings from the session were that OCIO is on track to meeting its performance goals for fiscal year 1999.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. OCIO has recently established a procedure for having senior executives and key managers quarterly apprise the CIO and Deputy CIO (DCIO) of progress towards achieving the fiscal year performance goals. Individual accountability of managers is defined by means of individual performance standards. Formal performance evaluations take place once a year.

Question. How is performance information being used to manage the agency?

Answer. OCIO utilizes performance information as a tool for measuring program success. The CIO and DCIO also review these indicators to determine if in fact they are based on outcomes. If the performance measure does not yield the intended goal, it is changed to measure the intended goal.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. During the fiscal year 2000 budget development process, OCIO staff made certain that all increases were aligned with the Strategic plan and with the Annual Performance Plan. OCIO developed specific performance measures for each increase requested in an effort to track the progress of OCIO program objectives. See the example below:

Performance Goals and indicators

Establish USDA policy on IT management using the Capital Planning and Investment Control methodology:

Number of USDA agencies using CPIC in the selection, evaluation, and control of their IT investment portfolio fiscal year 1997, n/a; fiscal year 1998, 5; fiscal year 1999, 10; and fiscal year 2000, 20.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. Strategic tactical planning was instituted in fiscal year 1998 to help improve performance and meet the goals established in the strategic and annual plans.

Question. How does the agency budget structure link resources to performance goals?

Answer. OCIO directly links its budget resources to performance goals. During the fiscal year 2000 budget development process, OCIO staff made certain that all in-

creases were aligned with the Strategic plan and with the Annual Performance Plan. OCIO developed specific performance measures for each increase requested in an effort to track the progress of OCIO program objectives.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. We do not consider changes to be necessary at this time.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. OCIO expects that its measures will supply reliable information for the first report. OCIO performance measures will be improved with each iteration of its tactical plan.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The fiscal year 2001 and future budget processes will follow the previous year's budget development process which directly linked performance measures with increases and dollars in the base.

Question. To what extent do the dollars associated with specific performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. All costs associated for a program activity are fully realized in the OCIO performance goals, including overhead for support staff.

OFFICE OF THE GENERAL COUNSEL

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. I welcome and act upon feedback from Subcabinet level officials on the success and timeliness of legal services provided as it relates to achieving the jointly established performance goals and objectives as required by the Government Performance and Results Act (GPRA). Where additional legal resources are required, I direct senior OGC managers to reallocate resources to properly reflect priorities set for the Department by the Secretary of Agriculture, Subcabinet level officials and agency heads.

For example, a paramount issue that has required increased assistance and counsel is the issues of concentration in agriculture and the impact on producers. I have directed the reallocation of legal resources—a senior level official—to work directly with Subcabinet policy officials to evaluate, assess and address problems in this area.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. In addition to meetings with the senior OGC managers as issues arise, I meet with them collectively, on a weekly basis, to assess their progress in achieving the agency goal and objectives. Managers will be held accountable for achieving results through year end surveys conducted with agency officials which will reveal whether managers have done a good job in striving to meet the priority needs of agency officials. The results of these surveys will be discussed during yearly performance evaluations to inform, guide and direct management of the achievement of not only OGC's goal but of the success in assisting USDA officials in meeting their strategic goals.

I also use the established Incentive Awards Program for managers that deserve special recognition for performance in the achievement of OGC's goal and objectives. I have sponsored and held management conference with senior management throughout the organization in order to be able to evaluate our performance in achieving agency goals.

Question. How is performance information being used to manage the agency?

Answer. Within OGC, the information gathered through meetings and consultation with Subcabinet and agency heads, will enable senior managers to better provide an understanding of priorities to agency attorneys. This in turn, will regulate the work flow and lessen, to some extent, the crisis mode of handling agency legal work. This performance information will also be used to provide managers with continuing feedback concerning the development of new issues that require substantial amounts of OGC input, so that resources can be effectively managed and/or reallocated.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000?

Answer. The process of more carefully prioritizing demands for legal services is clearly required by the current budget environment. In this current budget climate, increases in staffing to meet constant or increasing work loads are unlikely to be forthcoming. Therefore, OGC must plan how resources will be allocated and agency officials must be educated to understand that legal resources are limited. The process envisioned by our performance plan will force managers in OGC to work and consult more closely with agency officials to determine priorities for legal services and determine whether or not OGC services were effective and responsive, taking into account established priorities. For example, If USDA officials indicate that OGC services were not effective and responsive, taking into account established priorities, then OGC will determine the reason for this. If additional resources are needed, then such information will be included in OGC's budget submission in order to achieve the goals and objectives set forth in our plan.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plan?

Answer. One of the objectives was to create a Civil Rights unit within OGC. In achieving OGC's objective in a manner that supports the Secretary's policy objectives, we made a fundamental change within the agency's organization to transfer and request substantial legal resources to a newly created Civil Rights division. We have hired a cadre of experienced civil rights attorneys and support staff, to include a senior executive with a track record of achievement in Civil Rights to support the Department's Civil Rights program. We also have been successful in our efforts to promote workforce diversity by conducting an outreach program regarding employment opportunities to minority law students and the physically challenged. We have also improved the computer and communications systems in the office by upgrading OGC computers, providing OGC employees with Internet access and continuing with the implementation of the paradox work tracking system.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The performance goals articulated in the annual performance plan will be tied directly to the goal stated in our strategic plan. The goal centers around making OGC more responsive by ensuring that demands for legal services are prioritized in a manner consistent with the priorities of the Secretary.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage.

Answer. Since the budget for OGC is requested via single line item in the President's budget, we do not anticipate any need to change or modify the account or activity structure to improve this linkage.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. We are in the process of developing an internal agency database which will be used to track OGC's performance measures.

Question. How will future funding requests take into consideration actual performance compared to expected target performance?

Answer. The assumption underlying the OGC strategic plan are based on a recognition that staffing levels within OGC are unlikely to change significantly over the next five years. Therefore, the focus of the plan will be to ensure that OGC prioritizes its work in a manner which properly reflects the priorities of the Secretary of Agriculture, the Under and Assistant Secretaries and Agency Heads. Should funding be provided at a level that is less than requested, OGC would be unable to meet its objective of providing effective legal services in a responsive manner.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The fully allocated costs of providing legal services have been distributed to OGC's performance goals.

OFFICE OF THE INSPECTOR GENERAL

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. We have developed the strategic and annual plans required by the Act and identified the mission and performance goals, objectives, and performance indicators to foster performance-based management within OIG. We have initiated revi-

sions to our management information system to capture the data needed to measure our progress, and we continually stress the need to achieve our performance goals to our managers.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

The agency's executives and managers are being held accountable through an ongoing assessment of the results produced. Senior executives and other key managers are evaluated based on the measurable activities results of the personnel. Executives and managers are directing the efforts of the agency towards areas that can maximize our efforts and are evaluated accordingly.

Question. How is performance information being used to manage the agency?

Answer. We are using performance information to enable us to gain insight into the adequacy of our internal policies and procedures and to compare quantitative and qualitative results with our initial benchmarks. As mentioned above, the agency tracks a wide range of data on the audits and investigations conducted and results achieved by its staff. This computerized management information system is the backbone of program management. Performance information is being used to identify areas in which our methods need to be changed and to assess the effectiveness of these changes.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. Program performance and all other aspects of the agency's operations and needs are routinely considered as decisions are made regarding the agency's funding requests. Our special Presidential law enforcement initiative identified as Operation Talon exemplifies this effort. Under Operation Talon, the agency has worked with local law enforcement and social service agencies to identify fugitive felons who are receiving Government benefits from the Department's programs. It has been highly successful nationwide providing outstanding results in identifying these fugitive felons and removing them from the benefit roles. It has been so successful it was announced by the Vice President in December 1997 at a high profile media event which also touted cooperation between Federal, State, and local Governments. These results helped support our decision to seek additional funding to enhance our law enforcement efforts under our goal of promoting program integrity in the Department's programs by detecting fraud, waste, and abuse in these programs.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. We have intensified our planning efforts by seeking input from agency management personnel and gathering information from other sources, such as consultations with the Congress and through the media to identify those areas that require a more intensive focus. We continuously evaluate, and changes are made to the workload, staffing assignments, etc., to improve performance. We also perform research to familiarize ourselves with any changes that may have occurred in USDA agencies and mission areas during each year and prepare profiles detailing the changes and their impact. The profile information is used to prepare strategies that define those areas where OIG resources can best be applied to help ensure that the Department's programs are more efficient, effective, and better protected against fraud, waste, and abuse.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. All of the agency's appropriated funding is allocated to its performance goals which are linked to the agency's budget structure.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. None.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. Audit and Investigations' performance data are expected to be available for the performance evaluation and will be available in time for the first performance report.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. As more information is available—and its accuracy and reliability assessed—on how the agency's goals actually reflect its operations, costs, and results, these will be made part of the agency's decisionmaking process in determining fu-

ture funding requests, as well as other activities of the agency's day-to-day operations.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. The agency's performance goals reflect the full costs of each goal including a pro rata portion of all associated overhead or other related costs.

RURAL DEVELOPMENT

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. The development and implementation of performance-based management is an ongoing process. We expect managers to use the strategic plan as a guiding management tool. In addition to the development of annual performance plans at the agency-level, as required by the Results Act, Rural Development State Directors are required to develop annual performance plans for their States, including measurable performance targets. Agency Administrators annually issue their "Administrator's Priority Performance Goals" which detail performance targets by program to be achieved at the state-level. These performance targets, directly and indirectly, support the performance measures used in the annual performance plans. State Directors' annual performance appraisals reflect their success in attaining these performance targets and implementing their annual plans.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The annual performance appraisal for senior executives and State Directors now includes an evaluation of their success in meeting specific program performance targets.

Question. How is performance information being used to manage the agency?

Answer. The performance indicators in the Annual Performance Plans, along with other measures and forms of information, are used by senior management in the day-to-day management of the agencies. For example, to maximize its limited resources and increase the amount of funds available for rural development, leveraging is a key objective in the mission area's strategic plan. Rural Development agencies have strongly pushed their employees and customers to find ways to leverage their funds with private and public partners. Each of the Annual Performance Plans include performance measures tracking the Agency's leveraging activity for most of their programs.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. Funding requests for Rural Development programs are based on many factors, especially need, which is essentially determined by requests for funding. For loan and grant programs the performance measures in the Annual Performance Plan are tied directly to the level of funding provided for each program. For example, the strong need for clean drinking water in rural areas, as defined through the President's Water 2000 Initiative, has resulted in an increase in the President's request for Water and Waste Loan funds from $730 million in fiscal year 1999 to $900 million for fiscal year 2000. This results in an increase in the performance measurement "rural people served who did not previously have public water service" from 539,000 people served in fiscal year 1999 to an estimate of 648,000 people served in fiscal year 2000.

Likewise, the unmet demand for Business Programs and the performance of loans in recent years were considered in fiscal year 2000 funding request decisions. In the Intermediary Loan Program, a large unmet need (approximately $41.4 million) due to a lack of funds existed at the end of the fiscal year 1998. This level of unmet need continued in fiscal year 1999 and is anticipated to continue in fiscal year 2000. Because of this a significant increase in program level funding, from $33 million in fiscal year 1999 to $52.5 in fiscal year 2000, is being requested by the President. This increase will result in an increase in the Performance Measure "number of jobs created or saved" through the IRP from 25,250 in fiscal year 1999 to 40,170 in fiscal year 2000.

Poverty among rural seniors is staggering. The Economic Research Service reports 42 percent of rural seniors, over the age of 74, are at or below 150 percent of the poverty rate. A majority of these seniors are women and own their own homes. The Section 504 Home Repair loan and grant programs help low-income senior citizens eliminate health and safety problems in their homes. The average income of a Section 504 recipient is $12,400 and fifty percent of all participants earn less than

$8,710 each year. All recipients of Section 504 grants are very low-income elderly people, and 67 percent of them are single women (usually widows). More than half of the Section 504 loan recipients are senior citizens. The President's proposal to increase the Section 504 loan and grant programs, from $55 million in fiscal year 1999 to $62 million in fiscal year 2000, will result in an increase in the "number of existing houses improved" for low income rural senior citizens from 8200 homes in fiscal year 1999 to over 11,200 homes in fiscal year 2000.

The Farm Labor Housing loan and grant programs received increases from $33.5 million in the fiscal year 1999 budget to $40 million in the President's fiscal year 2000 budget. This increase was in recognition that the programs reach a population, namely farmworkers, that is underserved not only by USDA but also by the rest of the Federal Government. The USDA Farm Labor Housing programs are the only Federal programs dedicated to farm worker housing and these programs are among the few programmatic opportunities USDA has to serve farmworkers, since farmworkers typically do not participate in food assistance programs such as WIC or food stamps. The Secretary committed to increasing the funding for these programs as part of his civil rights initiative. The proposed funding increases will result in an increase in the "number of Section 514/516 units built" for farmworkers from 495 units in fiscal year 1999 to over 600 units in fiscal year 2000.

The Community Facilities direct and guaranteed loan programs, plus the grant program, allow communities to provide basic services that will enhance the quality of life of the residents. Community Facilities programs can be used to address a panoply of rural community needs, ranging from child care centers to job training centers to teacher housing. Ninety percent of the recipients of Community Facilities direct loans receive loans at "poverty" or "intermediate" interest rates, which are significantly below market rates, because the communities cannot afford to repay the debt at the full interest rate. The President proposed an increase in the Community Facilities programs from $387 million in fiscal year 1999 to $473 in fiscal year 2000. This increase is reflected in a number of performance measures in the Rural Housing Service's Annual Performance Plan. Several of these measures are: an increase in the "number of new or improved health care facilities" in rural areas, from 136 in fiscal year 1999 to 165 in fiscal year 2000; an increase in the "number of beds available at new or improved elder care facilities" from nearly 2200 in fiscal year 1999 to over 2650 in fiscal year 2000; and an increase in the "number of children served by new or improved child care centers" from approximately 6100 in fiscal year 1999 to approximately 7400 in fiscal year 2000.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. Rural Development has made several program changes to improve performance and performance measurement. For example, the Rural Utilities Service observed that the existing eligibility and application scoring criteria for its Distance Learning and Telemedicine program were impeding its ability to meet its goals for targeting of funds to the neediest applicants. The criteria was changed to eliminate the problem. The Rural Business-Cooperative Service observed that its information management system did not track certain information to monitor goal accomplishments. While the automated system is being enhanced, a manual reporting system was designed so the State Offices can report their accomplishments on goals to the National Office on a quarterly basis.

The Rural Housing Service recognized the need to increase its leveraging activity in order to implement the mission area strategic plan and to increase the funding available for rental housing in rural communities. In fiscal year 1999 the Agency changed its regulations to begin awarding Farm Labor Housing and Section 515 Rural Rental Housing funds through nationwide competitions and to give preference to leveraged applications. The Farm Labor Housing competition has not been completed but the Section 515 process is done. By giving priority to leveraged applications, the Rural Housing Service was able to leverage its $79 million for new construction by more than 75 percent. This excellent precedent sends a signal to Section 515 applicants that they must leverage in order to receive funding from the Agency and it will hopefully elicit an even higher level of matching funds in the future.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. Rural Development established one strategic plan which supports the three agencies constituting the mission area. The Rural Development Strategic Plan contains a mission statement which encompasses the role of the entire mission area and three Goals, one for each agency. It also contains four broad Management Initiatives which support the entire mission area. By having a Goal for each agency, alignment with the existing budget structure, which is agency and program based,

is achieved. Separate Annual Performance Plans for each agency facilitate reconciliation with the budget request over the entire mission area. The Goals in the mission area Annual Performance Plan, which align with the Objectives in the strategic Plan, are supported by one or more quantifiable performance measures to be achieved during the fiscal year.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. Rural Development does not need any changes to the account and activity structure to support the Results Act. Individual agency performance plans focus on the major programs that account for the bulk of the mission area's funding.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. We have established performance measures in the annual performance plans that support the goals in the strategic plan and have given priority to the development of measures which could be verified in future performance reports. These measures are largely based and drawn from our existing automated data systems, which are mainly financial systems and are audited annually by the Office of the Inspector General. The quality of these data are generally good but, since they are primarily financially-based, may not be as outcome-oriented as some might like. These measures are indicative of the types of data used in the day-to-day management of the agency. While we believe having results-oriented data, which would measure the impact of the program on the customer, would be useful, it is also difficult to define and would require the development of new data and systems. No resources are now available to support new systems development for Results Act reporting purposes. Until additional resources become available, we will continue to rely on existing information systems for monitoring accomplishments.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. Funding requests for loan and grant programs are primarily needs-driven while the performance measures are primarily a function of the amount of funds provided for the program. Programs that perform exceptionally well on measures of greatest priority, such as their capability to serve those rural Americans most in need, will be considered for increases. However, given the Administration's desire to stay within budget targets, it is unlikely that any programs will receive significant increases.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. Rural Development's comprehensive program delivery structure, which provides services across all of rural America, is not conducive to explicitly identifying and associating all overhead costs directly with individual performance activities. Rural Development staff and support resources are generally commingled in the delivery of mission area programs. Field staff provide housing, business, cooperative, water and waste, and community facilities program services. Administrative service activities support all of the program areas. It would not be useful or meaningful to attempt to allocate costs at too fine a level. Overhead costs are fully allocated to the goals, but only at the macro level.

RISK MANAGEMENT AGENCY

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. In January of this year, the Risk Management Agency (RMA) initiated a series of quarterly executive meetings for the purpose of discussing and improving Agency performance. At the first meeting, six macro performance measures were identified: 1) loss ratio, 2) market information, 3) financial audit, 4) public awareness, 5) program integrity, and 6) administrative costs. These measures were developed in consultation with the private insurance sector.

At the second meeting, these macro-level indicators were merged into our operational strategy. From this strategy, numeric micro-level performance standards will be developed.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Each of our senior executives have performance elements in their standards that relate to the performance measures established in compliance with the

GPRA. Data will not be available this year to judge the performance of all of these measures. Thus, executives will be judged by their having completed initiation of a process to obtain and evaluate these measures.

For example, farmers' awareness of risk management methods is one performance measure. RMA has included questions to assess this awareness in upcoming farmer surveys. The results of this survey, however, will not be available in this rating period.

Question. How is performance information being used to manage the agency?

Answer. Many of the performance measures are relatively new and baselines are still being established. In addition, the performance of an insurance program is typically measured over a period of years due to the statistical basis of an insurance program.

The major divisions within RMA have been assigned macro-level performance measures. For example, Research and Development has been assigned responsibility for the loss ratio. Loss ratio measures the amount of indemnities paid per premium received and is set by statute to be 1.075 with a reasonable reserve. Compliance with this standard is measured over a period of years. RMA is working with an actuarial consulting firm to determine if the means used to set premiums, which directly affects the loss ratio, are adequate. If the loss ratio is routinely exceeded, premium rates will be adjusted to compensate.

Similarly, Insurance Services has been assigned to monitor market indicators such as the market share and penetration for various risk management products. A marketing plan is being developed to establish the baseline for these measures as well as to determine means to improve them. The summary of business reports and related analyses will be used to determine which insurance products are most frequently used. Maintenance on remaining products will be dropped so that scarce resources can be used elsewhere.

These are two examples of how performance measures are used to adjust the course of the agency.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. When the fiscal year 2000 President's Budget was announced earlier this year, USDA presented specific ideas for strengthening the farm safety net. These ideas emerged as a result of the farm crisis in 1998. Farm income fell precipitously, commodity prices plummeted as world markets softened, and other farmers struggled with the effect of natural disasters that hit many parts of the country. Neither the crop insurance program nor the 1996 farm bill were able to ameliorate the dramatic losses the farm economy suffered. As a result, weaknesses in the program were exposed. For example, we learned that our program is unable to provide adequate levels of protection to producers suffering multiple years of loss. Too many farmers remain uninsured or under-insured. Many crops and commodities, like livestock, do not have federally-backed insurance available to them, and farmers have far too little instruction on the risk management tools and strategies that can protect and improve their farm revenue.

In response to these concerns, USDA offered the following preliminary proposals: bring new, more flexible risk management tools to farmers; make the basic program more financially worthwhile by raising the floor on basic crop insurance coverage; increase incentives for farmers to purchase higher levels of coverage; cover multi-year disasters; cover livestock; make farmers in designated disaster areas eligible for NAP assistance once such a designation occurs; and provide better information and risk management education to farmers.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. In response to the farm crisis that exposed weaknesses in the crop insurance program, USDA has suggested the following proposals for change. These changes would allow RMA to achieve their goal established in its strategic and annual plans, "To strengthen the safety net for agricultural producers through sound risk management programs and education."

—*Raise the Coverage Floor*.—Raise coverage to 60 percent of approved yield indemnified at 70 percent of the expected market price, a 50 percent increase. Caution is needed to avoid raising buy-up insurance too high thereby shifting production and potentially depressing prices further. Caution is also needed to avoid raising CAT coverage too high due to the potential buy-down affect on current buy-up policy holders.

—*Make Higher-level Coverage More Affordable*.—Increase the premium subsidy so that coverage at 70 percent of the approved yield indemnified at 100 percent of the expected market price level (or 70/100) will cost the producer the same as 65/100 coverage does today. Additionally, provide an additional premium

subsidy for coverage above the 70/100 level of 50 percent of the additional premium, and make all insurance plans, including revenue, equal in terms of assistance for premium. Review of company expense reimbursements may be warranted in recognition of the higher premium. The subsidy rate at these higher coverage levels would be 55 percent.

—*Cover Multi-year Disasters*.—Develop a new multi-year insurance "umbrella" to complement single-year policies. Further, crop insurance price elections and company expense payments would be based on multi-year price averages, avoiding sharp inter-year swings. In this context, RMA would also examine alternatives to the current method of determining the yields used as the basis for coverage.

—*Speed Flexible, New Risk Management Tools to Market*.—Stimulate the flow of new risk management tools to farmers by: (a) authorizing RMA to reimburse companies for costs of successful new products that they develop; (b) expanding contracting with the private sector to develop products for smaller crops; (c) reducing the regulatory procedures required to develop and update policies; and (d) giving RMA greater flexibility to use pilot projects, including pilot programs on a nationwide scale.

—*Cover Livestock*.—Authorize RMA to pilot revenue-based livestock insurance products proposed by the private sector. On an initial basis, USDA proposed providing up to $50 million per year from the Federal Crop Insurance Corporation (FCIC) Fund for these products.

—*Improve the Noninsured Assistance Program (NAP)*.—Many farmers rely on the NAP program as their primary protection from natural disaster losses. Coverage should be increased to 60 percent of yield and 70 percent of price, commensurate with the CAT increase. In addition, the cost-effectiveness of the current area trigger versus a Secretarial disaster designation should be reviewed.

—*Provide Better Information and Services to Farmers*.—As changes are made to strengthen the crop insurance programs as part of the farm safety net, it will also be important that farmer awareness is increased so that producers can more quickly access a wide range of both new and existing risk management tools. Crop insurance reform should include a public awareness outreach effort to enable producers to assume more responsibility for greater understanding, and to better manage their risk management planning portfolios.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The performance measures specifically link resources to goals, as many of the goals are financially based. The Agency also uses the approach of establishing annual performance goals and indicators that gauge progress toward achieving the long-term general goal and objectives found in its strategic plan. As a result, all resources directly support the general goal of the Agency, "To strengthen the safety net for agricultural producers through sound risk management programs and education."

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. RMA feels no changes are necessary given the fact that we have established performance goals and indicators that gauge progress toward achieving the long-term general goal of the Agency.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. Yes. We envision difficulty in gauging farmers' use and knowledge of risk management tools. The following steps are being taken to try to improve the reliability of the measure: RMA is sponsoring some educational projects which include surveys on farmers' use and knowledge of risk management tools for certain regions of the U.S. However, sufficient funding for a comprehensive and reliable U.S. survey is not currently available. RMA is closely monitoring risk management educational opportunities of U.S. producers through regional activity logs. The extent of risk management education opportunities can be a proxy measure for knowledge of risk management tools.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. RMA intends to monitor the crop insurance program and take into consideration the actual performance of the program when requesting future funding. For example, RMA will continue to evaluate and address program concerns such as: shortfalls of basic CAT coverage; low prices; multiple-year losses; revenue insurance participation; and lack of federally-backed livestock insurance. In addition, RMA

will continue to analyze the number of acres which were actually insured, compare them to our fiscal year estimates, and revise as necessary. The number of policies in force, potential policies, premium cost per acre, and participation levels will also be evaluated and revised to reflect the most current data or trend. Furthermore, RMA intends on using the results of farmer surveys that gauge farmers' awareness of risk management methods, as well as regional activity logs, in determining future resource requirements of the Risk Management Education and Public Awareness/ Outreach initiatives.

There are some factors, however, that are more difficult to consider when comparing actual performance and target performance. For example, it would be nearly impossible to predict a loss ratio based on prior year actuals, due to occurrences such as unforeseen weather disasters. Compliance with this standard is generally measured over a period of years. As as result, the Agency uses the mandated loss ratio of 1.075 in projecting loss estimates. If, however, the loss ratio is routinely exceeded, premium rates will be adjusted to compensate.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. All resources, including total Administrative and Operating (A&O) and Federal Crop Insurance Corporation (FCIC) Fund dollars, are linked to and directly support the general goal of the Agency, "To strengthen the safety net for agricultural producers through sound risk management programs and education."

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

NONDEPARTMENTAL WITNESSES

[The following testimonies were received by the Subcommittee on Agriculture, Rural Development, and Related Agencies for inclusion in the record. The submitted materials relate to the fiscal year 2000 budget request for programs within the subcommittee's jurisdiction.]

PREPARED STATEMENT OF THE AD HOC COALITION

Mr. Chairman, Members of the Subcommittee, this statement is respectfully submitted for the hearing record on behalf of the ad hoc coalition [1] supporting fiscal year 2000 appropriations for title I of Public Law 480 at not less than the same level as provided in the current fiscal year. The ad hoc coalition applauds the Administration's estimate that $91 million of CCC funds will be used to support Food for Progress in fiscal year 2000. The coalition also supports full funding for title II at not less than the same level as provided in the current fiscal year.

In its fiscal year 2000 budget, the Administration without explanation recommends a title I program level of only $150 million, a substantial decline from that established by the Congress for the current fiscal year. Our members also note with dismay that funding for title III, Public Law 480, has been zeroed out in the President's budget. This small program, which protects the poorest of the poor, should be restored at least to the $25 million level provided by Congress in the current fiscal year. At a time when U.S. agricultural prices are low, the Department should sustain these historic programs, with strong Congressional support, to alleviate hardships in friendly countries and promote new markets over the long term for our farmers.

LONG-TERM SIGNIFICANCE OF PUBLIC LAW 480

Mr. Chairman, the title I program has an illustrious history. From enactment in 1954 until the mid-1960s, title I shipments accounted for about 20 percent of the annual value of all agricultural exports. Until foreign sales dramatically increased in the 1970s, title I shipments continued to represent more than five percent of all agricultural exports. As recently as fiscal year 1990, moreover, title I export values regularly exceeded $700 million. Only in recent years has the U.S. commitment to this program eroded substantially, to a low of $202 million in title I credit sales in fiscal year 1997.

Under the leadership of your Subcommittee, Mr. Chairman, Congress in fiscal year 1998 reversed the severe decline in title I program funding. In that year, credit sales increased from $202 million to $252 million, despite severe limitations im-

[1] The ad hoc coalition is composed of the USA Rice Federation, the National Association of Wheat Growers, the National Corn Growers Association, the National Council of Farmer Cooperatives, the American Soybean Association, the National Grain Sorghum Producers, the American Maritime Congress, the Maritime Institute for Research and Industrial Development, the Transportation Institute, TECO Transport Corporation, and Liberty Maritime Corporation.

posed by the Congressional budget process. When the administration proposed again that the title I program level for fiscal year 1999 be sharply reduced, you responded by nearly doubling the funding requested for the program. Under severe budget constraints, the Agriculture Appropriations Subcommittees of the Congress have sustained title I when competing demands for resources have been most persistent.

This year the wisdom of Congress' decision to preserve title I has been demonstrated for everyone to see. In the face of declining farm prices at home and serious economic dislocations abroad, the Clinton Administration has undertaken a Food Aid Initiative which includes an allocation of $726 million from the CCC to the title I program accounts. This will increase the program level for title I in fiscal year 1999 to $1,070,000,000, including $996 million in commodity credits and $104 million for ocean freight differential and ocean transportation costs.

In fiscal year 1999, the title I program of Food for Peace was available to provide emergency assistance to the Russian Federation, and to provide additional markets for American agricultural products. This has happened before. It will happen again. The program must be preserved and sustained at reasonable levels to ensure its availability when adverse conditions recur at home or abroad. The great significance of title I in trying times has once again been shown; its long-term significance as a principal food aid and market-developing program cannot be forgotten.

Mr. Chairman, the export subsidy reduction commitments established in conjunction with the Uruguay Round Agreement on Agriculture severely restrict U.S. flexibility in agriculture export market development. Those commitments curtail the use of the Export Enhancement Program and similar strategies that might be implemented in the future. But Food for Peace is exempt from the Uruguay Round restrictions: Public Law 480 remains one of the principal programs for penetrating new overseas markets, for establishing trading relationships that will surely become essential to the economic survival of our agricultural sector.

OUTLOOK FOR U.S. AGRICULTURAL TRADE

In the two decades following World War II, Food for Peace was instrumental in securing long-term, stable markets for American food and fiber. In fiscal year 1996, U.S. agricultural exports reached a record value of $59.8 billion, representing more than 25 percent of total farm cash receipts for crops and livestock. In that year, the U.S. share of the global agricultural export market reached 23 percent, an increase of more than one-third in a single decade. But the record level achieved in fiscal year 1996 was no more than a snapshot of conditions at a given moment in time. Regrettably, conditions have only deteriorated since that banner year.

Mr. Chairman, as the Department has reported, lower world market prices and export volumes reduced U.S. agricultural exports to $53.6 billion in fiscal year 1998, a full ten percent below fiscal year 1996's record high. In the current fiscal year, the Department expects the value of farm exports to decline to $49 billion. About 85 percent of the decline reflects reduced exports to Asia, but Brazil this year is also expected to reduce significantly its purchases from American farmers. This is particularly important to rice farmers, as Brazil in fiscal year 1998 accounted for one-fifth of total U.S. rice exports.

The President's Food Aid Initiative will account for shipments of 5.0 million metric tons of farm produce, an amount equal to all other U.S. food aid combined for the current fiscal year. This initiative has the strong support of the American agricultural sector, but it is not sustainable over the long term. As conditions at home and abroad return to normal, the United States once again will rely upon title I, Food for Peace, and other critical programs to maintain and expand export markets, and to create new markets in emerging economies throughout the world.

The Foreign Agricultural Service of the U.S. Department of Agriculture, in administering Food for Peace, will be instrumental in protecting existing markets and developing potential new markets. Through sustained title I funding, Congress must give the Department the tools it needs to do the job.

USDA SHOULD BE DIRECTED TO USE TITLE I RESOURCES

Mr. Chairman, the ad hoc coalition strongly recommends a fiscal year 2000 appropriation for title I of Public Law 480 at not less than the level provided in fiscal year 1999. Using carryover funding from prior fiscal years, increased levels for the baseline program can be achieved without diverting resources from other worthwhile programs of the Department.

Mr. Chairman, the ad hoc coalition respectfully requests report language accompanying the fiscal year 2000 funding bills which would direct the Department of Agriculture to increase title I country allocations and make full use of the resources available for this worthwhile program. A strong and sustained title I program is the

best insurance for Congress that the Department can promptly respond to future changes in the global agriculture export market and protect and develop new markets for our farmers.

CONCLUSION

Mr. Chairman, the administration has long acknowledged the importance of title I of Food for Peace as a program to promote long-term markets for U.S. commodities, and to alleviate hardship in friendly countries. But the administration suggests a title I program level for fiscal year 2000 of only $150 million, a substantial decline from that established by Congress for the current fiscal year.

With enactment of the 1996 Farm Bill, Government price supports and producer payments are being phased down. As a result, agricultural producers have become increasingly dependent on export markets to sustain a healthy economy. The title I, Public Law 480 program, coupled with the other export programs, have become of even greater significance than ever before in meeting this objective, sustaining the many allied industries dependent upon a healthy agricultural economy, as well as providing valuable humanitarian assistance to developing countries.

The members of the ad hoc coalition respectfully request an appropriation of not less than last year's level for the title I program and committee report language directing the Department of Agriculture to establish a program level for the title I program that makes full use of this appropriation and the carryover funds. The need is there. We also request that the Agriculture Appropriations Subcommittees of Congress closely monitor the performance of the Department in fulfilling this objective over the course of the fiscal year.

Our farmers and the U.S. maritime transport system depend upon Congress to set the standard, and upon the Department to meet that standard, as we enter an era of uncertainty and volatility in trading relationships. The title I program of Food for Peace must be preserved and effectively employed to promote American interests in an environment of uncertain markets and increasing global competition.

PREPARED STATEMENT OF THE AMERICAN FARM BUREAU FEDERATION

The American Farm Bureau Federation has identified four USDA program areas for which adequate fiscal year 2000 funding is essential. They are:

—programs key to the proper implementation of the Food Quality Protection Act (FQPA),

—funding for reform of the crop insurance program

—programs to expand foreign markets for agriculture

—funding for research to keep American agriculture competitive.

These priorities are highlighted in the first portion of this statement. The second portion contains a list of additional programs supported by Farm Bureau.

FOOD QUALITY PROTECTION ACT

Farm Bureau supports the Administration's request for $204 million for the Food Quality Protection Act (FQPA) and related programs. Farm Bureau supports $36 million for FQPA directly related programs, plus $127 million for integrated pest management research (IPM), $21 million for pesticide data collection and $20 million for pesticide registration, clearance, assessment and training

We support full funding for the Pesticide Data Program (PDP). PDP provides valuable pesticide residue information to the Environmental Protection Agency (EPA) so that pesticide tolerance reassessment decisions can be made on actual residue levels rather than on theoretical maximums. Implementation of the FQPA must occur in a manner that does not harm production agriculture. This depends on the availability of accurate data on pesticide use and residues on crops.

We support full funding for the Office of Pest Management. The Office of Pest Management should provide advocacy for farmers' continued access to safe and effective crop products and must be adequately funded to perform this important task.

Key functions of the Office of Pest Management must include assisting EPA in establishing accurate data for risk assessments where current data is inaccurate or incomplete. This includes the development of crop profiles, which will be used by EPA in making risk assessments and tolerance decisions. USDA must be a full partner with EPA in all key implementation policy decisions. To reduce disruption of U.S. agricultural producers, USDA should conduct an economic impact analysis of proposed EPA implementation strategies, including EPA's proposals relating to risk assessments for the organophosphate and carbamate pesticides.

We support full funding for the IR–4 Program, which provides data to EPA to clear new uses and tolerances for pesticides used on minor crops. Minor crops are likely to be impacted first by FQPA implementation. The IR–4 Program, if properly utilized, can provide data to support new, effective, economical and safe pesticide uses for crops impacted by FQPA.

CROP INSURANCE/RISK MANAGEMENT

The federal crop insurance program must provide greater flexibility and more effective coverage for all agricultural commodities. Participation must be increased and the program should be expanded to include a comprehensive revenue insurance program to protect farmers from economic disasters due to weather or prices. The need for a short-term emergency financial assistance package last year again pointed up the urgency for effective crop insurance and risk management programs.

Reforms in risk management programs must assure broad-based availability and affordability for livestock as well as crops. Producers must have the opportunity to purchase coverage with small deductibles. These programs must also address multi-year disasters.

We were disheartened that the Administration did not include additional money for crop insurance reform in its fiscal year 2000 budget proposal after indicating earlier that it planned to submit a proposal. Several members of Congress have come forward with major reform plans that merit serious consideration. Depending on the assumptions used, most of the plans carry yearly costs beyond current funding levels of $1.5 billion to $2.5 billion per year. We recommend that a minimum of $2 billion per year in additional funding be earmarked for these programs.

EXPORT PROGRAMS

Continued funding of export development programs is fundamental to improving farm income, both in the short and long run. We recommend maximum funding of all export development programs consistent with our commitments under WTO trade rules.

We support increased funding for the GSM credit program. We endorse the Administration's aggressive use of GSM 102, GSM 103 and supplier credit guarantee programs in fiscal year 1999, and back its plans to continue.

We support increased funding for the Market Access Program (MAP) and the Export Enhancement Program (EEP). MAP funding should be restored to its original funding level of $200 million. We oppose efforts by the Administration to reduce the Export Enhancement Program program level by $85 million to $494 million. While we understand the administration's need to find budget offsets for other high priority spending, this reduction sends the wrong signal to other countries that subsidize exports, hurts our competitiveness overseas, and puts the United States at a disadvantage in the upcoming negotiations on agriculture in the World Trade Organization. We support funding for the Dairy Export Incentive Program to the full extent allowed under the Uruguay Round Agreement.

We support increased funding for Public Law 480 programs, the primary means by which the United States provides foreign food assistance. We appreciate the Administration's aggressive use of $1.07 billion in Public Law 480 Title 1 credit sales to move additional products into the export markets during fiscal year 1999. We do not agree with the recommendation to reduce use of the program to $150 million.

We support funding of APHIS Import/Export programs at $7.2 million to maintain current services and assist in reducing unfair trading practices. The Foreign Market Development Cooperator Program should be funded at no less than the current level.

AGRICULTURAL RESEARCH

Agricultural research and the distribution of that research to producers is critical to the future of our industry. One of the implicit areas of agreement when the 1996 Farm Bill was enacted was that funding for agricultural research would be increased to allow U.S. producers to maintain their competitive position in world markets. To date this has not happened. In order to move the research agenda forward we support the following:

—$120 million for the Initiative for Future Agriculture and Food Systems authorized by the Agricultural Research, Extension, and Education Reform Act of 1998.

—$200 million for the National Research Initiative Competitive Grants program. Originally authorized at $500 million annually, the program has only been funded at $100 million to $120 million.

We support enhanced funding for the Agricultural Research Service (ARS), with particular emphasis in the following areas:

—an increase of $8.1 million for emerging diseases and exotic pests of plants and animals. Care must be taken to assure that animal, plant and aquaculture concerns are addressed.

—an increase of $9 million for work in the area of plant and animal genetic resources and the Agricultural Genome Project.

—an increase of $11.7 million for work in food safety, to address both pre-and post-harvest areas. This should include work on manure handling, risk assessment and antibiotic resistance.

—an increase of $2 million for Agricultural Information to develop or enhance information systems delivery for rural America.

We support adequate funding for ARS to transfer the National Swine Research Center at Ames, Iowa from Iowa State University to ARS and to fully staff the facility. Estimated needed funding for this would be $10 million per year.

We support ARS funding of $8.2 million for general maintenance and modernization of the Plum Island Animal Disease Center.

We support current ARS activities regarding honeybee research and strongly opposes plans to close the Tucson laboratory.

The National Soil Tilth Lab at Ames, Iowa should be maintained at its current level of funding to continue work on soil, water, manure and nutrient management to improve the environment and farmers' ability to sustain profitable operations for the long term.

We support CSREES funding of $4.8 million for Animal Health and Disease, Section 1433.

We support CSREES requests for funding of the following special research grants:

—$2.7 million for Integrated Pest Management and Biological Control

—$600,000 for minor use animal drugs.

—$2 million for the Bi-national Agricultural Research and Development Fund (BARD).

Other Issues

We oppose all efforts to reduce funding for APHIS-Wildlife Services. At minimum, Wildlife Services should be funded at last year's level for "methods development" and "operations." Additional funding of $1.2 million should be made available for wildlife hazards at airports. Any unfunded Congressional directives should receive funding. APHIS-Veterinary Services should be funded so there is no loss of services.

GIPSA should be funded so there is no loss of services and to provide for additional administrative oversight of the poultry industry. GIPSA should receive full funding to monitor business transactions between produces and packers

For FDA, we support additional funding of $200,000 per year for the next five years for the Center for Veterinary Medicine to hire staff to reduce the backlog of animal drug applications.

We support the Commission on 21st Century Production Agriculture and urge sufficient funding to ensure that the Commission will be able to conduct a thorough revaluation of the effectiveness of the FAIR Act and potential agricultural policy alternatives.

We support efforts to provide loans to producers to build on farm grain storage facilities.

We reject plans to cut funding to boll weevil eradication programs. We support full funding to provide a 30 percent match with producer funding and increased availability of low interest revolving loan funds to facilitate expansion of the program.

We support increased funding for USDA guaranteed operating and ownership loans and streamlined administrative procedures to ensure that loans are made in a timely manner.

We support funding of the Conservation Reserve Program to increase enrollment to the 36.4 million acres allowed under current law.

We are concerned about adequate NRCS conservation operation funding. Conservation program delivery and technical assistance should be a priority for NRCS funding. No new initiatives should be funded in the conservation operations budget. Emphasis should be placed on traditional technical assistance and the development of reliable resource data for assisting producers deal with nutrient management. We support earmarked funding for technical assistance under the Grazing Lands Conservation Initiative.

With regard to conservation programs under the Commodity Credit Corporation Program (CCC), we believe that emphasis should be placed on the Environmental Quality Incentive Program (EQIP). EQIP is an important program for assisting pro-

ducers dealing with increased water quality regulation. We support the $100 million increase for EQIP proposed by the Administration to bring funding to $300 million. We also support the removal of the CCC Section 11 cap on reimbursement of NRCS for technical assistance provided for CRP and Water Reserve Program delivery.

We oppose all user fees for conservation programs.

We oppose the Administration's zero funding for the Forestry Incentive Program and suggest funding of $6 million.

We support APHIS funding of:

—$1.2 million to facilitate development of a National Animal Health Emergency Management System;

—$68 million to maintain and enhance the Animal Health Monitoring and Surveillance program, including funding for both Johne's and trichinae programs

—$10.6 million for veterinary biologics

—$16.9 million for veterinary diagnostics to facilitate more reliable tests for use with animals that are to enter the U.S. as well as for emerging diseases such as Johne's and porcine respiratory and reproductive syndrome.

—$3.8 million for the animal care unit to bring total funding to $13 million. This will allow for effective operation and enforcement of the Animal Welfare Act.

We support the FSIS proposal of $33.1 million for continued implementation of the HACCP based food inspection system. We are opposed to user fees to finance federally mandated meat and poultry inspection programs. Programs to ensure food safety benefits everyone should be funded by tax dollars.

PREPARED STATEMENT OF THE AMERICAN HONEY PRODUCERS ASSOCIATION, INC.

My name is Richard Adee. I am President of the American Honey Producers Association, Inc. and I am submitting this statement in its behalf. The American Honey Producers Association, Inc. is a national organization of commercial beekeepers with activities in most of the States in this country.

First, the Association wishes to thank you for the support the Subcommittee has provided in the past for agricultural research activities in behalf of the beekeeping industry. It has enabled the Agricultural Research Service to staff its bee laboratories at the minimum level necessary to meet with the critical needs of the industry. At this time, the Association supports the President's budget proposal for bee research with one notable exception. To continue this research, the Association is seeking the restoration of $200,000 that the Administration would cut from the baseline funding for the bee laboratory at Weslaco, Texas, along with cuts for many other research projects contained in the fiscal year 1999 appropriation. On the other hand, we fully support the increase in the level of funding recommended by the Administration for the ARS honey bee breeding, genetics, and physiology laboratory at Baton Rouge, Louisiana.

(1) *Background.*—Honey bees pollinate over 90 cultivated crops whose estimated value exceeds $9.3 billion and produce an average of 227 million pounds of honey annually. Since 1984, the survival of the honey bee has been threatened by continuing infestations of mites and pests for which appropriate controls have not yet been developed and research must provide the answers. Unfortunately, there is no simple solution to these problems. The honey bee industry is too small to support the cost of the needed research, particularly with the current depressed state of the industry. As you know, there are no longer any federal subsidies on honey. Further, there are no funds, facilities, or personnel elsewhere available in the private sector for this purpose. Accordingly, the beekeeping industry is dependent on research from public sources for the scientific answers. The key to the survival of the honey industry lies with the honey bee research program conducted by the Agricultural Research Service.

(2) *Research at the ARS Weslaco, Texas, Laboratory.*—Parasitic mites, primarily the varroa mite, are causing a crisis for the U.S. beekeeping and pollination industry. Tens of thousands of domestic honey bee colonies are being lost annually to varroa mites. Wild bee colonies have been decimated. The only chemical now registered for varroa mite control, fluvalinate, is being rendered ineffective by the development of resistant mite populations. The USDA honey bee lab at Weslaco, Texas, has been working hard trying to find alternative chemicals to control the varroa mite. This past summer it appears that they have found a chemical, coumaphos, which is equally effective as fluvalinate. This is a real break through for the bee industry but as of today we have only been able to obtain a section 18 emergency registration. Much work still remains to be done before a section 3 general registration is granted by EPA.

A new pest, the small hive beetle, has been found in Florida this past year and has caused severe bee colony losses. Apparently, it originated in South Africa. Estimates put the losses in just one season at over 30,000 colonies. There is evidence that the beetles are spreading to other areas in the East coast. As the beetles spread, they will just devastate the bee industry. In order to contain the beetle, several states have quarantined bees from Florida, North Carolina, South Carolina, and Georgia or are actively considering such quarantines.

The USDA–ARS honey bee research scientists at the Weslaco laboratory have been working overtime to find chemicals, techniques, pheromones, or other methods of controlling the beetle. Time is of the essence, as a control must be found immediately as all the bee colonies in the Western Hemisphere are at risk.

Additionally, the Weslaco lab is responsible for finding new and improved methods for control of other parasitic mites as well as solving beekeeping problems that interfere with honey production and effective crop pollination, and determining the impact and spread of Africanized honey bees.

The uncertainty of continued funding is hampering the efforts of the Weslaco laboratory in finding a solution to our most pressing problems. They cannot operate effectively with a reduction of $200,000 in its baseline appropriation. These funds need to be restored.

(3) *Research at the ARS Baton Rouge, Louisiana, Laboratory.*—The Association supports the request of the Administration for an increase of $300,000 in the appropriation for the ARS laboratory at Baton Rouge, Louisiana. The Baton Rouge lab is the only laboratory world wide focusing on the development of long-term, genetics-based solutions to the varroa mite. Their research programs have taken them to the far corners of the world looking for mite resistant bees. In eastern Russia, they found bees that have co-existed for decades with the mites and survived. The bees were brought to the United States and are in the process of being evaluated to assure that the resistance holds up under a wide range of environmental and beekeeping conditions. Attributes such as vigor, pollination, and honey production must be tested. There is an immediate need to propagate the resistant queen bees in large numbers for wide scale distribution to beekeepers so that this evaluation can be accomplished. The work is slow and tedious. It is also costly. The requested appropriation will accelerate the research, development, and transfer of queen bee stock resistant to varroa mites to U.S. beekeepers.

(4) *Summary.*—In conclusion, we wish to thank you again for your support of honey bee research in the past. We would appreciate your continued support by approving restoration of the $200,000 that the Administration would cut from the fiscal year 2000 appropriation for the Weslaco, Texas, lab and by otherwise supporting the Administrations's request for bee research. This would include the increased appropriation recommended for the AES Baton Rouge, Louisiana, lab, as discussed previously in this statement. Only through research can we achieve and maintain profitability in U.S. beekeeping industry and continue to provide stable and affordable supplies of bee pollinated crops which make up fully one-third of the U.S. diet.

I would be pleased to respond to any questions that you may have.

PREPARED STATEMENT OF THE AMERICAN INDIAN HIGHER EDUCATION CONSORTIUM

I. Introduction

Mr. Chairman and Members of the Subcommittee, on behalf of the American Indian Higher Education Consortium (AIHEC) and the 30 Tribal Colleges that comprise the AIHEC land-grant institutions, we thank you for this opportunity to share our funding requests for fiscal year 2000. On behalf of the Tribal Colleges, we respectfully request full funding of our original four land-grant programs, along with funding under the Agriculture Research Reauthorization. Specifically, we request: $4.6 million for the Tribal College endowment; $1,552,000 for the equity grant program; $5 million for the extension program; $1.7 million for institution capacity building grants; and $10 million for research.

This statement will cover three key points: First, it will provide a brief background on the Tribal Colleges and our long-awaited inclusion in this nation's land-grant system; second, it lays out Tribal Colleges' ambitious efforts through extension services to fulfill the agricultural potential of American Indian communities and to ensure that American Indians have the skills needed to maximize the economic development potential of our resources; and third, it describes and justifies our other program requests for fiscal year 2000.

II. Background on Tribal Colleges

Today, almost 140 years after enactment of the first land-grant legislation, Tribal Colleges, more so than any other institutions, truly exemplify the original intent of the land-grant legislation. The first Morrill Act was enacted in 1862 specifically to bring education to the people and to serve their fundamental needs. Mr. Chairman, this is the definition and mission of the Tribal Colleges. We truly are institutions by, of, and for our people.

The dismal statistics concerning the American Indian experience in education brought tribal leaders to the realization that only through local, culturally-based education could many American Indians succeed in higher education and help bring desperately needed economic development to the reservations. In the late 1960s and early 1970s, the first Tribal Colleges were chartered on remote reservations by their respective tribal governments, to be governed by boards of local tribal people. In 1972, the first six tribally-controlled institutions came together to form the American Indian Higher Education Consortium. Today, AIHEC is a cooperatively sponsored effort on the part of 32 member institutions in the United States and Canada, 30 of which are the 1994 Land-grant Institutions. AIHEC has become the premier national voice of the Tribal College movement and Indian higher education.

Tribal Colleges now serve more than 25,000 students each year, offering primarily two-year degrees, with some colleges offering four-year and graduate degrees. Since their inception, the Tribal Colleges have helped address the problems and challenges of our welfare system. Tribal Colleges provide GED, other college preparatory courses and have high success rates in student job training and placement. Our mission requires us to help move American Indians toward self-sufficiency and help make American Indians productive, tax-paying members of our society. Fulfilling this obligation will become even more difficult over the next several years as Tribal Colleges feel the impact of the welfare reform laws. Already, our colleges are seeing increasing numbers of welfare recipients turning to the colleges for training and employment opportunities. Also, Tribal Colleges serve as community centers, providing libraries, tribal archives, career centers, economic development and business centers, public meeting places, and child care centers.

Despite our many obligations, functions, and notable achievements, Tribal Colleges remain the most poorly funded institutions of higher education in this country. Historically, states do not have an obligation to American Indian lands because our reservations are trust lands under federal jurisdiction. Unlike mainstream land-grant institutions, we cannot depend on state and local governments to match or surpass the federal investment. Our core funding under the Tribally-Controlled College or University Assistance Act of 1978 remains grossly inadequate; and total funding for the agriculture programs authorized for all 30 of the 1994 Institutions combined is less than the amount the Department of Agriculture gives to just one state land-grant institution each year.

III. Extension Services—Ambitious Efforts to Reach Economic Development Potential

Although current land-grant programs at the Tribal Colleges are modest, our 1994 authorizing legislation is vitally important to us because of the nature of our land base. Of the 54.5 million acres that comprise American Indian reservations, 75 percent are agricultural lands and 15 percent are forestry holdings. In fact, Indian agricultural production has been valued at nine times the production potential of oil and gas resources.

Tragically, due to lack of expertise and training, millions of acres lie fallow, under-used, or are developed through methods that render the resources non-renewable. The Educational Equity in Land-Grant Status Act of 1994 is our hope for turning this situation around. It is absolutely critical that American Indians learn more about new and evolving technologies for managing our lands. We are committed to becoming, as we were when your forefathers came to this land centuries ago, productive contributors to this nation's—and the world's—agricultural base.

Recent years show impressive efforts to address economic development through land use, as Tribal Colleges entered into partnerships with 1862 Land-grant Institutions through extension services. The Extension program represents an ideal combination of federal resources and Tribal College-state institution expertise, with the overall impact being far greater than the sum of the parts. Some examples of the innovative programs that are funded under extension services include:

—Northwest Indian College, Bellingham WA and Washington State University are partnering in a special emphasis grant project entitled: "Honor the Gift of Food". The objective of this undertaking is to support and expand a distance-learning nutrition education program for Pacific Northwest Tribal communities. The overall goal will be to develop nutrition education modules and support materials to train nutrition assistants in tribal communities.

—Fort Peck Community College in Poplar, MT and Montana State University-Bozeman, are collaborating on a project focusing on development of institutional infrastructure and capacity building from which FPCC will provide extension services in the areas of "Community Resource and Economic Development" and "Family Development and Resource Management". Specifically, program objectives associated with these areas are designed to strengthen existing employers and attract new enterprises and local entrepreneurship.

Additional funding to support such efforts is needed because extension services provided by the states on our reservations are woefully inadequate, and the Tribal Colleges need to fill that void. It is important to note that this program is not duplicative of ongoing extension activities, as it is specifically designed to complement and build upon the Indian Reservation Extension Agent program. In Fiscal 1999, the 1994 institutions were awarded $2,060,000 for extension services. In fiscal 2000, we are requesting that Congress build on the $3.5 million proposed in the President's budget, and raise funding to $5 million, the fully authorized level for this program. The increase recommended in the President's request emanates from the strong relationship we have with USDA and is evidence of our successes in this program.

IV. Other Funding Requests For Tribal College Program

The thirty 1994 Institutions' appropriations request for fiscal year 2000 are extremely modest when compared with the annual appropriations to each existing land-grant institution. Along with our request of $5 million for our cooperative extension program, we are seeking the following amounts for the four other authorized programs for 1994 Institutions: $4.6 million for the Tribal College endowment (not scored as budget outlay); $1.552 million for the equity grant program; and $1.7 million for institution capacity building grants; and $10 million for research.

The Tribal Colleges are grateful for the Subcommittee's past support of the three programs that have been funded. These small programs catalyzed the 1994 Institutions' crucial first steps in initiating and strengthening agriculture and natural resource programs in our communities. However, it is critical that we build on the momentum we have gained. Justifications for our requested funding levels are as follows:

(1) $1.7 million Institutional Capacity Building Grant Program.—This competitive grant program, which requires a non-federal match, would provide the 1994 Institutions with the investment necessary to allow us to strengthen and more fully develop our educational infrastructure. Facilities maintenance and improvement are urgently needed at many of the Tribal Colleges, which are currently operating in donated, abandoned and even condemned buildings. Hazards include leaking roofs, asbestos insulation, exposed wiring, and crumbling foundations. In a recent needs assessment, nine of the Tribal Colleges identified facility maintenance and renovation as a high priority, at an estimated cost of $8.3 million. Many of these facility improvements are needed to provide American Indian students with the education necessary to fully compete in the modern agricultural world.

(2) $4.6 million Endowment Fund for 1994 Land-Grant Institutions.—This endowment installment remains with the U.S. Treasury, and only the interest is distributed to the 1994 Institutions. It is important to note that this program is not scored as budget outlay or authority. Just as other land-grant institutions historically received large grants of land or endowments in lieu of land, this sum assists the 1994 Institutions in establishing and strengthening our academic programs in such areas as curricula development, faculty preparation, and instruction delivery. The third year interest payment totaled $673,678, which was distributed among all of the 1994 Land-grant Institutions on a formula basis.

(3) $1.552 million Tribal College Educational Equity Grant Program.—Closely linked with the endowment fund, this program last year provided almost $52,000 per 1994 Institution to assist in academic programs. The 1994 Institutions are in their third year of funding under this program. Through the funding made available since fiscal year 1996, the Tribal Colleges were able to begin to support vital courses and planning activities specifically targeted to meet the unique needs of our respective reservations. Examples of these programs include:

—Fond du Lac Tribal and Community College's Environmental Institute, located in Cloquet, MN is entering the third phase of its Environmental Science Delivery Project that is designed to attract students to environmental studies by combining the latest and most sophisticated technologies and teaching methodologies with the historical perspective of American Indian culture. One additional goal of this phase of the project is to expand the Environmental Study Area to include an Environmental Interpretative Center. The college intends to continue current projects as well as implement new collaborative environmental

projects with various public and private agencies to promote student education and research opportunities.

—Southwestern Indian Polytechnic Institute (SIPI), in Albuquerque, NM has used the education equity grants to build the SIPI Agricultural Science, Engineering and Technology (ASET) Development Project. The overall goal of the SIPI–ASET project involves the establishment of a comprehensive Agricultural Science, Extension and Technology program which serves the immediate and long-term economic needs of the National Indian Community, and also provides a bridge to regional university programs in science, engineering and agricultural technologies.

Other Tribal Colleges have started natural resource management courses; nutrition and dietetic programs; environmental sciences curricula; comprehensive horticulture programs; and courses on sustainable development, forestry, and buffalo production and management.

Funding for Research.—In addition, we are requesting funding for our newly authorized research program, which was authorized at "such sums as necessary" as an amendment to the Agriculture Research, Extension, and Education Reform Act of 1998. With 30 institutions competing in this new research authority, we feel the President's suggested level of $667,000 is simply not adequate to address the pressing agricultural and nutritional research needs of our colleges and their communities. Therefore, we respectfully request an appropriation level of $10 million.

This authority, and its corresponding appropriation, is vital to ensuring that Tribal Colleges finally have the opportunity to become full partners in this nation's land-grant system of colleges and universities. Many of our institutions are currently conducting applied agriculture-based research, yet they struggle to finance this research and meet their community's other research needs. Some of the research in progress includes soil and water quality research; amphibian propagation; pesticide and wildlife research; range cattle species enhancement; and native plant preservation for medicinal and economic purposes. We urge the committee to fund this program at an appropriate level to allow our institutions to develop and strengthen their research potential.

V. Conclusion

The 1994 Institutions are efficient and effective tools for bringing education to American Indians and bringing opportunity and hope for self-sufficiency to this nation's poorest regions. The modest federal investment in the Tribal Colleges has paid great dividends in terms of employment, education, and economic development, and continuation of this investment makes sound moral and fiscal sense. No communities are in greater need of land-grant programs than American Indian reservations, and no institutions better exemplify the original intent of land-grant institutions than the Tribal Colleges.

Mr. Chairman and Members of the Subcommittee, we appreciate your long-standing support of the Tribal Colleges and are grateful for your commitment to bring self-sufficiency to our communities. We look forward to continuing a partnership with you, the U.S. Department of Agriculture, and the mainstream land-grant system—a partnership that will bring equal educational, agricultural, and economic opportunities to Native America. Thank you again for inviting us to present our statement to you.

Prepared Statement of the American Seed Trade Association

Mr. Chairman and members of the Subcommittee, we appreciate this opportunity to provide you with our views on the fiscal year 2000 agricultural appropriations bill. The American Seed Trade Association (ASTA), founded in 1883, is one of the oldest trade associations in the United States. With 850 members, the ASTA is the premiere advocate for the seed industry and related interests. ASTA's diverse membership consists of the leading companies that are developing, providing, supporting, and promoting new varieties that hold tremendous promise and opportunity for farmers and consumers everywhere. ASTA strongly urges you to provide, at least, a $5 million increase in fiscal year 2000 funding for the National Plant Germplasm System (NPGS).

Our request for a $5 million increase for the NPGS is the number one appropriations issue and the number one legislative issue for ASTA. This increase will allow seed companies to meet the diverse challenges facing our customers. Support for significant increases to the NPGS goes well beyond industry; we, also, have the support of our customers and the scientific community since they recognize that this will pay huge dividends. We recognize the tight budget constraints under which the

Subcommittee must operate; however, we believe a significant increase in funding for the NPGS is integral to U.S. agriculture reaping the full benefits of biotechnology and the ongoing genomics revolution.

Over the past few years, much attention has been focused on the enormous potential that biotechnology offers to American agriculture and the Nation's consumers. Many of the challenges confronting the U.S. can be met through the application of plant-based technologies. With sufficient genetic resources, we will have an abundant, safe, nutritious, and affordable supply of food and fiber that is produced in an environmentally friendly manner and that ensures a reasonable return for our farmers and livestock producers. In an editorial in Science magazine last year, Philip H. Abelson stated that "ultimately, the world will obtain most of its food, fuel, fiber, chemical feedstocks, and some of its pharmaceuticals from genetically altered vegetation and trees." (Science, Vol. 279). We agree that biotechnology can revolutionize American agriculture and can provide continually renewable resources for all of these products, if diverse genetic resources are available and accessible to U.S. scientists and plant breeders. Molecular biotechnology has given us new opportunities to tap genetic resources more effectively and efficiently, if the resources have been preserved and are accessible.

To take full advantage of modern biotechnology, we must have access to diverse genetic resources that will allow us to develop the varieties necessary to meet new and changing needs. The improvement of plants is based on the utilization of genetic diversity. Without a wide diversity of genetic resources, there will be nothing available, eventually, to improve plants or to prevent plants from becoming genetically susceptible to plant pathogens. Narrow genetic bases can result in widespread crop losses. For example, in 1970, Southern corn leaf blight cost farmers 15 percent of the corn crop; in the 1950s and early 1960s, about 70 percent of the wheat crop in the Pacific Northwest was wiped out by stripe rust; and the Irish potato famine of the 1840s was the result of the reliance on only a single variety of the potato. Breeders must have open access to extensive, well-maintained, and well-documented genetic resources.

Preserving the genetic diversity of plants is essential to the future of agriculture as the genes to add new traits, such as tolerance to diseases and resistance to insects, are often present in wild relatives of the major crops. Wild ancestors and relatives of cultivated plants give us the sustained ability to develop new varieties. Most of the U.S. crops raised and used for food, fiber, ornamentals, and industrial feed stocks originated from outside of the U.S. Consequently, the plant breeding community is highly dependent upon germplasm from other countries, some of which is endangered. Once lost, the germplasm cannot be fully reconstructed. These sources of productive capacity and efficiency and sources for potential resistance to pests and environmental stresses may be lost forever. Continued use of and access to a broad diversity of germplasm is necessary, if we are to develop varieties to meet new and changing circumstances and if we are to sustain agricultural productivity.

The NPGS germplasm collections underpin crop breeding efforts throughout the U.S. Preservation of and filling gaps in the base collections is a unique Federal responsibility. The major activities of the NPGS include (1) acquiring germplasm; (2) developing and documenting information on the germplasm in its collections (including entering the information into the Germplasm Resources Information Network); (3) preservation and distribution of the germplasm; and (4) maintenance of quarantine facilities for testing of imported germplasm for pests and pathogens before introduction in the U.S. The NPGS maintains over 440,000 germplasm samples for over 85 crops.

To ensure that these genetic resources are accessible and that they remain available, the NPGS must obtain a significant increase in funding over the next few years. Last year, recognizing the crucial importance of diverse genetic resources, the ASTA board of directors passed a resolution that calls for approximately a doubling, by 2002, of the annual Agricultural Research Service (ARS) budget for the NPGS. This would result in a minimum level of $40 million for the NPGS by 2002. While this may seem to be an exceptionally large request, the same amount has been called for since 1991. In that year, the NPGS reported that an annual budget of $40 million would be required, over a ten-year period, to remedy shortfalls in secure storage, back-up, evaluation, and development of core germplasm collections. According to a recent GAO report (GAO/RCED–98–20), ARS funding for the NPGS between 1992 and 1996 declined by 14 percent, in constant dollars, while germplasm collections increased by more than 10 percent. The picture is even more bleak when one takes into consideration the substantial reduction in non-salary dollars available for NPGS operations (including acquisitions), equipment, supplies, and facilities. For fiscal year 1999, only 15 percent of the budget is available for these critical aspects of the program.

The steady decline in available funding has had an extremely negative impact on the NPGS. To fulfill its mission to provide access to diverse genetic resources, the NPGS must have a balanced program that includes (1) acquisition of germplasm to fill gaps in the collections and to preserve endangered germplasm; (2) maintenance and preservation of germplasm with secure back-ups to prevent loss; (3) adequate documentation and characterization of the germplasm; (4) sufficient supplies of viable seeds to allow for distribution; and (5) quarantine facilities that make germplasm available in a timely manner.

Unfortunately, the lack of resources has placed the NPGS in a dire state. Insufficient funding, as well as the increasing difficulties encountered while attempting to acquire germplasm from developing countries, has limited germplasm acquisitions. Today, additions to the collections have slowed to one-fourth of the level they were at in 1993. And, according to the above referenced GAO report, even when NPGS acquires germplasm, its release to breeders and scientists is often delayed as a result of the management of the quarantine process.

Further, seed and clonal collections are without secure back-ups, adequate evaluation, documentation, and viability. For genetic resources to be useful, sufficient information concerning the germplasm must be available. The lack of germplasm passport information, documenting the geographic origin and ecological condition of the origin site, makes it difficult to utilize, fully, the sample and it precludes the development of long-range planning for the acquisition of germplasm. Currently, two-thirds of the NPGS germplasm lacks passport data on its location of origin. In many cases, even when data on traits such as plant structure and color have been developed, the information has not been entered into the database.

One of the primary purposes of gene banks is to preserve, and provide accessibility to, germplasm forever. To ensure that germplasm maintains viability, germination must be tested and the germplasm must be regenerated in a timely manner. The seeds of some plants remain viable for only a few years and without regeneration, they may be lost forever. Backlogs in regeneration can result in loss of diversity and, in some cases, the loss of resources that cannot be duplicated. According to the GAO, preservation activities—including viability testing, regeneration, and secure, long-term back-up storage of germplasm—have not kept pace with the preservation needs. When resources are restricted, administrative staff have no choice but to focus most of the budget on maintaining and preserving the current germplasm collections. Although 75 percent, or more, of the NPGS budget is devoted to maintenance and regeneration, the NPGS simply does not have enough funding to keep up with regeneration needs. According to the GAO report referenced above, at two of the plant introduction stations (Griffin, GA, and Pullman, WA), it may take 75 to 100 years for the samples to be regenerated, assuming current funding levels. With these kinds of backlogs, it is very likely that important germplasm will be lost.

Germplasm must be available for distribution for it to be beneficial. The NPGS distributes germplasm to plant breeders and scientists from all over the world. A minimum of 10,000 seeds is required before a particular germplasm sample can be distributed. In some cases, germplasm is not available, currently, because the NPGS has not had sufficient resources to generate or regenerate enough samples to allow for distribution.

In addition to the requirements for regeneration, it is essential to have back-ups of the collection. While NPGS policy requires back-up at the National Seed Storage Laboratory, over one-third of the accessions are not. In 1992, over 2,000 germplasm samples were lost at the Miami facility following Hurricane Andrew. Since these samples were not backed-up at another facility, they were lost.

The above problems are just a few of the many that are plaguing the NPGS due to the lack of adequate funding. These problems, however, are jeopardizing the security of the U.S. food and fiber system. As some plant breeders have stated, genetic diversity is the engine that drives plant breeding. Without new sources of genetic variation, plant breeders cannot make improvements. Without improvements, we will be unable to ensure the continued economic viability and security of our food and fiber system.

The NPGS is a fundamental, strategic resource that we cannot afford to jeopardize. Without a significant infusion of funds, the NPGS will not be able to ensure the preservation of important germplasm. We strongly, urge you to provide a minimum increase of $5 million for fiscal year 2000 and to double the funding for the NPGS by fiscal year 2002. We recognize that this will be difficult and that there are many competing priorities for limited resources; however, we cannot afford to be complacent. We believe that a $5 million increase for next year will send a signal that the Congress is committed to preserving this vital, strategic resource.

We, also, understand that the American Soybean Association has requested a $500,000 appropriation for an ARS soybean pathogen collection. ASTA believes that microbial germplasm collections are, also, important, and we, therefore, support that request.

Thank you for the opportunity to present ASTA's views on the importance of the National Plant Germplasm System. We look forward to working with you to ensure that the NPGS is able to provide the germplasm necessary for U.S. agriculture to meet the demands and challenges of the 21st Century.

PREPARED STATEMENT OF THE AMERICAN SHEEP INDUSTRY ASSOCIATION, INC.

The American Sheep Industry Association (ASI) is a federation of state member associations representing the nearly 80,000 sheep producers in the United States. The sheep industry views numerous agencies and programs of the U.S. Department of Agriculture as important to lamb and wool production. Sheep industry priorities include rebuilding and strengthening our infrastructure, critical predator control activities, maintaining and expanding research capabilities and animal health efforts.

The rapid changes that have occurred in the domestic sheep industry and continue to take place put further emphasis on the importance of adequately funding the U.S. Department of Agriculture programs important to lamb and wool producers.

We appreciate this opportunity to comment on those portions of the USDA fiscal year 2000 budget.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

The mission of APHIS, "to protect U.S. animal and plant resources from diseases and pests," is very important to the sheep industry of the nation.

Wildlife Services

With the loss of 520,000 sheep and lambs to predators each year, the Wildlife Services (WS) program of USDA-APHIS is vital to the economic survival of the sheep industry. The value of sheep and lambs lost to predators and predator control expenses are second only to feed costs for sheep production. Costs associated with predation currently exceed our industry's veterinary, labor and transportation costs.

The sheep industry adamantly disagrees with the Administration's budget proposal to reduce the Wildlife Services operations budget $1.8 million and to decrease methods development funding $776,000. If salary increases, which are rarely funded by Congress, are included, the total budget cut recommended by the President total $3.47 million. Add the $1.2 million in funds that is redirected and existing programs will be impacted $4.7 million. Such reductions will have devastating impacts on agriculture and other programs.

Budget recommendations should not punish agriculture for providing wildlife, belonging to the American public, with habitat. According to the International Association of Fish & Wildlife Agencies, agriculture and private landowners provide over 70 percent of the habitat for the American public's wildlife. The National Agricultural Statistics Service estimates that two-thirds of the nation's farms suffer some form of wildlife damage each year. The Berryman Institute for Wildlife Damage Management estimates wildlife damage is costing agricultural producers over $4 billion annually.

Wildlife Services has over 1,400 cooperative agreements with agriculture, forestry groups, private industry, state game and fish departments, departments of health, schools, county and local governments and others to mitigate the damage and danger that the public's wildlife can inflict on private property and public health and safety. This budget proposal not only cuts federal cooperative dollars, but also endangers cooperative funding raised through these agreements. Such cuts mean fewer Wildlife Services professionals will be available to not only assist agriculture, but other areas including human health and safety and endangered species management.

Wildlife Service's cooperative nature has made it the most cost effective and efficient program within federal government in the areas of wildlife damage management and public health and safety. WS is one of the few federal programs that has been consistently at or above the 50:50 federal to cooperative funding ratios. If you discount Congressional Directives, cooperative entities provided 55 percent of the total funding in fiscal year 1997, while the federal appropriations made up 45 percent of the cooperative dollars. The President's recommendation that a 50:50 ratio of cooperator funding be applied at the state and local level has no justification in statute, regulation or policy. Efforts by the administration to micromanage this suc-

cessful cooperative program will only serve to take away needed flexibility of WS managers and will inhibit Wildlife Service's ability to accomplish its mission as mandated by the Animal Damage Control Act, NEPA and the Government Performance and Results Act.

Although funding for Wildlife Services has seen slight increases in past years, most increases were in the form of Congressional Directives aimed at specific problems. Inflation has slowly eaten away at funds used to support general operations programs. ASI strongly supports the funding for fiscal year 2000 to be set at $32,346,000, an increase of $2,349,000 over the fiscal year 1999 level.

Aerial hunting is one of Wildlife Service's most efficient and cost-effective core programs. It is used not only to protect livestock, but is also critical for protection of wildlife such as mule deer in Utah and in endangered species programs such as those for the wolf and grizzly. A lack of funding for adequate safety was found to have contributed to a number of accidents experienced within the program. To implement core aerial safety provisions, a total of $2.457 million is needed. This is an increase of $1.257 million over the fiscal year 1999 budget.

In fiscal year 1999, Congress provided $350,000 for wolf management in Rocky Mountain region and Minnesota. A total of $742,000, a $392,000 increase over last year's budget, is needed to properly manage wolves. Wolf numbers have doubled in Montana, Wyoming and Idaho, and wolf predation on livestock consumed the funds provided by USDA and DOI by June of 1998. ASI asks Congress to fully fund the $175,000 directive for wolf management in the fiscal year 2000 budget, plus add an additional $72,000 to cover last year's shortfall in the program. Minnesota, Wisconsin and Michigan are experiencing similar rates of increase in wolf numbers and predation. ASI asks that Congress increase the funding for wolf management in Minnesota and Wisconsin $145,000 over the funds provided in fiscal year 1999.

The President's budget recommends that $1.5 million for rabies control be cut. The control of rabies is vital to human health and safety in a number of states and ASI asks Congress to restore these funds in the budget.

Last year, Congress redirected $700,000 for brown tree snake control in Hawaii. This program should be fully funded by Congress. While ASI is supportive of civilian airport safety, Congress should fund new airport safety programs it feels necessary rather than redirect existing program funds.

ASI asks Congress to fund Wildlife Service's Methods and Development at the fiscal year 1999 level of $10,365,000. Budget cuts suggested by the President will stop or reduce a number of important programs including rate damage in Hawaii, blackbird work on rice in Louisiana, sunflower work in the Dakotas and mammal contraceptive and predation work in Utah.

Emergency Management

The ability to manage animal health emergencies is crucial to the survival and well being of U.S. animal agriculture and the security of the nation's food supply. We are encouraged by the administration's request of $1 million for a "national animal health emergency management system". We believe that this is an important first step in developing a more modern, functional system that will improve and build upon state programs and industry initiatives.

Scrapie

Adequate funding of the Voluntary Scrapie Flock Certification Program and other scrapie control measures through USDA–APHIS is of critical importance to the sheep industry, as well as all segments of the livestock industries. ASI appreciates this Subcommittee's efforts in recognizing the seriousness of this devastating disease and the real need for control and eradication. ASI and others have urged APHIS to step up its efforts in scrapie control/eradication through a more aggressive regulatory approach. We request that the scrapie control/eradication program be funded more adequately in fiscal year 2000 as requested by the administration.

No country has, to date, conducted an active surveillance study of scrapie. ASI has requested that APHIS conduct a national surveillance study of scrapie since our industry's ability to compete in the market place is encumbered by both existence of scrapie in our flock and the lack of quantitative data about the disease. ASI has committed to investing producer funds to help cover laboratory costs associated with the study. Additional appropriations up to $600,000 are supported by the industry to insure completion of this critical surveillance effort.

AGRICULTURAL MARKETING SERVICE

Lamb Market Information and Price Discovery Systems

The sheep industry strongly supports the fiscal year 2000 budget of $22,166,000 for Market News of USDA-Agricultural Marketing Service. The increased appropria-

tions of $820,000 is critical for the agency to conduct the increased international market reporting and activities associated with the concentration in the livestock industry. The sheep industry has requested a review and update to the lamb and lamb meat market reporting system in the U.S. and inclusion of imported lamb product prices in the market news.

FOREIGN AGRICULTURAL SERVICE (FAS)

The sheep industry participates in FAS programs such as the Market Access Program (MAP) and the Foreign Market Development Program. ASI strongly supports continued appropriations at the fiscal year 1998 level for these critical Foreign Agricultural Service programs. ASI is the cooperator for American wool and sheep genetics and has achieved remarkable success in increasing exports of domestic wool, breeding sheep and semen. Wool exports have increased 170 percent over the last five years with the aid of this funding. American lamb sales also benefit from the Foreign Market Development Program through increased international efforts.

NATURAL RESOURCES CONSERVATION SERVICE (NRCS)

ASI urges increased appropriations for the range programs of the Soil Conservation Service to benefit the private range and pasture lands of the United States with conservation assistance. We support the budget item and recommend an increased level for the Grazing Lands Conservation Initiative that ASI has worked with, along with other livestock and range management organizations, to address this important effort for rangelands in the U.S.

RESEARCH, EDUCATION AND ECONOMICS

The sheep industry recognizes that it must become globally competitive. We are also striving to be profitable and sustainable as a user of and contributor to our natural resource base. Research, both basic and applied, and modern educational programming is essential if we are to succeed. We are disappointed in the decline in resources USDA is targeting toward sheep research and educational programs. With approximately $15 million in ARS funding increases for animal systems in fiscal year 1999, there was an actual reduction in the planned expenditure for sheep with all other livestock categories receiving significant increases. In the Administration's fiscal year 2000 budget, ARS has a planned expenditure of less that $200,000, again out of an approximate $15 million increase for animal systems with other livestock species targeted for significant increases.

In order for the sheep industry specifically and U.S. agriculture in general to be globally competitive and environmentally sound in the future, we must invest in the discovery and adoption of new technologies for producing, processing and marketing food and fiber. We urge the subcommittee to send a strong message to USDA supporting sheep research and education funding increases.

Agricultural Research Service

ASI urges an increase in funding of the scrapie research initiatives at Pullman, Washington in the following areas: (1) defining the relationships between prion genetics, resistance to infection and linkage to production traits and (2) the further development of and the validation of pre-clinical, live-animal diagnostic tests. A collaborative relationship has been developed between the ARS laboratory at Pullman, Washington and the U.S. Sheep Experiment Station at Dubois, Idaho which will combine the appropriate resources to begin answering the above mentioned needs. An additional $400,000 appropriation is needed to do this work.

We also urge the subcommittee to recommend an additional appropriation to study ovine progressive pneumonia (OPP) in the area of immunogenetics and host resistance in sheep as a collaborative study between the ARS laboratories at Pullman, Washington and the U.S. Sheep Experiment Station at Dubois, Idaho. OPP is endemic in U.S. sheep population, causes economic damage to the industry and is an impediment to trade with some countries. An additional $300,000 is needed to begin this study.

Research into Johne's disease has received additional funding through ARS over the past two years, focusing on cattle. Johne's disease is also endemic in the U.S. sheep population and is not well understood as a sheep disease. The same concerns exist regarding food safety and other countries are aggressively addressing Johne's in sheep regulatorily. We urge the subcommittee to send a strong message to ARS that Johne's disease in sheep should receive more attention with an emphasis on diagnostics.

We also strongly support the administration's request for emerging diseases and we urge significant appropriations for the animal component of this line item.

COOPERATIVE STATE RESEARCH EDUCATION AND EXTENSION SERVICE (CSREES)

We strongly support the National Research Initiative (NRI) and we appreciate the Administration's request of $200 million. The competitive grants awarded under its program are for the highest quality research addressing the goals and objectives of FAIR 1995.

Ongoing research in wool is critically important to the sheep industry. ASI supports continued funding of $212,000 for fiscal year 2000 through the special grants program of the CSREES.

We urge the subcommittee to appropriate both intramural and extramural funding for research to measure the well being of livestock. Animal well being is an emotional issue; in order to consider new management strategies for the enhancement of animals, we need improved methods of measurement.

The industry greatly appreciates this opportunity to discuss these programs and appropriations important to the sheep industry.

PREPARED STATEMENT OF THE AMERICAN SOCIETY FOR NUTRITIONAL SCIENCES

The American Society for Nutritional Sciences (ASNS) is the principal professional organization of nutrition research scientists in the United States representing 3,500 members whose purpose is to develop and extend the knowledge and application of nutrition science. ASNS members include scientists involved in human as well as animal nutrition research. Our members hold positions in virtually every land grant and private institution engaged in nutrition-related research in the United States as well as industrial enterprises conducting nutrition and food related research.

ASNS wants to express gratitude for the work that this committee did last year, on both sides of the aisle, to help increase competitively awarded agricultural research in the National Research Initiative Competitive Grants Program. Another significant increase in fiscal year 2000 for the NRI would help set the course for providing increased emphasis in the critically emerging areas such as genomics and genetics. While genomics is being studied under NIH and NSF funded grants, they have not addressed the areas of the genetic influence on nutrient requirements of individuals, nutrient gene interactions, and nutrient metabolism on the genetic basis of diseases in their intramural grants programs. These areas easily fit into the purview the of USDA's NRI mission. ASNS supports these and other key elements that will enhance cross-cutting areas of nutrition research having broad health outcomes.

The President's Budget for fiscal year 2000 calls for a net increase of $81 million above fiscal year 1999 funding for the NRI. We strongly endorse this substantially needed investment.

While we endorse the proposed increase, we do not believe that the President's budget supports the original intended priorities outlined in Section 401 of the Agricultural Research, Extension and Education Reform Act (AREERA) of 1998 for the Initiative for Future Agricultural and Food Systems. The President's Budget has transposed these priorities into the NRI. We know there are concerns from this Committee and the Congress about the new competitive grants programs. At this time we offer some suggestions as to how USDA's CSREES may incorporate such an increase so that the funds are effectively managed for the best possible health research outcomes. ASNS encourages Congress to urge department officials to consider administering all ongoing and new initiatives through a centralized office. This allows new grant administrators to take advantage of the investment and experience of an established program. ASNS stresses that the NRI use the model of other federal agencies that have more than one review cycle per year. Two or three cycles per year would allow for timely resubmission and encourage institutions to provide bridging funds for quality programs. Currently only 25 percent of qualified grants receive funding. Inadequate funding limits the productivity of researchers that the NRICGP is able to fund. NRI awards are small, averaging $133,210 in fiscal year 1998, and short, averaging 2.2 years for a total average support of about $60,000 each year. Additionally a 14 percent cap on indirect (facilities and administrative) costs deters many capable investigators from seeking NRI grants. These caps are detrimental and we urge you to reexamine the 14 percent cap on indirect costs.

A recent report from the National Association State Universities and Land Grant Colleges (NASULGC) stated that research and development funding for space exploration, the environment, basic science research, and health research has increased in constant dollars from 23 to 58 percent over the last ten years. But during this same time period, the funding for agricultural research and extension programs, the lifeblood of our food supply system, has shrunk by eight percent in constant dollars.

Base funds have eroded by 16 percent. These funds support the scientists and extension educators who can respond quickly and effectively to unexpected problems that arise for producers and consumers. The benefit is a food system that enables the consumer dollar and the welfare family's food stamps to purchase inexpensive, safe, and nutritious food. A food system that creates jobs, competes worldwide, and conserves its natural resources base.[1]

RESEARCH FUNDING MECHANISMS AND ISSUES

Competitive Grants

A competitive system for allocating government research funds is the most effective and efficient mechanism for focusing efforts on cutting edge research aimed at improving the health of the American people. Competitive grants provides the most effective, efficient and economic return to the public. ASNS strongly supports the competitive grants process as reflected in the National Research Initiative and believes that an open, merit and peer review process, applied as extensively as possible throughout the research system, is the best way to distribute research funds among qualified scientists.

Special Grants

ASNS strongly believes that the best research results come from research that is peer reviewed. That is why researchers funded by federal agencies, such as the NIH and the NSF, that award grants on merit have made such great progress. There is a potential danger that special grants and earmarked research funds from USDA may be awarded on the basis of politics rather than merit, priority or research need. Therefore, the perception might be that the integrity of the research system and agricultural science is undermined. Last year special grants were appropriated at $78 million even though the Administration's request for this year was less than half of that figure. We recognize that there is pressure to maintain these special grants. While special grants have their place to address emergency needs of national priority such as food safety, they may also be used to address research that is not deemed of the highest priority or merit. Thus, the proportion of special grants in comparison to the total research budget at USDA should be decreased.

Initiative for Future Agriculture and Food Systems

The Initiative, despite being signed into law, had no funds appropriated for fiscal year 1999. The legislation, calls for priority mission areas to be addressed: food genome; food safety; food technology and human nutrition; new and alternative uses and production of agricultural commodities and products; agricultural biotechnology; and natural resource management. The Initiative also includes provisions that allow merit/peer review and lets those who benefit from agricultural research provide input about the priority setting process. ASNS supports this Initiative and urges members of this sub-committee make it a funding priority.

National Needs Initiative

Another important area where funding has remained stagnant is the National Needs Initiative (NNI) of the Graduate Fellowship Program at the Higher Education Office of the USDA. This program fills an important need to help train the next generation of agricultural researchers. Despite its importance, funding for the NNI has seen a dramatic decline in recent years. ASNS supports the FASEB recommendation of $5 million for the NNI so that it may be restored to its previous funding levels. We also support the review and subsequent reorganization of USDA-sponsored graduate training.

THE NEED FOR NUTRITION-RELATED RESEARCH

The need for nutrition science and research is critical within the USDA. Nutrition and agricultural research are areas that impact the constituents of every congressional district in the nation. New technologies are demanded to reduce the likelihood of pathogen transmission by food, to improve the quality of processed foods, and to deliver greater nutritional value in foods. Additionally the economic impact on society in healthcare costs produced by advances in nutrition research is significant in the number of dollars saved by the American taxpayer. As health costs continue to rise, it is imperative that our medical practices take a preventive approach. This requires a thorough understanding of the role of nutrients in foods in preventing chronic illnesses such as heart disease, cancer and diabetes.

---

[1] Investments that Make a Difference, National Association of State Universities and Land-Grant Colleges, Fiscal Year 2000 Budget Proposal.

The USDA has a unique role in the area of nutrition research, particularly as it applies to human nutrition. For example, although there is a serious and obvious commitment to the funding of disease-related research within the National Institutes of Health, issues important to the basic mechanisms of nutrient function and the safety of the food supply have traditionally been the purview of USDA funded research. Most of the recent work on nutrient content and availability in various foods has come from USDA–NRI supported research. From a consumer perspective, it is this type of information that is often the most useful.

FOOD SECURITY AND BEHAVIORS

A 1994 Institute of Medicine Report stated that reducing foodborne illness will require research in all aspects of the food system, from production to consumption.[2] For example, identifying the foods most involved in foodborne illnesses, characterizing new foodborne pathogens, and developing new monitoring protocols are some ways to detect pathogens or toxicants responsible for outbreaks and minimize their impacts. Studies are also needed to identify food behaviors and nutritional effects in relation to more vulnerable populations such as infants and the elderly. Also, knowing more about health protectants will enable individuals to maximize the nutrition and "healthfulness" of their food choices relative to the prevention of disease. The need also exists to better understand the biology and behavior of food choices. Here we also need to study consumption related to risk analysis which demands better data on food consumption.

BIOTECHNOLOGY AND NUTRITION

Increased interest in enhancing the nutritional quality of the food supply has sparked ways to design foods not just for disease prevention but also for health promotion. For example, opportunities exist to influence food habits and food choices, by using technology to enhance healthful foods.

Ultimately we will want to know what compositional changes in crop plants have the best nutritional value. There are many basic questions left unanswered on the role of diet in health and disease when it comes to phytonutrients in plants.

USDA is encouraged to collaborate with other federal agencies in the area of nutrition whenever possible. This objective naturally spans research done in both the USDA and NIH.

GENETICS AND NUTRITION

Studying genetic interactions will allow us to address several issues at once. For example, what intakes of nutrients are needed to achieve optimal health and minimal risk of various diseases associated with diet? Do requirements differ depending on genetics? How do genetics influence efficiency of metabolism and does this affect nutrient requirements? What are metabolic and health consequences of inadequate nutritional status, as affected by genetics? Many research opportunities exist in this area.

GENOMICS AND NUTRITION

ASNS supports a recent report from the Federation of American Societies for Experimental Biology that states, increased funding should bring an emphasis on all aspects of genomics. Such an initiative would significantly enhance existing programs within the NRI. One example might be functional genomics. ASNS has provided detailed scientific background about this kind of research to USDA program directors at a recent stakeholders meeting.

Research and resources devoted to unraveling the genomes of a few selected organisms have been expanding dramatically in recent years. While the administration of large-scale programs has been placed in agencies other than USDA, the power and long-term impact of a large-scale genome initiative directed toward agriculturally important organisms-including animals, plants, and microbes (plant, animal and human pathogens)—represents a major opportunity and fulfills an important need in agriculture.

USDA's NRICGP is well positioned to use genomic data to address programs in agriculturally important organisms. However, given its present budget—and even with the most optimistic incremental increases—the NRICGP currently lacks the re-

[2] Opportunities in the Nutrition and Food Sciences, Institute of Medicine, 1994, p. 111.

source depth to meet this challenge. ASNS endorses the allocation of at least $50 million in new money to be directed toward an agricultural genomics program.[3]

ANIMAL WELFARE ACT

Research using animals has been crucial to virtually every advance in medicine in the past century. Agents for control of high blood pressure and the management of diabetes, vaccines for the control of poliomyelitis and mumps, development of artificial joints and heart-lung machines, and many more medical advances have depended on animal research.

USDA's Animal and Plant Health Inspection Service (APHIS) is charged by Congress to enforce the Animal Welfare Act (AWA). Under the AWA, USDA licenses dealers to buy and sell random-source animals to research facilities that are unable to obtain them from municipal pounds and shelters. This provides access to a critical supply of animals since animals bred specifically for research often lack characteristics needed by researchers studying health-related problems. Much of their work relies on older, larger, and genetically diverse animals.

ASNS recommends that Congress provide APHIS with adequate funding for enforcement of the Animal Welfare Act in fiscal year 2000 so that it can continue to ensure compliance with the AWA.

Most recently an issue has emerged that will impact researchers and their institutions using rats, birds, and mice. ASNS strongly opposes a proposal to include rats, mice, and birds as part of the USDA regulatory efforts under the AWA. At this time the vast majority of the rats and mice used in research in the United States are in institutions that follow the guide for the Care and Use of Research Animals, the guidelines published by the Institute of Laboratory Animal Research (ILAR) of the National Academy of Sciences. With its limited resources in USDA's APHIS, the burden of adding rats, mice, and birds to its responsibilities would have a negative effect on overall AWA enforcement. This increased regulatory burden imposed on researchers and their institutions by introducing redundant regulations will have a detrimental effect to the efforts of the research being conducted. If this regulation is expanded to require new responsibilities, APHIS will need several million more dollars each year to extend its AWA coverage to rats, birds and mice. ASNS feels such allocations of funds are not in the public interest. Such resources could be more effectively used elsewhere within the USDA's competitive research grants program.

CONCLUSION

Agriculture is and will continue to be important to human health in terms of food that provides proper nutrition for healthier people. As the future challenges us with more complicated diseases, research must expand outside the traditional disciplines and approaches, such as the work that is being done is plant and animal genomics. New approaches must be implemented to address new societal concerns. For example, despite our hard efforts to plan healthy diets for school children much of this food is being wasted. Nutritionists are constantly challenged to develop nutrient-balanced meals that will encourage our children to choose more healthful foods. New demands to fit busy lifestyles is another example. Issues such as product convenience, uniformity of products, ease of preparation, "automatic" nutrient balancing, and packaging are all areas scientists must address. Research in areas of how our food is produced, pesticide usage, animal care and food handling issues also present demands to our scientists. These demands and opportunities must be answered in a way that sustains or enhances our quality of life. Although greater challenges lie ahead, agricultural research funding continues to have slow growth despite significant increases at other research agencies such as the NIH and NSF.

It is for these reasons that ASNS reiterates the following recommendations to the sub-committee:

—Increase funding for USDA's NRICGP from $119 million to $200 million, of which $50 million will be used for a genomics initiative.
—ASNS recommends $120 million for the Initiative for Future Agriculture and Food Systems in which human nutrition research remains a research priority.
—Provide an increase of $5 million to the National Needs Initiative so that it may be restored to its previous funding levels.
—Reexamine the 14 percent cap on indirect (facilities and administrative) costs in NRI grants.

PREPARED STATEMENT OF THE ASSOCIATION OF RESEARCH DIRECTORS 1890 LAND-GRANT UNIVERSITIES

Senator Thad Cochran, Chairman, and other distinguished members of the Committee, my name is Samuel L. Donald, Regional Research Director for the seventeen Historically Black 1890 Land-Grant Universities, including Tuskegee University (hereafter referred to as the 1890s). Mr. Chairman, I submit, on behalf of the 1890 community, this written testimony in support of the fiscal year 2000 Budget recommendations for the 1890s.

GENERAL INFORMATION

Mr. Chairman, today, the rich legacy of the land-grant tradition remains prominent on the campuses of the 1890s. These institutions are increasingly serving as economic instruments of the state and the nation. They have their extraordinary influence on the lives of all citizens including African Americans and other minority groups. While enduring inequities in state and federal funding, the 1890s serve as exemplary role models; provide educational access to those who may otherwise be denied the opportunity to pursue a college education; and foster an unyielding commitment to academic excellence, social equality and the assurance of a decent future for all students including those from the lowest economic strata of the nation. These universities have been in the forefront of educating youth-at-risk, producing research vital to the quality of life and the environment, and addressing the social and economic needs of urban and rural communities. Teaching, research and extension remain prominent on the campuses of the 1890s.

ACCOMPLISHMENTS AND IMPACTS

Historically Public Black Colleges and Universities (HPBCUs) constitute some of the largest and most prestigious institutions of higher education in the nation. Among them, two of the largest are 1890 HPBCUs. Several of the 1890s offer doctoral degrees and/or professional degrees in engineering, food science, toxicology, environmental science, and other areas of national need. Three of the top five HPBCUs in the nation contributing to the production of African American doctorates are 1890s. Annually, six HPBCUs produce nearly 20 percent of all African American bachelor degree recipients in engineering and the 1890s graduate over 80 percent of all Black recipients of bachelor degrees in agricultural sciences. Tuskegee University alone has trained more than 80 percent of the nation's Black veterinarians. The 1890s depend heavily on federal support for sustaining their academic, research, and extension programs. These institutions contributions to science and other accomplishments are reasons for maintaining and expanding the federal partnership. For the purposes of improved food quality and food safety, improved and sustained agriculture production, improved quality of life for rural people, etc., some of the more recent accomplishments of the 1890s are:

—Tested water samples from wells of rural families for nitrates and pesticides residues.
—Determined soil loss coefficients for fruits and vegetables.
—Developed new invitro systems for enhancing root system development of pine and hardwood trees.
—Found that increased production of rapeseed will provide an efficient domestic source of erucic acid oil, reduce expensive imports of rapeseed oil, help control environmental pollution resulting from use of inorganic pesticides, and assist in the development of sustainable crop production.
—Found that N-methyl aspartate enhanced growth and reduced fat in swine and chickens.
—Demonstrated that gamma irradiation of broilers eliminated 99 percent of microbial contamination.
—Found that self-rating by 9–12 grade students in 19 rural schools mirrored the reward systems in the schools.
—Developed Simmental cattle with a high rate of twinning.
—Determined that lambs and kids produced on cowpeas are lean and low in fat and preferred by consumers.
—Developed a simplified field test for water engineers and seafood producers and processors of two major flavor contaminants.
—Developed a new vegetable-legume cropping system for small-scale farmers in the Southeast.
—Established seed and tissue culture systems to grow peanut and sweet potato *invitro.*
—Developed a screening system to detect aflatoxins in peanut.

—Developed a database that provides information used by the swine industry, agencies and educational institutions.
—Demonstrated a direct relationship between diet and exercise on hypertension and diabetic African American women.
—Determine that dietary omega-3 polyunsaturated fats have beneficial properties to change physical and biochemical processes to control blood pressure.
—Developed technology to improve goat meat and fiber production.
—Developed intensified "Farm Planning Program" for farmers to improve profitability from crops, livestock, and alternative farm enterprises.
—Assisted fish farmers to develop viable aquaculture operations.
—Conducted senior citizens conferences on consumer fraud, security, energy conservation, and modification of dwellings for handicapped use and access.

The above accomplishments had major impacts on improving (a) the quality of lives of people served and (b) the entrepreneurial skills and farming operations of farmers served. The bottom line is, due primarily to federal appropriated dollars to the 1890s, many under-served clientele, customers and stakeholders have a "brighter" tomorrow.

BUDGET RECOMMENDATIONS

The 1890s support the fiscal year 2000 budget recommendations of the National Association of State Universities and Land-Grant Colleges (NASULGC) which emphasizes modest increased funding for the research, extension, and academic programs. This is especially the case for formula/base funded programs, that is, a requested 6–8 percent increase not a decrease as recommended in the President's budget. Mr. Chairman, the 1890s urge the Committee to strongly support the NASULGC recommendations which includes the following for the 1890s:

Evans-Allen Research Program ($31.976 Million)

The 1890s request a marginal increase in base funds for research. These funds will enhance the capacity of these institutions to become more competitive in the private sector and in domestic and international research endeavors designed to undergird the vitality of the nation's agricultural enterprise. This support will enhance the ability of the 1890s to compete for grants and contracts in a wider variety of programs in the U.S. Department of Agriculture, other federal agencies, and the private sector.

Capacity Building Grants Program ($10 Million)

The Capacity Building Grants Program is making a major difference in the quality and quantity of teaching and research programs in food and agricultural sciences and technology on the campuses of the 1890s. Since the creation of this enormously important program, the 1890 leadership has strongly advocated a substantial and sustained increase in funding at more than $25 million annually. This level of funding would allow these institutions to significantly improve the range and level of academic programs offered, enhance the performance and productivity of faculty in the sciences and increase research opportunities for undergraduate and graduate students. However, consistent with the NASULGC's recommendation, the 1890s support the request of $10 million.

Extension and Research Facilities Grants Program ($12 Million)

The 1890s unequivocally support the $12 million facilities funding request in the NASULGC as well as the President's budgets for renovation, maintenance and overall improvement of the infrastructure on our campuses. The 1890s face nearly insurmountable barriers in attracting public and private support for enhancement of facilities. Although this level of funding will not fully address the critical facility needs of our institutions, it will complement existing efforts to make major improvements.

Extension Program ($27.943 Million)

The 1890s support a modest increase in base funding requested by NASULGC for extension activities. This marginal increase will allow our institutions to sustain program activity at current levels and respond more efficiently to the growing demand for services in severely depressed and under-served communities.

CLOSING COMMENTS

Mr. Chairman, based on past accomplishments and visionary approach, the 1890s are positioning themselves to enter the 21st Century with a renewed commitment and capacity to implement their land-grant mission of teaching, research and extension. Full appropriations of the fiscal year 2000 budget recommendations as stated

above will facilitate this and is vital to the 1890 Land-Grant Universities. If there is a need for additional information, you may contact me as indicated below.

PREPARED STATEMENT OF THE ASTA CORN & SORGHUM BASIC RESEARCH COMMITTEE

SUMMARY

We are requesting $500,000 be appropriated annually for enhancing corn germplasm.

1. Corn is a key resource providing food, industrial uses, livestock feed, and export.

2. Corn production in the U.S. is based on less than 5 percent of corn germplasm available in the world. Broadening the germplasm base would provide genes to improve yields and protect against new disease, insect and environmental stresses. Exotic germplasm would also be a source for changes in grain quality being demanded by export markets, industrial processors, and other end users.

3. Most exotic germplasm is unadapted to growing conditions in the U.S. This proposal is a joint USDA/ARS, university, and industry effort to adapt this material, so that it can be used by commercial breeders in the development of new hybrids to meet the demands of the American consumer and our foreign markets.

4. We greatly appreciate the $500,000 previously appropriated for this research, beginning with the 1995 federal budget. This funding is supporting the two main USDA/ARS locations involved in this research (Iowa and North Carolina), as well as USDA/ARS and university locations in Delaware, Illinois, Iowa, Missouri, Ohio, New York, Tennessee, Texas and Wisconsin. Industry is providing $450,000 in-kind support annually for this effort.

5. The additional appropriation of $500,000 annually would enable the Iowa and North Carolina locations to purchase equipment and add staff necessary for carrying out this research. It would also provide funding for the increased germplasm evaluation and breeding necessary to test and enhance the exotic materials available.

BACKGROUND

Corn is the major crop on the cultivated land of the USA where approximately 75 million acres are planted each year. U.S. corn production, accounting for about half of the world's annual production, adds over $16 billion of value to the American economy as a raw material. About 20 percent ($3.2 billion) of this production is exported each year, thereby providing a positive contribution to the nation's trade balance. Approximately 17 percent of the yearly corn crop is industrially refined. A portion of the refined products is exported resulting in an additional $1.4 billion in export. Through feeding livestock, the rest of the crop is processed into meat and dairy products that affect everyone in our society. Corn is a key resource within our country.

CONCERNS

All of this production is based on using less than 5 percent of the corn germplasm available in the world. Less than 1 percent of our commercial corn is of exotic (foreign) origin, and tropical exotic germplasm is only a fraction of that. This situation exists because private sector corn breeders have generally concentrated on genetically narrow based, or elite by elite, sources for their breeding efforts, since their use results in getting hybrids to the marketplace faster.

Traditionally, corn has been treated as a commodity. In recent years corn grain users and processors have become more interested in the quality characteristics of the grain itself and how this affects their business. Since much of the exotic germplasm has undergone selection for many indigenous uses (foods, beverages, etc.) by various cultures, it seems likely that new grain quality characteristics will be found in exotic germplasm rather than the narrow-based germplasm now used. A small increase in value to the grain, such as 10 cents per bushel, would increase its annual value by $800 million for an eight billion bushel harvest.[1]

Breeders must still be concerned with breeding for higher yields so that U.S. corn farmers can remain competitive. Tapping into the broader germplasm pool could provide new sources of genes for higher yield and other performance traits, such as disease and insect tolerance or improved stalk and root strength.

[1] Salhuana, Pollak, Tiffany 1994. Public/Private Collaboration Proposed to Strengthen Quality and Production of U.S. corn through Maize Germplasm Enhancement, Diversity Vol. 9, No. 4, 1993/Vol. 10, No. 1, 1994.

A further concern with a narrow genetic base is the potential for widespread disease or insect damage due to new diseases or insect species spreading into U.S. corn growing areas. It is more likely that resistance to these dangers would be found in genetically diverse exotic germplasm sources than in our breeding material. One major benefit would be reduced pesticide use. In addition to protection against diseases and insects, these exotic materials provide insurance for unforeseen climatic or environmental problems.

A great deal of excitement has been generated over the new techniques of biotechnology, especially over the potential value to the corn industry of gene transformation using genetic engineering. Research conducted on exotic germplasm could yield many beneficial genes that genetic engineers could quickly transfer to commercial hybrids.

LAMP PROJECT

What would be the source of this exotic germplasm? Over the years, collections of corn have been made from farmers' fields and other sources all over the world, and are stored in various germplasm banks. In 1987, the Latin American Maize Project (LAMP) was initiated to evaluate these corn collections (accessions). It was a cooperative effort among 12 countries to identify accessions that might provide valuable source material for further improvement in hybrid and open-pollinated cultivars in the U.S.A. and other areas. Pioneer Hi-Bred International gave USDA/ARS $1.5 million to fund the LAMP research.

Nearly 12,000 maize (corn) germplasm accessions were evaluated. In successive stages, the project identified the top 268 accessions. The environmental areas of adaptation for these 268 "elite" populations range from temperate to tropical, and are prime candidates for enhancing the U.S.A. corn germplasm base.

GERMPLASM ENHANCEMENT

Most of this germplasm is unadapted to growing conditions in the U.S. and requires genetic enhancement to make it adapted, or able to grow and mature in our environmental conditions. Enhancement basically means that these exotic materials will be bred with U.S. adapted materials and breeders will select progeny that carry the desired exotic traits and are also adapted to U.S. growing conditions. This will require a concerted long-term breeding approach by corn breeders at numerous locations (environments) throughout the U.S. Only after this process of enhancement will these exotic materials be ready to enter commercial corn breeding channels and be effectively utilized by a broad cross-section of the industry in the development of new hybrids for farmers and corn users.

The total process of enhancement is too large and long-term for public institutions and/or seed companies to accomplish individually. An ambitious task of this nature can only be completed through a coordinated and cooperative effort between the USDA/ARS, land-grant universities, and industry.

The Corn and Sorghum Basic Research Committee of the American Seed Trade Association has been concerned that enhancement of this exotic germplasm would proceed. The Committee consists of representatives from about 30 companies actively involved in the corn and sorghum seed industry, and at the committee's request, Dr. Linda Pollak, Research Geneticist, USDA/ARS, et al, developed a proposal for enhancing exotic germplasm starting with materials which will include the elite LAMP accessions as noted above. This proposal has developed into the U.S. GEM (Germplasm Enhancement of Maize) Project.

U.S. GEM PROJECT OUTLINE

Since this project serves a national need, the primary effort and direction has come from the USDA/ARS. Two permanent USDA/ARS locations are being used as primary sites for enhancement breeding and coordination. One is in Ames, Iowa, where the USDA/ARS currently conducts corn evaluation and enhancement efforts. Dr. Linda Pollak, Research Geneticist, is located there. Dr. Pollak was the Principal Investigator of the U.S.A. for LAMP, and is the lead scientist for this project.

The other permanent site is the USDA/ARS location in North Carolina. This site has responsibility for initial evaluation and conversion of the tropical materials. Tropical corn populations normally will not reach maturity in the Corn Belt, but will produce seed in North Carolina. After initial enhancement of the tropical materials in the South, they will be sent to Ames for further enhancement and testing in Corn Belt conditions. Dr. Marty Carson is in charge of this program.

A number of corn researchers at various land-grant universities and other ARS locations are also taking part in the enhancement and evaluation of this exotic germplasm. This cooperative effort is very important and serves not only as a source

of improved germplasm but also provides excellent training for future plant scientists.

Industry is also involved. A total of 23 companies have pledged research nursery and yield trial plots to be used in this breeding effort. This in-kind support is valued at $450,000 per year.

An important component of the project is an annual meeting of all cooperators to evaluate progress and plan strategies. An information network has been established to keep everyone up-to-date. A U.S. GEM Technical Steering Group consisting of members from USDA/ARS, University, and Industry has been formed for guidance and administration of this cooperative effort.

This germplasm enhancement project is public and is open to all public sector institutions as well as private seed companies. Information will be freely available and publicly developed materials will remain in the public domain, accessible to all.

ACCOMPLISHMENTS 1996–1998

Following is a description of accomplishments and research conducted at various locations using 1996–1998 funding.

Ames, Iowa.—Priorities for the corn enhancement work at this location are overall project coordination, data analysis and management, management and release of enhanced germplasm, analysis of materials for value-added traits, and as one of the many breeding sites. To date, 200 hybrids from crosses with GEM breeding lines have beaten the average of commercial check hybrids in trials analyzed in Ames.

The laboratory is continuing to evaluate oil, starch, and protein in the exotic accessions and in the breeding populations made up of exotic materials crossed to proprietary corn belt inbreds. In results from 1996, a line from one breeding cross measured total protein of 16 percent (corn belt germplasm has 10 percent) and total oil level of 6 percent (corn belt is 4 percent). It is extremely unique to find increased levels for both of these traits in the same line, and it is potentially very useful for food and feed applications. In 1997, lines were identified with unique starch characteristics, which may be beneficial for human food products. In 1998, three lines were identified with high percent retrogradation, which may have applications as a new source of dietary fiber or as a dry lubricant. Other lines were found to exhibit certain potentially useful traits, such as low protein (5.1 percent), high protein (15.4 percent) and high starch content (73.6 percent).

GEM's World Wide Web site opened on July 15, 1996. From this site cooperators can obtain the latest data from yield tests, disease and insect screening, and value-added trait research, as well as news and upcoming events.

Raleigh, North Carolina.—The focus of this location is twofold. One priority is to develop enhanced material adapted to the Southern U.S. corn growing conditions. The second is to be a stepping stone for adapting tropical material to Midwest conditions.

Breeding populations were tested for resistance to various leaf diseases and stalk rots. Selections were made for improved material with resistance to these diseases as well as for improved yield, standability, and adaptation to North Carolina conditions. For example, in 1997 significant resistance to Fusarium ear rot was found in four GEM breeding populations. Resistance to Aspergillus ear rot was also found in two of these same four populations. Hybrids of about 55 advanced breeding lines developed from tropical by elite breeding populations yielded equal to or outyielded the mean of commercial check hybrids over two years. These lines are now candidates for release.

Other public cooperators conducted evaluations in 1998 as follows: Drought resistance in Delaware. Yield data accumulation in Georgia, North Carolina, Maryland, Tennessee, Kentucky Missouri, Texas and Delaware. Grain yield and disease resistance in Illinois. Fusarium ear rot resistance in Iowa. Zein content, wet milling properties, starch functionality, and other value added grain traits in Iowa. Resistance to corn rootworm and corn borer in Missouri. Resistance to anthracnose stalk rot in New York. Breeding in Tennessee. Evaluation of silage quality in Wisconsin.

Demonstration nurseries were planted at Iowa and North Carolina for viewing by cooperators. Fall field days were held at Iowa and North Carolina.

In 1998, private cooperators continued the breeding and adaptation of about 15 accessions following the protocol developed by the GEM Technical Steering Group. Companies increased their nursery and yield trial in-kind support by approximately 25 percent in 1996.

RESEARCH IN 1999

Research will continue at the various USDA/ARS, university, and company locations similar to 1998.

EFFECTS OF INCREASED FUNDING BEGINNING IN 2000

Appropriation of the additional $500,000 annually would provide funds to increase research in the following ways:

Ames, Iowa.—The addition of a database manager (GS–11) would allow GEM to meet the increasing demand for value added trait and other data from the GEM project, and link this data with genomic data, benefiting the Corn Genome Project. Continuation of the postdoctoral position for value added trait research would provide for the study of food technology aspects of the unique traits being discovered. A graduate research assistant would study the inheritance of these value added traits, developing invaluable information for the breeding effort. By nearly tripling the amount for public cooperators, it would greatly enhance the data gathering and adaptation breeding of these materials.

Raleigh, North Carolina.—This location has a number of equipment needs, such as a seed storage unit, because current facilities are filled to capacity and a minivan for transportation (see "Budget" document). A technician would be added to handle the expanded field work. Current resources restrict testing and development work to relatively few breeding populations. With the increased funding, the number of breeding crosses could be increased, greatly speeding up the introduction of adapted GEM material into private and public breeding programs. Additional funding would provide for yield trial testing at more locations and more extensive disease and insect resistance screening, greatly increasing the precision in selecting materials that are high yielding and have high levels of pest resistance.

Other Public Cooperators.—The increase in funding for public cooperators would allow for full evaluation and development of new breeding materials improved for productivity as well as disease and insect resistance and value-added traits. It would also provide for the use of biotechnology tools in this development work. Most public cooperators are willing to participate, but cannot unless they have at least partial funding. There are approximately 30 public cooperators now, and as the project develops we are likely to have more.

CONCLUSION

Corn hybrids in the U.S. have a very narrow genetic base, utilizing only a small percentage of all available corn germplasm. This greatly increases vulnerability to unforeseen pest problems, and may lead to an eventual yield cap. Exotic corn germplasm could provide genes for resistance to pest problems and for increased yields. These exotic materials may also contain quality traits to meet new market demands. This will help ensure the U.S. maintains its world leadership in providing the best raw materials to meet the demand for the production of meat, eggs, milk, and many other food and industrial uses.

The LAMP project identified the top 268 corn accessions from among 12,000 populations evaluated. The present proposal represents a joint USDA/ARS, land-grant university, and industry effort to enhance these and other exotic accessions so that they can enter commercial corn breeding programs. The result of this cooperation will be an increase in the productivity, quality, and marketability of hybrid corn in the U.S. and for export, benefiting the farmer, the feed and processing industries, and the consumer.

Therefore, the ASTA Corn and Sorghum Basic Research Committee hereby requests the 106th Congress of the United States to add funding of $500,000 (in addition to the $500,000 appropriated initially in 1997, for a total of $1,000,000) annually for this corn germplasm enhancement project beginning with the 2000 federal budget.

BUDGET SUMMARY

This is a summary of the operational and capital budgets for 1999, 2000, and 2001; 2001 will only be operational. The budget is divided into the Corn Belt Location and corresponds to Ames, Iowa (USDA–ARS) and the cooperators in the Corn Belt area. The Southern Location corresponds with Raleigh, North Carolina (USDA–ARS) and the cooperators in the states in the South. For a complete copy of the budget, please contact Dr. David Harper, Holden's Foundation Seeds LLC, Box 839, Williamsburg, IA 52361 or 319–668–1100.

Items	1999	2000	2001
Corn Belt Location			
Board Reductions	$19,100	$20,105	$21,185
Personnel	164,550	243,990	312,832

Items	1999	2000	2001
Office/Field	44,900	85,125	89,381
Capital Equipment	11,450	81,780	7,602
Specific Agreements for Public Cooperators [1]	60,000	169,000	169,000
Total for Corn Belt Location	300,000	600,000	600,000
Southern Location			
Personnel	68,200	111,600	114,000
Indirect Costs	16,213	13,363	13,363
Office/Field	30,587	45,037	46,637
Capital Equipment	5,000	65,000	41,000
Specific Agreements for Public Cooperators [1]	30,000	65,000	85,000
Total for Southern Location	150,000	300,000	300,000
SUMMARY			
Corn Belt Location	300,000	600,000	600,000
Southern Location	150,000	300,000	300,000
USDA/ARS Overhead	50,000	100,000	100,000
Grand Total	500,000	1,000,000	1,000,000

[1] Specific Agreements for Public Cooperators: Agreements for public cooperation can be made with universities and ARS scientists in many locations which could include the following states: Delaware, Ohio, Pennsylvania, Indiana, Illinois, Wisconsin, Kentucky, Missouri, New York, Iowa, Michigan, Minnesota, North Dakota, South Dakota, Nebraska, North Carolina, Mississippi, Georgia, Louisiana, Texas and Tennessee. Research at these locations would include selection for disease and insect resistance, evaluation for value added traits, and yield trials.

Prepared Statement of the California Industry and Government Coalition on PM–10/PM–2.5

Mr. Chairman and Members of the Subcommittee: On behalf of the California Industry and Government Coalition on PM–10/PM–2.5, we are pleased to submit this statement for the record in support of our fiscal year 2000 funding request of $436,500 (one-half of the historical baseline split of $873,000 between California and Washington) from CSREES, for the California Regional PM–10/PM–2.5 Air Quality Study.

The San Joaquin Valley of California and surrounding regions exceed both state and federal clean air standards for small particulate matter, designated PM–10/PM–2.5. The 1990 federal Clean Air Act Amendments require these areas to attain federal PM–10/PM–2.5 standards by December 31, 2001. Attainment of these standards requires effective and equitable distribution of pollution controls that cannot be determined without a major study of this issue.

According to EPA and the California Air Resources Board, existing research data show that air quality caused by the PM–10/PM–2.5 problem has the potential to threaten the health of more than 3 million people living in the region, reduce visibility, and impact negatively on the quality of life. Unless the causes, effects and problems associated with PM–10/PM–2.5 are better addressed and understood, many industries will suffer due to production and transportation problems, diminishing natural resources, and increasing costs of fighting a problem that begs for a soundly researched solution.

PM–10/PM–2.5 problems stem from a variety of industry and other sources, and they are a significant problem in the areas that are characteristic of much of California. Typical PM–10/PM–2.5 sources are dust stirred up by vehicles on unpaved roads, and dirt loosened and carried by wind during cultivation of agricultural land. Soil erosion through wind and other agents also leads to aggravation of PM–10/PM–2.5 air pollution problems.

The agriculture portion of this study is developing specific types of information, tools and techniques needed to develop an inventory and the management practices that will most likely be part of the control strategies. They are: (1) validate method or methods for accurately measuring fugitive PM–10/PM–2.5 emission rates from an individual site or operation; (2) a method to easily and quickly estimate PM–10/PM–2.5 emissions; (3) an accurate inventory of fugitive PM–10/PM–2.5 dust sources by individual farming operations; (4) validated (field tested) best management practices; (5) a clear understanding of significant factors that effect PM–10/PM–2.5 emissions; and (6) a workable, validated model or models for predicting PM–10/PM–2.5 emission, based on operational parameters.

The primary focus of the short-term objectives is on those soils, practices, and conditions presumed to have the highest PM–10/PM–2.5 emissions. Priority for this work will be focused on the following situations, practices, and crops within the study area.

Almond, Walnut and Fig Harvest: Preparation for harvest; Shaking trees; Windrowing; Picking up nuts; and Ambient conditions before and after.

Dairy Industry: Dairy Lagoons; and Livestock Corrals.

Cotton Harvest: 1Harvesting—1st and 2nd picking; Shredding of stalks; Stalk incorporation; and Ambient conditions before and after.

Feedlots: Feedlot activities.

Fall/Spring Land Preparation: Deep tillage; Discing; Land planning; Bed formation; and Ambient conditions before and after.

Grain Harvesting: Harvesting; Stubble incorporation; Discing; and Burning.

Land Leveling: Appropriate practices.

The importance of this study on PM–10/PM–2.5 is underscored by the need for more information on how the federal Clean Air Act Amendments standards can be met effectively by the business community, as well as by agencies of federal, state and local government whose activities contribute to the problem, and who are subject to the requirements of Title V of the Clean Air Act. There is a void in our current understanding of the amount and impact each source of PM–10/PM–2.5 actually contributes to the overall problem. Without a better understanding and more information—which this study is providing—industry and government will be unable to develop an effective attainment plan and control measures.

Agriculture wants to be a part of the effort to solve this major problem, but to do so, we need federal assistance to support research and efforts to deal effectively with what is essentially an unfunded federal mandate.

Agriculture and industry, in concert with the State of California and local government entities, are attempting to do our part, and we come to the appropriations process to request assistance in obtaining a fair federal share of financial support for this important research effort. In 1990, our Coalition joined forces to undertake a study essential to the development of an effective attainment plan and effective control measures for the San Joaquin Valley of California. This unique cooperative partnership involving federal, state and local government, as well as private industry, has raised more than $24 million to date to fund research and planning for a comprehensive PM–10/PM–2.5 air quality study. Our cooperative effort on this issue continues, and our hope is that private industry and federal, state and local governments will be able to raise the final $4.6 million needed to complete the funding for this important study.

To date, this study project has benefited from federal funding provided through USDA's, DOT's, DOD's, EPA's, and Interior's budgets—a total of $13.3 million in federal funding, including $436,500 from USDA (one-half of CSREES amount provided for California and Washington) in each of the last four fiscal years. State and industry funding has matched this amount virtually dollar for dollar.

The UC Davis research into the contribution of agriculture to airborne PM–10 in the San Joaquin Valley has produced a number of interim results. Some of these results have already been incorporated into the San Joaquin Valley Unified Air Pollution Control District's planning, and additional research efforts have been planned in consultation with district personnel.

The agricultural emissions research is critical to the district's efforts to understand and control PM–10 in the valley. The San Joaquin Valley is a serious nonattainment area for PM–10 and also experiences high concentrations of PM–2.5. The district's strategies toward PM–10 emissions from agriculture focus on research to identify activities that significantly contribute to the PM–10 problem, and then to develop feasible methods of controlling emissions from those sources. Without this information, the district could be demanded to control agricultural sources in ways that may or may not be effective at reducing PM–10. Effective control plans are those that actually reduce PM–10 concentrations, so that there is some assurance that the cost of implementing them is well-placed.

UC Davis research has produced much better emission factors for the harvesting of cotton than were previously available, and has produced the only available emission factors to date for harvesting almonds. These emission factors were obtained under actual harvest conditions, so should be representative of agricultural operations in the San Joaquin Valley. UC Davis research has also investigated the emissions generated from harvesting figs and walnuts, and the burning of raisin trays. For raisin trays, the results indicate that the emissions are not significant. For fig and walnut harvesting, the results also show that the emissions are not highly significant. Moreover, actions taken to reduce almond harvest emissions will be effec-

tive at controlling emissions from fig and walnut harvesting, as these crops use the same harvesting equipment.

UC Davis has initiated research into the emission of ammonia from livestock facilities in the San Joaquin Valley, primarily dairies and feedlots. Approximately half of all ammonia emissions in the San Joaquin Valley is thought to come from animals. This research is significant because ammonia combines with NO in the atmosphere to produce fine particles in the PM–2.5 size range. Further, the ammonia emissions are not well characterized for the livestock management practices prevalent in the San Joaquin Valley, so new information is needed. Some preliminary results have been obtained, but they need to be confirmed with additional measurements.

The currently available fugitive dust emission factors approved for use by the U.S. EPA rely on the dry silt content of the soil, defined as the fraction that passes through a 75 PM sieve. The emission factors were developed empirically, and there is scientific disagreement over their utility as a predictive tool. UC Davis research is exploring other methods of defining the potential of a soil to emit PM–10 and has developed laboratory procedures to measure an index of PM–10 emission potential in a repeatable manner. Additional research is ongoing to develop this as a useful tool.

The fugitive dust emissions UC Davis has measured from agricultural operations so far has relied on physically collecting the dust from the plumes on filters. UC Davis has developed a remote sensing LIDAR (light detection and ranging) instrument to characterize the extent of a dust plume from afar. This instrument has been used successfully in the field to collect information on the size and shape of dust plumes. Additional research is ongoing to calibrate it and use it to quantitatively measure the dust concentrations. The device will be particularly useful under conditions when it is not possible to collect a valid sample on filters.

During the coming year, UC Davis will focus on the following research areas:

—*Fugitive dust emission from land preparation activities*.—Land preparation is common to nearly all agricultural crops in the valley, but the emission factors from this activity are very poorly defined in the current methods. There is tremendous value in developing better emission factors from this activity.

—*Controlled testing of almond harvesting. Almond harvesting is one of the dustiest activities examined to date*.—This summer, UC Davis plans to test several different harvesters on the same orchard, including the latest harvester from each of the two companies that produce them, as well as the most commonly used harvester of each manufacturer.

—*Initiate emissions testing of garlic harvesting*.—This crop is expanding in the San Joaquin Valley, and is potentially very dusty. A few pilot tests will provide information on how much further this crop should be examined.

—*Emissions from livestock management*.—UC Davis has conducted preliminary testing of dust and ammonia emissions from dairies and feedlots; additional research is needed to acquire a valid database for analysis.

The support of the Department of Agriculture has been indispensable to the completion of the work performed to date. Continued support for this research is essential to assure that decisions made on behalf of improved air quality are based on scientifically valid information, and that the interests of agriculture are considered in the process.

For fiscal year 2000, our Coalition is seeking federal funding once again through the U.S. Department of Agriculture to support continuation of this vital study in California. In the budget for the Cooperative State Research, Education, and Extension Service (CSREES), we request $436,500, representing one-half of the $873,000 historical baseline split between California and Washington in the past four budget cycles.

The California Regional PM–10/PM–2.5 study will not only provide vital information for a region identified as having particularly acute PM–10/PM–2.5 problems, it will also serve as a model for other regions of the country that are experiencing similar problems. The results of this study will provide improved methods and tools for air quality monitoring, emission estimations, and effective control strategies nationwide. Consequently, the beneficial results of this research will contribute to national policy as well.

The Coalition appreciates the Subcommittee's consideration of this request for a fiscal year 2000 appropriation of $436,500 for U.S.D.A. to support the California Regional Region PM–10/PM–2.5 Air Quality Study. U.S.D.A's past contributions have helped ensure the success of the study. The coalition thanks you for your support of this important program.

PREPARED STATEMENT OF THE COALITION FOR AFFORDABLE PHARMACEUTICALS

Mr. Chairman and Members of the Subcommittee, the Coalition for Affordable Pharmaceuticals (CAP) is pleased to have the opportunity to present these comments on the fiscal year 2000 budget request for the Food and Drug Administration, on behalf of its members. CAP is a coalition of three national trade associations representing manufacturers and distributors of finished multi-source generic pharmaceuticals, manufacturers and distributors of bulk active pharmaceutical chemicals, and suppliers of other goods and services to the generic drug industry. CAP's combined membership encompasses virtually the entire U.S. generic pharmaceutical industry.

I. Generic Drugs Create Significant Health Care Cost Savings

As in recent years, the generic drug industry addresses this Subcommittee in order to request that appropriations be allocated to FDA's Office of Generic Drugs (OGD). OGD is the agency's office with responsibility for reviewing and approving generic pharmaceutical applications, called abbreviated new drug applications (ANDAs). Unlike past years, however, our testimony does not stand alone but, rather, supports the Administration's $1.9 million appropriations request for OGD. CAP is pleased that the Administration is advocating increased funding for OGD, which will lead to faster generic drug approvals.

Generic drugs continue to represent one of the most effective means of curbing spiralling healthcare costs in the U.S.[1] For example, the cost of prescription drugs increased by 22 percent in 1998 according to the Office of Personnel Management,[2] for a total of $94 billion spent on prescription drugs.[3] In the federal health program, one out of every five health care dollars is spent on prescription medicine.[4] In the face of these costs, competition from generics in the prescription drug market has saved American consumers, taxpayers, and Federal and state governments billions of dollars since 1984 when the Hatch-Waxman Act was passed. According to a July 1998 Congressional Budget Office study, purchasers of pharmaceuticals at retail pharmacies saved $8—$10 billion in 1994 alone.[5] These savings occur because generic drugs typically enter the market at 25 percent—30 percent below the brand price and, within two years, decline to 60 percent—70 percent of the brand price.[6] This price discount creates a substantial savings for taxpayers and consumers, which is especially important to those seniors and the uninsured who have difficulty meeting their health care needs.

While cost-effective generic pharmaceuticals have reduced health care costs in this country, the savings could be even greater if FDA took final action on generic applications within the statutorily required six months.[7] This Subcommittee previously has emphasized the importance of accelerating generic drug approvals.[8] Due in large part to the appropriations designated in 1998 and 1999, OGD has successfully focused on this mandate. Nevertheless, the Subcommittee must continue its support

---

[1] According to surveys conducted by Hewitt Associates, Towers Perrin, and Buck Consultants, companies can expect increases in their health care costs ranging from 7 to 10 percent in 1999. That increase is double the 4 percent average increase in health care costs in 1998. Great-West Executive Says Self-Funded Insurance Offers Businesses an Alternative to Traditional Health Care Plans, PR Newswire, Mar. 3, 1999, at 2061. Moreover, after record financial losses in 1998, managed care companies and health maintenance organizations reportedly intend to "ratchet up premiums to restore profit margins." [7] Under the law, FDA must take final action on generic drug applications within 180 days. 21 U.S.C. 355(j)(5). In 1998, the median time to approval for ANDAs was 18 months—three times the length mandated by statute. Comments of Douglas L. Sporn, Director, OGD, "Update on the Office of Generic Drugs," at the NAPM 1999 Annual Meeting & Education Conference (Feb. 3, 1999).

[8] S. Rep. No. 105–212 (1998) at 121.

for OGD, ensuring that the agency has adequate funding to approve safe and effective generic drugs promptly and efficiently.

II. CAP Recommends Increased Funding To Expedite Generic Drug Approvals

We encourage the Subcommittee to continue this initiative by providing additional funds that will allow OGD to progress further toward meeting the six month statutory period for final agency action on ANDAs. Specifically, we recommend that the Subcommittee take the following actions: Grant the Administration's request for a direct appropriation of $1.9 million for the Office of Generic Drugs, in addition to its fiscal year 1999 funding level; and Continue to insist that FDA provide detailed and accurate information about agency expenditures specifically for, and by OGD.

Not only would the appropriations assist in reducing approval times, but also the funds would aid OGD in addressing artificial barriers to competition that are continuously erected by the brand drug industry, as is explained further below.

III. With Increased Appropriations, OGD Can Hire Additional Staff To Meet Its Workload

Among the most pressing needs at OGD is one for additional staff members to review generic applications. While the Administration reports that a majority of the $1 million appropriated to OGD in 1999 will be used to fund FTE's, the current appropriations request would add another 11 FTE's to the office.[9] These staff members are essential to handling OGD's ever increasing workload. In 1998, OGD received an unprecedented 564 ANDAs, up from 464 in 1997.[10] This increase in application submissions will likely continue. In fact, over the next five years, approximately $22 billion in annual prescription drug sales will be open to generic competition due to patent expirations.[11]

Further compounding these numbers, the Administration asserts that the fiscal year 2000 funding will enable them to meet only the modest goal of a 3.2 percent increase in the average monthly number of OGD actions (which include approvals, tentative approvals, not approvals and facsimile requests).[12] The modest nature of this goal highlights the need for additional funding to continue OGD's efforts toward accelerating generic drug approval times. Thus, Congress has the opportunity now to positively impact OGD's workload and speed generic drugs to consumers.

IV. With Additional Funding And Staff, OGD Can Address Troublesome Citizen Petitions

OGD's priorities should be expanded to address the misuse of citizen petitions for challenging FDA's scientific decisions related to generic drug applications. At least 50 citizen petitions have been filed since 1990 seeking actions that would result in a delay in approval of generic drugs.[13] In response, scarce OGD resources are used to review these petitions, many of which are frivolous, anti-competitive actions. While FDA has worked tirelessly to close out these petitions, the agency falls further behind as more petitions are filed. For instance, although FDA completed its review of eight petitions related to generic drugs in 1998, 10 more were filed by the brand industry that year.[14] OGD senior scientists who otherwise would be reviewing ANDAs must turn their attention to these petitions, delaying ANDA review times even further.[15] With additional funds, OGD could hire senior scientists that would devote much of their time to clearing the backlog of petitions that delay generic approvals.

[13] A detailed chart describing 51 citizen petitions is available on request. It is titled, "Citizen Petitions That Request FDA Actions Against Generic Drug Applications (ANDAs), 1990—Present."

[14] Id.

[15] Douglas Sporn, Director of FDA's Office of Generic Drugs, has stated that the "speed of [ANDA] approvals depends on how much reviewers are distracted by citizen petitions . . . ." Sporn Updates Generic Drug Industry on Forthcoming Guidances, FDA Week (Apr. 2, 1999), at 11 (comments at GPIA Annual Meeting, March 1999).

V. Additional Funds Could Be Used To Educate The Public About Generic Equivalence

An increase in appropriations also could be used by FDA to counter inaccurate claims made by some brand companies that the substitution of generic drugs for brand drugs poses a health risk for patients.[16] While this scare tactic is belied by sound science, it serves to undermine the public's confidence in the value of FDA's decisions about the safety and effectiveness of generic drug products. With additional funding, OGD could provide accurate information to educate consumers, policy makers, and state government officials about the scientific integrity of the ANDA process and FDA's therapeutic equivalence decisions.

VI. Conclusion

In summary, we request that Congress continue to guide FDA's priorities by appropriating and allocating resources directly to OGD. As medical treatment becomes even more expensive, it is important that generic drug applications move through the approval process as quickly as scientifically sound reviews for bioequivalence permit. Although generic drug median approval times have improved tremendously, the agency's review period is still three times longer than the six month statutory requirement.[17] Every day that a generic drug is delayed from entering the market, Americans pay millions of dollars more for their prescription drug products. Without additional appropriated funds, and with million-dollar drugs coming off patent, the delay in approval is likely to increase—an unacceptable scenario. Only Congressional mandates can ensure that FDA will continue to invest the resources necessary to ensure timely generic approvals which, in turn, will continue to provide a check on prescription drug prices. Mr. Chairman, the Coalition for Affordable Pharmaceuticals would like to thank you and the Subcommittee for its time and attention concerning this critical aspect to FDA's fiscal year 2000 budget request. We look forward to continuing our work with you and members of the Subcommittee to bring safe, effective and more affordable pharmaceuticals to the American public.

PREPARED STATEMENT OF THE COALITION OF AGRICULTURAL MEDIATION PROGRAMS

We request that you include $4 million in the fiscal year 2000 Agriculture Appropriations bill for the certified state mediation grant program. This is the minimum funding level needed for state mediation programs to operate and provide meaningful services. The mediation program has been successfully used by thousands of producers, creditors and USDA to resolve disputes without costly litigation. Most importantly, mediation has allowed all the parties to resolve the disputes themselves according to their own best interests.

The President's budget for fiscal year 2000 requests $4 million for the grant program, which is consistent with his Proclamation dated May 1, 1998 encouraging greater use of mediation and other Alternative Dispute Resolution techniques throughout the executive branch. USDA has the benefit of well-developed and experienced certified mediation programs in over 20 states. What it now needs is adequate funding to ensure the continuation of these programs, and the development of programs in more states.

The Coalition of Agricultural Mediation Programs (CAMP) is comprised of the states that have had their mediation programs certified by USDA. In fiscal year 1999 the twenty-two state programs requested grants totaling around $3.3 million. With only $2 million appropriated, all state program grants were pro-rated to only 60 percent of their needs. At the same time, the on-going economic crisis in agriculture is increasing the demand in established state mediation programs, while interest in establishing new programs in additional states is growing. In fact, it is entirely possible that the requested $4 million appropriation may fall short if the agricultural economic crisis persists.

Certified state mediation programs were originally authorized under the Agricultural Credit Act of 1987 as a way to assist agricultural producers and their creditors resolve disputes through mediation, reducing the cost of administrative appeals, litigation and bankruptcy to all parties. Agricultural mediation played a very important role in resolving financial disputes between farmers/ranchers and lenders during the farm economic crisis in the 1980s. As you are well aware, many agricultural

[16] A detailed chart describing the state lobbying initiatives undertaken by the brand industry is available on request. It is titled, "Anti-Generic Challenges Before State Formularies (Other Than Coumadin(/NTI Challenges)."

[17] Comments of Douglas L. Sporn, Director, OGD, "Update on the Office of Generic Drugs," at the NAPM 1999 Annual Meeting & Education Conference (Feb. 3, 1999).

producers in our country are once again facing economic crises. Financial problems for producers translates into problems for local banks, co-ops, feed suppliers, etc. This will create a greater need for state mediation services in fiscal year 2000.

Adequate funding for this program has been recognized and recommended as one of the measures to help address the challenges being experienced by the nation's farmers, their lenders, and others.

—Governors and agriculture officials from 15 states gathered for the Plains States Rural Crisis Summit in Oklahoma City on August 6–7, 1998. Adequate funding for the USDA Certified Mediation Grants Program was one of nine emergency recommendations that were forwarded to Congress.

—On September 28, 1998, the National Association of State Departments of Agriculture (NASDA) included adequate resources for mediation, financial analysis, and related services as part of its recommended disaster assistance package.

—By letter dated March 1, 1999, NASDA urged Congress to appropriate supplemental funding for Farm Service Agency loan programs and mediation grants.

The financial restrictions, increasing demand for mediation services and current economic conditions make it critical that the $4 million appropriation be granted. Please give me a call at (618) 453–5181 if you have any questions. Thank you for your attention to this important issue.

PREPARED STATEMENT OF DR. ROBERT A. ALTENKIRCH, VICE PRESIDENT FOR RESEARCH, MISSISSIPPI STATE UNIVERSITY

Mr. Chairman and Members of the Subcommittee, thank you for the opportunity to submit this testimony on behalf of the Coalition of EPSCoR States [1] regarding the U.S. Department of Agriculture Experimental Program to Stimulate Competitive Research (USDA EPSCoR). USDA EPSCoR is extremely important to agricultural research in the state of Mississippi and in our nation. I appreciate the opportunity to submit this testimony.

I would also like to extend my appreciation to you, Mr. Chairman, for your strong support of USDA EPSCoR. This important program is having a significant impact in Mississippi and in the other USDA EPSCoR states. Your support and the support of this Subcommittee have been absolutely crucial in establishing and maintaining this important program. Mr. Chairman, those of us committed to improving Mississippi's research and development capability deeply appreciate your support and your effort. Thank you for your fine work representing Mississippi in the United States Senate.

Seven federal agencies have EPSCoR or EPSCoR-like programs, including USDA. EPSCoR works to improve our country's science and technology capability by funding activities of talented researchers in states that have historically not received significant federal R&D funding. USDA EPSCoR was established in fiscal year 1992 with a goal of increasing the amount of agricultural research at academic institutions within states that have had limited success obtaining competitive funds from USDA.

The Mississippi EPSCoR program began in 1988 with the naming of the state EPSCoR Committee by the Governor. Mississippi EPSCoR obtained its first funding in 1989 from USDA EPSCoR's sister program in the National Science Foundation. Since that time, EPSCoR has had an enormously positive impact within the state and at the four research institutions and their affiliates.

Because of the multi-institutional framework of EPSCoR and of the commitment of the state EPSCoR Committee to creating a critical mass of scientists and engineers around specific issues as well as a more fully developed statewide infrastructure, Mississippi EPSCoR has produced a stronger, more competitive research community and closer working relationships among the institutions that participate in the federal EPSCoR programs: Jackson State University, Mississippi State University, the University of Mississippi, the University of Southern Mississippi, and the University of Mississippi Medical Center.

Mr. Chairman, USDA EPSCoR is helping to improve the quality and competitiveness of agriculture research in Mississippi. Since the program was established in 1992, 64 Mississippi researchers have received USDA EPSCoR Strengthening Awards. These investigators have been located at Mississippi State University, the University of Mississippi Medical Center, and the University of Southern Mississippi. The amount of USDA research funds received by Mississippi increased by

---

[1] Alabama, Arkansas, Idaho, Kansas, Kentucky, Louisiana, Maine, Mississippi, Montana, Nebraska, Nevada, North Dakota, Oklahoma, Puerto Rico, South Carolina, South Dakota, Vermont, West Virginia, and Wyoming

more than 500 percent between 1990 and 1996, a clear indication that Mississippi researchers are becoming more effective.

Important examples of Mississippi's research include studies in such areas as: kenaf processing, which is a potential economic opportunity for rural states; rapid detection of E coli, an important factor in food safety; and disease mechanisms in channel catfish, which impacts a significant cash crop across the southern part of the country. These projects and many, many others address issues important to rural states and to the rest of the nation. USDA EPSCoR allows researchers across our country to contribute to our economy and our agricultural research knowledge base.

USDA EPSCoR states are those whose funding ranks no higher than the 38th percentile of all states, based on a three year rolling average. For fiscal year 1999, the following states are eligible: Alaska, Arkansas, Connecticut, Delaware, Hawaii, Idaho, Maine, Mississippi, Montana, Nevada, New Hampshire, New Mexico, North Dakota, Rhode Island, South Carolina, South Dakota, Utah, Vermont, West Virginia, Wyoming, and the Commonwealth of Puerto Rico. Let me stress that EPSCoR relies on rigorous merit review in order to ensure that it funds only high-quality research.

USDA makes four types of competitive awards through USDA EPSCoR: Research Career Enhancement Awards, Equipment Grants, Seed Grants, and Strengthening Standard Research Project Awards. Proposals must be related to the program priorities of the National Research Initiative Competitive Grants Program, which address critical issues facing agriculture today.

—Research Career Enhancement Awards help faculty enhance their research capabilities by funding sabbatical leaves. Applicants may not have received a NRICGP competitive research grant within the past five years.

—Equipment Grants strengthen the research capacity of institutions in USDA EPSCoR states. The grant cannot exceed 50 percent of the cost of the equipment. The principal investigator for this grant is responsible for securing non-Federal matching funds.

—Seed Grants enable researchers to collect preliminary data in preparation for applying for a standard research grant. Seed Grant awards are limited to a total cost of $50,000, including indirect costs, and are non-renewable. Applicants must indicate how the research will enhance future competitiveness in applying for standard research grants.

—Strengthening Standard Research Project Awards fund standard research projects of investigators who have not received a NRICGP grant within the past five years.

Through USDA EPSCoR, Mississippi and the other USDA EPSCoR States contribute more effectively to our nation's science and technology capability, and help provide our country with needed, high-quality, peer-reviewed research. This program allows all regions of our country to contribute to our nation's science and technology capability while allowing flexibility to meet regional research needs. USDA EPSCoR is a sound investment of taxpayer dollars.

Mr. Chairman, the Subcommittee has for several years directed USDA to set aside 10 percent of USDA NRICGP funds for USDA EPSCoR. Those funds have provided significant opportunity and significant success in Mississippi and the other EPSCoR states. I request that the Subcommittee once again include report language directing USDA to set aside 10 percent of its NRI competitive grant funds in fiscal year 2000 for an EPSCoR program. These funds will allow the EPSCoR states to continue providing for the agricultural research needs of rural America and of our nation.

I thank the Subcommittee for the opportunity to submit this testimony.

PREPARED STATEMENT OF THE COALITION TO PROMOTE U.S. AGRICULTURAL EXPORTS

As members of the Coalition to Promote U.S. Agricultural Exports, we commend the Chairman and members of the Subcommittee for their interest and support of U.S. agriculture and express our appreciation for this opportunity to share our views.

The Coalition to Promote U.S. Agricultural Exports is an ad hoc coalition of over 80 organizations, representing farmers and ranchers, cooperatives, small businesses, regional trade organizations, and the State Departments of Agriculture. We believe the U.S. must continue to have in place policies and programs that help maintain the ability of American agriculture to compete effectively in a global marketplace still characterized by subsidized foreign competition.

This is especially true as the Federal Agriculture Improvement and Reform Act of 1996 (FAIR Act), that resulted in the most sweeping reforms in farm policy in over 60 years, continues to be implemented. Under this legislation, farm income and the economic well being of American agriculture are now dependent more than ever on continued access to foreign markets and maintaining and strengthening U.S. agricultural exports.

American agriculture and American workers, however, continue to be threatened by subsidized foreign competition. Recent trade agreements, including NAFTA and the Uruguay Round Agreement on GATT, did not eliminate the use of export subsidies or other forms of export assistance. According to a recent analysis by USDA, the European Union (EU) and other foreign competitors are outspending the U.S. by a factor of 20 to 1 with regard to the use of export subsidies and other expenditures for export promotion.

The same study showed that such countries are spending over $100 million just to promote sales of their products in the United States. In other words, they are spending more to promote their agricultural exports to the United States, than the U.S. is currently spending ($90 million) to promote American agricultural exports worldwide!

According to the same study by USDA, the U.S. faces a growing challenge in the area of market promotion. In 1997, in addition to spending over $7.2 billion in export subsidies, our leading foreign competitors spent a combined $924 million on various activities to promote their exports of agricultural, forestry, and fishery products, including some $365 million by the EU.

USDA's study goes on to say that "because market promotion is a permitted 'green box' activity under World Trade Organization (WTO) rules, with no limit on public or producer funding, it is increasingly seen as a centerpiece of a winning strategy in the future trade battleground. Many competitor countries have announced ambitious trade goals and are shaping export programs to target promising growth markets and bring new companies into the export arena * * *" European countries are expanding their promotional activities in Asia, Latin America, and Eastern Europe. Canada, Australia and New Zealand have also sharply bolstered their export promotion expenditures in recent years. Clearly, our foreign competitors are aggressively seeking to maintain and increase their share of the world market at the expense of U.S. producers.

For this reason, we believe the Administration and Congress should give serious consideration to strengthening funding for MAP and other export programs, and ensuring that such programs are fully and aggressively utilized. Since MAP was originally authorized, funding has been gradually reduced from a high of $200 million to its current level of $90 million—a reduction of more than 50 percent. Again, given what our foreign trade competitors are doing, we believe it's time to restore funding for this vitally important program to its original level.

We also urge that funding for USDA's Foreign Market Development (FMD) Cooperator Program be maintained at no less than the current year level. In addition, we want to express our strong support for ensuring adequate funding for USDA's Foreign Agricultural Service (FAS) to help meet critical export goals and objectives. Such action is essential to America's overall trade strategy and economic interests.

Both MAP and FMD, which are administered on a cost-share basis, remain one of the few tools specifically allowed under the Uruguay Round Agreement to help American agriculture and American workers remain competitive in a global marketplace still characterized by subsidized foreign competition. By any measure, they have been tremendously successful and extremely cost-effective in helping maintain and expand U.S. agricultural exports, countering subsidized foreign competition, protecting American jobs and strengthening farm income. American agriculture is the most competitive industry in the world, but it can not and should not be expected to compete alone against the treasuries of foreign governments.

For all these reasons, we want to emphasize again the need to help strengthen the ability of U.S. agriculture to compete effectively in a global marketplace still characterized by subsidized foreign competition. As a nation, we can work to export our products, or we can export our jobs. USDA's export programs, such as MAP and FMD, are a key part of an overall trade strategy that is pro-growth, pro-trade and pro-job.

Again, as members of the Coalition to Promote U.S. Agricultural Exports, we appreciate very much this opportunity to share our views and we ask this statement be included in the official hearing record.

PREPARED STATEMENT OF THE COLORADO RIVER BASIN SALINITY CONTROL FORUM

The Congress concluded that the Colorado River Basin Salinity Control Program should be implemented in the most cost-effective way and realizing that agricultural on-farm strategies were some of the most cost-effective strategies authorized a program for the Department of Agriculture. With the enactment of the Federal Agriculture Improvement and Reform Act of 1996 (FAIRA), the Congress concluded that the Salinity Control Program could be most effectively implemented as one of the components of the Environmental Quality Incentives Program. Since the enactment of FAIRA, the Salinity Control Program has not been funded at a level adequate to ensure that water quality standards in the Colorado River, with respect to total dissolved solids (salinity), will be honored, nor is the funding sufficient to prevent salt loading from irrigated farms from impacting the quality of water delivered to Mexico under a minute of the International Boundary and Water Commission, United States and Mexico.

The problem rests with the Department of Agriculture concluding that it should not designate any area of the country as a national priority area at this time. The Salinity Control Program has been subsumed into the EQIP program without the Secretary of Agriculture giving adequate recognition to the requirement in Section 202(c) in the Colorado River Basin Salinity Control Act to carry out salinity control measures. Further, the Administration has concluded that the expenditure of EQIP funds shall be determined by initiatives developed at the grassroots level. Under USDA directives, this means that Upper Basin agricultural communities advance salinity control proposals for the salinity control program. The proposal must be implemented in the Upper Basin, as that is where the salt loading is occurring. Water users hundreds of miles downstream are the beneficiaries of this water quality improvement program. Agriculturalists in the Upper Basin, however, see local benefits as well as downstream benefits and have submitted cost-effective proposals to the State Conservationists in Utah, Wyoming and Colorado. A majority of the EQIP funds are designated to be used in priority areas which are normally small geographic watersheds. Priority Area proposals for EQIP funding are ranked in each state under the direction of the NRCS State Conservationist. The existing ranking criteria, however, does not consider downstream benefits (particularly out of state benefits) when proposals are being evaluated.

If the Department of Agriculture believes that it is directed by the Congress to implement the Salinity Control Program, then it is incomprehensible that the program that is designed to provide downstream benefits cannot receive credit in ranking criteria for the accomplishment of the downstream benefits. The solution to the problem is simple. Grassroots in the Colorado River Basin with respect to salinity control means at the states level and review of proposals should take place at the seven Colorado River Basin states level through the Forum. The states, through the efforts of the Salinity Control Forum, have adopted a program approved by EPA. The Forum should be recognized as the grassroots level for the Salinity Control Program and the Forum should serve as the Technical Advisory Committee (local work group) to Administration officials as to the need for and the expenditure of funds for the Salinity Control Program. The Colorado River Basin is covered by two NRCS regions and the program must be coordinated at a high administration level. A national priority designation is needed. Numerous requests have gone to the Department of Agriculture to make this designation, and the response has been that there are not adequate funds in the EQIP program to go beyond the initially adopted "grassroots" effort. Therefore, the Forum is pleased with the Administration's statement that it intends to expend $300,000,000 in fiscal year 2000 on the EQIP program.

The Basin states were led to believe by Congressional staff that when the EQIP program was created, the $200,000,000 annual Commodity Credit Corporation (CCC) borrowing authority given to the Secretary would ensure that through the year 2002 at least this amount of funding would be expended for the EQIP program. The Forum was very dismayed when last year this committee acted to reduce the fiscal year 1999 funding to $174,000,000. This level of funding is not adequate for this most important nationwide program and the Administration does not believe that it provides sufficient funds to implement National Priority Areas as allowed by Congress under FAIRA. The Forum urges that the funding for EQIP for fiscal year 2000 total $300,000,000.

This last year, the Natural Resources Conservation Service (NRCS) set aside Congressionally earmarked funds to use in areas of special interest in the Colorado River drainage and in Mississippi. The Forum commends this designation and believes this is a first step towards designation of National Priority Areas. However, under NRCS earmarked designation, not enough funds were made available to ade-

quately implement the needed program in the Colorado River Basin. The Forum fears that adequate funding may not be made available by the Secretary until the Congress increases, in a significant way, the funds to be spent in the EQIP.

The Basin states have cost sharing dollars available to participate in on-farm salinity control efforts in the cost-sharing fashion provided by the Congress. The agricultural producers in the Upper Basin are waiting for their applications to be considered so that they might also cost share in the program. When all of the cost sharing is tabulated, the federal cost of the program is less than 50 percent. However, because of the structure of the EQIP and the associated authorized cost sharing under the Colorado River Basin Salinity Control Act, these funds cannot be expended in this cooperative effort until federal funds are made available.

The Forum urges that this committee support the funding of $300,000,000 from the CCC in fiscal year 2000 for EQIP. The Forum also requests that this Committee advise the Administration that $12,000,000 of these funds be designated for the Colorado River Basin Salinity Control Program.

OVERVIEW

The Colorado River Basin Salinity Control Program was authorized by Congress in 1974. The Title I portion of the Colorado River Basin Salinity Control Act responded to commitments that the United States made, through a minute of the International Boundary and Water Commission, to Mexico with respect to the quality of water being delivered to Mexico below Imperial Dam. Title II of the Act established a program to respond to salinity control needs of Colorado River water users in the United States and to comply with the mandates of the then newly legislated Clean Water Act. Initially, the Secretary of the Interior and the Bureau of Reclamation were given the lead federal role by the Congress. This testimony is in support of funding for the Title II program.

After a decade of investigative and implementation efforts, the Basin states concluded that the Salinity Control Act needed to be amended. Congress revised the Act in 1984. That revision, while keeping the Secretary of the Interior as lead coordinator for Colorado River Basin salinity control efforts, also gave new salinity control responsibilities to the Department of Agriculture, and to a sister agency of the Bureau of Reclamation—the Bureau of Land Management. Congress has charged the Administration with implementing the most cost-effective program practicable (measured in dollars per ton of salt removed). The Basin states are strongly supportive of that concept as the Basin states consider cost sharing 30 percent of federal expenditures up-front for the salinity control program, in addition to proceeding to implement their own salinity control efforts in the Colorado River Basin.

Since the Congressional mandates of nearly two decades ago, much has been learned about the impact of salts in the Colorado River system. The Bureau of Reclamation has recently completed studies on the economic impact of these salts. Reclamation recognizes that the damages to United States' water users alone may soon be approaching $1 billion per year.

The Colorado River Basin Salinity Control Forum (Forum) is composed of Gubernatorial appointees from Arizona, California, Colorado, Nevada, New Mexico, Utah and Wyoming. The Forum has become the seven-state coordinating body for interfacing with federal agencies and Congress to support the implementation of a program necessary to control the salinity of the river system. In close cooperation with the Environmental Protection Agency (EPA) and under requirements of the Clean Water Act, every three years the Forum prepares a formal report analyzing the salinity of the Colorado River, anticipated future salinity, and the program necessary to keep the salinities at or below the levels measured in the river system in 1972.

In setting water quality standards for the Colorado River system, the salinity concentrations measured at Imperial, and below Parker, and Hoover Dams in 1972 have been identified as the numeric criteria. The plan necessary for controlling salinity has been captioned the "plan of implementation." The 1996 Review of water quality standards includes an updated plan of implementation. The level of appropriation requested in this testimony is in keeping with the agreed to plan. If adequate funds are not appropriated, state and federal agencies involved are in agreement that the numeric criteria will be exceeded and damage from the high salt levels in the water will be widespread in the United States and Mexico and will be very significant.

ADDITIONAL FUNDING NEEDS

The authorized cost sharing by the Basin states was at first difficult to implement as attorneys for USDA concluded that the Basin states were authorized by FAIRA to cost share in the effort, but the Congress had not given USDA authority to re-

ceive the Basin states' funds. After almost a year of exploring every possible solution as to how the cost sharing was to occur, the states, in agreement with the Bureau of Reclamation, with state officials in Utah, Colorado and Wyoming and with NRCS State Conservationists in Utah, Colorado and Wyoming, agreed upon a parallel program wherein the states' cost sharing funds will be used. We are now in the third year of that program and, at this moment in time, this solution to how cost sharing can be implemented appears to be a good one.

With respect to the states' cost sharing funds, the Basin states felt that it was most essential that a portion of the program be associated with technical assistance and education activities in the field. Without this necessary support, there is no advanced planning, proposals are not well thought out, assertions in the proposals cannot be verified, implementation of contracts cannot be observed, and the most valuable partnering and education efforts cannot occur. Recognizing these values, the parallel state cost sharing program spends 40 percent of the funds available on these support activities. Initially, it was acknowledged that the federal portion of the salinity control program funded through EQIP was starved with respect to needed technical assistance and education support. The Forum is encouraged with the Administration's recent determination that 19 percent of the EQIP funds will be used for technical assistance. The Forum urges this Committee to appropriate adequate funds for these support activities rather than to direct NRCS to borrow these needed funds from the CCC.

PREPARED STATEMENT OF THE COLORADO RIVER BOARD OF CALIFORNIA

Your support and leadership are needed in securing adequate funding for the U.S. Department of Agriculture with respect to it's on-farm Colorado River Basin salinity control program for fiscal year 2000. This program has been carried out through the Colorado River Basin Salinity Control Act, which was initially enacted by Congress in 1974. With the enactment of the Federal Agricultural Improvement and Reform Act (FAIRA) in 1996, specific funding for salinity control projects in the Colorado River Basin were eliminated from the federal budget, and aggregated into the newly created Department of Agriculture Environmental Quality Incentive Program (EQIP) as one of its program components. With the enactment of the FAIRA, Congress concluded that the salinity control program could be more effectively implemented as one of the components of the EQIP. In the past, the Department of Agriculture had specific line item funding for salinity control projects as high as $14.7 million but in recent years it has advanced only $3.4 to $4.6 million which is inadequate to ensure that water quality standards in the Colorado River, with regards to salinity can be met. It has been estimated through previous federal studies that the Lower Basin States' (Arizona, California, and Nevada) Colorado River water users were suffering economic damages estimated to be in excess of $750 million per year in 1995 due to the salts in the River system. Most of that damage is occurring in California. The potential impact of failing to move forward with the plan of implementation for salinity control would be to permit these damages in the Lower Basin to reach an estimated $1.25 billion annually by the year 2015.

The Colorado River Board of California (Colorado River Board) is the state agency charged with protecting California's interests and rights in the water and power resources of the Colorado River System. In this capacity, California along with the other Basin States through the Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin States' salinity control efforts, established, in June 1975, numeric criteria for salinity concentrations in the River. These criteria were established to lessen the future damages in the Lower Basin States as well as assist the United States in delivering water of adequate quality to Mexico in accordance with Minute 242 of the International Boundary and Water Commission. The goal of the Colorado River Basin salinity control program is to offset the effects of water resource development in the Colorado River basin after 1972 rather than to reduce the salinity of the River below levels that were caused by natural variations in river flows or human activities prior to 1972. To maintain these levels, the salinity control program must remove 1.48 million tons of salt loading from the River by year 2015. To date, only 717,000 tons of salt load reduction have been achieved. In the Forum's last report entitled *1996 Review, Water Quality Standards for Salinity, Colorado River System* released in June 1996, the Forum found that additional salinity control measures were necessary to meet the implementation plan that had been adopted by the seven Colorado River Basin States and approved by the Environmental Protection Agency. Since implementation of the EQIP, federal allocations by the Department of Agriculture have not equaled the Forum's identified funding needs for the Depart-

ment of Agriculture's portion of the program. The Forum identified a "backlog" of salinity control measures which stands at 312,000 tons. This is in addition to future controls designed to lower the River's salt loading by 437,000 tons by 2015 in order to meet the established salinity standards. Very simply, there is a need for at least 47,000 tons of new salinity control measures to be implemented each year until 2015. The Forum has presented testimony to Congress recommending that the salinity control efforts through EQIP be accelerated to continue to meet the salinity standards through 2015.

The President's proposed budget for fiscal year 2000 contains funding of $300 million for implementation of EQIP, up $100 million from the $200 million Commodity Credit Corporation borrowing authority provided the Secretary of Agriculture by FAIRA. The Colorado River Board is pleased with the Administration's statement that it intends to expend $300 million in fiscal year 2000 through EQIP. Of the amount to be appropriated for EQIP, the Colorado River Basin Salinity Control Forum, at its meeting in Santa Fe, New Mexico, during October 1998, recommended a funding level of $12.0 million for on-farm salinity control in the Colorado River Basin for fiscal year 2000 to maintain water quality consistent with the established standards. These federal dollars if earmarked would be augmented by state cost sharing of 30 percent with an additional 30 percent provided by the agricultural producer with whom the Department of Agriculture contracts for salinity control. The Colorado River Board supports the recommendation of the Forum. The salinity control program has proven to be a very cost effective approach to help mitigate the impacts of higher salinity. Continued federal funding of the program is essential.

In addition, the Colorado River Board recognizes that the federal government has made significant commitments to the Republic of Mexico and to the seven Colorado River Basin States with regard to the delivery of adequate quality water to Mexico. In order for those commitments to be honored, it is essential that in fiscal year 2000 and in future fiscal years, the Congress provide funds to the Department of Agriculture to allow it to continue providing technical support in the Basin for salinity control.

The Colorado River is, and will continue to be, a major and vital water resource to the 17 million residents of southern California as well as throughout the Lower Colorado River Basin. As stated earlier, preservation of its quality through an effective salinity control program will avoid the additional economic damages to users of Colorado River water in California, Arizona, and Nevada.

The Colorado River Board greatly appreciates your support of the federal/state Colorado River Basin Salinity Control Program and again asks for your assistance and leadership in securing adequate funding for this program.

PREPARED STATEMENT OF THE USDA UVB RADIATION MONITORING PROGRAM, NATURAL RESOURCE ECOLOGY LABORATORY, COLORADO STATE UNIVERSITY

Discovery of the Antarctic ozone hole in 1985, accompanied by a large increase in surface UVB radiation has raised serious questions about the continued protection by the stratospheric ozone layer of the earth's living systems from the harmful effects of UVB radiation. In the northern hemisphere estimates based primarily on satellite and limited ground based measurements indicate that stratospheric ozone is decreasing at the rate of 3–5 percent per decade. While these decreases will result in increased solar ultraviolet radiation penetrating the stratosphere, it is not fully understood how this will affect the amount of UVB radiation reaching the earth's surface. If stratospheric ozone depletion does result in increased surface radiation, it is not clear what the consequences will be for the earth's plant and animal as well as human populations. To help in answering this question, the USDA is supporting a program to develop a national UVB radiation climatology, to determine future trends in UVB, and to conduct research to better understand factors effecting UVB radiation at the earth's surface. Measurements are required in agricultural and rural areas of the U.S. in order to provide a record of climatology and trends relevant to potential impacts on agricultural productivity. Also, agriculture cannot rely on the commitment of other agencies to make measurements which meet their needs nor to sustain a long-term monitoring program (for example, the closing of weather stations critical to agriculture). The network is thus an integral part of the overall effort of the USDA to meet its obligation to assure the future productivity of American agriculture. The unique requirements of agriculture have been recognized by the ultraviolet radiation measurements community and the USDA monitoring program is an integral component of United States Global Change Research Program (USGCRP) as outlined in the 1995 report (USGCRP–95–01) titled "The U.S. Interagency UV-Monitoring Network Plan".

The USDA UVB Radiation Monitoring program at Colorado State University (CSU) was initiated in 1992 with funding from the USDA CSREES Special Research Grants program. The network now consists of 27 sites across the U.S. including Hawaii. The network was scheduled to expand to a planned 30–40 sites. This is now delayed as a result of budget reductions. Each of these sites has a seven wavelength UV spectral instrument (interference filters with 2 nm bandpass at 300, 305, 311, 317, 325, 332, and 368 nm) equipped with a shadowband which permits the simultaneous measurement of the total horizontal, diffuse, and direct normal irradiance at each wavelength. Each site is also equipped with a similar instrument with wavelengths in the visible (415, 500, 610, 665, 862, and 940 nm) to provide ancillary information to aid in interpreting factors effecting UVB irradiance. In order to provide data for comparison with many who are using less expensive broadband instruments, each site is equipped with a broadband radiometer. Data from all of the instrumentation are stored on a data logger and downloaded over a phone line nightly and stored on a database file server.

The USDA requested that a UVB radiation monitoring program be designed to include the agricultural areas of the U.S., to provide information to support UVB effects research and to serve as an "early warning" system for agriculture. Subsequently, realizing that such a network could serve a broader role for the benefit of the American public, the objectives were expanded to include UVB radiation information to support human health studies and atmospheric science research related to causes of ozone depletion. Specifically the program objectives are to:

—Provide information to the agricultural community and others about the climatology, geographical distribution and long-term trends in UVB irradiance in order to relate changes in stratospheric ozone to UVB flux at the earths surface, to support research on UVB effects on agricultural crops as well as natural ecosystems, human health and materials.

—Provide data which will support research to increase our understanding of the factors controlling surface UVB irradiance—serve as ground truth for calculations of UVB irradiance based on radiative transfer model calculations and measurements from satellites—techniques which will aid in our ability to forecast future UVB radiation levels.

To meet these objectives, the USDA UVB Radiation Monitoring program at CSU has established a network to measure UVB radiation along with other ancillary measurements required to interpret variations in UVB levels. A research effort is necessary to understand the role of ozone and other absorbing gasses, as well as scattering by clouds and aerosols (turbidity) in controlling UVB radiation before it is possible to forecast the effect of stratospheric ozone changes on UVB levels at the earth's surface. This network is providing, for the first time, comparable measurements of surface UVB radiation (as well as visible) over the continental United States and Hawaii and will eventually include Alaska and Puerto Rico if budgets permit. Latitudinal differences as well as seasonality of UVB levels are now being documented in a standardized manner (See Attachment I). These data are now available within one day of collection to the scientific community, policy makers and others through a World-Wide-Web server or by contacting the monitoring program office. Those interested in only viewing the data will find daily plots of UVB radiation measured every three minutes. The USDA network is the only network in the U.S. providing this information. The USDA UVB Web site address is: http://uvb.nrel.colostate.edu/.

Realizing that historical measurements of UVB as well as many contemporary measurements both in the U.S. and internationally have suffered from inadequate instrumentation and lack of attention to data quality (primarily instrument calibration and documentation of procedures), the USDA program has made a major commitment to assuring high quality. In order to meet this goal, the program at CSU has a staff of nine including quality assurance specialists, fields technicians, computer programmers, and scientists to assure that the production of data is of the highest possible quality. This effort has resulted in 95 percent data capture from all sites which is not duplicated in any other long-term radiation monitoring program. In addition, the program has committed over 30 percent of its budget to instrument characterization and calibration and partial support for the development of a high resolution spectroradiometer. The USDA program initiated the development and has provided primary support for a national calibration facility operated by the National Oceanic and Atmospheric Administration (NOAA) in Boulder, CO, with oversight by the National Institute of Standards and Technology (NIST). It has provided for the development of a high-resolution spectroradiometer to serve as a reference instrument, six of which will be placed at research sites to validate the performance of the climatological network instruments, to provide the most reliable information to access trends, and to provide high resolution spectral data to serve

additional research needs. The first of the high resolution spectroradiometers has been installed at a NOAA/NIST research site north of Boulder Colorado. The specifications and quality of this spectroradiometer far exceeds that of any other instrument in the world. This phase of the program is under the direction of Dr. Lee Harrison at the Atmospheric Sciences Research Center, SUNY, Albany, NY.

In 1997, the USDA UVB Radiation Monitoring Program Web site was accessed by 5,130 users who remained on the site for one hour or more or who downloaded data. For example, U.S. government accounted for 276, higher education, 814, U.S. commercial, 974, and international, 1,105. It should also be noted that the ancillary measurements taken at each site to aid in interpretation of the UVB radiation levels are also of primary interest to other scientists—primarily NASA, DOE, and NOAA—interested in measuring turbidity (aerosols). Joint research programs have been developed with these agencies. The U.S. Weather Service (NOAA) is using the data to validate the forecasted UV Index and NASA to validate satellite measurements (see Attachment II). To assure data comparability with Canada, two sites have been collocated with the Canadian UVB monitoring network. This will permit the development of a North American data base. A research site at Mauna Loa Observatory, Hawaii permits additional comparisons and joint studies not only with Canadian but also with New Zealand programs. In addition, the USDA program maintains close cooperation with NOAA and the Environmental Protection Agency through instrument collocation.

ATTACHMENT I

CURRENT DATA USES

UV Radiation Measurements

1. Validate UV Index (US Weather Service)
2. Study of large smoke events (with NASA)
3. Validate TOMS satellite UV irradiances (NASA)
4. Urban pollution studies (California Air Resources Board)
5. Studies of plant canopy penetration (U. of Nebraska)
6. Establish background levels for effects Research (Utah State Univ., USDA/ARS at Beltsville, MD)

Visible Radiation Measurements

1. Aerosol optical depths (NASA and DOE)
2. Corrections for remote sensing of vegetation reflectance (USDA project by Boeing)
3. Studies of cloud transmission (NASA)
4. Study of large smoke events (with NASA)

ATTACHMENT II

ADVANTAGES OF GROUND-BASED MEASUREMENTS OF UV VERSUS SATELLITE RETRIEVALS

1. Ground-based (GB) UV radiometers actually measure UV irradiance at the earth's surface. Satellites like TOMS measure back-scattered UV and use a model to infer UV irradiances. The models need input on aerosol and cloud properties which are limited.

2. GB UV radiometers make measurements continuously whereas satellites make at most a few overpasses near local noon. Therefore, GB measurements of daily totals are much more accurate than satellite retrievals.

3. Satellite footprints are typically 50 x 50 km. A satellite is therefore unable to distinguish sub-pixel inhomogeneity due to spatial variations in cloud, aerosol, albedo. This often results in inaccurate satellite retrievals of GB UV.

PREPARED STATEMENT OF COLUMBIA UNIVERSITY

Mr. Chairman, and Members of the Subcommittee, thank you for the opportunity to submit a statement for inclusion in the hearing volume for outside witnesses. My statement concerns USDA fiscal year 2000 funding related to climate change. USDA's Budget Request includes $15,300,000 for research in support of Global Change Research. An existing institution, the International Research Institute For Climate Prediction (IRI), through a Cooperative Agreement with NOAA of the Department of Commerce, has conducted a great deal of the research in the USDA proposal. Moreover, the IRI has begun three interrelated projects in water, agriculture and health from which USDA could benefit in their proposed fiscal year 2000 pro-

gram. This statement provides a brief outline of IRI activities, and makes the case for IRI involvement in USDA's global change research program. Our joint effort will promote cooperation and collaboration and encourage the avoidance of duplication of effort.

Columbia University and the IRI support full funding of the fiscal year 2000 USDA initiative for Global Change Research. The proposal is based on sound scientific and public policy principles. With the results of the proposed plan of research, USDA will contribute to the body of knowledge on climate change and provide better tools for decision making.

THE INTERNATIONAL RESEARCH INSTITUTE FOR CLIMATE PREDICTION (IRI)

Columbia University's Lamont-Doherty Earth Observatory (LDEO), in conjunction with The Scripps Institution of Oceanography (SIO) of the University of California at San Diego, has entered into a Cooperative Agreement with NOAA to establish and manage the International Research Institute for Climate Prediction (IRI).

The IRI's mission is to provide experimental climate forecast guidance on seasonal-to-inter annual time scales for use by affected communities around the world. Working with an extensive network of domestic and international research and applications centers worldwide, the IRI will provide the necessary scientific institutional focus for a multi-national "end-to-end" prediction program. This "end-to-end" prediction program supports the development and production of forecasts of changing physical conditions (temperature and precipitation) on year-to-year time scales, assessments of the regional consequences of those variations, and the application of this information to support practical decision making in critical sectors such as agriculture, water resources, fisheries, emergency preparedness, and public heath and safety.

FISCAL YEAR 1999 ACTIVITIES

The fiscal year 1999 program level for the IRI (through Department of Commerce funding) is $6 million. Since the IRI was initially funded by NOAA, Columbia and Scripps have invested heavily in capital and research efforts. The ratio of private to public investment has been on the order of 3 to 1. The fiscal year 1999 Appropriations Act was the first year in which the Congress fully funded NOAA's request for the Office of Global Programs, through which the IRI receives Federal funding. The realization of the severity of impact that climate events can cause was demonstrated by the 100-year El Nino of 1997–1998. The back-to-back occurrence of this year's 50-year La Nina will further demonstrate our vulnerability to climate variability.

The IRI has conducted several studies over the past five years through contract with prominent agricultural economists for impact assessments and analyses of climate change on US agriculture. The economists who conducted the studies previously occupied senior level positions in USDA as policy and program officials. They possess credentials as highly respected academics as well as public policy practitioners.

The IRI has expertise and experience in the areas of proposed research that USDA has outlined in the fiscal year 2000 Budget Request. The IRI offers to collaborate with the USDA effort, and assist USDA officials in launching the projects where IRI expertise would be helpful.

The IRI has incorporated the findings and results of these studies into a program of work that will move the use of science to a new stage. The focus of the IRI applications will be in the interrelated areas of water, agriculture, and health. A discussion of this integrated effort follows.

PROJECT PARTICIPATION

In 1999, the IRI will progress to a new phase of research. The research from this growth will focus on the integrated modeling of water, agriculture, and public health. Because the IRI modeling deals primarily with temperature and moisture, the link of water modeling with agriculture and health modeling can be accomplished by building on the same database and utilizing similar approaches.

The most complex modeling relates to water modeling. It is the basis and foundation, however, of the agriculture modeling, and must be developed prior to agriculture modeling. Once the water modeling has been developed, and trial forecasts have validated the model, the agriculture modeling component can be built as a component to the water model.

This ambitious multifaceted modeling project will provide a unique contribution to climate change studies world-wide. Because the IRI specializes in end-to-end inter annual to seasonal forecasts, the water and agriculture models that will be developed will be resource for regional and country forecast efforts. As USDA begins to

develop the agriculture assessment and impact analysis, the IRI could become a valuable tool toward more conclusive research.

WORLD SUPPLY AND DEMAND ESTIMATES

For operational purposes, and USDA's statutory responsibilities for providing world supply and demand estimates, USDA could make good use of the IRI's improved modeling on moisture and temperature. The longer lead time on climate variability, with a higher degree of accuracy, could provide governments and private decision makers improved knowledge on probable growing conditions. With this improved source of information, more accurate forecasting could result in reduced famine, timely shipments for international trade, and more stable world commodity markets. The improved IRI modeling will permit rationale agricultural decisions based on information and more certain probabilities, rather than speculation based on guesses.

FUNDING REQUEST

The IRI effort cannot proceed without some infusion of Federal funds. For this reason, and for the programmatic relevance to USDA's efforts outlined above, The IRI respectfully requests $300,000 in support from USDA for fiscal year 2000.

CONCLUSION

Mr. Chairman, the IRI could provide a great deal of expertise and assistance to USDA if involved in the USDA Climate Program initiatives in fiscal year 2000. The IRI has the unique responsibilities in climate change forecasting necessary to conduct USDA's million. The new initiatives in water and agriculture modeling will be of great use to USDA in fully completing the agriculture assessment in fiscal year 2000 and beyond. If the IRI were to be a part of the USDA effort, it is estimated that the costs associated with participation would total $300,000 in fiscal year 2000.

Thank you for the opportunity to present this statement for the Committee's consideration in funding decisions you will make for the fiscal year 2000 Agriculture Appropriations Act.

PREPARED STATEMENT OF THE COUNCIL ON FOOD, AGRICULTURAL AND RESOURCE ECONOMICS (CFARE) AND THE CONSORTIUM OF SOCIAL SCIENCE ASSOCIATIONS (COSSA)

Mr. Chairman and members of the subcommittee, it is a pleasure to submit this testimony to you on behalf of the Council on Food, Agricultural and Resources Economics (C–FARE) and the Consortium of Social Science Associations (COSSA). C–FARE is a non-profit association actively working to represent the agricultural economics profession in matters of science policy, priority setting, and budget determination at the federal level, and to collaborate with other agricultural science groups and government agencies in these activities. COSSA is an advocacy organization supported by over 100 professional associations, scientific societies, universities and research institutes, that promotes attention to and federal funding for the social and behavioral sciences.

Our recommendations are summarized below:

1. Promote and support accountability for USDA programs by providing funding for an innovative study on performance measurement guidelines for agricultural research, extension and education programs. Such a study was authorized in Title VI, Subtitle C—Studies, Section 631 of the Agriculture Research, Extension and Education Reform Act of 1998, and would cost less than $500,000.

2. Increase social science funding within the National Research Initiative Competitive Grants Program (NRI). Double funding for the Markets, Trade and Rural Development Division to $9.2 million. And, increase the Natural Resources and the Environment Division to $32 million to generate new knowledge about the economic and social consequences of environmental regulation. We support increasing funding for the NRI to a total of $200 million.

3. Further expand competitive research grants programs at USDA by either: (1) allowing $120 million in funding for The Initiative for Future Agriculture and Food Systems, or (2) expanding the NRI to $320 million by targeting $120 million towards integrated critical and emerging issues on topics related to biotechnology, genomics, food safety, natural resources and the environment, farm efficiency and profitability, and precision agriculture.

4. Increase support for USDA agencies that promote the development and use of economic and social science tools to guide decision making.

—Increase the Economic Research Service budget for research and analysis to $60 million, plus $14 million to evaluate the food and nutrition programs.
—Increase the National Agricultural Statistical Service budget to $86 million for agriculture estimates and research, and $17 million for periodic Census of Agriculture.
—Increase the Natural Resources Conservation Service (NRCS) Budget to $1,415 million to maintain existing programs, and enhance economic and social science analysis.

5. Increase funding for the Cooperative State Research, Education and Extension Service base research and extension programs by $40 million (includes Hatch Act, McIntire-Stennis, Evans-Allen, Animal Health, Smith-Lever Formula 3 (b) and (c), 1890 Colleges and Tuskegee).

Recommendation One: Promote and support accountability for USDA programs by providing funding for an innovative study on performance measurement guidelines of the agricultural research, extension and education programs. Such a study was authorized in Title VI, Subtitle C—Studies, Section 631 of the Agriculture Research, Extension and Education Reform Act of 1998.

Research accountability, assessment, evaluation, and impact analysis are receiving considerable attention in light of pressures on public budgets, a need to link benefits with costs, and the search for better strategic planning of research and education. Despite the Government Performance and Results Act of 1993 and ongoing USDA responses, no clear consensus exists about the most effective approaches to evaluate agricultural research, extension and education programs supported by USDA or within the land grant system.

A special study is needed to produce a consensus-based set of guidelines to evaluate the performance of agricultural research, extension and education programs. These guidelines should cover the spectrum from broad programs to specific projects and activities, basic to applied work, and across the social, biological and physical sciences. The guidelines should also address research evaluation on both ex-ante and ex-post bases, as well as progress toward goal attainment during the research process. The study team should draw from recognized university experts and USDA representatives implementing GPRA.

Recommendation Two: Increase social science funding within the National Research Initiative Competitive Grants Program (NRI). Double funding for the Markets, Trade and Rural Development Division to $9.2 million. And, increase the Natural Resources and the Environment Division to $32 million to generate new knowledge about the economic and social consequences of environmental regulation. We support increasing funding for the NRI to a total of $200 million.

We urge you to double the amount of spending in the Markets, Trade and Rural Development Division of the National Research Initiative from $4.6 million to $9.2 million. The economic and social research funded in this division develops new knowledge and enhances our understanding of the economic and social forces on our agriculture and food system. The research is of high quality and value.

HIGHLIGHTS OF NRI-FUNDED RESEARCH

International Trade Liberalization and Global Competitiveness

Research on international trade liberalization and global competitiveness has greatly improved our understanding of the demand for US products and how to access it. There is an improved understanding of the costs and benefits of increased trade, and of different kinds of trade restrictions imposed by the U.S. and other countries. Innovative policies have been studied to estimate how to stimulate demand for U.S. agricultural exports and, consequently, improve farm income. We also have an improved understanding of currency volatilities and other pitfalls of globalization and expanded trade.

Risk Management Policies and Programs

NRI-funded economics research has made substantial and important progress in analyzing existing and new insurance programs that may help producers protect themselves against crop and revenue losses. Innovative credit programs have been developed, and incentives for supply management programs have been analyzed.

Understanding the Implications of an Industrializing Agricultural Sector

Through NRI-funded economics and social science research we have a better understanding of the economic drivers of increasing consolidation of production units, and greater coordination and concentration among stages of the food system. Social science research is helping producers and others understand how to survive and take advantage of change, whether through contracts, alliances, cooperative arrangements or other innovative business forms. Agriculture's relationships with the

environment, communities and independent farmers have changed with the structure of agriculture. To understand these changes, we need more economics and social science research.

We support an increase in funding for the Natural Resources and the Environment (NRE) Division of the NRI to $32 million with the following caveat: the increased funds will be used to generate new knowledge about the economic and social consequences of environmental regulation. This recommendation is consistent with the number one research priority generated by a national priority-setting activity conducted by scientists involved in and stakeholders of our food and agriculture system.

In its current form, the NRE Division of the NRI supports virtually no social science research. In 1996 (the most recent year complete data are available), only one project of 96 had any social science involvement. In addition, only 7 percent of the projects funded involved interdisciplinary teams usually defined as teams of applied biologists, microbiologists and molecular biologists. This narrow definition limits our ability to solve important economically- and socially driven problems in the agriculture and food system.

Recommendation Three: Expand competitive research grants programs at USDA by either: (1) allowing $120 million in funding for The Initiative for Future Agriculture and Food Systems, or (2) expanding the NRI to $320 million by targeting $120 million towards critical and emerging issues on topics related to biotechnology, genomics, food safety, natural resources and the environment, farm efficiency and profitability, and precision agriculture.

Increased spending on agricultural research is the cornerstone of a productive and profitable agricultural sector. Current estimates of the rate of return on public spending on agricultural research, education and extension are extremely high (40–60 percent per year or higher). A recent report by the Economic Research Service finds that 75 percent of the productivity gains in agriculture can be traced to public spending on agricultural research.

Economic and social science research is needed in the following priority areas.

Develop New Knowledge About Economic and Social Consequences of Environmental Regulation.—Economics and social science research programs are needed to: (1) enhance existing and develop new methods to assess the benefits and costs of government regulation, (2) develop, design and evaluate integrated policies and institutions to mitigate negative environmental impacts of production agriculture, and (3) expand scientific knowledge about quantitative and qualitative assessment tools that can be applied to non-market goods.

Enhance Knowledge and Improve Understanding of the Economic and Social Impacts of Biotechnology and Genomics.—Economists and social scientists can develop integrated models to analyze how biotechnology affects farm size, production efficiency, competitiveness, trade potential, and other elements of economic performance in agriculture. Economics can be used to understand how the consolidation among agricultural chemical, seed and biotechnology companies will affect producers, consumers and environmental quality. Economic and social science research methods can promote understanding of how changes in the industry will affect the types of technologies produced and who benefits from these products.

There are at least three important contributions economists and social scientists can make to a national genomics research program. First, economic methods can be developed to help select target species for gene sequencing. Second, economic models can be developed to answer questions about the trade-offs consumers are willing to make between food characteristics such as taste, nutritional value, and shelf life. Third, the social sciences can examine and develop new knowledge about the potential social, economic and ethical consequences of various types of genomics research.

Expand the Science and Application of Economics to Improve Food Safety.—Economics can improve our understanding of the benefits and costs of options to reduce food borne illness from pathogens, and pesticide residues in fresh and processed foods. Agricultural economists can generate new knowledge about how changes in consumer demand affect food safety, health and nutrition. Economic models could then be developed to evaluate the effectiveness of public and private efforts to promote safer food production, transportation, handling and preparation.

Improve Farm Income and Risk Management Tools: Farm Efficiency and Profitability.—Agricultural economics research can improve the efficiency of farm income and risk management tools. Economics can enhance our understanding of how to measure and manage risk in a new, globalized, vertically coordinated food system for an expanded clientele base. Economics can be used to develop new knowledge about risk management strategies, instruments, and portfolios and adapt them to meet current challenges with in the agriculture sector. Finally, economics can im-

prove producers' ability to manage complex financial accounting and reporting systems.

Examine the Impacts of the Changing Farm and Agribusiness Structure.—The impacts of the changing farm and agribusiness structure are profound. Economic and social science research can improve our understanding of the forces driving structural change and concentration, and the impacts of this change on the economic performance of vertically coordinated farming and agribusiness. Economic and social science models of vertically coordinated systems can answer important questions about market access, bargaining power, concentration, location of production, financial arrangements, rural communities and the environment.

Recommendation Four: Increase support for USDA agencies that promote the development and use of economic and social science tools to guide decision making.

Increase the Economic Research Service (ERS) budget for economic analysis and research to $60 million, plus $14 million to evaluate the food and nutrition programs. ERS is the principal intramural social science research agency for USDA. ERS provides timely short and long run economic and social science information and analyses to public and private sector decision makers including farmers. The trend towards a more market-driven agricultural sector heightens the needs for increased spending on economic and social science analysis and research. Sixty million dollars for economic analysis and research is needed to maintain innovate, on-going programs and to support a number of critical initiatives such as carbon sequestration research, global climate change, enhanced commodity market analysis, and addressing the information needs of small and limited resource farmers.

We ask that you continue giving ERS the responsibility and funding for Food Assistance Program Evaluation. We believe that program evaluation and analysis will be most effective when it is conducted and managed by an agency separate from the one implementing the program itself. An increase to $14 million in funding for fiscal year 2000 will greatly improve basic knowledge and understanding of the forces affecting poverty, the impacts of welfare reform, the long-term effects of assistance programs, and waste, fraud and abuse in the food stamp program.

Increase the National Agricultural and Statistical Service (NASS) Budget to $86 million for agriculture estimates and research, and $17 million for the periodic census of agriculture. NASS provides the official USDA production, economic, and environmental forecasts and estimates on agriculture and rural America. NASS' objective and accurate statistical information is highly valued by stakeholders of the agricultural research and education. A funding increase is needed to maintain and enhance existing programs, and to support new initiatives such as the Agricultural Economics and Land Ownership Survey, the establishment of a field office in Puerto Rico, and an expansion of the pesticide use survey to include commercial nursery and greenhouse operations.

Increase the Natural Resources Conservation Service (NRCS) Budget to $1.415 billion to maintain existing programs, and enhance economic and social science analysis. NRCS provides national leadership in partnerships to help people conserve, improve, and sustain the Nation's natural resources and environment. NRCS technical experts help land managers and communities take a comprehensive approach in planning the use and protection of soil, water, and related resources on private and non-Federal lands, in rural, suburban, urban, and developing areas. A funding increase is needed to enhance Conservation Technical Assistance programs to meet increased demand for conservation services. This would include economic analysis of resource problems associated with conservation assistance for animal feeding operations, non-point source pollution, misapplication of fertilizers and pesticides, and land use changes. Increased funding is also needed for economic and social science analysis of thousands of important watershed dams that will reach the end of their design life this decade.

Recommendation Five: Increase funding for Cooperative State Research, Education and Extension Service base research and extension programs by $40 million (includes Hatch Act, McIntire-Stennis, Evans-Allen, Animal Health, Smith-Lever Formula 3 (b) and (c), 1890 Colleges and Tuskegee).

An increase in base research and extension programs is needed to maintain and enhance mission-linked multi-disciplinary, multi-function projects and programs in a number of critical and emerging areas. For example, integrated research, extension and education programs are needed to address problems and challenges related to the changing structure of American agriculture, agricultural genome and germplasm preservation, expanded food nutrition and education programs, agricultural waste management, water quality, carbon sequestration, and children, youth and families at risk.

Base programs are an important and productive component of the federal research, education and extension system. Combined with other federal funding mech-

anisms such as competitive and special grants, base programs have provided state experiment stations and extension systems with an effective balance of resource stability, flexibility in planning, regional collaboration, and a linkage between national and local priority setting.

Thank you for the opportunity to present these views. Please contact us with any questions. Tracy Irwin Hewitt, Executive Director, C–FARE, 703–524–2145; Peter Barry, Chair, C–FARE, 217–333–1827; Howard Silver, Executive Director, COSSA, 202–842–3525.

PREPARED STATEMENT OF THE COSMETIC, TOILETRY, AND FRAGRANCE ASSOCIATION

The Cosmetic, Toiletry, and Fragrance Association (CTFA)[1] respectfully urges you to grant the Food and Drug Administration's fiscal year 2000 budget request for $5.2 million for the Office of Cosmetics and Colors in the Center for Food Safety and Applied Nutrition (CFSAN). This level of funding is comparable to that provided by the Congress for fiscal year 1999 and includes a restoration approved by Congress last year of $2.5 million that the administration had proposed in cuts for the Office. We believe that it will enable the agency to maintain in CFSAN the kind of credible cosmetic regulatory program needed to ensure confidence in the safety of cosmetic products.

CTFA members provide consumers with a wide variety of safe cosmetic products, such as makeup preparations, shampoos, deodorants, toothpastes, mouthwashes, perfumes, shaving creams, and skin lotions. These products promote personal hygiene. They help people look and feel their best, thereby increasing self assurance and self esteem. Virtually every man, woman, and child in this country uses cosmetics routinely. Because of FDA's effectiveness and the voluntary safety programs undertaken by the cosmetic industry—often with the agency's cooperation and participation—they do so safely and with confidence. Failure to fund the agency's Office of Cosmetics and Colors adequately would undercut a vital component of a safety system that serves consumers well.

Moreover, the economic well-being of the $25 billion cosmetic and personal care product industry depends on a strong FDA regulatory program. Our industry relies on the FDA compliance function. Without compliance, unscrupulous competitors can not only defraud the public, but undermine legitimate industry as well. The cosmetic industry needs a level playing field. We need to know what regulatory requirements apply. We want to be certain that the FDA law and regulations will be enforced consistently against all marketed products, whether imported or produced domestically.

A strong FDA Office of Cosmetics and Colors exerts national leadership, maintains appropriate standards to assure the safety and proper labeling of cosmetics throughout the nation, and ensures that Americans can enjoy a nationwide marketing system with adequate public protection and uniform enforcement in every part of the country. If the FDA's cosmetic program were diminished, the states might be encouraged to ignore the agency and establish their own, potentially conflicting, regulatory requirements for cosmetics. Such a patchwork of state mandates could only confuse consumers and wreak havoc on our industry's ability to operate in interstate commerce.

The FDA is currently recognized as the preeminent international body in the field of cosmetic regulation. A visible and vigorous Office of Cosmetics and Colors is necessary to maintain this international leadership and to move even more quickly toward the goal of international harmonization, which the Congress established as an FDA priority for cosmetics and other regulated products under Section 410 of the FDA Modernization Act of 1997.

We are not asking for increased funding or new programs. We are merely seeking the continuation of a level of stable funding for the Office of Cosmetics and Colors that will help ensure the maintenance of an effective FDA regulatory program for cosmetics. We strongly support the FDA's fiscal year 2000 budget request for $5.2 million for the Office of Cosmetics and Colors. Thank you for considering our views.

---

[1] CTFA is the national trade association representing the cosmetic and personal care product industry. Founded in 1894, CTFA has an active membership of more than 285 companies, which manufacture or distribute the vast majority of the finished cosmetic and personal care products marketed in the United States. The Association also has approximately 300 associate members, which provide services, equipment, or supplies, such as raw materials and packaging components, to our active members.

PREPARED STATEMENT OF THE COUNCIL FOR AGRICULTURAL RESEARCH, EXTENSION, AND TEACHING

Thank you, Mr. Chairman. I appreciate the opportunity to again provide testimony this year in support of the Land-Grant system.

My name is Sam Minor, Chairman of the Council for Agricultural Research, Extension, and Teaching, commonly called CARET. CARET is a national focal group of lay support persons working on behalf of the land-grant university system. The CARET group was formed a number of years ago for the expressed purpose of enhancing national support and understanding of the important role played by the land-grant colleges in the food and agriculture systems, as well as the role of this system in enhancing the quality of life for all citizens of the nation.

As I have emphasized in each of the last two years in which I have given testimony to the Congress, I take part in this activity with a great amount of pride and commitment. Our family and I know first hand of the important role played by our land-grant institutions.

I do not want to again take your time this year in discussing all of the contributions that the land-grant system has made to us as a family or to our farming and farm retail business. I would, however, want to emphasize that this contribution has been very significant. The same can be said about the contribution of our land-grant universities to hundreds of thousands of farm families across this country.

The land-grant system is a very unique system of research, education, and extension. It is a system that has brought together a partnership of federal, state, local (or county), and now private resources to contribute so significantly to building an agricultural industry that is truly the envy of the world. This system, this agricultural industry, at the national level continues to have a tremendous impact on our economy, our balance of trade, our workforce, and the health and quality of life of our society. Yet, in many ways, it is an industry that is taken for granted.

Too little do we hear or talk about the significance of the research and education that has provided the scientific basis to allow 1.8 million U.S. farms, such as ours in southwestern Pennsylvania, to produce a record in excess of $200 billion of food and fiber. Too little do we recognize the records that have been set in export agricultural sales that have contributed so significantly to a positive balance of agricultural trade. To infrequently do we acknowledge that this food and agriculture industry provides almost 20 percent, one out of every five, of the jobs in this country and accounts for 16 percent of our gross national product. Yet, the consuming public spends less of their disposal income, just over 10 percent, for their food needs than any other country in the entire world. I do recognize that these are familiar numbers. They do, however, continue to be significant today.

Now, as we have entered a new era in agriculture and the role that government plays in this industry, we believe that the need for an agriculture that is based on research and science is greater than ever before.

We are, for many reasons, in a very rapidly changing agriculture. Some call it an industrialization of agriculture. We are seeing a consolidation of our agriculture enterprises. This is occurring at the farm level and in our processing and distribution systems. This change, this consolidation, this industrialization, is today having a tremendous impact on farm families, farm businesses, and rural communities across this country. The significance of this impact will be even greater in the weeks and months ahead.

The impact of these changes has been even further accentuated as we are experiencing the affects of lessened government participation in the pricing mechanism. And this is all occurring at a time when we are experiencing considerable destabilization of the financial markets in many parts of the world. Some are now beginning to talk about the reoccurrence of a "farm crisis." It is apparent that consideration at the federal level is being given to ways to assist during this transition period.

As we go through this transition period we are seeing a rapid implementation of new emerging technologies. Information of all kinds that enhances the ability to make more rapid and more correct decisions is increasingly available. New plant and animal species, varieties, and characteristics are emerging from the rapid advancement of the biotechnological sciences. These changes and advancements have come about, to a very great extent, because of the past investment in agriculture research and education, much of it from public sources.

As we consider this transition in the framework of new work that is now being done and the new scientific advancements that are just on the threshold of disclosure, one has to think that our opportunities are greater today than at any time in the past. It will, however, take dollars to bring these opportunities to fruition. It will be a continuation and expansion of the federal, state, local, and private part-

nership that can best provide these dollars critically needed for this work. Your decisions in the coming months to increase the federal outlay for agricultural research can provide some much needed leadership for this effort. The federal funds are the heart of this partnership.

Specifically, the federally-supported programs in cooperation with our state land-grant colleges and universities are crucial for us to retain and expand the U.S. competitive edge in the world-wide marketplace. Additionally, these research and extension programs that result from this federal, state, local, and private partnership are very crucial at this time to assure strength and stability at the family farm level and to assure continuity in our rural communities.

This testimony is principally to request support for the fiscal year 2000 budget recommendations of the National Association of State Universities and Land-Grant Colleges' (NASULGC) Board on Agriculture of $1.098 million, an increase of $174.2 million. This increased amount is consistent with the amount of increase proposed in the President's proposed budget for the fiscal year 2000 for the Cooperative State Research, Education, and Extension Service, U.S. Department of Agriculture (CSREES, USDA). We strongly endorse this critically needed added investment.

While we do endorse the President's proposed increase, we are recommending a different mix of funding mechanisms that we feel will best address the critical issues that need to be addressed in fiscal year 2000. We do recognize that at this stage there is not complete agreement between the Administration, the Congress, and all interested stakeholders on how this increased funding should be best structured. Most important, however, is that there is an immediate, urgent need for this additional "critical issue"-oriented research, extension, and education funding.

In saying this, we do realize that the Congress is facing a tight fiscal year and that the House and Senate Agricultural Appropriations Subcommittees will address a number of complex and challenging issues facing farmers, ranchers, and rural communities. However, there is no doubt, from our experience, that these targeted investments proposed for the land-grant system is one of the very best ways to address these challenging problems in the long run.

After a great amount of interaction with the land-grant system and a broad number of stakeholders from the agriculture community the NASULGC Board on Agriculture Budget Committee has some 22 critical issues that have been identified for special emphasis in this fiscal year 2000 budget request. These issues have been organized within the five goals developed by the Department of Agriculture as part of their process for responding to the Government Performance and Results Act (GPRA). These proposed activities are organized within the five categories to facilitate future reporting on accomplishments. This is a key component to assure the Congress that these funds are being utilized effectively to solve today's most critical problems and to best prepare for tomorrow's greatest opportunities.

To re-emphasize, NASULGC and CARET support the President's bottom line of 2.6 percent increased funds for research, education, and extension funding. NASULGC does, however, recommend that from this increase an additional $40 million go to an increase in base or formula funds. Base program funding is unmatched as a vehicle to foster multi-year programs essential to the science of agriculture. These base funds allow the colleges and universities to invest in long-term research activities where continuity is critical for success. These funds also support the infrastructure and faculty that are necessary for successful completion of the research and extension activities. Additionally, these base funds are essential for leveraging external resources.

An additional increase of $120 million is also proposed for competitive grants. This is very consistent with the President's proposed increase in the National Research Initiative. It is also consistent with the establishment of the Fund of Rural America two years ago and is especially consistent with the new initiative that was authorized as a part of the Research and Science (Title VIII) of the Farm Bill last year. We do know there may be different thoughts on how to work through the grant or funding mechanisms for this expanded new competitive funding approach. The Land-Grant University community stands ready to work with the Congress to find ways to resolve current questions and to effectively utilize the available mix of competitive grants programs. Most importantly, there is an immediate and urgent need for new, integrated problem-solving competitive grants to address real-world problems.

An additional increase of $14.2 million is also proposed as a mix of targeted mechanisms that would provide an opportunity to address immediate areas of critical concern.

The Council on Agricultural Research, Extension, and Teaching is very pleased to support this request for an additional funding of $174.2 million on behalf of the land-grant university system. This land-grant partnership working in close coopera-

tion with the USDA Cooperative State Research, Education, and Extension Service is a very important and very strong relationship. This is a partnership that undergirds the research and science of a successful agriculture in the United States, a partnership and an industry that is the envy of the entire world.

This is a partnership that our CARET organization believes should be financially supported to the fullest possible extent at both the federal and at the state levels. We ask that you give this request your fullest possible consideration this year.

As an individual farmer and a member of the agriculture community, I am proud of what the federal, state, and local partnership has provided to us. At the same time, agricultural research and education must be an important part of our long-term agricultural policy. We must continue to strengthen our financial commitment to assure that these basic programs of the land-grant system will be prepared to meet the emerging needs of the food and fiber sector.

We in agriculture and the country as a whole want to enhance our production, processing, and marketing capabilities. We also want to be prepared to take full advantage of the further opening of global markets. We in agriculture also want to understand and to effectively apply risk management programs to gain the greatest returns from our commodities. And we want to be prepared to fully adopt and utilize new scientific breakthroughs in the production, processing, and marketing of these products. It is also our goal that all of this be done in a way that effectively preserves the environment while continuing to provide the most nutritious and safe food supply in this country and those markets served worldwide. These all provide unprecedented opportunity to continue to put science and education to work for mankind.

Thank you for this opportunity to provide this testimony in support of the appropriations for our land-grant system.

PREPARED STATEMENT OF THE COUNCIL FOR RESPONSIBLE NUTRITION

Mr. Chairman, the Council for Responsible Nutrition (CRN) appreciates the opportunity to testify as the Committee reviews the fiscal year 2000 Appropriations for the Food and Drug Administration (FDA). CRN represents 100 companies that manufacture dietary supplements, including vitamins, minerals, herbs, and botanical products. These products account for a large share of the $15 billion in sales anticipated for this industry in 1999—products which are used by more than half of our nation's population.

CRN and its members are committed to improving the public's health through improved nutrition, including the appropriate use of dietary supplements. Like FDA, we are committed to science-based products and decisions. We also recognize that even the most responsible industry needs fair and appropriate regulations in order to ensure consumer protection as well as to encourage good business practices and facilitate fair trade. The Food and Drug Administration critically needs adequate resources to perform these functions.

The Dietary Supplement Health and Education Act of 1994 (DSHEA) was passed because FDA had, for several decades, pursued a regulatory agenda that was not appropriate for dietary supplements. DSHEA established a new regulatory framework which is working well, but which could work even more effectively if FDA had the resources needed to fully implement the intent of Congress. CRN urges Congress to appropriate adequate resources to support FDA action in the following areas relating to dietary supplements. Urgent needs include:

—Establishing a Dietary Supplement Advisory Committee.
—Timely review of 75-day notices for new dietary supplement ingredients.
—Promulgating Good Manufacturing Practice Regulations appropriate to dietary supplements.
—Improving the adverse reporting system.
—Strengthening FDA's capabilities in international regulatory activities.
—Withdrawing the proposed structure/function rule.

Allow me to elaborate on these urgent requirements.

ESTABLISH A DIETARY SUPPLEMENT ADVISORY COMMITTEE

FDA must deal with a wide variety of critical issues affecting dietary supplements. In the past several years, three out of six meetings of the existing Food Advisory Committee have been devoted to consideration of dietary supplement issues. Unfortunately, the Food Advisory Committee does not have the appropriate expertise to deal with dietary supplements, and FDA has found it necessary to convene other experts to participate in evaluating dietary supplement issues, including the safety of ephedra, necessary provisions of Good Manufacturing Practices, improving

postmarket surveillance, and evaluating consumer understanding of dietary supplement labels.

CRN believes FDA urgently needs a Dietary Supplement Advisory Committee, comprised of individuals with a wide range of backgrounds, possessing expertise in dietary supplement products and knowledgeable about the scientific evidence relating to dietary supplement ingredients. Funding to establish, staff, and support this critical advisory committee is essential, and should be included in the fiscal year 2000 appropriations for FDA.

REVIEW OF NOTICES FOR NEW DIETARY INGREDIENTS

DSHEA places a great deal of responsibility on the industry to ensure that only safe ingredients are marketed in dietary supplements. Ingredients that were marketed in dietary supplements before October 15, 1994, are "grandfathered" and may continue to be marketed. However, even grandfathered ingredients may be considered adulterated if they are injurious to health or if they are not reasonably expected to be safe under the intended conditions of use.

DSHEA requires any marketer of a new dietary ingredient (one first marketed on or after October 15, 1994) to submit a notification to FDA at least 75 days prior to marketing. The notification is to include a statement of the manufacturer's basis for concluding that the ingredient is reasonably expected to be safe. FDA reviews the notifications, and the file is placed on public display approximately 90 days following its receipt.

For example, a new dietary ingredient notification was recently filed for gamma butyrolactone (GBL), a precursor to gamma hydroxybutyrate (GHB), a substance with activity similar to the so-called "date rape" drug. Based on the information submitted and based on other information available in the scientific literature, CRN believes FDA was right to object to the marketing of GBL, and CRN supported the agency's recent action in requesting a recall. The companies contacted by FDA have apparently complied with the request for a recall, but we note that there are still numerous Internet sites promoting and selling both GBL and GHB.

Further actions need to be taken against such marketing, and it is essential that FDA have adequate resources to review new ingredient notifications and to respond promptly and effectively to curtail the marketing of adulterated (unsafe) dietary supplement ingredients.

GOOD MANUFACTURING PRACTICES

DSHEA authorized FDA to establish Good Manufacturing Practice (GMP) regulations for dietary supplements, modeled after GMP regulations for foods. CRN took the lead immediately following DSHEA in drafting appropriate GMPs for dietary supplements, based on CRN's existing GMPs. CRN invited other associations to join in this effort, and several industry groups jointly submitted a GMP draft to FDA in November 1995. These GMPs incorporate virtually all provisions of the existing food GMPs and would also require every manufacturer to have a strong quality control unit with authority to accept or reject bulk ingredients and finished products that fail to meet appropriate standards.

Fifteen months later, in February 1997, FDA published the industry draft as an Advance Notice of Proposed Rulemaking and numerous comments were received. One year after that date, in February 1998, FDA asked its Food Advisory Committee for recommendations regarding certain provisions that would be covered by GMPs, including appropriate tests for product identity. At that Committee meeting, CRN urged FDA to establish a working group including industry members with the necessary expertise to consider these issues, and the agency did so. That working group has recently submitted its report.

Mr. Chairman, FDA must have sufficient resources to move this process along at a faster pace, so that new dietary supplement GMPs can be in place as soon as possible. These GMPs will provide vital consumer protection by requiring manufacturers to have adequate procedures in place to ensure product quality, as envisioned by DSHEA. While many responsible manufacturers already have such procedures in place, it is essential to ensure a standard for the industry as a whole.

ADVERSE EVENT REPORTING

The Office of Special Nutritionals at FDA established an Adverse Event Reporting System (AERS) five years ago to compile adverse event reports related to medical foods, infant formula, and dietary supplements. At this time, there are 2,621 adverse reports in the system. Many are minor complaints, but some are serious, and there are some reported deaths.

During 1998, the reports were put on the FDA website. Unfortunately, a company can find itself in the position of having its company name and brand associated with a serious adverse event posted on the Web without having any prior warning that such an event has occurred. Further, the background information on the case is unlikely to be available under FOIA, because FDA does not have adequate staff to purge personal case information not releasable under FOIA. In addition, FDA does not have adequate staff or other resources to properly evaluate the adverse event reports, and the reports are released with no comment regarding the likelihood of any actual causal relationship between the product named and the event which occurred. This puts every company at risk of being held "guilty until proven innocent," without investigation. The industry is at risk of being charged with causing a large number of adverse events, many of which may be minor complaints and many of which may not in fact be due to dietary supplement use.

It is essential that some scientific evaluation be applied to the adverse event reports dealing with dietary supplements, in order to identify those areas where a genuine safety issue exists, so that FDA and industry can take appropriate action. Criteria have already been established for determining the likelihood of a causal relationship between a product and an adverse event, and FDA applies such evaluations in some other product areas.

For example, FDA received about 3,000 adverse event reports in 1997 regarding veterinary drugs. Scientific evaluation revealed that only 1 percent of the veterinary adverse events were definitely associated with product use; 31 percent were probably associated, 45 percent were possibly associated, and 12 percent were definitely not related to the product. In 11 percent of the cases, there was inadequate information to evaluate likely causality. A similar analysis of the adverse event reports on special nutritionals would be valuable in better understanding the likelihood of a causal relationship between the dietary supplements used and the adverse events reported. Criteria used in evaluating likely causality include whether the effects are consistent with the known pharmacology of the product, whether there are other explanations for the event, whether the timing of the event suggests a relationship to use of the product, and whether the effects went away when use of the product was stopped or reappeared if the product was given again.

It is essential for FDA to have sufficient resources to update the special nutritionals adverse event reporting system on a regular basis and to be able to screen and release background information on the case reports before they are made publicly available. Finally, FDA must have the capacity to evaluate the likely association between the events that occurred and the products that were used.

FULFILLING INTERNATIONAL OBLIGATIONS

FDA currently participates in many international policy-setting activities, and sometimes leads the U.S. delegation on specific issues. These international efforts, including those relating to the Codex Alimentarius, can have a significant impact on world trade, including trade involving dietary supplements. CRN is an officially designated Non-Government Organization (NGO) at these international meetings and has worked with FDA, USDA, USTR, the Department of Commerce, and the State Department in developing consensus regarding the U.S. position on various issues. To augment current efforts, we strongly urge that FDA be provided with the necessary resources to train U.S. delegates in the communication and negotiation skills critical for a forum such as Codex. Further, we believe that the FDA budget should include funding to provide the additional resources required to employ and contract for the necessary legal, academic, technical, or scientific expertise to supplement delegate skills and substantiate U.S. positions. We also urge FDA to fully cooperate with other U.S. agencies and to support industry/government dialogue in the international arena such as collateral international efforts to regulate dietary supplements by playing an active role in the TransAtlantic Business Dialogue (TABD) and the Transatlantic Economic Partnership (TEP).

Mr. Chairman, I would like to comment on the importance of new cooperative efforts. The FDA Modernization Act of 1997 (FDAMA) directed FDA to work more cooperatively with all of its stakeholders. Now is the time for the agency and the dietary supplement industry to begin a new era of working together. For its part, CRN is committed to doing everything in its power to help FDA obtain adequate funding to fulfill its duties under DSHEA, including finalizing GMPs for dietary supplements, enforcing the requirements applicable to new dietary ingredients, and improving the adverse reaction reporting system.

FDA would send a powerful signal of goodwill to dietary supplement manufacturers and consumers if the agency withdrew or drastically modified the March 1998 proposal regarding structure/function statements. This proposed rule seeks to define

what are permissible statements under DSHEA that deal with the structure and function of the human body. However, the proposed rule includes an overly broad definition of "disease" which encompasses many structure/function effects. FDA should not interpret "disease" so broadly that meaningful information about the health benefits of dietary supplements cannot be provided, as intended by DSHEA.

The proposed structure/function rule has drawn a large number of comments, including almost 200,000 consumer letters. The overwhelming majority of the comments are critical of the proposal. We believe that the U.S. Department of Agriculture's response to public comment on the misguided "organic" proposal would serve as a good model for FDA on this issue. As USDA did with the "organic" proposal, FDA should simply withdraw the structure/function proposal. Instead of creating a new regulation, FDA could simply continue to rely on the provisions of DSHEA, which clearly states that statements of nutritional support cannot mention a disease. Beyond that, all statements that are literally about affecting the structure or function of the body should be permitted.

CRN and its member companies appreciate this opportunity to testify regarding the urgent need for adequate resources to permit FDA to fully implement the intent of DSHEA. We believe responsible regulation through DSHEA is needed for the health of the industry as well as the health of American consumers, and we support fair and appropriate regulation. We would welcome the opportunity to celebrate the new millennium by entering into a new era of cooperation with FDA, based on mutual respect and grounded in science.

PREPARED STATEMENT OF EASTER SEALS

EASTER SEAL RECOMMENDATIONS FOR USDA AGRABILITY PROGRAM

Easter Seals appreciates the opportunity to report on the notable accomplishments of the USDA Cooperative State Research, Education, and Extension Service (CSREES) AgrAbility Program and to recommend that funding for the AgrAbility Program be increased to $4.6 million in fiscal year 2000.

The AgrAbility Program is an essential, unduplicated, hands-on resource for farmers, ranchers, and farmworkers with disabilities. It is the only USDA program dedicated exclusively to helping agricultural producers with disabilities. It demonstrates the value of public-private partnership by securing donations of funds, talent, and materials to magnify the impact of a modest federal investment. The fiscal year 1999 appropriation is $2,055,000, which funds 18 state programs.

Disability and Agriculture

Agricultural production is one of the nation's most hazardous occupations. Each year, approximately 200,000 people working in agriculture experience injuries that limit their ability to perform essential farm tasks. Tens of thousands more become disabled as a result of non-farm injuries, illnesses, other health conditions, and the aging process. Nationwide, approximately 500,000 agricultural workers have physical disabilities that prevent them from performing one or more essential farm tasks.

For many of these individuals, the presence of a disability jeopardizes their rural and agricultural futures. Rural isolation, a tradition of self-reliance, and gaps in rural service delivery systems frequently prevent agricultural workers with disabilities from taking advantage of growing expertise in modifying farm operations, adapting equipment, promoting farmstead accessibility, and using assistive technologies to safely accommodate disability in agricultural and rural settings. Yet, with some assistance, the majority of disabled agricultural workers can continue to earn their livelihoods in agriculture and participate fully in rural community life.

AgrAbility's Role and Record of Success

Since 1991, thirty-one states have been served by AgrAbility projects. AgrAbility has:

—Provided direct on-farm assistance to more than 4,700 farmers, ranchers, and farmworkers with disabilities and their families.
—Provided information and advice to 10,000 persons with disabilities employed in agriculture and related occupations.
—Educated more than 160,000 agricultural, rehabilitation, and rural health professionals on safely accommodating disability in agriculture.
—Recruited and trained more than 3,500 volunteers to assist agricultural producers with disabilities and their families.

—Reached approximately 8.4 million people through 3,800 exhibits, displays, and demonstrations to increase awareness of the challenges affecting and resources available to people with disabilities who work in agriculture.

The AgrAbility Program was established under the 1990 Farm Bill in response to the needs of farmers with disabilities. The Farm Bill authorizes the Secretary of Agriculture to make grants to Extension Services for conducting collaborative education and assistance programs for farmers with disabilities through state demonstration projects and related national training, technical assistance, and information dissemination. Easter Seals is proud to be a partner with Purdue University's Breaking New Ground Program in providing the national training and technical assistance portion of AgrAbility. Thousands of people in states with and without state AgrAbility projects are aided through this initiative.

AgrAbility combines the know-how of Extension Service and national disability organizations to provide people with disabilities working in agriculture the specialized services that they need to safely accommodate their disabilities in everyday farm operations. AgrAbility received strong bipartisan support during the 1998 reauthorization of the USDA research and education programs, and was extended through fiscal year 2004. The $6 million authorization level for AgrAbility was continued.

Under the statute, state and multi-state AgrAbility projects engage Extension Service agents, disability experts, rural professionals, and volunteers in offering an array of services, including: identifying and referring farmers with disabilities; providing on-the-farm technical assistance for agricultural workers on adapting and using farm equipment, buildings, and tools; restructuring farm operations: providing agriculture-based education to prevent further injury and disability; and, upgrading the skills of Extension Service agents and other rural professionals to better promote success in agricultural production for people disabilities.

In 1998, USDA received an allocation of $2,055,000 to support eighteen state projects in Colorado, Delaware, Illinois, Indiana, Iowa, Kentucky, Minnesota, Mississippi, Missouri, Nebraska, North Carolina, North Dakota, Pennsylvania, South Dakota, Tennessee, Texas, Utah, and Wisconsin. For the 1998 grant cycle, USDA received applications from twenty states for the fourteen available AgrAbility project slots.

AgrAbility provides customized assistance to farmers, ranchers, and farmworkers with disabilities and their families. The nature and degree of assistance depends on the individual's disability needs and agricultural operation. For example: The Mississippi AgrAbility Project has been working with a 23-year old farmer from Bentonia, Mississippi who uses a wheelchair because of the effects of Spina Bifda. He works on his family's beef cattle and hay operation, and needed help continuing to safely and effectively complete all the farm chores. The Mississippi AgrAbility Project helped locate hand controls for the family's Kawasaki Mule utility vehicle that allow him to remain a vital part of the daily farm activities. The state partnership was particularly fruitful in this case, because Easter Seals Mississippi, the nonprofit disability partner, was able to provide assistance in purchasing the hand controls through their Special Assistance Fund. This Mississippi AgrAbility project has also partnered with the T.K. Martin Center for Technology and Disability to provide assistance to this young man regarding accessible and proper seating for farm equipment.

Rodney Lane of Harrison Valley, Pennsylvania has operated a farm in the Harrison Valley since 1979. He has a dairy herd and over 500 acres of crops. He lost his left arm below the elbow and part of three fingers on his right hand in a corn picker accident. He uses a prosthesis on his left arm when tending his cows. AgrAbility for Pennsylvanians worked with the Pennsylvania Office of Vocational Rehabilitation to acquire a mixed ration wagon that eliminates the need for multiple trips to and from the grain bin and reduces the need for heavy lifting. Rodney has this to say about his modification, "Assistive technology has made things easier so that I can farm more self-sufficiently."

A third generation farmer, Don Wolford of Franklin County, Iowa, farms about 1,100 acres, cares for 40 head of beef cattle, finishes 560 head of hogs, and maintains a 24-stall farrowing building. In 1992, he had surgery to remove a tumor along his spine, which left him paralyzed from the waist down. AgrAbility staff first met with him in the hospital and showed him videos of farmers with disabilities using modifications, and recommended modifications he could make to his operation. After he returned home, AgrAbility staff wrote a proposal that helped get funding for Don to purchase an all terrain vehicle that was adapted for him using a kit from the manufacturer in order to provide him with a means of moving equipment and supplies on his farm. A friend designed hand brakes for both his tractors and pick-ups. AgrAbility provided him with plans for installing a lift on his tractor, which local welders were able to install. Since his injury, Don has been elected president of the

Franklin County Farm Bureau and named 1997 Franklin County Master Pork Producer. He has also been volunteering his time as an AgrAbility peer counselor to help other farmers with disabilities in similar situations.

Ron Brown from Edgar, Wisconsin, sought help from AgrAbility because a 1981 injury that limited the use of his arm and arthritis in his knees was making it increasingly difficult to accomplish the chores on his 40 to 50 head dairy farm. AgrAbility staff worked with Ron and enlisted the help of the state Division of Vocational Rehabilitation to create solutions to allow Ron to stay active in farming. AgrAbility staff recommended new types of equipment to minimize the stress on Ron's knees and arm. A John Deere "Gator" utility vehicle allows Ron to get around the farm easily, helping him herd cows, fix fences and do other chores. Ron did some of the modification work himself. The added extra steps and handrails he added to his tractors allow him to get on and off more easily and safely. Ron says that the partnership has helped make farming "a little better, and easier to do." Ron now travels the state talking to other farmers with disabilities about AgrAbility.

Impact of Current Funding Levels

AgrAbility projects are underfunded relative to need and objective. At $85,000 per state, only a few staff can be hired to provide statewide education and assistance to farmers with disabilities, educate rural professionals, recruit volunteers, and work with rural businesses on disability-related issues. Despite AgrAbility's proven record of success, rising demand for services and the great distances that must be traveled to reach farmers and ranchers have severely strained even the most dedicated of AgrAbility's outstanding staff. Easter Seals fears that failure to invest adequately in this worthwhile program will ultimately cause it to falter.

In the 1990 Farm Bill, a funding floor of $150,000 per state was set to assure that the state programs were successfully implemented. However, because funding has not approached the $6 million authorized level, state projects have been funded at only $85,000 per state. In the 1998 reauthorization of the USDA research and education programs, the Committee reaffirmed a commitment to that $150,000 per state floor. Easter Seals strongly supports full funding of state programs to assure that they continue to be effective for farmers with disabilities. Without a related increase in appropriations, fully funding state projects at $150,000 per state would result in a loss of almost half of the existing AgrAbility projects. The fiscal year 2000 request of $4.6 million would bring all current states up to the $150,000 level and would allow eight currently unserved states to implement AgrAbility programs.

One of the consequences of limited funding is that in every grant cycle, some states that have existing AgrAbility programs, and can demonstrate a legitimate need for services, are not renewed and forced to discontinue services to farmers with disabilities in that state and often have difficulty getting the access to the limited state and private funding sources that the federal seed money granted them. More than a dozen states have sought AgrAbility funding without success. Other states, including Louisiana, Michigan, New Hampshire, South Carolina, and Vermont, had USDA-funded AgrAbility projects in the past and seek to re-establish their programs. Each of these states can demonstrate significant unmet needs among farm and ranch families affected by disability that AgrAbility could potentially address. In the 1998–1999 grant cycle projects in Ohio, New York, Idaho/Montana, and New Jersey ceased to receive federal support. The need for the program in these once-funded states is exemplified by the fact that last year the technical assistance telephone line operated by AgrAbility staff at Breaking New Ground Resource Center at Purdue University logged over 268 calls for assistance from these nine states alone. Any loss of programs will greatly affect farmers with disabilities in states for whom AgrAbility is the primary resource through which they seek information and assistance on farming with a disability.

The need for AgrAbility services has never been greater, and its accomplishments to date are remarkable by any standard. Easter Seals is proud to contribute to the ongoing success of the USDA–CSREES AgrAbility Program. Please support the allocation of at least $4.6 million for AgrAbility in fiscal year 1999 to ensure that this valuable public-private partnership continues to serve rural Americans with disabilities and their families. Thank you for considering Easter Seals' views and recommendations.

PREPARED STATEMENT OF FARM*A*SYST/HOME*A*SYST

Thank you for the opportunity to submit a written statement to the Subcommittee on the issue of appropriations for agricultural research. education and economics. Our statement will address the importance of providing base support to education

and other CSREES programs of proven merit, the function of GPRA standards in assessing the merits of these programs, and the application of GPRA standards to Farm*A*Syst/Home*A*Syst, an education program that receives funding through CSREES. At the outset, we would like to acknowledge the support of the National Association of State Universities and Land Grant Colleges and our program coordinators in fifty states including Alaska, California, Iowa, Illinois, Kentucky, Mississippi, Missouri, Montana, North Dakota, Pennsylvania, Washington and Wisconsin.

There are those who believe that the country can best address a host of agricultural concerns including pollution by expanding competitively-funded projects at the expense of base funding for programs. Certainly projects funded through competitive grants are an essential component of research, education and extension, particularly when such projects seek to integrate these three activities, but the benefits of competitively-funded projects will be greatly diminished without adequate support to maintain the infrastructure designed to transfer research findings to the agricultural community and provide education to improve agricultural practices. This infrastructure was built with base support for programs of proven value.

Without base support for effective programs, there is an inadequate framework in place to respond to issues of the moment. For example, the newly-crafted AFO strategy has elevated nutrient management to new levels of importance. Had Congress failed to make its annual commitment to support the national network of Extension specialists and agents, we as a nation would not have the ready-made capacity to effectively implement this strategy. By providing base support for effective programs, moreover, Congress can increase the benefits of competitively-funded projects. The latest research findings regarding nutrient management would never leave the laboratory without a mechanism such as Cooperative Extension to translate research findings into information useful to farmers. By shifting funds away from base program support, Congress not only dismantles the support system that delivers research findings to the public, it reduces the capacity to continue projects that have used competitive funds to effectively address issues of significance. In regard to the latter situation, Farm*A*Syst/Home*A*Syst is in this position, needing base support to maintain a national network of voluntary pollution prevention programs built with competitive funds.

While competitively-funded projects offer certain levels of accountability, they cannot provide policy makers with complete and detailed information to make spending decisions. Whether the decision involves competitively-funded projects or base funding for programs, there must be a more fundamental analysis that tests programs and projects by the same benchmarks of efficiency, effectiveness and accountability.

In fact, Congress recognized the fundamental importance of this analysis when it enacted the Government Performance and Results Act (GPRA) of 1993, Public Law 103–62. GPRA provides a structure for measuring efficiency, effectiveness, and accountability in federal spending by directing CSREES and other agencies to develop and use performance-based planning, reporting, and budgeting. This structure improves program delivery by fundamentally shifting the focus of federal management from inputs, such as staffing and activity levels, to the outputs and outcomes of federal programs.

Most importantly for this discussion, GPRA provides Congress with a basis for making spending decisions whether they involve programs or projects. A September 1998 Report to Congress "Unlocking Our Future Toward a New National Science Policy submitted by the House Committee on Science (www.house.gov/science/science—policy—report.htm) indicates that GPRA can be applied to insure accountability of federally-funded research, including investigator-driven grant projects. By applying the same tests to funding questions involving projects and programs, Congress can establish a basis of comparison to evaluate its spending options.

When the GPRA yardstick is used to measure a program such a Farm*A*Syst/Home*A*Syst, the results show that the program is an outstanding example of how Land Grant Universities and CSREES are providing high quality and effective programming to address issues of national importance. The following section documents Farm*A*Syst/Home*A*Syst's performance in regard to the CSREES 1997–2002 Strategic Plan (www.reeusda.gov/part/gpra/stratpl.htm) developed in accordance with GPRA requirements.

FARM*A*SYST/HOME*A*SYST PERFORMS UNDER GPRA STANDARDS

Farm*A*Syst/Home*A*Syst fulfills these key elements of the CSREES Strategic Plan, including 4 of the 5 goals which form the core of agency procedural and program strategies:

1. Farm*A*Syst/Home*A*Syst provides strong leadership in voluntary pollution prevention to address national water quality priorities; fosters collaboration through a network of state delivery teams that emphasize interagency and private sector partnerships; and increases access to, transfer of, and dissemination of education and research-based information targeted to customer needs.

2. Farm*A*Syst/Home*A*Syst increases harmony between agriculture and the environment by:

a. nationwide program implementation involving locally-modified materials and innovative delivery approaches that increase awareness. knowledge and use of voluntary actions among:

—livestock producers to reduce pollution risks from animal waste.

—agricultural producers to improve cropland practices including nutrient management.

—agricultural producers to protect ground and surface water used for drinking and other functions.

—forest managers to ensure water quality, ecosystems integrity and biodiversity.

b. improving the quality of information about agricultural pollution risks, thereby enhancing the decision-making on public policies related to agriculture and the environment.

3. Farm*A*Syst/Home*A*Syst improves food safety by increasing agricultural producer awareness, knowledge and use of voluntary actions to control or eliminate food-borne risks (e.g. microbial and pesticide) through integrated pest management, the control of pesticide application, water quality protection measures, and animal waste management.

4. Farm*A*Syst/Home*A*Syst promotes health by increasing individual awareness, knowledge and use of voluntary actions to reduce health risks related to drinking water from private wells, indoor air quality, exposure to lead, and hazardous products management.

5. Farm*A*Syst/Home*A*Syst increases the capacity of communities, families, and individuals to improve their own quality of life by helping:

—communities protect public drinking water supplies through tools to manage farm and residential pollution.

—limited resource and other under-served audiences reduce pollution risks with simplified materials for use in homes and on farms.

—government programs such food and nutrition efforts provide additional benefits through education that helps participants protect their health and the environment.

This high level of performance results from contributions of a network of 50 state Farm*A*Syst/Home*A*Syst programs and a national office that coordinates this network. Organized according to the five categories listed above, the following represent highlights of these contributions.

1. STRONG MODEL OF EFFECTIVE PROGRAMMING AND PARTNERSHIPS

In this recent statement, Colien Hefferan, Acting Administrator, CSREES, captures the program contributions in this area:

"The Farm*A*Syst/Home*A*Syst program is an cutting-edge example of effective programming—translating technical research information into easily understood, hands-on education that empowers private citizens to take actions that prevent pollution.

"Its proven ability to foster partnerships among local, state and federal agencies and the private sector presents a strong model for future Extension programs."

2A. TOOL THAT SUPPORTS VOLUNTARY ACTION TO IMPROVE ANIMAL WASTE AND NUTRIENT MANAGEMENT

Wisconsin and California have developed model materials for land application of manure and other aspects of nutrient management that have been shared with many state Farm*A*Syst/Home*A*Syst programs.

A pilot study of the Nebraska livestock systems worksheet had these results: 45 of 95 livestock producers (averaging 1346 swine, 1218 beef cattle and 238 dairy cattle) made or anticipate making improvements in manure removal from pens and lagoons, manure use (e.g. incorporation, soil sampling, manure testing), odor control. equipment and facilities. These producers will voluntarily invest between $2,100–8,400 to make these improvements.

In California, an EQIP-funded project the Environmental Stewardship Short Course has incorporated Farm*A*Syst to improve education of dairy producers. Delivered to 900 dairy producers in 19 locations, the course uses Farm*A*Syst worksheets on livestock lots, manure storage and nutrient management to identify com-

pliance issues. Over 90 percent of the participants would recommend the course to other producers and plan to make management changes.

In Pennsylvania, an eco-labeling program, The Environmental Quality Initiative, uses Farm*A*Syst in a market-based approach to reducing pollution from dairy operations. Farm*A*Syst is the tool to measure environmental performance of the voluntary participants. Those who pass the test are rewarded with a premium from milk sales through Fresh Fields.

A Wisconsin project with the Milk & Dairy Beef Quality Assurance Center will modify Farm*A*Syst for deliver by veterinarians. Using these materials, this project will educate dairy producers about the links between pollution and health risks.

In states such as Missouri, Farm*A*Syst is recognized as an alternative to satisfy the industry-sponsored National Pork Producers Council's Environmental Quality Assurance Program.

Arkansas is actively supporting EQIP with a web site "Arkansas Farm*A*Syst An Environmental Quality Incentives Program (EQIP) Tool For Agriculture" (www.uaex.edu/natural/eqip4/eqiphome.htm).

New York's specialized worksheet on pathogens improves herd management to minimize pathogens among calves and reduces risks of pathogen contamination of water bodies.

2B. TOOL THAT SUPPORTS VOLUNTARY ACTION TO PROTECT WATER QUALITY

Iowa Farm Bureau Federation is providing leadership to implement Farm*A*Syst to help producers understand environmental requirements, identify pollution risks that threaten water quality, and stimulate market-based incentives such as loan discounts and reduced insurance premiums for Farm*A*Syst users. (Rick Robinson. Why Iowa Farm*A*Syst, Iowa Farm*A*Syst Newsletter, Fall 1998).

A Mississippi project known as Delta FARM (Farmers Advocating Resource Management) has made use of Farm*A*Syst materials to increase adoption of BMPs specifically tailored to the unique farming conditions in a region that runs from Memphis to Vicksburg.

Illinois FarmASyst has developed a program that works with rural landowners living in recharge zones for community wells. By helping these individuals protect their private wells from pollution, the program minimizes the risk of contamination threats to public supplies.

In Wisconsin's Buffalo and Grant Counties, EQIP-funded projects using Farm*A*Syst's computerized assessments can aggregate data from individual farm sites to develop watershed pollution profiles, and provide a reliable basis to target future spending and evaluate program impacts.

The program's effectiveness in protecting water quality was documented in the *Journal of Soil and Water Conservation* 53(1), 4–10 (1998) by ERS economist, Marc Ribaudo in his assessment of USDA agricultural nonpoint source programs:

"If a link between farming activities and personal health can be clearly demonstrated, evidence suggests that farmers are more likely to take action. A successful program for educating farmers about the relationship between their activities and personal health is Farm*A*Syst . . . It has been effective in getting individuals to take cost-effective, voluntary actions to remediate and prevent problems such as leaking fuel storage tanks, pesticide spills, and poor well maintenance."

3. TOOL THAT SUPPORTS VOLUNTARY ACTION TO IMPROVE FOOD SAFETY

In California, Georgia and Wisconsin, private sector organizations are supporting commodity-specific worksheets to promote responsible pesticide use among growers of wine grapes, cotton and potatoes.

Several states such as Texas have model materials to improve pesticide use and support integrated pest management available on the web (e.g. waterhome.tamu.edu/texasyst/index.html).

4. TOOL THAT SUPPORTS VOLUNTARY ACTION TO PROMOTE FAMILY HEALTH

States such as Kentucky and Illinois have modified Home*A*Syst to address health risks related to drinking water from private wells, indoor air quality, exposure to lead, and hazardous products management.

Mississippi and New York are using Home*A*Syst to expand the health benefits of EFNEP, a food and nutrition program.

Montana Home*A*Syst is working with the Low-Income Weatherization program to remove mercury from the home by replacing and recycling mercury thermostats.

In Washington state Home*A*Syst is teaming with the Women, Infants and Children (WIC) program to educate at-risk individuals on how drinking water contamination impacts family health.

5. TOOL THAT HELPS PEOPLE IMPROVE THEIR QUALITY OF LIFE

Arkansas and Montana Farm*A*Syst and Home*A*Syst are linked into state agency efforts to promote source water protection among communities.

Missouri Farm*A*Syst is ready to support source water protection activities with a web site "Missouri Farm*A*Syst: A Tool for Source Water Protection" (www.wisc.edu/farmasyst/contact/mos/wp.html).

North Dakota has extensively used Farm*A*Syst in education and outreach programs involving school children and vocational students.

In Alaska, Home*A*Syst will be a key part of educational efforts to improve sanitation and protect water quality in traditional Alaskan villages.

CONCLUSION

It is vital to CSREES to provide base support to education and other CSREES programs of proven merit. These form the critical elements of an infrastructure that makes our Extension Service the envy of the world. Congress can apply GPRA standards to assess the efficiency, effectiveness and accountability of these programs, and make spending decisions that intelligently balance support for programs and projects. By way of example, applying GPRA standards to Farm*A*Syst/Home*A*Syst, it is clear that the program is enabling CSREES to achieve priorities and goals in its Strategic Plan.

Furthermore, Farm*A*Syst/Home*A*Syst is enhancing the programmatic activities of NRCS and US EPA—the agencies that partner with CSREES to support Farm*A*Syst/Home*A*Syst. In terms of NRCS, the contributions to EQIP are evident in several of the examples provided above. Pearlie Reed, Chief, NRCS, also notes that "Farm*A*Syst is an excellent tool for resource planning," adding that the program "offers us opportunities for partnerships and encourages voluntary, locally-led conservation." EPA has recognized that Farm*A*Syst is a tool in promoting voluntary pollution prevention among AFO openers and operators. More generally. Farm*A*Syst/Home*A*Syst is making contributions to reduce nonpoint source pollution from agricultural activities outside livestock production and from residential sources such as septic systems. Farm*A*Syst/Home*A*Syst has demonstrated that it can be more than a tool to help protect private wells. As the program highlights suggest, it has shown promise as a tool to help protect public drinking water supplies. In the future, Farm*A*Syst/Home*A*Syst can play an important role in addressing TMDLs, as highlighted by the Conservation Technology Information Center (www.ctic.purdue.edu/KYW/TMDLFact.html).

In light of these significant contributions, it makes sense that funds not only be set aside in the CSREES budgets to support Farm*A*Syst/Home*A*Syst, but that funds also be identified in the budgets of EPA and NRCS to support the program.

PREPARED STATEMENT OF THE FEDERATION OF AMERICAN SOCIETIES FOR EXPERIMENTAL BIOLOGY (FASEB)

Mr. Chairman, Mr. Kohl, Members of the Subcommittee: I am Dr. William Brinkley, Vice President for Graduate Sciences and Dean of the Graduate School of Biomedical Sciences at Baylor College of Medicine in Houston, Texas. I am a cell biologist who conducts research on cell division and genomic instability in tumor cells. This year I also serve as the President of the Federation of American Societies for Experimental Biology, FASEB. Founded in 1912, FASEB is the largest organization of life scientists in the United States with a combined membership of more than 56,000 researchers. Our members include scientists involved in a wide array of agricultural research including human and animal nutrition, plant science, animal physiology and reproduction. These scientists hold positions in virtually every land grant and private institution engaged in nutrition-related research in the United States, as well as in industrial and biotechnology enterprises conducting nutrition and food related research.

FASEB maintains, as we believe this committee does, that research sponsored by the Department of Agriculture and conducted at universities throughout the United States generates vitally important new knowledge. These advances ensure an affordable, abundant and wholesome supply of food and fiber, as well as promoting the competitive position of U.S. agriculture in the global marketplace. As the world's population grows, societies everywhere are becoming more dependent on the productivity of U.S. farmers. Consequently, life sciences research is one of the keys to the improvements in agriculture which are required to feed and clothe the world, to reduce environmental pollution, to increase food safety and to improve nutrition.

The USDA supports basic and applied research through its Research, Education, and Extension (REE) budget and through its intramural research arm, the Agricultural Research Service (ARS). Half of the total REE budget supports the Cooperative State Research, Education, and Extension Service (CSREES). CSREES targets its funding to national and regional priorities by using a variety of mechanisms to allocate resources, including "base funding" of mission-oriented research, education, and extension programs. Base-program funding maintains the cooperative partnership between the USDA and universities, sustaining the university-based agricultural research and education system as well as supporting the infrastructure necessary to address important national, state, and county issues.

NATIONAL RESEARCH INITIATIVE COMPETITIVE GRANTS PROGRAM (NRICGP)

The National Research Initiative Competitive Grants Program (NRICGP), a CSREES base program, funds competitive extramural research projects at public and private universities and colleges. Research proposals are reviewed for merit by panels of experts, and those attaining the best scores are funded. The NRICGP, the largest national competitive research grant program in the USDA, was authorized at $500 million at its inception in 1990, but annual funding has never exceeded $119 million. FASEB's recommendations for the USDA focus principally on the NRICGP. Some examples of the program's recent accomplishments are:

—Basic studies in the genetics, growth, and development of plants have enabled scientists to develop transgenic plants containing agronomically important genes. These procedures facilitate the improvement of disease resistance, productivity, and nutritional quality.

—Human nutritionists have developed improved techniques for evaluating the absorption and metabolism of nutrients, and for assessing the nutritional status of human beings. Researchers using such techniques yielded evidence that the requirements of calcium and folic acid were substantially higher than previously believed, which has led to the development of new dietary recommendations for these essential nutrients.

—Research funded by the NRI Food Safety program has led to a greater understanding of the food processing and storage procedures needed to reduce the risk of food-borne illness from bacteria such as Salmonella and E. coli. Such research also has led to the development of rapid genetic and immunological methods for detecting such microorganisms.

The competitive and highly productive merit-reviewed research program of the NRICGP is vital to the future of U.S. agriculture, yet its share of the USDA budget is hardly commensurate with the importance of its mission. Indeed, only 5.4 percent of the USDA's $1.8 billion research budget is devoted to nationally competitive grants. Congress recognized the value of the research being conducted by the NRICGP, and increased its funding in fiscal year 1998 and again in fiscal year 1999. FASEB applauds Congress for these actions, given that they represent an important change from the fiscal year 1994 through fiscal year 1997 period when funding for the NRICGP was decreased.

Yet, even with these additional resources, critical agricultural research is still underfunded. Currently, only 25 percent of qualified grants receive funding. Inadequate support limits the productivity of researchers that the NRICGP is able to fund. NRICGP awards are small, averaging $133,210 in fiscal year 1998, and short, averaging 2.2 years (i.e., a total support of about $60,000 per year). Researchers are forced to limit the scope of their work or spend valuable time writing additional grant proposals.

FASEB believes that research support for areas such as animal, plant and microbial genomics; human nutrition; food safety; plant biochemistry; environmental impact of animal pollutants; integrated agricultural systems; and infrastructure should be augmented. The funds now available for these areas of critical research are insufficient to enable them to reach their full potential. FASEB makes the following recommendations.

—In 1990, Congress established the NRICGP with the goal that it be incrementally increased to $500 million within 5 years. The increase in fiscal year 1999 brought NRICGP funding to only $119.3 million, well below the originally intended level for this critical program. FASEB recommends that the base funding for the NRICGP be increased to the level recommended in the president's fiscal year 2000 budget, $200 million.

—To provide the foundation for the technology-intensive agriculture of the 21st century, FASEB reaffirms its support for NRICGP funding reaching the originally authorized $500 million goal as soon as budgetary resources can be found for this investment.

—NRI grants provide a vital funding opportunity for first-time investigators. FASEB supports the ongoing NRI process for enhancing the funding of new investigators, and encourages the NRI to expand the number of these awards.
—FASEB recommends that efforts be made within NRI to fund grants at levels and for periods sufficient to achieve their peer-reviewed, recommended aims.
—FASEB endorses the policy of using funds from the NRI program to nominate and fund young investigators for the President's Early Career Award for Scientists and Engineers.
—FASEB commends and supports the USDA and NRI for their successful collaboration with other federal agencies on issues such as the Plant Genome Project and the Food Safety Institute. These relationships reduce duplication, allow for rapid response to emerging opportunities and crises, and assure the public that tax dollars are being spent wisely.
—FASEB urges Congress to reexamine the 14 percent cap on indirect (facilities and administrative) costs for NRI grants.

EDUCATION—THE NATIONAL NEEDS INITIATIVE

The National Needs Initiative (NNI), the Graduate Fellowship Program of the Higher Education Office, and several other USDA programs contribute to the training mission of the USDA. Despite its importance, funding for the NNI has seen a dramatic decline in recent years. In fiscal year 1996, the NNI budget was $5 million; this amount was decreased $1 million in each of the following two years. The program received $3 million in fiscal year 1999, the same as the previous year.

—FASEB specifically recommends that NNI funding be restored to its previous level of $5 million in fiscal year 2000 because of the critical need to train the next generation of agricultural researchers.
—To insure the optimal development of the future supply of agricultural researchers, FASEB continues to call for a review and subsequent reorganization of USDA-sponsored graduate training.

INITIATIVE FOR FUTURE AGRICULTURE AND FOOD SYSTEMS

Last year, Congress authorized the Initiative for Future Agriculture and Food Systems, a new mandatory spending program that would fund competitively awarded research grants at the USDA to support large, multidisciplinary, multicenter programs beyond the scope of the NRI. Financial resources for this initiative were to be drawn from a provision that reduced federal spending for Food Stamp Program administration by $600 million over five years. Unfortunately, due to financial constraints on the Congress last fall no funds were appropriated in fiscal year 1999.

Had funds been made available, priority mission areas to be addressed in the first year would have been (1) the food genome; (2) food safety, food technology and human nutrition; (3) new and alternative uses and production of agricultural commodities and products; (4) agricultural biotechnology; and (5) natural resource management. The initiative also includes provisions for merit/peer-review and for input into the priority-setting process from those who benefit from agricultural research.

—FASEB strongly endorses the Initiative for Future Agriculture and Food Systems and recommends that full funding authorized under current law be provided in fiscal year 2000.

USE OF ANIMALS IN RESEARCH

Research using animals has been crucial to most of the major medical advances of the past century. Reasonable guidelines concerning how animals are used in research provide safeguards and ensure public confidence. One area of particular concern has been the supply of dogs and cats that were not specifically bred for research. The USDA's Animal and Plant Health Inspection Service (APHIS) is charged by Congress with enforcing provisions of the Animal Welfare Act (AWA) standard to ensure that these "random source" dogs and cats needed for research can be acquired by licensed dealers through legitimate channels. FASEB commends the USDA for its diligent enforcement efforts, including "trace backs" of the ownership records that dealers are required to keep. In recent years USDA has issued steep fines against dealers whose records were incomplete or false, and putting out of business several who were guilty of serious violations.

FASEB recommends that Congress provide the Animal and Plant Health Inspection Service with adequate funding for enforcement of the Animal Welfare Act in fiscal year 2000, so as to ensure compliance with this law.

FACILITIES FOR AGRICULTURAL RESEARCH

A hallmark of American success in agricultural research has been the central role of land-grant universities. Federal funds for construction of agricultural research facilities at land-grant universities, however, have been severely curtailed. The growth of facilities at these institutions has not matched the explosion of the biotechnology research that has occurred in the late 1990's. The 1996 Farm Bill wisely required the development of a long-range plan for all federally supported facilities and this planning requirement should be extended to university-based agricultural research facilities.

—FASEB supports a long-range plan for renewing agricultural research facilities at land-grant universities, which will parallel research needs and funding opportunities. This plan should include a merit-review process.

Mr. Chairman, these are FASEB's recommendations as you and the Committee begin the task of deciding how best to increase the base funding for the 26 research programs of the NRICGP. We have also made other policy recommendations in our FASEB Report on Federal Funding for Biomedical and Related Life Sciences Research for fiscal year 2000, distributed earlier to members of this subcommittee, and we hope you will review this report carefully.

In conclusion, Mr. Chairman, we believe this is an opportunity to expand our country's historic effort to improve America's health and productivity through agricultural research.

PREPARED STATEMENT OF FLORIDA STATE UNIVERSITY

Mr. Chairman, thank you and the Members of the Subcommittee for this opportunity to present testimony. I would like to take a moment to acquaint you with Florida State University. Located in the state capitol of Tallahassee, we have been a university since 1950; prior to that, we had a long and proud history as a seminary, a college, and a women's college. While widely known for our athletics teams, we have a rapidly emerging reputation as one of the Nation's top public universities. Having been designated as a Carnegie Research I University several years ago, Florida State University currently exceeds $100 million per year in research expenditures. With no agricultural or medical school, few institutions can boast of that kind of success. We are strong in both the sciences and the arts. We have high quality students; we rank in the top 25 among U.S. colleges and universities in attracting National Merit Scholars. Our scientists and engineers do excellent research, and they work closely with industry to commercialize those results. Florida State ranks fourth this year among all U.S. universities in royalties collected from its patents and licenses, and first among individual public universities. In short, Florida State University is an exciting and rapidly changing institution.

Mr. Chairman, let me describe three projects that FSU is pursuing this year. The first is a major collaborative effort which draws upon the expertise of three outstanding Florida universities. Focusing on climate variability in the State of Florida and the Southeast (SE), the objectives include exploring the value of climate data based on the El Nino-Southern Oscillation (ENSO) and developing practical applications for climate forecasts, particularly for agriculture.

This consortium draws upon the expertise of scientists at FSU, who have the technical capability to deliver detailed climate variability knowledge; the University of Florida, who possess technical expertise in agricultural engineering, modeling, agricultural decision support and information delivery; and the University of Miami, who have expertise in implementing the knowledge into the agricultural community.

Abundant evidence illustrates the economic importance to farmers of early climate forecasts of extreme weather events. The unanticipated January 1997 freeze that cost the winter vegetable industry in South Florida more than $200 million is just one reminder. Storms, drought and flooding associated with the unusually strong El Nino event of 1982–83 that cost thousands of lives and an estimated $13 million in crops globally is another reminder.

ENSO-based forecasts can now provide useful weather information in many regions at the required lead times. Short- and long-term forecasts could provide the agricultural industry with a range of opportunities for mitigating adverse impacts of bad weather, as well as taking advantage of favorable weather.

During the initial phase of this effort, the FSU team described qualitatively the impact of El Nino (and the other extreme, La Nina) on temperature and precipitation patterns across the SE. Additionally, the team found a geographic shift in tornadic activity associated with El Nino events. A new climate forecast system to provide predictions of seasonal temperatures and precipitation with longer lead times and improved skill now is in the testing phase. Improvements are due in part

to the coupled nature (i.e., the linking of the ocean and atmosphere so they respond to each other dynamically) of the forecast system.

Our colleagues at the University of Florida identified several crops in Florida that are vulnerable to shifts in weather patterns associated with El Nino and La Nina, and further noted that the impact is not uniform in nature across the state.

Continuing this collaboration, the consortium hopes to estimate the economic advantages of incorporating information from climate forecasts into farming management systems, and to eventually work with sector representatives in developing guidance products for the agricultural community.

The National Oceanic and Atmospheric Administration provided the initial funding for this project. We are seeking $2.5 million to continue this worthwhile effort in fiscal year 2000.

Our next two projects involve marine aquaculture efforts. The opportunity for the U.S. aquaculture industry to meet the increasing demand for seafood has never been greater than it is today. The majority of the world's marine aquaculture production takes place in coastal ponds or sea cages. U.S. aquaculture industry development has been inhibited by the high cost and limited availability of coastal lands, high production costs, restricted growing season and governmental regulations. In order for U.S. marine aquaculture production to expand and develop, innovative approaches to address the constraints being faced by the emerging aquaculture industry must be found.

Florida State University (FSU) and Harbor Branch Oceanographic Institution (HBOI) have formed a collaboration to design and develop engineered, intensive recirculating culture systems for marine species in new environments. Expanding marine aquaculture opportunities to inland sites through species that can be adapted to fresh water, designing low-cost, recirculating production systems, and the development of energy efficient (i.e., solar) production systems provide solutions to several of the production and regulatory constraints faced by U.S. producers. If progress is made in these areas, aquaculture offers a new business opportunity for economically disadvantaged communities.

There is an increasing global awareness of the need for sustainable aquaculture development. By the year 2025 global population is projected to be nearly 8.5 billion people, with a projected demand for seafood of 120 million metric tons (MMT). Seafood fisheries reached carrying capacity ten years ago with a capture of 60 MMT but demand for seafood has shown no signs of abating. The Food and Agriculture Organization (FAO) reported that by 1995, aquaculture only accounted for 26 percent of the total world harvest of food fish. In 1997, U.S. seafood imports increased both in volume and value with shrimp topping the list at 278,600 metric tons valued at $2.7 billion dollars. Shrimp imports continue to be the second largest contributor to the U.S. trade deficit and it is expected that finfish imports will follow the same scenario. There remains a great need for U.S. aquaculture production to fill this void and relieve some of the harvest pressure on natural stocks.

Competition for access to the now limited U.S. coastal land resources requires innovative approaches to develop and expand marine aquaculture into new environments. HBOI has work underway that suggests many saltwater species thrive in freshwater systems with the appropriate chemical makeup. Another issue is environmental protection of coastal waters and biosecurity to protect both wild and farmed aquatic resources from disease and exotic introductions, which necessitates the development of cost-effective recirculating production systems. In many locations around the U.S., regulatory constraints already require the use recirculating aquaculture systems. HBOI has designed an intensive recirculating, production system to culture marine finfish species in fresh or brackish water. FSU's Department of Oceanography and the FSU/FAMU College of Engineering are teaming with HBOI to conduct parallel experiments to determine the optimal production parameters using hard freshwater in Florida. FSU's research on solar technologies will be utilized to design more energy efficient systems for this effort as well. All of this work will expand U.S. aquaculture production of saltwater species into new locals, result in better utilization of land resources and reduce the demand for imported aquaculture products.

The two collaborating institutions are seeking $1.2 million in fiscal year 2000 from the U.S. Department of Agriculture to initiate this project.

Our second aquaculture effort involves sustaining aquaculture opportunities through distance learning. To meet the needs of the growing aquaculture industry in Florida and across the Nation, Florida State University (FSU) is partnering with Harbor Branch Oceanographic Institution (HBOI) to develop materials that would be employed in an outreach training program in the field of aquaculture though the use of distance learning technologies.

Aquaculture may provide the opportunity for the U.S. aquaculture industry to expand and meet the increasing demand for seafood. Worldwide commercial harvest of fish and shellfish has remained essentially unchanged from 100 million metric tons since 1989. Nearly 70 percent of conventional commercial species are now fully exploited or over exploited. Yet U.S. marine aquaculture development has lagged behind overseas competition.

In 1997, HBOI initiated a short and long-term training program related to aquaculture. Working with faculty at FSU, new technological capacities will allow these two groups—separated by several hundred miles—to rely on distant learning technology to facilitate communication between research staff and faculty, and provide increased aquaculture instructional opportunities for students.

With this technology in place and materials related to aquaculture, its opportunities, and its challenges being developed, the two institutions will build upon a successful program established nearly a decade ago through HBOI's successful implementation of community-based training programs in clam and oyster aquaculture. The programs spanned from 1989 to 1998 and focused on training fishermen and women in shellfish farming, thereby allowing them to maintain their way of life on the water. The number of clam farmers has grown from a handful in the mid-1980s to nearly 600 today. A number of other aquaculture business opportunities exist for rural communities throughout Florida, but their implementation requires that the training and technical support be provided in the home community. Through a combination of distance learning technology and satellite education and support hubs, we propose to provide aquaculture training, technical support, and appropriate economic information to rural communities throughout Florida. As materials are being developed in the first phase of this project, the collaborators will work with such groups as the Panhandle Library Access Network, a collection of 47 libraries in 13 rural Florida Panhandle counties, agricultural extension agents, and local economic development officials to develop a comprehensive dissemination network for this information.

FSU and HBOI are requesting $470,000 for this initial phase of this work in fiscal year 2000 from the U.S. Department of Agriculture.

Mr. Chairman, these are just a few of the exciting activities going on at Florida State University that will make important contributions to solving some key problems and concerns our Nation faces today. Your support would be appreciated, and, again, thank you for an opportunity to present these views for your consideration.

PREPARED STATEMENT OF THE FRIENDS OF AGRICULTURAL RESEARCH—BELTSVILLE

Mr. Chairman, and Members of the Subcommittee, thank you for the opportunity to present this statement in support of funding for agricultural research. We are requesting your support for programs of the Agricultural Research Service (ARS) and its world renowned Beltsville Agricultural Research Center in Maryland.

The Friends of Agricultural Research—Beltsville (FAR–B) is a private non-profit organization dedicated to supporting and promoting excellence in agricultural research, especially the ARS research programs at Beltsville. FAR–B provides supplementary private funds for both research and education. The Friends co-sponsor symposia, conferences, and workshops on topics of current scientific interest. Financial assistance is provided for Beltsville scientists to spend time at other research centers here and abroad to update their technical skills. Funds are provided to cohost international scientists who visit Beltsville each year to discuss cooperative programs and exchange scientific information. This public/private partnership promotes excellence, helps to ensure that useful new BARC technology is put into practice, and is supportive of the mission and goals of the Agency.

The productivity of American agriculture is the envy of the world. The outstanding performance of U.S. agriculture and the unprecedented gains in productivity during this century can be attributed in large measure to the dynamic research and development system in this nation. Scientists and engineers contribute a continuing stream of new knowledge, technological innovations, and new products to sustain the U.S. agricultural enterprise. Public investments in agricultural research have been critical to the success of U.S. agriculture. In return, the public has reaped substantial benefits. Studies show that every tax dollar invested has paid back at least $1.35. These returns have been broadly shared through lower prices for American consumers, increased international competitiveness for farmers, jobs for working families, and increased profitability in agricultural industries. Funds for research are sound investments.

The U.S. Department of Agriculture (USDA) is a major player in basic and applied research to solve problems and to keep America's food and fiber system com-

petitive in the global marketplace. The Agricultural Research Service is the principal in-house research Agency of USDA. It has a lead role in solving high-priority problems of broad national significance. The Beltsville Agricultural Research Center is the flagship research facility of ARS.

BELTSVILLE

The Beltsville Agricultural Research Center (BARC) is a comprehensive research complex consisting of 47 laboratories and a staff of 1,500 scientists, engineers, technicians, and other support personnel. Research programs range from conservation of soil and water resources to human nutrition. Beltsville scientists do basic and applied research in plant and animal genetics, physiology, and chemistry, as well as a wide range of projects in other areas, including new instrumentation, germplasm databases, and computer modeling of complete production systems.

In recent years, the research program at BARC has expanded to encompass biotechnology, genome mapping, and fundamental research on biological control of plant and animal diseases,insects, nematodes, and weeds. Major emphasis is focused on environmental issues, food safety and health, and sustainable agriculture.

Beltsville's record of accomplishments and ongoing programs have made it a world leader in agricultural research. Its international reputation attracts thousands of visitors each year from the United States and abroad. The world renowned National Agricultural Library—the largest agricultural library in the world and the Nation's chief resource of agricultural information—is also located on the BARC campus.

PRIORITY RESEARCH ISSUES

A number of important issues confront American agriculture and are of deep concern to the public. Central among them are the quality of the environment and the nutritional quality and safety of our food. The fiscal year 2000 Budget for ARS proposes new funds and increased initiatives to address these vital challenges. Beltsville scientists are currently engaged in research in these critical areas and will expand their efforts if the proposed budget thrusts are funded.

Biologically-Based Integrated Pest Management.—The reliance on chemical-based pesticides, the increasing occurrence of pesticide resistance, particularly in insect pests, and the threat of agricultural chemicals for polluting the environment have presented an important challenge to the agricultural community. ARS has risen to this challenge by increasing its research to develop a broad array of strategies for use in integrated pest management (IPM), i.e., a system that relies on a variety of control techniques as alternatives to total dependency on chemical pesticides in order to reduce health risks, sustain natural resources, protect the fragile ecosystem, and at the same time maintain a viable agricultural enterprise. The goal of USDA is to have IPM in practice on 75 percent of U.S. agricultural acres by the year 2000.

The search for new and more effective ways to implement IPM programs has led to greater emphasis on biological control. There is great potential for research and development in this area. Knowledge of the basic biology of insects, viruses, bacteria, fungi, nematodes, and weeds is essential for identifying, developing, and using biological control agents successfully.

Beltsville scientists have pioneered in fundamental and applied research on both the chemical and biological processes associated with the behavior and development of insects. They have been in the forefront of basic studies of pheromones, attractants, repellents, deterrents, and growth regulators derived from insect, plant or synthetic origin. Such research has led to practical new techniques for the control of a variety of insect pests such as the Mediterranean fruit fly, gypsy moth, Japanese beetle, corn earworm, and many other pests of economic importance.

The fiscal year 2000 budget proposes increased funding for Beltsville to develop attractants for invasive pest species, such as the Asian long horned beetle, a potential new and devastating threat to forests and urban trees nationwide. New research is needed to develop attractants and traps necessary to detect and monitor populations so that appropriate remedial action can be taken. This Beltsville research program is currently significantly underfunded to carry out this work and is at risk of losing its critical mass of scientific expertise in this important mission area. This is a top priority funding need.

National Nutrient Database.—Many studies have implicated dietary factors in the cause and prevention of important diseases, including cancer, coronary heart disease, diabetes mellitus, birth defects, and cataracts. For diseases linked strongly to diet, the cost of medical treatment and care is estimated to exceed $200 billion a year. Clearly, this is an important issue for those in human nutrition research; the ARS human nutrition research program seeks to address this public concern.

An important and essential component of the ARS human nutrition program is the National Nutrient Database maintained by the Beltsville Human Nutrition Research Center. This database of foods consumed in this country is the foundation for food consumption tables throughout the world. In spite of its position as the preeminent nutrient database, many food items are not included due to rapid changes that have taken place in food production, processing, and preparation in recent years. Some data are as much as 30 years out of date. There is a critical need to update data to ensure that nutrition research is based on a solid understanding of the nutrient content of foods and that information provided to producers, the food industry, and consumers is accurate and reliable. The ARS budget proposes $2.2 million for Beltsville to update this mission-critical resource.

Food Composition Methods.—The value of the National Nutrient Database depends upon the accuracy and reliability of methods used to develop the data. The Food Composition Laboratory at Beltsville has a staff which develops and refines methods that will allow chemists to measure the nutrients and contaminants among thousands of compounds in foods. Scientists have found that many analytical methods for specific components are lacking or inaccurate. Either existing technology or new techniques must be developed for the unique requirements of the complex biological samples that need to be evaluated. For example, a food compound can have many forms. Some are more biologically active than others. Chemists take food apart—molecule by molecule. To develop a definitive method, it is important to know how the body uses different forms of the compound. Researchers are especially interested in the active plant compounds—or phytonutrients—that are associated with lower incidence of cancer and cardiovascular disease in populations that eat plenty of fruits, vegetables, and other food plants. Scientists at the Beltsville Human Nutrition Research Center have been collaborating with colleagues at the National Cancer Institute and the National Heart, Lung, and Blood Institute since the 1970's to develop better analytical methods and to more completely understand the relationships between the composition of foods and the biological effects from a nutrition perspective. Sound dietary decisions depend upon good analytical methods.

The fiscal year 2000 budget for ARS proposes an increase of $1.2 million to develop sophisticated and reliable analytical methods that will be needed to determine the concentration of nutrients in foods, with particular emphasis on nutrients that are being newly discovered in fruits, vegetables, and other food plants. This is an important priority.

Risk Assessment/Agricultural Waste.—The public is very concerned about the risks associated with agricultural wastes that enter into the water supply. Livestock manure and fertilizers are excellent sources of essential plant nutrients. However, excessive application or poor management practices can contribute to the contamination of streams, ponds, and ground water. ARS is increasing its research to better understand the relationships between agricultural practices and water quality. A major portion of the research on animal waste and nutrient management is at Beltsville, where the emphasis is on an integrated approach to crop and animal production systems.

The budget proposes an increase in funding at BARC to develop predictive models for assessing the risk of transmission of zoonotic parasites through farm management systems, animal wastes, and water runoff. This will strengthen research on pathogen transmission as a part of the ongoing animal waste/management program. The emphasis is on the Cryptosporidium parvum, a single celled parasite excreted in animal wastes that can contaminate water supplies. Healthy individuals infected with this parasite may suffer symptoms of diarrhea, dehydration, abdominal pain, nausea, and fatigue. A person whose immune system is compromised can also suffer damage to the liver, pancreas, or lungs. BARC is a major center of excellence on cryptosporidium research. Studies will focus on the life cycle of this parasite, its impact on humans, and methods for combating and reducing the risk of transmission. We hope that the Committee will see fit to support increased funding for this program.

MODERNIZATION OF FACILITIES

A recent General Accounting Office report found widespread problems with aging Federal facilities around the country and recommended a massive overhaul of these facilities, especially of those built over 50 years ago. With the support of this Committee, modernization of the facilities at Beltsville began in 1988. Significant progress has been made in upgrading and modernizing the facilities, equipment and infrastructure at BARC. We are grateful for this support. This has been critical to

keeping research at Beltsville in the forefront of science and competitive with other international research centers.

The current highest priority in the modernization plan is to upgrade the facilities for the Beltsville Human Nutrition Research Center (BHNRC). The Department proposes in the fiscal year 2000 Budget funding for the construction of a new facility for human nutrition research at Beltsville. Current facilities are among the oldest in USDA and are, thus, in the greatest need of overhaul or replacement. This Committee provided in fiscal year 1997 $1.7 million for planning and design of new BHNRC facilities. The design is now underway. Funding is now needed to complete the construction in a timely and efficient manner. Costs to fully fund the new facility are estimated at $22 million. BHNRC scientists have made many significant contributions to Federal nutrition programs, including uninterrupted input over the past 30 years to the establishment of the Federal government's Recommended Daily Allowance (RDA) for dietary intake by the U.S. population. Modernization of these research facilities will promote continued scientific excellence well into the next century.

Mr. Chairman, FAR–B thanks you and the Committee for your interest, leadership, and generous support of ARS and the Beltsville Agricultural Research Center. We recognize that finding funds for Federal agricultural research programs and facilities is a difficult challenge no matter how important the work is to the health, safety, prosperity, and well being of the Nation. This Committee has met the challenge over the years, and we encourage your continued efforts. We look forward to working with you in any way you may desire to serve the interests of American agriculture.

PREPARED STATEMENT OF FRIENDS OF THE NATIONAL ARBORETUM

Mr. Chairman and Members of the Subcommittee, I am grateful for this opportunity to present testimony on behalf of Friends of the U.S. National Arboretum (FONA), in support of FONA's fiscal year 2000 request for $500,000 for engineering and design to implement the new Master Plan and $500,000 for information technology support to expand the National Arboretum's internet service.

Thanks to your Committee, and after some years of preparation, your U.S. National Arboretum is poised to move into the 21st Century and enhance its mission of horticultural education mandated by Congress. With the private support and encouragement of FONA, the Agricultural Research Service (ARS) has contracted for a new Master Plan to modernize the National Arboretum and make it a more viable and significant educational resource and attraction. Because the new Master Plan commissioned by the ARS is scheduled to be completed before fiscal year 2000, FONA is requesting design funds in the amount of $500,000 so work on modernizing the U.S. National Arboretum will not be delayed yet another year. The new Master Plan was not sufficiently developed in time to enable these funds to be included in the President's budget.

The new Master Plan is being prepared under the leadership of Geoffrey L. Rausch, of Environmental Planning & Design (EDP), an internationally acclaimed designer of arboreta and botanic gardens. The Plan envisions four major conceptual developments at the U.S. National Arboretum to enhance the Arboretum's singular role as a source of horticultural education and as a national showcase of advances in horticulture. All four concepts have the strong support of FONA.

First, the new Master Plan envisions a new entrance to the National Arboretum off Bladensburg Road. The most used current entrance is through a residential neighborhood on R Street. For a number of years the National Arboretum has sought to improve the New York Avenue entrance but this has been rejected by District of Columbia authorities because of the traffic volume on New York Avenue. The recommended entrance off Bladensburg Road is a superior solution.

Second, the new Master Plan envisions a walkable central core to the National Arboretum which would contain enhanced garden displays and offer the educational opportunity of interactive video explaining the meaning and significance of the displays. This core concept is critical to making the National Arboretum more attractive to visitors in order to stimulate interest and education in horticulture. Gardening is the nation's favorite hobby and horticulture the fastest growing segment of the agricultural industry.

Third, the new Master Plan envisions a new visitors center adjacent to the walkable core which would provide orientation, exhibit space and offer the potential of electronic classrooms for horticultural education similar to the classrooms at the National Museum of Natural History. This is also critical to enhancing the education mission of the U.S. National Arboretum.

Fourth, the new Master Plan envisions tram service to provide further orientation and service to collections beyond the central core. This would improve educational opportunities and alleviate traffic congestion at peak visitation periods.

In further development of the new Master Plan, engineering and design for the Grounds/Site Work requires long lead time. As detailed on Exhibit 1, this engineering and design is estimated to cost $500,000. The figures on Exhibit 1 were prepared by the National Arboretum in conjunction with EDP at the request of FONA.

It is significant that the new Master Plan contains a number of projects such as the new entrance, the visitors center and new collections in the core which are candidates for private financing. FONA intends to include these projects in a capital campaign if approved.

With the private support of FONA, the National Arboretum has also developed a website and a home page displaying horticultural information on the internet. This internet site has shown a dramatic increase in national and international use in the first year and one half of operation. Of the $500,000 requested for information technology, $250,000 would be devoted to the National Arboretum's horticultural library including a full-time professional librarian to help support the data being added to and made available on the National Arboretum's home page. The remaining $250,000 would be devoted to support a full-time Web Master for the Arboretum's home page and to maintain its Local Area Network computer system.

Your U.S. National Arboretum is repository of a huge backlog of useful horticultural information to place on its home page. It has a talented staff the fruits of whose labors should be available on the Internet. Ultimately, the home page and server, with interactive systems, can be your National Arboretum's major method for dispensing horticultural information and providing horticultural education to constituents across the United States and indeed world-wide.

While the missions of the U.S. National Arboretum mandated by Congress are research and education, the improvements described in this testimony are sorely needed to enhance its capability to fulfill its mission of education and to promote our research capabilities.

FONA is most appreciative of the efforts of your Subcommittee on behalf of your National Arboretum and on behalf of horticultural research and education.

PREPARED STATEMENT OF THE GROCERY MANUFACTURERS OF AMERICA

GMA appreciates the opportunity to submit testimony to the Senate Agriculture Appropriations Subcommittee on the President's fiscal year 2000 budget. GMA is the world's largest association of food, beverage and consumer product companies. With U.S. sales of more than $450 billion, GMA members employ more than 2.5 million workers in all 50 states. The organization applies legal, scientific and political expertise from its member companies to vital food, nutrition and public policy issues affecting the industry. Led by a board of 44 Chief Executive Officers, GMA speaks for food and consumer product manufacturers at the state, federal and international levels on legislative and regulatory issues.

USER FEES

The Food Safety and Inspection Service (FSIS)

We are disappointed that the proposed budget would again include "user fees" to fund FSIS, even though the Administration, for the first time, has at least developed an alternative approach to assuming user fees in the budget. It also recognizes the fact that any user fee must be agreed to by all stakeholders and then authorized before it can be considered. Because of the nature of the anticipated authorizing language, we continue to have concerns about the Administration's lack of understanding of what exactly constitutes a true user fee. User fees, by definition, are intended to reimburse agencies for specific private benefits they provide to identifiable companies. Public funds and not user fees should pay for regulatory activities such as inspection. As Congress itself has repeatedly pointed out in previous years, these regulatory activities are designed to protect the public health and should not be funded by new taxes on the regulated industries.

The Food and Drug Administration (FDA)

For the first time in many years, the President's proposed budget does not impose general purpose user fees to fund the FDA. However, it does include a proposal to implement a user fee above the baseline for premarket approval of direct and indirect additives. We have not taken a position on the proposal at this time because we have not seen legislative language.

We were also pleased to see that, in the Center for Food Safety and Applied Nutrition's 1999 list of priorities, the premarket review of food ingredients was included on the "A" list. As GMA has said, beginning with the June, 1995 hearing before the House Human Resources Subcommittee, this is an area of FDA which has been dramatically overlooked, and must be reformed. In fact, the industry has made this a high priority and is in discussions with the Food and Drug Administration about how to best proceed on reforming the food additive approval process. GMA is legitimately concerned about the length of time it takes for an additive to be approved. The process needs continued attention of FDA senior management and more resources.

THE PRESIDENT'S FOOD SAFETY INITIATIVE

The President's proposed fiscal year 2000 budget includes an increase of $74.8 million to fund the President's Food Safety Initiative. We applaud the efforts of the Administration to place such a high priority on enhancing the U.S. food safety system. GMA has long believed that consumers and the food industry are best served by strong food safety agencies. which develop policy based on sound science.

Since the announcement of the President's food safety initiative in May, 1997 GMA has actively engaged in discussions within its industry, with Congress and with the Administration on the U.S. food safety system. In response to the Congressional directive, to the National Academy of Sciences to study ways in which the U.S. food safety system might be improved, GMA formed a food safety task force in December, 1997, composed of 15 major food industry associations representing hundreds of manufacturers, marketers, wholesalers, retailers and restaurants. Over the next several months, the task force developed a series of white papers the industry felt were critical to a constructive evaluation of the current food safety system. The Task Force's papers were provided to the NAS committee for its consideration.

GMA found that, while the current food safety system is not perfect, it is effective. The current system can and should be enhanced but not replaced. The goals of the President's Food Safety Initiative are admirable and are focused in the right direction. The U.S. food safety system must have more resources to identify and fight the true causes of foodborne illness with the right scientific weapons. Resources must be targeted toward laboratory research and practical testing food safety research which should receive high priority and funding.

Second, we also support increased funding for educational programs. Everyone who handles food from the farm to the table must be educated about their roles in helping to reduce the risk of foodborne illness. We support the President's Food Safety Initiative's focus on the development of education programs for food service workers and educational programs that target high-risk under-served populations. Using the Fight BAC Program and other methods will achieve the goal of teaching all Americans how to handle and prepare food safely.

Finally, GMA supports the efforts of the President's newly formed Food Safety Council, which has begun work on a unified food safety budget as well as a long term strategic plan, scheduled for release in January, 2000. Better communication, coordination and elimination of duplicate government food safety programs is needed.

SUMMARY

To summarize, GMA supports increased funding for the President's Food Safety Initiative, and opposes any general purpose food user fees. We appreciate the opportunity to submit testimony for the record.

PREPARED STATEMENT OF THE HEALTH INDUSTRY MANUFACTURERS ASSOCIATION

SUMMARY

This testimony is submitted on behalf of the Health Industry Manufacturers Association (HIMA) and the more than 800 manufacturers we represent. HIMA is the largest medical technology trade association in the world. Our members manufacture nearly 90 percent of the $58 billion of health care technology products purchased annually in the United States and more than 50 percent of the $137 billion purchased annually around the world. We welcome the opportunity to comment on issues surrounding FDA's funding for the next fiscal year.

This year marks a departure from the position HIMA has taken on funding for FDA for the past few years. This year, we believe there should be an increase in funding for the Center for Devices and Radiological Health (CDRH) that is specifically targeted to the following activities:

—Premarket review process
—Activities associated with mutual recognition agreements and international harmonization, and
—The Sentinel Reporting System

With regard to additional recommendations for increased funding contained in the President's fiscal year 2000 budget and FDA's budget accountability, our position is as follows:

—Congress should (1) ensure the optimal design of the Adverse Event Reporting System and (2) direct the agency to invite participation by interested parties in its design.
—Congress should direct the agency to invite participation by interested parties in the design of the Sentinel Reporting System.
—Congress should continue to press for greater budget accountability from FDA.
—We remain opposed to user fees and believe Congress should provide sufficient funds to enable the agency to review device applications within the time frames mandated by law.

BASIS FOR INCREASED FUNDING FOR DEVICES

In the past, we have supported level funding for CDRH. However, this year, there are several factors that convince us that, unless CDRH receives additional funds for the premarket review process, review times could increase thus depriving patients access to beneficial medical technology. Moreover, we believe FDA needs to invest resources now in initiatives that will ultimately result in a harmonized worldwide regulatory system. We do not wish to see a return to the circumstances of several years ago when products were regularly available to people outside the United States years before American citizens could benefit from them.

Among the reasons for our support of a targeted increase in funding is that FDA itself has announced loudly and clearly that it cannot carry out its statutory obligations without additional resources. Moreover, the agency has taken on new responsibilities-notably in the tobacco and food safety areas-without full funding. The Food and Drug Administration Modernization Act of 1997 (FDAMA) has been implemented without any additional funding.

At the Food and Drug Law Institute's annual educational conference in December of 1998, FDA's Associate Commissioner for Strategic Management, Linda Suydam, estimated that the agency is $165 million short of what it actually needs to do its job. She stated that "The agency has been effected by . . . new programs, which were not fully funded and flat-lined budgets which did not allow for the cost of inflation on personnel and procurement dollars. These numbers clearly illustrate that there's less money to do our core responsibilities." Those core responsibilities include device reviews, she stated.

In the "FDA Compliance Plan" required by FDAMA and its budget justification documents, the agency projects that its review times for fiscal year 1999 will increase from fiscal years 1997 and 1998. In the plan, the agency cites insufficient funds as well as the increased complexity of medical technology for the longer review times. This is an alarming statement and one that is completely counter to the underlying goal of FDAMA to create efficiencies that help speed beneficial technology to patients.

We strongly believe that FDA should have the resources to meet its statutory time frames. This means the completion of final actions for PreMarket Approval Applications (PMAs) within 180 days and 510(k)s within 90 days. The agency has been expressing its review goals in terms of completion of first actions within the statutory time frames. The "Compliance Plan" mandated by FDAMA required the agency to tell Congress how it was going to meet all of its obligations under the Federal Food, Drug, and Cosmetic Act—including the obligation to complete reviews within established limits. We believe the agency should let Congress know exactly what resources are needed in order to meet the statutory time frames set forth in the law. We support a funding plan that will ultimately result in full compliance with the law's time limits.

STREAMLINING THE REGULATORY PROCESS

Although we support increased funding targeted to device reviews, we believe that the need for increased funds should diminish in future years. Through full implementation of FDAMA, continued reengineering, effective execution of mutual recognition agreements, and aggressive international harmonization activities, FDA should be moving steadily toward a regulatory system that will be more efficient, faster, and less costly. This system should reduce unnecessary governmental procedures, eliminate regulatory redundancy, provide a uniform framework for protecting

and promoting public health worldwide, and recognize and adapt to the realities of the global economy.

FDAMA mechanisms that, when fully implemented, will reduce regulatory burden include adoption and use of national and international standards, reliance on the declaration of conformity to standards, exemptions from 510(k), and adoption of a sentinel reporting system. In addition, FDAMA's requirement that FDA consider the "least burdensome" appropriate means of demonstrating effectiveness has yet to be fully defined and incorporated into standard operating procedure. This should, over time, together with the new collaboration requirements of FDAMA, result in a net savings of resources although more time may be spent at the beginning of the premarket approval process while the parties come to a meeting of the minds on the blueprint for device approval. Similarly, the agency has a variety of reengineering initiatives in the early stages of implementation that have the potential to ripen into substantial resource savings tools. Examples include the special and abbreviated 510(k)s, guidance on when to file a PMA modification, and the product development protocol. Congress should direct the agency to aggressively and fully implement the tools of FDAMA and the agency's own reengineering mechanisms.

GLOBAL HARMONIZATION

While the above initiatives concern the current processes for device review, FDA should not discount the potential savings to be realized from ongoing and future mutual recognition agreements and international harmonization activities. The need for federal funds will be reduced as devices approved offshore in accordance with harmonized requirements will not need to be re-reviewed by FDA.

This past year, the United States and the European Union entered into a Mutual Recognition Agreement (MRA). This agreement authorizes its signatories to review and approve devices based on the requirements of the other parties to the agreement, thus providing a forum for one-stop shopping for manufacturers. The agency is in the midst of determining the level of resources to be devoted to a confidence-building period required by the MRA. Through this activity, U.S. and European officials will learn about each other's requirements for regulating medical devices. This type of learning among nations is an important building block to a new global system that will reduce unnecessary, time-consuming, and costly regulatory redundancy. Investing the time and resources now to build a foundation of trust and respect will contribute enormously to the long-term goal of harmonizing regulatory requirements with Europe and provide valuable lessons for other global harmonization initiatives.

Ultimately, the forces of the global marketplace will drive nations of the world to recognize the economic value and efficiencies of a unitary worldwide regulatory system. Such a system will reduce if not eliminate duplicative reviews and inspections, with the added benefit of standardizing public health protection for patients throughout the world. The United States does not have a monopoly on what is the best approach to protecting and promoting the public health. In fact, there is some evidence to suggest that the European device approval process is faster and more efficient than our system with no demonstrable loss of product safety or quality. Aggressive and full participation by FDA in discussions with nations on a common sense approach to regulatory requirements worldwide will hasten the day when international harmonization becomes a reality. And, while we recognize that this type of activity costs money in the short term, in the long term, it should reduce the financial burden to U.S. taxpayers as other nations share responsibilities formerly performed exclusively by FDA.

THE PRESIDENT'S FISCAL YEAR 2000 BUDGET

We note that the President's fiscal year 2000 budget requests an increase of $26 million for the device program—$7 million in user fees for premarket reviews and $19 million for improved inspections, MRA implementation, compliance activities, the Sentinel Surveillance System, and adverse event reporting.

HIMA opposes user fees for the medical device industry and believes Congress should provide sufficient funds to the agency to enable it to review applications within the time frames mandated by law. This core statutory obligation is essential to ensuring patient access to the benefits of medical technology.

With regard to inspections, we applaud the agency's recent efforts to streamline the inspection process.[1] The industry has worked with the agency in a "grass-roots"

[1] One pending change that we strongly support is an agency proposal to "credit" time spent by field personnel in educational and outreach activities that promote voluntary compliance by the industry rather than focusing solely on actual inspection time as a performance measure.

initiative to bring common sense changes to key aspects of the inspection process.1 We believe that there are additional efficiencies that can be realized through continued agency-industry discussions. At the FDAMA-mandated stakeholders meeting of August 18, 1998, we suggested that the agency take into account inspections conducted by internationally recognized organizations in executing a risk-based inspection strategy. We continue to believe that ISO (International Standards Organization) certification should provide some level of assurance to FDA that good manufacturing practices are being followed.

In addition, we note that the agency itself has questioned the biennial inspection requirement in the statute for certain manufacturers.[2] We support giving FDA the flexibility to exercise its own discretion in determining the frequency of reviews necessary to assure safety, based on the risk presented. Other types of flexibility may also be desirable.

The Sentinel Surveillance System—designed to replace reporting of adverse events by device user facilities (hospitals, nursing homes, etc.)—is one that holds great promise for improving the ability to collect meaningful information about device-user interaction. We believe it also has the potential to eliminate medical device reports from manufacturers. We support increased funds devoted to this system. However, we believe that it is important for the system to be well designed and provide optimal benefits for the provider, the agency, and the manufacturer. We recommend that the agency participate in a tripartite working group to engage in discussions as to how such a system can best meet the needs of the various interested parties.

The agency's proposal for increased funds for the Adverse Event Reporting System (AERS)—totaling $15.3 million agency-wide—raises questions about whether such an expensive system will produce the intended results. We know little about the system and simply urge Congress to ensure that (1) there is a real need for this system and (2) its benefits will justify its costs. We believe that the system could benefit from an open airing of the agency's plans early in the design stages. Such an airing would enable industry and other interested parties to provide valuable observations and comments to help ensure that taxpayer dollars are being spent wisely.

On a process-related matter, we strongly support this Subcommittee's efforts to seek greater accountability from the agency on the allocation and use of taxpayer dollars appropriated by Congress. The submission of detailed operating plans from the agency to this subcommittee is key to ensuring appropriate execution of the laws of the land. We are grateful for your initiative in this area and urge the continuation of this important process.

CONCLUSION

In conclusion, we support a funding increase for FDA for fiscal year 2000 that is specifically targeted to device review functions, MRA confidence building, international harmonization activities, and the Sentinel Surveillance System. We ask Congress to ensure that such funds are not diverted to other agency activities. We believe this increase will help the agency meet its statutory obligations, advance the long range harmonization goal, and provide the means whereby the agency can achieve its FDAMA-mandated mission to "promote the public health by promptly and efficiently reviewing clinical research and taking appropriate action on the marketing of regulated products in a timely manner." We further believe the Congress should encourage the agency to continue to seek improvements in the inspection process—including consideration of legislation to enable the agency to exercise discretion in the frequency of inspections. We urge Congress to help open the agency to input and ideas from interested parties on key initiatives such as the Sentinel Surveillance System and the Adverse Event Reporting System. We oppose user fees for the medical device industry. Finally, we support this subcommittee's continued efforts to seek greater budget accountability from FDA.

Thank you for the opportunity to present our views.

---

[2] In the FDAMA-mandated "FDA Plan for Statutory Compliance" published in the Federal Register on November 21, 1998, the agency said, in a section on inspections, "Because all public and private sector organizations in the future will be subject to the same resource-constrained environment, FDA may have to consider that even a highly collaborative inspectional network may not be adequate to completely meet existing statutory inspection requirements. A strategic reassessment may be in order to determine the kinds of statutory flexibility that would be desirable to preserve the comprehensive consumer protection intent of the FD&C Act, and at the same time, allow FDA to address the most critical health and safety priorities."

PREPARED STATEMENT OF THE HUMANE SOCIETY OF THE UNITED STATES

We appreciate the opportunity to provide testimony to the Agriculture and Rural Development Subcommittee on two funding items of great importance to the Humane Society of the United States and its 6.7 million members and constituents. As the largest animal protection organization in the country, we urge the Committee to address these priority issues in the fiscal year 2000 budget.

THE ANIMAL WELFARE ACT

The Animal Welfare Act, the federal law designed to protect animals in research, exhibition, and commercial breeding facilities, as well as animals transported in interstate commerce, is in danger of becoming an empty promise. Due to a serious shortfall in the U.S. Department of Agriculture's Animal and Plant Health Inspection Service (APHIS)/Animal Care budget, regulated facilities and the public cannot depend upon having the high quality inspection program and consistent enforcement of federal animal welfare regulations that are vital to demonstrating compliance with the law. Funding of $13 million for APHIS/Animal Care is urgently needed in fiscal year 2000 to protect animals as Congress mandated and the public expects.

Funding for enforcement of the Animal Welfare Act has been stagnant since 1991. The Animal Care (AC) unit received $9.175 million in fiscal year 1999 to cover, among other things, inspections of more than 10,500 separate locations at regulated entities—research facilities; exhibitors such as zoos and circuses; animal dealers and breeders; and animal carriers such as airlines and ground freight handlers.

The AC funding situation has reached a crisis point, not only jeopardizing the well-being—indeed the very lives of millions of animals—but also threatening consumer protection and public health. USDA Inspector General audits over the last decade have confirmed our organization's concerns that APHIS cannot ensure humane care and treatment of animals at all facilities covered by the Animal Welfare Act as Congress intended with the resources currently provided.

In a commendable effort to streamline the unit, AC headquarters administrative and support staff have already been reduced by 35 percent and five sector offices are being consolidated into two. At this point, the erosion in AC's funding is compromising the quality and quantity of its inspectors and other direct enforcement efforts. Despite the need for at least 100 well-trained inspectors around the country, Animal Care had only 88 at its maximum in fiscal year 1991 and the number has continued to decline due to budget limitations. This year, the field staff will be cut to 70 inspectors.

Because of staff and other resource reductions, the number of inspections has declined by nearly 50 percent between fiscal year 1993 (AC's most productive year to date) and fiscal year 1998. Diminishing AC funds have also caused inspections to be increasingly complaint driven, meaning that AC is responding to situations where animal well-being may already be severely compromised. True animal welfare depends on a proactive approach that prevents animal abuse by assuring compliance with the law, rather than on a reactive enforcement process that starts only after animal abuse has occurred.

The Humane Society of the United States is pleased to join forces on this request with an unprecedented coalition of approximately 400 national and grassroots organizations representing regulated facilities and animal interests. We urge the Committee to appropriate $13 million for the APHIS Animal Care unit in fiscal year 2000 to begin addressing these urgent needs.

THE HORSE PROTECTION ACT

Enacted by Congress in 1970, the Horse Protection Act was passed to end the obvious cruelty of physically soring the feet and legs of horses. In an effort to exaggerate the high-stepping gate of Tennessee Walking Horses, unscrupulous trainers use a variety of methods to inflict pain on sensitive areas of the feet and legs for the effect of the leg-jerk reaction that is popular among many in the show-horse industry.

Just as in 1970 the practice of soring was rampant, in 1999 the practice continues unabated by the well intentioned but woefully underfunded, understaffed APHIS inspection program. The authorization limit for enforcement of the Act has been frozen at $500,000 since the enactment of the law, and the annual appropriation of $350,000 has been consistently inadequate for proper enforcement of the law.

In April of 1998, the *Tennessean* ran a front page story reporting that USDA veterinarians had found 673 cases of soring since 1987, despite the fact that they were able to attend only 10 percent of the shows. They also found that nine of the last 16 winners of the Trainer of the Year award had either been suspended from show-

ing or have cases pending for soring. The practice of soring is more entrenched today than when Congress originally acted in 1970. In response to a questionnaire from the Tennessee Walking Horse Breeders and Exhibitors Association, the head of the largest industry competition held annually in Shelbyville, TN stated that every trainer of Tennessee Walking Horses sores them with chemical irritants, heavy chains, or painful shoeing practices. The will of Congress has clearly been thwarted.

In a less than magnanimous gesture to the cash-strapped APHIS enforcement authority, in 1976, Horse Industry Organizations pushed for and won greater self-regulating authority. Unfortunately, the individuals trained to be Designated Qualified Persons (DQP) have not been willing or able to responsibly enforce the act. Industry inspectors consistently report fewer than half the number of violations cited when APHIS personnel are present. As a result, thousands of horses continue to suffer an outdated torture under the guise of training.

Since the day that the Horse Protection Act was passed, Horse Industry Organizations have sought to undermine the spirit of the law by managing soring with loopholes and road blocks instead of ending the cruel practice. Given past enforcement funding levels, Congress also has failed to ensure meaningful enforcement of the Horse Protection Act. To end the practice of soring, APHIS must receive adequate funding to carry out the provisions of the Act. The Humane Society of the United States urges the Committee to approve a modest increase of $150,000 in fiscal year 2000, to achieve the full $500,000 annual appropriation of funds authorized under the Horse Protection Act.

Again, we appreciate the opportunity to share our views and priorities for the Agriculture and Related Development Appropriation Act of fiscal year 2000. We hope the Committee will be able to accommodate these modest funding requests to address some very pressing problems affecting millions of animals in the United States. Thank you for your consideration.

PREPARED STATEMENT OF ILLINOIS INSTITUTE OF TECHNOLOGY

Chairman Cochran, Senator Kohl, Senator Durbin and members of the subcommittee, I am Darsh Wasan, Ph.D, Vice President and Motorala Chair at the Illinois Institute of Technology ("IIT"), Chicago, Illinois. I want to thank the subcommittee for the opportunity to submit this testimony for the record on behalf of IIT's National Center for Food Safety and Technology (the "Center") located at our Moffett Campus in Summit-Argo, Illinois. The Center is a unique collaboration of government, academia and industry scientists, all focused on the safety of the food on our tables.

I am submitting this statement primarily to thank you, Mr. Chairman, Senator Kohl, our home state senator, Senator Richard Durbin, and the rest of the subcommittee for your past support of the Center. I also want to update you on the work the Center is performing with its principal partner, the United States Food and Drug Administration ("FDA"), through the FDA's Center for Food Safety and Applied Nutrition ("CFSAN"). The Center supports the FDA in its mission to ensure the safety of all food products other than meat and poultry. The Center works with FDA to develop methods to detect and prevent life threatening pathogens from contaminating our nation's food supply. The recent deadly outbreak of Listeria that killed 20 people emphasizes the importance of food safety. Although not directly involved with this Listeria outbreak, as it involved processed meats, the Center routinely conducts research and education programs to decrease the incidence of Listeria, E.coli and Salmonella in other types of food.

The Center's collaboration between government, academia and the food industry—to develop methods to detect and prevent contamination of foods—is what makes the Center so unique. The Center was founded on the belief that open communication among government regulators, the scientific community and the food industry is the best way to establish a current knowledge base for food safety and for ensuring compliance with FDA regulations. This makes the Center not only a laboratory for scientific research. It is also makes the Center a laboratory in public policy. It is a laboratory where technologies for safer foods are transferred to the private sector, where food safety standards are defined and improved and where the "regulated" work with the "regulators" in a non-adversarial setting. Indeed, a recent National Academy of Sciences report, Ensuring Safe Food, lists this type of collaboration as essential for an effective federal food safety system.

IIT manages the Center. Our on-site Director is Charles Sizer, Ph.D., a highly regarded food scientist with years of experience in private industry and academia. I oversee the Center from IIT's Main Campus. I take great pride in the fact that I

helped create the Center eleven years ago, in 1988. We started with a grant of $3.7 million from the FDA and a gift of a pilot plant and five buildings from Corn Products International in Summit-Argo. Since then, we have had "Cooperative Agreements" with the FDA through which we have operated the Center. The effectiveness of this concept has made for a satisfying long-term relationship for both IIT and me. This public-private partnership will be even more successful with the new FDA Commissioner, Dr. Jane Henney. Dr. Henney recently visited the Center. We were impressed by her commitment and interest in food safety.

Most of the Center's research on food safety has been incorporated as part of the Clinton Administration's Food Safety Initiative. The Center presently has 18 of its own food science researchers working along side scientists from the FDA's Division of Food Processing and Packaging, which reports to Joseph A. Levitt, Director of CFSAN in Washington, D.C. NCFST and FDA scientists use the Center's facilities and laboratories to conduct their research side by side with private industry scientists.

The Center receives $2 million annually from the FDA. The Center uses this funding for the salaries and expenses of its own food scientists, the operation of laboratories and scientific equipment and the maintenance of its buildings and facilities. Those facilities include a "pilot plant" in which the Center has a "pathogen containment" laboratory for validating commercial-scale food processing equipment. The Center's budget includes another $1.5 million from corporate members, outside grants, and program income.

Presently, 47 food industry companies are members of the Center, including Kraft Foods, Inc., Corn Products, Inc., Bestfoods, Inc., General Mills, Inc., FMC Corporation, and Quaker Oats. Representatives of member companies serve with representatives of the FDA and academia on committees that direct the Center's activities, including selection and oversight of research projects. The research projects provide information for the FDA to use as it makes its regulatory decisions.

This collaboration has resulted in cutting edge research and development in food safety. The NCFST's accomplishments include the following:

(1) Developed a test for rapidly detecting E. coli O157:H7 in foods. This procedure is currently being used in food plants to improve product safety;

(2) Established a pilot-scale pathogen containment laboratory for testing commercial-size food processing systems. This laboratory has the actual process operations to demonstrate the inactivation of pathogens like Salmonella and Listeria;

(3) Organized a Sprout Safety Task Force with the International Sprout Growers Association to develop techniques for improving the safety of alfalfa sprouts. (The American Medical Association recently declared alfalfa sprouts "high risk" for Salmonella poisoning.);

(4) Conducted industry-wide research to develop protocols for the safe use of recycled packaging material;

(5) Conducted a workshop resulting in the establishment of guidelines for a new process to eliminate pathogens in liquid foods containing particles such as soups and stews;

(6) Formed a Task Force of 20 leading industrial partners to obtain approval of specific polymer packages to be used with irradiated foods. These packages will be used to protect red meats and poultry from contamination after they have been irradiated;

(7) Assisted industry in establishing the criteria for the safe processing of aseptically processed entrees in convenient packages. Aseptically processed foods provide the highest level of safety for convenience foods and home meal replacements;

(8) Contributed to the development of a high pressure process to make raw oysters safe to eat by eliminating Vibrio vulnificus bacteria; and

(9) Developed high pressure and ultra-violet light processes to kill pathogens in fresh fruit juices.

We believe these accomplishments are only a preview of the Center's future potential. We are proud to be part of the Administration's "Food Safety Initiative" that will help us maximize our potential. As part of that initiative, the Administration is proposing an additional $75 million in its fiscal year 2000 budget. The FDA would receive $30 million of that, $3.7 million of which would go to accelerating food safety research.

In the future, the Center will work with its government and industry partners to obtain more commercial size food equipment so that its research continues to produce practical and realistic benefits. The Center will also expand its outreach and collaboration with the food industry. For example, the Center will interact more with small-to-medium sized food companies. Many small food processors and packagers do not have the resources to address the complex technical and regulatory

issues associated with food safety. The smaller enterprises desperately need to leverage the Center's knowledge and facilities to test the integrity of their processes. The Center will also continue implementation of a unique new membership category called "Task Force Member." This new membership will allow the Center to rapidly mobilize industry resources to respond to public health hazards. A "Task Force" participant becomes a temporary member of the Center for the duration of the project. Resources for the project are raised by the Task Force and funds are allocated by "Task Force" members. This alliance exemplifies the Center's effort to bring government, academia and private industry together to respond rapidly to the causes of food borne outbreaks.

Mr. Chairman, the National Center for Food Safety and Technology hopes that it can continue to contribute to the integrity of the nation's food supply. Commissioner Henney, CFSAN Director Levitt and their FDA colleagues give us reason for that hope. Our industry members also give us reason for optimism. With your leadership and support, and that of Senator Kohl's and Senator Durbin's, the National Center for Food Safety and Technology will become an example to other federal agencies of how limited federal monies can be spent with maximum benefit to the taxpayers. It will become an example of how cooperation, rather than contest, can produce the maximum benefit to the public health.

Thank you again for the opportunity to submit this testimony for the record.

PREPARED STATEMENT OF THE ILLINOIS SOYBEAN ASSOCIATION

Mr. Chairman and distinguished members of the Agriculture, Rural Development, FDA, and Related Agencies Subcommittee: We represent the Illinois Soybean Association, an organization of approximately 3,200 leading soybean farmers. Among other goals, we foster well-coordinated public and private research leading to safe, nutritious, healthy, affordable, and convenient soy products for consumers and sustainable competitive advantage for the U.S. and Illinois soy industries.

We request that $3.5 million in federal funds be authorized to plan and construct a Soybean Disease Biotechnology Research Center within the National Soybean Research Laboratory (NSRL) located at the University of Illinois. If federal funds are secured, the Illinois Soybean Checkoff Board will contribute $500,000 in program support initially and entertain proposals for additional support. We will ask the University of Illinois to provide approximately 8000 square feet of shell space within the building housing the National Soybean Research Laboratory and will seek $500,000 in state funds to equip the Center. We will also ask the University to provide access to utilities and connections for a big-containment greenhouse proposed as part of the Center and, henceforth, to staff, operate, and maintain the Center in support of soybean disease biotechnology research.

ROLE OF THE CENTER

The Soybean Disease Biotechnology Research Center will be the first line of defense against major soybean diseases that threaten the U.S. soybean industry, and to programmatically attack current disease problems, such as the soybean cyst nematode (SCN). It will provide outstanding research talent and state-of-the-art facilities, equipment, and support services for cutting-edge biotechnology research on major soybean diseases. The Center will bring the power of the new sciences of structural, comparative, and functional genomics and genetic transformation to bear on SCN and other current and potential disease threats, including major diseases not yet in the U.S., such as soybean rust.

Center researchers will identify and create new and improved mechanisms of disease escape, tolerance, and resistance. The aim is to protect the soybean crop and increase its profitability throughout the industry. Genetic disease control mechanisms in the germplasm and genetic stocks of the National Soybean Germplasm Collection, located at the University of Illinois, will be a unique, readily accessible resource for the Center. In addition, genetic mechanisms of escape, resistance, and tolerance in other species will be identified and transferred to the soybean. Accordingly, highly effective disease control genes can be used for "stacking" in soybean varieties. This will assure the realization of gains from other genetic improvements, such as unique quality traits.

SETTING FOR SOYBEAN DISEASE BIOTECHNOLOGY RESEARCH

Researchers in the Soybean Disease Biotechnology Research Center will use the support services of the University of Illinois' new Keck Center for Comparative and Functional Genomics, with its high throughput genetic sequencing and unequaled

bioinformatics capabilities. This will greatly facilitate evaluation of materials in the National Soybean Germplasm Collection. Researchers will also have ready access to the University of Illinois Biotechnology Center, which provides recombinant DNA and protein science services, immunological resources, flow cytometry, high capacity transgenic plant production, and cell and tissue culture, among other valuable support services.

There will be direct access to superb conventional greenhouse and controlled environment facilities in adjacent, connected structures. As part of this project, a big-containment greenhouse will be constructed specifically to provide the levels of isolation and protection required for sophisticated disease biotechnology research. An elaborate system of research farms will be available for testing new developments in a wide range of soil, climatic, and socio-economic conditions.

The Center will complement and connect with the new St. Louis-headquartered Danforth Plant Science Center and participate in the Illinois Missouri Biotechnology Alliance. By virtue of the Center's location within the federal-state-industry-sponsored NSRL, work at the Center will be strategically integrated with other public and private efforts to conceive, plan, and implement soybean production and marketing systems of the future. This will foster interdisciplinary and cross-functional efforts that speed development and adoption of new technology and gain competitive advantage for the U.S. soybean industry.

NSRL is a major interface between the soybean industry, as represented by state and national soybean organizations and checkoff boards, and university research and education programs. NSRL was created by a USDA special grant of $5 million, which was used to renovate 30,000 square feet of space in a University of Illinois building and provide facilities for NSRL research and education programs. NSRL is directed by a Chair Professor of Agricultural Strategy, the only so-named professorship in the nation. The Chair position was endowed by the soybean industry, which contributes $40 to $80 million annually to soybean research.

NSRL fosters strategic public/private alliances within the soybean industry and with other commodity-based industries. It achieves extraordinary levels of communication, coordination, and integration of publicly and privately financed research and educational programs across the nation. As developer of STRATSOY, the most sophisticated and useful commodity website, NSRL provided the soybean industry with a powerful tool for uniting its far-flung checkoff funded programs, disseminating information, eliminating redundancy, sharpening strategic focus, and increasing the return on both public and private investment in soy research.

Its location within NSRL will assure that research in the Soybean Disease Biotechnology Research Center will fully complement and benefit from other soy research programs across the nation and world. It will assure that the results of fundamental soybean disease biotechnology research are quickly translated into practical technology, useful information, and sustainable competitive advantage for the industry. The NSRL mission of increasing the volume of profitable, sustainable business in the soy industry will become the mission of the Soybean Disease Biotechnology Research Center.

This is an excellent time to establish the proposed Center because the University is initiating its Postgenomic Biotechnology Program in fiscal year 2000. A multi-million investment of state funds will provide 25 new biotechnology positions in functional genomics, bioinformatics, developmental biology, microanalytic systems, and cellular and molecular bioengineering. Within this framework, new positions in plant disease biotechnology will be filled with outstanding scientist/educators who already have established impressive track records. Under this program, leading biotechnology scientists will be recruited for the Soybean Disease Biotechnology Research Center.

GOALS OF THE CENTER

The Soybean Disease Biotechnology Research Center will:

1. Provide a superb setting for cutting-edge soybean disease biotechnology research.
2. Foster and support the very best soybean disease biotechnology research team in the world.
3. Assure that effective soybean disease escape, resistance, and tolerance genes are available for "stacking" in top U.S. soybean varieties.
4. Eliminate the soybean cyst nematode as a major threat to the U.S. soybean industry and prevent harm from introduction of foreign disease organisms.
5. Enable molecular soybean pathology research through which the Illinois and U.S. soybean industries will achieve and maintain preeminence in global and domestic markets for soybeans and soybean products.

6. Enable the U.S. soy industry to capture proprietary benefits from soybean biotechnology research and other research conducted all over the world.
7. Enhance the global and strategic significance of the National Soybean Research Laboratory and empower its scientists, thus maximizing its benefits for the nation.

CREATING THE SOYBEAN DISEASE BIOTECHNOLOGY CENTER

The Soybean Disease Biotechnology Research Center will be created by extensively remodeling approximately 8000 square feet of currently undeveloped space within the NSRL. This will provide elaborate laboratories, a bio-containment greenhouse in the adjacent greenhouse complex, instrument rooms, coldrooms, other workrooms, support facilities, and offices dedicated to soybean disease biotechnology research. To the extent feasible, physical connections will be established between the NSRL and the greenhouse complex linking the Soybean Disease Biotechnology Center to interconnected buildings housing the Keck Center, Biotechnology Center, and the University of Illinois' existing food and agriculture biotechnology research on animals, microbes, and other plants.

SUMMARY

We request that $3.5 million be authorized to plan and construct a Soybean Disease Biotechnology Center within the National Soybean Research Laboratory at the University of Illinois.

PREPARED STATEMENT OF THE STATE OF ILLINOIS

As you begin to finalize your appropriations priorities for fiscal year 2000, I am submitting for your review, the enclosed book of appropriations goals and requests for the State of Illinois. I am hopeful that these requests can be included and accommodated in the upcoming appropriations process.

These items reflect the input of the various state agencies, cities, and counties of Illinois. As you will see in the enclosed briefing book, the appropriations requests are organized by the appropriate subcommittee. In addition, these requests include both ongoing federal funding needs and new funding requests.

For additional information about these requests, please call any member of my DC staff at 624–7760. Thank you very much for giving these requests your fullest consideration and your enthusiastic support.

AGRICULTURE, RURAL DEVELOPMENT AND RELATED AGENCIES

AGRICULTURE

Special supplemental nutrition program for WIC

Request: Support the Administration's proposed increase in the Special Supplemental Nutrition Program of $281 million.

This will amount to an additional $15 million for Illinois.

Farmer's market nutrition program (FMNP) for WIC

Request: Support funding for FMNP at the requested level of $20 million.

This is an increase of $5 million over the fiscal year 1999 appropriation. This will expand the reach of FMNP to many Illinois communities. The current regulations require a 30 percent state match of the total award. The Illinois Department of Human Services supports changing the match to 30 percent of the administrative costs.

Infant formula rebate funds

Request: Support language that would grant states the flexibility to use a portion of the infant formula rebate funds for infrastructure needs such as clinic expansion.

Illinois currently receives $55 million annually in infant formula rebate funds.

Food stamp quality control system

Request: Support language that would change Food Stamp regulations to allow standards to be adopted that would judge and compare state performance more effectively than the current single measure for payment accuracy.

Under the current regulations, samples are taken in a single month to determine the correct food stamp allotment. Sanctions are levied if the state's payment error rate exceeds the average of all other states. This could result in millions of dollars in sanctions.

National corn to ethanol research pilot plant (NCERPP)

Request: Support funding of $14 million for the National Corn to Ethanol Research Pilot Plant (NCERPP) in the fiscal year 2000 Agriculture Appropriations bill.

The State of Illinois has appropriated $6 million for construction of the NCERPP at Southern Illinois University-Edwardsville. The total cost of constructing the project is estimated at $20 million. The cost of operating the facility will be borne by industry and university research conducted at the plant.

Congress appropriated $2 million for the Agriculture Research Service (ARS) for design work in the fiscal year 1996 and fiscal year 1997 budgets.

Pseudorabies swine slaughter

Request: Support full funding for Animal Plant and Health Inspection Service (APHIS). Illinois supports an appropriation of $75,000 from APHIS to institute a pseudorabies swine slaughter surveillance collection point at Johnsonville Packing, Momence, Illinois. The Administration is planning to cut funding for APHIS by $3.1 million for fiscal year 2000.

Extrapolating from a recent survey of an average four-week kill, approximately 14,000 animals are processed at this plant every month. Of this kill, 32 percent of the swine were traced back to Illinois, 18 percent to Iowa, and 17½ percent to Indiana. The cost of collecting the backtagged animals at this plant has been estimated to be $20,000, calculating 70 cent/sample. The laboratory testing would cost $55,000, making the total expenditure $75,000 to collect at the Momence Plant. This figure does not include shipping cost.

Currently, Illinois is struggling to acquire an adequate number of slaughter surveillance samples to maintain the compliance established by the National Program Standards. Last year, first point testing was conducted at the end of the year to achieve the required numbers. It has been established that slaughter surveillance of cull sows and boars is the superior method of determining the PRV status in herds at the grassroots level.

Failure to collect the needed number of surveillance samples will result in the need to initiate more costly methods of swine surveillance (i.e. first point testing or down the road testing). Swine producers from Illinois and neighboring states would benefit from the collection.

Voluntary Johne's disease herd certification program

Request: Support full funding for Animal Plant and Health Inspection Service (APHIS).

Illinois supports a one-time appropriation from APHIS for $200,000 for the purpose of defraying the cost to producers wishing to enroll in the Voluntary Johne's Disease Herd Certification Program. This program allows a producer to do testing for the presence of *Mycobacterium paratuberculosis.*

Johne's is an incurable wasting disease of cattle, sheep, goats and cervidae, contracted through direct contact with infected animals. Animals are generally infected at a young age, but may not exhibit signs of the disease until they are four or five years of age. It has been estimated that economic losses can amount to $227 per cow. A recent National Animal Health Monitoring System (NAHMS) sampling of Illinois dairy cows indicated a prevalence of at least 10 percent in the cull cows from the dairy herds tested.

A positive serology test normally indicates the animal has Johne's Disease, at a lab cost of $5.00. To do a whole-herd test for a 100-cow operation, it would cost a producer $500 in laboratory costs alone. (A more accurate, time-consuming confirmatory test may also be run following a positive serum test, with a lab cost of about $7.00.) Both tests are run by the Illinois Department of Agriculture's two animal diagnostic laboratories at Centralia and Galesburg, and the diagnostic laboratory at the University of Illinois College of Veterinary Medicine.

There are approximately 1,750 dairy farm families, 26,000 beef producers, and 3,100 sheep and lamb producers in Illinois. We have about 475,000 beef cows, 145,000 milk cows, 79,000 sheep and lambs, and an undetermined number of goat and cervid herds, which would qualify in this voluntary program.

Under this proposed program, the producer would still be responsible for veterinary costs associated with acquiring the samples. This funding would offset the costs of the testing to the producer and encourage enrollment in this program. Animals certified under this program should be worth more money. Producers purchasing these animals would have a high degree of certainty the animals are free of Johne's Disease.

Swine producer laboratory testing

Request: Support full funding for Animal Plant and Health Inspection Service (APHIS). Illinois supports a one-time appropriation from APHIS for $100,000 to defray the cost for swine producers conducting laboratory testing necessary to diagnose or maintain the health of their swine herds.

With the current low prices for hogs, many producers are either foregoing diagnostic or preventative health measures in an effort to obtain some profit from their animals. Maintaining a healthy swine herd helps the producer produce his product in a more efficient manner. Providing this assistance would insure that animals that are unhealthful and diseased would have access to proper diagnosis and eliminate potential disease situations arising in the herd and possible spread within the swine industry. In 1997, Illinois produced 1.82 billion pounds of pork, placing it fourth in US hog production. The number of hog producers in Illinois continues to drop: 8,800 hog farms in 1996; 7,500 hog farms in 1997; and 7,000 hog farms in 1998.

APHIS—Gypsy Moth "Slow the Spread" program

Request: Support fiscal year 1999 funding levels to provide Illinois with $200,000 for the APHIS program.

The Illinois Department of Agriculture, under authorities provided in the Insect Pest and Plant Disease Act, annually cooperates with APHIS and various units of local and county government to identify and control the Gypsy Moth in Illinois. The annual program includes both the identification of gypsy moth infestations as well as a treatment control program. In the past, no funding has been transferred between agencies. In the trapping (identification) program, the APHIS has concentrated on the Chicago Metropolitan area and the Illinois Department of Agriculture has worked in the balance of the state. Once an area is identified as being in need of a treatment control, the APHIS has provided the biological pesticide, the local unit of government has provided funding for the applicator and the Illinois Department of Agriculture has provided overall project oversight and coordination. In fiscal year 1999, the APHIS provided funding to states for an expansion of the trapping (identification) program to attempt to further reduce the spread of the insect.

Invasive species program

Request: Support the Administration's proposed $16 million increase to U.S. Department of Agriculture programs intended to combat invasive species (plants and animals non-indigenous to the U.S.) which are negatively impacting many areas of the nation.

The recent detection and eradication efforts associated with the Asian long-horned beetle in Chicago and New York are examples of the types of programs to be supported through this new initiative. No further information is available relative to the possible transfer of funds to states at this time. However, this initiative could have a significant impact of the Illinois Department of Agriculture's administration of the Insect Pest and Plant Disease Act as well as the Illinois Nursery Industry.

Natural Resources Conservation Service (NRCS) budget shortfall due to section 11 cap

Request: Support for Amendment Number 115 to S. 544 Supplemental Appropriations. This amendment provides $28 million in additional funding under the Section 11 cap to deal with the States (Illinois is one) where NRCS has severe budget shortfalls for fiscal year 1999 which will seriously impact the delivery of Farm Bill Programs.

In Illinois, the NRCS has a budget deficit of $1.8 million in fiscal year 1999. If Amendment 115 to S.544 does not pass, the state NRCS will furlough all Illinois NRCS employees at least 35 days. This will have a devastating impact on all Illinois conservation and watershed programs. It will directly impact 1,825 program applications, 480 Illinois conservation projects, 1,257 conservation and resource plans and over 401,100 rural and urban Illinois constituents. There is no State funded Agency or entity who can fill the void in the technical assistance that will be lost. No other federal agency can deliver the local technical assistance that NRCS has provided for in each county of the State. NRCS has worked very closely with the Soil and Water Conservation Districts (SWCDs) to help maintain and improve natural resources in every county. The State has committed $48 million dollars to the Illinois River Conservation Reserve Enhancement Program (CREP) which will be severely hampered if NRCS furloughs employees. All other conservation and watershed programs statewide will also be hampered.

Illinois groundwater consortium

Request: Illinois supports $3,000,000 for the Department of Agriculture to restore and expand funding for the Illinois Groundwater Consortium (IGC).

Funding for the Consortium was not included in the fiscal year 1999 USDA budget. Restoration and an increase to the requested level in fiscal year 2000 will enable the Consortium to continue and expand research and outreach programs that provide a scientific base for management and regulatory decisions on the use and protection of water and land resources.

In 1990, Southern Illinois University at Carbondale joined forces with Illinois State Geological Survey, Illinois State Water Survey, Southern Illinois University at Edwardsville, University of Illinois Cooperative Extension Service, and the University of Illinois Agricultural Experiment Station to form the Illinois Groundwater Consortium. From direct appropriations in the USDA budget for 8 years, the IGC awarded competitively selected grants to support collaborative and interdisciplinary research and outreach projects focused on scientific and policy issues relating to groundwater protection, fate and transport of agricultural chemicals, and the impacts of natural disasters (e.g., flooding) on surface- and ground-water, soils, and biodiversity. The members of the consortium have provided significant resources to the IGC from their own appropriations so that the state's contribution has approximately equaled the annual federal appropriations. It is expected that the match will continue.

Throughout its history, the IGC has primarily funded research seeking answers to questions raised by public policy makers working on land use and water protection issues. Results of the work of the Consortium have impacts statewide. The members of the Illinois Groundwater Consortium are uniquely positioned to conduct investigations on issues of economic, ecological and political importance to all the people of Illinois.

Analyses of environmental restoration programs for the Illinois River

Request: Illinois supports a fiscal year 2000 appropriation of $1,500,000 from the U.S. Department of Agriculture for analyses of environmental restoration programs for the Illinois River. The outyear appropriation request is $1,500,000 per year for 7 years.

The Illinois River Conservation Reserve Program (CREP) is a $500 million, 15-year joint federal and state initiative to restore the Illinois River watershed. The proposed appropriation will fund monitoring and scientific assessment of the land management benefits of CREP, leading to the development of sound land management strategies that will improve the efficiency of CREP and other future programs. These actions will jointly benefit agricultural production and water quality in Illinois, and promote the overall health of the Illinois River's ecosystem and the 11 million residents of its watershed. The benefits would be to demonstrate the effectiveness of a $500 million program. State matching funds: $158,700 (fiscal year 2000)

Agriculture research service USDA recordkeeping cooperative agreement

Request: Support the fiscal year 1999 level of funding to promote $13 million to Illinois. The Illinois Department of Agriculture annually enters into a cooperative agreement with the U.S. Department of Agriculture's Agricultural Marketing Service (AMS) to monitor certified private pesticide applicator's restricted-use pesticide recordkeeping. The Food, Agriculture, Conservation, and Trade (FACT) Act of 1990, otherwise known as the 1990 Farm Bill, required the Secretary of Agriculture (USDA) to require certified private applicators to maintain records regarding the use of federally restricted use pesticides. Under the cooperative agreement, the Illinois Department of Agriculture annually conducts approximately 188 randomly-selected applicator records checks to ensure compliance with these requirements.

Agriculture Research Service—Greenhouse Facility at University of Illinois

Request: Earmark $4.4 million for a Greenhouse Facility at Illinois University

Funds will be used for the construction of a Greenhouse Facility at the Urbana-Champaign campus. The facility will operate in support of the Maize Genetics Stocks and National Soybean Germplasm collections maintained at the University. Federal investment in biotechnology research are important to the future of the food and agricultural sectors and consumers in Illinois.

OTHER ISSUES AND PROGRAMS

Tobacco Recoupment

Request: Tobacco Agreement funds be distributed to the states without HCFA claiming a share and with no limitations on the use of the money.

Illinois will receive approximately $9.1 billion over 25 years from the recent settlement with tobacco companies. Governor Ryan believes that all of the funds should be utilized pursuant to discussions among state and local elected public officials. To that end he supports measures to prohibit the Secretary of HHS from recouping a portion of the settlement and opposes any limitation placed on the use of the money by the federal government.

The states accepted all of the risks and expense of this litigation and the federal government choose not to participate, despite a direct invitation to Attorney General Reno.

Advocates for a federal share of these funds justify their claim on federal Medicaid payments. However, the settlement agreement does not mention Medicaid and many states did not employ the Medicaid expense argument as part of their cause of action. Generally, state causes of action were predicated on consumer protection, fraud, racketeering, antitrust violations and health related costs—only some of which are Medicaid.

In addition, the legislative intent of the Medicaid law provides for recovery of overpayments to healthcare providers or to compensate for fraud and abuse, and not to provide a basis for any such federal claim.

Requiring states to spend some of these funds on programs such as smoking cessation has been suggested. The settlement already requires the tobacco industry to fund a charitable trust in the amount of $2.5 billion to conduct research about reducing smoking and creates a $1.45 billion national public education fund for tobacco cessation efforts. In Additional the settlement has many provisions, which should reduce, smoking such as bans on advertising designed to appeal to you adults.

The U.S. Senate-passed Supplemental includes the provisions desired by Illinois.

Low Income Housing Tax Credits (LIHTC)

Request: Raise the allotted amount of LIHTC to $1.75 per capita from its current level of $1.25 per capita and index it for inflation.

Illinois will gain $6 million in increased tax credits. The LIHTC program was established as part of the Tax Reform Act of 1986. Tax credits are awarded to developers of qualifying affordable housing projects who then sell the tax credit to private investors to raise equity for the development. The credit is used by the buyer as a reduction in their tax liability for a ten year period after the successful completion of the project. Over 90 percent of all affordable housing in the United States is funded by the LIHTC program, including 30,000 units in Illinois alone. However, current demand for affordable housing for senior citizens and working families exceeds our tax credit resources by a 3 to 1 ratio. Since being codified, the per capita allotment has not been increased, and as a result of inflation, has lost approximately 45 percent of its original value.

PREPARED STATEMENT OF THE ILLINOIS-MISSOURI ALLIANCE FOR AGRICULTURAL BIOTECHNOLOGY

Mr. Chairman and distinguished members of the Senate Agriculture, Rural Development, and Related Agencies Subcommittee: Our testimony is on behalf of the federally-funded project entitled the Illinois-Missouri Alliance for Agricultural Biotechnology (IMBA). A special grant of $1.3 million was provided to launch this effort in fiscal year 1995. Additional grants of $1.3 million in fiscal year 1996 and fiscal year 1997, $1.2 million for fiscal year 1998, and $1.1 million for fiscal year 1999 were provided. An innovative management plan was developed, refined, approved by the Cooperative States Research, Education, and Extension Service (CSREES), and implemented. Updated plans have been submitted to CSREES each year and approved. Several important research and development projects are underway.

Request: In order to sustain, expand, and enhance this productive and strategically essential program, we request that $3.0 million be appropriated for IMBA for fiscal year 2000. The increased appropriation will allow us to fund a larger proportion of the superb proposals being submitted to IMBA. It will allow us to implement fully the unique, IMBA performance-based management strategy, which addresses the major concerns of stakeholders concerning management of federal competitive grants programs. It will allow the program to go into continuous mode, as explained below, rather than annual cycles, and fully implement the "virtual" research institute concept. An increased appropriation will provide significant economies of scale and scope, thus disproportionately increasing the funds directly available for research. In addition, it will increase the annual leveraged contributions from about $4 million to at least $9 million.

Needs and opportunities: It is now evident that the Illinois Missouri Biotechnology Alliance is focused on the world's most important agricultural problem/opportunity. Rapidly growing population, urbanization, and affluence, especially in southeast Asia, are causing a dramatic increase in the consumption of animal protein. These factors are fostering unprecedented growth in large scale animal production facilities and in global markets for animal products.

Corn and soybeans are superior economically, nutritionally, and for logistical reasons to other grain crops for feeding almost all classes of livestock, but especially swine, beef, dairy, poultry, and confined fish. These classes of livestock are undergoing the most rapid increase and inevitably will be produced in large scale, confinement facilities around the world. With superior technology, Illinois, Missouri, and surrounding corn belt states can be the principal suppliers not only of corn and soybeans but also of livestock products and other value-added products produced from corn and soybeans. To reap the potential benefits, however, the U. S. will have to compete vigorously against sophisticated producers, primarily in Latin America, for these emerging markets.

Likewise, to keep the food situation from ravaging both agricultural and natural environments around the world, it is imperative that corn and soybean yield and quality, production efficiency, and efficiency of conversion into animal products and other high quality food and non-food products be increased at rates never achieved before. These are principal objectives of IMBA.

Mission, objectives, and strategy: The mission of the IMBA is to increase the volume of profitable business in the U. S. food and agriculture sector by improving the diversity, quality, safety, affordability, and convenience of products and services marketed by the sector. The IMBA is accomplishing this mission by supporting cutting-edge biotechnology research conducted as part of strategically sound, competitively funded, research and development projects organized around clearly defined, practical objectives.

A steering committee made up of Roger Mitchell, Dean of the University of Missouri College of Agriculture, Food, and Natural Resources; Frank Stokes, Director of Policy and Planning, Monsanto Company; James McGuire, Dean of the Southern Illinois University College of Agriculture; and Don Holt, then Director of Research, University of Illinois College of Agriculture, prepared the original management plan for IMBA. The plan was implemented to create and coordinate a market-driven, mission-linked, practical-goal-focused research and development program characterized by public/private cooperation. The plan is aligned with the performance-based management philosophy of the Government Performance and Results Act (GPRA).

When the management plan is approved each year, program funds are transferred to the Illinois Agricultural Experiment Station, which serves as repository until the funds are dispersed within the program. To avoid spreading the IMBA research investment too thinly, we limited the practical scope of the program to the corn and soybean industries; geographical scope to Illinois, Missouri, and other Midwestern states; and disciplinary scope to biotechnology.

Day-to-day operations of IMBA are managed by a Program Manager, Dr. Bruce Bullock, Professor of Agricultural Economics, University of Missouri, and former Director of the Missouri Agricultural Experiment Station. The University of Illinois contracts with the University of Missouri-Columbia for Dr. Bullock's services. An Executive Committee is made up of Program Manager Bullock, new Missouri Dean Thomas Payne, Dean McGuire, new Illinois Associate Dean for Research Steven Pueppke, and Senior Associate Dean Holt, who serves as principal investigator on the project. The Executive Committee oversees the program and approves all major expenditures of IMBA funds.

IMBA-funded biotechnology research grants are awarded competitively, based on relevance to IMBA objectives, soundness of the proposed research and development strategy, and scientific merit. Proposals are evaluated by both scientific peers and industry experts to assure that the best science and the best business strategies are brought to bear on agricultural problems and opportunities that are important to the region. The Program Manager works with the Executive Committee to design and develop a biotechnology research investment portfolio that addresses the following objectives.

1. Develop new and improved uses for corn and soybeans and products that can be manufactured profitably from them.

2. Increase the value of corn and soybeans as raw materials for manufacturing food, feed, fiber, fuel, and chemical feedstocks.

3. Lower the unit cost of producing, processing, distributing, retailing, and utilizing corn, soybeans, and products manufactured from them.

4. Maximize positive effects and minimize negative effects of the corn and soybean industries on the environment.

5. Conserve non-renewable resources consumed in the corn and soybean industries.

In designing the IMBA research portfolio, the Executive Committee defines and seeks an appropriate balance among the above objectives, among projects with varying degrees of uncertainty and risk, and among objectives that can be achieved in relatively short and long periods of time. On the high risk side, provision is made for some funding of promising but unproven scientists with good ideas.

Innovative management: The IMBA Management Plan includes several innovations that differentiate IMBA from other major public agricultural research grant programs. IMBA proposals are solicited and projects organized around desired practical outcomes. Success is measured in terms of achieving practical objectives. Only biotechnology research projects that are fully integrated into strategically sound research and development projects are funded. Participating institutions, agencies, and private firms are expected to share project costs through direct and in-kind contributions. It appears that public and private direct and in-kind matching contributions will continue to exceed the IMBA investment by a factor of two or more.

We intend to operate the program in continuous, parallel mode rather than in linear, stepwise sequences, repeated yearly. This approach should speed the R&D process while reducing cost. Information technology is being employed to bring an exceptional level of communication and coordination to each project. Each IMBA project involves public/private cooperation to achieve a useful practical outcome. The IMBA program manager is expected to take a more hands-on approach to research coordination than the usual grants manager.

Achievements of IMBA research: IMBA-supported researchers accomplished the following during the past year: (1) refined genetically engineered baculovirus insecticides (produced in earlier IMBA work) by adding additional insect-specific toxins that increased virulence against corn borer and several other species of harmful insects. These viruses offer backup and alternatives to the bt approach; (2) developed and are patenting a unique genetic transformation process that increases lysine in corn proteins, thus markedly increasing corn protein quality. Two companies are seeking access to this technology; (3) produced gene constructs that should enable scientists and plant breeders to modify soybean oil quantity and quality at will so as to emulate desirable characteristics of competing oils, and, at the same time, studied market channels to see where it would be most profitable to market these modified soybeans and resulting products; (4) successfully transformed soybean plants, using the unique approach that will be used to introduce and target heat-stable phytase genes discovered in earlier IMBA work. Successful introduction of phytase genes to crop plants and use of heat-stable phytase in processing will reduce the cost of phosphate supplementation of animal rations and greatly reduce the passage of plant phosphate through animals into water sources, where it is a major pollutant.

In projects launched more recently, scientists accomplished the following; (1) through genetic transformation, produced corn hybrids with increased nitrogen use efficiency, 10 percent greater grain yield, and 10 percent greater biomass yield, measured in field experiments. As a side benefit, the GDH (glutamate dehydrogenase) gene incorporated into inbreds used to produce these superior plants was found to enhance considerably the so-called Liberty-Link herbicide resistance. The GDH gene promises to reduce the environmental impact of corn production by enabling the corn plant to thrive on the ammonium rather than the nitrate form of nitrogen. Garst and Monsanto tests of GDH-transformed corn were promising; (2) in a project to introduce a new mechanism of resistance to the most serious pest of soybeans, the cyst nematode, scientists isolated a gene that is being patented. The details are confidential at this point, but this gene plays an important role in plant development and may be manipulated to benefit U.S. agriculture.

In addition, IMBA supported scientists: (3) developed the first databases of genes regulated by calorie level in foods; specific nutrients, such as lipids; and non-nutritive dietary chemicals, such as pytochemicals. With knowledge of these genes, it should be possible to identify each individual's unique food-related genetic profile, anticipate certain responses to food, and adjust eating habits accordingly. These tests will also facilitate treatment of various chronic and acute food-related disorders, including obesity, some forms of cancer, and heart disease. The food-related gene database will permit more accurate interpretation of toxological, drug, and disease gene expression experiments. Results of this work are being commercialized by a new firm, Electropharmacology, Inc., which has partnerships with major pharmaceutical and biotechnology companies.

During the past year, an IMBA-funded group produced an online journal, AgBioForum, two issues of which are already on the web. The journal addresses important biotechnology issues such as mergers and acquisitions within the bio-

technology industry and European resistance to genetically modified organisms. Response to this journal has far exceeded expectations. Over 20,000 people from all over the world accessed the journal and 600 became members of the journal association in the first four months it was on the web.

The group that developed AgBioForum is also redesigning the IMBA web page to increase its utility an important mechanism of communication and coordination among biotechnologists. Besides providing IMBA background, project lists, and requests for proposals, the IMBA home page now contains over 100 "hot links" to the home pages of other biotechnology-related institutions, agencies, organizations, and firms. The IMBA home page will become the hub of a "virtual" research institute focused on IMBA objectives.

New projects underway include efforts to: (1) genetically engineer corn to produce genistein, one of a class of phytochemicals thought to prevent cancer and provide other health benefits; (2) develop an automated system for screening large numbers of seed samples and detecting and selecting superior resistance to soybean sudden death syndrome, thus saving years of field testing, (3) Isolate apomixis genes and transfer them to major crops, thus enabling "permanent" hybridization, in which the progeny of hybrids have the same genetic makeup as parents. This would make it practical to save corn produced on hybrid plants for seed; and (4) develop high oil, high oleic acid, value-added corn hybrids.

Cooperators: Current cooperators in IMBA projects include the Universities of Illinois and Missouri, Southern Illinois University, Iowa State University, and the USDA-Agricultural Research Service group at Woodward, Oklahoma. Private, nonprofit cooperators include Sapient's Institute and Northwestern University. Private sector commercial firms cooperating or involved in negotiations include Monsanto Company, Garst Seeds, Pioneer Hybrids, ADM-Growmark, Clarkson Grain, Cargill, Dupont, Biosys, Zeneca Agrochemicals, Novartis, DowElanco, GeneTech, Healthtech, and Electropharmacology, and others. Each phase 1 project is generating potential new and improved projects. Private firms are evaluating the commercial potential of each product of IMBA research, and, in some cases, gearing up to produce these products.

Summary: We believe IMBA projects constitute an outstanding portfolio of promising research investments focused on the major problems and opportunities associated with the U.S. corn and soybean industries and the world food situation. Because of the economically important subject matter being addressed by the Illinois-Missouri Biotechnology Alliance, the unique capabilities of participating institutions, and the innovative research management approach being employed, we believe the project will continue to be unusually productive and will generate an unusually high return on the federal investment. This will be more than justify the $6.2 million appropriated to date and the $3.0 million requested to continue the project in fiscal year 2000.

PREPARED STATEMENT OF THE INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES

NATURAL RESOURCE CONSERVATION SERVICE (NRCS)

The Natural Resource Conservation Service has immense responsibilities for implementing the conservation provisions of the 1985 Food Security Act (FSA), the 1990 Food, Agriculture, Conservation and Trade (FACT) Act, and the Federal Agricultural Improvement and Reform (FAIR) Act of 1996.

Technical Assistance.—The USDA publication "Geography of Hope" identifies that the need for general conservation technical assistance for America's private landowner will continue to increase to 2002 and beyond. Additionally, a fiscal year 1999 workload analysis indicated the need for an additional $300 million for technical assistance. The Association supports the $31 million requested increase in conservation operations but is extremely concerned about the substitution of new initiatives without adequate present funding levels to meet existing needs. The Association is further strongly concerned about the decrease of 1,055 field level staff when all indicators point to the need for more field level staff to provide technical assistance required for existing programs as well as the Administration's proposed new initiatives.

In addition to increasing general (non-programmatic) technical assistance, increased technical assistance funds are needed to implement increasingly popular provisions of the 1996 FAIR Act. The budget for the Wetlands Reserve Program (WRP), Wildlife Habitat Incentives Program (WHIP), and the Farmland Protection Program (FPP) all include the customary 19 percent to 20 percent for technical as-

sistance. The Association strongly supports this level of funding provided to ensure that optimum agriculture and natural resource benefits will accrue from these programs. Notably absent from the list of programs provided adequate levels of technical assistance is the Environmental Quality Incentives Program (EQIP). The proposed fiscal year 2000 budget raises EQIP from $200 million to $300 million, which the Association applauds. It is not clear, however, that additional funds are available to provide the required technical assistance to a field level program with a 50 percent increase. Some Programs (CRP, WRP, CFO and FPP) have a technical assistance cap set by Section 11 of the CCC Charter Act at the 1995 spending level. No such constraint exists on EQIP. The Association therefore strongly urges the restoration of the customary 19 percent for technical assistance on EQIP.

State Technical Committees (STC).—The 1990 FACT Act required that State Technical Committees (STC) be established to facilitate interagency cooperation and coordination of technical guidelines for the conservation programs. Further, the USDA 1995 Reorganization Act specifically exempted the STC from the Federal Advisory Committee Act (FACA). The 1996 FAIR Act further added additional members to the STC. Federal-State coordination is an ongoing normal function that is required with or without a formal State Technical Committee. We commend the strong efforts of NRCS that has ensured the establishment of the State Technical Committees in each State with representation from the respective State fish and wildlife agency.

Wetland Determination.—We believe the need for wetland determination, certification, and mapping is great and urge NRCS to proceed as soon as possible, under the guidance of the FAIR Act of 1996. The Association urges expeditious completion of the wetland determinations required to implement the Swampbuster provisions of the 1985 FSA, 1990 FACT Act, and the 1996 FAIR Act as well as the FAIR Act directed interagency cooperation, whereby NRCS assumed responsibility for wetland designation for Section 404 (Clean Water Act) purposes on farmland, including tree farms, rangelands, native pasture, and other private lands used to produce or support the production of livestock. The Association and individual states wish to continue to work with NRCS to help achieve these goals.

Public Law 566.—The Association generally supports the small watershed (Public Law 566) Projects. That support is based upon continued emphasis on updated watershed planning and management. Such efforts could utilize and expand upon existing Public Law 566 plans examined in light of present day issues of wetland protection, water quality enhancement and fish and wildlife habitat. The greatest potential for these programs is for land treatment measures that retain the water on the land, improve infiltration, improve water quantity and quality, and provide fish and wildlife habitat. Structural and non-structural land treatment activities require state and local matching funds and are therefore leveraged to provide greater conservation benefits for each federal dollar spent while promoting valuable partnerships among states, local agencies, and other organizations.

National Buffer Initiative.—NRCS has implemented the initiative in cooperation with industry and other partners. The Association is pleased to be a sponsor of this innovative approach. The National Academy of Sciences has found that buffer strips can reduce off-field pollution by 70 percent, thus also contributing to meeting nonpoint source remediation goals under the Clean Water Act. Unfortunately, the level of sign-up by producers remains very low. NRCS has committed special emphasis and a major effort to use the strip practices covered by the continuous CRP signup in a more targeted fashion. Unlike the large or whole field CRP retirements, buffer strips will require extensive outreach plus the much more attractive rental rate now available. The Association supports the allocation of increased funds specifically for outreach to increase participation in the various buffer strip practices. In addition, a review and evaluation of why sign-up is low is strongly recommended. Increased activity on the Buffer Initiative (continuous CRP sign-up) will require an increase in field staff for technical assistance rather than a decrease as proposed.

Forest Incentive Program (FIP).—The Forest Incentive Programs (FIP) has multiple resource values for fish, forests, wildlife, clean water and erosion control. The Association opposes the NRCS proposed intention to drop FIP funding and strongly recommends that the fiscal year 1999 level of $16.325 million be continued in the fiscal year 2000 budget.

Capped Programs.—The Wetlands Reserve Program (WRP), Wildlife Habitat Incentives Program (WHIP), and the Farmland Protection Program (FPP) have all reached or are near authorized acreage or appropriation caps. The Association continues to recognize and support the benefits to our natural resources from these programs. We believe that due to the overwhelming success, customer acceptance and public benefits of these programs, they should be re-authorized. We applaud the NRCS proposal to continue the WHIP at $10 million annually through 2002 with

legislation removing the appropriations can. The Association likewise applauds the proposal to budget $27.5 million for continuation of the Farmland Protection Program. The Association strongly suggests that similar efforts be made to remove the 975,000 acre can on WRP before that cap is reached in fiscal year 2000.

Program Delivery.—Continued erosion of field staff with the additional staff reduction proposal in fiscal year 2000 is inconsistent with the needs demonstrated by the recent workload analysis. That analysis determined the need for $300 million for additional field staff for implementation of existing programs. The addition of new initiatives (worthy as they are) simply exacerbates the shortage of sufficient field staff providing technical assistance.

The Association is very strongly concerned about this continued erosion of technical staff and equally strongly recommends the addition of $300 million in fiscal year 2000 to help meet this critical need for technical assistance for effective program delivery of these vital conservation programs.

FARM SERVICE AGENCY (FSA)

An adequately funded budget for the FSA is essential to implement those conservation related programs and provisions under FSA administration and/or in cooperation with NRCS as a result of passage of the Federal Agricultural Improvement and Reform (FAIR) Act of 1996. The Association strongly advocates that the budget include sufficient personnel funding to service a very active program and strongly believes that the continued erosion of personnel with the additional proposed reduction of 752 employees is inconsistent with program needs.

FSA programs have tremendous quantifiable impacts on natural resources, and yield substantial public as well as private benefits. Building on the Provisions of the 1985 FSA the 1990 FACT Act, and the 1996 FAIR Act, the Association wants to ensure that each program accomplishes the broadest Possible range of natural resource objectives, and encourages close cooperation between FSA. NRCS and the State Technical Committees in implementing the 1996 FAIR Act.

Flood Risk Reduction Program.—We believe this program has great potential to mesh with the Army Corp of Engineers Rivers Ecosystem Restoration and Flood Hazard Mitigation Project which is a part of the President's Clean Water Initiative. We urge FSA to prepare regulations and budget for implementation and make every effort to ensure that language used in its easements and agreements provide a streamlined basis for appropriate administration and are user-friendly. The Association is disappointed that no budget is requested and urges that a start-up budget be initiated to assist in the President's Clean Water initiative.

Conservation Reserve Program.—The continued administration of CRP under the guidelines of the 1996 FAIR Act is a very significant and valuable commitment of USDA and the FSA. The Association applauds FSA efforts to fund and extend CRP contracts for the multiple benefits that accrue to the public as well as the landowner. The Association is especially pleased to note the commitment to reach as soon as practical and maintain the authorized 36 million acres in CRP. The Association provides special thanks to FSA for the continuous CRP sign-up of high value environmental practices and urges a special effort to advertise and increase landowner participation.

The commitment of FSA to provide high wildlife benefits in CRP contracts was most obvious in the 15th and 16th sign-up. The Association applauds FSA in those efforts with their special emphasis on native grass species and enlightened pine planting and management strategies for maximum wildlife benefits.

WILDLIFE SERVICES/ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

The President's fiscal year 2000 proposed budget for the APHIS Wildlife Services Operations is $28.15 million and reflects a $1.845 million decrease from the fiscal year 1999 level. For Methods Development, the proposed budget is $9.59 million, a $776,000 reduction from the fiscal year 1999 level. Additionally, if $655,000 in pay costs is not appropriated for Operations and $194,000 for Methods Development, this will amount to a further reduction for the program from the fiscal year 1999 enacted level. The Association continues to be strongly concerned about the steady erosion of funding in the President's budget request for Wildlife Services.

Wildlife Services (WS), a unit of APHIS, is the Federal agency responsible for controlling wildlife damage to agriculture, aquaculture, forest, range and other natural resources; for protecting public health and safety through the control of wildlife-bone diseases; and wildlife control at airports. Its control activities are based on the principles of wildlife management and integrated damage management and are carried out cooperatively with State fish and wildlife agencies. Most APHIS-WS operational

work is cost shared between the Federal WS program, State and county governments, agricultural producers, and other cooperators.

The cooperation and support of the public and the agricultural community are essential to maintaining wildlife populations because much of the Nation's wildlife exists on private agricultural lands. A progressive wildlife damage management program which reduces the adverse impact of wildlife populations is necessary to maintain the support of the agrarian community and to counter increasing pressures for indemnity due to wildlife damage.

Since Congress transferred the WS program to USDA in 1986, the Association has worked closely with this program on numerous issues critical to the State fish and wildlife agencies. The Association commends the WS program for its continuing effort to be attuned to the changing public values related to the Nation's wildlife, while remaining responsive to emerging wildlife problems.

The Association is concerned with the Administration's proposed reduction in both the WS Operations and Methods Development programs for fiscal year 2000. Many wildlife populations such as mammalian predators (e.g., coyotes) and mid-sized carnivores (e.g., raccoons), some species of waterfowl (e.g., resident Canada geese, snow geese), fish-eating birds (e.g., double-crested cormorants), white-tailed deer, and beavers are at all-time highs. Human/wildlife conflicts and requests for assistance are also at record numbers. The Association strongly requests the WS appropriation be restored to at least the fiscal year 1999 level to adequately address these increasing wildlife overabundance problems.

The fiscal year 2000 budget also contains $875,000 in unfunded Congressional directives regarding wolf control in the northern Rocky Mountains and brown tree snake control efforts and the establishment of a State office in Hawaii. The Association agrees that these are priority issues and recommends that $875,000 for these directives be Provided to WS to conduct these activities.

The wolf population in the upper Midwest is growing at a rapid rate. Wolves have increased their range into new areas in Minnesota, as well as Wisconsin and Michigan. The Association recognizes the impacts of wolf recovery on the WS program both from the standpoint of the workload increase from escalating complaints regarding predation, and the reduction in WS' ability to provide damage protection to the livestock industry from other predators in the wolf recovery area because of restrictions on management tools. The Association supports increase of $100,000 to adequately address wolf depredations in Minnesota, Wisconsin, and Michigan. The Association further supports an increase of $150,000 to address livestock/wolf conflicts attributable to wolf reintroduction in the intermountain west, and establishment of a wolf/grizzly conflict resolution position in Wyoming.

We commend Congress for recognizing the need for wildlife damage research when they appropriated funds to begin construction several years ago on what has become the National Wildlife Research Center located in Ft. Collins, Colorado. This state-of-the-art facility is the only one of its kind in the entire world devoted exclusively to the identification and development of effective wildlife damage control methods. The WS research facility places a significant emphasis on non-lethal methods development. The Association supports the effort to develop more socially acceptable wildlife damage management methods and recommends an increase of $800,000 to the WS program to effectively address this area.

The Association strongly supports the request for $450,000 in fiscal year 2000 to continue the trap testing begun in fiscal year 1999 to support the U.S. agreement with the European Union. These funds are critical to fulfilling the agreement to identify and develop the most humane possible traps practicable for taking furbearing animals. As many of these species are overabundant relative to historic conditions (e.g., coyotes, raccoons), this effort is supportive of important wildlife management as well as economic and trade issues.

The Association recognizes the importance of aircraft to WS for both predator control and the distribution of oral vaccine baits for rabies control projects and we commend Congress for providing $1.2 million in fiscal year 1999 to WS to begin implementing improved safety procedures for their aerial operations. However, no funding was proposed in the fiscal year 2000 budget to continue this effort, and the Association recommends that a similar (to fiscal year 1999) amount of funding be provided to address this critical area of the program.

The Association supports the increased emphasis on aircraft/wildlife hazards, but opposes the redirection of funds from other critical needs toward this problem. Therefore, the Association instead recommends the addition of $1.2 million to WS' budget to address this important problem.

The Association is concerned with recent attempts by various organizations and individuals in the past several years to significantly reduce WS' funding for predator control activities in the western United States. The Association opposes attempts to

reduce the WS budget through broad scale or across-the-board funding cuts. Instead the Association encourages WS to continue cooperation through coordinated predator management agreements with western state partners in order to ensure funding and management activities are directed towards the most effective and beneficial predator management strategies.

The Association is pleased with the accomplishments of the Berryman Institute at the Utah State University in Logan, Utah. However, we would like to see the Institute enhance its capabilities to conduct social science research, expand continuing education programs, and start a new high quality scientific journal for wildlife damage management that would be patterned after other established journals. To reach these new Goals. the Association supports an increase of the funding to the Berryman Institute by an additional $300,000.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES), U.S. DEPARTMENT OF AGRICULTURE

The Association recognizes that the research and educational programs of the CSREES and its Land Grant Partners effect relevant, positive changes in attitudes and implementation of new technologies by private landowners, managers, community decision-makers, and the public. This results in significant benefits to individuals and to the Nation through building and sustaining a more viable and productive natural resource base and a competitive and profitable agriculture. Since over two-thirds of our lands, approximately 1.35 billion acres, are controlled by over 10 million private landowners and managers, it is most appropriate that the CSREES-Land Grant System, with its grass roots credibility and delivery system, be adequately funded to translate and deliver research-based educational programs and new technologies to help the Nation's private landowners and managers move towards a more sustainable society. However, in the President's fiscal year 2000 budget, we see virtually no emphasis on natural resources research and education directed toward helping these clientele. In fact, the total number of farmers based on recent statistics is just slightly over one million, yet the great majority of CSREES' budget is devoted to production agriculture with only $3.192 million budgeted for the Renewable Resources Extension Act to assist the over ten million private landowners and managers who own and manage most of the nation's natural resource base. This amount is infinitesimal in the total CSREES proposed fiscal year 2000 budget of $948.01 million.

The Association recommends that the fiscal year 2000 appropriation for CSREES should redirect funding to accomplish the following goals:

IAFWA recommends that the Renewable Resources Extension Act be funded at a minimum level of $12.0 million in fiscal year 2000. The RREA funds, which are apportioned to State Extension Services, effectively leverage cooperating partnerships at an average of about four to one, with a focus on the development and dissemination of useful and practical educational programs to private landowners (rural and urban) and continuing education of professionals. The increase to $12.0 million would enable the Extension System to accomplish the goals and objectives outlined in the 1991–1995 Report to Congress. The need for RREA educational programs is greater today than ever because of the fragmentation of ownerships, the diversity of landowners needing assistance, and the increasing environmental concerns of society about land use. It is important to note that RREA has been reauthorized through 2002. It was originally authorized at $15 million annually; however, even though it has been proven to be effective in leveraging cooperative state and local funding, it has never been funded at a level beyond $3.4 million. An increase to $12.0 million would enable the Extension Service to expand its capability to assist over 500,000 private landowners annually to improve decision-making and management on an additional 35 million acres while increasing productivity and revenue by $200 million.

IAFWA recommends that Smith-Lever 3(b)&(c) base program funding be increased by 9.0 percent to a level of $280.95 million with an appropriate portion of this increase targeted to Extension's Natural Resource and Environmental Management Programs (NREM). The President's fiscal year 2000 budget requests a reduction of $18,795,000 funding for Smith-Lever 3(b)&(c) funds from the fiscal year 1999 level. IAFWA appreciates that Smith-Lever 3(b)&(c) base programs provide "Block Grant" type funds for land grant universities to provide essential educational outreach based on local needs assessment. This will enable NREM programs to develop the critical mass of expertise at the state and local levels to redirect and leverage limited funding to address critical existing and emerging natural resource and environmental issues that are directly affecting small landowners and farmers in both rural and urban communities nationwide. Expanding Extension programs in natural

resource public issues education on such issues as forest health, wetlands, endangered species, and human/wildlife interactions, as well as to strengthen its programs in urban and community forestry and environmental education, as called for in the 1990 FACT Act, is essential to address natural resource issues that are relevant to the sustainability of these critical resources. Such an increase targeted appropriately would help producers better understand and implement the changes in the 1996 Farm Bill Conservation Provisions. Moreover, we are concerned that appropriate positions in the Natural Resources and Environment Unit have not been retained to provide needed national leadership for critical interdisciplinary resources such as range management.

IAFWA encourages continuation of close cooperation between State CES's and their State Fish and Wildlife agencies, as well as other appropriate state and federal agencies and conservation organizations. Extension 4-H Youth natural resource programs and projects continue to increase with over 1,350,000 youngsters presently enrolled from both urban and rural communities across the Nation. Increased Smith-Lever funds targeted appropriately will enable CSREES to carry out its environmental education and NREM National Strategic Plan obligations nationwide.

IAFWA recommends restoration of the Rangeland Research Grants $500,000 budget for fiscal year 2000. The Association is disappointed that the practical and applied problems addressed by the Rangeland Research Grants (RRG) program were zeroed out in the President's 1998 budget, and totally ignored in the fiscal year 1999 budget and in the fiscal year 2000 budget. Over one half of the land area of the United States is rangeland; and elimination of the only federal competitive grants program for rangelands has serious implications for wildlife, watersheds, and other natural resources. Modest appropriations for RRG in the past have supported some of the most important rangeland research conducted over the past decade, and wildlife issues on rangelands will present some of the more critical rangeland research problems over the next decade. This would help increase the interdisciplinary capacity of research and educational programs to help landowners improve the adoption of forests and rangelands habitat conservation and management recommendations.

IAFWA recommends that an appropriate portion of the total increased appropriation for Pest Management should be dedicated to educational programs for prevention and control of vertebrate pests in urban and rural communities and to address invasive exotic species and noxious weed problems on rangelands for restoring, managing, and sustaining the biological integrity of the Nation's natural resource base upon which the agricultural and natural resource economies depend. IAFWA notes that a combined total increase of almost $15.5 million has been recommended in the President's budget for Pest Management and related research and extension programs over and above increases received in fiscal year 1999 and that a significant increase in plant and animal research in the National Research Initiative of $48 million is included, with no opportunity for addressing vertebrate pests. Yet, vertebrate pests and invasive species have been identified in many states as posing the most significant problems, now and in the future, that agricultural and related crop producers and private landowners face. The targeting of Pest Management funds for research and educational programs to reduce significant losses to vertebrate pests and invasive species would effectively advance the knowledge and capability of landowners and managers to significantly reduce their losses caused by vertebrate pests and invasive species. It would also enable CSREES and its land grant partners to better address the recently announced Executive Order on Invasive Species (1999–02–03).

IAFWA recommends that the Hatch and McIntire-Stennis funds be restored to fiscal year 1999 levels and, if necessary, redirected from the substantial $80.7 million proposed increase in NRI funding. IAFWA is pleased that the Administration proposes a $11.5 million increase in basic research identified under the National Research Initiative (NRI) as Natural Resources and the Environment; however, what is proposed in the current version of the President's Budget does not address natural resource issues and clearly does not address critical natural resource research needs that the Natural Resource Community, the public, and the over 10 million private landowners are vitally concerned about. The Association is alarmed at the significant reduction in both the Hatch Act and McIntire-Stennis research programs of $28.92 million. Both of these research programs, conducted by land grant university partners and other educational institutions, are crucial to addressing natural resource and environmental issues critical to agriculture and natural resource sustainability now and in the future. The Association is extremely disappointed in the Goal 4 Greater Harmony between Agriculture and the Environments which is the only one of the six CSREES Strategic Goals that even purports to address natural resources. There is no mention of research or extension programs to address the erosion of the nation's natural resource base except that alluded to by the Integrated

Research and Extension Water Quality Program. The others are totally focused on agriculture. The nation's agricultural base cannot be sustained if its natural resource base is not sustained.

LETTER FROM THE IOWA SENATE AGRICULTURE COMMITTEE

THE SENATE,
STATE OF IOWA,
Des Moines, Iowa, April 21, 1999.

The Honorable THAD COCHRAN,
Chair, U.S. Senate Appropriations Agriculture Subcommittee, SD–136, U.S. Senate, Washington, D.C.

DEAR SENATOR COCHRAN: I am submitting this letter as an indication that the Food and Agricultural Policy Research Institute (FAPRI) Consortium provides significant analysis and data to state policy makers. As Chairman of the Iowa Senate Agriculture Committee, I have relied on the information and data provided by FAPRI in our deliberations dealing with policy questions on agriculture and trade policy. With events such as the Asian economic difficulties, continuing developments within the European Union, the currency problems in the Southern Hemisphere, and other events throughout the world it becomes essential to have a reliable source of unbiased information and data.

The baseline and other large-scale econometric models developed and maintained by FAPRI have provided analyses enabling us to more accurately project our budgets and determine appropriate policy courses for this state's agriculture, as well as to determine our role in national policies. Additionally, FAPRI forecasts enable agricultural producers and policy makers to form and assess their outlook of national and world markets.

Certainly at this time of concern and difficulty in the farm economy, this type of data and intelligence is extremely valuable to all policy makers at the local, state, and national level. I would hope that this type of support would continue in the future.

Sincerely yours,

E. THURMAN GASKILL,
Chairman of Iowa Senate Agriculture Committee.

PREPARED STATEMENT OF THE JOSLIN DIABETES CENTER

INTRODUCTION

Mr. Chairman, thank you for this opportunity to submit a statement for the public witness hearing record. The subject of this short statement is the continued funding in fiscal year 2000 for the Diabetes Project in the Extension Service of CREES. We have developed a plan for fiscal year 2000 that will require $975,000. This includes costs of Federal Administration, participation expenses of the states of Washington and Hawaii and the personnel, equipment and associated costs of Joslin Diabetes Center within the total cost of the program.

FISCAL YEAR 1999 BACKGROUND

I would like to express Joslin Diabetes Center's sincere appreciation to you and Representative Nethercutt for your leadership in the fiscal year 1999 process in providing $550,000 for the initial year of the Diabetes Project. We know you faced difficult decisions concerning funding priorities. We feel that your allocation of these funds indicates that you share the vision of the growing community role and organizational flexibility of the Extension Service as we enter the 21st Century.

Joslin and Extension personnel have met and agreed to a plan of action in implementing the fiscal year 1999 program. Extension Service officials characterized the concept as a "win-win" program during the first meeting. When initial meetings were held, Extension Service officials immediately embraced the concept of utilizing components of Extension's national partnership infrastructure for a pilot program with Joslin. In fact, Extension was already involved at the state level with the National Diabetes Education Program (NDEP), a joint program of the Centers for Disease Control (CDC) and the National Institutes of Health (NIH), both part of the Department of Health and Human Services. Extension officials recognized that Joslin's non-invasive screening proposal, based on components of the Joslin Vision Network (JVN) brought an important new facet to the NDEP and services to the rural health population. The addition of the Joslin pilot program is of particular im-

portance in providing this new technology to minority rural residents, who suffer a much higher incidence rate than is the national average.

To date, we have been in contact with the State officials of Washington and Hawaii, and have had several visits and conference call sessions with Federal Extension officials. We are at the point of signing a Memorandum of Understanding with the Federal Extension component to launch the full-scale program. We have submitted a plan of action and are incorporating some alterations suggested by both State and Washington personnel. Once the revised plan is completed and approved by Extension, we will deploy the equipment and materials that both Joslin and Extension have been preparing during this period of partnership formalization.

Joslin is eager to commence the program. By the time this hearing volume is published, the program will be underway and operating within both Washington and Hawaii.

FISCAL YEAR 2000 PLAN

For fiscal year 2000, the mission and objectives for the two state pilot program remain the same as for fiscal year 1999. For any project to prove its benefit, at least two years of operational experience must be conducted in order to gather sufficient data to prove the project's value. The Diabetes Project will be fully operational October 1, 1999, the first day of fiscal year 2000. In fiscal year 1999, much of the first six months was devoted to establishing organizational responsibilities, developing proposals in the standard CREES/Extension forms, and coordinating the implementation mechanism necessary to deliver services to the target populations of Washington and Hawaii.

As with first year funding, the following will be accomplished in the second year (fiscal year 2000):

—training of Washington and Hawaii Extension personnel in equipment use will have taken place;

—deployment of the diabetes non invasive screening portion of the project will be completed;

—educational materials will have been devised for the specific target populations of Washington and Hawaii;

—coordination with the NDEP, local and State health officials to handle referrals will have been established;

—preliminary baseline comparisons will have been completed for the first year's operational phase; and

—plans to monitor third year independent operation will have been established.

The evaluation of the two year performance, compared with baseline data, will yield the results of the introduction of the advanced technology and the advanced medical care and prevention techniques that are the subject of this project. When similar testimony is provided to the Committee next year, we hope to have preliminary findings to report to you on this investment in American rural health and the cooperative partnership between the Extension Service and the Joslin Diabetes Center.

Mr. Chairman, this concludes my brief statement. we are submitting a detailed budget for the fiscal year 2000 funds of $975,000 we are seeking to the Extension Service for their review. If you or the Committee staff have any questions we may answer concerning this project, we would be pleased to meet and discuss the details in more detail.

Mr. Chairman, thank you again for your efforts in fiscal year 1999. The Extension Service and Joslin Diabetes Center appreciate your confidence in our capabilities and your focus on the improvement of quality life in rural America. We respectfully request continued funding of $975,000 in fiscal year 2000 to fully demonstrate the benefits and potential national returns that can be derived from this pilot effort.

PREPARED STATEMENT OF THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA

Chairman Cochran and members of the subcommittee: The Metropolitan Water District of Southern California (MWD) appreciates the opportunity to submit testimony regarding the U.S. Department of Agriculture's (USDA) fiscal year 2000 budget, for the Hearing on Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations. MWD is a public agency created in 1928 to meet supplemental water demands of those people living in what is now portions of a six-county region of southern California. Today, the region served by MWD includes nearly 16 million people living on the coastal plain between Ventura and the international boundary with Mexican border. It is an area larger than the State of

Connecticut and, if it were a separate nation, would rank in the top ten economies of the world.

Included in our region are more than 225 cities and unincorporated areas in the counties of Los Angeles, Orange, San Diego, Riverside, San Bernardino, and Ventura. We provide more than half the water consumed in our 5,200-square-mile service area. MWD's water supplies come from the Colorado River via the district's Colorado River Aqueduct and from northern California via the State Water Project's California Aqueduct.

Introduction

MWD continues to favor USDA implementation of conservation programs, and is especially encouraged by the new actions identified in the recently released Clean Water Action Plan. The Clean Water Action Plan fosters integration of efforts by USDA, the U.S. Environmental Protection Agency, and other federal agencies to improve water quality. MWD firmly believes that inter-agency coordination along with cooperative conservation programs, that are incentive-based and facilitate the development of partnerships are critical to addressing natural resources concerns, such as water quality degradation, wetlands loss and wildlife habitat destruction. It is vital that Congress provide USDA with the funding necessary to successfully carry out its commitment to natural resources conservation.

Our testimony focuses on USDA's conservation programs that are of major importance to MWD. In particular, MWD urges your full support for funding for USDA's Environmental Quality Incentives Program (EQIP). Full funding for this program is essential for achieving Colorado River Basin salinity control objectives through the implementation of salinity control measures as part of EQIP. In addition, MWD requests your full support for the Wildlife Habitat Incentives Program, Conservation Reserve Program, Wetlands Reserve Program, Integrated Pest Management and related programs, and the Water and Waste Disposal Loans and Grants program. Sufficient federal funding for these USDA programs is necessary to achieve wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and in California's Sacramento/San Joaquin Bay-Delta (Bay-Delta) estuary.

Environmental Quality Incentives Program

The Environmental Quality Incentives Program provides cost-sharing and incentive payments, technical assistance and educational assistance to farmers and ranchers for the implementation of structural practices (e.g., animal waste management facilities, filterstrips) and land management practices (e.g., nutrient management, grazing management) that address the most serious threats to soil, water and related natural resources. EQIP is to be carried out in a manner that maximizes environmental benefits per dollar expended. This assistance is focused in conservation priority areas identified by the Natural Resources Conservation Service's State Conservationists, in conjunction with state technical committees and Farm Service Agency personnel. MWD does have some concern with respect to this aspect of EQIP. Beginning with the first full year of EQIP funding in 1997, USDA's participation in the Colorado River Salinity Control Program has significantly diminished. The mechanism by which funding has been allocated by USDA to date inherently overlooks projects for which benefits are interstate and international in nature. Clearly, Colorado River salinity control has benefits that are not merely local in nature, but continue downstream and EQIP as it is currently administered by USDA does not adequately fund national priorities. MWD supports the recommendation of the Colorado River Basin Salinity Control Forum as a way to remedy this situation. In Public Law 104–127, Congress amended the Colorado River Basin Salinity Control Act to direct the Secretary of Agriculture to carry out salinity control measures in the Colorado River Basin as part of EQIP. Sufficient federal funding for implementation of EQIP is critical in order to achieve Colorado River Basin salinity control objectives as well as source water quality protection and ecosystem restoration objectives in the Bay-Delta estuary and watersheds tributary to the Bay-Delta.

The Colorado River Basin Salinity Control Forum (Forum), the interstate organization responsible for coordinating the Basin states' salinity control efforts, issued its 1996 Review, Water Quality Standards for Salinity, Colorado River System (1996 Review) in June of 1996. The 1996 Review found that additional salinity control was necessary with normal water supply conditions beginning in 1994 to meet the numeric criteria in the water quality standards adopted by the seven Colorado River Basin states and the U.S. Environmental Protection Agency. For the last six years (1994–99), funding for USDA's salinity control program has not equaled the Forum-identified funding need for the portion of the program the Federal Government has the responsibility to implement. It is essential that implementation of Colorado

River Basin salinity control efforts through EQIP be accelerated to permit the numeric criteria to be met again under average annual long-term water supply conditions, making up the shortfall. The Basin states and farmers stand ready to pay their share of the implementation costs of EQIP.

The President's proposed fiscal year 2000 budget contains program funding of $300 million for implementation of EQIP through financing provided by the Commodity Credit Corporation. MWD supports this level of EQIP funding which is also consistent with the USDA actions called for under the Clean Water Action Plan. MWD also support the proposed level of funding for Conservation Technical Assistance included within the Natural Resources Conservation Service's (NRCS) Conservation Operations Program. Conservation technical assistance provides the foundation for implementation of EQIP and other conservation programs. The Forum has determined that allocation of $12 million in EQIP funds in fiscal year 2000 is needed for on-farm measures to control Colorado River salinity. This level of funding is necessary to meet the salinity control activities schedule to maintain the state adopted and federally approved water quality standards.

MWD also supports the proposed level of funding for Conservation Technical Assistance (CTA) included within the Natural Resources Conservation Service's (NRCS) Conservation Operations Program. Conservation technical assistance provides the foundation for implementation of EQIP and other conservation programs. The proposed funding will be used, in part, to assist animal feedlot operation (AFO) owners to develop and implement waste management plans. AFOs are potential sources of pathogens which can impair drinking water sources.

MWD urges you and your Subcommittee to support full funding for EQIP and NRCS CTA as requested in the President's fiscal year 2000 budget for USDA, with the specific earmark allocation of EQIP funds to the Salinity Control Program. MWD also recommends that the Colorado River Basin be designated as a national priority area for salinity control.

Wildlife Habitat Incentives Program

The Wildlife Habitat Incentives Program (WHIP) is a voluntary program, providing technical assistance and cost-sharing, to help landowners develop habitat on their properties that will support wetland wildlife, upland wildlife, threatened and endangered species, fisheries, and other types of wildlife. WHIP offers an opportunity to encourage development of improved wildlife habitat on eligible lands by providing assistance to landowners who wish to integrate wildlife considerations into the overall management of their operations.

WHIP cost-sharing assistance could be utilized to support ongoing interim conservation efforts both in the Bay-Delta estuary and for the Lower Colorado River Multi-Species Conservation Program. The CALFED Bay-Delta Program is a cooperative effort among state and federal agencies and the public to develop a long-term, comprehensive solution to ecosystem and water supply problems in the Bay-Delta. One of the main objectives of the CALFED Bay-Delta Program is to improve and increase aquatic, wetland and riparian habitats so that they can support sustainable populations of wildlife species, by implementing a system-wide ecosystem restoration approach. WHIP could benefit this program by providing cost-share assistance for the development of wildlife habitat on private lands in the Bay-Delta watershed.

The Lower Colorado River Multi-Species Conservation Program (LCR MSCP) is a broad-based partnership of state, federal and private entities in Arizona, California, and Nevada. Participants include water, hydroelectric power and wildlife resource management agencies, Tribal governments, and environmental organizations with interests in the Lower Colorado River. The LCR MSCP is focusing on the conservation of over 70 threatened, endangered and sensitive species and their habitats. WHIP would allow the combination of federal cost-sharing dollars and voluntary agricultural land-use practices to enhance habitat for listed and sensitive species of interest in the Lower Colorado River. This could be a valuable vehicle for gaining further agricultural support for conservation efforts and the goals of the LCR MSCP.

The President's budget requests $210 million for WHIP for fiscal year 2000. MWD recommends that you and your Subcommittee support continued funding of WHIP at the level requested in the President's fiscal year 2000 budget for USDA.

Conservation Reserve Program

Continued support for the Conservation Reserve Program (CRP) is necessary in order to build on the past successes of this USDA conservation program. Under the CRP, incentive payments are provided to producers to remove highly erodible and other environmentally sensitive land from production. This program helps protect the quality of drinking water supplies and facilitates ecosystem restoration efforts

by reducing soil erosion, improving water quality, protecting wildlife habitats, and achieving other natural resource conservation measures. The National Buffer Initiative program will further maximize environmental benefits per dollar expended, and we are supportive of this effort.

Enrollment of eligible agricultural lands that are located in the Bay-Delta estuary and tributary watersheds in the CRP, could provide water quality improvement benefits for this important source of drinking water. We note, however, that the method which determines the rental rate for CRP enrollments effectively precludes the enrollment of much irrigated agriculture land and land with high value crops. As a result, states in the arid west do not benefit from the CRP in proportion to their contribution to agricultural production. While MWD urges you and your Subcommittee to support the President's budget request for the CRP of $1.596 billion for fiscal year 2000, we also strongly request that you review the method for rental rate determination. We understand that one of the key actions under the Clean Water Action Plan is to review and increase, where appropriate, the incentives available for conservation buffers. Such review should also be undertaken for the CRP overall.

Wetlands Reserve Program

The Wetlands Reserve Program (WRP), first authorized in 1990, is a voluntary program providing incentives to landowners for the restoration and protection of wetlands with long-term or permanent easements. Wetlands restoration provides important water quality improvement and wildlife habitat restoration benefits that are important to the Bay-Delta estuary. MWD urges you and your Subcommittee to support appropriation of $209 million for the WRP in fiscal year 2000, as requested in the President's budget. Full support for the WRP is necessary to achieve the Administration's goal of enrolling an additional 199,820 acres into the program currently, for a cumulative enrollment of approximately 825,000 acres by the end of 1999 and 975,000 acres by the end of calendar year 2000.

Conclusion

Thank you for your consideration of our testimony. We believe our comments emphasize the importance of continued funding for USDA's agricultural conservation programs. The USDA's conservation programs are critical for achieving Colorado River Basin salinity control objectives, as well as broader wildlife habitat restoration and source water quality protection objectives in the Colorado River Basin and the Bay-Delta estuary.

LETTER FROM CHARLES E. KRUSE

MISSOURI FARM BUREAU FEDERATION,
Jefferson City, MO, April 21, 1999.

Hon. THAD COCHRAN,
Chair, U.S. Senate Appropriations Agriculture Subcommittee,
Washington, DC.

DEAR SENATOR COCHRAN: On behalf of Missouri Farm Bureau, I am submitting this letter as public record of our support of the agricultural policy research conducted by the Food and Agricultural Policy Research Institute (FAPRI) consortia. As Missouri's largest general farm organization, Farm Bureau maintains a strong working relationship with the FAPRI institutions.

As you know, U.S. farmers and ranchers are currently facing many challenges. Low commodity prices are threatening the viability of agriculture as we know it and it is critical that policy-makers have access to the best analysis possible. Furthermore, producers must utilize this information as they attempt to restore profitability. FAPRI has a well-deserved reputation for conducting objective research; both large-scale econometric and farm-level economic and environmental modeling. Their researchers go to great lengths to validate models using both economic theory and producer input.

Over the years, with the assistance of federal funding, FAPRI has developed a comprehensive modeling system that remains the envy of the world. Their system, capable of quantifying proposed policies from the international to the farm level, is more important than ever. We appreciate their efforts and believe they continue to be a tremendous asset to American agriculture.

Sincerely,

CHARLES E. KRUSE,
President.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF CONSERVATION DISTRICTS

The National Association of Conservation Districts is a nonprofit, nongovernment organization that represents the nation's 3,000 conservation districts and more than 16,000 men and women who serve on their governing boards. Established under state law, conservation districts are local units of state government charged with carrying out programs for the protection and management of natural resources at the local level. Conservation districts work with nearly two-and-a-half million cooperating landowners and operators each year and provide assistance in managing and protecting nearly 70 percent of the private land in the contiguous United States.

NRCS's Conservation Technical Assistance Program, delivered through local conservation districts to cooperators and other land users, is the nation's foremost private lands pollution prevention program. It provides landowners and operators with much needed help in planning and applying conservation treatments to control erosion and improve the quantity and quality of soil resources; improve and conserve water; enhance fish and wildlife habitat; conserve energy; improve woodland, pasture and range conditions; and protect and enhance wetlands. Many federal and state agencies also rely upon the technical expertise unique to NRCS to carry out other conservation programs that complement the NRCS effort not only in the agricultural areas, but in rural, suburban and urban communities as well.

Conservation districts believe that the federal government must provide a basic level of technical assistance funding to maintain its commitment to support locally led conservation initiatives that complement federal efforts to ensure a safe and productive environment. The federal technical presence that NRCS provides is vital to ensuring that sound technical standards are maintained in our nation's conservation programs. It is also critical in the actual implementation of needed conservation practices.

This NRCS technical presence, along with federal cost-share programs, leverages a tremendous investment in conservation by state and local governments. State and local governments contribute nearly $1 billion in personnel and cost-share funding each year to support conservation programs carried out by the partnership. This is roughly equal to NRCS's annual budget and does not include the volunteer time of district officials.. Many states are also working to increase this support, but depend on the federal government to provide its fair share.

In developing funding recommendations for specific agencies and programs, we recognize our own responsibilities to contribute a fair share of resources. NACD's recommendations on federal funding for NRCS conservation programs are based on input from conservation districts, state and local program managers and data from various surveys and reports examining the workload generated by federal, state and local program authorities. Although this statement focuses primarily on the Natural Resources Conservation Service, additional recommendations on other important USDA programs are contained in the attached chart.

CONSERVATION TECHNICAL ASSISTANCE

In September 1998, the Conservation Partnership of NRCS, NACD, the National Association of State Conservation Agencies, National Association of Resource Conservation and Development Councils and the National Conservation Districts Employees Association completed data collection for its first-ever National Field Workload Analysis. The purpose of the study was to examine the staff years of technical support needed at the field level to carry out 29 core work elements in fiscal year 1999 and beyond.

Early analysis of the data show that, nationally, the resources needed exceeded those available to address each of the core work elements, thus revealing a "gap" in the Conservation Partnership's capability to maintain the nation's basic conservation infrastructure. Although the analysis has yet to be finalized, it appears that the gap for NRCS technical assistance is more than 7,000 staff years. Initial reports also indicate that an additional $300 million in funding for conservation technical assistance to support 3,000 new field staff years is needed to provide adequate conservation assistance at the local level.

Even without the National Field Workload Analysis data it is obvious that the responsibilities of NRCS and its partners have increased significantly over the past few years. The 1985, 1990 and 1996 Farm Bills created substantial new demands from farmers and ranchers for conservation assistance. The Clean Water Act and the Safe Drinking Water Act, with their nonpoint source pollution and source water protection initiatives, increased the for assistance to install land treatment measures to protect water quality. The President's Clean Water Action Plan, which includes the Unified Animal Feeding Operations Strategy, will add significantly to the

workload as thousands of producers request assistance in developing comprehensive nutrient management plans. Increasing requests for farmland protection and urban conservation assistance are further burdening an already overstressed conservation delivery system.

All of this is occurring at a time when Congress is ratcheting the budget down and agency budgets are shrinking in real terms. If America is serious about protecting its resource base, however, we must not let our conservation efforts diminish and fall by the wayside. We must demonstrate a renewed commitment to our natural resources, the foundation of the nation's economic prosperity.

Although our National Field Workload Analysis final reports will no doubt show a much greater need to effectively address conservation issues on private lands, our federal partners have reported that an additional $90 million is the bottom line needed just to sustain current efforts and prevent a reduction in staff at the field level. We urge you to support this increase, at a minimum, to maintain the basic infrastructure of private lands conservation efforts.

CONSERVATION TECHNICAL ASSISTANCE AND THE FARM BILL

When Congress passed the Federal Agricultural Improvement and Reform Act of 1996—the 1996 Farm Bill—it signaled a renewed commitment to a locally led, incentive-based approach to private lands conservation. In addition to fine-tuning existing programs, it provided new opportunities to promote voluntary conservation efforts on private lands through the Environmental Quality Incentives Program (EQIP), Farmland Protection Program, Conservation Farm Option and Wildlife Habitat Incentives Program.

Although it fashioned new opportunities, the Farm Bill added significant new responsibilities for USDA and its state and local partners. These new responsibilities, which the Conservation Partnership welcomes, also have unintentionally created problems because there simply are not enough staff and funding resources available to carry out the new programs and still maintain a basic conservation program at the field level.

These federally mandated activities are pulling NRCS staff away from addressing significant local natural resource problems. Often, these federal programs do not adequately address local conservation issues by the federal programs. These new programs have not been accompanied by any increase in staff ceilings or any significant increase in technical assistance funding.

The shortfall in technical assistance is further compounded by the fact that the Farm Bill conservation programs are funded through the USDA Commodity Credit Corporation (CCC). Although Congress intended for the CCC to reimburse NRCS for technical assistance activities in carrying out the Farm Bill programs, it unintentionally created a serious problem by capping the amount of CCC funds that USDA could spend on personnel and administrative services to carry out CCC programs at $36 million—the level spent in 1995, before CCC was responsible for the Farm Bill conservation programs. The unintended result was that NRCS would be responsible for carrying out the CCC-Farm Bill programs, but the Corporation would be severely limited in its ability to fund the technical assistance needed for the effort. Since the passage of the 1996 Farm Bill, much of the funding for conservation technical assistance has come from unspent funds remaining from previous spending authority. These sources for technical assistance to support CCC-funded conservation programs are essentially depleted leaving NRCS with a serious shortfall in technical assistance funding.

WATERSHED PROTECTION AND FLOOD PREVENTION

Through its Small Watersheds Program (Public Law 83–566 and Public Law 78–534), NRCS partners with states, local units of government, tribes and other sponsoring organizations to address water quality and quantity issues and assistance communities in flood prevention activities. More than 2,000 plans, covering 160 million acres in watersheds in every state, Puerto Rico and the Pacific Basin, have been completed or are underway. Land treatment measures have been applied to more than 30 million acres and more than 15,000 individual measures have been installed, resulting in substantial contributions to environmental improvement, economic development, flood prevention and social well being.

However, many of the more than 10,000 structures built over the past 50 years are nearing the end of their lifespan, no longer meet current dam safety standards and need to be upgraded, repaired or decommissioned. Approximately 5,000 of the installed floodwater retarding structures are 30 years old. More than 70 percent of all structures were built before the National Environmental Policy Act of 1970 was fully implemented and thus, may not have considered all environmental impacts.

Over time, the areas surrounding the structures have changed. Populations have grown. Flood plains have been developed. Upstream land use has changed. Sediment pools have filled. Flood-pool capacities have decreased. Structural components and vegetated measures have deteriorated. As a result, public safety, quality of life and community economic stability are being affected.

Under many of the original agreements, local sponsors accepted responsibility for assuring that the structures would function as designed over their lifetime. Sponsors, many of which are conservation districts, and NRCS are now finding that they may have liability almost in perpetuity for the integrity of these structures. In most cases, sponsors have diligently maintained the structures, but because dam-safety requirements have changed dramatically since the 1970s, many find they do not have the resources needed for costly renovations needed to keep them safe, functional and in compliance.

By the year 2000, approximately 2,000 structures built with assistance from the NRCS Small Watershed Program will require significant rehabilitation work to meet current environmental, economic and safety needs. Unless these issues are addressed, the magnitude of the problems will only increase as the infrastructure continues to age. Project sponsors in the 500 active watersheds need technical and financial assistance to implement rehabilitation plans to meet current environmental, economic and safety needs. NRCS estimates that roughly $540 million in federal, state and local resources is needed to protect and upgrade already installed works. To meet its share of that need, conservation districts recommend funding for the NRCS Watershed Protection and Flood Prevention account to $120 million in fiscal year 2000.

In his budget request, the President proposes transferring all technical assistance for Watershed Surveys and Planning and Watershed Protection and Flood Prevention Operations to the Conservation Operations Program after enactment of appropriate legislation. Conservation districts oppose shifting technical assistance out of the Watershed and Flood Prevention Operations account. We believe that action would be the first step toward dismantling this important program and that Public Law 566 funds would likely disappear in future budget proposals.

FORESTRY INCENTIVES PROGRAM

The President's proposal requests no funding for the Forestry Incentives Program (FIP) because it promotes timber production on private lands. Congress transferred FIP from the Farm Service Agency to NRCS as part of a major program restructuring in the Federal Agricultural Improvement and Reform Act of 1996 in recognition of NRCS as the Department's private lands natural resource management agency. Its technical assistance is used primarily to assist America's farmers in production agriculture, as do its conservation cost-share programs. USDA recognizes private lands forestry as a farming activity, and the Internal Revenue Service treats forestry cost-share payments as such. Conservation districts urge Congress to fund the Forestry Incentives Program at $25 million for fiscal year 2000.

RESOURCE CONSERVATION AND DEVELOPMENT PROGRAM

Through its Resource Conservation and Development Program (RC&D), NRCS provides conservation assistance to rural communities. Resource management and rural development initiatives undertaken by local RC&D councils help revitalize economically disadvantaged rural areas. Conservation districts support increasing RC&D funding to $69 million in fiscal year 2000 to support funding for 450 RC&D Councils as authorized under the program's enabling legislation.

FARM BILL PROGRAMS

The 1996 Farm Bill established the Environmental Quality Incentives Program (EQIP), the Conservation Farm Option (CFO), the Wildlife Habitat Incentives Program and the Farmland Protection Program (FPP) and strengthened and re-focused the Conservation Reserve and Wetlands Reserve Programs. Conservation districts continue to be strong supporters of these initiatives that protect soil resources, water quality, wetlands and wildlife habitat.

EQIP, in particular, is a highly targeted program intended in part to help producers comply with the requirements of the Farm Bill and other federal and state conservation programs. Requests from producers for assistance through EQIP have been overwhelming—far exceeding the amount of funds available and further stressing the already overburdened NRCS-conservation district delivery system. With additional funding EQIP has the potential to garner tremendous environmental benefits. It also provides an opportunity to reach out to socially disadvantaged producers who traditionally have not participated in USDA's conservation programs Conserva-

tion districts support the President's budget request to raise EQIP funding to $300 million annually to further enhance the program's outreach, water quality, soil conservation and wildlife habitat benefits. The attached chart includes recommendations for other NRCS conservation financial assistance programs.

The 1996 Farm Bill also authorized the Secretary of Agriculture to establish a grazing lands conservation initiative to provide technical and educational assistance to landowners on the nation's 642 million acres of private grazing lands. Conservation districts support this initiative and urge Congress to provide at least $15 million for its operation in fiscal year 2000.

The Wetlands Reserve Program (WRP) provides assistance to farmers to restore cropped wetlands through easements and cost-share payments. In addition to its environmental and wildlife habitat benefits, this voluntary wetland protection program has been extremely popular among farmers and ranchers. Conservation districts support funding WRP at $207.065 million in fiscal year 2000 to enroll the remaining authorized acreage in the program.

The Conservation Reserve Program similarly provides cost-share assistance and rental payments to farmers to retire highly erodible and environmentally sensitive cropland for 10 to 15 contract periods. In addition to dramatically reducing soil erosion on cropland by as much as 694,062,336 tons per year, it provides myriad other benefits including stemming agricultural runoff and providing critically needed wildlife habitat. Conservation districts strongly support the CRP and recommend funding to enroll the maximum number of acres authorized.

FUNDING FOR COOPERATIVE STATE RESEARCH, EDUCATION & EXTENSION SERVICE

Several extension programs represent critical components are significant in USDA's natural resource management delivery system. For example, the Renewable Resources Extension Act provides educational assistance to help private landowners manage their lands to meet commodity demands and needs. At the same time, it provides many public values associated with the forests and rangelands of our nation

Research also remains one of the keys to the continued vitality of agriculture and effective management of the nation's resource base. U.S. competitiveness in world markets is contingent an aggressive research and development program for agricultural conservation and production techniques. We also recognize that conservation, environmental quality and production research needs vary across the United States. Conservation districts support maintaining strong research programs in NRCS, the Agricultural Research Service, the Cooperative State Research, Education and Extension Service and other agencies as needed.

America's conservation districts fiscal year 2000 funding recommendations begin rebuilding the nation's commitment to helping land managers conserve natural resources on private lands. They represent a commitment to embrace and protect the nation's natural resources for our present and future generations.

We appreciate the opportunity to provide our recommendations to the Subcommittee.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF HOME BUILDERS

The National Association of Home Builders (NAHB), which represents more than 197,000 member firms, offers the following comments on the administration's fiscal year 2000 budget for U.S. Department of Agriculture's Rural Housing Service (RHS) programs.

NAHB believes there is a critical need for affordable housing in rural areas overall. Unfortunately, there are serious obstacles to providing such housing. High among these obstacles are problems with the availability of credit in rural areas compared to urban areas. The flow of capital into rural areas is crucial to the economic health of these rural areas. This position is supported by reports analyzing rural credit markets that were presented to the Senate Agriculture Committee during the 105th Congress by the Economic Research Service, the U.S. General Accounting Office, the Federal Reserve Bank of Kansas City and the Rural Policy Research Institute.

In light of the acknowledged shortage of housing opportunities for rural families with low- and moderate-incomes, NAHB strongly believes that the federal programs designed to provide affordable housing in rural areas, i.e. the programs administered by USDA's Rural Housing Service, are crucial. These programs include both rental housing programs and programs that provide homeownership opportunities through direct loans at below-market interest rates and loan guarantees.

RURAL HOUSING SERVICE MULTIFAMILY PROGRAMS

In the multifamily arena, Congress provided $114 million in direct loans for Section 515 multifamily rental housing production for fiscal year 1999. The Administration has requested a further reduction for fiscal year 2000 to $100 million. The recent budget allocation and requests for the Section 515 program suggest intent to replace it with the Section 538 multifamily loan guarantee program. This would be a serious mistake since the bulk of Section 515 recipients are at incomes too low to qualify for the rents charged to meet the mortgage and other debt service payments necessary for the Section 538 multifamily rental housing loan guarantee program. The two programs simply are not structured to serve families of similar incomes. Therefore, NAHB supports an increase, not a decrease, in current funding for Section 515. A program level of $300 million annually is supportable to meet the needs of rent burdened low-income families in non-urban areas. In view of the desire of many in Congress to maintain the budget caps imposed for fiscal year 2000 by the 1997 Budget Reconciliation Act, and discussions with RHS staff, a level of $300 million for the Section 515 program would be defensible and desirable. NAHB would support this level. Appropriating $300 for the Section 515 program would to a long way toward meeting the serious housing needs of lower income families and the elderly in rural America.

Likewise, the Section 538 program increase requested by the administration, from the $100 appropriated in fiscal year 1999 to $200 million requested for fiscal year 2000, is too minimal. Current low interest rates and continued economic growth support a program level nearer to $300 million per year for this program that costs the government very little to support. As no budget authority is needed to support this program, NAHB believes that it would be a serious mistake to underfund the anticipated demand for the worthwhile Section 538 loan guarantee program.

We also recommend that the $640 million requested for Section 521 Rental Assistance not be split between fiscal year 2000 and 2001 as proposed in the administration's budget. Such an approach could threaten the renewal of expiring rental assistance contracts and might harm efforts to preserve the affordable housing stock in rural areas. The $640 million request should be applied entirely in fiscal year 2000 so as not to create funding allocation problems in future years. Additionally, RHS staff informs us that this level allows for very little new construction activity. Consequently, NAHB would strongly support any increase that Congress might provide.

RURAL HOUSING SERVICE SINGLE FAMILY PROGRAMS

The fiscal year 1999 budgetary authority for the Rural Housing Service Section 502 Guaranteed Rural Housing (GRH) loan program is $3 billion. Through March 2, 13,818 loans have been made under the Section 502 GRH program for a total of $1.304 billion. Funds for future loans are allocated to program users through a reservation system. The exact amount of funds reserved is not publicly known, but NAHB believes that the sum of loans closed and loans reserved is closing in on the $3 billion level authorized for fiscal year 1999. In fact, NAHB understands that RHS will be forced to institute a moratorium on additional reservations for the Section 502 GRH program in May or early June, effectively removing the Section 502 GRH program as a financing option for rural home buyers until the beginning of fiscal year 2000.

Demand for the Section 502 GRH program has proven increasingly popular over the past few years, growing from just 662 loans for $38.4 million in fiscal year 1991 to 39,403 loans totaling $2.82 billion in fiscal year 1998. The withdrawal of the Section 502 GRH program, even temporarily, will have a detrimental effect on families who need the program to qualify to purchase homes, and will cause lenders to have second thoughts regarding future participation in the program. A major source of the rural mortgage credit shortage has been a lack of lender interest and participation in these markets. The Administration has proposed an authorization of $3.2 billion for this program for fiscal year 2000. At a minimum, NAHB believes that a program level of $4 billion should be authorized for the Section 502 Guaranteed Rural Housing loan program to ensure uninterrupted operation and continued lender participation.

The Section 502 Direct loan program has been obligated for 4,783 loans totaling $281.5 million this fiscal year. With a fiscal year 1999 budget of $965 million, it appears on the surface that this program might be adequately funded. Unfortunately, RHS is currently holding additional applications for 24,756 loans totaling $1.666 billion, a good portion of which could be made this year if the budgetary authority were available. Discussions with RHS staff yield a recommended program level of at least $1.5 billion as the minimum level needed to responsibly serve those applications on hand.

Like the Section 502 Direct program, the Section 504 loan and grant programs have backlogs far exceeding the budgeted levels. The Section 504 loan program has seen 1,373 loans closed totaling $6.8 million out of a fiscal year 1999 budget of $25 million. Currently, however, there is a backlog of 4,740 applications totaling $31 million. Almost 2,100 Section 504 grants have been made totaling $9.5 million out of a budget of $20 million. There is a backlog of 11,159 grant requests totaling $22.3 million. NAHB believes that the Section 504 loan and grant programs should each be authorized at $50 million for fiscal year 2000.

In closing, NAHB strongly supports viable Rural Housing Service programs, funded at responsible levels, as we believe both are necessary to help meet the needs for affordable housing for low- and moderate-income families and the elderly living in rural areas. For Congress to allocate federal resources for fiscal year 2000 at the levels requested by the administration for the Rural Housing Service programs will fail to meet current demand on these important programs. Consequently, NAHB respectfully urges funding the rural housing programs at the more responsible levels noted above.

We appreciate your consideration of our views as you formulate the fiscal year 2000 Agriculture Appropriations Bill. Thank you.

Prepared Statement of the National Association of Professional Forestry Schools and Colleges

The National Association of Professional Forestry Schools and Colleges (NAPFSC) is comprised of the 67 universities that conduct the Nation's research, teaching, and extension programs in forestry and related areas of environmental and natural resource management. NAPFSC strongly supports increased funding for federal forestry research programs, including those operated by the USDA's Cooperative State Research Education and Extension Service (CSREES) and the Forest Service. We appreciate this opportunity to comment on the three programs administered by CSREES which greatly enhance the abilities of our member institutions to effectively address forest and natural resource issues facing our nation: the McIntire-Stennis Cooperative Forestry Research Program (McIntire-Stennis), the Renewable Resources Extension Act (RREA), and the National Research Initiative (NRI). All three of these programs have stimulated the development of vital partnerships involving universities, federal agencies, non-governmental organizations and private industry.

USDA-CSREES FORESTRY RELATED PROGRAMS

	FISCAL YEAR—				AUTHORIZED LEVEL
	1998 ENACTED	1999 ENACTED	2000 CLINTON BUDGET	2000 NAPFSC RECOMMENDATION	
MCINTIRE-STENNIS	$20,497,000	$21,932,000	$19,882,000	$23,332,000	[1]
RREA	3,192,000	3,192,000	3,192,000	4,000,000	$15,000,000
NRI	97,200,000	119,300,000	200,000,000	200,000,000	.....

[1] One-half of Forest Service Research Budget (approx. $95 million).

The National Association of Forestry Schools and Colleges believes that university-based education is central to providing the research and landowner education that is needed to address NIPF issues. On February 22–23, NAPFSC co-hosted, along with USDA, a major "Forestry Summit" in Washington, D.C. with over 90 key forestry leaders from across the nation, including tree farmers, representatives from forest landowner associations, forest industry, forestry consultants, and representatives from state and federal agencies and universities.

The outcome of the Summit confirmed the need for increases in forestry research funding with a particular focus on non-industrial private forestlands and forest productivity and an increase in collaborative efforts between university-based research and that of the Forest Service.

The Case for Enhanced Forestry Research Funding.—NAPFSC submits that a "quiet crisis" is rapidly approaching in the nation in terms of the need for more university-based forestry research and extension. The forests and other renewal natural resources of this country are primary contributors to the economic health of the nation; are reservoirs of biodiversity important to the well-being of our citizens; are significant to the maintenance of environmental quality of our atmosphere, water,

and soil resources and provide diverse recreational and spiritual renewal opportunities for a growing population.

Tremendous strains are being placed upon the nation's private forest lands by the combination of increasing demands for forest products coupled with dramatic changes in timber policies concerning our National Forests. Because of the changes in federal forest policy, private forest lands in the United States are now being harvested at rates not seen since the beginning of the 20th century.

Until recently, wood and wood fiber demands have been met in significant part from federal lands. The changes in federal forest timber harvesting policy means the bulk of supply requirements has shifted to privately owned forest lands. To meet this challenge, research priorities must be adjusted to better address the needs of private landowners, and to specifically enhance the productivity of such lands through economically efficient and environmentally sound means. Increased fiber imports are not a viable option as the Nation cannot afford the trade imbalance, loss of jobs, loss of rural economies, or the importing of potentially serious plant, animal, and human diseases and pests. These challenges, however, can be substantially addressed by the university community through the building of integrated research and extension programs assisted by McIntire-Stennis, RREA, and NRI.

Non-industrial private forest (NIPF) landowners provide a large array of goods and services throughout the country. For example, in the East, NIPFs are projected to increase their timber harvests almost 30 percent from the 1986 levels until 2010. Hardwood timber harvests on NIPF lands in the South are actually projected to increase more than 60 percent from 1986 to 2010. These spectacular increases will require larger investments and enhanced public educational programs—and hopefully much more regeneration and intensive timber management—at a scale never before realized on NIPF lands in the U.S.

There are currently approximately 10 million private forestland owners in the U.S. These landowners control nearly 60 percent of all forestland in the country. And it has been to the universities, with strong support from CSREES, that landowners traditionally look for new information about managing their lands. The combination of research conducted by the forestry schools, combined with the dissemination of that research through the cooperative extension network, has never been more essential.

The overwhelming majority of the 10 million private landowners are not currently equipped to practice the sustained forest management that is critical to the health of our environment and economy. Not only are these lands important to the nation's supply of wood and fiber, these same lands provide other substantial benefits to their owners and the nation, including wildlife habitat, clean water and recreation. Enhanced forestry research and extension activities is essential to reach these landowners. Although the McIntire-Stennis, RREA, and NRI programs can help address these concerns, these programs are inadequately funded.

Mr. Chairman, NAPFSC is pleased that Congress provided a small increase in fiscal year 1999 for the McIntire-Stennis program; the first increase in several years. We are very concerned about the more than nine percent reduction proposed in President Clinton's fiscal year 2000 budget for the McIntire-Stennis forestry program. That is the wrong direction when there is such a great need for increased forest research and extension. While much of the President's budget calls for increases in federal research and development funding, agriculture and forestry research were targeted for decreases. We believe that reducing the McIntire-Stennis program is short-sighted. The National Association of State Universities and Land-Grant Colleges (NASULGC) has recommended a McIntire-Stennis funding level of $23,332,000. We strongly support funding at least at this level.

For more than 25 years, McIntire-Stennis funds have been a critical part of University-based forestry research. McIntire-Stennis funds leverage significant additional state and private support and assure long-term forest resource research, graduate training, and outreach across the country. Each dollar in federal appropriations has been leveraged by a factor of up to five in non-federal dollars in support of research programs having state, regional, and national significance.

Importance of Forestry Research and Extension.—Research has improved the understanding of (1) the biology of forest organisms; (2) the structure and function of forest ecosystems; (3) human-forest interactions; (4) wood as a renewable raw material; (5) economics, environmental policy, and business management related to the forest industry; and (6) international trade, competition, and cooperation. McIntire-Stennis programs have advanced our knowledge of the forest ecosystem including the basic chemical, physical, and biological forces that influence forest health and productivity. These programs have also expanded the marketing horizons for environmentally friendly and renewable wood and fiber-based products. Very recent work has examined the economic and ecological benefits of combining agricultural

and forestry practices into integrated land-use systems termed "agroforestry". Furthermore, these programs have significantly aided the development of new forest management systems for multiple-uses including timber, water, wildlife, grazing, recreation, and aesthetic purposes.

The Renewable Resources Extension Act (RREA) provides funds for technology transfer and educational outreach to ensure that the benefits of forestry research are made available to private forestland owners and forest industries through CSREES. More than ever before this program is needed to help private landowners address the increasing challenges facing non-federal forest lands. President Clinton recommended a funding level of $3,192,000 in his fiscal year 1999 budget. NAPFSC recommends funding RREA at a level of $4 million for fiscal year 1999. We urge the Committee to support the NASULGC request. This increase would take RREA to slightly over 25 percent of its authorization level.

RREA funds have created programs and provided expertise that benefit private forestland owners and the forest product industry throughout the country. For example:

—In Arkansas, over $5 million have been estimated to have been earned or saved by forestland owners and the forest products industry because of RREA educational programs.

—In Washington, RREA funding allows the universities to engage in logger training activities. To date, 289 loggers have fulfilled accreditation standards, and regulatory agencies are reporting improved compliance with forest practice rules.

—In Missouri, RREA funding supported a Wildlife Habitat Enhancement Program for Conservation Reserve lands. Participants have already installed practices benefitting 125,000 acres.

Similar stories can be found in all 50 states. It is vital that Congress continue proper funding for this important program for distributing the knowledge gained through our research institutions to the private landowners.

Lastly, we urge your support of the Competitive Grants Program administered under the National Research Initiative of the USDA. Peer competition for grants is at the heart of the university system and this program has become very important to natural resource scientists working within NAPFSC institutions. Research funds from NRI enable NAPFSC institutions to build upon the base provided by McIntire-Stennis. We are pleased that President Clinton's budget calls for a funding level of $200 million for fiscal year 2000, a level also recommended by NASULGC, and we urge your Subcommittee to fund the program at this requested level.

The past, present, and future success of forestry research and extension activities arising from the NAPFSC member institutions results from a unique partnership involving federal, state, and private cooperators. Federal agencies have concentrated on large-scale national issues while state funding has emphasized applied problems and state-specific opportunities. University research in contrast, with the assistance of federal, state and private support, has been able to address a broad array of applied problems related to technology development and fundamental biophysical and socioeconomic issues and problems that cross ownership, state, region, and national boundaries. Schools and colleges with programs in forestry, forest products, and natural resources have the expertise in-house to address a broad range of problems and opportunities related to the forest resource and its use.

We encourage expanded federal participation in this partnership with NAPFSC institutions through McIntire-Stennis, RREA, and NRI. We respectfully urge you to provide much needed increases for fund the McIntire-Stennis Cooperative Forestry Research Program, the Renewable Resources Extension Act, and the National Research Initiative in your fiscal year 2000 Agricultural Appropriations bill.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND-GRANT COLLEGES

Mr. Chairman, I am Bob Moser, Vice President for Agricultural Administration at The Ohio State University, and Chair of the National Association of State Universities and Land-Grant Colleges' (NASULGC) fiscal year 2000 Budget Committee. I represent the 105 institutions that work in close partnership with USDA's Cooperative State Research, Education, and Extension Service (CSREES). These universities comprise the State Agricultural Experiment Stations, Cooperative Extension, Forestry, Human Sciences, Veterinary and Academic Programs of the Land-Grant Universities, representing the 1862, 1890, 1994 Colleges, and Hispanic-serving institutions. This testimony also encompasses the views of Thomas Payne, representing

the Experiment Stations Committee on Organization and Policy, and Dick Wootton, representing the Extension Committee on Organization and Policy.

The Land-Grant Universities and USDA's CSREES comprise a federal-state partnership that links new science and technological development directly to the needs and interests of the people. It builds a strong, globally competitive U.S. agricultural system. This dynamic system evaluates environmental impacts of new concepts in production. It protects the health of the nation by producing a highly nutritious and safe food supply. It builds the capacity of the nation to access new information and to educate the coming generation of agricultural scientists, producers, and community leaders.

We employ more than 24,000 professional staff who work directly with more than 40 million Americans each year through our Extension Service. We educate more than 150,000 college students. We conduct research projects central to the nation's interests in food, agriculture, natural resources, the environment, and human development.

The member institutions of NASULGC and I appreciate the on-going support from this Subcommittee and pledge that investment in research, extension, and education programs will continue to benefit both farmers and consumers. Agriculture contributes to the economic well-being of the nation while providing Americans with the cheapest and safest food supply on the planet. Eleven percent of our wages, salaries, rents, and profits stem from food and agricultural-related businesses. Americans spend only 11 percent of their disposable income on food, compared with 15 percent in France, 18 percent in Germany, 33 percent in Mexico, and 51 percent in India. The profitability and quality of tomorrow's agriculture depends on today's research and education system.

Research and development funding for space exploration, the environment, basic science research, and health research has increased in constant dollars from 23 percent to 58 percent over the last 10 years. During that same time, funding for agricultural research and extension programs, the lifeblood of our food supply system, has shrunk by 8 percent in constant dollars. Base funds have eroded by 16 percent. These funds support the scientists and extension educators who can respond quickly and effectively to unexpected problems that arise for producers and consumers.

The President's Budget for fiscal year 2000 proposes a net increase for research, extension and education of $174.2 million above fiscal year 1999 funding for USDA/CSREES. We strongly endorse this critically needed investment. However, we do not believe that the President's budget has identified the best mix of funding mechanisms. It eliminates some $64.5 million from funding lines that Congress typically supports and redirects these funds to other priorities supported by the Administration.

We propose that the $174.2 million increase be distributed with a $40 million increase for base programs, a $120 million increase for competitive grants, and a $14.2 million increase for a mix of targeted mechanisms. Competitive grants and base funding are complementary and both are necessary funding tools. Base funding provides the foundation and stability to assure that needed long-term research and extension programs are supported. Base funds also provide for quick responsiveness to local and regional problems and unexpected crises, such as food safety issues or pest infestations, that could not have been anticipated in the budget preparation process. Competitive grants target high-priority "discovery" research and extension programs, and can operate efficiently with the infrastructure established through base funds.

We will direct this funding toward critical needs and focus areas, determined after numerous meetings with interest groups and stakeholders. The issues mesh with the five goals developed by USDA as part of their process for responding to the Government Performance and Results Act:

GOAL 1. AN AGRICULTURAL PRODUCTION SYSTEM THAT IS HIGHLY COMPETITIVE IN THE GLOBAL ECONOMY

The changing structure of American agriculture: $40.324 million

U.S. farm and ranch families are experiencing financial stress to a degree not matched since the mid-1980s, and they are facing this stress as protection provided by the government diminishes. There are many immediate challenges as a result of weather-related production problems and dramatic changes in international markets, putting many producers in jeopardy. Targeted programs are needed in the states to provide farmers and ranchers with risk management tools and capital management training necessary to make decisions in the short and long term to survive difficult times. Other factors impacting U.S. agriculture include new communication technologies, genetic modifications of plants and animals, vertical integra-

tion of parts of the industry, worldwide population growth and redistribution, a changing global economy, and changing farm policy.

Global competitiveness: $8.0 million

The ability of the United States to compete in global markets will be increased by: (1) developing and disseminating information about market, trade, business, and global finance opportunities; (2) providing information about global agribusiness and investment opportunities; (3) developing and disseminating information about non-tariff trade barriers; (4) identifying niche markets for agricultural products and their derivatives in other nations; and by developing options for improved decision making in global markets, trade, and policy; and linking farmers and agribusiness to international trade providers.

Agricultural genome, germplasm preservation: $45.0 million

The mapping of the human genome has tremendous implications for future health and medical discoveries. In the same manner, mapping the genomes of economically important crops, animals, and microbes has tremendous implications for agricultural production and processing. The result of mapping critical agricultural genomes will also have great impact on food safety and quality, as well as environmental protection. In addition, it is essential that germplasm that has already been developed through the years is adequately preserved and protected. Targeted competitive grants are needed that complement the work of other agencies such as USDA/ARS, DOE, NASA, and NSF.

Ag in the Classroom: $0.268 million

The Ag in the Classroom program plays a critical role in helping students gain some understanding of the realities of production agriculture. At a time when children might believe that milk comes directly from the grocery store, the Ag in the Classroom program assists in providing for a better-informed public-a public that knows that there are real cows, real farms, and real ranch families that help get that milk to the store.

GOAL 2. A SAFE AND SECURE FOOD AND FIBER SYSTEM

Food safety: $9.0 million

(a) *Prevention of food-borne illness ($3 million).*—Research on the actual causes and prevention of food-borne illnesses as well as education on how to handle food safely not only saves money, but also saves lives. Prevention of food-borne illnesses is the responsibility of informed producers, processors, handlers, and consumers of food. Critical points of contamination must be identified and eliminated through targeted research and education programs. While we are in the process of more fully understanding the current list of microbial pathogens and food contaminants with each passing day, there are emerging and unidentified risks facing our food supply.

(b) *Risk assessment and management ($3 million).*—Risk assessment is the relative degree of risk associated with natural and manufactured substances to which humans may become exposed. Safe food depends on broad-based understanding of the causes of food-borne illness, paths to prevention, and commitment to preventive practices employed by producers, processors, handlers, and consumers. Better methods are critically needed for analyzing available data and addressing any uncertainty. Understanding tolerance for risk—real and perceived—is an essential basis for education programs.

(c) *Safety of food imports ($3 million).*—Food imports are increasing dramatically, bringing with them the threat of new and emerging diseases. Contamination could occur at any point in agricultural production, from the farm to the overseas processing plant. There is also the threat of introducing exotic diseases into the U.S. food supply and production systems. Furthermore, the integrity of future agricultural markets will depend on both avoiding domestic crises in food safety and preventing unfair trade barriers. Special attention must be given to cross border flows of safe and healthy food.

Pesticide management and FQPA implementation: $23.776 million

In 1996, Congress passed the Food Quality Protection Act (FQPA), which resulted in many essential changes in food safety and pesticide laws. Included in this legislation was the repeal of the Delaney Clause, which imposed a zero-tolerance of pesticide residues. In its stead, EPA is in the process of reviewing more than 10,000 chemicals used on crops. It appears that some pesticides that have played a key role in current agricultural production practices will not be available to farmers and ranchers in the near future. Immediate steps need to be taken to identify alternative technologies and practices to replace agricultural chemicals that may soon

become unavailable. EPA, USDA and the Land-Grant university community must work quickly to target research and education efforts to provide farmers with ecologically and economically sound alternatives to pesticides that may no longer be available.

GOAL 3. A HEALTHIER, MORE WELL-NOURISHED POPULATION

Expanded Food and Nutrition Education Program (EFNEP): $2.348 million

The Expanded Food and Nutrition Education Program plays a pivotal role in assuring that the recipients of food assistance programs have the training and education that they need to improve the use of their food resources and the nutritional quality of their diets. EFNEP has a well-documented history of developing the ability of food assistance recipients to improve their diets with scarce resources and to fully benefit from the assistance they receive.

Nutrition and health: $6.0 million

The capacity to learn and to contribute to society is traced directly to the quality of health and nutrition from prenatal status through adulthood. Healthy diets minimize illness and disease and reduce medical costs. Assuring a healthy, well-nourished population requires continuing effort toward development of quality research information on nutrient function for maintenance of optimal health, understanding the availability of food for all population groups, especially those at greater risk for nutrition-related diseases, including infants, the elderly, and new immigrant groups. Nutrition education can incorporate research information in a form that is appropriate to each of these segments of the population. Education should include knowledge of how to secure foods to provide adequate nutrition with a commitment to the dietary guidelines. Uses of foods to prevent diseases (e.g., functional foods) and the production of pharmaceuticals from plants are new areas of nutrition research that need to be targeted for support.

GOAL 4. GREATER HARMONY BETWEEN AGRICULTURE AND THE ENVIRONMENT

Agricultural waste management: $14.0 million

In the past several years, outbreaks of microorganisms linked to fish kills and human sickness have focused public attention on better management of nutrients, such as phosphorus and nitrogen. Some scientists believe nutrient runoff from agricultural plant and animal production nourishes algal blooms. In response to public concerns, EPA and USDA have recently developed a draft "Unified National Strategy for Animal Feeding Operations (AFOs)." This unified strategy identifies an array of research, extension, and education activities that need to be addressed. A mix of base support to address research needs in each state is combined with competitive grants to develop integrated research, extension, and education projects.

Water quality and nutrient management: $3.0 million

Water quality and nutrient management encompasses the issues cited in the preceding paragraph. In addition to addressing the issues of agricultural waste, there is an array of pressing issues that need to be addressed, including increased collaboration with other agencies. Farm*a*Syst is a voluntary, science-based extension program that helps farmers and ranchers calculate and manage nutrient loading and run-off on their properties.

Carbon sequestration: $3.4 million

Carbon sequestration could be part of the solution to global climate change. Agricultural crop production uses carbon dioxide from the atmosphere, sequestering the carbon back into plants and the soil. Optimizing the efficiency of agricultural plant production therefore reduces possible threats from global warming. Forest production also plays a pivotal role in carbon sequestration. Base funding for forest research and integrated competitive grants is recommended so that efficient agricultural production can help protect the global environment.

The changing American landscape: $2.0 million

The American urban-suburban-rural interface is rapidly shifting. As a consequence of new demographic patterns, attention needs to be focused on supporting management decisions by local authorities. New knowledge is needed on policy and program options, and the consequences of those choices.

The changing structure of rural America: $7.0 million

Rural America includes the vast and dynamic regions of the national landscape that produce our food, fiber, and raw materials that support our industries, recreation, and a valued quality of life. In the twenty-first century, forces that will shape rural America include information technology, genomics, and global information systems and trade policy. Such major forces can cause great stress as well as opportunities. To support rural Americans in adapting to change, three elements of human capacity development are proposed for fiscal year 2000.

(1) *Professional work force preparation*.—Aggressive approaches are needed to attract more people into the science and practices of American agricultural enterprises if they are to advance. Collaborative efforts between universities and private sector laboratories to provide internships can enhance interest and commitment to agricultural sciences. Study abroad experiences can attract graduates into international agriculture.

(2) *Work force transition*.—The national work force preparation initiative coordinates federal, state, and local resources for extension, education, and research to address the training and retraining needs of youth and adults. Economic viability of rural communities with special emphasis on farm and ranch families is of high importance to maintaining the quality of life sought by rural citizens and communities. The initiative focuses on funding support for transitional educational opportunities for farm and ranch families, entrepreneurial job creation, small single-scale manufacturing, value-added food processing, and others.

(3) *Technology transfer*.—Availability of information useful to agricultural producers and practitioners has proliferated with increased access to technology. Greater attention should be given to the use and application of information and technologies that are readily produced by the global agricultural research system. Databases such as those maintained by NASA and the National Research Library should be evaluated as to their utility to the agriculture sector. Attention must be given to assisting users in the verification and management of information specific to their needs.

Children, Youth and Families at Risk: $1.0 million

The national Children, Youth and Families at Risk initiative provides funding to Cooperative Extension Service programs in Land-Grant Universities to develop community based projects that are designed to help at-risk audiences-both children and their families-solve their own problems. Essential to the success of the projects is self-sufficiency. Federal support for the projects extends for a maximum of five years, with states contributing matching funds. This highly successful program addresses parenting skills, building family strengths, community leadership development, health and nutrition education, positive youth development, and more. The return on investment provided by this model program deserves strong continued support and enhancement.

Higher education: $14.750 million

The Administration has proposed a mix of increases and some new programs in the area of higher education, particularly in the area of supporting the needs of minority communities. The Land-Grant Universities support these proposals. In addition, the Land-Grants have targeted much needed increases to the 1890 Institution Capacity Building Grant Program and the Institution Challenge Grants.

Conclusion

Land-Grant Universities are key to the economic, environmental, and social health of our nation. We work one-on-one to help farmers, businesses, communities, and families thrive. We strive to help the United States provide the safest, most abundant, and most affordable food supply in the world. We do all of this in the context of a healthy and protected environment.

With this budget proposal, we have identified the most urgent needs of the people we serve. We believe this mix of basic and competitive dollars, focused on these five priority areas, will best serve agriculture and the general public. Thank you for your consideration.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND LAND-GRANT COLLEGES

Mr. Chairman, I am the Assistant Director of the International Agriculture at Cornell University. I am also the current the chair of the International Committee

on Organization and Policy. I testify here in support of the fiscal year 2000 Agriculture Appropriations. Our committee is particularly interested in several programs. These include:

—The proposed Competitive Grants program of USDA/CSREES for Global Competitiveness. The goal of this program is to enhance U.S. competitiveness in global markets through the development and dissemination of information about markets, trade, non-tariff trade barriers, and global agribusiness opportunities. The Agricultural Research, Extension and Education Reform Act (AREERA) of 1998 created a new competitive grants mechanism specifically designed to address these and other tasks.

—Markets, Trade & Rural Development program under the National Research Initiative (NRI)

This program supports the development of innovative research concepts and methods to enhance understanding of the global forces that affect the competitiveness of U.S. agricultural, aquacultural, and forest products sectors in domestic and international markets.

—National Needs Competitive Grants program under Higher Education.

This program supports strengthening of higher education curriculum and teaching. Increasingly, college graduates must be prepared to live and work in a global society. Internationalization of the undergraduate and graduate curricula through coursework and experiential learning is essential. This in turn requires faculty and staff development.

By contributing to a better informed citizenry, these programs will increase U.S. capacity to compete in the global economy.

The impact of current Asian economic turmoil on U.S. agriculture has demonstrated in dramatic fashion the need for sound, research-based understanding of global interdependencies. Studies to assess the impact of national and international public policy, the changing trends in comparative advantages across nations, and the causes and impacts of changing demand patterns are clearly critical to sound public policy and business decision-making. Universities are not only direct sources of high quality research in these areas, but serve as the training grounds for future government and private sector researchers.

Between 1970 and 1995, the fraction of world agricultural production that moved through international markets more than doubled. The United States currently exports over thirty percent of its agricultural output, contributing significantly to the U.S. balance of payments. There is little reason to believe that the international marketplace will decline in importance for U.S. agriculture. U.S. farmers, food industries and consumers are increasingly aware of these trends. The result is a new set of stakeholder expectations for public universities. Land-grant universities across the country are responding, establishing as priority objectives the globalization of research, extension and teaching programs.

In order to compete successfully in global and increasingly free markets, U.S. producers must continue their remarkable progress in improving production efficiency. Increasingly U.S. researchers find genetic resources and ideas to fuel this continued progress through collaboration with overseas scientists. Productivity gains, however, are no longer sufficient to maintain or improve market position. Better understanding of value added opportunities and international market dynamics are now a major determinant of successful competition. It is well known that other countries invest heavily to prepare their future public and private sector leaders to function in an interdependent and competitive world. Large enrollments of foreign students in the universities of the United States and Europe give compelling evidence of this. The U.S. needs to target investments in its own human capital that will better prepare graduates in the food and agricultural sciences for the global economy.

The Global Competitiveness Grants, the National Research Initiative and the National Needs Competitive Grants (Higher Education) programs are designed to help us expand capacity to increase production and marketing efficiencies, and to extend them to users in the food system. The Globalizing Agricultural Science and Education Program for America (GASEPA) Agenda, which is sponsored by our Committee, focuses specifically on how to harness available land-grant university resources, including those to be provided through the above mentioned programs, to increase capacity to compete in global markets. Let me conclude with a brief review of the major components of the GASEPA Agenda.

Under the GASEPA agenda, U.S. land-grant universities will work with various agencies of the U.S. Department of Agriculture to jointly internationalize our staff and programs. We will seek ways to use funds included in the above programs to promote these outcomes.

The GASEPA agenda proposes to initiate and to strengthen globally relevant and useful agricultural teaching, research and outreach programs at land-grant and other qualifying institutions. Specific objectives are:

—Enhancing global competitiveness of U.S. agriculture through human resource development
—Development and dissemination of information about market, trade and business opportunities
—Mutually beneficial collaborative global partnerships
—Promoting trade through global economic development
—Promoting global environmental quality and stewardship of natural resources

It is proposed that at least the first four of these objectives be funded through some combination of the three competitive grants mentioned at the beginning of this testimony. Each of these competitive grant programs will be administered by an agency of the U.S. Department of Agriculture. This framework will ensure that quality standards are maintained and that program activities are integrated with those of other related initiatives.

Among the activities to be supported under the GASEPA agenda are those which will:

—increase the international content of teaching programs;
—provide university faculty and staff with cross-cultural, professional experiences in areas related to their expertise;
—increase the ability of faculty and staff to adapt agricultural technologies developed overseas for use in the U.S.;
—increase faculty, staff and student ability to support the marketing of U.S. agricultural products and services overseas;
—help U.S. agribusiness identify overseas opportunities; and
—provide students in agriculture and related fields with study and work experiences related to international competitiveness.

Land-Grant universities must continue to reorient their higher education, research and extension programs to more effectively address the global dimensions of the agricultural industry. Our stakeholders expect it. The GASEPA agenda seeks to position U.S. agriculture as a major contributor to global food security well into the 21st Century.

Thank you.

PREPARED STATEMENT OF THE NATIONAL ASSOCIATION OF UNIVERSITY FISHERIES AND WILDLIFE PROGRAMS

The National Association of University Fisheries and Wildlife Programs (NAUFWP) submits this statement on the proposed fiscal year 2000 appropriations for the Cooperative State Research, Education, and Extension Services (CSREES), U.S. Department of Agriculture.

Fifty-two universities hold membership in the NAUFWP. They seek to advance the science and practice of fisheries and wildlife ecology and management, and enhance public understanding of natural resources affairs.

Members recognize that information from research and education outreach efforts of the CSREES and its Land Grant University partners help to build public understanding that stimulates uses of new technologies by private landowners, managers, community decision makers, and other segments of the general public. Significant benefits accrue to individuals, the states, and the nation by encouraging sustainable uses of the natural resource base, while simultaneously maintaining a competitive and profitable agricultural industry.

With more than two-thirds of the U.S. lands, or approximately 1.35 billion acres, owned or managed by more than 10 million private individuals, it is essential that the CSREES/Land Grant system be adequately funded. This long-standing partnership delivery system, with its grass roots credibility, must function more effectively in conveying important information to land managers and others. A continuous flow of reliable information is essential to encourage uses of the resource base that are ecologically sound, economically compatible, and socially acceptable. This approach is required to ensure that the natural resource base is used sustainably and yields multiple products, services, and values, including quality of life aspects for people.

The NAUFWP is disappointed in the President's proposed fiscal year 2000 budget. It lacks emphasis on natural resources research and education. For example, the major portion of CSREES's proposed budget is for production agriculture carried out by slightly more than 1 million farmers. Only a very small amount ($3,192,000) is identified for the Renewable Resources Extension Act (RREA), which provides information and technical assistance to the more than 10 million private landowners and

managers who handle most of the U.S. natural resource base. This proposed amount for RREA is inadequate and much too small a percentage of the total $948,012,000 proposed for the CSREES in fiscal year 2000.

Natural resources, upon which our economy and quality of life are based, deserve much more attention and greater consideration. This statement focuses on needed realignments in the President's proposed fiscal year 2000 budget for CSREES. Five recommendations are provided by the NAUFWP.

1. That the Renewable Resources Extension Act be allotted a minimum of $15 million in fiscal year 2000.

RREA funds apportioned to State Extension Services leverage about four dollars from cooperating partners for each appropriated dollar. The major emphasis of this investment is to develop and disseminate practical, useful information to rural and urban landowners and managers. The recommended level of funding was originally authorized at $15 million annually. This level is needed to enable the Extension system to accomplish the goals and objectives set forth in the 1991–1995 RREA Report To Congress.

Needs for RREA information and educational programs are greater now than ever before. Parcels of private land are being fragmented into smaller units, there is greater diversity in landowners needing and requesting assistance, and the general public continues to be increasingly concerned about how land uses are carried out. Funding RREA at $15 million in fiscal year 2000 would permit the Cooperative Extension Service to expand its capabilities to assist more than 500,000 private landowners and managers yearly in bolstering their base of information for carrying out their management and other activities on an estimated 35 million acres, while increasing productivity and revenue by $200 million.

2. That Smith-Lever 3(b) & (c) base program funds should be increased by 9.0 percent to $280,951,000, with an appropriate portion of this increase designated for Extension's Natural Resource and Environmental Management Programs (NREM).

The President's fiscal year 2000 proposal calls for a $18,795,000 reduction for Smith-Lever 3(b) & (c) from the fiscal year 1999 level. This is inconsistent with the goal of enhancing information outreach to individuals with local needs.

The 9.0 percent increase recommended by the NAUFWP would permit developing expertise and services at state and local levels to address existing and emerging natural resource concerns and problems encountered by small landowners and farmers in both rural and urban settings. Extension programs need to be strengthened, particularly on natural resource topics such as forest management, wetlands, threatened and endangered species, and wildlife/human interactions. The designated portion of the 9.0 percent increase would be instrumental in improving landowner understanding of changes and opportunities in conservation provisions of the 1996 Farm Act and to enhance range management.

The NAUFWP strongly recommends that close cooperative working relations be strengthened among representatives of State Extension Services, State Fish and Wildlife Agencies, conservation organizations, and others. More team efforts are needed. One of increasing interest and value is the Extension 4–H youth natural resource program, with more than 1,350,000 youngsters from both urban and rural communities presently enrolled. Enrollments for this fundamental, popular program continue to increase.

Increased Smith-Lever 3(b) & (c) funds, with appropriate targeting, would assist CSREES in carrying out its essential education and service programs, and help meet its NREM National Strategic Plan obligations, nationwide.

3. That the Rangeland Research Grants budget be restored to $500,000 for fiscal year 2000.

In view of the pressing needs to improve management of rangelands, it is disappointing to see this Administration fail to recognize and fund the Rangeland Research Grants Program. More than one-half of the U.S. land area is rangeland, most of which requires increased attention and management, especially to restore and maintain watershed integrity, fish and wildlife, and outdoor recreational opportunities. Providing $500,000 in fiscal year 2000 would reestablish interdisciplinary research and education programs to help landowners and managers restore and perpetuate multiple products, services, and values from these extensive lands.

4. That an appropriate portion of the total increased appropriation for Pest Management be dedicated to educational programs focused on preventing and controlling vertebrate pests in urban and rural communities, and to address invasive exotic species and noxious weed problems on rangelands.

Funds are required to restore, manage, and sustain the ecological integrity of the nation's resource base, upon which the economy and quality of life are based. Regrettably, the President's proposed fiscal year 2000 budget, with substantial increases for Pest Management ($15.5 million) and the National Research Initiative

($48 million for plant and animal research), lacks opportunities to address vertebrate pests. This void needs attention now, to help agricultural producers and other private landowners address vertebrate pests and invasive species, which are the most prevalent problems they encounter in many states.

Targeting a sizeable percentage of Pest Management funds for research and educational programs is needed to enhance the understanding and capabilities of landowners and managers to curtail damages from vertebrate pests and invasive species. It also would enable the CSREES and its Land Grant partners to respond more effectively to the recent Presidential Executive Order on Invasive Species (1999–20–03).

5. That Hatch Act funds be restored at least to the fiscal year 1999 level ($180,545,000), McIntire-Stennis be funded at least to $30 million for fiscal year 2000, and proposed increased funds for the National Research Initiative (NRI) Competitive Grants be reevaluated.

The NAUFWP is deeply concerned over the proposed fiscal year 2000 decrease in funds for the Hatch Act (−$26,873,000) and McIntire-Stennis Cooperative Forestry program (−$2,050,000). These proposed cuts are inconsistent with recognized needs for research and information to address natural resource problems, and to respond to the needs of more than 10 million private landowners and managers. These cuts should not be made.

The NAUFWP is pleased that the President's proposed fiscal year 2000 budget carries a $12,500,000 increase over fiscal year 1999 for NRI research under the category Natural Resources and the Environment. It is recommended that these funds, as well as others, be aligned to address critical natural resource research and information needs, such as those of private landowners and managers. Much greater attention and more funds should be focused on CSREES Strategic Goal 4: Greater Harmony Between Agriculture and the Environment. Soil erosion, water quality, excessive nutrient enrichment, contaminants, and effects of agricultural chemicals on living organisms warrant prompt attention and investment of research, information, and Extension funds. The U.S. land and water base must be maintained in a healthy, productive status.

In summary, the National Association of University Fisheries and Wildlife Programs recommends the following realignments in the President's proposed fiscal year 2000 budget for CSREES.

1. That the Renewable Resources Extension Act be fully funded at $15 million.
2. That Smith-Lever 3(b) & (c) base program funds be increased by 9.0 percent to $280,951,000, with an appropriate portion of this increase designated for Extension's Natural Resource and Environmental Management Programs.
3. That Rangeland Research Grants be restored to $500,000.
4. That an appropriate portion of the total increased appropriations for Pest Management be dedicated to research and education programs to address prevention and control of vertebrate pests, and problems associated with invasive exotic species and noxious weeds.
5. That Hatch Act funds be restored at least to the fiscal year 1999 level, McIntire-Stennis Cooperative Forestry be funded at least to $30 million, and proposed increased funds for the National Research Initiative Competitive Grants be revaluated, with more funds aligned to address critical natural resource research and information needs, such as those of private landowners and managers.

Please include this statement in the official record on the fiscal year 2000 appropriations. Your positive response will be appreciated very much.

Prepared Statement of the National Center for Resource Innovations

As ever, we appreciate this opportunity to provide testimony to the Senate Appropriations Subcommittee on Agriculture, Rural Development and Related Agencies.

The National Center for Resource Innovations (NCRI) was established in 1990 through a joint private/federal initiative in an appropriation to USDA's-Cooperative State Research, Extension and Education Service (CSREES). The consortium now includes seven sites (including one added last year at the Southwest Indian Polytechnic Institute, Albuquerque, NM) and an administrative office in Rosslyn, Virginia. Each site in the consortium contributes unique expertise to this national program. NCRI capabilities include integration of large data sets in a Geographic Information Systems (GIS) framework from the national level down to the farm field as well as weather analysis, land use planning, resource management at state and local levels, and support for public and private policy development.

The mission of NCRI

The mission of NCRI is to provide collaborative and innovative transfer of geographic information systems technologies to support local government and other public policy development and decision making.

NCRI funding history, matching funds and cost effectiveness

In the past, NCRI has consistently requested $1.8 million annually for minimum program operations. Grants have been awarded from funds appropriated as follows: fiscal year 1990, $494,000; fiscal year 1991, $747,000; fiscal year 1992 and 1993, $1,000,000; fiscal year 1994, $1,011,000; fiscal year 1995, $877,000; fiscal year 1996, $939,000; fiscal year 1997 and 1998, and 1999: $844,000.

NCRI has either matched federal funds or had to reduce program objectives. The total non-federal support generated for fiscal years 1990 to 1998 was in excess of $5,500,000. The total federal appropriated amounts for the same period were $8,600,000. In fiscal year 1997, NCRI prepared, at the request of Congressman Skeen's office, a cost-benefit study. Results showed that for every federal dollar invested, $7.40 in benefits through innovative projects was realized.

NCRI site expertise and accomplishments

The advantage of the consortium of seven regional centers that makes up NCRI is that each site has unique expertise and shares technical support with other sites. In this way, projects are strengthened through shared resources and the experience needed to build complex and comprehensive information systems. Site-to-site technology transfer and networking build NCRI's overall capabilities, aids in problem solving and facilitates consistency.

JOINT ACTIVITIES (SEVEN SITES)

All of the NCRI sites plan engaged in two major collaborative activities this year: a DISTANCE LEARNING PROGRAM broadcast at the Southwest Indian Polytechnic Institute site March 4th and a RESOURCES TECHNOLOGY FAIR on Capitol Hill held on March 22nd, 1999 in the House Science Committee Room. Congressmen and Senators were invited to act as sponsors for the fair, which will include exhibits by the seven NCRI sites as well as by federal agencies and private sector companies who have been partners in technology implementation with NCRI sites.

NCRI—GREAT LAKES UNIVERSITY OF WISCONSIN-MADISON, MADISON, WISCONSIN

The NCRI-Great Lakes project site is located at the Land Information and Computer Graphics Facility (LICGF) in the College of Agriculture at the University of Wisconsin. The Facility was instituted in 1993 to function as a research, teaching, and outreach resource in land and geographic information systems (LIS/GIS). Researchers at LICGF explore uses of LIS/GIS for local and regional land and resource planning to support social, economic, and environmental decision making processes.

During 1999–2000, NCRI-Great Lakes has established the following objectives:

—Conduct seminars for the Wisconsin Land Council to develop citizen-based land use planning and the use of Land Information Systems. Effectiveness of this approach will be assessed.

—Support Wisconsin State Legislature in GIS needs, Research and Prototyping of Wisconsin Administrative Boundaries.

—Accelerate the use of GIS technology by governments with coastal zone jurisdictions.

—Work with the State of Wisconsin on the 2000 Census and its implementation.

NCRI—CHESAPEAKE, INC., ROSSLYN, VIRGINIA

NCRI-Chesapeake builds cooperative integrated information systems "from the nation to the neighborhood" with federal and state agencies, universities and others to provide new information for better decision-making. These systems focus first, on the farm, productivity and the farmers in their own very specific neighborhoods as related to natural systems and their socio-economic position in the landscape. NCRI-Chesapeake has established the following goals for 1999–2000:

—Continuing to expand through Internet research descriptions of impacts of animal manure on water quality, evaluation of agro-ecoindices, and assessment of watershed priorities.

—Assist citizens in becoming involved in planning future growth in North Carolina, the Washington-Baltimore metropolitan area and other urbanizing areas of the country regarding the impact of urban sprawl on ecosystems.

—Cooperate with EPA in defining ecologically sensitive resources potential affected by furze growth.

NCRI—NORTHWEST, CENTRAL WASHINGTON UNIVERSITY, ELLENSBURG, WASHINGTON

NCRI–NW continues to concentrate on the local and regional resource issues of the Yakima Valley and eastern Washington. These issues include irrigation of agricultural lands, county planning needs, Native American interests, and the management of inter-mixed public and private lands. The site works in close cooperation with the faculty and staff of Central Washington University as well as the GIS lab.

NCRI–NW plans for 1999–2000 include:

—Work with the Natural Resources Conservation Service to speed the delivery of digital soils maps to GIS users, precision farmers, and others.

—Initiate a study for the U.S. Bureau of Reclamation on the Yakima River Floodplain.

—Continued assistance to the Kittitas Reclamation District for data development and data exchange.

NCRI—SOUTH WEST, UNIVERSITY OF ARKANSAS, FAYETTEVILLE, ARKANSAS

NCRI–SW has been based at the University of Arkansas at Fayetteville since its inception in May of 1990. Through university support and hardware and software grants, the program has a fully equipped research, training, and outreach facility capable of demonstrating a wide range of software for geographic information systems, remote sensing, spatial statistics, and database management. In the fall of 1994, expansion of Center facilities was completed to include five state-of-the-art teaching and research laboratories, ten offices, and a library/reading room. A variety of advanced computer equipment now facilitates the center's teaching, outreach, and cooperative project capabilities. NCRI-SW continues to focus on technology transfer through training, the development of statewide GIS databases and representative projects demonstrating the cost benefits and efficiency of GIS technology.

NCRI-South West has proposed the following objectives among those to be achieved in 1999–2000:

—Provide technical support to the Arkansas Land Records Modernization Board as well as serving as a member of the Board.

—Participate with a consortium of private and public sector partners to initiate the Seamless Warehouse of Arkansas Geodata (SWAG) so that users will be able to access any selected area of the state with the data provided over the net in OGC Simple Features Format.

—Expand base of county and local government staff who are knowledgeable as to benefits and costs for GIS technologies.

NCRI—NORTH CENTRAL, UNIVERSITY OF NORTH DAKOTA, GRAND FORKS, NORTH DAKOTA

NCRI–NC's interdisciplinary research and technology transfer programs are located and supported at the University of North Dakota Regional Weather Information Center. From this facility, NCRI–NC is linked to the UND Aerospace Scientific Computing Center which houses a CRAY 190. The resource issues in the region are related to the enhancement and protection of farming and ranching, which are principal contributors to the region's economy. The work performed by NCRI–NC and the Regional Weather Information Center has resulted in their being recognized by the Ford Foundation as a semifinalist in the 1995 Innovations in American Government Awards Program.

During 1999 and 2000, NCRI–NC has set the following objectives:

—Disseminate GIS technology to local, county and state agencies in the North Central region.

—Intergate weather and climate data into the GIS environment.

—Provide support for agricultural datasets and methods in GIS practices.

NCRI—SOUTH EAST, SOUTH GEORGIA REGIONAL DEVELOPMENT CENTER, VALDOSTA, GEORGIA

NCRI–SE's program is an integral component of the South Georgia Regional Development Center—a regional agency that supports local governments across ten counties. NCRI–SE's primary objective is to encourage the use of geographic information for ecologically responsible decisionmaking in this primarily rural region. "Real world" presentations by NCRI–SE using actual local geographic data have proven to be an effective method of demonstrating the value of GIS. This, coupled with the experience gained by NCRI–SE personnel from implementing GIS for local governments, has proven invaluable to government managers in the South East re-

gion. NCRI–SE also provides direct technical and "hands on" advice and training for any regional entities working in the GIS realm.

NCRI–SE's goals include:

—Demonstrate the value of GIS to local governments using information that applies directly to their own situations, using the existing regional database and GIS applications built by NCRI-SE.

—Provide leadership in the GIS development process by promoting local government cooperative agreements in order to increase involvement and defray costs, and to promote standards that allow simple transfer of GIS data among state, local and federal agencies.

—Continue to refine data and databases for regional wetlands.

SOUTHWEST INDIAN POLYTECHNIC INSTITUTE, ALBUQUERQUE, NEW MEXICO

NCRI–SIPI is the newest of the NCRI sites, having been added in 1997. SIPI is a National Indian Community College, funded by the federal government. Nearly 50 percent of all American Indians live within a 500-mile radius of the school. SIPI's overall objective is to provide technology transfer through distance education in conjunction with the development of precision farming on the SIPI campus and on Indian reservation lands in New Mexico and southern Colorado.

For fiscal year 1999–2000, SIPI has the following objectives:

—Provide leadership, support and direction to advocates, practitioners and users of geo-spatial predicts and services.

—Expand the base of county and local government staff who are knowledgeable as to benefits and costs for GIS technologies.

—Offer GIS and GPS training/short courses locally for tribal personnel.

CONCLUSION

—The current level of funding for NCRI (fiscal year 1998) is $844,000. We request that the level of funding through USDA/CSREES be restored to $1.2 million for fiscal year 2000. For the past two years, NCRI has provided SIPI with $50,000 of its own funds. The requested funds would provide uniform funding levels for all sites.

The NCRI Consortium appreciates this opportunity to provide testimony to the Senate Appropriations Subcommittee on Agriculture, Rural Development and Related Agencies.

PREPARED STATEMENT OF THE NATIONAL COMMODITY SUPPLEMENTAL FOOD PROGRAM (CSFP)

Mr. Chairman and subcommittee members, I am Frank Kubik, President of the National Commodity Supplemental Food Program (CSFP) Association. Our association of state and local CSFP operators work diligently with the Department of Agriculture Food, Nutrition, and Consumer Service to insure a quality supplemental nutrition assistance commodity food package program for elderly men and women, and mothers, infants, and children. The program which was authorized in 1969 serves 412,000 individuals every month in 19 states and the District of Columbia.

This 30 year old CSFP program stands as testimony to the power of partnerships between community-based organizations, private industry and government agencies. The CSFP offers a unique combination of advantages unparalleled by any other food assistance program.:

—The CSFP specifically targets our nation's most vulnerable populations: the very young and the very old.

—The CSFP provides a monthly selection of foods specifically tailored to the nutritional needs of the population we serve. Each eligible participant in the program is guaranteed [by law] a certain level of nutritional assistance every month.

—The CSFP purchases foods at wholesale prices which amounts to ⅓ the cost it would be to provide the same supplemental nutrients at retail voucher cost. The average food package cost for fiscal year 1999 is $15.44 and retail cost would be at least $50.

—The CSFP involves the entire community in the problems of hunger and poverty. Thousands of volunteers as well as many private companies donate money, equipment, and most importantly time to deliver food to homebound seniors. These volunteers not only bring food but companionship and other assistance to seniors who might have no other source of friendship.

—For these historical reasons I would like to submit the National CSFP Association legislative issues and a report of our 1998 survey of monthly volunteer labor hours to support our requests.

Chairman Cochran, the committee has consistently been helpful with funding support for our very prudent way of providing nutritional supplements to the seniors and mothers and children. Please help us continue.

LEGISLATIVE ISSUES FISCAL YEAR 2000

Position: The CSFP Association recommends an appropriation of $95 million for fiscal year 2000. This would increase the budget figure of $90.2 million. The increase is necessary for:

—a new state program
—additional caseload for existing programs
—adjustment for state/local support funding

Reasons:

—CSFP is a very effective food delivery system. According to USDA FNS the average cost of a food package is $16. The average retail value of those foods distributed by grassroots community organizations is $50-$60. Our 1998 survey of monthly volunteer labor hours shows we have at least $390,400/month donated to stretch support funding for the program.
—The proposed funding for CSFP includes the transfer of $6 million in food inventory for total program support for fiscal year 2000. This mix of funds and inventory will result in a decrease of $1.2 million in state/local support funding due to computation on funds not total program assets.
—There are requests from existing programs for 20,000 additional caseload slots and one new state has a approved plan for a pilot program of 5,000 slots.

Position: With the aging of America, CSFP should be an integral part of USDA Senior Nutrition Policy. This is the most cost effective way to provide the nutrient rich foods that low income seniors are lacking.

Reasons: The advantages of CSFP include:

—The food box for seniors is nutritionally balanced.
—Supplemental nutrition is proven to reduce public health care costs.
—Nutrition education is provided.
—Food is distributed through community and faith based organizations, familiar to many seniors.
—Seniors resist participation in programs such as food stamps, but readily access commodity programs.
—CSFP requires a means test that assures participants are truly needy.
—Actual food is provided to those who need it most.
—CSFP supports United States farmers.
—Program operators utilize volunteers and other in-kind donations to reach homebound seniors.
—Food boxes are valued at approximately $50–$60 retail and only cost USDA $15.44.

MOBILE SITE: Distribution where foods are transported to a facility (not warehoused) and distributed to participants by paid staff.
VOLUNTEER SITE: Location where distribution of prepacked foods is performed by volunteer groups or individuals.

PREPARED STATEMENT OF THE NATIONAL CONSERVATION BUFFER COUNCIL

The National Conservation Buffer Council and its sponsoring organizations urge you to give high priority to conservation and environment programs in the fiscal 2000 agricultural appropriations bill.

NCBC is a private-sector, nonprofit organization formed to advocate agricultural conservation practices, especially the family of practices known as buffers, so as to protect water quality and reduce future regulatory burdens on farmers and ranchers.

We hope to help encourage the establishment of two million miles of buffers on private agricultural lands by 2002.

Such an ambitious goal can only be achieved through a vigorous private-public partnership with the Department of Agriculture—especially the Natural Resources Conservation Service—and the continued availability of the department's incentive programs and technical assistance to landowners. To those ends, we ask that you consider the following recommendations regarding fiscal year 2000 appropriations:

Environmental Quality Incentives Program.—NCBC supports the Administration's request for an additional $100 million in funding for EQIP. This addition is critical to meet the overwhelming demand for the program's cost-share and incentive payments and technical assistance—demand which, it should be noted, stands to only increase as additional requirements such as the Administration's Animal Feeding Operation strategy and various state-level water quality regulations come on line.

With these new environmental challenges for agriculture so obviously on the horizon, it was extremely disheartening that EQIP funding was actually reduced for fiscal year 1999. At the very least, no cuts to EQIP should be made in the future.

Conservation Reserve Program.—Wetlands Reserve Program CRP and WRP are major sources of incentives for buffer establishment. We request that no restrictions on enrollments be enacted in fiscal year 1999.

The CRP continuous signup stands to be the most lucrative program in many regions. However, participation in this option has been limited. Our extensive contacts in the field suggest this is due in part to several obstacles, including indifference of USDA personnel in some counties toward the continuous CRP, inconsistent application of program guidelines nationwide, and insufficient payment rates in some areas. We would appreciate direction from your subcommittee to the Secretary to remedy these barriers.

NRCS operations.—The agency's own workload analysis, based on expectations of demand for technical assistance connected with the environmental challenges mentioned above, suggests that the staffing levels provided for in the Administration's own fiscal year 2000 budget will leave NRCS about 1,000 person-years short of what will be needed. This assistance is critical, especially for landowners with limited resources. NCBC urges the subcommittee to carefully consider the critical technical assistance needs of farmers and ranchers when setting the funding level for NRCS. At this juncture, we would also register our concern about the limitations on NRCS technical assistance for development of CRP conservation plans that have arisen as a result of the 1996 farm bill's amendment to Section 11 of the Commodity Credit Corporation charter act. As you are aware, this is an issue with respect to both the fiscal year 2000 agricultural appropriations bill and the fiscal year 1999 supplemental appropriations measure. We request your support for an exemption of conservation programs from the so-called Section 11 cap on reimbursable agreements, especially since conservation technical assistance was not among those agreements in fiscal year 1995 that are the basis for the cap.

Alternatively, we would ask that you urge the Secretary to expedite the process for contracting outside the Department for the technical assistance necessary to allow the CRP enrollments to progress unhindered.

Thank you for your consideration of our recommendations. I would be happy to discuss these points, especially the suggestions of direction to the Department, with you or your staff.

PREPARED STATEMENT OF THE NATIONAL COOPERATIVE BUSINESS ASSOCIATION

Mr. Chairman, members of the committee, we appreciate the opportunity to present testimony as you prepare to consider appropriations for the Department of Agriculture for fiscal year 2000. I would like to discuss the Grants for Rural Cooperative Development program and the centers for cooperative development receiving funding from the program. I urge you to appropriate at least the President's budget amount of $5 million for this valuable program that is offering real solutions to the daunting challenges being faced in rural America.

The National Cooperative Business Association (NCBA) is proud of its role in assisting the creation of a network of rural cooperative development centers across the country. We know that Congress is equally as proud of its role in fostering a cooperative business development support network throughout rural America. Congress and this Administration recognize the vital role that cooperatives play in providing jobs, increasing incomes and reducing expenses for millions of rural Americans.

The Grants for Rural Cooperative Development program was originally authorized by section 2347 of the 1990 farm bill as a program of Grants for Technology Transfer and Cooperative Development. In fiscal year 1993, this committee began to provide funding for the program, and report language over the years has indicated your strong support for the concept of using this funding for the purpose of creating a network of centers for rural cooperative business development. While the centers offer technical assistance, information and other resources for cooperative business formation, their network provides a vital support system for the centers to continue operating.

NCBA's members, along with other supporters of cooperatives around the nation, joined together as the National Rural Cooperative Development Task Force to advocate for support for a national network of centers and to develop the linkages among the centers and between the centers and local partners to sustain the network's development. NCBA is now working with these regional centers that provide vital technical assistance and support for the development of cooperative enterprises in rural America. NCBA also signed a partnership agreement in 1997 with USDA's Cooperative Services program to coordinate strategies to assist rural cooperative development.

In 1996, Congress demonstrated its strong commitment to the centers approach when it passed the FAIR Act, also known as the 1996 farm bill. The program is now called Grants for Rural Cooperative Development in section 747(c)(4) of Public Law 104–127. The program focuses on supporting "nonprofit institutions for the purpose of enabling the institutions to establish and operate centers for rural cooperative development." It is authorized to provide funding at $50 million per year. The revised statutory language defines the goals of these centers as "facilitat[ing] the creation of jobs in rural areas through the development of new rural cooperatives, value added processing, and rural businesses."

With the support of funding received from the program over the past few years, the rural cooperative development centers have demonstrated quantifiable results. The National Network of Centers that NCBA works with has established more than 50 value-added cooperatives serving in excess of 5,000 members. These centers have created or saved 16,500 jobs in the communities they serve. They have assisted more than 400 local communities and organizations. The centers have raised the quality of technical assistance being provided on cooperative development, they have developed significant information-sharing capability among their network and created the first report of best practices in the field of cooperative development.

This coming year, centers will be involved in replicating successes they have achieved and breaking new ground in areas where cooperative development is needed. The electricity industry is rapidly being deregulated in every part of the country. Consumer-owned rural electric cooperatives have provided reliable and affordable electricity to rural Americans since the rural electrification program began directing federal resources for them in the 1930s. Once again, a small federal investment can provide essential assistance to develop consumer-owned energy purchasing cooperatives so that Americans are able to provide themselves with access to electricity. By pooling the purchasing power of many small consumers, cooperative businesses give their members the same bargaining power as large users of electricity. Centers are working with rural Americans to create and build these self-help enterprises.

Other cooperative development projects include the formation of new value-added agricultural cooperatives, new child care cooperatives, and cooperative housing projects. Value-added agricultural cooperatives give farmers more of the consumer dollar. Child care cooperatives provide former welfare recipients and other low-income people the opportunity to reduce the cost of child care and give them control over how their child care facilities are operated. Cooperative housing gives seniors and others in rural areas the chance to save money on their housing and live in safe communities.

The President's budget includes $5 million for this program. This is a significant increase in funding from prior years, demonstrating the Administration's acknowledgement of the value of this program. USDA's National Commission on Small Farms recently recommended that this program "be increased by $10 million annually up to $20 million." The Commission's report calls the program "one of the few that supports rural cooperative development at the grassroots level." The program is authorized to be funded at $50 million annually.

We urge this committee to do what over 100 organizations from around the country are urging Congress and the Administration to do: increase funding for this valuable program. Mr. Chairman, I ask that the letter signed by those organizations be included in the record of this hearing along with my testimony.

NCBA is a national membership association representing cooperatives—over 120 million Americans and 47,000 businesses ranging in size from small buying clubs to businesses included in the Fortune 500. NCBA's membership includes cooperatives in the fields of housing, health care, finance, insurance, child care, agricultural marketing and supply, rural utilities and consumer goods and services, as well as associations of cooperatives. NCBA brings its members together to provide business opportunities and to develop, advance and to protect cooperative enterprise.

PREPARED STATEMENT OF THE NATIONAL CORN GROWERS ASSOCIATION

The National Corn Growers Association (NCGA) appreciates the opportunity to provide the subcommittee with corn growers' recommendations regarding fiscal year 2000 appropriations for key programs administered by the U.S. Department of Agriculture. NCGA represents 30,000 corn growers in 48 states and the association's mission is to create and increase opportunities for corn growers in a changing world and to enhance corn utilization and profitability.

GENOMIC RESEARCH

For the fiscal year 2000 agricultural appropriations bill, NCGA supports the Administration's budget request for an increase of $1.8 million for plant and animal genetic resources at the Agricultural Research Service (ARS). We believe, however, that this amount should be increased significantly to ensure that the ARS has sufficient resources to participate fully in the ongoing genomics revolution. NCGA was disappointed that the Administration's Information Technology proposal did not include the ARS and that the Administration is no longer proposing a new, competitive grants program for Food Genomics. NCGA supports efforts to ensure that the $120 million in funding for the Initiative for Future Agriculture and Food Systems is utilized for agricultural research and, in particular, for a significant plant and animal genomics program at the USDA.

While many federal agricultural programs are important to the nation's corn growers, NCGA believes that the future of the corn industry is written in corn's genetic code and that plant genomics will give us the fundamental information necessary for biotechnology to revolutionize American agriculture. NCGA concurs with Philip H. Abelson's statement, in a 1998 editorial, that we are in the early phases of the third technological revolution—a genomics revolution—and that "* * * the greatest ultimate global impact of genomics will result from manipulation of the DNA of plants." (Science, Vol. 279, p. 2019.) Thus, NCGA believes that the most important appropriations issue for fiscal year 2000 is funding for coordinated, plant genomics research. Genomics consists of mapping, sequencing and analyzing genomes to determine the function of genes. Plant genomics research advances our understanding of the structure, organization and function of plant genomes. The complete genetic makeup of any organism is known as its genome.

In January 1998, the National Science and Technology Council issued an Interagency Working Group report on the National Plant Genome Initiative. The report stated that the time was right for the implementation of a comprehensive, five-year National Plant Genome Initiative to meet the major challenges that will face mankind in the 21st Century. In the transmittal letter accompanying the report, the President's science advisor, Dr. John H. Gibbons, stated the following:

> The timing of this initiative is critical, since our international and private sector partners are moving forward aggressively. A significant public sector program * * * carried out in partnership with industry will ensure plant genome data and materials are openly accessible to all scientists. It is a critical step toward promoting future scientific breakthroughs in plant biology and their practical application.

To accomplish the short-term goals of the National Plant Genome Initiative that focus on building plant genome research infrastructure, the Interagency Working Group on Plant Genomes estimated that $400 million in funding was needed, over five years, to meet the anticipated needs of the Initiative. For fiscal years 1998 and 1999, $90 million was provided for the National Science Foundation Plant Genome Initiative. Without a significant plant genomics investment from the USDA, it will be difficult, if not impossible, to achieve the level of federal funding necessary to fulfill the short-term goals of the National Plant Genome Initiative. Thus, NCGA

strongly supports increases for the plant genomics program at the ARS and supports increases in competitively awarded plant genomics funding. The Administration's budget request is inadequate for both the short-term and long-term goals of the National Plant Genome Initiative.

The National Plant Genome Initiative will help scientists, geneticists and plant breeders identify and utilize genes from corn and other economically significant crops that control important traits, such as nutritional value, stress tolerance and resistance to pests. The far-reaching benefits of this Initiative include:

—protection of U.S. interests and access to important biotechnology and gene patents;
—revitalization of rural America due to a more robust agricultural sector;
—expansion of plant-based renewable resources for energy and raw materials;
—significant reductions in crop losses and reliance on pesticides through improved biological methods to control and alleviate serious industrial threats and targeted pests;
—improved yields and reduced crop losses caused by adverse environmental conditions such as heat, drought and salt;
—improved nitrogen-use efficiency, thereby, limiting the potential for nitrates in the water supply;
—reduced environmental problems confronted by livestock producers, such as modifying the digestibility of phosphorous in feed corn to reduce the amount of phosphorous that enters our ground water;
—improved animal nutrition leading to healthier meat and increased meat productivity;
—reductions in the occurrence of mycotoxin contamination by significantly improving resistance to fungal infection;
—the development of tailored hybrids with valuable specialty starches, oils and protein content; and
—reduced worldwide malnutrition due to higher yielding and more nutritious crops.

The National Plant Genome Initiative is critical to the long-term viability of U.S. agriculture. To compete in the global market, the U.S. must continually strive to efficiently and economically improve production capabilities—to maximize yield and combat serious threats from disease, pests and climate changes—without harming the environment. Genomics research holds the key to achieving this goal.

The NCGA, also, understands that the American Seed Trade Association (ASTA) is requesting a $5 million increase for the National Plant Germplasm System (NPGS). The NCGA concurs with ASTA that the NPGS is a fundamental, strategic resource. Access to diverse genetic resources that are well maintained by the NPGS is essential to the future of agricultural biotechnology. Thus, the NCGA supports the request for a $5 million increase for the NPGS.

The NCGA urges Congress to provide increased funding for plant and animal genomics research and plant germplasm research at USDA to ensure that our growers have the tools to meet the challenges and demands of the 21st century.

MARKET DEVELOPMENT PROGRAMS

The Market Access Program (MAP) and Foreign Market Development Cooperator Program (FMD), both administered by USDA's Foreign Agricultural Service (FAS), help promote access to key overseas markets for U.S. agricultural products, including corn and value-added corn products.

MAP uses funds from the Commodity Credit Corporation (CCC) to reimburse a portion of the costs of carrying out overseas marketing and promotional activities, such as direct consumer promotions, market research, technical assistance, and trade servicing. MAP participants include nonprofit agricultural trade organizations, State regional trade groups, cooperatives, and private companies that qualify as small business concerns. Historically, more than 80 percent of MAP funding has been devoted to building export markets for U.S. high value agricultural products.

FMD, also known as the Cooperator Program, seeks to develop long-term export markets for generic U.S. agricultural commodities. For more than 40 years, FMD has fostered a trade promotion partnership between USDA and U.S. agricultural producers and processors who are represented by nonprofit commodity or trade associations called cooperators. By providing cost-share assistance and the opportunity to work closely with FAS and its overseas offices, FMD has mobilized private sector support and funding for market development activities in more than 100 countries worldwide. Historically, USDA's contribution to this program has averaged approximately $30 million a year, with additional funding provided by cooperators and

third-party participants such as the foreign firms or governments that import and distribute U.S. products in the target markets.

NCGA urges appropriators to support full funding for the Market Access Program at the authorized level of $90 million and to support efforts to maintain funding for the Foreign Market Development Cooperator Program for fiscal year 2000 at no less than the level necessary to support marketing plans for the development of overseas markets for U.S. commodities at current levels.

CONSERVATION PROGRAMS

As society's expectations for clean air, clean water and abundant wildlife habitat increase, so does the need to deliver conservation technical assistance to our nation's farmers and ranchers. Private lands comprise 70 percent of the lower 48 states and 80 percent of all precipitation in our country falls on private land. Therefore it is wise and in the public's interest to make sound investments in educating and equipping private landowners to conserve the natural resources in their care and to build upon stewardship efforts they already have in place.

The Administration's proposed fiscal year 2000 budget for USDA's Natural Resources Conservation Service (NRCS) included $584.7 million for conservation technical assistance, an increase of approximately $36.8 million from 1999. After accounting for policy decisions and inflation, the president's request would result in a loss of 1,055 staff positions from fiscal year 1999, most of which will come from NRCS field offices. It is estimated that an additional $90 million will be needed to retain these 1,055 staff positions to deliver technical assistance to the field. Therefore, we ask the committee to appropriate $674.7 million for NRCS technical assistance for fiscal year 2000.

ETHANOL PILOT PLANT

The nation's corn growers also urge your support for full funding, through ARS, for the National Corn-to-Ethanol Research Pilot Plant to be constructed in Edwardsville, Illinois. The Pilot Plant will provide a necessary tool to expand and perfect new technologies in wet and dry-mill corn processing. What many people do not understand is that ethanol is just one of many products produced in corn processing facilities. Other products include high fructose corn syrup, glucose, dextrose and several high-protein animal feed ingredients. The corn milling industry is expected to grind 1.885 billion bushels of corn in the 1998–99 crop year, accounting for 16.4 percent of the total corn crop. Ethanol production accounts for between 550 and 600 million bushels of the corn grind. Corn processing adds value to corn and provides U.S. consumers with a wide array of products we all use every day.

Since 1990, the corn milling industry has expanded, primarily because of expansion in the demand for ethanol. Many of the new corn milling facilities are small dry mills that are farmer-owned co-ops. While the capital investments required to build a dry mill are small relative to a large integrated wet mill, there are severe limitations in the product options dry mills have. Because of their small size and limited financial resources, these dry mills are not able to conduct the kind of research that is necessary to keep them competitive.

The Pilot Plant would allow small corn millers to band together and form partnerships with NCGA, state corn grower associations, university researchers, and each other to pursue the development and commercialization of new technologies that will improve the economics of corn processing. Moreover, developing technologies that convert the cellulose in corn fiber into ethanol or other valuable products could be shared by corn processors of all sizes. Breakthroughs in these areas and the commercialization of new corn processing technologies could boost the domestic demand for corn by one billion bushels or more within the next seven to ten years.

In fiscal year 1996, Congress appropriated $500,000 for ARS to study the feasibility of a Pilot Plant that industry, government and universities could use to assess the commercial potential of laboratory concepts. The project has moved forward with impressive results. In fiscal year 1997, Congress further endorsed this project by appropriating $1.5 million for final design and engineering. Final plans were completed in August 1998, and the project is ready to proceed with construction as soon as additional funds are appropriated. The state of Illinois has appropriated $6 million as matching funds, contingent upon $14 million in federal funds to construct this $20 million project.

The Ethanol Pilot Plant has been through an exhausting series of feasibility and engineering studies that have confirmed the need for, and the potential of, the project. It has also been endorsed by Congress. The project is ready for construction, with 30 percent of the capital funds provided by state government. Therefore, NCGA

urges Congress to appropriate $14 million to the U.S. Department of Agriculture in fiscal year 2000 to bring the potential of this project to bear in the marketplace.

The NCGA appreciates the opportunity to submit this testimony and looks forward to working with the committee on these priority issues for the corn industry.

PREPARED STATEMENT OF THE NATIONAL COTTON COUNCIL OF AMERICA

This is to transmit the cotton industry's request for fiscal year 2000 funding for selected programs under the jurisdiction of the Subcommittee on Agriculture, Rural Development, and Related Agencies. The National Cotton Council appreciates your assistance in making this letter a part of the hearing records related to the fiscal year 2000 appropriations bill.

The National Cotton Council of America (NCC) is the central organization of the U.S. cotton industry representing growers, ginners, warehousemen, cottonseed crushers, merchants, cooperatives and manufacturers whose primary business operations are located in 17 cotton producing states. Cotton Council International (CCI) is the overseas promotion arm of the cotton industry. The annual average farm gate value of U.S. cotton production is about $6 billion and its retail value averages approximately $60 billion. U.S. raw cotton exports normally account for approximately 40 percent of annual production and are valued at approximately $4 billion. U.S. textile manufacturers have invested nearly $25 billion in new plants and equipment in the U.S. during the last 10 years and continue to be the U.S. cotton producer's most important customers. Further, the growth in exports of U.S. manufactured cotton textile products, approaching 3.5 million bale equivalents, has been an important and positive development for the cotton industry and for farm income.

Cotton prices have declined dramatically in recent months and market observers predict low prices could continue for the next 12–36 months. The Asian economic crisis; changes in China's import policy; over production of cotton in Uzbeckistan and the Southern Hemisphere which has affected U.S. raw cotton export demand and spurred apparel exports to the U.S.; excess production of and cheap prices for synthetic fibers all contribute to a situation which has farmers deeply concerned by shrinking operating margins.

The assistance Congress provided for economic and weather related losses in late 1998 was very important. However, prices remain at their lowest point in a decade and USDA projections suggest farm income will remain under stress. For cotton, the exhaustion of funding for Step 2 competitiveness provision has left the industry unable to compete in a heavily subsidized international market.

In the long-term, cotton farmers will benefit from activities designed to reduce production costs and build demand. Successful completion of the boll weevil eradication program, control of the pink bollworrn, new technology developed by research, and demand building export programs including MAP, FMD and GSM credit are all essential to our industry.

The cotton industry's long-term viability and potential for continued improvement depend on: an effective farm policy including adequate funding for cotton's 3-step competitiveness provisions; an investment in the development and application of scientific principles; and, aggressive market development activities. The National Cotton Council welcomes the opportunity to provide the following recommendations and requests for fiscal year 2000 appropriations for programs which make important contributions to our industry's ability to compete and prosper (detailed description of these projects is attached):

FUNDING PRIORITIES

(1.) Pink Bollworm Programs—APHIS.—$6.0 million to continue San Joaquin Valley containment program and initiate an eradication program in 5 cotton producing counties in Arizona to move sequentially to eastern Arizona, New Mexico and west Texas.

(2a.) Boll Weevil Eradication—FSA.—$3.0 million (or adequate funding) to allow FSA to make at least $100 million in loans to eligible Boll Weevil Eradication Foundations, clarify eligibility criteria, and require FSA to collect acreage data.

(b.) Boll Weevil Eradication—APHIS.—Sufficient funds for APHIS to restore Federal cost share to 30 percent from current level of less than 5 percent.

(3a.) Market Access Program (MAP).—$90 million.

(b.) Foreign Market Development (FMD & FAS).—Sufficient funding to provide authority for FAS to write marketing plans at same funding level (approximately $33 million) as fiscal year 1999.

(c.) GSM–102 Credit Guarantee (FAS).—Maintain authority to make at least $5.9 billion in GSM–102 guaranteed export credit available for use by U.S. exporters and customers.

(4.) Aflatoxin.—Increase ARS aflatoxin research budget by $900,000 to expand the area wide management program in Arizona.

(5.) Ginning Research—ARS.—Urge ARS to provide adequate funding for operation of 3 regional ginning labs at Stoneville, MS; Lubbock, TX; and Mesilla Park, NM and instruct ARS not to reprogram fiscal year 1998 funds provided to Lubbock lab.

(6.) Farm Service Agency.—Adequate funding to deliver programs.

(7.) Other.—Support funding for value-added textile research at New Orleans SRRC & Clemson; PM–10 research by CSREES; germplasm enhancement; silverleaf whitefly control programs; various conservation programs; and, Office of Pest Management Programs.

Thank you for your consideration of our recommendations.

PREPARED STATEMENT OF THE NATIONAL COUNCIL OF FARMER COOPERATIVES

The National Council of Farmer Cooperatives (NCFC) appreciates very much this opportunity to share its views regarding the fiscal year 2000 agriculture appropriations bill, and respectfully requests this statement be made a part of the official hearing record.

Overview of NCFC

The National Council of Farmer Cooperatives (NCFC) is a national trade association representing nearly 100 regional marketing, supply and credit cooperatives, and state councils. Included among these regional cooperatives are over 3,500 local cooperatives whose farmer-owners represent a majority of America's 2 million individual farmers.

These farmer-owned cooperative businesses are engaged in virtually every facet of agriculture. This includes handling, processing, marketing and exporting of U.S. produced agricultural commodities and related products; the manufacture, distribution and sale of farm supplies; and the providing of credit and related financial services, including export financing for, and on behalf of, their farmer owners.

Support for Farmer Cooperatives

For farmers, such cooperative self-help efforts provide the opportunity to reduce risks, capitalize on market opportunities and earn a greater return on their productivity and investment. Earnings derived from such business are returned to the cooperative's farmer owners on a patronage basis, which also helps contribute to local and regional economic activity as well as the national economy. Another important contribution is reflected in the fact these farmer-owned cooperative businesses also employ nearly 300,000 people (full and part-time) with a combined payroll of approximately $6.8 billion. Many of these jobs are in rural areas where employment opportunities are sometimes limited.

Recent changes in farm policy, along with trends shaping the global business climate for U.S. agriculture, call for a renewed emphasis in support of policies and programs to help farmers help themselves through cooperative efforts to: (1) better manage the risks and uncertainty inherent in production agriculture; (2) capitalize on new market opportunities, including moving more into value-added production and processing; (3) compete more successfully in a global marketplace still characterized by subsidized foreign competition, and (4) help maintain and create needed jobs in communities throughout rural America.

USDA's Rural Business-Cooperative Service

For these reasons, we strongly recommend that funding and staffing be strengthened for USDA's Rural Business-Cooperative Service (RBS) and its related programs aimed at achieving these important objectives. Such action would help ensure that USDA is fully able to carry out its historical mission as mandated by Congress in support of farmer cooperatives. It should be noted that many of the programs administered by RBS relating to farmer cooperatives are generally derived from amounts made available for salaries and expenses in the Rural Development mission area. To better provide for program continuity and long term planning, we believe that specific language should be included in the fiscal year 2000 agriculture appropriations bill to ensure needed funding and staffing for RBS programs for research, education and technical assistance in support of farmer cooperatives.

Commodity Purchase Programs and Farmer Cooperatives

We want to express our strong support for maintaining both the statutory provisions and report language included in the fiscal year 1999 agriculture appropriations bill as an amendment by Senator Cochran to ensure that farmer cooperatives are fully eligible to participate in USDA's commodity purchase programs. Such programs serve two important purposes. One, they help meet the food and nutrition needs of consumers. Second, they provide an important market outlet for farmers, especially during periods of surplus production, thereby helping strengthen farm income and promoting orderly marketing.

We want to express our strong support for maintaining both the statutory provisions and report language included in the fiscal year 1999 agriculture appropriations bill as an amendment by Senator Cochran to ensure that farmer cooperatives are fully eligible to participate in USDA's commodity purchase programs. Such programs serve two important purposes. One, they help meet the food and nutrition needs of consumers. Second, they provide an important market outlet for farmers, especially during periods of surplus production, thereby helping strengthen farm income and promoting orderly marketing.

However, under previous guidelines established by USDA, this important market was eliminated for many farmers choosing to cooperatively market their products. The Cochran amendment addresses this by clearly providing that farmer cooperatives are fully eligible to participate in such programs for and on behalf of their farmer owners. In doing so, it preserves an important market outlet for many farmers, promotes orderly marketing, encourages cooperative self-help efforts, and helps maintain and strengthen farm income—since proceeds from the sale of commodities and related products are returned to the cooperatives' farmer owners as patronage income. The amendment also serves to increase the potential quantity and quality of commodities and related products available for purchase and use under such programs, and provides for more competitive bidding among participants. Finally, it helps contribute to stronger rural communities where farmer cooperatives and their farmer owners are located.

Crop Insurance/Risk Management

As the Administration and Congress consider changes and improvements in the federal crop insurance program, we believe there needs to be an expanded role and opportunity for farmers through their cooperatives and associations to join together to help obtain broader coverage on a more cost-effective basis. We believe such action would also help encourage program participation, improve the current delivery system, strengthen private sector involvement, reduce administrative and related costs, and further encourage cooperative self-help efforts.

Export Programs

We also believe it important to maintain and strengthen funding for USDA's export programs, including the Market Access Program (MAP) and Foreign Market Development (FMD) Cooperator Program, and we endorse the recommendations of the Coalition to Promote U.S. Agricultural Exports of which NCFC is a member. Such programs have been tremendously successful and extremely cost-effective in helping maintain and expand U.S. agricultural exports, countering subsidized foreign competition, protecting American jobs and strengthening farm income.

Programs such as MAP and FMD have also helped encourage and strengthen the ability of farmers to join together in cooperative efforts to promote their products in overseas markets and improve their income. Administered on a cost-share basis, they remain one of the few tools specifically allowed under the Uruguay Round Agreement to help American agriculture and American workers remain competitive in a global marketplace still characterized by subsidized foreign competition.

According to a recent analysis by USDA, the European Union (EU) and other foreign competitors are now outspending the U.S. by a factor of 20 to 1 with regard to the use of export subsidies and other expenditures for export promotion. The same study shows that such countries are spending over $100 million just to promote sales of their products in the United States. In other words, they are spending more to promote agricultural exports to the United States, than the U.S. is currently spending ($90 million) to promote American agricultural exports worldwide!

For this reason, we believe the Administration and Congress should give serious consideration to strengthening funding for MAP and other export programs, and ensuring that such programs are fully and aggressively utilized. Since MAP was originally authorized, funding has been gradually reduced from a high of $200 million to its current level of $90 million—a reduction of more than 50 percent. Again, given what our foreign trade competitors are doing, we believe it's time to restore funding for this vitally important program to its original level.

We also urge continued funding for other related USDA export programs, including the Export Enhancement Program (EEP), Dairy Export Incentive Program (DEIP), GSM Export Credit Guarantee Program, and Public Law 480. All of these programs continue to be essential to help encourage U.S. agriculture exports, counter subsidized foreign competition, protect American jobs, and strengthen farm income.

Agricultural Research

Another important area of emphasis when it comes to enhancing the global competitiveness of farmer cooperatives and American agriculture is research. It is equally important to help ensure that farmer cooperatives and American agriculture can continue to help provide consumers at home and abroad with a dependable supply of safe, high quality food and fiber at reasonable prices, while meeting important environmental and food safety objectives.

This includes recognition of the need to help farmers, their cooperatives, and others engaged in agriculture meet the goals and requirements of such statutes as the Food Quality Protection Act (FQPA), the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA) and the Clean Air Act (CAA), among others. To help meet these challenges, we believe every effort should be made to maintain and strengthen the highly successful public-private partnership involving USDA, the land grant universities and colleges, and the private sector. This includes providing needed funding at the federal level through USDA and ensuring that such funding helps achieve the important objectives outlined above.

Conservation/EQIP

We strongly support continued funding for the Conservation Reserve Program (CRP), as well as restoring funding for the Environmental Quality Incentives Program (EQIP), as recommended in the Administration's budget. Such programs are necessary to help achieve and maximize water quality and other environmental benefits.

The CRP and EQIP programs in particular are critical to empowering farmers to continue voluntary efforts to sustain the natural resource base and to respond to societal expectations and demands with regard to water quality and protecting our natural resource base.

Crop Protection/Pesticide Programs

The Administration's budget request includes funds for Integrated Pest Management (IPM) programs and IR–4 program to collect and analyze data on pesticide residues through the Pesticide Data Program (PDP). We endorse the views of: (1) the Food Quality Protection Act-Implementation Working Group (FQPA–IWG) of which NCFC is a steering committee member, and (2) the Minor Crop Farmer Alliance (MCFA) of which NCFC is a member of its executive committee. USDA's role in this process is critical if FQPA is to be implemented as intended by Congress.

We believe USDA is uniquely qualified to (a) gather and provide data to the EPA regarding pesticide use and dietary consumption patterns, and (b) to provide information about crop protection needs and efficacious and affordable alternatives. USDA has statutory obligations to carry out regarding minor use pesticides pursuant to FQPA, including establishment of a minor use office to facilitate grower efforts to provide information needed to maintain or develop label uses. Clearly, USDA has an essential role to play in working with EPA regarding implementation of FQPA to ensure that food and agricultural policy considerations are taken into account. For these reasons, we strongly urge that adequate funding be provided to ensure that it has the necessary resources to carry out such responsibilities.

Meat Inspection/User Fees

We continue to be opposed to user fees relating to Food Safety and Inspection Service (FSIS) for meat inspection. Such inspection programs provide important public benefits relating to food safety and quality and should continue to be publicly funded.

Farmers through their farmer-owned cooperatives are already contributing to meeting important food safety and quality requirements through investment in new Pathogen Reduction Hazard Analysis and Critical Control Point (HACCP) Systems for meat and poultry. The imposition of new user fees, to the extent that such fees could not be passed on to consumers, would impose an additional cost burden on farmer cooperatives and their farmer members, and reduce farm income. Again, in recognition of the public benefits of such programs and the need to maintain confidence in the safety and quality of such products, the federal government should maintain its historic role.

Conclusion

Mr. Chairman, on behalf of NCFC and its members, we want to again thank you for the opportunity to share our views with regard to the fiscal year 2000 agriculture appropriations bill. We also wish to take this opportunity to express our appreciation to you and the members of the Subcommittee for your interest and support of farmer cooperatives and American agriculture.

PREPARED STATEMENT OF THE NATIONAL FOOD PROCESSORS ASSOCIATION

The National Food Processors Association (NFPA) is pleased to submit testimony to the Subcommittee expressing our views on the President's fiscal year 2000 Budget Request for the Food and Drug Administration (FDA) and Department of Agriculture (USDA).

NFPA is the voice of the $430 billion food processing industry on scientific and public policy issues. Our members, whose headquarters and plants span from California to Connecticut, Maine to New Mexico, and points around the world, include large, small, and medium-sized purveyors of all kinds of packaged foods.

Unique among food groups, NFPA is a science-based organization, employing 60 Ph.D.'s and regulatory experts and maintaining state-of-the-art laboratories in Washington, D.C., Dublin, California, and Seattle. Our scientists conduct exacting experiments to protect the safety of America's enviable food supply and to guard against risks to consumers' well being.

We are a science-based organization that invests in food safety and willingly shares its findings with all public health officials throughout the world. As this suggests, NFPA takes its responsibilities seriously.

Guiding Principles.—NFPA does not automatically oppose or promote more spending on federal food safety programs. Rather, we recommend that any spending decisions be measured against these principles:

(1) Congress should reject or delay any increases in spending to expand the powers of the Food and Drug Administration and the U.S. Department of Agriculture until these agencies demonstrate that their current levels of funding are allocated in the most effective and efficient manner possible to protect the public's health. Agencies should be expected to clearly delineate their current statutory powers and explain why any new authority is needed.

(2) The agencies should vigorously apply the principles of sound science and risk assessment to their food safety programs.

(3) Appropriations should be linked to a determined effort by the FDA and USDA to approve new technologies and food safety tools that can safety deter or eliminate foodborne pathogens.

(4) Through its power of the purse, Congress should persuade federal food safety agencies to fully exercise their capacity for research and education.

User Fees.—For nearly a decade, the annual budget requests of President Clinton and preceding Administrations have doggedly proposed user fees—regulatory taxes—that require food processors to pay for the privilege of being regulated. Congress has summarily rejected the idea each year.

The President's fiscal year 2000 budget proposes nearly $525 million per year in regulatory taxes on the food industry—most of which would be imposed on meat and poultry processing plants. Imposing fees upon Federally regulated food processing facilities would amount to nothing more than a highly regressive tax on food products to be passed on to consumers in the form of higher food prices, and to farmers and ranchers in the form of reduced profit margins. In fact, the Supreme Court has held that the imposition of user fees on regulated companies for benefits enjoyed by the general public must be considered a tax.

There is no clearer example of a fundamental government function that broadly benefits society than regulating the safety and soundness of the food supply. Because all Americans benefit from this important public health work the agencies' resources must come from appropriated funds. Moreover, food taxes imposed upon the regulated industry threaten to compromise public confidence in the independence of food regulation.

Food Safety Initiative.—The President's fiscal year 2000 Budget recommends nearly $105 million in increased spending for the third year of the President's Food Safety Initiative (FSI), including new food safety funding for FDA and USDA. NFPA has been supportive of funding in fiscal year 1998 and fiscal year 1999 for FDA and USDA to enhance their food safety programs relative to research, risk assessment, coordination and education.

NFPA is concerned, however, with the Food Safety Initiative's continued emphasis on seeking additional funds simply to hire additional inspectors. In order to ensure

that resources are used wisely, it is essential that resources first be dedicated to identification and prevention of foodborne illness, particularly in high-risk foods. In that regard, NFPA strongly urges that if the Subcommittee provides additional FSI funding in fiscal year 2000 that such funds be dedicated toward risk assessment, research and education.

Funding for U.S. Codex Activities.—NFPA joins with other members of the food industry and the Food Industry Codex Coalition (FICC) to recommend that the Subcommittee provide initial "seed" funding to support the activities of the U.S. Codex Office in the Department of Agriculture. Codex Alimentarius (Codex) is the referenced organization for food safety standards used to resolve trade disputes under the World Trade Organization (WTO). Dedicated resources are necessary to ensure U.S. leadership in Codex, and to expand and preserve export opportunities for U.S. products and advance international food policy based on sound science.

Juice Safety.—The FDA has proposed a pending regulation that would impose a new layer of mandatory, costly, and unnecessary federal regulation on juice processors who pasteurize their products or employ equivalent methods to kill pathogens. Under FDA's proposed rule, processors of pasteurized fruit and vegetable juices would have to implement a Hazard Analysis Critical Control Point (HACCP) regimen.

Such action runs contrary to these findings: ninety-eight percent of all fruit and vegetable juices consumed in the U.S. are pasteurized or undergo an equivalent "kill step" to eliminate pathogens that can cause sickness or worse. Each year, the FDA estimates that 6,000–6,200 Americans will suffer sickness from juices—and all are caused by the 2 percent of juices that are not pasteurized.

For unpasteurized juices, those that cause all the illnesses recorded, the FDA has prescribed a mere label saying the juice isn't pasteurized. For the 98 percent that have caused no sicknesses, the FDA prescribes the redundant and costly application of HACCP.

NFPA supports HACCP as an effective means of protecting the public's health when appropriate. Mandatory HACCP is decidedly not appropriate here. NFPA recommends that the Subcommittee work to ensure that FDA's final regulation on juice safety imposes no new HACCP mandate, but instead requires that juices are pasteurized, or treated by any equivalent method.

Reform of FDA's Food Additive Review Process.—The food additive approval process at FDA is badly broken. Despite statutory requirements for approval within six months, it can take a decade or more for the FDA to approve new food additives. Problems associated with FDA's failure to act in a timely manner on direct food additive petitions were well documented in 1995 during hearings before the House Government Reform Committee, but since then, little or no progress has occurred. Because of these unreasonable delays and the disincentives they impose, fewer companies seem willing to explore new roads to food safety or submit food "additive" petitions to clear these paths.

The food industry, led by NFPA, has and continues to approach the FDA with proposals to reform the food additive approval process. Contrary to NFPA's general opposition to user fees where there is no unique proprietary benefit, NFPA has agreed to support "review fees" in exchange for FDA's adherence to specific performance goals to expedite the review and approval of direct food additive petitions. NFPA does not support the Administration's fiscal year 2000 request to impose user fees on food additive petitioners since there is no apparent obligation upon FDA to ensure that a petitioner would enjoy a more timely review of its petition.

Instead, NFPA recommends that the Subcommittee encourage the FDA to work with its constituent groups to reach agreement on an approach that will permanently reform the current food additive review and approval process.

Food Irradiation.—NFPA continues to have serious concerns with the slow pace of federal review and approval of food irradiation as a proven and effective food safety technology. Irradiation poses no threats, only advantages, to consumers and does not alter the taste or texture of the food. Yet, it took FDA nearly three and one-half years to approve its use on red meat in December 1997. Compounding this delay has been the Department of Agriculture's failure to even propose a regulation to enable irradiation's use until early 1999. USDA is not expected to complete its review of red meat irradiation until the year 2000. Meanwhile, the need for red meat irradiation in the marketplace has never been greater.

NFPA recommends that the Subcommittee ensure that USDA devote ample resources to ensuring the timely review and approval of red meat irradiation. In addition, we recommend that USDA and FDA be directed to examine their review and approval procedures for irradiation to ensure better coordination and to avoid duplicative and unnecessary resource demands that undoubtedly have contributed to the lengthy delays.

Finally, NFPA recommends that the Subcommittee direct both USDA and FDA to more thoroughly examine their existing policies toward food irradiation labeling disclosures. Existing labeling requirements convey uncertainty to many consumers about the safety of irradiated foods, and may serve to deny many consumers access to irradiated food products. Pending USDA and FDA rulemakings are soliciting public comment on this subject, and NFPA urges this review be completed in a timely manner.

Imported food safety.—The FDA has requested additional funds for fiscal year 2000 to increase inspections of imported food. FDA has also indicated its intent to seek increased statutory authority in 1999 to prevent the importation of foods from countries determined by FDA to provide food safety systems that are less than "equivalent" to that of the United States. NFPA and its member companies strongly support efforts to improve the safety of imported foods, but believes FDA should fully exercise its existing authority before seeking new powers.

NFPA recommends that the Subcommittee encourage FDA to identify what specific new regulatory activities FDA would be expected to undertake, along with commensurate resource demands, if the Congress grants FDA new statutory. Furthermore, NFPA recommends that FDA undertake a comprehensive review of its coordination with the U.S. Customs Service to ensure utilization of the full panoply of existing enforcement authorities to deter and reduce the incidence of imported food violations attributable to repeat offenders.

Other routes to the same goal—safe food without debilitating confrontations—are already in place. Codex Alimentarius, a framework for international negotiations on food safety, is well established in its process and success. Bilateral Equivalence Agreements, Memoranda of Understanding, and Mutual Recognition Agreements are also in place.

NFPA sees in these approaches less provocation and intrusion, coupled with more effect. Other strategies may include requiring equivalent safety protocols in foreign countries (not "the same as"), punishing repeat offenders, and ensuring that port shopping is brought to a halt (that is, when a shipment of food is rejected at one port, they re-label the product and try to bring it in at another).

Once again, NFPA seeks a full explanation from the FDA of any inadequacies they see in current statute before Congress wades into changes in the law. Only through a complete disclosure can we engage in a productive debate. We also think that this subcommittee would be well served by demanding such documentation and delineation.

Thank you for your time and consideration of NFPA's views. Please contact us if we can provide additional information to the Subcommittee. In the meantime, please visit our web site a www.nfpa-food.org.

PREPARED STATEMENT OF THE NATIONAL POTATO COUNCIL

My name is Chuck Gunnerson. I am a potato farmer from Minnesota and current Vice President, Legislative/Government Affairs for the National Potato Council (the Council). On behalf of the Council, we thank you for your attention to the needs of our potato growers.

The Council is the only trade association representing commercial growers in 50 states. Our growers produce both seed potatoes and potatoes for consumption in a variety of forms. Annual production in 1997 was 407,164,000 cwt with a farm value of $2.2 billion. Total value is substantially increased through processing. The potato crop clearly has a positive impact on the U.S. economy.

The potato is the most popular of all vegetables grown and consumed in the United States and one of the most popular in the world. Annual per capita consumption was 143 pounds in 1996 up from 107 pounds in 1962 and is increasing due to the advent of new products and heightened public awareness of the potato's excellent nutritional value. Potatoes are considered a stable consumer commodity and an integral, delicious component of the American diet.

The National Potato Council's fiscal year 2000 appropriations priorities are as follows:

Agricultural Research Service (ARS).—The NPC proposes additional potato research funds for:

—Orono, Maine.—Potato production in northern Maine has shown a significant decline in recent years. This trend will, however, be reversed with the construction of a new potato processing facility in Maine by McCain Foods. It is estimated that 15,000 acres will be returned to potato production. The current ARS research program has included a search for alternative crops that could be used in a potato rotation. Potatoes are grown in three-year rotations with soybean,

canola, green bean, sweet corn, and barley/clover. An interdisciplinary team of two scientists is evaluating cropping system impacts on soil nutrient dynamics and soilborne pathogen ecology. A third scientist is being recruited to assess crop management system effects on potato late blight. Integrating the production of several crops is a high priority. The addition of an agronomist to supplement the soil science and pathology research will greatly strengthen the potato program in Maine. Estimated cost is $300,000/year.

—Prosser, Washington.—The "precision agriculture" group at Prosser that focussed on potato production was disbanded. Currently, recruitments are in process for a weed and soil scientist. There is a need to continue research on site-specific management and to focus on the biology of potato production. To accomplish this goal, an agronomist should also be added to the Prosser group. The objective of this position would be to integrate the soil, weed, pathology and entomology information on potato production into a more effective system. There is a need to achieve better quality as well as improved yield. The estimated cost is $300,000/year.

—Beltsville, Maryland.—Improving the nutritional value of the potato is a high priority of the NPC. The Beltsville Vegetable Laboratory program has relied heavily on traditional breeding and new high quality germplasm has been introduced over a period of many years. Genes critical to the accumulation of selected nutrients such as B-carotene, lycopene, polyamines, lipoic acid, glutathione and ascorbic acid have been identified in several crops. These phytonutrients have been correlated with a reduced incidence of some forms of cancer. It is now possible to introduce these genes, after specific modification, into potatoes and other vegetable crops. Research should be initiated that combines traditional breeding and plant biotechnology to increase the nutritional value of the potato and add value to the crop. Estimated cost would be $300,000/year.

—Albany, California.—Introduction of genes for potato improvement utilizing biotechnology procedures is a goal of ARS research. Currently, there are significant restrictions on the use of some important reagents that prevent successful commercialization of plants transformed by ARS scientists. Dr. William Belknap in Albany has been funded by ARS, with endorsement from the NPC, to develop genetic constructs for potato transformation that will be publicly available without patent restrictions on their use. His laboratory should serve as a source of reagents for use by ARS scientists and others who work in the public sector. Estimated cost of providing this service is an additional $100,000/year to Dr. Belknap's base CRIS budget.

—Report Language.—Agricultural Research Service (ARS)—The NPC urges that the Congress once again add Committee report language urging the ARS to work with the NPC on how funds can best be used for research priorities.

Cooperative State Research, Education and Extension Service (CSREES).—The NPC urges that the Congress increase funding to a level of $1.4 million for the potato research special grant program to return to previous year's funding levels.

The NPC also urges that the Congress, once again, include report Committee language as follows:

"Potato research.—The Committee expects the Department to ensure that funds provided to CSREES for potato research are utilized for varietal development testing. Further, these funds are to be awarded competitively after review by the potato industry working group."

Plant Protection and Quarantine Service (APHIS-USDA).—The NPC urges that the Congress appropriate $580,000 for the Golden Nematode Quarantine Program, which amount is the fiscal year 2000 budget request. The National Potato Council also supports increasing the fiscal year 2000 budget request for AQI user fees from $95 to $100 million. The NPC also supports fiscal year 2000 budget requests for the AQI appropriated funds, sanitary/phytosanitary (SPS) management and pest surveillance and detection.

Finally, we also support the Administration's budget request for funds to meet the data requirements of the new Food Quality Protection Act, (FQPA).

PREPARED STATEMENT OF THE NATIONAL RURAL TELECOM ASSOCIATION

SUMMARY OF TESTIMONY REQUESTS

Project involved:Telecommunications lending programs administered by the Rural Utilities Service of the U.S. Department of Agriculture

Actions proposed:

—Supporting loan levels for fiscal year 2000 in the same amounts as those contained in the fiscal year 1999 Agriculture Appropriations Act (Public Law 105–277, Sec. 101(a)) for hardship, cost-of-money and guaranteed loan programs and the associated subsidy to fund those programs at existing levels.
—Supporting Rural Telephone Bank loans in the amount requested in the President's budget and the associated subsidy to fund this level.
—Supporting funding in the amount of $200 million in loans and $20 million grant authority designated for distance learning and telemedicine purposes as requested in the President's budget.
—Supporting an extension of the language removing the 7 percent interest rate ceiling on cost-of-money loans.
—Supporting continuation of the restriction on retirement of Rural Telephone Bank class A stock in fiscal year 2000 at the level contained in Public Law 105–277 and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund.
—Opposing the proposal contained in the budget to transfer funds from the unobligated balances of the liquidating account of the Rural Telephone Bank for the bank's administrative expenses and loan subsidy costs.

Mr. Chairman, Members of the Committee: My name is John F. O'Neal. I am General Counsel of the National Rural Telecom Association. NRTA is comprised primarily of commercial telephone companies which borrow their capital needs from the Rural Utilities Service of the U.S. Department of Agriculture (RUS) to furnish and improve telephone service in rural areas. Approximately 1000, or 71 percent of the nation's local telephone systems borrow from RUS. About three-fourths of these are commercial telephone companies. RUS borrowers serve almost 6 million subscribers in 46 states and employ over 22,000 people. In accepting loan funds, borrowers assume an obligation under the act to serve the widest practical number of rural users within their service area.

Program background

Rural telephone systems have an ongoing need for long-term, fixed rate capital at affordable interest rates. Since 1949, that capital has been provided through telecommunications lending programs administered by the Rural Utilities Service and its predecessor, the Rural Electrification Agency (REA).

RUS loans are made exclusively for capital improvements and loan funds are segregated from borrower operating revenues. Loans are not made to fund operating revenues or profits of the borrower system. There is a proscription in the Act against loans which would duplicate existing facilities providing adequate service and state authority to regulate telephone service is expressly preserved under the Rural Electrification Act.

Rural telephone systems operate at a severe geographical handicap when compared with other telephone companies. While almost 6 million rural telephone subscribers receive telephone service from RUS borrower systems, they account for only four percent of total U.S. subscribers. On the other hand, borrower service territories total 37 percent of the land area—nearly 1½ million squares miles. RUS borrowers average about six subscribers per mile of telephone line and have an average of more than 1,000 route miles of lines in their systems.

Because of low-density and the inherent high cost of serving these areas, Congress made long-term, fixed rate loans available at reasonable rates of interest to assure that rural telephone subscribers, the ultimate beneficiaries of these programs, have comparable telephone service with their urban counterparts at affordable subscriber rates. This principle is especially valid today as the United States endeavors to deploy telecommunications "information superhighway" technology and as customers and regulators constantly demand improved and enhanced services.

At the same time, the underlying statutory authority which governs the current program has undergone significant change. In 1993, telecommunications lending was refocused toward facilities modernization. Much of the subsidy cost has been eliminated from the program. The subsidy that remains has been targeted to the highest cost, lowest density systems. Other loans are made at Treasury's cost-of-money or greater.

We are proud to state once again for the record that there has never been a default in the RUS/REA telephone program! All loans have been repaid in accordance with their terms with interest. As of December 31, 1997, over $4.5 billion of principal and over $5 billion in interest had been paid by telephone borrowers to the federal government under this program.

Need for RUS telecommunications lending continues

The need for rural telecommunications lending is great today, possibly even greater than in the past. Technological advances make it imperative that rural telephone companies upgrade their systems to keep pace with improvements and provide the latest available technology to their subscribers.

These rapid technological changes and federal policies of competition and deregulation in the telephone industry, as evidenced by passage of the "Telecommunications Act of 1996", underscore the continuing need for targeted assistance to rural areas. The inherently higher costs to serve these areas have not abated. Regulatory trends encouraging competition among telephone systems increase pressures to shift more costs onto rural ratepayers. Interstate subscriber line charges have already shifted substantial costs to local exchange customers. Pressures to recover more and more of the higher costs of rural service from rural customers to foster urban competitive responses will further burden rural consumers. And, as rural rates rise, small telephone systems will tend to lose confidence that they can recover the investments for costly network upgrades.

1996 Telecommunications Act effect on rural America

Congress passed the Telecommunications Act of 1996 as the culmination of more than a decade of debating national telecommunications policy and balancing many diverse needs and interests. The 1996 Act responded to a number of rural needs and differences with a series of safeguards to ensure that rates, services and network development in rural America will be reasonably comparable to urban telecommunications opportunities.

The process of implementing the new law continues to raise troubling uncertainties and concerns about whether the FCC and the states will honor the balance Congress achieved in its policy, as regulators (a) radically revise the mechanisms for preserving and advancing "universal service," (b) adjust the cost recovery responsibilities and allocations of authority between federal and state regulation, (c) effectuate the Act's somewhat different urban and rural ground rules for how new companies and incumbent universal service providers connect their networks and compensate each other and (d) peel back layers of regulation developed over a century. So far, the FCC has been overzealous in expanding the Act's market-opening provisions to give new entrants a regulatory head start and advantage at the expense of the Act's rural development and universal service provisions. The FCC is trying to unsurp the role of competition by dictating a whole new—and wholly inadequate—way to measure the costs of modern, nationwide telecommunications access to information. The FCC needs to reorder the sequence of its proceedings to ensure that rural Americans are not denied the ongoing network development and new services the Act requires. Rural telephone systems with universal service obligations must not be thwarted in their efforts to upgrade and provide rates and services reasonably comparable to urban offerings. The FCC must not falter in delivery on these national policies either during or after the difficult process of implementing the law. Congress and the courts must carefully supervise the FCC's implementation to achieve the rural access to information and an evolving modern public network intended by Congress, as well as the benefits of deregulation and genuine competition.

Expanded congressional mandates for rural telecommunications

Considerable loan demand is being generated because of additional mandates for enhanced rural telecommunications standards contained in the authorizing legislation enacted in 1993 by Congress in Public Law 103–129. These mandates coupled with the need for stable financing sources to meet the infrastructure demands envisioned for rural areas by the 1996 telecommunications act amply demonstrate the continuing need for this important program at the following levels:

5 percent Hardship Loans	$75,000,000
Cost-of-Money Loans	300,000,000
Guaranteed Loans	120,000,000
Rural Telephone Bank Loans	175,000,000
Total	670,000,000

These are the levels established in the fiscal year 1999 appropriations act for the hardship, cost-of-money and guaranteed loan programs. The $175 million loan level is the historical level for Rural Telephone Bank loans and the amount requested in the President's fiscal year 2000 budget. However, the President's budget also seeks to reduce the amount of hardship loans despite the substantial ongoing demand. We believe that the needs of this program balanced with the minimal cost to the tax-

payer argue for its continuation at enacted levels given the fact that it provides funding for the neediest borrower systems serving the highest cost areas.

Specific Additional Requests

Continue the Removal of the 7 percent Cap on Cost-of-Money Loans

Again this year we are supporting removal of the 7 percent ceiling on cost-of-money loans even though long-term Treasury rates are currently substantially below this level. This Committee included language in the fiscal year 1996 act to permit borrower interest rates on cost-of-money loans to exceed the 7 percent per year interest rate ceiling contained in the authorizing act. The language has been continued in subsequent acts. We support an extension of this provision in the fiscal year 2000 bill. In the event that long-term Treasury interest rates might exceed 7 percent during the next fiscal year. If that happens, the cost-of-money loan program could be disrupted and loan levels not achieved since adequate subsidy would not be available to support the program at the authorized levels. For this reason, we believe it is important to incorporate this language in the bill again this year.

Continue the Restriction on Retirement of Class A Government Stock in the Rural Telephone Bank (RTB) and also Continue the Prohibition Against Transfer of RTB Funds to the General Fund and Require the Payment of Interest

The Committee should continue the restriction on retirement of the amount of class A stock by the Rural Telephone Bank in fiscal year 2000. The Bank is currently in the process of retiring the government's stock as required under current law. We believe that this process which began in fiscal year 1996 should continue to be an orderly one as contemplated by the retirement schedule enacted four years ago and continued in last year's bill to retire no more than 5 percent of the total class A stock in one year. We also urge the Committee to continue the prohibition against the transfer of any unobligated balance in the bank's liquidating account which is in excess of current requirements to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private Class B and C stockholders of the Rural Telephone Bank have a vested ownership interest in the assets of the bank including its funds and their rights should be protected.

Reject Budget Proposal to Transfer Funds from RTB Liquidating Account for Subsidy and Administrative Costs

In this same vein, we are also opposed to the proposal contained in the President's budget again this year that the subsidy cost associated with Rural Telephone Bank loans be funded by a transfer from the unobligated balances of the bank's liquidating account rather than by a traditional appropriation from the general fund of the Treasury which has been the funding mechanism utilized for the bank since enactment of the federal credit reform act in 1990. Requiring the bank to fund the subsidy cost of its loans would dilute the interests of the bank's stockholders. By definition, the bank's unobligated balances are not exclusively federal funds but are subject to the respective ownership interests of all the stockholders of the bank. Previous appropriations acts, including the fiscal year 1997, 1998 and 1999 acts, have recognized the ownership rights of the private class B and C stockholders of the bank by prohibiting a similar transfer of the bank's excess unobligated balances which otherwise would have been required under the federal credit reform act. This cost is more properly funded through a regular appropriation from the general fund of the Treasury.

The President's budget also proposes that the bank assume responsibility for its administrative costs also by a transfer of funds from the unobligated balances of the bank's liquidating account rather than through an appropriation from the general fund of the Treasury. This recommendation is contrary to the specific language of Sec. 403(b) of the RTB enabling act.

The budget language acknowledges that neither proposal would result in budgetary savings. Both proposals were specifically rejected last year by this Committee. No justification for these recommendations is contained in the budget again this year. Both proposals would require consideration by the authorizing committees and enactment of new authorizing legislation as a prerequisite to an appropriation. As of this date, no such legislation has been transmitted by the Administration or is under consideration before the authorizing committees.

Loans and Grants for Telemedicine and Distance Learning

The President's budget requests $200 million in loan authority for fiscal year 2000 and $20 million in grants specifically devoted to telemedicine and distance learning

purposes. Loans are made at the government's cost-of-money. The purpose is to accelerate deployment of telemedicine and distance learning technologies in rural areas through the use of telecommunications, computer networks, and related advanced technologies by students, teachers, medical professionals, and rural residents.

We believe this program specifically designated for distance learning and telemedicine purposes is particularly important. Continuing to target funds in this manner spurs deployment of this important new technology which is vital for the survival of rural schools, hospitals and the rural communities they serve. At the same time, we believe the level proposed strikes a cost effective balance for the taxpayer.

CONCLUSION

Thank you for the opportunity to present the association's views concerning this vital program. The telecommunications lending programs of RUS continue to work effectively and accomplish the objectives established by Congress at a minimal cost to the taxpayer.

PREPARED STATEMENT OF THE NATIONAL TELEPHONE COOPERATIVE ASSOCIATION REGARDING

SUMMARY

The information age continues to evolve at lightening speed, permeating every element of our existence. No longer a luxury at all, today, access to advanced, affordable, communications infrastructure and services, by every American, is an absolute necessity. Indeed, federal, state, and local executives, legislators, and regulators, as well as the general public, are demanding nothing less.

The small rural incumbent local exchange carrier (ILEC) segment of the communications industry has responded to these demands with outstanding vigor, providing perhaps the most exceptional telecommunications services of anywhere in the nation. It has done so through both a deep commitment to community and by having access to the affordable financing that is available via the Rural Utilities Service (RUS) Telecommunications Loan Program.

For 50 years, NTCA's small rural ILEC members, in partnership with the RUS, have fulfilled the joint statutory mission of both providing and improving rural telecommunications service, with distinction. With the RUS appropriately funded, they will be able to continue doing so well into the future. Therefore NTCA recommends full funding for all accounts of the RUS Telecommunications Loan Program and its related community development program. Additionally, NTCA recommends that language be included in the fiscal year 2000 appropriations package which will protect the program, and particularly the Rural Telephone Bank (RTB), from frivolous or premature actions intended to redirect their course.

BACKGROUND

NTCA is a national trade association representing more than 500 small, rural, cooperative and commercial incumbent local exchange carriers (ILECs) located throughout the nation. These locally owned and operated ILECs provide local exchange service to more than 5 million rural Americans. Through the 50 year history of the RUS Telecommunications Loan Program, more than 80 percent of NTCA's member systems have been able to utilize the federal program to one degree or another.

NTCA's members, like most of the country's independent ILEC's, evolved to serve high cost rural areas of the nation that were overlooked by the industry's giants as unprofitable. And there can be no doubt regarding the high cost of such markets. Consider that the combined service area's of these ILECs constitutes approximately 40 percent of the nation's geographic area, yet the more than 5 million subscribers served in this territory account for little more than 4 percent of the nation's total access lines. On average, RUS borrowers have approximately 6 subscribers per mile of infrastructure line, compared with 130 for the larger urban-oriented, non-RUS financed systems. This results in an average plant investment per subscriber that for RUS borrowers is 38 percent higher than for most other systems.

Congress recognized the unique financing dilemma confronting America's small rural ILECs as early as 1949. It was in that year that it amended the Rural Electrification Act (RE Act) to create the Rural Electrification Administration (REA) Telephone Loan Program, today known as the RUS Telecommunications Loan Program. Through the years Congress has periodically amended the RE Act to ensure that that original mission—to furnish and improve rural telephone service—was

met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the RUS was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. In 1993, Congress established a fourth program lending facet, the Treasury Cost of Money account.

RUS HELPS MEET INFRASTRUCTURE DEMANDS

While the RUS has helped the subscribers of NTCA's member systems receive service that is comparable or superior to that available anywhere in the nation, their work is far from complete. As federal policies such as the Telecommunications Act of 1996 continue to evolve, the high costs associated with providing modern telecommunications services in rural areas will not diminish. Three years into the implementation of the 1996 Act, the Federal Communications Commission's (FCC's) interpretation of the statute, and several court decisions, have held little regard for congressional intent particularly with respect to universal service which is so vital to small rural ILECs. Consequently, the ongoing need for the well defined, understood, time-tested RUS Telecommunications Loan Program is even greater.

For example, RUS telecommunications lending has stimulated billions of dollars in private capital investment in rural communications infrastructure. In recent years, on average, less than $10 million in federal subsidy generated $670 million in federal loans and loan guarantees. For every $1 in federal funds that were invested in rural communications infrastructure, $4.50 in private funds were invested.

The RUS is also making a difference in our rural schools, libraries, and hospitals. Since 1993, the RUS Distance Learning and Telemedicine Grant and Loan program has funded approximately 200 projects throughout the nation for interactive technology in rural schools, libraries, hospitals, and health clinics. This program has provided unprecedented educational opportunities for rural students and enhanced health care for rural residents.

In addition, two other RUS related programs are making a difference in rural America. Formerly under the RUS and known as the Zero Interest Loan and Grant Program, the Rural Economic Development Grants Program and the Rural Economic Development Loans Program are now managed by the Rural Business Cooperative Service. The two programs provide funds for the purpose of promoting rural economic development and job creation projects, including funding for project feasibility studies, start-up costs, incubator projects and other expenses tied to rural development. The two programs have allowed hundreds of communities to build, acquire, and/or install everything from firehouses to recreational facilities that enhance the viability of the community.

NTCA'S APPROPRIATIONS RECOMMENDATIONS

Fully Fund The RUS Telecommunications Loan Program:

Increasing demand for expanded telecommunications services and infrastructure upgrades indicates a continuing strong need for stable loan levels at the authorizations established by the Rural Electrification Loan Restructuring Act of 1993. The president's budget proposal to cut the Hardship account to a level of $50 million is inappropriate considering that a backlog of applications for these funds continues to exist. Likewise, last year's congressional response to fully funding the Hardship account by reducing funding for the RTB account would be inappropriate as the RTB is again being fully utilized. Adequate subsidy must be appropriated to support the following fiscal year 2000 loan account levels:

Hardship Account	$75,000,000
Treasury-rate Account	300,000,000
Guaranteed Account	120,000,000
Rural Telephone Bank Account	175,000,000
Total	670,000,000

Extend Removal Of The Interest Rate Cap On Treasury-Rate Loans:

NTCA is also requesting that Congress again include language removing the 7 percent interest rate cap on Treasury-rate loans. This provision has been included in recent appropriations measures to prevent the potential disruption of the program in the case where interest rates exceed 7 percent and insufficient subsidy cannot support authorized lending levels.

Prohibit The Transfer Of Unobligated Balances Of The RTB Liquidating Account

NTCA also recommends that Congress continue the prohibition against the transfer of any unobligated balances of the Rural Telephone Bank liquidating account to the general fund of the Treasury. This language has routinely been included in annual appropriations measures since the enactment of the Federal Credit Reform Act (FCRA), Public Law 101–508, that allows such sweeping to potentially occur. Restatement of this language will again ensure that the RTB's private class B & class C stockholder are not stripped of the value of their statutorily mandated investment in the Bank.

Prohibit RTB From Self Funding Subsidy And Administrative Costs

The Administration's fiscal year 2000 budget proposal suggests funding the RTB's loan subsidies and administrative expenses out of unobligated balances in the bank's liquidating account rather than out of the general fund of the Treasury as is required by the RE Act. NTCA urges Congress to reject this proposal, as it did last fiscal year, for the following basic reasons: (1) such action would require amendment of the RE Act, (2) the proposal appears to be in conflict with the intent of the FCRA, (3) the proposal will not result in federal budgetary savings, (4) it is unnecessary to the determination of whether the bank could operate independently, and thus would amount to wasting the resources of the bank which could be put to better use upon its complete privatization, and (5) the bank should not be expected to self fund these expenses while concurrently being prohibited from utilizing the unobligated balances in its liquidating account for the re-making of new loans.

Rural Telephone Bank Privatization

Under the President's fiscal year 2000 budget proposal, the RTB is proposed to "become a Performance Based Organization (PBO) to establish its financial and operational independence prior to its being privatized within ten years." At this time, it is difficult to support, or evaluate any privatization proposal without first obtaining an answer to the critical question of who owns the assets of the bank at any given time during the privatization period, which is already underway at a minimal statutory pace. Without a definitive and official determination of this central issue, it is not possible to formulate an informed position regarding privatization of the bank.

NTCA believes any privatization plan should be well conceived before implementation. At the very least, privatization should proceed in an orderly fashion with a full accounting of the various financial and legal implications involved. Congress, RTB Stockholders, and the rural telecommunications industry deserve the benefit of having RTB privatization reviewed thoroughly, and not in the vacuum of the budgetary process. In addition to having a high concentration of RTB stockholders as members, NTCA itself is a RTB stockholder. The RTB's portfolio is currently valued at well over $2 billion and consequently it continues to play a critical role in the modernization of rural telecommunications infrastructure throughout the United States. For these reasons, the RTB's future will continue to be closely monitored, and protected, by NTCA and its members. Furthermore, NTCA urges Congress to refrain from commencing such deliberations without the asset question answered, or in an effort to simply respond to the administration's budget suggestion.

Continue RUS Distance Learning and Telemedicine Loan and Grant Program The RUS Distance Learning and Telemedicine Loan and Grant program has proven to be an indispensable tool for rural development. In this regard, NTCA urges Congress to provide adequate funding for this critical program. NTCA supports the recommendations for this program that are contained in the president's budget proposal.

Preserve RBCS Rural Development Grant and Loan Programs

Likewise, NTCA has witnessed the good these programs have done for rural communities. NTCA urges Congress to ensure funding is at levels that are adequate to meet current demand for the programs.

CONCLUSION

The RUS Telecommunications Loan Program bears a proud 50-year record of commitment, service, and achievement to rural America. Never in its entire history has the program lost even a dollar to abuse or default—an unparalleled feat for any government-sponsored lending program. Clearly such a successful program should remain in place to continue to ensure rural Americans have the opportunity to play a leading role in the information age in which we live. After all, an operational and advanced rural segment of the nation's telecommunications infrastructure is critical

to truly ensuring that the national objective of universal telecommunications service is fulfilled. Please help us accomplish that objective.

PREPARED STATEMENT OF THE NATIONAL UTILITY CONTRACTORS ASSOCIATION

Mr. Chairman and Members of the Subcommittee, my name is Andy Mayts. I am Director of Operations for Gigliotti Contracting North in Palm Harbor, Florida. Thank you for the opportunity to submit written testimony on behalf of the National Utility Contractors Association (NUCA) regarding the U.S. Department of Agriculture (USDA) Rural Utilities Service (RUS) Water and Waste Disposal infrastructure funding for fiscal 2000.

FISCAL 2000 RECOMMENDATION

NUCA respectfully requests that the Committee reject the Administration's proposed 12 percent cut to the RUS Water and Waste Disposal loan and grant budget authority and appropriate, at minimum, the current funding level of $645 million for fiscal 2000.

RUS Water and Waste Disposal loan and grant programs provide funds for small communities with 10,000 or fewer residents that cannot secure reasonable financing for drinking water and wastewater infrastructure improvements. As you well know, these are widely popular and successful programs among rural communities. In fact, currently there is a $3.2 billion backlog of eligible applications for the grant ($1 billion) and loan ($2.2 billion) programs.

For fiscal 2000, the President proposed $503 million in grants for water and waste disposal and $64 million in loans for water and waste disposal. We recognize that the fiscal 2000 subsidy rate of 7.1 percent, as determined by the U.S. Office of Management and Budget, is such that the proposed cut does not result in a reduction in programs. But the President has failed to recognize the historic opportunity to capitalize on the low subsidy rate and make a big dent in the backlog of $3.2 billion of eligible loan and grant applications. As illustrated on the chart on the following page, merely maintaining the current funding level could provide an additional $766,590,520 to the RUS programs to tackle the backlog. Please compare:

Assumptions: Row 1 reflects the fiscal 1999 Budget Authority of $645,007,000 and the fiscal 1999 subsidy rate of 16.52 percent. For fiscal 1999, grant programs assumed approximately 82 percent percent of the Budget Authority. Row 2 reflects the Administration proposal of $567 million for fiscal 2000, and the OMB subsidy rate of 7.10 percent. The Administration proposed $503 for RUS grants and $64 million for loans, thus grants assume 89 percent of the total proposed Budget Authority. Row 3 reflects NUCA's recommendation that the Committee maintain the current funding level, $645 million. It also assumes the OMB subsidy rate of 7.10 percent and allocates 89 percent of the total Budget Authority to grants. Row 4 reflects the current funding level, the fiscal 1999 percentage of grants of total Budget Authority (82 percent), and the fiscal 2000 subsidy rate of 7.10 percent.

Fiscal year	Budget authority	Grants	Subsidy rate (percent)	Loans	Program dollars
1999 actual	$645,007,000	$528,363,000 (at fiscal year 1999, 82 percent).	16.52	$706,077,482	$1,234,440,482
2000 Admin proposal	$567,000,000	$503,000,000 (at fiscal year 2000, 89 percent).	7.10	$901,120,000	$1,404,120,000
2000 at fiscal year 1999 funding.	$645,007,000	$574,056,230 (at fiscal year 2000, 89 percent).	7.10	$998,986,842	$1,573,043,072
2000 at fiscal year 1999 funding.	$645,007,000	$528,363,000 (at fiscal year 1999, 82 percent).	7.10	$1,642,347,520	$2,170,710,520

The RUS Water and Waste Disposal programs are popular and important investments and have proven track records. They provided $28 billion in loans and grants to more than 12,500 communities across the country between 1965 and 1995. With a loan default rate of 0.1 percent and a repayment delinquency rate less than 2 percent, RUS loans and grants are wise investments in rural America.

RURAL WATER AND WASTE DISPOSAL NEEDS AND THE RUS CURE

NUCA is comprised of nearly 2,000 companies that build and maintain water, sewer, and other underground infrastructure systems in rural communities as well as in metropolitan areas nationwide. Every day of the week we witness the consequences of failed or nonexistent water and waste disposal infrastructure on the most dire of human needs—WATER! Without water, our bodies cease to function, and without clean water, our ability to live healthy, productive lives is diminished. Waterborne illness is a serious, life-threatening condition that affects nearly 1 million people annually. Children and the elderly are particularly vulnerable because of weaker immune systems. Fortunately, there is a cure for this needless illness in rural America. RUS capital investment in water and waste disposal facilities (including solid waste disposal and storm drainage) is the first line of defense in protecting water quality and thus public health.

Once the RUS investment is in place, additional dividends in the form of jobs, quality of life, environmental protection, and public safety are attained. The now-healthy workforce in what would be a high-unemployment community can go to work. When $1 billion is invested in clean water infrastructure, as many as 57,400 jobs are created, and more than half of these jobs are permanent because new businesses relocate to the area and existing businesses expand operations. In rural communities where unemployment and poverty rates are much higher than the national average, RUS programs improve people's lives.

RUS water and waste disposal loans and grants also provide for the everyday conveniences that you and I generally take for granted, such as the simple acts of watering the tomato plants, taking a shower, or making a pitcher of lemonade. The programs also protect the natural environment—often the very reason people wish to live in rural communities—from the degradation caused by untreated sewage and stormwater runoff tainted with chemicals and animal feces that contaminate waterways and groundwater supplies. Finally, public safety in the form of fire protection is enhanced by modern water storage and distribution systems. Leaking, clogged, and undersized water lines compromise water pressure and make it virtually impossible for firefighters to do their jobs. Similarly, aged water and sewer mains can burst and collapse, creating dangerous sinkholes and shutting off travel routes. These threats to public safety drive up the price of community services and homeowner insurance, hampering individuals and communities from achieving economic prosperity. If the public investment is made, however, it repays itself over time and produces lasting rewards for the community.

RUS PROPOSAL IN RELATION TO EPA ESTIMATES

There are an estimated 46,500 small drinking water systems in the United States serving 3,300 or fewer people. The Environmental Protection Agency's 1997 Drinking Water Needs Survey (EPA) projected more than $37.2 billion in needed infrastructure improvements for these systems over the next 20 years. In addition to these identified needs, a significant number of households are not served by a centralized water distribution and treatment facility. Some 15 million households use private wells, and another 1 million homes rely on untreated sources that include cisterns and water hauled from springs, rivers, and lakes.

The EPA 1996 Wastewater Needs Survey estimates that small communities with 10,000 or fewer residents face more than $13.8 billion in capital costs over the next two decades for sewage collection and treatment works. That figure does not include an estimation of septic system needs. The total $51 billion is considered by most to be a conservative estimate. Thus, a $645 million investment for fiscal 2000 is worth every penny.

NUCA CLEAN WATER FOR RURAL AMERICA BROCHURE

Attached, please find a copy of one of NUCA's new brochures titled, *Clean Water for Rural America.* Our state chapters and members will share this information with other business leaders and public officials in the rural communities where they live and work. NUCA is pleased to serve as an information resource for this widely popular and beneficial program. We will also provide copies of the brochure to the full Senate and House.

CONCLUSION

We, the members of NUCA, urge you to reject the Clinton Administration's fiscal 2000 proposed cut to the RUS Water and Waste Disposal loans and grants programs and appropriate, at minimum, the current funding level, $645 million. These are important sources of financing for small, rural communities that have been turned

down by more conventional lenders. The program has a solid track record in terms of loans repaid and maximum use of appropriated dollars. More than $50 billion in water and waste disposal needs exist in the communities RUS serves. And currently there is a backlog of more than $3.2 billion in eligible applications to be funded.

Thank you for considering our recommendation.

PREPARED STATEMENT OF THE NATIONAL WATERSHED COALITION

Mr. Chairman and members of the subcommittee: The National Watershed Coalition (NWC) is pleased to present this testimony in support of some of the most beneficial water resource conservation programs ever developed in the United States. The Coalition recognizes full well the need to use our tax dollars wisely. That makes the work of this Subcommittee very important. It also makes it imperative that the federal programs that are continued are those that provide real benefit to society, and are not programs that would be nice to have if funds were unlimited. We believe that the Small Watershed Program (Public Law 83–566) and the Flood Prevention Operations Program (Public Law 78–534) are examples of those rare programs that address our nation's vital natural resources which are critical to our very survival, do so in a way that provide benefits in excess of costs, and are programs that serve as models for the way all federal programs should work.

The National Watershed Coalition is an alliance of national, regional, state and local organizations that have a common interest in advocating the use of the watershed when dealing with natural resource issues. We also support the use of total resource management principles in planning. We are advocates of both the Small Watershed Program and the Flood Prevention Operations Program administered by USDA's Natural Resources Conservation Service (NRCS). These resource protection programs deserve much higher priority than they have had in the recent past. Even in difficult financial times, and we keep hearing we are in a period of budget surpluses, their revitalization would pay dividends in monetary and other benefits, and jobs! The disastrous 1993 Midwest floods and the floods in Texas last fall, should have taught us something. If one examines the Report of the 1994 Interagency Floodplain Management Review Committee that studied the 1993 Midwest flood event, we see that flood damages were significantly reduced in areas where Public Law 566 projects were installed. The requests for disaster assistance were also less.

The watershed as the logical unit for dealing with natural resource problems has long been recognized. Public Law 566 offers a complete watershed management approach, and should have a prominent place in our current federal policy emphasizing watersheds and total resource management based planning. Why should the federal government be involved with these watershed programs?

—They are programs whose objectives are the sustaining of our nation's precious natural resources for generations to come.

—They are not federal, but federally assisted, locally sponsored and owned. They do not represent the continued growth of the federal government.

—They are locally initiated and driven. Decisions are made by people affected, and respect private property rights.

—They share costs between the federal government and local people. Local sponsors pay between 30—40 percent of the total costs of Public Law 566 projects.

—They produce net benefits to society. The most recent program evaluation demonstrated the actual ratio of benefits to costs was approximately 2.2:1. The actual adjusted economic benefits exceeded the planned benefits by 34 percent. How many other federal programs do so well?

—They consider and enhance environmental values. Projects are subject to the discipline of being planned following the National Environmental Policy Act (NEPA), and the federal "Principles and Guidelines" for land and water projects. That is public scrutiny!

—They are flexible programs that can adapt to changing needs and priorities. Objectives that can be addressed are flood damage reduction, watershed protection (erosion and sediment control), water quality improvement, rural water supply, water conservation, fish and wildlife habitat improvement, recreation, irrigation and water management, etc. That is flexibility.

—They are programs that encourage all citizens to participate.

—They can address the needs of low income and minority communities.

—And best of all—they are programs the people like!

The National Watershed Coalition commends the Congress for the support given these programs over the years, and hopes that the outcome of the fiscal year 2000 appropriations process will enable this vital work to continue and expand as we

seek to preserve, protect and better manage our nation's water and land resources. Every State in the United States has benefited from the Small Watershed Program.

In order to continue this high priority work in partnership with states and local governments, the Coalition recommends a fiscal year 2000 funding level of $250 million for Watersheds and Flood Prevention Operations, Public Law 83–566 and Public Law 78–534. We recommend that $30 million of this amount be for Public Law 78–534 projects. We would also suggest that $60 million be used for structural rehabilitation and replacement, in accordance with H.R. 728 recently introduced in the 106 Congress by Representative Frank Lucas of Oklahoma. We recognize that Congress may not find it possible to provide these amounts, but we also believe that we are not doing our job of helping you recognize the true need if we continually recommend the federal share of these needed funds be less. We would hope that everyone understand that these funds are only a part of the total that are committed to this vital purpose. The local project sponsors in these "federally assisted" endeavors have a tremendous investment also. Additionally, the Coalition supports $25.0 million for watershed planning, surveys and investigations. We also suggest that the Emergency Watershed Program (EWP) be provided with $20 million to allow the NRCS to provide rapid response in time of natural disaster. Our recommendations are considerably different from those proposed by the Administration for the fiscal year 2000 budget. Congress increasingly talks of wanting to fund those investments in our nation's infrastructure that will sustain us in the future. Yet this and past Administration's budgets have regularly cut funding for some of the best of these programs. This makes absolutely no sense! We continue to read that we are in a period of budget surpluses, almost as if the federal coffers were overflowing with cash, yet there is next to nothing for watershed protection and improvement. Our Gross Domestic Product has risen for about 93 straight months, unemployment is low, the stock market has risen to new highs, and we can't seem to invest and reinvest in our vital watershed infrastructure. That is simply unconscionable.

The issue of the current condition of those improvements constructed over the last fifty years with these watershed programs is a matter of great concern. Many of the nearly 10,400 dams that NRCS assisted sponsors build throughout the United States no longer meet current dam safety standards and need to be upgraded to current standards. A USDA study published in 1991 estimated that in the next ten years, $590 million would be needed to protect the installed works. Of That amount, $100 million would come from local sponsors as their operation and maintenance contributions. NRCS also conducted a more recent survey, which indicated the current national needs were about $540 million. That is the reason we are recommending starting with $60 million for the work necessary to protect these installed structures, and commend Oklahoma Representative Frank Lucas for his leadership in introducing H.R. 728, the Small Watershed Rehabilitation Amendments of 1999. Watershed project sponsors throughout the US appreciate his leadership on this vital issue. If we don't start to pay attention to our rural infrastructure needs, the ultimate cost to society will only increase, and project benefits will be lost. This is a serious issue we hope you will recognize.

In addition to offering our thoughts on needed conservation program budget levels, we would like to express our great concern with the way in which the Administration's budget proposes to change the watershed program funding in fiscal year 2000. We will address each "account" in some detail as to the adverse impacts we see.

Watershed and Flood Prevention Operations.

—The Administration proposes $83,423,000, a decrease of $16,010,000 from the grossly inadequate funding of fiscal year 1999. They talk of their concern for the environment, but it is not reflected in their budget proposals.

—All watershed funds would be transferred to the Conservation Operations (CO) account. We believe again that this is another attempt by the Administration to put these finds into an account where they may not be used for Small Watershed Projects. In our view this represents the desire of some in the Administration to circumvent the will of Congress and eliminate Small Watershed projects. We ask that you not allow this to happen.

—Of the funds proposed under the Public Law 566 authority, no funds are specifically suggested for the Public Law 534 projects, only $9 million is available from the Public Law 566 account for Public Law 534 projects, a decrease of $6 million—or 40 percent —from fiscal year 1999. This is unacceptable.

—No funding is proposed to address the aging watershed infrastructure problem which poses great risk to human health, safety and quality of life, and which we discussed earlier. We suggest $60 million is needed in fiscal year 2000. Pass H.R. 728!

Watershed Surveys and Planning.

—The Administration proposes $11,732,000 for these vital planning activities, and we think $25 million is a more realistic figure considering the need. There are many potential projects and project sponsors in every state wanting watershed planning assistance, and that assistance is not available. And this at a time when our federal government is encouraging the watershed approach and local leadership. Here we have the ideal partnership cost-share program that encourages local leadership, and the federal share of the funds is not there.

—The Administration again proposes putting all these funds in the Conservation Operations account, and we have the same concern we expressed under watershed operations. This must not be allowed to happen. We demand fiscal accountability!

Emergency Watershed Protection Program.

—The Administration proposes no funds to maintain readiness to deal with emergencies caused by natural disasters, or maintain any technical staff capacity. This makes no sense! We suggest that $20 million be put into this account to provide rapid early response, and then deal with total disaster needs for each incident with supplemental appropriations as in the past.

There are a number of suggestions we would like to make concerning this very important legislation, that we will be making to other committee's and they have budget implications. We believe the objectives of this legislation should be expanded to include more non-structural practices, allow the law to provide assistance in developing rural water supplies (without water there is no rural development) and eliminate the current requirement that mandates that twenty percent (20 percent) of the total projects benefits be "directly related to agriculture" which can be very subjective and has the unintended effect of penalizing projects in poor, small, rural communities.

The Coalition appreciates the opportunity to offer these comments regarding fiscal year 2000 funding for the water resource programs administered by the Natural Resources Conservation Service. With the "downsizing" the NRCS has experienced, we would be remiss if we did not again express some concern as to their ability to provide adequate technical support in these watershed program areas. NRCS technical staff has been significantly reduced and budget constraints have not allowed that expertise to be replaced. Traditional fields of engineering and economics are but two examples. We see many states where the capability to support their responsibilities in these program areas is seriously diminished. This is a disturbing trend that needs to be halted. This downsizing has a very serious effect on state and local conservation programs. Local Watershed and Conservation Districts and the NRCS combine to make a very effective delivery system for providing the technical assistance to local people—farmers, ranchers and rural communities—in applying needed conservation practices. But that delivery system is currently very strained! Many states and local units of government also have complementary programs that provide financial assistance to land owners and operators for installing measures that reduce erosion, improve water quality, and maintain environmental quality. The NRCS provides, through agreement with the USDA Secretary of Agriculture, "on the land" technical assistance for applying these measures. The delivery system currently is in place, and by downsizing NRCS we are eroding the most effective and efficient coordinated means of working with local people to solve environmental problems ever developed. Our system and its ability to produce food and fiber is the envy of the entire world. In our view, these programs are the most important in terms of national priorities.

We are also disappointed that the subcommittee has a practice of not accepting oral testimony from organizations such as the National Watershed Coalition. When we were allowed to make an oral presentation in the House, we were able to talk to subcommittee members who could ask us questions. It was a chance for them to actually talk with people doing the work on the land. That personal contact in both houses is now missing, and it would be easy to think that our written testimony may not be seriously considered. We hope you will reconsider this practice in future years, and again allow oral testimony.

The Coalition pledges its full support to you as you continue your most important work.

Our Executive Director/Watershed Programs Specialist Mr. John W. Peterson, who has over forty years experience in natural resource watershed conservation, is located in the Washington, DC area, and would be pleased to serve as a resource as needed. John's address is 9304 Lundy Court, Burke, VA 22015–3431, phone 703–455–6886 or 4387, Fax; 703–455–6888, email: jwpeterson.erols.com.

Thank you for allowing the National Watershed Coalition (NWC) this opportunity.

PREPARED STATEMENT OF THE NATURE CONSERVANCY

Mr. Chairman, and members of the Committee, I appreciate the opportunity to submit this testimony for the record on fiscal year 2000 appropriations for the Natural Resources Conservation Service (NRCS).

The Nature Conservancy is an international, non-profit organization dedicated to the conservation of biological diversity. Our mission is "to preserve the plants, animals and natural communities that represent the diversity of life on Earth by protecting the lands and waters they need to survive." The Conservancy has more than 900,00 individual members and over 1,850 corporate sponsors. We currently have programs in all 50 states and in 17 nations. To date our organization has protected more than 9 million acres in the 50 states and Canada, and has helped local partner organizations preserve millions of acres overseas. The Conservancy itself owns more than 1,600 preserves—the largest private system of nature sanctuaries in the world. Three concepts have been fundamental to our success: sound science; strong partnerships with public and private landowners; and tangible results at local places.

The Conservancy is deeply committed to working with agricultural producers to conserve biodiversity on private lands. We currently work with local landowners at approximately 75 sites across the country to implement conservation on the ground, and plan to increase this number to 500 sites within the next decade.

RECOMMENDATION

The Conservancy recommends:

Wetland Reserve Program WRP enrollment level of 209,000 acres in fiscal year 2000. In addition, we ask the committee not to use the WRP account to offset other expenditures.

EQIP funding of $300 million for fiscal year 2000. We also urge the committee not to target EQIP to offset other expenditures.

Full support to the President's budget request of $680 million in appropriations for the Natural Resources Conservation Service (NRCS). This appropriation supports principally the agency's basic conservation program, called Conservation Technical Assistance.

Wetland Reserve Program (WRP)

The agriculture conservation program most important to the Conservancy is the WRP. This program makes a sizeable amount of money available to producers who enroll in the program after having concluded that the best economic return on their land would be from the receipt of program dollars rather than from crop or livestock production. Because wetlands provide excellent habitat for wildlife, the program serves the Conservancy's mission of habitat conservation, and at the same time provides farmers who elect to enroll in the WRP with the opportunity to generate income by renting WRP acres to hunting groups.

The Conservancy strongly supports WRP because it is the only program administered by the U.S. Department of Agriculture that at least in part buys permanent protection for resource values on private lands. These values include: 1) conservation of wildlife habitat, 2) purification of groundwater runoff and, 3) regulation of the flow of water in watershed systems by storing surface and groundwater. Permanent protection of environmentally significant resources is the best investment of public conservation dollars. In these times of economic distress for many producers, making financial options available for producers that also results in conservation benefits for the general public is good public policy.

The Conservancy asks that the committee not turn to the WRP account to offset expenditures in other program areas. We recognize that the budget caps set a difficult goal for Congress in crafting a budget for fiscal year 2000. Still, we believe that voluntary, cost-effective programs like the WRP must be made available to producers to conserve resources on private lands.

The Conservancy recommends a WRP enrollment level of 209,000 acres in fiscal year 2000. Additionally, we are working with the Agriculture Committee to increase the number of acres that may be enrolled in the program and ensure that WRP continues to operate at an appropriate level in the future.

Environmental Quality Incentive Program (EQIP)

The Conservancy seeks a $100 million increase in funding for EQIP for fiscal year 2000, for a total of $300 million. In addition, we urge the committee not to target EQIP to offset other expenditures. The agricultural conservation community recognizes the significant contribution made by farm runoff to the impairment of our nation's watersheds. An important strategy for addressing this problem must be voluntary farm runoff abatement measures, such as that provided by the EQIP pro-

gram. The increased funding recommended will begin to help animal feeding operators in financial distress deal with regulatory pressure to keep water clean.

Conservation Technical Assistance

Agricultural production depends on the conservation of the soil and water resource base. NRCS and the Conservancy both know that conservation will succeed ultimately only to the extent that it also serves the need of producers to engage in economically viable farming. NRCS has a relationship of trust with private landowners that is unusual among federal agencies. It takes a non-regulatory, voluntary approach to conservation. The voluntary conservation programs administered by NRCS, along and the Conservation Reserve Program administered by the Farm Service Agency, provide farmers with highly effective tools for conserving soil and water resources.

NRCS provides Conservation Technical Assistance through their district conservationists, who give free advice to producers interested in managing the natural resources on their land. In addition, district conservationists provide a number of products requested by producers. These include conservation management systems for a variety of land types, irrigation water management plans, animal waste management plans, program eligibility determinations, wetland creation or restoration plans, conservation education, and long-term strategic resource planning to individuals and communities.

Congress appropriated $641 million for the agency in fiscal year 1999. The current demand for these services approximately doubles NRCS' ability to provide them. The Conservancy believes that if NRCS is not funded at a level sufficient to provide these services, the resource base on private lands will be impaired and biodiversity will be put at greater risk. In particular, NRCS will have difficulty providing technical assistance in support of the Wetland Reserve Program (WRP) and the Conservation Reserve Program (CRP) in the absence of full funding of the Conservation Technical Assistance account.

A comprehensive clean water policy at the federal level must include funding for the tools that enable producers to implement voluntarily conservation practices and regulatory activities. An increase in appropriations for Conservation Technical Assistance is needed this year in particular because of the increased requirements for animal feeding operators to change practices that affect water quality.

We appreciate the support that you have shown for agriculture conservation through the years, and appreciate this opportunity to present a written statement to your committee. The Conservancy looks forward to working with you on these issues in this and future agriculture appropriations bills.

PREPARED STATEMENT OF THE ORGANIZATION FOR THE PROMOTION AND ADVANCEMENT OF SMALL TELECOMMUNICATIONS COMPANIES

SUMMARY OF REQUEST

The Organization for the Promotion and Advancement of Small Telecommunications Companies [OPASTCO] seeks the Subcommittee's support for fiscal year 2000 loan levels for the telecommunications program administered by the Rural Utilities Service [RUS] in the following amounts:

Telecommunications Loans Program

5 percent hardship loans	$75,000,000
Treasury rate loans	300,000,000
guaranteed loans	120,000,000
Rural Telephone Bank [RTB] loans	175,000,000

In addition, OPASTCO requests the Subcommittee's support for the following: removal of the statutory 7 percent cap on Treasury rate loans for fiscal year 2000; a prohibition on the transfer of unobligated RTB funds to the general fund of the Treasury; and, funding of the distance learning and telemedicine grant and loan program at sufficient levels.

GENERAL

OPASTCO is a national trade association of approximately 500 independently owned and operated telephone companies serving rural areas of the United States. Its members, which include both commercial companies and cooperatives, together serve over 2,000,000 customers in 42 states. Well over half of OPASTCO's members are RUS or RTB borrowers.

Perhaps at no time since the inception of the RUS (formerly the REA] has the telecommunications program been so vital to the future of rural America. The telecommunications industry is at a crossroads, both in terms of technology and public policy. Advances in telecommunications technology in recent years will deliver on the promise of a new "information age." The Federal Communication Commission's [FCC] implementation of the landmark Telecommunications Act of 1996, as well as modernization resulting from prior statutory changes to RUS's lending program, will expedite this transformation. However, without continued RUS and RTB support, rural telephone companies will be hard pressed to build the infrastructure necessary to bring their communities into this new age, creating a bifurcated society of information "haves" and "have-nots."

Contrary to the belief of some critics, RUS's job is not finished. Actually, in a sense, it has just begun. We have entered a time when advanced services and technology—such as broadband fiber optics, digital switching equipment, custom calling features, and the Internet—are an expected and needed part of a customer's telecommunications service. Unfortunately, the inherently higher costs of upgrading rural networks has not abated. Rural telecommunications continues to be more capital intensive and involves fewer paying customers than its urban counterpart. RUS borrowers average only 6.3 subscribers per route mile versus 130 subscribers per route mile for large local exchange carriers. In order for rural telephone companies to modernize their networks and provide their customers with advanced services at reasonable rates, they must have access to reliable low-cost financing.

The relative isolation of rural areas increases the value of telecommunications services for these citizens. Telecommunications enables applications such as distance learning and telemedicine that can alleviate or eliminate some rural disadvantages. Telecommunications can also make rural areas attractive for some businesses and result in revitalization of the rural economy. For example, businesses such as telemarketing and tourism can thrive in rural areas, and telecommuting can become a realistic employment option.

While it has been said many times before, it bears repeating that the RUS telecommunications loans and RTB programs are not grant programs. The funds loaned by RUS are used to leverage substantial private capital, creating public/private partnerships. For a very small cost, the government is encouraging tremendous amounts of private investment in rural telecommunications infrastructure.

Most importantly, the programs are tremendously successful. Borrowers actually build the infrastructure and the government gets paid back with interest. There has never been a default in the history of the lending programs.

RECENT LEGISLATION HAS HEIGHTENED THE NEED FOR THE RUS TELECOMMUNICATIONS LOANS PROGRAM

The Telecommunications Act of 1996

The FCC's implementation of the Telecommunications Act of 1996 will only increase rural telephone companies' need for RUS assistance in the future. The forward-looking Act defines universal service as an evolving level of telecommunications services that the FCC must establish periodically, taking into account advances in telecommunications and information technologies and services. While the competitive environment engendered by the 1996 Act may offer the means of meeting this definition in urban areas, rural and high cost areas have less potential for economically sound competitive alternatives. RUS now has an essential role to play in the implementation of the new law, as it will compliment new funding mechanisms established by the FCC and enable rural America to move closer to achieving the federally mandated goal of rural/urban service and rate comparability.

At present, considerable regulatory uncertainty exists for rural telephone companies as several critical FCC proceedings implementing the 1996 Act remain unresolved. These include fundamental changes to the universal service and access charge systems and the procedures incumbent carriers use to separate their costs between the Federal and state jurisdictions. In addition, uncertainty exists as to whether rural incumbent carriers will be able to recover the costs of the extensive regulatory obligations and potential infrastructure development demands placed on them under the Act. If, as it presently appears, these outstanding issues are resolved in a piecemeal fashion and/or with a strong bias toward new entrants, rural incumbent carriers with universal service obligations could be hampered in their ability to modernize their networks and provide quality, affordable service to all of their customers. Managed sequencing and coordination of existing proceedings is necessary if the Commission is to achieve Congress's public policy goals of affordable rates and access to an evolving telecommunications network for all Americans. Equally important is for Congress to monitor the FCC's implementation of the Act

to ensure that all of its goals—including universal service, an even playing field for competition, and deregulation—are realized in rural areas.

RELRA

Working in tandem with the 1996 Act, the Rural Electrification Loan Restructuring Act of 1993 [RELRA] will further help to ensure the comparability of telecommunications service between urban and rural America. As a prerequisite to eligibility for insured and RTB loans, RELRA requires that every state have an RUS approved modernization plan which provides a timeline for the improvement of the state's telecommunications network and assures that the purpose of every loan is consistent with achieving the requirements of the borrower's state plan. These plans set forth the requirements for the transmission of video images and high speed data that will promote educational and health care opportunities as well as provide the necessary infrastructure for economic development. Implementation of these plans has already begun to generate additional loan demand as rural telephone systems strive to meet the increased service objectives in the rural areas they serve.

A $75 MILLION LOAN LEVEL SHOULD BE MAINTAINED FOR THE 5 PERCENT HARDSHIP LOAN PROGRAM

One of the most vital components of RUS's telecommunications loans program is the 5 percent hardship loan program. These loans are referred to as hardship loans for good reason: They provide below-Treasury rate financing to telephone companies serving some of the most sparsely populated, highest cost areas in the country. The commitment these companies have to providing modern telecommunications service to everyone in their communities has made our nation's policy of universal service a reality and, in many cases, would not have been possible without RUS's hardship loan program. Companies applying for hardship loans must meet a stringent set of eligibility requirements and the projects to be financed are rated on a point system to ensure that the loans are targeted to the most needy and deserving. For fiscal year 1999, the government subsidy needed to support a $75,000,000 loan level was under $7,500,000. Given the necessity of this indispensable program, it is critical that the loan level be maintained at $75,000,000 for fiscal year 2000.

REMOVAL OF THE 7 PERCENT CAP ON TREASURY RATE LOANS SHOULD BE CONTINUED

With regard to RUS's Treasury rate loan program, OPASTCO supports the removal of the 7 percent ceiling on these loans for fiscal year 2000. This Subcommittee appropriately supported language in the fiscal year 1996 Agriculture Appropriations Act to permit Treasury rate loans to exceed the 7 percent per year ceiling contained in the authorizing act. This language was continued in fiscal year 1997, 1998, and 1999. Were long-term interest rates to exceed 7 percent, adequate subsidy would not be available to support the Treasury rate loan program at the authorized levels. Accordingly, OPASTCO supports the continuation of this language in the fiscal year 2000 appropriations bill in order to prevent potential disruption to this important program.

THE PROHIBITION ON THE TRANSFER OF ANY UNOBLIGATED BALANCE OF THE RTB LIQUIDATING ACCOUNT TO THE TREASURY AND REQUIRING THE PAYMENT OF INTEREST ON THESE FUNDS SHOULD BE CONTINUED

OPASTCO urges the Subcommittee to reinstate the language introduced in the fiscal year 1997 Agriculture Appropriations Act, and continued in fiscal year 1998 and 1999, prohibiting the transfer of any unobligated balance of the RTB liquidating account to the Treasury or the Federal Financing Bank which is in excess of current requirements and requiring the payment of interest on these funds. As a condition of borrowing, the statutory language establishing the RTB requires telephone companies to purchase Class B stock in the bank. Once all loans are completely repaid, a borrower may then convert its Class B stock into Class C stock. Thus, all current and former borrowers maintain an ownership interest in the RTB. As with stockholders of any concern, these owners have rights which may not be abrogated. The Subcommittee's inclusion of the aforementioned language into the fiscal year 2000 appropriations bill will ensure that RTB borrowers are not stripped of the value of this required investment.

THE ADMINISTRATION'S PROPOSAL TO FUND THE RTB'S ADMINISTRATIVE EXPENSES AND SUBSIDY FROM THE BANK'S LIQUIDATING ACCOUNT SHOULD BE REJECTED

As it did last year, the Subcommittee should reject the Administration's proposal to fund the RTB's administrative expenses and subsidy budget authority through

the bank's liquidating account balances. The Administration's proposal is inappropriate on both legal and policy grounds. Statutorily, the Rural Electrification Act provides for the RTB's use of facilities and services of employees of the Department of Agriculture, without cost to the RTB, until such time as the bank is privatized. The proposal also appears inconsistent with the bifurcated structure of the RTB under the Federal Credit Reform Act of 1990 which does not permit funds in the liquidating account to finance new loans. From a public policy standpoint, unobligated balances of the liquidating account have been targeted to support the privatization of the RTB and use of these funds for other purposes would only serve to dilute the value of the bank for all stockholders. Finally, paying for the RTB's administrative expenses and subsidy through the liquidating account offers no budgetary savings. For these reasons, OPASTCO is opposed to the Administration's proposal and urges the Subcommittee to continue to fund the RTB through the general fund of the Treasury.

THE DISTANCE LEARNING AND TELEMEDICINE PROGRAM SHOULD CONTINUE TO BE FUNDED AT ADEQUATE LEVELS

In addition to RUS's telecommunications loans program, OPASTCO supports adequate funding of the distance learning and telemedicine grant and loan program authorized in the Federal Agriculture Improvement and Reform Act of 1996. This sensible investment allows rural students to gain access to advanced classes which will help them prepare for college and jobs of the future. Also, rural residents will gain access to quality health care services without traveling great distances to urban hospitals. Loans are made at the government's cost-of-money, which should help to meet demand for the program in the most cost effective way. In light of the Telecommunications Act's requirement that schools, health care providers, and libraries have access to advanced telecommunications services, sufficient targeted funding for this purpose is essential in fiscal year 2000.

CONCLUSION

The development of the nationwide telecommunications network into an information superhighway, as envisioned by policymakers, will help rural America survive and prosper in any market—whether local, regional, national, or global. However, without the availability of low-cost RUS funds, building the information superhighway in communities that are isolated and thinly populated will be untenable. By supporting the RUS telecommunications programs at the requested levels, the Subcommittee will be making a significant contribution to the future of rural America at a negligible cost to the taxpayer.

PREPARED STATEMENT OF THE PHARMACEUTICAL RESEARCH AND MANUFACTURERS OF AMERICA

On behalf of the Pharmaceutical Research and Manufacturers of America (PhRMA), I present recommendations on the fiscal year 2000 budget request submitted by the Administration for the Food and Drug Administration, for inclusion in the Subcommittee hearing record. PhRMA represents the country's leading research-based pharmaceutical and biotechnology companies, which are devoted to investing more than $24 billion annually in discovering and developing new medicines. PhRMA companies are leading the search for new cures and treatments.

We recognize the difficulties confronting the Subcommittee in meeting overall domestic spending caps affecting programs under your jurisdiction, under the 1997 budget agreement. We also recognize that pressures on appropriators to ensure an appropriate level of U.S. defense spending is likely to be even greater in light of the recent military activity with NATO. Decisions about which domestic programs to maintain or increase thus will be even more difficult. We urge you, however, to remember that many of the fruits of biomedical research are brought to the bedsides of patients through the research and development of new pharmaceuticals and through actions by the FDA to bring those safe and effective medicines to patients as soon as possible. To achieve this translation of medical research into better health for our citizens requires a commitment to appropriate funding for FDA.

That is why PhRMA fully supports the Administration's fiscal year 2000 request for budget authority specifically for direct federal appropriations of $1.016 billion (excluding rental payments of $95 million) for FDA salaries and expenses. This account is the major and essential component of FDA's resources, and the budget request represents a $128 million increase over the appropriations enacted by Congress for the current fiscal year under Public Law 105–227.

This level of funding is particularly important under the "trigger" provisions of the 1997 FDA Modernization Act (FDAMA) if the pharmaceutical industry is to continue to be required to pay the user fees that have enabled FDA to make new lifesaving, cost effective medicines available to patients much more quickly. The trigger provisions require that general fund appropriations for all FDA salaries and expenses must equal or exceed the fiscal year 1997 appropriation level (excluding user fees), as adjusted for inflation or changes in discretionary budget authority for overall domestic spending, beginning after fiscal year 1997.

As FDA Commissioner Jane E. Henney, M.D., noted in her recent prepared testimony before your Subcommittee, FDA's dedication to the health and safety of the American people is well established. It is America's most important consumer protection agency. The FDA regulates products that account for one-quarter of all consumer spending and that comprise about $1 trillion in sales—including foods, medical and radiological devices, medicines, animal drugs, and cosmetics. These are goods that Americans expect to be safe and reliable.

However, Congress has imposed increasing responsibilities on FDA's staff during the past decade—most recently, under FDAMA and the Animal Drug Availability Act. For example, FDAMA requires that FDA inspect establishments that make drugs and devices every two years. But between 1990 and 1998, the number of firms subject to inspections reportedly rose from 89,000 to 114,000—a 28 percent increase.

In addition, the agency has had to respond quickly to an increasing variety of new public health issues, such as ensuring the safety of food and the nation's blood supply. For these reasons, it is of critical importance that FDA be able to retain and recruit highly qualified staff.

The research-based pharmaceutical and biotechnology industries are particularly concerned that FDA be able to continue to meet highly important performance goals, mutually agreed upon in an historic compact between FDA, Congress and industry. The agreement was first reached in 1992 in the Prescription Drug User Fee Act (PDUFA) and was confirmed in 1997 under FDAMA as PDUFA ll. The total FDA "program" request for salaries and expenses in fiscal year 2000 includes authorized appropriations of over $145 million for PDUFA II user fees—an increase of some $13 million over the current fiscal year, to add staff to handle vitally important drug reviews. During fiscal year 1998–2002, pharmaceutical companies will pay over $550 million in user fees under FDAMA, so FDA can continue to reduce both review and overall drug development times. As FDA Commissioner Henney has testified:

"PDUFA is among the most successful agency programs in history. Within its first five years of implementation, the increased resources provided by PDUFA to hire additional review staff has resulted in cutting the average review times for new drugs, without compromising the high standards that FDA has traditionally applied in weighing the risks and benefits of new drugs and thereby in determining their safety and effectiveness."

Under PDUFA, the pharmaceutical industry and FDA are continuing to work to serve a common client—the patient. The industry is working to develop new and better drugs, FDA is striving to improve the drug development and review process.

The critical importance of this partnership, in cooperation with Congress, in delivering new medicines to patients as soon as possible cannot be overemphasized. The 30 new drugs and 9 new biologics approved by FDA in 1998 are to treat diseases that affect 180 million patients and that cost more than $400 billion a year. New treatments include medicines for patients suffering from AIDS, cancer, including breast cancer, cardiovascular disease, Crohn's disease, tuberculosis, rheumatoid arthritis, depression, Parkinson's disease, erectile dysfunction, and the first vaccines to prevent Lyme disease and retrovirus infection. The prescription drug user fee program—which must be sharply distinguished from proposals for general purpose user fees—is based on three key principles:

—User fees must supplement FDA appropriations, not substitute for them.

—User fees must be targeted to the review and approval of innovative prescription medicines and their supplemental indications, and are not to be used for general agency activities.

—User fees must be applied to meet specific performance goals, agreed upon by FDA, to ensure the timely review and approval of new drugs.

Before user fees, FDA review times averaged about 30 months. But the 30 drugs approved in 1998 were reviewed in an average of 11.7 months—slightly better than the 12-month goal specified in PDUFA II. FDA also exceeded the fiscal year 1998 goal to review 90 percent of all standard new drug and biologic applications within 12 months, by completing 100 percent of the reviews within this timeframe.

The prescription drug user fees collected in fiscal year 2000 will enable FDA to continue to meet its PDUFA II performance goals, including:

—Review and act upon 90 percent of standard original NDA and PLA/BLA submissions filed during fiscal year 2000 within 12 months of receipt, and review and act on 50 percent within 10 months of receipt.
—Review and act on 90 percent of priority original drug NDA and biotechnology BLA submissions filed during fiscal year 2000 within six months of receipt.
—Review and act on 90 percent of standard drug efficacy supplements filed during fiscal year 2000 within 12 months of receipt, and review and act on 50 percent within 10 months of receipt.

Review and act on 90 percent of priority drug efficacy supplements filed during fiscal year 2000 within six months of receipt.

What this means is that FDA can continue to build on its record of helping patients to obtain new medicines more than a year and a half sooner than they did before user fees were enacted, while maintaining its high standards of safety and effectiveness.

In addition, FDAMA contains important provisions that facilitate access by patients to experimental drugs; give FDA more flexibility in determining effectiveness; expand access by doctors to peer-reviewed medical information; and encourage the development and testing of medicines for children.

The U.S. system of new drug approvals is the most rigorous in the world. On average, a company invests about $500 million and takes about 12–15 years to discover and develop a new drug. Only five in 5,000 compounds that enter preclinical testing make it to human testing. And only one of these five is approved for use by patients.

R&D investment by research-based pharmaceutical firms continues to break records. In 1999, pharmaceutical companies will invest $24 billion to discover and develop important new medicines. That figure represents a 14.1 percent increase over last year's record setting R&D spending. And no industry devotes a higher percentage of sales to R&D—20.8 percent—than the research-based pharmaceutical industry.

However, the pharmaceutical industry's ever increasing R&D investment, and FDA's determined efforts to improve the drug development and review process, will be nullified if adequately increased baseline appropriations for all of the agency's programs are not provided.

For these reasons, PhRMA strongly urges that Congress appropriate $1.016 billion (exclusive of rental payments) in fiscal year 2000 for FDA salaries and expenses, as requested by the Administration, to ensure that the agency can fulfill its vital responsibilities to promote and protect the health and safety of the American people.

PREPARED STATEMENT OF THE RED RIVER VALLEY ASSOCIATION

Mr. Chairman and members of the Committee. I am Lynn Lowe, and I am pleased to represent the Red River Valley Association as its President. Our organization was founded in 1925 with the express purpose of uniting the citizens of Arkansas, Louisiana, Oklahoma and Texas to develop the land and water resources of the Red River Basin.

As an organization that knows the value of our precious water resources we support the most beneficial water and land conservation programs administered through the Natural Resources Conservation Service (NRCS). We understand how important a balanced budget is to our nation; however, we cannot sacrifice what has been accomplished. The NRCS programs are a model of how conservation programs should be administered and our testimony will address the needs of the nation as well as our region. We believe strongly that the whole, national program must be preserved.

We appreciate that the fiscal year 2000 President's budget increases the NRCS overall funding; however, some programs are NOT adequately funded, to the detriment of the agency and our citizens. The increases are earmarked for grants, financial assistance and other non-federal personnel items. The effect is a decrease of funds for direct technical assistance. It is imperative to understand that NRCS is funded by program and not by employees.

We would like to address several of the programs affected by the President's fiscal year 2000 budget proposal. Failure to fund these initiatives would reduce assistance to those who need it.

1. Conservation Operations Budget.—This has been a steady decline in real dollars over the past several years. This has happened partly as a result of dollars being diverted from Conservation Operations to fund newer programs, especially the increases in financial assistance for conservation. The recent Workload Analysis con-

ducted by NRCS shows that nationally the needs by private land users for conservation services of all the kinds provided by NRCS exceeds the funded levels by $300 million. RRVA supports the increase in the Conservation Operations budget for NRCS by $300 million per year beginning in fiscal year 2000.

The Conservation Operations budget of NRCS is the foundation of technical support for conservation to the private users and owners of land in the United States. The President's Clean Water Action Plan and the Unified Strategy for Animal Feeding Operations will rely heavily on the technical assistance provided through NRCS's Conservation Operations program. Increases in other programs such as EQIP will not make up for the declines in Conservation Operations.

Another factor which has seriously reduced the ability of NRCS to meet the considerable demands for its technical assistance is the limitation on funding which can be provided to NRCS due to the Section 11 cap on transfer of funds from the Community Credit Corporation (CCC). The CCC provides the funding for NRCS technical assistance for several programs including EQIP and CRP. Currently, this cap prevents NRCS from covering its staff costs for these crucial programs. We support the lifting of the Section 11 cap.

2. Watershed and Flood Prevention Operations (Public Laws 566 & 534).—More than 10,400 individual structures have been installed nationally. They have contributed greatly to environmental enhancement, economic development and the social well being of our communities. More than half of these structures are over 30 years old and several hundred are approaching their 50 year planned life.

These programs offer a complete watershed management approach and should continue for the following reasons:

—They protect people and communities from flooding.
—Their objectives sustain our nation's natural resources for future generations.
—They are federally assisted and do not grow the federal government.
—Initiatives and decisions are driven by the communities.
—They are cost shared.
—They follow NEPA guidelines and enhance the environment.
—They can address the needs of low income and minority communities.
—The benefit to cost ratio of this program has been evaluated to be 2.2:1. What other federal programs can claim such success?

There is no doubt of the value of this program. The cost of losing this infrastructure exceeds the cost to reinvest in our existing watersheds. Without repairing and upgrading the safety of existing structures we will miss the opportunity to keep our communities alive and prosperous. It would be irresponsible to dismantle a program that has demonstrated such great return and is wanted by our citizens.

We fully support H.R. 728, recently introduced by Representative Frank Lucas (R-OK). This is a crucial bill to address a serious problem.

In addition to the needs for reinvesting in existing infrastructure there are many new projects which are awaiting funds to be built. The present level, outlined in the budget, of $83 million is not adequate. We strongly recommend that a funding level of $250 million be dedicated to Flood Prevention Public Law 534 and Watershed Operations Public Law 566. This is more realistic and compares to the programs appropriated in the years prior to 1997. At the proposed funding level it would take over 30 years to complete just the identified projects, with no attention given to rehabilitation needs.

3. Emergency Watershed Protection Program.—This program comes under Watershed and Flood Prevention Operations, but is a separate line item. This has been a zero budget item; however, there will always be emergency needs. It is estimated that $80 million was spent in fiscal year 1998 and funds are already being used for this purpose in fiscal year 1999.

As our land use expands, to include sensitive environmental ecosystems, major weather events will have an adverse impact requiring NRCS to assist under this program; therefore it should be funded up front. It is important for NRCS to be prepared for a rapid response. With funds available they can react immediately to any emergency when it occurs.

We request that a minimum of $50 million be appropriated for this program in the fiscal year 2000 budget and that these funds are not taken from elsewhere in the NRCS budget.

4. Conservation Reserve Program (CRP).—This program, administered by Farm Services Agency, impacts NRCS the most. NRCS conducts and is reimbursed for the technical assistance of this program.

In fiscal year 1999 approximately 6.8 million acres was enrolled into CRP. Only 1.8 million acres will be enrolled in fiscal year 2000 as the Congressionally mandated cap is reached.

This reduction in the program would mean a loss of about 1,000 staff years nationwide. This is a tremendous loss in manpower, all realized at the field level where technical assistance is most valuable. You cannot allow this to occur.

We request that, as a minimum, the CRP cap be increased to 45 million acres. This is an extremely beneficial program to our nation and should not be allowed to expire. It provides a safety net to those farmers trying to make a living on the marginal lands most suited for this program.

5. Watershed Survey and Planning.—This was budgeted by the President at $11.7 million and is an extremely important community program. NRCS has used this to become a facilitator for the different community interest groups, state and federal agencies.

It is imperative that our communities conduct proper water resource planning as they grow. The consequences for the lack of planning will be detrimental. Watershed Survey and Planning insures that water resource issues are addressed, bringing the community leaders, agencies and interest groups together.

As our municipalities expand the water resource issues tend to be neglected until a serious problem occurs. Proper planning and cooperative efforts, through this program, can prevent problems and insure the water resource issues are met.

We request that this program be funded at a level of $15 million.

6. Forestry Incentives Program.—The President's budget has no funding for this program. Congress transferred this program to NRCS from the Farm Service Agency as a restructuring in the Federal Agricultural Improvement and Reform Act of 1996. Forestry on small, privately owned lands is recognized as a farming activity. NRCS is the best agency to administer this program which assists farmers in production agriculture.

It is more than just a timber production program. Forests are the most effective land users as they relate to water quality, non point source pollution, air quality, greenhouse gas reduction and wildlife habitat. The fact that this program pertains to small, privately owned forests is another important aspect. Even though the initial impact is on wood fiber production, without it the landowners may sell the land for other development or misuse the resource jeopardizing water quality and proper runoff practices. This is a needed conservation program.

We request Congress to fund the Forestry Incentives Program at a level of $6.5 million for fiscal year 2000.

7. Environmental Quality Incentives Program (EQIP).—Requests for assistance through the EQIP program have been overwhelming. The resulting requests far exceed the available funds and is an additional workload on NRCS's delivery system. Additionally, the Administration must provide adequate funding for technical assistance to implement the program. We are appreciative that the President's fiscal year 2000 budget increases the program by $126 million but the technical assistance must be set and maintained at a minimum of 19 percent of the total program, or $57 million. In essence, the program, or workload, cannot be increased while the technical assistance is reduced, as was attempted in fiscal year 1999.

It appears that EQIP will be the primary means of supporting the voluntary portion of the Unified National Strategy for Animal Feeding Operations. Implementation of this strategy will greatly increase the demands for EQIP funds and technical services. Funding for NRCS to staff the technical assistance part is critical for the success of EQIP.

The $300 million proposed for the EQIP program is an adequate budget for fiscal year 2000; however, we request that the technical assistance for this program be a minimum of $57 million.

8. Wetlands Reserve Program (CCC).—As the WRP reaches its mandated cap in fiscal year 2000 the cap must be raised. This is a very popular and important program. It serves as a safety net to those farmers trying to make a living on these marginal lands. It also addresses conservation needs from water quality to global warming. The President's budget increased the program in fiscal year 2000 by $100 million to $209 million. In addition, the budget only allows for $11.8 million for technical assistance when a minimum of $18.3 million is required for NRCS to support this level of sign up.

We agree with the funding level for this program; however, the acreage cap will be met in fiscal year 2000. We strongly recommend that the program be amended to add 1 million acres. This will allow the program to continue until fiscal year 2002 when a reauthorization for the program can be made.

9. Conservation Technical Assistance (CTA).—A further reduction to technical assistance will jeopardize the local, state and federal partnership in conservation making it impossible to meet this nation's commitment to land stewardship in a voluntary manner. CTA provides landowners one-on-one assistance in planning and application of practice to protect our natural resources. The President's fiscal year

2000 budget degrades this assistance. Much of the funds will be used for grants and "passed through" for use other than field delivery staff. After analysis of the proposed budget NRCS would actually be reduced by 1,055 staff years. You and our nation cannot allow this reduction in service and conservation management to happen.

Over 70 percent of our land is in private ownership. This is important to understanding the need for NRCS programs and technical assistance. Their presence is vital to ensuring sound technical standards are met in our conservation programs. These programs not only address agricultural production, but sound natural resource management. Without these programs and NRCS properly staffed to implement them many owners of our private lands will not apply conservation measures needed to sustain our natural resources for future generations.

The administration has proposed "new" Clean Water Initiatives, but why do they ignore the agency that has a proven record for implementing conservation watershed programs? Congress must decide: will NRCS continue to provide the leadership within the communities to build upon the partnerships already established? The President's proposal does not provide for that leadership and so it is up to Congress to insure NRCS is properly funded and staffed to provide the needed help to our taxpayers for conservation programs.

All these programs apply to the citizens in the Red River Valley and we are concerned for the future. The RRVA is dedicated to work toward the programs which will benefit our citizens and provide for high quality of life standards. We therefore request that you appropriate the required funding levels within the individual programs to insure our nation's conservation needs are met.

Attached is a summary of the additions and amendments we believe should be made to the President's budget to insure that NRCS remains funded to deliver America's conservation services and programs to our citizens.

I thank you for the opportunity to present this testimony on behalf of the members of the Red River Valley Association and we pledge our support to assist you in the appropriation process.

Red River Valley Association Summary of Budget Request, Fiscal Year 2000 Appropriations, Natural Resource Conservation Service (NRCS)

Appropriations:	
President's fiscal year 2000 Budget	$1,601,000,000
Conservation Operations (President's Budget—$680.7 million) Additional Request	300,000,000
Watershed and Flood Protection Operations:	
Public Law 566 & Public Law 534 (President's Budget—$83 million) Additional Request	167,000,000
Emergency Watershed Protection Program	50,000,000
Watershed Survey and Planning (President's Budget—$11.7 million) Additional Request	3,300,000
Forestry Incentive Program	6,500,000
Wetlands Reserve Program (Tech Asst, President's Budget—$11.8 million) Additional Technical Assistance	6,500,000
Total NRCS fiscal year 2000 Appropriation	$2,134,300,000
Technical Assistance: Environmental Quality Incentives Program Technical Assistance (Min 19 percent of the proposed budget)	57,000,000
Acreage Cap Increases:	
Conservation Reserve Program	45,000,000
Wetland Reserve Program	1,000,000

Grant Disclosure: The Red River Valley Association has not received any federal grant, subgrant or contract during the current fiscal year or either of the two previous fiscal years.

PREPARED STATEMENT OF THE CATFISH FARMERS OF AMERICA

Mr. Chairman and Members of the Subcommittee, I appreciate the opportunity to provide testimony in support of the USDA Regional Aquaculture Center program. My name is Hugh Warren, and I am Executive Vice President of the Catfish Farmers of America. Founded in 1968, and with current membership from 30 states, the Catfish Farmers of America is the trade organization that represents the interests of the farm-raised catfish industry.

Production of farm-raised catfish has increased over SO-fold since 1970, a rate of growth unmatched in other segments of domestic agriculture. Per capita consumption of farm-raised catfish ranks fifth among all seafood products in the United States, behind tuna, shrimp, pollock, and salmon. Because farm-raised catfish has become a widely accepted food item throughout much of the United States, the demand for catfish should continue to increase as American consumers increasingly turn toward fish as part of their overall diet.

The rapid growth of the catfish industry has brought about a pressing need for research to make farming more efficient and to assure the continued production of a safe, healthy food for American consumers. The Southern Regional Aquaculture Center has become an important part of that research support as Center programs are responsive to industry needs within the region, and projects are conducted as cooperative, interstate projects that ensure that the best scientific talent in the region is brought to bear on the problem in a cost-efficient manner. I would like to highlight two projects developed through the Southern Regional Aquaculture Center that illustrate the response of the program to important national and regional issues.

Production of safe, high-quality products is the foremost goal of fish farmers. Through the Southern Regional Aquaculture Center, research and extension scientists from Alabama, Georgia, Louisiana, Mississippi, Tennessee, Texas, and Virginia evaluated methods of detecting pathogenic microorganisms and reducing spoilage of farmed raised channel catfish, trout, and crawfish. Packaging techniques developed through this project have been implemented in commercial processing plants throughout the country, and have helped to improve shelf-life on many aquaculture products. More than 100 scientific and lay publications were developed through this project, and have provided critical information on processing, temperature control, spoilage, purchasing, storage, handling, and preparation of aquaculture products. This project has helped assure the quality and safety of aquaculture products.

Producing food in an environmentally sound manner is another fundamental goal of American aquaculture. Research and extension scientists in Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina and South Carolina recently cooperated in a Southern Regional Aquaculture Center project to evaluate waste management practices that reduce the impact of aquaculture on the environment. Results of the project showed that aquaculture ponds can be operated with minimal impact on the environment by using simple management practices that can be implemented with little or no extra expense or labor. These practices have been widely adopted in the southeast because aquaculture producers are aware that the use of environmentally responsible farming practices can be part of the marketing appeal of farm-raised fish.

Funding for the Regional Aquaculture Center program has been level for the past decade. Over that time, domestic aquaculture has grown at a remarkable rate and the cost of conducting research has increased. Accordingly, it has become increasingly difficult for the Center program to address the needs of this important segment of American agriculture. I respectfully request your sincere consideration of the Regional Aquaculture Centers in the fiscal year 00 budget, and I urge you to provide funding at the full authorized level of $7.5 million for the five Regional Centers.

PREPARED STATEMENT OF THE SECOND HARVEST NATIONAL NETWORK OF FOOD BANKS

Chairman Cochran, Ranking Member Kohl, and Members of the Subcommittee, thank you for the opportunity to submit this written testimony before the Subcommittee.

Second Harvest is the nation's largest hunger relief charity. Our network is compromised of nearly 200 regional certified affiliate food banks, which provide more than one billion pounds of food and grocery products to an estimated 50,000 local private charitable agencies, operating 95,000 social service programs. Second Harvest network food banks provide assistance in all 50 states, the District of Columbia and Puerto Rico.

On behalf of Second Harvest and its member food banks, I want to express our deep gratitude to each of you for your attention to the needs of the food banks in your state and their efforts to feed America's hungry. America's food banks have more nutritious, higher quality and greater quantities of food because of your work.

To cite just one example, in your state Mr. Chairman, the Mississippi Food Network, led by Mr. John Alford, provides food and grocery products to more than 350

local charities around the state and distributed more than 6 million pounds in federal commodities to needy Mississippians in 1997. The efforts of Mr. Alford's food bank, its network of churches and local agencies and thousands of volunteers, is made more effective through the distribution of USDA commodities made possible by this Subcommittee. Thank you.

In 1998, through the generosity of private donations and the grant of federal commodities through the Emergency Food Assistance Program (TEFAP), our network provided food to an estimated 26 million low-income Americans, including 21 million people who were aided at emergency feeding sites such as soup kitchens, food pantries, and emergency shelters.

Mr. Chairman, I submit my testimony today urging the Subcommittee to fund TEFAP at the level recommended by the Administration, $100 million for commodity food assistance and $45 million for administrative funds. The need for adequate TEFAP funding is essential to our food banks and the hungry Americans they serve.[1]

Last year, Second Harvest released HUNGER: The Faces & Facts, independent research providing the most comprehensive review of the private sector response to the problem of hunger ever conducted in the United States. What our research provided—and what I hope will influence the fiscal year 2000 appropriations process now being considered by this Subcommittee—is important demographic information about hungry Americans and the local charities that serve them.

What our research found was that disproportionately higher percentages of women, children, and elderly people are served at emergency feeding sites than are represented in the general US population. They are typically the poorest of the poor, with more than 86 percent with incomes below the federal poverty level and more than 11 percent with no income in the past month at all. These are our nation's most vulnerable families, and they rely heavily on the assistance of community based charities like the local food bank.

We also find "working poor" families being served through food pantries. Increasingly, these working poor are being fed at soup kitchens that were once almost exclusively utilized by homeless people. Working poor households represent more than one-third of emergency food recipients. They are people who are working, paying taxes and contributing to the productivity and economic prosperity of our nation, but are reaping few of the rewards. A recent study in Virginia found that half of all people relying on food pantries and other local feeding agencies had been employed in the past six months.[2] Unfortunately, the economic boats of these working Americans have not been lifted by the rising tide of our nation's current economic boom.

The ranks of the working poor that turn to charities for aid is also increasing through the often-difficult transition from welfare to work. A South Carolina Department of Social Services report found that 17 percent of former welfare recipients had no way to buy food some of the time, since leaving welfare.[3] A recent study in Massachusetts found that 10 percent of former welfare recipients reported having gone hungry, and the length of time former recipients went without food grew to 10 days in some cases.[4] In each of these states food banks have reported significant increased demand for emergency food services.

Food banks have become an essential component in the public-private partnership that has emerged in the efforts of local communities to end hunger. In 1998, the Second Harvest network distributed approximately 1.2 billion pounds of food to local charities with an estimated value of $1.5 billion. More than 85 percent of all the food and grocery products distributed throughout our network are provided by the private sector. Two-thirds of all private sector donations to food banks come through local activities such as canned food drives, church and synagogue sponsored activities, local grocery retailers and wholesalers, local food manufacturers and processors, and farmers who make available their fields for a "second harvest" for the needy in their communities.

Despite the generous donation of food and grocery products by the private sector, we are finding increased demand for emergency food assistance that is outstripping our available resources. The Hunger 1997 Second Harvest report provides quantifi-

[4] Life After Welfare: Still Poor, Still Hungry. Massachusetts Law Reform Institute and the Family Economic Institute, Boston, MA. 1999.

able data showing a substantial shortage of emergency food aid in the charitable sector.

Our research findings have been confirmed by other human service organizations that have experienced similar shortages of emergency food. For example, Catholic Charities USA reported in December 1997 that the number of people receiving emergency food assistance at Catholic Charities sites increased by 14 percent since 1995.[5]

Similarly, the US Conference of Mayors Annual Survey of Hunger and Homelessness found that emergency food assistance was up 14 percent in 1998.[6] Eighty-four percent of the cities surveyed reported increased demand for emergency food among families with children. And, due to insufficient stocks of emergency food, emergency feeding agencies were forced to turn away one in five individuals in cities surveyed.

We estimate that in 1997, approximately 16 percent of requests for emergency food aid went unmet. Nearly half (46 percent) of all local agencies reported that they were forced to stretch food resources in the past year. Moreover, emergency food pantries experienced shortages most often, with nearly 60 percent reporting that they have had to stretch food at some time in the past year, and 17 percent stretching food resources monthly.

Local agencies reporting a need for additional food resources were asked to estimate the amount of additional food needed. Based on those agency reports, researchers were able to project a national shortage of 900 million pounds of emergency food. In the worst instances, local charities can no longer stretch food resources and are forced to operate on a sort of "triage" system, serving only the most needy, or the charity simply closes. Our research found that a median number of 20 people were turned away last year by those food programs lacking sufficient food resources to serve them. In 1997, at least 115,000 people were turned away and denied emergency food assistance because the local charitable agency had no food available.

Mr. Chairman, it should be noted that it takes a serious and nearly insurmountable shortage of donated food to force a charity to turn a needy person away, or, worse yet, close a soup kitchen, pantry or emergency shelter. The director of soup kitchen or church food pantry will go to extraordinary efforts before they will accept that they must turn someone away or close their doors for even a short period of time.

Mr. Chairman, the depth of the emergency food shortage is profound and provides a compelling argument for the subcommittee to fully fund TEFAP to the Administration's request of $100 million in commodity food donations and $45 million in administrative funding. This is the same TEFAP mandatory funding level provided for in fiscal year 2000 through the Personal Responsibility Work Opportunity Reconciliation Act (Public Law 104–193). We cannot cut emergency food assistance at a time when food banks, food pantries and soup kitchens are reporting that approximately 16 percent of emergency food requests currently go unmet.

TEFAP is the cornerstone program in the charitable efforts to feed America's hungry, and is the "bridge" between public and private hunger relief efforts. TEFAP is a unique community based and community supported federal nutrition program, which relies on volunteers at food banks and local agencies to prepare and distribute federally donated agricultural commodities to hungry people in those communities.

TEFAP serves the public good in two primary and important ways: high quality, nutritious food gets to hungry Americans in an efficient manner utilizing the assistance and efficiencies of the private sector, and the agricultural economy is strengthened through surplus removal and providing a non-competitive market for agricultural commodities. A 1994 USDA—Economic Research Service report stated "although TEFAP's sector-wide farm impacts are small because the program is small, producers of the commodities donated through TEFAP can be significantly affected ... as a surplus disposal program TEFAP returned to farmers approximately 85 cents for every dollar of Federal TEFAP expenditure."[7] TEFAP provides increased farm-gate income and serves as direct connection between America's farmers and hungry Americans in a manner that few federal programs can.

In fiscal year 1998, TEFAP commodities (purchased and bonus) represented more than 15 percent of all the food supplied through the Second Harvest network. Nearly 190 million pounds of TEFAP food—the equivalent of 148 million meals—was dis-

[7] Comparing the Emergency Food Assistance Program and the Food Stamp Program, USDA-ERS Agricultural Economic report Number 689, 6/94; page 7.

tributed through the Second Harvest network last year. We estimate that a similar level of TEFAP commodities (150 million to 180 million pounds) will be distributed through the network of food banks in fiscal year 1999, based on projections of surplus commodities available through Section 32 of the Agricultural Act of 1935.

Though USDA commodities seemingly represent a proportionally small amount of the total food distributed through our network, TEFAP commodities are critical in that they help stabilize a massive system of unpredictable donated supplies that are typical in a charitable network such as ours.

According to our research, the types of food most needed by local charities, primarily meat, dairy, fish, fruits and vegetables, and grain products, are almost exclusively the commodities provided through TEFAP. Those are also the least likely types of food to be donated in significant quantities or with any kind of regularity. This year, nearly two dozen types of nutritious commodities will be available to food banks through TEFAP mandatory commodity purchases.

Americans are a fair, compassionate and generous people, and it is through their kind donations of food, funds, and volunteer time that food banks are able to come to the aid of the 21 million low-income people with emergency hunger relief. But, more must be done. Hunger relief charities are the last line of defense against hunger in most American communities, and too many needy people have already been turned away for a lack of food and resources.

I am mindful of the difficult fiscal constraints faced by this Subcommittee. But I am also aware of the even more difficult reality of 21 million Americans that turn to us for aid and help in their hunger. We cannot allow these vulnerable and needy people to be turned away. TEFAP is essential to our ability to feed America's hungry. I urge you to not cut TEFAP, and allow the mandatory funding paid for in the 1996 Welfare Reform Act to proceed through the Committee without reduction.

In light of the nation's considerable agricultural surpluses and the first federal budget surplus in three decades, it is morally unacceptable that there are tens of thousands of American children that may go to bed tonight because they have no food in their home or because the church pantry they have visited is empty. The TEFAP program is an essential component in our work. Please fund the program no less than the Administration's request.

Mr. Chairman, I ask that the following two front-page articles from the New York Times, (2/26/99 and 2/27/99) be submitted with my testimony for the hearing record. These articles provide additional information that I sincerely hope will help guide the Subcommittee in its deliberations on fiscal year 2000 TEFAP funding.

Thank you Chairman Cochran, Ranking Member Kohl and Members of the Subcommittee.

PREPARED STATEMENT OF THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe of Florida is pleased to submit this statement regarding the fiscal year 2000 budget for the Natural Resources Conservation Service (NRCS) in the Department of Agriculture. The Tribe asks that Congress provide $946 million for NRCS's Conservation Operations Partnership; this request exceeds fiscal Year 1999 spending levels by $300 million. The Seminole Tribe's agricultural enterprises and environmental programs benefit from the technical assistance the NRCS provides through its Conservation Operations Partnership. Recently, the Tribe has been working closely with the Florida State Conservationists on a number of 1996 Farm Bill programs and anticipates increased technical assistance needs in the coming fiscal year.

THE SEMINOLE TRIBE OF FLORIDA

The Seminole Tribe lives in the Florida Everglades. The Big Cypress Reservation is located in the western basins, directly north of the Big Cypress National Preserve. The Everglades provide many Seminole Tribal members with their livelihood. Our traditional Seminole cultural, religious, and recreational activities, as well as commercial endeavors, are dependent on a healthy Everglades ecosystem. In fact, the Tribe's identity is so closely linked to the land that Tribal members believe that if the land dies, so will the Tribe.

During the Seminole Wars of the 19th Century, our Tribe found protection in the hostile Everglades. But for this harsh environment filled with sawgrass and alligators, the Seminole Tribe of Florida would not exist today. Once in the Everglades, we learned how to use the natural system for support without harm to the environment that sustained us. For example, our native dwelling, the chickee, is made of cypress logs and palmetto fronds and protects its inhabitants from the sun and rain,

while allowing maximum circulation for cooling. When a chickee has outlived its useful life, the cypress and palmetto return to the earth to nourish the soil.

In response to social challenges within the Tribe, we looked to our Tribal elders for guidance. Our elders taught us to look to the land, for when the land was ill, the Tribe would soon be ill as well. When we looked at the land, we saw the Everglades in decline and recognized that we had to help mitigate the impacts of man on this natural system. At the same time, we acknowledged that this land must sustain our people, and thereby our culture. The clear message we heard from our elders and the land was that we must design a way of life to preserve the land and the Tribe. Tribal members must be able to work and sustain themselves. We need to protect the land and the animals, but we must also protect our Tribal farmers and ranchers.

Recognizing the needs of our land and our people, the Tribe, along with our consultants, designed a plan to mitigate the harm to the land and water systems within the Reservation while ensuring a sustainable future for the Seminole Tribe of Florida. The restoration plan will allow Tribal members to continue their farming and ranching activities while improving water quality and restoring natural hydroperiod to large portions of the native lands on the Reservation and ultimately, positively effecting the Big Cypress National Preserve and Everglades National Park.

The Seminole Tribe's project addresses the environmental degradation wrought by decades of federal flood control construction and polluted urban and agricultural runoff. The interrupted sheet flow and hydroperiod have stressed native species and encouraged the spread of exotic species. Nutrient-laden runoff has supported the rapid spread of cattails, which choke out the periphyton algae mat and sawgrass necessary for the success of the wet/dry cycle that supports the wildlife of the Everglades.

The Seminole Tribe designed an Everglades Restoration project to allow the Tribe to sustain ourselves while reducing impacts on the Everglades. The Seminole Tribe is committed to improving the water quality and flows on the Big Cypress Reservation. We have already committed significant resources to the design of this project and to our water quality data collection and monitoring system. We are willing to continue our efforts and to commit more resources, for our cultural survival is at stake.

In addition to addressing the ecosystem concerns related to the Big Cypress Reservation, the Tribe has been actively involved in the development of the ecosystem-wide restoration plan. The Tribe, as an active member of both the Governor's Commission for a Sustainable South Florida and the South Florida Ecosystem Restoration Task Force and Working Group, has worked cooperatively with our neighbors to design a sustainable future for all of South Florida.

SEMINOLE TRIBE EVERGLADES RESTORATION INITIATIVE

The Tribe has developed a conceptual water conservation plan that will enable us to meet new water quality standards essential to the cleanup of our part of the Everglades ecosystem and to plan for the storage and conveyance of our water rights. We have also designed, with the assistance of the NRCS, the Tribe's best management practices program. We continue to use available funds to further the design and planning work necessary to implement our Everglades Restoration Initiative.

The Tribe's Everglades Restoration Initiative is designed to mitigate the degradation the Everglades has suffered through decades of flood control projects and urban and agricultural use and ultimately to restore the nation's largest wetlands to a healthy state. Our Everglades Restoration Initiative will enable the Tribe:

—to collect and monitor data to establish a baseline and to evaluate performance of the overall system design;

—to design and construct surface water management systems to remove phosphorus, convey and store irrigation water, improve flood control, and rehydrate the Big Cypress National Preserve;

—to commit to the long-term operation and maintenance of new water management systems; and

—to design and implement comprehensive best management practices for the Big Cypress Reservation.

This project will enable the Tribe to meet proposed numeric target for low phosphorus concentrations that is being used for design purposes by state and federal authorities. It will also provide an important public benefit: a new system to convey excess water from the western basins to the Big Cypress National Preserve, where water is vitally needed for rehydration and restoration of lands within the Preserve.

Conclusion

Everglades restoration is a well-recognized national priority. Through its assistance to the Tribe, NRCS has provided valuable technical assistance to date. The Tribe anticipates that beginning in fiscal year 1999, NRCS will provide programmatic support through EQIP and WRP. In the following fiscal year, the Tribe anticipates additional programmatic assistance through the implementation of a significant portion of the Tribe's water conservation plan through the small watershed program as authorized through Public Law 566. None of the joint objectives of the Tribe and the NRCS can be accomplished, however, without sufficient funding of the Florida Conservationist's technical assistance budget.

The Seminole Tribe is ready, willing, and able to begin work immediately. Doing so will require substantial commitments from the Tribe, including the dedication of over 9,000 acres of land for water management improvements. However, if the Tribe is to move forward with its contribution to the restoration of the South Florida ecosystem, a substantially higher level of federal financial assistance will be needed as well.

The Tribe has demonstrated its economic commitment to the Everglades Restoration effort; the Tribe is asking the federal government to also participate in that effort. This effort benefits not just The Seminole Tribe, but all Floridians who depend on a reliable supply of clean, fresh water flowing out of the Everglades, and all Americans whose lives are enriched by this unique national treasure.

Thank you for the opportunity to present the request of the Seminole Tribe of Florida. The Tribe will provide additional information upon request.

PREPARED STATEMENT OF THE SOCIETY FOR ANIMAL PROTECTIVE LEGISLATION

We respectfully request the following modest appropriations and oversight to permit these programs within the U.S. Department of Agriculture to be carried out effectively and efficiently.

$13 MILLION APPROPRIATION FOR APHIS/ANIMAL CARE TO ENFORCE THE ANIMAL WELFARE ACT

APHIS/Animal Care is responsible for ensuring basic protections to millions of animals nationwide through enforcement of the federal Animal Welfare Act (AWA). The Animal Care program oversees the care and handling of animals used in research, exhibition, and the wholesale pet trade. More than 10,000 separate locations across the country must be inspected for compliance with the AWA by Animal Care's field staff of only 70 inspectors. A total of 100 inspectors are desperately needed for USDA to meet their responsibilities under the law.

Animal Care's dedicated, hard-working staff are struggling to do the best possible job despite woefully insufficient funding, but they have reached a limit on what they can squeeze our of their appropriation. The agency's responsibilities have grown over time, yet its current budget is below the fiscal year 1993 level.

An unprecedented list of 350 organizations including the American Veterinary Medical Association, the American Zoo and Aquarium Association, the National Association for Biomedical Research and the Society for Animal Protective Legislation are supporting a request for an increase in appropriations for Animal Care of $3.825 million for its enforcement of the AWA. A copy of the letter is attached to my testimony.

A budget of $13 million for fiscal year 2000 for Animal Care would ensure compliance with the law by permitting: regular unannounced inspections of all entities regulated under the Animal Welfare Act; increased vigilance at substandard facilities; prompt response to complaints; and increased attention to searches for unlicensed dealers and exhibitors.

Allocation for USDA/APHIS Animal Care of Additional $3.825 Million for Fiscal Year 2000

Field Inspection Staff Expansion:	
18 Veterinary Medical Officers (salary and benefits)—69,696 × 18	$1,254,528
12 Animal Care Inspectors (salary and benefits)—49,212 × 12	590,544
Transportation, equipment, phone and on-line service, and training for new spectors 25,245 × 30	757,350
Subtotal	2,602,422

Allocation for USDA/APHIS Animal Care of Additional $3.825 Million for Fiscal Year 2000—Continued

Critical Needs of Existing Animal Care Program:	
Current Field Inspection Staff Needs: adequate training to permit performance-based inspections; upgrading computers and computer training to permit acquisition, transfer and storage of data; repair and acquisition of vehicles; equipment; supplies including gas; overnight travel; and departmental services	972,600
Crisis Management: emergency funds for seizure and subsequent care of animals; containment of potential public or animal health threats; consulting fees for veterinary specialists; emergency travel; and other services as needed	250,000
Subtotal	1,222,600
Total	3,825,022

The breakdown of expenses for each of the 30 new members of the field staff is as follows: $15,935 for acquisition of a vehicle; $4,860 for a laptop computer; $2,210 for job and computer training; $1,490 for gasoline; and $750 for phone and on-line service. The total for individual expenses is $25,245 × 30 inspectors equals $757,350.

The breakdown of expenses for existing program needs is as follows: $467,900 for repair, and when necessary acquisition, of vehicles; $175,000 for computer upgrades and training; $109,400 for overnight travel; $105,000 for job training including specialized training in enforcement of performance-based standards; $69,800 for departmental services; and $45,500 for equipment (cameras, etc.) and supplies. The total of these expenses is $972,600.

Congress and USDA should support H.R. 453 to save money and strengthen enforcement of the Animal Welfare Act.—Last month another USDA licensed Class B random source dog dealer and 8 accomplices were convicted of charges related to theft of animals for sale to experimental laboratories. According to the U.S. Department of Justice, the dealer conspired with others to acquire dogs through deception and theft and conspired to falsify the records of acquisition required by Animal Care. Only 3 pets were reunited with their families; the others had already been experimented on by researchers and were euthanized. This case exemplifies the problems associated with random source dog and cat dealers who provide these animals for research purposes.

There are only 40 random source Class B dog and cat dealers left, but Animal Care is spending an inordinate amount of time and money attempting to get them to comply with the minimum requirements under the AWA, including one of the fundamental objectives of the Act: preventing the theft of pets for research purposes. Despite all of the time and attention Animal Care is putting into enforcing the law at Class B dealer facilities, Animal Care is not able to assure the public that pets are not being taken and sold for research as the former USDA-licensed dealer cited above did.

H.R. 453, The Pet Safety and Protection Act sponsored by House Agriculture Committee Members Charles Canady and George Brown, would end the supply of dogs and cats to research facilities by Class B dealers. Other sources will remain available to ensure that researchers will be able to obtain the dogs and cats they need for experimentation. Report language could offer support for H.R. 453; adoption of this legislation would greatly reduce USDA's regulatory burden, while still permitting research to continue unhindered.

$900 THOUSAND LINE ITEM APPROPRIATION FOR THE ANIMAL WELFARE INFORMATION CENTER AT THE NATIONAL AGRICULTURAL LIBRARY

In 1985, Congress had the ingenuity to create the Animal Welfare Information Center (AWIC) to serve as a resource for all individuals involved in the care and use of animals in research. Those who use the services of AWIC include scientists, veterinarians, animal caretakers, research facility administrators, members Institutional Animal Care and Use Committees and APHIS/Animal Care inspectors who are responsible for enforcing the Animal Welfare Act.

AWIC provides information on : (a) appropriate care for animals including minimization of pain and distress, (b) reduction and/or replacement of the use of animals in research where possible, (c) preventing unintended duplication of experiments, (d) training for employees in the laboratory, and (e) legal requirements regarding the use of animals in research. Its value to the research community has led to an ever-increasing demand for assistance.

AWIC has not received an increase in appropriations during its 12 years, making it impossible to provide services as needed. Lack of funds is restricting the Center's ability to publish critical documents. Travel to important national meetings has been cut back too. At the most recent annual meeting of the American Association for Laboratory Animal Science, the AWIC educational exhibit was being run by only one, extremely overworked employee, and he ran out of AWIC's extremely popular materials during the first day of the three day meeting. The Center had to cut back on employees and cease its work study program with students from Prince Georges County schools.

The Center staff have responded to more than 24,000 requests for specific publications and more than 2,000 requests for reference services. AWIC produces a bulletin, now in its ninth year. It also maintains a worldwide web site (http://www.nal.usda.gov/awic) which by the end of February was being used an average of nearly 900 timers per day!

A line item appropriation of $900 thousand is requested for AWIC to increase production and dissemination of its excellent information. AWIC's resources are vital to assist registered research facilities with compliance with the Animal Welfare Act and to encourage the replacement, reduction and refinement of experiments involving the use of animals.

$500 THOUSAND APPROPRIATION FOR APHIS/ANIMAL CARE TO ENFORCE THE HORSE PROTECTION ACT

The Horse Protection Act (HPA), passed in 1970 and amended in 1976, is intended to prevent the cruel practice of "soring" gaited horses. According to APHIS, soring is defined as "the application of any chemical or mechanical agent used on any limb of a horse or any practice inflicted upon the horse that can be expected to cause it physical pain or distress when moving." Soring is done to give the animal an exaggerated gait. Tennessee Walking horses are the common victims.

It has been almost 30 years since the HPA was signed into law, yet many competitors in the industry are still defying the law. Horse Industry Organizations should adopt a policy of "zero tolerance" for violators of this federal law, and they should shun individuals who are soring horses. Instead, industry representatives appear to be bent on weakening enforcement of the HPA to make it easier to violate the law with impunity.

APHIS' Horse Protection Enforcement reports to Congress repeatedly document the soring of hundreds of horses; the National Horse Show Commission, Heart of American Walking Horse Association and Spotted Saddle Horse Breeders and Exhibitors Association consistently have high turndown rates because of noncompliance with the law.

The lack of funds has made it necessary for APHIS to increasingly turn over enforcement of the law to industry. This trend has continued despite evidence that the industry has failed to achieve the level of enforcement of the unbiased, well-trained, professional inspectors who work for Animal Care. The inspectors from industry are called "Designated Qualified Persons" (DQPs). The rate at which DQPs turned down horses for soring in fiscal year 1997 was 1.42 percent, less than half the rate of government inspectors who had a turndown rate of 3.57 percent.

541 horse industry organization shows took place in fiscal year 1997, yet Animal Care veterinary inspectors were only able to inspect 31. Based on APHIS figures for the horse shows that are inspected, we estimate that at least 2,000 sore horses a year are going undetected. Additional resources are needed to permit Animal Care inspectors to attend more shows thereby ensuring significantly stronger compliance with the HPA.

INCREASED OVERSIGHT OF WILDLIFE SERVICES

Last year, the House of Representatives nearly slashed funding for the predator control field operations of Wildlife Services (WS). Many Members supported this effort because of the inhumane, ineffective methods of predator control used by WS. Development of effective, publicly acceptable, humane alternatives is essential by the research section of WS. As these alternatives are developed they must be implemented in the field.

Steel jaw leghold traps, notorious for their cruelty, have been condemned as "inhumane" by the American Veterinary Medical Association, the American Animal Hospital Association and the World Veterinary Association. Not surprisingly, an increasing number of states are prohibiting use of leghold traps, making the work of the research section of WS all the more critical.

The 30,000 steel traps owned by WS should be discarded in favor of less cruel alternatives such as footsnares and box traps. The successful development of tran-

quilizer tabs by the research section must continue and use of the tabs by the operations staff should be pursued.

In an international trapping "Understanding" reached on December 11, 1997, between the U.S. and the European Union, the U.S. agreed to phase out use of "conventional steel-jawed leghold restraining traps". WS has the responsibility of complying with the U.S. obligation by ending its use of these barbaric traps.

No further testing of leghold traps should be pursued by WS as this would be an extremely wasteful and cruel use of taxpayer funds.—In the past, such funds designated for trap research were merely passed on to a nongovernmental organization to utilize as it saw fit. If any funds are allocated for trap testing, the research should be conducted by WS since the agency has the technical expertise.

WS has been involved in extremely successful oral rabies vaccine programs. Despite the positive results to date, the Agency has suggested that funding would be reduced for this work. Funding for the oral rabies vaccine work is important and should be continued.

Thank you for your consideration of our requests.

PREPARED STATEMENT OF SUFFOLK COUNTY, NY

Mr. Chairman, my name is Robert J. Gaffney and I am the County Executive of Suffolk County, New York. I want to thank you for the opportunity to present the following testimony in support of the Federal Farmland Protection Program.

Suffolk County was first settled in 1640 and was incorporated in 1683 as one of the ten original counties in New York State. Suffolk County is located on New York's Long Island, east of New York City, and bordered on the west by Nassau County. Suffolk's land area totals 911 square miles, is 86 miles long, and 15 miles wide. Shoring on both the Atlantic Ocean and the Long Island Sound, Suffolk's shoreline totals 987 miles. Suffolk's prime agricultural locale can be found on its east end, commonly known as the "twin forks" of the island. The 28-mile northern peninsula, known as the "North Fork" is the County's primary farm country, and ends at Orient Point.

THE NEED FOR FARMLAND PRESERVATION

Despite booming commercial and residential development and its proximity to New York City, Suffolk County and its residents have, and continue to maintain its rural tradition via a sound agricultural industry. This expanding industry is seasonally highlighted by Suffolk's vineyards, strawberry and pumpkin patches, local produce stands, nursery and greenhouse cultivation, and an established potato growth. As aforementioned, Suffolk's wine industry is experiencing considerable expansion and currently accounts for the largest premium wine industry of any county in the United States outside the State of California. It is these agricultural products that have afforded Suffolk's residents a profitable link to the past, while at the same time affording protection from developmental pressures.

Suffolk County's Farmland Preservation Program is now 23 years old, and was the first Purchase of Development Rights (PDR) program in the United States. Farmland preservation in Suffolk County is crucial on many fronts. The remaining farmland in Suffolk County represents the last vestige of an historical way of life dating back to the mid 1600's. Farmland preservation is critical to maintaining a rural character that will result in ensuring the scenic beauty of Suffolk's east end. Additionally, on a larger scale, it is this rural character that contributes to tourism on Long Island, currently a $2 billion industry. Economically, as an agricultural producer, Suffolk County continues to lead New York State in the market value of agricultural products sold, totaling over $133 million.

Suffolk County's farms are facing significant, even intense, developmental pressure. Commercial and residential development has already consumed a large percentage of the vast blocks of vacant land and farmland in the County's four western towns. Less than 1,800 acres remain, and much of this is in the process of being developed. The remainder is prohibitively expensive, with approximate values ranging from at least $50,000 to $100,000 per acre. Unless farmland is preserved now, significantly higher prices will result in the Town of Brookhaven and the five eastern Towns.

OUR COMMITMENT TO FARMLAND PRESERVATION

Recognizing the necessity of immediate action in preserving our last remaining farmland acres, I have recently increased the amount of money included in my capital budget from $1.5 million per year to $5 million per year commencing in 1998.

Moreover, a Community Greenways Fund was recently established, allocating an additional $20 million for farmland purchases. Overwhelmingly passed by referendum in November of 1998, we hope to leverage these dollars with both federal and state funds.

Suffolk County has demonstrated a commitment to long term conservation of our prime farmlands, which are among the most fertile in the United States. Overall, we have appropriated in excess of $32 million to preserve over 6,200 acres. These voluntary easements are used with other preservation mechanisms such as clustering and agricultural districting to protect Suffolk's farmlands against non-agricultural conversion uses. Suffolk County's current farmland preservation agenda also stems from the County's 1982 passage of a "Right to Farm" law, establishing an official County policy to conserve, protect, and encourage agricultural uses.

Suffolk County is currently in contact with the owners of 1,763 farm acres that have offered to sell the development rights to the County. This list awaits necessary funding, and would require approximately $15 million to acquire. On average, two farms are added to the list each month. As evidenced by the decline in total acreage in Suffolk County from 123,346 acres in 1950 to 35,323 acres in 1992, federal funds are needed to help accelerate the PDR programs before a critical mass of Suffolk farmland is lost forever. Alarmingly, Suffolk County loses approximately 1,289 acres annually. At the County's previous annual spending rate of $1.5 million, it may be as soon as 15 years before the remaining farmland left in Suffolk numbers only 10,000 acres. As outlined in the Suffolk County Farmland Preservation Plan of 1996, in order to meet our goal of preserving 20,000 acres, an expenditure of $15 million annually would be necessary. Suffolk County and its residents cannot afford to bear this cost alone.

To date, disproportionate to our overall financial need, Suffolk County has received only a small appropriation of federal funds through the Federal Farmland Protection Program. Additional federal funding will ensure that future generations of Suffolk County residents will gain from, and participate in the rich rural heritage that attracted the County's original inhabitants. Furthermore, with federal funds, we will encourage and stimulate local Town involvement in farm conservation, namely the four eastern Towns of Suffolk County. On an individual basis, support of the County's preservation initiative has proven to be overwhelming in terms of farmer assistance and participation. Suffolk's farmers and non-farmers alike recognize the urgency of shielding one of the County's last remaining natural resources. With a new millennium of high tech industrialization approaching, Suffolk County recognizes that such aspirations will prove futile without appropriate federal funding.

In conclusion, non-agricultural conversion of such lands will remove excellent soil from productive use, destroy historic farming, and diminish the scenic attractiveness traditionally enjoyed by Suffolk's residents. Therefore, farmland preservation in Suffolk County is not an option, but a necessity. It is for these reasons that I ask for your support in appropriating additional dollars into the Federal Farmland Protection Program.

Thank you for your sincere consideration of this matter.

PREPARED STATEMENT OF THE SOUTHERN LEGISLATIVE CONFERENCE (SLC) AGRICULTURE AND RURAL DEVELOPMENT COMMITTEE AND OF THE SLC FIRE ANT TASK FORCE

Mr. Chairman and members of the Committee: Thank you for the opportunity to testify before the Committee. As the Chairman of the Southern Legislative Conference (SLC) Agriculture and Rural Development Committee and of the SLC Fire Ant Task Force, I am very concerned about the appropriation for the fire ant research budget within the Agricultural Research Service (ARS) of the United States Department of Agriculture. The SLC Agriculture and Rural Development Committee and the Fire Ant Task Force strongly supports the administration's request for an additional $300,000 appropriation for the ARS's fire ant program. Furthermore, we feel that in order to continue the successes of this program and to develop successful pilot programs in affected states, an additional $1.5 million is necessary.

Fire ants are a problem for urban, suburban, and rural communities alike, costing Southerners billions of dollars each year. Fire ants have a powerful sting which gave them their name. For the one person in a hundred allergic to the sting, a fire ant attack can cause extreme medical complications. Fire ants also are blamed for a handful of deaths every year. Less serious, but still worrisome, are the pain and discomfort the stings give the hundreds of thousands of people attacked each year. Fire ants have been known to invade houses, hospitals, and nursing homes, where

they have attacked bedridden patients, and have colonized playgrounds and parks. The ants are attracted to low-level electrical current, have shorted out electrical junction boxes and air conditioner units, and attacked utility workers who unknowingly disturb their nests. As an agricultural pest, the fire ants' impact ranges from attacking calves and chicks, girdling young crops, blocking or destroying drip irrigation systems, restricting hand and mechanical harvesting of crops, and damaging harvesting equipment. Fire ants also can have a devastating effect on biodiversity and have caused significant problems for several endangered species.

While fire ants can colonize new territory through mating flights, relocation of their colony, and by "rafting" during floods, their real "invasion" of the South was assisted by the actions of people, especially in the transport of sod, nursery stock, and agricultural equipment. During the housing boom following World War II, the fire ant began to appear in areas not contiguous with its previous range and, by 1953, a connection between commercial plant nurseries and the spread of fire ants was established. By 1958, with the ants in eight southern states, federal quarantine regulations went into effect which has undoubtably helped to slow the further spread of the pest.

During this period, and up into the early 1970's, two chemicals, heptachlor and mirex, were used to control the ant, but both were eventually banned because of their impact on non-target species, their persistence in the environment and the possible risk to human health. In 1980, new chemical compounds which would break down more quickly, began to appear on the market, including Ambdro, Logic, Ascend, and Affirm. They are neither as cheap nor as effective as previous treatments, but they do still provide 80 percent to 90 percent control with little residual effect. New chemical applications are being developed, but it is certain that future fire ant management will add cultural and biological controls and integrated pest management to chemical controls.

Chemical controls are generally broad in scope and eliminate beneficial and harmful ants indiscriminately, with fire ant reinfestations almost certain to occur, often in even greater numbers. The expense of pesticide treatment and the environmental impacts of excessive or improper application of chemical treatments can extract a heavy toll as well. Biological controls, while not as immediately effective in controlling fire ants, can have excellent long-term results with minimal recurrent costs and can re-establish balance to the ecosystem. An integrated approach which uses both chemical and biological methods seems to offer out best hope for controlling the worrisome ant.

The SLC Agriculture and Rural Development Committee, for which I serve as Chairman, has had a long-standing interest in activities to control fire ants. In 1997, the Committee formed a special Fire Ant Task Force to serve as a driving force behind fire ant research, education, pilot testing of control activities, information-sharing, and area-wide management. In January 1998, the SLC Fire Ant Task Force met in Atlanta with representatives of ARS and members of the research and extension communities to discuss strategies for developing a cooperative effort to control the imported fire ant.

During this meeting, the SLC Fire Ant Task Force formally requested assistance from the USDA on creating a strategic plan for developing and field-testing new technologies aimed at controlling the fire ant. This strategy, which was subsequently developed in cooperation with state level scientists and extensionists identified by Task Force members, provides the framework for cooperation between states and the USDA/ARS. The goal of the strategy is the management of fire ants to levels below economic thresholds on agricultural lands and to eliminate the fire ant as a nuisance or health threat in urban environments.

Recently, ARS has had some success in developing new strategies and technologies for controlling fire ants. Much of their work involves biological control agents which selectively attack fire ants and precision targeting of fire ant baits to suppress fire ant populations, reducing the total amount of pesticide needed for control.

Work conducted by ARS over the past six years in America, Brazil, and Argentina has identified three biological control agents as most promising: the *Thelohania* microsporidium, a bacteria; a parasitic ant; and a phorid fly. These biological controls should give native competitor species an edge over the more competitive fire ant. This will hopefully return balance to ecosystems thrown out of alignment by this aggressive ant and remove the serious threat of harm by the fire ant.

In order to test the effectiveness of the new technologies, and to speed the process of transferring these technologies to the states, the SLC and the USDA have entered into a partnership to provide states access to ARS technologies, allowing states to conduct field tests on these new advances in their region at a fraction of the cost of developing them independent of the ARS.

The states of Oklahoma and South Carolina, and soon the state of Texas, all have committed substantial resources to further the USDA's research, including direct cost-share money to support USDA research. Testing activities are underway as well in Alabama, Arkansas, Florida, Georgia, Louisiana, North Carolina and Tennessee. In all, there are 14 test sites in 10 states investigating the viability of biocontrol agents through a partnership with the USDA and the states. These test sites, intended for research, are very local in their scope. More ambitious, and critical, pilot projects in key affected states are the next logical steps, and this is the direction the states and the USDA are heading.

The new technologies do not offer a "magic bullet" for the elimination of fire ants. Realistically, fire ant eradication may be beyond the capacity of any treatment. But managing fire ants to levels below economic and public safety threats is perceived as possible. The new SLC/USDA partnership is a step toward that goal, and a step aimed at providing states access to the most current research and information with the flexibility to direct their own controlled field tests.

The commitment of state resources to this effort is a key element of its success, but there is a need for continued and increased support of this effort from the USDA. As the new technologies and control agents enter into broader tests and proposed pilot projects, the USDA will need additional funds to support these activities. It is for this reason that the SLC Agriculture and Rural Development Committee and the Fire Ant Task Force strongly support the administration's additional $300,000 appropriation for the ARS's fire ant program. We feel that in order to continue the successes of this program and to develop successful pilot programs in affected states, an additional $1.5 million is necessary.

To put this in perspective, the state of California is considering spending $100 million over the next five years to combat fire ants which infest only about 50 square miles of the state. With more than 310 million acres in the southern U.S. and Puerto Rico infested with fire ants, the USDA is strained to its capacity to provide the necessary resources to states to continue research efforts. Any expansion of the program, including new pilot projects, would require input at the federal level to complement state contributions and commitments.

In closing, I want to underscore two points. The first is the tremendous impact the fire ant has had on the South, and the great potential for harm it has should it spread throughout the West. The second is the commitment of the states to a process already underway to find control solutions to this invasion. I hope you will agree with me that this is an appropriate and important area for increased federal activity. Thank. you.

PREPARED STATEMENT OF TEXAS A&M UNIVERSITY SYSTEM

Mr. Chairman and members of the Committee, I am Ed Hiler, Vice Chancellor for Agriculture and Life Sciences in the Texas A&M University System. I appreciate the opportunity to appear before you today, to describe a few exciting research projects we have underway, and to ask for your support for continued federal funding. New technology is the life blood of American agriculture. With the 1996 Farm Bill and resulting phase down in federal farm programs, it is imperative that research continues providing a technological underpinning for agriculture. Today, I will describe several examples of how we can provide this underpinning.

Designing fruits, vegetables and other food plants for prevention of life-threatening diseases.—Diet-related diseases—certain kinds of cancer, heart disease, stroke, atherosclerosis, and diabetes mellitus—are leading causes of two-thirds of the 2 million deaths that occur in the United States each year. Antioxidants in fruits and vegetables, including anthocyanins, beta-carotene, lycopene, quercetin, and vitamins C and E, can help prevent certain types of cancer, coronary heart disease, stroke, and atherosclerosis. However, additional study is needed to determine the most effective levels of these compounds; validate their mechanisms of action; and investigate their availability, absorption, metabolism, and interactions with other chemicals. Scientists at the Vegetable Improvement Center within the Texas Agricultural Experiment Station, Texas A&M University-Kingsville Citrus Center, University of Texas Southwest Medical Center in Dallas, University of Texas Health Science Center-San Antonio, Texas A&M University System Health Science Center, Baylor College of Dentistry, and South Carolina Cancer Center will cooperate in the effort. We are requesting increased funding for this important continuing project at $2,000,000 for fiscal year 2000.

Increasing food safety through biotechnology.—As many as 9,000 deaths and up to 81 million cases of foodborne illness occur in the U.S. every year. Approximately 5 percent of all cases can be linked to fresh produce and another 16 percent to con-

taminated meat products. New and rapidly improving biochemical techniques popularly known as "biotechnology" hold great promise for helping the food industry trace foodborne pathogens to their source using genetic "fingerprinting". Rapid tracing would prevent further consumption of contaminated food during an outbreak by quickly alerting health agencies and the public. In addition, more effective strategies can be developed to reduce sources of contamination and minimize emergence of disease-causing organisms. Scientists from Iowa State University, the Institute of Food Science and Engineering at Texas A&M University, and The Center for Research on Animal Production Issues at Texas Tech University will cooperate on the project, which we estimate will ultimately reduce medical cases associated with food borne pathogens by 210,000 and the numbers of deaths by 380 per year. We are requesting funding for this project at $1,250,000 for fiscal year 2000.

Southern Plains Cotton Research and Education Consortium.—Cotton producers and processors of the Southern Plains face unprecedented challenges from declining commodity prices and profit margins. Over the last several years, elimination of government acreage control programs combined with much improved boll weevil control in the southeastern U.S. have increased cotton production and depressed prices. During this same period, the boll weevil has become established on more than 4 million acres of cotton in the Southern Plains of Texas, threatening to cause $500 million in annual economic losses if successful management strategies are not implemented. To help Southern Plains producers, Texas Tech University, the Texas A&M University System Agriculture Program, and the USDA-ARS have formed a consortium to develop integrated research and education programs for the world's largest cotton patch. The principal elements of the integrated program will be genetic enhancement of cotton yields, quality, and stress tolerance, as well as improved management of the boll weevil. We are requesting funding of $5,500,000 for this project for fiscal year 2000.

Efficient irrigation for water conservation in the Rio Grande Basin.—The region along the U.S.-Mexico border north of the Rio Grande River is a land of contrasts, including severe poverty, rapid economic growth, and intensive irrigated agriculture. Recent drought conditions highlight the importance of ample water resources for the region's economy and environment. More efficient agricultural and urban irrigation systems can conserve large amounts of water. This initiative will focus resources of the Agricultural Experiment Stations and Extension Services of Texas and New Mexico and the Texas Engineering Extension Service on reducing amounts of irrigation water needed to economically produce field and horticultural crops and to maintain attractive urban landscapes. Training will be provided in the areas of water supply, irrigation, and waste water system assessment, planning, design, financing, installation, use, and maintenance. Applied research will be conducted on irrigation system efficiency, biological and chemical hazards of waste water, reuse of agricultural and municipal waste waters, and integration of municipal and agricultural water supplies. Conservation will be achieved through improved irrigation supply networks, urban and agricultural irrigation systems, salinity and drainage control, and reuse of municipal water. We are requesting funding of $3,250,000 for this project for fiscal year 2000.

Environmental services of rice lands in Arkansas, Louisiana, and Texas.—Privately-held rice lands provide a variety of ecological services, but they can also have adverse environmental impacts. Public benefits include wildlife habitat, water filtration through wetlands, and flood protection. Adverse impacts can include degradation of soil organic matter, salinization, sedimentation, agricultural chemical losses, and groundwater depletion. Elimination of Federal agricultural commodity price support programs is reducing acreage in some parts of the Rice Belt and increasing it in others—with the unintended result of decreasing ecological services in some regions and increasing adverse environmental impacts in others. Scientists from the Texas A&M University System, the University of Arkansas, Louisiana State University, and USDA-ARS will examine environmental benefits and costs of alternative rice production technologies and how we might strengthen communities and increase the environmental and economic benefits of rice culture. We are requesting funding of $1,000,000 for this project for fiscal year 2000.

Revenue insurance as a risk management tool.—Increased volatility of commodity prices and dissatisfaction with crop insurance as an income safety net policy have heightened interest in revenue insurance. Decision makers need a comprehensive farm level, regional, and aggregate sector analysis of revenue insurance as a risk management tool, including the place of current private sector insurance instruments. The Agricultural and Food Policy Center at Texas A&M University is currently involved in developing a preliminary exploration of the feasibility of revenue insurance as a safety net for farmers. In addition, it has led the development of a financial and risk management assistance decision aid to quantify payoffs to indi-

vidual producers utilizing alternative risk management packages. This initiative would also examine the conditions under which revenue insurance could serve as a safety net for farmers and, therefore, as a substitute for conventional farm programs. We are requesting funding of $750,000 for this project for fiscal year 2000.

Animal fiber research.—The phase out of wool and mohair incentive payments has left the United States sheep and Angora goat industry in a very difficult position. This is especially important for the large areas of semiarid U.S. lands that have few options for alternate agricultural enterprises. Scientists in Texas, Montana, and Wyoming have developed image analysis applications for measuring most of the important characteristics of wool, mohair, and cashmere. Results from this work have contributed significantly to acceptance and marketing of U.S. wool. More research is needed before industry fully adopts these innovative practices for product selection and marketing, helping producers become more competitive in new and existing markets. We are requesting continued support of this project at $300,000 per year.

Farm level impacts of agricultural policy.—The Agricultural and Food Policy Center conducts research directly supporting Congressional Committees that set agricultural policy. Its research emphasizes regional and farm-level effects of alternative agricultural policies on crop and livestock producers. The Center provides estimates of how regional production, commodity prices, farm incomes, and consumer food costs are economically affected by U.S. policy. It assesses how U.S. economic relationships impact individual representative farms, and the viability of the U.S. food and fiber industry. This activity is critical with a reduced government role embodied in the 1996 Farm Bill; moreover, these analyses are not available to Congress from USDA or other research centers. This program is conducted in collaboration with the Food and Agriculture Policy Research Institute (University of Missouri-Columbia) and the Farm Sector Financial Analysis Branch of CSREES/ERS. Since this effort was initiated in fiscal year 1990, it has helped agriculture committees assess more than 100 policy options. For fiscal year 2000, we request continued funding of this project at the level of $500,000.

Livestock and dairy policy analysis.—The Livestock and Dairy Policy Analysis project is a joint effort of Texas A&M University and Cornell University. It supports a dairy policy education program that involves economists at the University of Wisconsin, Ohio State University, Pennsylvania State University, and Clemson University. In the past, faculty at these universities have helped conduct a "dairy policy school" in the House of Representatives. Moreover, our faculty have been consistently available to the Livestock Subcommittee for analyses of dairy policy options. Building on the success of this initiative, we propose to expand the activities to create a national dairy economics education center at Cornell University with Texas A&M as a cooperating institution. For fiscal year 2000, we request continued funding of this project at $625,000.

Center for North American studies.—The Center for North American Studies, now in its sixth year of operation, promotes cooperative research, policy analysis, and training on critical agricultural issues of common interest to the United States, Mexico, and Canada. The Center's primary focus has been impacts of NAFTA, especially impacts on expanded trade and associated public policy concerns. Though the Center is located at Texas A&M University, it has strong cooperative linkages with Louisiana State University, Texas A&M University at Kingsville, and Texas A&M International University at Laredo. Since 1994, Center personnel have conducted nearly 30 workshops or conferences annually, reaching an estimated 3000 people per year. In July 1998, the Center initiated, in cooperation with USDA-FAS, a five-state interactive video conference to inform more than 100 agribusiness representatives about market opportunities, trade regulations, and economic conditions in Mexico, Central America, and Asia. We are requesting continued funding for this project at $300,000 for fiscal year 2000.

New products from rangelands at Texas A&M University-Kingsville.—This initiative will continue efforts to gain commercial products from native plants such as cacti and mesquite. Congress has funded this program at Texas A&M University-Kingsville for several years, and excellent progress has been made. A mesquite lumber grading system and industry is developing under project funding. The grading system has helped producers market mesquite wood for furniture, flooring, and other uses. Similarly, progress has been good on marketing cactus products, and a major grocery chain now offers fresh cacti fruit to consumers. In 1998, a tall-straight mesquite contest was conducted to identify trees that will serve as the basis for a genetic improvement program in mesquite . In 1999 the program will plant nearly 1,000 seedlings to evaluate for lumber quality and serve as a seed source for future selection. We are requesting continued support at $120,000 per year for Texas A&M University-Kingsville in fiscal year 2000.

International goat research at Prairie View A&M University.—The International Dairy Goat Research Center was established in 1983 and is now an important program of the Cooperative Agricultural Research Center at Prairie View A&M University. The primary objective of the Center is to generate and distribute technical information to owners of dairy goats concerning proper management of their animals. This research program conducts research on overall dairy and meat goat management and care in the areas of reproduction, reproductive efficiency, health, disease and toxicology. The Center also conducts comprehensive outreach activities, including an annual field day, short courses, and workshops. Special emphasis is given to assisting small landowners to diversify their production systems. We are requesting expansion of this project at Prairie View A&M University to $750,000 in fiscal year 2000.

Shrimp aquaculture research.—The U.S. Marine Shrimp Farming Program develops technology and provides service to the marine shrimp industry. The market for farm-raised salt water shrimp is expanding rapidly, especially as the wild catch in the Gulf of Mexico declines. With the help of this Program, the Texas marine shrimp farming industry has rebounded since a serious outbreak of Taura Syndrome Virus disease in 1995, reaching unprecedented $30 million in production in 1998, more than three quarters of all U.S. farmed shrimp. This initiative will extend the U.S. competitive technological advantage over foreign countries by supporting researchers working to improve animal quality, herd health, water quality, seedstock supply, pond management, production risks and profitability. The USDA/CSREES for the Oceanic Institute currently funds this program in Hawaii and the Gulf Coast Laboratory Consortium. We request funding at $5,000,000 for fiscal year 2000 through the USDA/CSREES Federal Administration Program.

Center for animal research and production issues.—This collaborative partnership led by Texas Tech University and including the Texas Tech University Health Sciences Center, the Texas A&M University System, and the USDA-ARS, will conduct research to solve problems related to animal production, including animal health and well-being, safety of animal products (pre-and post-harvest), and development of environmentally and economically sustainable production systems. We are requesting $2,100,000 for Texas Tech University to support this program in fiscal year 2000.

Efficient peanut production in west Texas.—Peanut acreage has increased dramatically in West Texas, which now accounts for 72 percent of the state's production. This initiative joins Texas Tech University, the Texas A&M University System, and regional peanut producers in a comprehensive research and education program to address peanut production and management strategies for West Texas. We are requesting $2,000,000 for Texas Tech University to support this program in fiscal year 2000.

Precision agricultural management systems for the Southwest.—This initiative is a partnership among Texas Tech University, the Texas A&M University System, New Mexico State University, West Texas A&M University, and USDA-ARS. Its objective is to develop and enhance the efficient use of resources in crop production and the management of rangeland, wildlife and the forests of the Southwestern US. We are requesting $4,200,000 for Texas Tech University to support of this program in fiscal year 2000.

Food safety and water quality at west Texas A&M University.—The West Texas A&M University Feedlot Research Group proposes to collaborate with the Texas Agricultural Experiment Station, Texas Agricultural Extension Service, and USDA-ARS to characterize the role of water as a vehicle for food safety-related pathogens in feedlot cattle. The cooperating agencies will then evaluate the effectiveness of intervention strategies to reduce contamination of carcasses, cattle and water. We are requesting $1,000,000 for West Texas A&M University to support this program in fiscal year 2000.

Plant Stress Research Program.—This initiative provides support for the integration of Texas Tech University, USDA-ARS, and the Texas Agricultural Experiment Station into a world class plant stress research effort. The main research efforts will be to increase water use efficiency, develop crops that are genetically superior in stress tolerance, utilize sophisticated modeling systems to maximize production, and overcome adverse water quality. We are requesting $1,000,000 in fiscal year 2000 for USDA-ARS to support this program.

PREPARED STATEMENT OF THE U.S. APPLE ASSOCIATION

The U.S. Apple Association (USApple) appreciates the opportunity to provide comments on U.S. Department of Agriculture (USDA) fiscal year 2000 appropriations.

Our testimony will focus on the following three areas: the Foreign Agricultural Service Market Access Program; Food Quality Protection Act implementation; and Agricultural Research Service funding.

The U.S. Apple Association (USApple) is the national trade association representing all segments of the apple industry. Members include more than 450 individual firms involved in the apple business, as well as 30 state apple associations representing the 9,000 apple growers throughout the country. The U.S. Apple Association's mission is to provide the means for all segments of the U.S. apple industry to join in appropriate collective efforts to profitably produce and market apples and apple products.

FOREIGN AGRICULTURAL SERVICE MARKET ACCESS PROGRAM (MAP)

U.S. Apple strongly supports increasing the annual appropriation for MAP from $90 million to $200 million

All segments of the U.S. apple industry benefit directly from the use of export promotion funds, which increase export demand. In fiscal year 1998, the apple industry received $4 million in MAP export-development funds. These funds are matched by grower funds, and are used to promote apples in more than 20 countries throughout the world. Since 1987, when the apple industry first utilized MAP funds, apple exports have increased by 53 percent.

The U.S. apple industry faces keen competition around the globe from competitors who receive significant government funds for generic promotions. Foreign governments spend approximately $500 million on export promotion and market development. With apple production increasing around the world, competition is expected to further intensify. MAP is of paramount importance to the apple industry as exporters endeavor to revive export demand in countries hard hit by economic shocks and currency devaluations over the past two years.

FOOD QUALITY PROTECTION ACT (FQPA) APPROPRIATIONS

U.S. Apple strongly supports full funding for the following programs intended to facilitate fair FQPA implementation and to offset its anticipated negative impact on apple growers

U.S. Apple supports the Administration's USDA budget requests of:

—$13.1 million for the Pesticide Data Program, managed by the Agricultural Marketing Service;

—$2 million for the food consumption survey undertaken by the Agricultural Research Service;

—$.3 million for the National Agricultural Statistics Service pesticide-usage surveys;

—$2.7 million the National Agricultural Pesticide Impact Assessment Program in support of the Office of Pest Management Policy;

—$12.3 million for the Cooperative State Research, Extension and Education Service Integrated Pest Management Research Grant Program; and

—$18 million for research and transition programs for crops negatively impacted by FQPA.

AGRICULTURAL RESEARCH SERVICE (ARS)—TEMPERATE FRUIT FLY RESEARCH POSITION—YAKIMA, WASHINGTON

U.S. Apple requests that $300,000 be appropriated to fill a critical position at the USD–ARS laboratory in Yakima, Washington to conduct research of temperate fruit flies, a major pest of apples.

FQPA implementation is expected to significantly reduce the number of pesticides currently being used by growers to control pests such as cherry fruit fly and apple maggot. Left unchecked, these temperate fruit flies can be devastating. Research is critically needed to develop alternative pest controls should presently-available crop protection tools be phased out under FQPA implementation.

Thank you for this opportunity to present this testimony in support of the apple industry's top USDA appropriations.

PREPARED STATEMENT OF THE UNITED STATES TELEPHONE ASSOCIATION

SUMMARY OF REQUEST

Project involved.—Telecommunications Loan Programs Administered by the Rural Utilities Service of the U.S. Department of Agriculture.

Actions proposed.—Supporting RUS loan levels and the associated funding subsidy for the hardship, cost of money, and loan and subsidy guarantee programs in fiscal year 2000 in the same amount as loan levels specified in the fiscal year 1999 Agriculture Appropriations Act (Public Law 105–277). Also supporting Rural Telephone Bank loans and associated subsidy in the amount requested in the President's budget. Also supporting an extension of the language removing the 7 percent interest rate cap on cost of money loans for fiscal year 1999. Also supporting continuation of the restriction on the retirement of class A Rural Telephone Bank stock in fiscal year 2000 at the level contained in Public Law 105–277) and an extension of the prohibition against the transfer of Rural Telephone Bank funds to the general fund. Supporting funding for $200 million in loan authority and $20 million in grants designated for distance learning and telemedicine purposes. Opposing the President's budget proposal to transfer funds from the unobligated balances of the liquidating account of the Rural Telephone Bank for the Bank's administrative expenses and loan subsidy costs.

The United States Telephone Association (USTA) represents over 1000 local telephone companies that provide over 95 percent of the access lines in the United States. USTA members range from large public held corporations to small family owned companies as well as cooperatives owned by their customers. We submit this testimony in the interests of the members of USTA and their subscribers.

USTA members firmly believe that the targeted assistance offered by a strong telecommunications loan program remains essential in order to maintain a healthy and growing rural telephone industry that contributes to the provision of universal telephone service. We appreciate the strong support this committee has provided for the telephone program since the program's inception in 1949 and look forward to a vigorous program for the future.

A CHANGING INDUSTRY

As Congress recognized through passage of the Telecommunications Act of 1996, the telephone industry is in the midst of one of the most significant changes any industry has ever undergone. Both the technological underpinnings and the regulatory atmosphere are dramatically different and changing very quickly. Without system upgrades funded by the reliable source of lower cost debt capital provided by the RUS telecommunications program, rural areas will be left out of the emerging information revolution.

The need has never been greater for the technology employed by RUS borrower rural telephone companies to continue to be modernized. The demand for new switches to serve rural areas could be unprecedented in the next year. What is driving this demand? First, there are several Federal Communications Commission mandates that incumbent local companies will have to meet. Upgrades related to new rules regarding pay phone compensation, implementation of four digit Carrier Identification Codes (CICs), and number portability are all new Commission requirements driven by the 1996 Telecommunications Act. Second, there are still some companies that are not equipped to offer equal access to competing long distance carriers. Third, the Communications Assistance for Law Enforcement Act (CALEA) imposes new requirements on all carriers to upgrade their capabilities to assist the Federal Bureau of Investigation and other law enforcement agencies. Fourth, telephone company switches, which are really just sophisticated computers, are impacted by the "year 2000" problem.

In addition to upgrading switching capability, it is important that rural areas be included in the nationwide drive for greater bandwidth capacity. In order to provide higher speed data services, such as ISDN (Integrated Services Digital Network) or even faster connections to the Internet, outside plant must be modernized in addition to new electronics being placed in switching offices. Rural areas with relatively long loops are particularly difficult to serve with these higher speed connections and require additional investment to allow modern services to be provided.

Provision of greater bandwidth and switching capabilities are crucial infrastructure elements which will allow rural businesses, schools and health care facilities to take advantage of the other programs available to them as end users. The money spent on having the most modern and sophisticated equipment available at the premises of the business, school or clinic is wasted if the local telephone company cannot afford to quickly transport and switch the large amounts of data that these entities generate. RUS funding enhances the synergies among and RUS programs and other federal telecommunications targeted at improving rural education and health care through telecommunications.

The RUS program provides needed incentives to help offset regulatory uncertainties related to universal service support and interconnection rules with a reliable

source of fairly priced long term capital. After all, RUS is a voluntary program designed to create incentives for local telephone companies to build the plant essential to economic growth. RUS endures because it is a brilliantly conceived public private partnership in which the borrowers are the conduits for benefits from the federal government to flow to rural telephone customers, the true beneficiaries of the RUS program. The government's contribution is leveraged by the equity, technical expertise and dedication of local telephone companies.

IMPACT OF CREDIT REFORM ON THE RURAL TELEPHONE BANK

Contrary to the intent of Congress, the interpretation of credit reform by the Office of Management and Budget (OMB) has significantly affected the operation of the Rural Telephone Bank (RTB). One of the most damaging impacts of OMB's interpretation of the credit reform law is to essentially cleave the RTB into two banks—a liquidating account bank which is responsible for pre-credit reform loans, and a financing account bank which is responsible for post credit reform loans. Until the Administration's current budget proposal, OMB has clung to the proposition that funds from the two banks could not be intermingled. USTA has protested this arrangement since it began, since it prevents the relending of borrower repayments to fund new loans in direct contravention of Sec. 409 of the Bank's enabling act.. This, in turn, forces the RTB to borrow unnecessarily from the Treasury to fund new loans. It also permits funds to build up in the liquidating account that were generated by GAO documented interest rate overcharges, instead of those funds being returned through relending to the same universe of borrowers that initially generated them.

In this new budget proposal, the Administration proposes to take funds from the liquidating account and fund the loan subsidy for new loans as well as the RUS administrative expenses allocated to the RTB beginning in 2000. This is in direct conflict with an existing provision of law, Sec. 403(b) of the Rural Telephone Bank Act (Public Law 92–12). That provision states ". . . in order to perform its responsibilities under this title, the telephone bank may partially or jointly utilize the facilities and the services of employees of the Rural Electrification Administration or of any other agency of the Department of Agriculture, *without cost to the telephone bank.*" (Emphasis added)

Instead of using the repayments into the liquidating account to fund the expenses of the RTB (contrary to the Rural Electrification Act) or to fund the loan subsidy, neither of which would result in any budget savings, those repayments should be used to fund new RTB loans, consistent with Sec. 489 of the Rural Electrification Act.

RUS TELEPHONE PROGRAM PROCEDURES SHOULD CONTINUE TO BE STREAMLINED

By revising its Annual Statistical Report as well as making other changes to reduce red tape and focus on results and service delivery, Administrator Beyer, Deputy Administrator McLean and Assistant Administrator Purcell have begun to take significant actions to streamline RUS telecommunications program procedures. These actions encourage the use of this voluntary program and promote the provision of modern telecommunications service to rural Americans. USTA is fully in support of less regulation and improved service delivery, within the context of the government's interest in security for these rural telecommunications infrastructure improvement loans. We applaud the efforts of RUS to this end and strongly support and encourage continuation of this long overdue initiative.

RECOMMENDATIONS

Continuation of the loan levels and necessary associated subsidy amounts for the RUS telephone loan programs that were recommended by this committee and signed into law for fiscal year 1999 would maintain our members' ability to adequately serve the nation's telecommunications needs and to maintain universal service.

For a number of years, through the appropriations process, Congress has eliminated the seven percent "cap" placed on the insured cost-of-money loan program. The elimination of the cap should continue. If long term Treasury interest rates exceeded the 7 percent ceiling contained in the authorizing act, adequate subsidy would not be available to support the program at the authorized level. This would be extremely disruptive and hinder the program from accomplishing its statutory goals. Accordingly USTA supports continuation of the elimination of the seven percent cap on cost-of-money insured loans in fiscal year 2000.

The restriction on the retirement of the amount of class A stock by the Rural Telephone Bank, adopted in fiscal 1997, should be continued. The Bank is currently retiring Class A stock in an orderly, measured manner as current law requires. This

should continue. The Committee should also continue to protect the legitimate ownership interests of the Class B and C stockholders in the Bank's assets by continuing to prohibit a "sweep" of those funds into the general fund.

Recommended Loan Levels

USTA recommends telephone loan program loan levels for fiscal year 2000 as follows:

[In millions of dollars]

RUS Insured Hardship Loans (5 percent)	−75
RUS Insured Cost-of-Money Loans	−300
Rural Telephone Bank (RTB) Loans	−175
Loan Guarantees	−120
Total	670

The President's budget proposes a reduction of in the hardship program designed for the neediest borrowers. There is strong demand for hardship loans. Rural Americans cannot wait any longer to be full participants in the Information Age. A minimum amount of subsidy authority would restore the hardship loan level to its fiscal year 1999 level. We cannot imagine a more deserving use of scarce government resources for the benefit of rural Americans.

Distance Learning and Telemedicine

USTA strongly supports the loan and grant proposal and recommends its funding for fiscal year 2000 at the levels proposed in the Administration's budget submission, that is, $20 million for the grant program and $200 million for the loan program. This program is a perfect complement to the traditional RUS telephone loan programs. For distance learning and telemedicine to become a reality, schools and hospitals need training and equipment. Similarly, local telephone companies need modern infrastructure to connect these facilities to the telecommunications network.

CONCLUSION

Our members take pleasure and pride in reminding the Subcommittee that the RUS telephone program continues its perfect record of no defaults in almost a half century of existence. RUS telephone borrowers take deadly seriously their obligations to their government, their nation and their subscribers. They will continue to invest in our rural communities, use government loan funds carefully and judiciously and do their best to assure the continued affordability of telecommunications services in rural America. Our members have confidence that the Subcommittee will continue to recognize the importance of assuring a strong and effective RUS Telephone Program through authorization of adequate loan levels.

PREPARED STATEMENT OF THE UNIVERSITY OF ILLINOIS

Mr. Chairman and distinguished members of the Agriculture, Rural Development, and Related Agencies Subcommittee.—We are pleased to provide this updated testimony on behalf of the federally-funded project entitled "Studies to Reduce the Aflatoxin Problem in Corn" being carried out in the University of Illinois Crop Sciences Department by Professors J. M. Widholm and D. G. White, in cooperation with scientists in other institutions and agencies. Professors White and Widholm provided the technical information in this report. We wish to thank you, Mr. Cochran and others on the Committee, for appropriating $1,119,000 to date for this important research. During the past year, some important milestones were achieved, bringing the project closer to achieving its objective. We request an fiscal year 2000 allocation of $180,000 so that we can move these promising results further toward fruition for U. S. corn producers and consumers.

THE AFLATOXIN PROBLEM

Because of its toxicity and carcinogenicity (causes cancer), aflatoxin in corn grain is a very serious problem. When the causal fungus, Aspergillus paves, is present on the grain, the toxin is often present also. Aflatoxin problems occur primarily in years and areas of moisture stress, which means their occurrence is relatively unpredictable. According to our studies of sixty-five widely grown commercial corn hybrids, including normal corn, white corn, and food-grade corn, there is little or no resistance to A. pavus in commonly grown hybrids. The inbred lines of corn widely used to produce these hybrids lack resistance genes.

The toxin can form in the maturing grain before harvest and in stored grain if the moisture levels are too high. Due to the danger posed by aflatoxin, levels of the toxic compound are closely Stored in corn grain. If levels of aflatoxin are too high in a given sample, the grain represented by the sample cannot be sold in interstate commerce. There is a significant monitoring cost, but it is small relative to other costs incurred by aflatoxin.

It is estimated that in any given year 5 to 30 percent of the nation's corn crop experiences severe moisture stress. Direct yield and quality losses caused by aflatoxin are at least $500 million annually. That loss accrues to producers. In addition, there are harmful health, social, and economic effects of aflatoxin when it is present in corn-based food products. Aflatoxin is one of the most carcinogenic of naturally occurring compounds. It is very detrimental to the health of humans or animals that ingest it. For these reasons, it is important to eliminate aflatoxin from corn grain. That is the mission of this project.

THE STRATEGY FOR REMOVING AFLATOXIN FROM CORN

The strategy of the project is to: through field tests, identify resistant germplasm in existing collections, using tissue culture techniques, evaluate and select corn cultures that inhibit A. paves growth and/or aflatoxin production, regenerate promising plants for greenhouse and field evaluation, using recombinant DNA techniques, introduce into corn antifungal genes encoding enzymes such as chitinase and B-glucanase, which may impart resistance to A flavus, and determine the effect of fungicides on A. paves growth and aflatoxin production.

PROGRESS REPORT AND LOOK TO THE FUTURE

Previous and current conventional breeding and selection approaches

Since 1991 we screened thousands of corn inbred lines, some of which already existed in various collections and some of which we derived from existing material. We identified 11 lines with high levels of resistance to Aspergillus ear rot and to the production of aflatoxin. We concentrated on sources of resistance that can be used to improve inbred lines B73 and Mol7, from which most important commercially used inbred lines are derived.

In inheritance studies, we found that resistance genes have both additive and dominant affects. It is desirable for resistance genes to be dominant, so that when resistant and susceptible lines are crossed, the resulting hybrids will be as resistant as the resistant parent. Some of the resistance genes discovered are strongly dominant. Much of the effort was concentrated on inbred line Tex 6, developed at the University of Illinois by selecting from a southern white corn population that has high levels of resistance to southern corn leaf blight.

Tex 6 confers extremely high levels of aflatoxin resistance when crossed with most of the inbreds that are important in the cornbelt. Inheritance studies indicate that the resistance in Tex 6 is controlled by just a few genes, which is very desirable. The fewer the genes controlling a trait, the easier it is to transfer that trait to otherwise desirable lines and the faster the trait can be introduced into widely used material using the common backcrossing approach. At best, it takes several years of backcrossing to restore the high yield potential of important inbreds, while at the same time retaining aflatoxin resistance introduced in the original cross with Tex 6.

A major milestone was reached when, using Tex 6 and other experimental lines and the backcrossing approach, we were able to transfer effective aflatoxin resistance into commercially used inbreds related to both B73 and Mol7. In 1995 and 1996 yield trials, hybrids with some of these new aflatoxin resistance inbreds as one parent yielded as well as popular commercial hybrids. This is extremely important because unless resistant varieties yield as well or better than normal varieties when aflatoxin is not a problem, they won't be acceptable to producers. This breakthrough paves the way for private firms to introduce resistance to A. pavus and aflatoxin into their best lines.

Important finding in fiscal year 1998

The most important development in corn production in recent years was the introduction of practical high oil corn hybrids by Dupont and Pfister Hybrids, using materials developed at the University of Illinois. Unfortunately, high oil hybrids, which are produced by the so-called topcross method, are more susceptible to Aspergillus ear rot and aflatoxin production than are normal hybrids of the same pedigree with a normal pollinator. Fortunately, high oil top crosses that involve some of the sources of resistance developed in this aflatoxin project are equal in resistance to

normal resistant hybrids. Thus, this project is providing the mechanism to assure that the enormous potential of high oil corn is not reduced by aflatoxin.

Past, current, and future biotechnology research on aflatoxin

Three years ago, we used Restriction Fragment Length Polymorphism (RFLP) markers, a powerful biotechnology technique, to identify those chromosome regions associated with specific genes for aflatoxin resistance. We found that some genes confer resistance to the fungal disease organism (A. paves) that causes ear rot. Some do not confer resistance to the fungal organism but do inhibit its production of aflatoxin. Some genes do both.

A cooperator, Professor Gary Payne of North Carolina State University, identified a specific protein from seed of inbred Tex 6 that inhibits aflatoxin production in culture but has very little effect on growth of the fungus. He identified another protein that inhibits the growth of the fungus. Apparently there are corn genes that code for each of these proteins. Researchers are now trying to develop a quick biotechnology test for these proteins and to locate the associated genes on the map of the corn genome. Among other advantages, this will enable corn breeders to use marker-assisted selection, a molecular selection technique, which should greatly speed the process of screening and selecting high-yield, aflatoxin-resistant lines of corn.

This year we started work with inbred line C12, which has good levels of resistance and also makes a protein that blocks some, but not all, aflatoxin synthesis. If we can enhance the production of these blocking proteins and transfer the gene or genes that code for them into otherwise productive corn hybrids, several advantages will accrue. First, fewer genes will have to be transferred to achieve the desired result. This should speed up the process of incorporating desirable aflatoxin-reducing genes into commercially important hybrids. Since the aflatoxin-synthesis-blocking corn genes will place little selection pressure on the fungus itself, the fungus will be less likely to develop ways to defeat the resistance mechanism.

Once these genetically controlled resistance mechanisms are fully characterized and understood, the resistance genes can be transferred to other crops, such as peanuts, that also have aflatoxin problems. The aflatoxin resistance mechanisms described above may resist other diseases as well. Corn lines identified in this project that are resistant to A. pavus also are resistant to Fusarium maniliforme, which produces fumonison, another highly toxic and carcinogenic mycotoxin. There is direct evidence that fumonison causes cancer in humans, not just in laboratory animals.

Fiscal year 1998 biotechnology breakthrough

After years of effort, we experienced a major breakthrough during early fiscal year 1998 with the successful introduction of antifungal genes bean chitinase and B–1,3-glucanase into corn cells, both alone and in combination. The particle gun was used to accomplish this transformation. The transformed cells were regenerated into plants and were self-pollinated to obtain plants that are homozygous for the antifungal genes. Subsequently, we demonstrated by several different methods that the introduced genes are stable, are passed to progeny in normal reproduction, and are expressed in seeds of the transformed plants. In other species, these particular genes are expressed as enzymes that break down cell walls of invading fungi, thus preventing or reducing fungal diseases. We found that Tex 6, which confers the highest level of natural fungal resistance, has high levels of natural chitinase in its tissues. This is a different chitinase, however, than the one we introduced by ombinant DNA techniques.

Plans for fiscal year 2000

In fiscal year 2000, we will conduct tests to determine how effective the bean chitinase and B–1,2-chitinase genes are, alone and in combination with resistance genes already identified in corn, in sting A. paves and aflatoxin production. We anticipate that the combination will be most effective and will, when incorporated into widely used hybrids, go far toward solving the aflatoxin problem. It will be very important to determine if a combination of chitinases confer greater and more lasting resistance than only one. We will also seek to enhance natural resistance to A. flavus through conventional breeding techniques and will conduct further research aimed at increasing the resistance of high oil corn hybrids to the pathogen.

Cooperation

We continue to have good cooperation with other institutions and USDA-ARS. Several sources of resistance we discovered and several resistant lines derived from them have been shown to be resistant in field studies conducted by cooperators in Mississippi and south Texas. We are also cooperating with Professor Dennis McGee

at Iowa State University, who found that the silks on our resistant lines inhibit growth of A. paves. Professor Gary Payne of North Carolina State University continues to make valuable contributions to the project.

SUMMARY AND REQUEST

We believe this project is making excellent progress toward the desired outcome of reducing or eliminating aflatoxin as a serious problem in corn production and use. To summarize project results to date, we identified several corn lines that are resistant to the organism (Aspergillus paves) that produces ear rot and produces aflatoxin. We also discovered lines that inhibit aflatoxin production without inhibiting fungal growth. This increases the possibility of inducing aflatoxin resistance that does not decrease with time.

We derived new lines that have both types of resistance. We learned how aflatoxin resistance is inherited when crosses are made. We have sources of resistance that are effective when used in either the northern or southern corn belt. We developed practical tissue culture tests and DNA analysis techniques to identify resistant germplasm. We found that high oil corn hybrids are more susceptible to aflatoxin-producing organisms than normal hybrids, but that resistance sources developed in this project can be used to produce resistant high oil corn. We showed that fungicides decrease A. pavus growth in stored grain. Procedures for this are still awaiting approval by EPA. The project continues to generate important papers in scientific journals. The papers provide valuable information on both practical and basic science issues associated with aflatoxin.

In a landmark achievement, we introduced antifungal genes bean chitinase and B–1,3-gluconase from other organisms into corn cells and successfully regenerated plants that have these genes. We found that the introduced genes are stable, passed to progeny during normal reproduction, and expressed in seeds. We still need to screen more germplasm for resistance sources. Natural resistance genes tend to work for a while and then become less effective as the pests evolve new virulence mechanisms. We still have to broaden the base of inbred lines that will be used to introduce aflatoxin resistance into commercial varieties grown in the major corn growing regions of the nation. Our goal is to insert new resistance genes that can be moved rapidly into commercially used inbreds and that are effective in reducing and eliminating other mycotoxins as well.

We respectfully request an allocation of $180,000 in federal funds for fiscal year 2000 to continue this Important project. This amount will allow us to maintain the momentum and productivity of this innovative aflatoxin research program and capitalize on the progress made to date.

PREPARED STATEMENT OF THE UNIVERSITY OF MIAMI

Mr. Chairman and Members of the Subcommittee, I appreciate the opportunity to present testimony on behalf of the University of Miami. The University is seeking your support for a vital initiative within your purview, the Florida Center for Climate Prediction. It is our belief, Mr. Chairman, that technological advances in climate prediction can save the nation's downtrodden farmers from financial crises.

On March 16, 1999, Federal Reserve Chairman Alan Greenspan reported that the nation's farm downturn can be traced to an important degree to the recessions that began in East Asia in 1997 and have since spread to Latin America and elsewhere. However, Mr. Greenspan cited technological improvements as vitally important for insulating U.S. agriculture from the worse effects of world-wide economic turmoil.

The Florida Consortium for Climate Prediction, a joint project of the University of Miami, the University of Florida, Florida State University brings to bear the latest climate prediction technology, which can provide the nation's farmers with predictive information to help maintain stable agricultural production.

This major collaborative program focuses on climate variability in Florida, the southeast region and beyond. Objectives include developing scientific applications for climate data. The Florida Consortium draws upon the expertise of scientists at Florida State University (climate analyses and coupled ocean-atmosphere prediction models), Miami (climate analyses and economic value forecasts) and the University of Florida (agriculture) to quantify climate variability (e.g. El Nino) for the southeast and to explore the potential value and practical application (with strong emphasis on agricultural issues) of climate forecasts.

The importance of El Nino South Oscillation (ENSO) events as a major source of climate fluctuations, together with advances in ENSO predictability, suggest that forecasts have significant potential for benefiting agricultural productivity and economic decision-making.

The geographic focus of this project will include the southeastern United States, a large food producer whose productivity is significantly impacted by weather conditions generated by the ENSO phenomenon. Decisions made by well-informed participants from farm to policy level, made several months or seasons in advance, can significantly benefit productivity.

This project presents an end-on-end approach that will provide the bridge between climate and forecast producers, such as the International Research Institute for Climate Prediction (IRICP) and agricultural decision-makers. Specific objectives of the project are to: (1) adapt, develop, and evaluate a generic, flexible set of tools and methodologies for assessing regional agricultural consequences of El Nino events and for applying forecasts to improve agricultural decision-making; (2) demonstrate by successful applications of forecasts to agriculture and other sectors that would benefit best in the southeastern United States that began in 1996; and assess the value of climate predictions to different agricultural sectors in those southeastern regions.

As an example, during the initial phases of this effort, the team focused on temperature and precipitation patterns across the southeast. At Florida State, for example, researchers found a geographic shift in tornadic activity associated with El Nino events. A new climate forecast system to provide predictions of seasonal temperatures and precipitation with longer lead times and improved skill is in the testing phase. Improvements are due party to the coupled nature (i.e., linking the ocean and atmosphere so they respond to one another dynamically) of the forecast system. Our colleagues at the University of Florida identified several crops in Florida that are vulnerable to shifts in weather patterns associated with El Nino and La Nina, but noted further that the impact is not uniform across the state

In continuing this collaboration, we plan to estimate the economic advantages that could be achieved by incorporating climate forecast information into farming management systems and eventually work with sector representatives in developing guidance products for the agricultural community. NOAA and NASA have provided initial funding.

Mr. Chairman, for fiscal year 2000, we seek $4 million from the Agriculture Appropriations Subcommittee through the Department of Agriculture to continue and expand this critical work for the agricultural community.

Mr. Chairman, we understand how difficult year this will be for you and the Subcommittee. However, we respectfully request that you give serious consideration to this vital initiative. It has great implications and will provide exceptional benefits to the well-being of the nation.

PREPARED STATEMENT OF THE U.S. MARINE SHRIMP FARMING PROGRAM

Mr. Chairman, I am pleased to have the opportunity to provide the Committee with an overview of the activities of the U.S. Marine Shrimp Farming Program.

This integrated multi-state research program continues to develop and transfer technologies, products and services necessary for domestic shrimp farming to become competitive in the world market. The long-term goals are to partially offset the annual $2.5 billion trade deficit, significantly expand the domestic shrimp industry, create new opportunities for U.S. agriculture, and forge new markets for U.S. grain products and technology services.

Success in the United States requires high rate, high yield, and high product quality production systems that are both environmentally and economically sustainable. The United States is a world leader and highly competitive in terrestrial animal production systems. However, because no such integrated production system exists for marine shrimp, this program undertook the task of developing a world competitive shrimp production system, technology-by-technology and product-by-product. The U.S. Marine Shrimp Farming Program, supported by this Committee since 1985, undertook the development of high tech processes, products, and services designed to make U.S. shrimp farmers competitive in the world market.

The Consortium enlisted the participation of top scientists, their institutions and states, the cooperation of the fledgling industry, and participation of government scientists and administrators, to undertake narrowly-focused and results-oriented projects, and to provide a sound scientific basis for industry expansion. Its approach is based on financial accountability and minimal bureaucratic constraint. The Program has been administered by CSREES/USDA, which provides oversight and conducts periodic review by independent scientific panels.

The obstacles to be overcome by new technologies and products, in order to underpin a competitive advantage for U.S. farmers, were formidable. Worldwide, shrimp farming practices are primitive as compared to modern animal husbandry stand-

ards. They depend on catching wild shrimp stocks, have little regard for the environmental consequences of their actions, use drugs and chemicals indiscriminately, and contribute to the spread of shrimp diseases with their products; this approach has often been referred to as "rape and run." These practices, while low-cost in the short-run, are not sustainable environmentally or economically in the long-run. Currently, world wide producers are experiencing increasing shrimp mortalities, lower quality product, and lower profits. These world wide problems open a substantial opportunity for U.S. exploitation of the technologies and products developed by the Consortium.

To date, the program has:

—established the world's first captive populations of high health shrimp stocks and the world's first breeding and genetic selection program for marine shrimp

—completed pioneering research and development in advanced molecular diagnostic tools for disease screening and control;

—described the etiology of shrimp diseases associated with viral pathogens;

—supported members of the U.S. American Processors Association in protecting receiving waters from the introduction of viral pathogens;

—played a lead role in the Joint Subcommittee on Aquaculture's efforts to assess the threat of foreign viral pathogens;

—supplied the U.S. industry with genetically improved and disease resistant shrimp stocks;

—developed small-scale high technology biosecure shrimp production systems to protect both cultured and wild stocks from disease

—developed new feed formulations to minimize waste generation.

These accomplishments are encouraging. The advances in these fundamental areas have provided the foundation for achieving the overall goal. The Consortium is in the process of integrating these advances into practical shrimp farming systems. USMSFP supports both industry and research. We are in the process of integrating these advances into working shrimp farming systems for demonstration purposes. The industry does not yet have the technology package and remains dependent upon the Consortium for critical products and services.

Abrupt loss of Consortium support would cut the existing industry off at the knees and preclude completion of this important work. In anticipation of near-term technology transfer, we are encouraging the industry to establish its own breeding program and disease control operations. The risks, however, are as yet too high to encourage the movement of investment capital. We are making substantial progress toward increasing profitability and reducing risk.

Mr. Chairman, it is envisioned that the United States, with the best animal feed grains in the world, will become a non-polluting producer and major competitor in the shrimp farming world. Superior technologies, products, and services will deliver higher quality and lower cost shrimp products to the nation and to the world.

The Consortium receives substantial support and encouragement from CSREES/USDA. They have suggested that this is a model program for resolving important problems and capturing opportunities in both agriculture and aquaculture. Such sentiments have been repeatedly expressed by independent scientific review teams in 1988, 1991, and 1995.

Exceptional research and development progress in the last several years, coupled with severe difficulties experienced by domestic shrimp farmers, form the basis of a request for an increase in funding from $3.354 million to $5 million. The additional resources would be directed to accelerate the transfer of high technology biosecure systems to the commercial industry, to assist the industry in retro-fitting existing production systems, and to strengthen research in biosecurity and disease control technologies.

PREPARED STATEMENT OF THE UNIVERSITY OF SOUTHERN MISSISSIPPI

Mr. Chairman, distinguished Members of the Subcommittee, I would like to thank you for this opportunity to provide testimony describing ongoing research and commercializing efforts of The University of Southern Mississippi (USM) and the Mississippi Polymer Institute. I am very grateful to the Subcommittee for its leadership and the support of the Institute and its work. This testimony will include an update on the progress of the Institute since my testimony of approximately one year ago. During the past year, our efforts have primarily focused on two commercialization thrusts; one arising from novel inventions of our emulsion polymerization team and the other to produce a commercially viable, formaldehyde free, soybean derived adhesive for a variety of composite board materials, i.e., particle board or oriented strand board (OSB). During the past year, we have continued to exploit the opportu-

nities offered by these novel materials and continue to be optimistic about their commercial fate. I will discuss the two inventions separately in order to offer more clarity. In the case of castor or soya oil we have designed and synthesized novel monomers or polymer building blocks that offer state-of-the-art technology. The attributes of the technology includes odor free, solvent free, non-polluting latex coatings. The technology offers for the first time, solventless emulsion technology based on an agricultural material. By contrast, contemporary latex coatings contain upwards of 1500 grams of VOC/gallon. Moreover, it is a technology that if practiced would allow the governmental regulatory agencies to tighten the restrictions on volatile organic content (VOC) emissions of applied coatings. I intend to share details of this novel and patented technology with the Environmental Protection Agency so that they can, if they wish, make an independent evaluation to confirm its suitability and efficacy. Much of the fundamental scientific principles regarding its mode of action have been confirmed, yet additional data must be collected. In particular, we believe this technology can be employed in light industrial and original equipment manufacture (OEM) industrial coatings as well as architectural coatings, and confirmation of these concepts is a priority in future work. The second and critically important objective is to secure manufacturing facilities for commercial production of the new material(s). We are currently in negotiations with parties who have expressed interest in manufacturing the novel emulsion monomers. We must secure a manufacturer during the 1999–2000 period if this technology is to be successful. For instance, we have provided samples to our industrial partners from samples prepared in our laboratory. However, requests for the novel material are far too great to continue this practice, and one industrial client has expressed interest in purchasing this monomer in the third or fourth quarter of 1999.

Furthermore, the uniqueness of this technology has been confirmed in industry, and at least one participating polymer manufacturing firm is sampling materials they have produced utilizing our novel technology. Therefore, we believe that the time when industrial firms will seek production quantities of the novel monomer is drawing closer, and we must be prepared to meet their needs. This is indeed an exciting time as we see the fruition of our efforts and your support coming to the conclusion we desire; i.e., the commercial production and sale of novel ag based materials to the polymer industry.

In yet another of our novel ag based technologies, we have developed formaldehyde-free adhesives for use in the composites industry, specifically for particle board and oriented strand board. The new adhesives are composed of more than 98 percent agricultural products and are comparable in properties with traditional formaldehyde adhesives. Formaldehyde emissions are regulated as formaldehyde is considered a potential cancer producing agent. Consequently, there is a move afoot to remove formaldehyde from articles of commerce.

In 1983, the Mississippi Legislature authorized the Polymer Institute at USM to work closely with emerging industries and other existing polymer-related industries to assist with research, problem-solving, and commercializing efforts. During the past year, seventeen new polymer-related industries have located in Mississippi. In particular, during the past four years Sunbeam-Oster, Dickten and Masch, Wellman, and Kohler have constructed facilities approaching a cost of 1.4 billion dollars and each has commented on polymer science and engineering as a significant factor in their decision to locate near to The University of Southern Mississippi and the Mississippi Polymer Institute.

The Institute provides industry and government with applied or focused research, development support, and other commercializing assistance. This effort complements existing strong ties with industry and government involving exchange of information and improved employment opportunities for USE graduates. Most importantly, through basic and applied research coupled with developmental and commercializing efforts of the Institute, the Department of Polymer Science continues to address national needs of high priority.

The focus of my work is commercialization of alternative agricultural crops in the polymer industry. This approach offers an array of opportunities for agriculture as the polymer industry is the largest segment of the chemical products industry in the world, and heretofore has been highly dependent upon petroleum utilization. However, my efforts are directed to the development of agricultural derived materials that will improve our nation's environment and reduce our dependence on imported petroleum. As farm products meet the industrial needs of the American society, rural America is the benefactor. Heretofore, this movement to utilize alternative agricultural products as industrial raw materials has received some attention but much less than opportunities warrant. Your decisions are crucial to the accomplishment of these goals as funding from this Subcommittee has enabled us to implement and maintain an active group of university-based polymer scientists whose energies

are devoted to commercializing alternative crops. We are most grateful to you for this support and ask for your continued commitment.

The faculty, the University, and the State of Mississippi are strongly supportive of the Mississippi Polymer Institute and its close ties with industry. Most faculty maintain at least one industrial contract as an important part of extramural research efforts.

Polymers, which include fibers, plastics, composites, coatings, adhesives, inks, and elastomers, play a key role in the materials industry. They are used in a wide range of industries including textiles, aerospace, automotive, packaging, construction, medical prosthesis, and health care. In the aerospace and automotive applications, reduced weight and high strength make them increasingly important as fuel savers. Their non-metallic character and design potentials support their use for many national defense purposes. Moreover, select polymers are possible substitutes for so-called strategic materials, some of which come from potentially unreliable sources.

As a polymer scientist, I am intrigued by the vast opportunities offered by American agriculture. As a professor, however, I continue to be disappointed that few of our science and business students receive training in the polymer-agricultural discipline as it offers enormous potential. The University of Southern Mississippi and the Mississippi Polymer Institute are attempting to make a difference by showing others what can be accomplished if appropriate time, energy, and resources are devoted to the understanding of ag based products.

I became involved in the polymer field 33 years ago and since that time, have watched its evolution where almost each new product utilization offered the opportunity for many more. Although polymer science as a discipline has experienced expansion and a degree of public acceptance, alternative agricultural materials are an under-utilized national treasure for the polymer industry. Moreover, there is less acceptance of petroleum derived materials today than ever before and consequently the timing is ideal for agricultural materials to make significant inroads as environmentally friendly, biodegradable, and renewable raw materials. These agricultural materials have always been available for our use, yet society for many reasons, has not recognized their potential. The following examples are included and represent opportunities other than those already described which supports this tenet:

—A waterborne, waterproofer has been designed and formulated with the help of several natural products. The material functions as a waterproofer yet is carried in water. However, after application to the intended substrate, typically wood or cementous products, the material becomes hydrophobic and highly water resistant. We have collected two and one-half years of exposure data on this product with excellent success. It is currently being marketed via Southern Chemical Formulators of Mobile, AL. The distribution of this material has been slowed as the result of a fire at Southern Chemical Formulators that destroyed production facilities.

—A new, multi-functional polymer additive was designed, synthesized, tested, and submitted to the patent office. The patent office has approved the issuance of a patent entitled, "Novel Multi-Functional Surface Active Agents, Syntheses and Applications Thereof," U.S. patent No. 5,807,922; the patent was issued on Sept. 15, 1998. The product is currently being evaluated by the Hanson Company as a potential commercial product. It is a highly efficient, multi-faceted additive that functions as a dispersant, a defoamer, an adhesion promoter, a gloss enhancer, and corrosion inhibiting species. It is derived from an agricultural raw material and is very novel in its performance and applications. If the Hanson Company is unsuccessful in its utility, we will continue commercialization efforts from these laboratories.

—We have exploited the potential of lesquerella, a crop that produces a triglyceride similar to castor oil. Several high performance products have been prepared and include polyesters, stains, foams, pressure sensitive adhesives, and 100 percent solid ultraviolet (W) coatings. This technology was highlighted at the AARC/NASDA meeting in Washington, DC.

—Novel open cell foams have been designed and prepared from lesquerella and/or castor oil. They are of high quality and can substitute for foams used extensively in industrial settings.

Lesquerella derived foams possess commercial viability yet the supply of lesquerella is currently not of the size that can support a high volume use. For instance, if lesquerella were accepted as a raw material for foam manufacture alone, huge quantities of oil would be consumed. The decision is now with the farm community as to whether or not to include lesquerella in their farm land rotation sequence. Our work has shown it to be a viable commercial crop with several significant potential uses and that was our goal. Consequently, we will concentrate our work in other areas with other ag crops.

U.S. agriculture has made the transition from the farm fields to the kitchen tables, but America's industrial community continues to be frightfully slow in adopting ag based industrial materials. Let us aggressively pursue this opportunity and in doing so:

—Intensify U.S. efforts to commercialize alternative crops.
—Reduce U.S. reliance on imported petroleum.
—Maintain a healthy and prosperous farm economy.
—Foster new cooperative opportunities between American farmers and American industry.

Mr. Chairman, your leadership and support are deeply appreciated by the entire University of Southern Mississippi community. While I can greatly appreciate the financial restraints facing your Subcommittee, I feel confident that further support of the Mississippi Polymer Institute will continue dividends of increasing commercialization opportunities of agricultural materials in American industry. Advances in polymer research are crucial to food, transportation, housing, and defense industries. Our work has clearly established the value of ag products as industrial raw materials; however, while these are but a limited number of applications, our success confirms that it is time to move to yet another level of effort. Thus, we respectfully request $1.2 million in federal funding to exploit the potentials of commercializing alternative agricultural materials and to continue our initiatives. Thank you Mr. Chairman and Members of the Subcommittee for your support and consideration.

PREPARED STATEMENT OF THE UPPER MISSISSIPPI RIVER BASIN ASSOCIATION

The Upper Mississippi River Basin Association (UMRBA) is the organization created 18 years ago by the Governors of Illinois, Iowa, Minnesota, Missouri, and Wisconsin to serve as a forum for coordinating the five states' river-related programs and policies and for collaborating with federal agencies on regional water resource issues. As such, the UMRBA has an interest in the budget for the U.S. Department of Agriculture's conservation programs and technical assistance.

Of particular concern to the UMRBA is funding for the Conservation Reserve Program (CRP), Wetlands Reserve Program (WRP), and Environmental Quality Incentives Program (EQIP). Taken together, these three Commodity Credit Corporation-funded programs provide an invaluable means for the USDA to work with landowners, local conservation districts, and the states to ensure that agricultural productivity is maintained while protecting the nation's soil and water resources. As stewards of some of the nation's most productive agricultural lands and important water resources, the five states of the Upper Mississippi River Basin believe these programs are vital. Strong farmer interest and state support demonstrate the region's commitment to the objectives of these programs. In 1998, state, local, and private entities matched every dollar of NRCS investment in the five states with an additional $0.80. Illinois and Minnesota are among the first states nationwide to commit to significantly increased state funding of conservation measures through the Conservation Reserve Enhancement Program (CREP). These CREP initiatives will be focused on the watersheds of the Illinois and Minnesota Rivers, both of which are important tributaries to the Upper Mississippi.

The President's fiscal year 2000 budget proposal includes essentially flat funding of $1.596 billion for the CRP, which the Administration estimates would be sufficient for the program to reach its full authorized acreage of 36.4 million acres by 2002. The Natural Resources Conservation Service (NRCS) estimates that the President's $209 million proposal for the WRP would bring that program to its 975,000-acre enrollment cap by the end of 2000. The Administration's proposed $126 million increase for EQIP, which would bring the program's total in fiscal year 2000 to $300 million, includes important funding to increase financial assistance available to the operators of animal feeding operations. The CRP, WRP, and EQIP have demonstrated their effectiveness and garnered strong support from state, local, and landowner partners. Thus, the UMRBA believes it is essential to place priority on providing adequate resources to these three important programs.

The UMRBA is also concerned with the adequacy of funding and staffing levels in the NRCS' conservation operations account. The technical assistance funded through conservation operations provides the foundation for the USDA's voluntary conservation planning. The President has proposed increasing conservation technical assistance by $37 million to $585 million in fiscal year 2000. This funding increase is certainly a move in the right direction. However, it would be coupled with an estimated net reduction of 1,055 staff people, most of whom would come from field offices. These are the very employees that NRCS relies upon to deliver vital

technical assistance to landowners. With this reduction, the overall cut in NRCS staff since 1993 would reach almost 19 percent. Reports from the field indicate that these reductions are beginning to take a toll, with the NRCS increasingly unable to provide the timely, comprehensive technical assistance that farmers need if they are to participate effectively in the USDA's conservation programs. A 1998 National Workload Analysis indicated that the NRCS may need as many as 4,000 employees at the field level in the Midwest. At the time, actual field staff in the Midwest numbered fewer than 2,500. The UMRBA urges Congress to ensure that the NRCS has both the staff and funding necessary to deliver its conservation programs effectively.

The five states of the UMRBA acknowledge that our region faces enormous soil and water conservation needs and limited public and private resources to address the problem. In this context, it is imperative that NRCS work with the states, conservation districts, and farmers to identify and target the most pressing problems. Coordination and communication with the states is particularly critical to success in addressing the interstate resource challenges faced by the Upper Mississippi River. Success in addressing such complex, large-scale issues will not come quickly. It will require long-range thinking and commitment over time from all levels of government and from farmers. The states look to both Congress and the Administration to join them in providing such leadership.

PREPARED STATEMENT OF THE USA RICE FEDERATION

The USA Rice Federation wishes to submit the following comments regarding the fiscal year 2000 appropriation bill for the Department of Agriculture. The USA Rice Federation represents producers of approximately 80 percent of the rice grown in the United States and practically all U.S. millers of rice as well as allied industries.

Background.—The national farm economy is in a period of financial stress with low prices, record supplies, and weak exports. The rice economy is no exception. Production currently is estimated to increase this year to 188 million cwt., up 3 percent from last year and will be the second largest crop on record. Exports are not expected to keep pace with production, leading USDA to estimate that ending stocks will be 44 percent higher than a year ago resulting in the highest stocks to use ratio since 1994/95. Rough rice sales to Latin America, one of our principal markets, are likely to be adversely affected by economic problems there, and the global long grain milled market will be very competitive, particularly with lower priced rice from Thailand and Vietnam. Prices have been falling steadily, and are expected to continue. It may well be that for the first time in many years payments under the marketing loan program will be triggered.

Export Programs.—(a) Public Law 480. With this as a background, the rice industry calls upon the appropriations committee to ensure that the export programs are fully funded for fiscal year 2000. To this end, we earnestly request that the appropriation for the Public Law 480 program be maintained at not less than the appropriation of $220 million for the current year, and not be allowed to drop as has been recommended by the Administration. In the current fiscal year the title I, Public Law 480 program was funded at a level of $220 million and was supplemented by the Secretary making an emergency transfer of $850 million from Commodity Credit Corporation to fund a title I agreement with Russia. The Secretary found this necessary despite the Administration having earlier recommended a 50 percent cut in the fiscal year 1999 appropriation. It is hard to understand why in the light of the distressed farm economy, the Administration would wish to reduce the appropriation for title I to $150 million and eliminate entirely the appropriation for title III of $25 million. The outlook for agriculture in fiscal year 2000 is no better than current conditions, and if anything, would justify an increase from the currently appropriated amount.

As you know, in programming sales under title I, priority is given to those developing countries which have demonstrated the potential to become commercial markets and are undertaking measures to improve their food security and demonstrate the greatest need for food. Title I has had a brilliant history in opening the doors for commercial sales as the recipient countries improve their economies. It should not be short-changed.

(b) Market Access and Foreign Market Development Programs. There are other important programs that assist in opening markets for U.S. agricultural products including rice. These include the market access program which is funded at a level of $90 million and the foreign market development program (FMD) program, often called the cooperator program, in which the rice industry and other cooperators provide cost sharing of at least an equal amount in carrying out market promotion activities overseas. These have been successful programs and should be fully funded.

Accordingly, we ask that the MAP program not be cut back and the FMD program continue to be funded at the prior year's level of $30 million.

Research.—Another area of great interest to the rice industry lies with the research activities of USDA. We support the increased funding that is recommended by USDA for the Agricultural Research Service and the Cooperative State Research, Education and Extension Service. We request that the appropriation for research at the Dale Bumpers National Rice Research Center at Stuttgart, Arkansas, be increased from last year's level by $500,000. This would enable the Center to hire the researchers needed to carry out the important work of developing germplasm which would be made available to plant breeders in the United States. The germplasm would be used to develop plant varieties to meet the demands of consumers of all kinds both here in the United States and elsewhere in the world, thereby improving markets for U.S. rice.

In addition, in the funding of the Cooperative State Research and Education and Extension Service (CSREES), the Administration has proposed an increase for competitive projects that would be offset by decreases in formula funds under the Hatch Act and related legislation and by decreases in non-competitive projects. We object to any reduction in the formula funds as this would adversely impact the land grant universities and state experiment stations where so much significant agricultural research including research of benefit to the rice industry, is being conducted. We would not object to an increase in funding of competitive grants, but not at the expense of the formula funds.

Animal Damage Control.—The USA Rice Federation also requests that the appropriation for wildlife service operations and research be continued at the same level as in the current year. This appropriation helps fund new and improved methods for reducing damage to the southern rice crop from the depredations of blackbirds that engulf the area each spring. Among other things, the appropriation for the APHIS National Wildlife Research Center is used for research on new non-lethal bird repellents for preventing blackbird damage to sprouting and ripening rice and for a more effective formulation for an EPA registered chemical. A reduction in either this appropriation or the appropriation for wildlife service operations would adversely affect these efforts.

We appreciate the opportunity to submit these comments for the consideration of the Subcommittee. If you should have any questions or would like us to amplify our remarks in any way, please let us know.

PREPARED STATEMENT OF THE U.S. AGRICULTURAL EXPORT DEVELOPMENT COUNCIL

Strong support for exports must be part of the "safety net" for the American farmer. Increasing exports is a significant tool to improve the lives of America's farmers and producers of USA agricultural products while improving our balance of trade and increasing receipts to the Treasury. Well-funded export programs must become a top priority for this Congress. Therefore, the U.S. Agricultural Export Development Council (USAEDC) respectfully but emphatically urges this subcommittee and Congress to strongly support export promotion programs in the U.S. Department of Agriculture's (USDA) fiscal year 2000 budget. Specifically, this shall include: a Foreign Market Development Cooperator program at a level which would allow FAS to approve marketing plans at historic levels, and within the FAS authorization; a Market Access Program at $200 million; and a strong USDA Foreign Agricultural Service at least at no less than last year's budget level.

A few years ago USA agricultural exports reached record levels. Unfortunately, the current downturn in many foreign economies has made it very difficult today to simply maintain markets for USA agricultural exports let alone expand them. Since the downturn, there are additional and significant hurdles to the pre-existing import tariffs and often-unjustifiable sanitary and phytosanitary barriers. These additional hurdles include the rise of the U.S. dollar against foreign currencies, foreign consumers' bias toward "buying domestic" to help their own producers, and increased production from our major competitors (e.g., the European Union, Canada, Australia). USA agricultural products are facing more competition than ever, especially in markets where there are fewer foreign consumers willing to consider buying USA agricultural products. Given these factors, it behooves Congress to fund an aggressive export promotion package for America's USA agricultural products to have a fighting chance to maintain and grow foreign markets for our agricultural products.

Chief within this export promotion package should be substantial and adequate funding for the Foreign Market Development Cooperator program (FMD), the Market Access Program (MAP), and USDA's Foreign Agricultural Service (FAS) which

administers these programs. As you may know, the FMD program is most often focused on maintaining foreign markets while working on long-term changes to a market's infrastructure to allow for increased USA agricultural exports. The MAP program is most often focused on increasing export levels in the near term, especially for USA agricultural exports that are purchased directly by consumers. Funding for both programs is awarded annually on a competitive basis to (1) not-for-profit USA trade organizations that represent specific sectors of American agriculture, (2) farmer cooperatives, and (3) small businesses within the USA agriculture and food industries. The vast majority of marketing is generic in nature with any branded programs being run by small businesses (less than 1,000 employees) that are most often new to the export market.

THERE ARE 5 IMPORTANT POINTS TO REMEMBER ABOUT FMD AND MAP

First, the FMD and MAP programs are cost effective.—Funds are awarded on a competitive basis via a meaningful formula developed by FAS which takes into consideration export potential, experience with managing export programs, as well as industry contributions. This process helps ensure that U.S. taxpayers' money is being invested in the agricultural sector and organization with the highest chance of success. Second, every organization that participates in either the FMD or MAP program must contribute its own resources to these programs. Thus, U.S. Government expenditures actually leverage more resources for foreign market promotion than American agriculture would be able to accomplish with only private sector funds. In addition, many of the small companies helped by the MAP branded program note that they often would not be able to have gained entry into the export market were it not for this program. The tables below show that for the last completed program year, American agriculture contributed the highest amount of their own money relative to the amount made available by FAS.

FOREIGN MARKET DEVELOPMENT/COOPERATOR PROGRAM ONLY

Program Year	Private-sector MAP annual expenditure	Public-sector MAP annual expenditure	Percent of private to public MAP dollars
1994	$38,275,000	$30,051,000	127.4
1995	40,675,000	31,199,000	130.4
1996	37,544,000	28,807,000	130.3
1997	47,203,000	28,986,000	162.8
1998	43,972,000	26,505,000	165.9
5 yr. average	41,534,000	29,110,000	142.7

MARKET ACCESS PROGRAM ONLY

Program Year	Private-sector FMD annual expenditure	Public-sector FMD annual expenditure	Percent of private to public FMD dollars
1993	$146,994,000	$154,372,000	95.2
1994	112,756,000	115,756,000	97.4
1995	89,179,000	106,353,000	83.9
1996	80,190,000	93,585,000	85.7
1997	101,208,000	97,549,000	103.8
5 yr. average	106,065,000	113,523,000	93.4

Source: USDA/Foreign Agricultural Service, Marketing Operations Staff.

Second, the FMD and MAP programs increase exports of USA agricultural products.—USAEDC posts on the Internet (www.usaedc.org/exports/industries.html) examples of the progress these programs make in increasing sales of USA agricultural products. A few examples follow:

A. Texas Grapefruit Exports to Canada—Texas Produce Export Association (TPEA)

Key Strategies

Meetings held on a continuous basis with the trade (importers, distributors and retailers) by TPEA's in-country representative have resulted in acceptance of the fruit. Promoting Texas red grapefruit with selected retail store groups interested in a niche market product that stands apart from other grapefruit and stressing the unique color and sweet taste has convinced consumers to purchase.

MAP activities assisted the Texas grapefruit industry to increase exports to Canada by 32.5 percent over the 1996/97 season and the outlook for 1998/99 shipments is very favorable for continued increases. A major success has been achieved in the province of Ontario, which historically has not been considered a Texas market—exports in 1997/98 grew by 37.7 percent over the prior year. TPEA shipped 430,099 cartons (7,819.9 MT) of grapefruit to Canada in 1997/98.

Texas Grapefruit Exports' Impact on Local Economy

Increasing the export of Texas grapefruit definitely helps to provide a better profit level to growers. Faced with a world wide oversupply situation, many growers are going out of business, or just barely hanging on, because of continuing depressed prices. Exports help to stabilize the Texas citrus industry, which directly employs about 3,000 workers. Without the MAP program, the industry would have difficulty expanding the market base and many of these jobs would be in jeopardy. There are approximately 750 commercial citrus growers and 16 registered shippers. Total citrus production is approximately 36,313 acres.

In season year 1997, more than 13,235 metric tons of Texas red grapefruit were shipped overseas to MAP targeted countries of which 7,819.9 metric tons were exported to Canada for a value of $3 million, up 69.4 percent from 1994/95 when TPEA first started promoting in Canada.

B. U.S. Farm-Raised Catfish Exports to Germany—The Catfish Institute (TCI)

Key Strategies

Using MAP funds, TCI joined forces with Aramark, the leading food service supplier in Germany and the world, to promote U.S. farm-raised catfish. In a promotion held at the beginning of September 1998, U.S. catfish took center stage in 340 Aramark corporate canteens. From north to south and east to west, this one-week promotion transported diners to the U.S. South for a variety of imaginative dishes. In preparation for the event, TCI held seminars for Aramark's canteen managers on the correct preparation of the fish. Over three thousand diners tasted "Mark Twain" catfish sandwiches and American Garlic Catfish with Tomatoes and Courgettes as well as several other recipes. The results speak for themselves. Aramark sold over 15 tons of catfish, double the amount originally planned. TCI promotional materials decorated all of the canteens with chefs and servers wearing caps and t-shirts featuring the TCI logo, "Der Amerikanische Wels."

U.S. farm-raised catfish faces an 8 percent import tariff, high transportation costs, a constantly strengthening dollar which puts its fish in the same price category as turbot, considered the premium fish by German consumers and trade, plus exacting calibration standards of every filet weighing exactly the same. Germany's fish trade continues to consolidate which also affects the overall market. Notwithstanding this situation, the German trade remains convinced of the quality of U.S. farm-raised catfish and repeat orders continue to be made.

Impact on U.S. Economy

Return to the U.S. economy from this industry is significant. The catfish industry provides 12,000 jobs in the Delta area of the mighty Mississippi, encompassing the states of Alabama, Arkansas, Louisiana and Mississippi. In a part of the U.S. where unemployment is high and income low, this industry employs over 8,000 individuals on a direct basis.

—Related industries such as feed mills, trucking equipment suppliers, packaging companies, steamship and airlines, etc., account for an additional 4,000 jobs.

—Not only does the catfish industry provide employment, it also leads the way in providing education for low-income workers by participating in the Welfare to Work program, which assists individuals graduate from welfare.

C. California Pistachio Exports to the United Kingdom—California Pistachio Commission

Key Strategies

The Commission's immediate move to provide the media and trade with positive messages about California pistachios following the September 1997 European Union ban on Iranian pistachios due to aflatoxin problems won praise and support from the British trade. This move turned the tide for the California industry and resulted in six of the major grocery chains now stocking pistachios from the Golden State up from only two the year before.

Exports are showing upward growth with 327 metric tons shipped in the first seven months of 1998 over 212 metric tons in 1997.

The Iranian government provides preferential treatment in exchange rates for pistachio exporters. That government also provides its pistachio producers with pref-

erential treatment for imported goods purchased with funds maintained out of the country from pistachio sales. Producers are also subsidized for the purchase of chemical fertilizers and pesticides. Using MAP funds, the California pistachio industry has now succeeded in displacing Iranian product in a number of key retail stores in the United Kingdom.

Impact on U.S. Economy

In 1986, U.S. pistachio exports were minuscule. Twelve years later, more than 40 percent of the industry's annual shipments are exported to countries around the world. Production is continually increasing with 174 million pounds harvested in 1997 and 195 million projected for 1998. This represents a phenomenal increase over the one and a one-half million pounds produced in 1986.

Exports translate into additional U.S. jobs and increased revenue for the economy and the U.S. Government. Benefits accrue not only to the industry itself, but pass through to the producers of packaging materials, equipment, fertilizers, transportation and nursery stock.

Third, the FMD and MAP programs help American agriculture overcome the effects of foreign unfair trade practices.—As noted in the pistachio example, USA agricultural exports often face subsidized or otherwise unfair competition from foreign products. It is simply impossible for American agriculture to combat the multitude of problems in the international marketplace on its own. For example, the European Union alone spent approximately $365 million in 1997 on export programs, far more than the total amount of USA private and public funding spent in support of the FMD and MAP programs. FAS is instrumental in monitoring such activities in foreign markets. (They make available their annual report via the Internet at www.fas.usda.gov/cmp/com-study/1997/comp97.html.)

Fourth, the FMD and MAP programs help keep USA agricultural exports strong. which in fiscal year 1997 supported almost 1 million American jobs.—These jobs were on the farm, ranch, in the forest, and on the water, as well as in transportation, processing, and other related industries. Every state and local economy in the Union has jobs that are dependent on healthy exports of USA agricultural products. (For a state-by-state listing of jobs supported by USA agricultural exports, as well as a listing of the top five agricultural commodities which generated these jobs, visit USAEDC's web site at www.usaedc.org/exports/states/indexall html.) The top ten states in fiscal year 1997 for jobs supported by USA agricultural exports, including wood products and fish, were:

1. California—122,500 jobs—$8.059 billion in ag exports
2. Iowa—63,000 jobs—$4.147 billion in ag exports
3. Illinois—57,600 jobs—$3.788 billion in ag exports
4. Nebraska—50,300 jobs—$3.308 billion in ag exports
5. Texas—49,900 jobs—$3.283 billion in ag exports
6. Washington—48,700 jobs—$3.201 billion in ag exports
7. Minnesota—42,300 jobs—$2.781 billion in ag exports
8. Kansas—40,300 jobs—$2.650 billion in ag exports
9. Arkansas—29,600 jobs—$1.948 billion in ag exports
10. Oregon—29,300 jobs—$1.926 billion in ag exports

Fifth, the FMD and MAP export effort is supported by American voters.—A 1996 national Election Day poll by Penn & Schoen found 75 percent of Americans surveyed support programs such as FMD and MAP to promote U.S. agricultural exports, counter subsidized foreign competition, strengthen farm income, and protect American jobs.

In conclusion, USA agricultural exports are vitally important to our local, regional, and national economies. At this time of dire need for America's farmers, ranchers, lumbermen, and fishermen, and all the jobs their work supports, we need to make sure programs like the Foreign Market Development Cooperator (FMD) program and the Market Access Program (MAP) are aggressively funded to increase foreign consumption of USA agricultural products. Given the state of the global economy, now is the time for an extra push in export promotion to ensure that whatever foreign money is available for imported food and agriculture is spent on the bounty of the United States of America.

PREPARED STATEMENT OF THE WESTERN RURAL TELEPHONE ASSOCIATION

SUMMARY OF REQUESTS

Program of Interest

Telecommunications lending programs administered by the Rural Utilities Service (RUS) of the U.S. Department of Agriculture.

Recommendation

WRTA supports loan levels for fiscal year 2000 at such amounts as they have been designated in the Agriculture Appropriations Act for fiscal year 1999 (Public Law 105–277, Sec. 101(a)) for hardship, treasury-cost, and guaranteed loan programs and the associated subsidy to support these loan programs. We also support the Rural Telephone Bank (RTB) loans in the amount proposed in the President's budget and the associated subsidy to fund this level. WRTA also supports the President's budget request for funding of the RUS's Distance Learning and Telemedicine (DLT) programs at $20 million in grants and $200 million in loan authority. WRTA supports a continuation of the current fiscal year's policy of language removing the 7 percent interest rate ceiling on Treasury-cost loans for fiscal year 1998. WRTA supports the continued provisions contained in Public Law 105–277 restricting retirement of RTB class A stock in fiscal year 2000 and prohibiting the transfer of RTB funds to the general fund. Finally, we are opposed to the President's budget proposal to transfer funds from the unobligated balances of the liquidating account of the RTB for the bank's administrative expenses and loan subsidy costs.

Mr. Chairman and Members of the Subcommittee: It is an honor and privilege to have the opportunity to discuss the unique infrastructure financing needs of the rural local exchange carrier (LEC) industry. My name is Sam J. Maselli, and I am the Executive Vice President of the Western Rural Telephone Association (WRTA). WRTA is a regional trade association representing nearly 150 small rural commercial and cooperative telephone systems throughout the western United States and the Pacific Rim territories.

Background

WRTA's member systems, like most of this nation's independent LECs, evolved to serve the high cost, low density areas in the rural western United States. Congress recognized this unique dilemma confronting America's rural LECs as early as 1949 when it amended the Rural Electrification Act (RE Act) to create the REA telephone loan program. With the future of rural America in mind, Congress charged the REA with the responsibility for making low interest rate loans to both ". . . furnish and improve . . ." rural telephone service at the local exchange level.

In subsequent years, Congress has periodically acted to amend the RE Act to insure that the original mission of the program is fully met. In 1971, the Rural Telephone Bank (RTB) was created as a supplemental source of direct loan financing. In 1973, the REA was provided with the ability to guarantee Federal Financing Bank (FFB) and private lender notes. And in 1993, the Congress established a fourth lending component, the Treasury-cost program, and Congress eliminated most of the subsidy costs associated with the administration of the program. The formal consolidation of the Department's utility programs through transferring the telecommunications loan and technical assistance programs of the REA to the Rural Utilities Service (RUS) in 1994 further served to enhance and update the effectiveness of the agency in promoting rural infrastructure development.

Due to the difficulty of providing service in high cost, low density areas, Congress provided for long-term, fixed rate loans available at reasonable rates to borrowers to assure that rural citizens benefited from the highest quality of telephone service and affordable subscriber rates. Through this ongoing commitment to capital financing, Congress affirmed the goal of comparable and affordable telephone service for rural Americans as their urban counterparts.

As a result of this commitment to rural telecommunications, rural America has greatly benefited from the highest quality of information technology. Through its effort, Congress has played a critical role in developing a rural telecommunications infrastructure financing program which best responds to the needs of rural America.

The Obligations of the Industry Continue The RUS telecommunications loan program represents a remarkable public/private partnership success story which continues to produce tangible results in the lives of rural citizens. With the assistance of RUS capital and technical standards, rural telephone systems are providing modern telecommunications services of a highly sophisticated quality. However, with the rapid pace of change in the development of information technology, the need for RUS telecommunications lending is greater than ever.

Due to the nature of rural areas, particularly in the rural West, the challenge of providing modern telecommunications services is formidable. Compared to their urban counterparts, rural communities are faced with higher poverty rates, lower income levels, physical isolation and higher costs associated with deploying modern infrastructure. Economic development is often frustrated by these unique rural conditions. With the United States in the midst of the "information revolution," rural areas are confronted with the dilemma of being left behind.

The implementation of the Telecommunications Reform Act of 1996 has also added to the uncertainty and collective uneasiness of the rural telecommunications industry. Despite the Act's solid rural safeguard provisions, the Federal Communications Commission (FCC) has embarked in a regulatory direction which explicitly threatens rural ratepayers, services, and infrastructure investment.

Congress must keep a vigilant watch over the FCC to ensure that implementation of the Act is consistent with congressional intent. This is particularly true of RUS program borrowers where the federal government has a significant loan security interest at stake. Whatever the outcome of the regulatory process, the RUS telecommunications loan program will be as important as ever to rural systems attempting to modernize their networks and improve service to rural residents.

The Promise of the RUS Program

Despite the obstacles to rural economic revitalization, information technology holds significant promise for our rural areas. As we have seen in recent years, information services can directly benefit our schools, libraries, hospitals and clinics. In addition, telecommunications services facilitate commercial opportunities such as telemarketing, insurance, and manufacturing not possible in previous years.

While the explosive nature of technological change offers our rural communities genuine opportunities for economic and social progress, special attention must be placed on providing rural areas with the appropriate tools to address their unique set of needs. In this context, the RUS telecommunications loan program is playing a critical front-line role in ensuring that rural America is linked to the Information Superhighway.

Today, RUS borrowers average only 6 subscribers per mile compared to 37 per mile for the larger, urban-oriented telephone systems. This results in an average plant investment per subscriber that is 38 percent higher for RUS borrower systems. Without the availability of affordable capital financing, enhancing telecommunications networks for rural communities would be untenable.

The RUS is providing affordable capital financing to allow its borrowers to upgrade their plant and facilities for digital switching, fiber optic cabling, emergency 911, and other enhanced features such as ISDN, SS7, and CLASS. Due to the dependability of the RUS program, borrowers provide their rural subscribers with cutting edge services.

RUS telecommunications lending also performs a pivotal function of stimulating substantial private investment. In fact, RUS borrowers invest in telecommunications plant at a rate of $4.80 for every RUS dollar spent.

In addition, the RUS telecommunications program boasts a proud financial record probably unprecedented for federal loan programs. To date, the program has never experienced a borrower-related default in its history. At the end of 1997, $4.5 billion in principal and over $5 billion in interest had been paid by RUS borrowers. For nearly 49 years, this successful public/private partnership has worked.

In 1993, this partnership agreed to a $31 million cut in the name of debt reduction, and it agreed to a twelve year freeze in program loan levels while other programs grew by at least the rate of inflation. This partnership is committed to providing service to areas long neglected by others. Ultimately, this partnership will foster the rural information network of the 21st century.

Specific Recommendations for the Subcommittee's Consideration

RUS Telecommunications Loan Program

Increasing demands for expanded telecommunications services and infrastructure upgrades suggests that the level of need continues. Congressional mandates as a result of the Rural Electrification Restructuring Act (RELRA) of 1993 (Public Law 103–129) have placed additional obligations on RUS borrowers to upgrade their technology in order to maintain their loan eligibility. To address the persisting need, WRTA recommends that the Committee consider the following RUS Telecommunications Program loan levels for fiscal year 2000:

5 percent Hardship Loans	$75,000,000
Treasury-cost Loans	300,000,000
FFB Loan Guarantees	120,000,000

Rural Telephone Bank Loans	175,000,000
Total	670,000,000

These loan levels are the same as the current fiscal year's funding provided by Congress and represent a genuine commitment to rural telecommunications.

Removal of Interest Rate Ceiling on Treasury-cost Loans

WRTA supports language removing the 7 percent interest rate cap on the program's Treasury-cost loans. This provision was originally included in the Agriculture Appropriations Act for fiscal year 1996 and continued for the current fiscal year. The inclusion of this provision for fiscal year 2000 will prevent a potential disruption of the program in the case where interest rates exceed 7 percent and insufficient subsidy cannot support authorized loan levels. Stated simply, it is a continuation of current policy, and it promotes the viability of the program at zero cost.

Rural Telephone Bank (RTB) Issues

During the course of fiscal year 1996, the Rural Telephone Bank began the statutory retirement of class A, government-owned stock. WRTA supports the restriction on accelerating the privatization process as conceived beginning in fiscal year 1996 of no more than 5 percent of total class A stock retired in one year. We believe that a continuation of this policy best addresses the orderly and systematic privatization of the RTB. WRTA also urges the Committee to continue the prohibition against the transfer of bank funds to the general fund of the Treasury along with the requirement that the bank receive interest on those funds. The private B and C stockholders of the RTB have an interest in the assets of the bank and the protection of all funds.

For these reasons, WRTA is also opposed to the proposal contained in the President's budget that the costs of RTB administration and loan subsidy be funded by a transfer from the unobligated balances of the bank's liquidating account rather than by appropriations consistent with the federal credit reform act. WRTA believes that this proposal would impinge upon the ownership interests of the bank's stockholders.

In addition, we believe that funding the administrative costs of the bank through a transfer of unobligated balances of the bank's liquidating account rather than through appropriation is contrary to the RTB enabling act (Public Law 92–12). Budget language suggests that these recommendations would not result in budgetary savings, and no justification for this proposal is contained in the budget. Furthermore, this proposal would require new authorizing legislation prior to an appropriation.

Distance Learning and Telemedicine (DLT) Loans and Grants

The RUS Distance Learning and Telemedicine (DLT) program has proven to be a remarkable tool for promoting rural development. The DLT loan and grant program administered by the RUS significant promise for the deployment of modern technology for scores of our rural communities. WRTA supports the President's request for $200 million in loans delivered at the government's cost-of-money and $20 million in grants for DLT purposes. We believe that the proposed level adequately responds to the overwhelming demand for DLT resources since the implementation of the program by the RUS in 1993.

CONCLUSION

Access to advanced information services is a critical condition for future rural economic and social development. The RUS telecommunications program has proven to be an indispensable tool for rural America, and it continues to improve the nature of rural life in our nation, particularly in our isolated Western communities. Thank you.

PREPARED STATEMENT OF THE STATE OF WYOMING

This testimony supports fiscal year 2000 expenditures for the Department of Agriculture's Environmental Quality Incentives Program (EQIP) in the amount of $300,000,000 and requests that $12,000,000 be designated for the Colorado River Salinity Control Program.

This testimony supports fiscal year 2000 appropriations for the Department of Agriculture's Environmental Quality Incentives Program (EQIP) to carry out Colorado River salinity control activities. Testimony was recently submitted by the Colorado River Basin Salinity Control Forum (Forum), a seven-state organization created by

the Governors of the Colorado River Basin States, by the Forum's Executive Director, Jack Barnett. The State of Wyoming, a member state of the Forum, concurs in the Forum=s testimony.

Wyoming is represented on both the Colorado River Basin Salinity Control Forum and the Colorado River Basin Salinity Control Advisory Council. The 1974 Colorado River Basin Salinity Control Act (Public Law 93–320) created the Advisory Council. Like the Forum, the Advisory Council is composed of gubernatorial representatives of the seven Colorado River Basin states and serves as a liaison between the seven States and the Secretaries of the Interior and Agriculture and the Administrator of the Environmental Protection Agency (EPA). It advises these Federal officials and the involved agencies on the progress of efforts to control the salinity of the Colorado River and annually makes funding recommendations, including the amount believed necessary to be expended by the USDA for its on-farm Colorado River Salinity Control (CRSC) Program. The Forum's testimony is in accordance with the Advisory Council's written recommendations.

The Plan of Implementation and the numeric water quality criteria set for three Lower Colorado River stations constitute the State-adopted, EPA-approved, water quality standards for salinity the Colorado River. Jointly developed and revised each three years by the States and involved Federal agencies, the Plan of Implementation is being carried out to ensure continuing compliance with the numeric water quality criteria for salinity.

During its most recent October 1998 meeting, the Advisory Council recommended that at least $12,000,000 be expended by the Department of Agriculture for cost-sharing to implement salinity reduction practices (funds that are matched with individual contractor's cost-share funds) in fiscal year 2000, plus sufficient funds for administration, technical information and education, to assure that the Program's progress of removing salt and preventing additional salt loading into the Colorado River system stays on the schedule set forth within the Plan of Implementation. Should a lesser funding level be provided for this important basin-wide water quality program, the progress (as measured in tons of salt prevented from entering the Colorado River system) achieved by the USDA component of the multi-agency, state and federal Colorado River Basin Salinity Control Program will fall far short of meeting the rate of salinity control determined to be determined necessary to assure compliance with the basin-wide standards for salinity in the Colorado River. Failure to maintain the standards' numeric criteria could result in the imposition of state-line water quality standards (as opposed to the successful basin-wide approach that has been in place since 1975) and impair the Colorado River Basin States' ability to develop their Compact-apportioned water supplies. The present basin-wide salinity control program and its funding arrangements appropriately reflect that the primary beneficiaries of the basin-wide salinity control program are in the Lower Basin while the most cost-effective opportunities to reduce salt loading are upstream in the Upper Basin. Further, it is unmistakable that funding shortfalls will result in significantly higher costs to implement the same level of salinity control through the CRSC Program in future years.

The Federal Agriculture Improvement and Reform Act of 1996 (Public Law 104–127) provided for the CRSC Program to continue in the future—as a component part of the Environmental Quality Incentives Program (EQIP). We view the inclusion of the Salinity Control Program in EQIP as a direct recognition on the part of Congress of the Federal commitment to maintenance of the water quality standards for salinity in the Colorado River. The Secretary of Agriculture has a vital role in meeting that commitment. We urge the Subcommittee to remind the Secretary of Agriculture of his obligations under that Federal commitment as he makes decisions about national conservation priority areas and priority resource concerns. The intention of Public Law 104–127 is that the nation's agricultural programs be "locally led and driven" and we agree with that approach. Since the enactment of that law, however, the Salinity Control Program has not been funded at a level adequate to ensure that the water quality standards for salinity in the Colorado River can be maintained at or below the numeric criteria levels specified in the standard.

The Colorado River Basin States have urged the U.S. Department of Agriculture to designate the Colorado River Salinity Control Program as a national conservation priority area as provided for in the USDA's promulgated regulations for the EQIP. Although numerous requests have been made for this designation, the response has been that there is not adequate EQIP funding. An authorization for EQIP funding in the amount of an additional $100,000,000 in fiscal year 2000 above the $200,000,000-level minimum specified in Public Law 104–127 is both appropriate and needed.

I accordingly request that this committee support the borrowing of $300,000,000 from the Commodity Credit Corporation (CCC) in fiscal year 2000 for the EQIP Pro-

gram, and that the Congress advise the Administration to designate $12,000,000 of the EQIP funding for the Colorado River Basin Salinity Control Program. I thank you for the opportunity to submit this testimony and would request, in addition to your consideration of its contents, that you make it a part of the formal hearing record concerning fiscal year 2000 appropriations for the Department of Agriculture. In accordance with the Subcommittee's direction, I have submitted five copies of this statement.

PREPARED STATEMENT OF THE YUKON RIVER DRAINAGE FISHERIES ASSOCIATION

Requesting $1,000,000 to support marketing of Yukon River salmon to compete against foreign production of farmed and hatchery salmon.

ABSTRACT

The Yukon River Drainage Fisheries Association (YRDFA) seeks $1,000,000 in funding for development, marketing and promotion of Yukon River salmon products to compete against foreign production of farmed and hatchery salmon. Funds would be utilized by the Association over a multi-year period to market and promote Yukon River chinook, chum and coho salmon as well as value-added products and caviar. This funding would enable Yukon River salmon products to regain foreign and domestic market share lost to farmed and hatchery salmon produced and subsidized by such countries as Norway, Chile, Japan, Canada, and the U.K. Funds could be authorized through the Agricultural Marketing Service or the Trade Adjustment Assistance Act.

INTRODUCTION

The Yukon River Drainage Fisheries Association was formed in December 1990 and unites diverse groups of commercial, subsistence and sport users of salmon amongst the 42 communities along the river and its tributaries in Alaska. The YRDFA has a 16 member Board of Directors with seats apportioned amongst the various areas of the drainage. The Board operates on a consensus basis and works to craft workable cooperative solutions on a variety of regulatory, management and allocation issues.

The YRDFA'S YUKON RIVER SALMON Marketing Program began in January 1996 and has been funded through a variety of small grants (less than $40K each) administered by agencies of the State of Alaska. These include the Department of Community & Regional Affairs, the Department of Commerce & Economic Development and the Alaska Science & Technology Foundation. From its beginning through fiscal year 1999, YRDFA will have received only $121,534 over these last four years for its marketing program.

With these minimal funds YRDFA designed and implemented the basics of marketing program. Just as YRDFA unites the diverse commercial, subsistence and sport fishermen of the Yukon, its YUKON RIVER SALMON Marketing Program unifies all Yukon processors and all Yukon salmon product forms under one umbrella organization. YRDFA has made significant progress in developing name recognition for Yukon River salmon products and in developing market niches that demand Yukon River salmon. Specifically, YRDFA has: generated significant market demand amongst Seattle-area white tablecloth restaurants for Yukon River king salmon; generated market demand for Yukon River chum salmon in Pacific Northwest retail market; increased public and media familiarity with Yukon River salmon and its key attributes; high oil content and excellent meat color.

Unfortunately, neither YRDFA nor Yukon River processors have enough marketing funds to compete against the flood of foreign farmed and hatchery salmon in both the domestic and foreign marketplace. Major market share has already been lost especially in Europe, Japan and in the United States.

IMPACTS OF FOREIGN PRODUCTION OF FARMED AND HATCHERY SALMON ON U.S. HARVESTS AND PRODUCTION OF YUKON RIVER SALMON

Foreign farmed salmon

As Congress may be aware, the salmon market has changed dramatically over the last decade. Prior to 1990, Alaska produced the bulk of salmon harvested throughout the world and the farmed salmon industry was only just beginning. In just a few short years, however, farmed salmon began to dominate not only in terms of total production but also in manufacturing high-quality salmon products such as boneless fillets and portions. By 1997, farmed salmon had climbed to more than 50 percent of total world salmon production.

Major farmed salmon producers include Norway, Chile, Canada and the United Kingdom. In contrast to wild salmon which is harvested and produced by thousands of individual fishermen and processors acting as small businesses, farmed salmon is produced by vertically-integrated conglomerates that produce, harvest and process the salmon into final consumer ready product forms. In many cases, these farmed salmon producers are also supported by generous government subsidies, both direct and indirect.

The specific effects of this boom in foreign farmed salmon production on harvests and sales of Yukon River salmon products are as follows:

—complete displacement of frozen Yukon salmon sales to European smoked salmon producers. These smokers used to buy numerous 40,000-lb. van loads of frozen Yukon salmon, particularly chum salmon but now they buy fresh lots of farmed salmon on a weekly basis especially from Norway and the U.K.

—substantial displacement of frozen Yukon chum and coho salmon sales to Japan. Traditionally, Japan was the main importer of Yukon River salmon. Indeed, Japan continues to purchase most of the Yukon king salmon harvest quota. However, due to imports of Norwegian and Chilean farmed salmon, Japan no longer purchases any Yukon summer chum salmon and buys only small lots of fall chum salmon.

—substantial displacement of fresh and frozen Yukon salmon sales to U.S. domestic distributor, retail and smoker operations, particularly on the U.S. east coast. Although retail grocery chains still purchase small lots of fresh Yukon chum salmon, they no longer purchase hardly any frozen Yukon salmon and their fresh purchases are much smaller than they were in the 1980s. Now these retailers carry fresh, farmed salmon year round and smoked operations, particularly on the U.S. east coast, have switched to farmed salmon almost exclusively.

Foreign hatchery salmon

Although the growth of foreign hatchery production is not as dramatic as that of farmed salmon, the impacts on Yukon River salmon fisheries have been almost as devastating. Since its citizens consume large amounts of salmon and salmon roe Japan has always had a large hatchery salmon program and from the early 1970s through 1982 annual chum salmon returns (catch + hatchery broodstock for escapement) ranged from 10 million to 30 million fish. However, in the last two decades Japan has more than doubled its production with harvests in 1988 reaching 51 million chum salmon, reaching 69 million fish in 1994, 78 million fish in 1995, 87 million fish in 1996 and 85 million fish in 1997. Production of chum salmon in government-supported hatcheries in British Columbia has also grown dramatically.

Due to this high production, particularly in the 1990s Japan now buys few Yukon chum salmon even though as recently as the late 1980s it would buy in excess of 3 million pounds annually. In the United States in recent years processors have been reluctant to buy and freeze any Yukon chum salmon, in part due to the glut of hatchery chum salmon from B.C.

The specific effects of this steady expansion in foreign hatchery salmon production on harvests and sales of Yukon River salmon products are as follows:

—substantial displacement of frozen Yukon chum salmon sales to Japan. As described above, farmed salmon from Norway and Chile have helped to displace Yukon salmon from the Japanese market. Japan's own massive hatchery chum salmon production has since 1990 completely glutted even Japan's own large salmon market and now Yukon summer chum are now no longer imported at all.

—new competition from imports of Japanese hatchery chum salmon and British Columbia hatchery chum salmon. In 1997 Japan's production of hatchery chum salmon was so large that Japanese companies began exporting their chum salmon direct to the U.S. at extremely low wholesale prices, in some cases below $0.70/lb., FOB-Seattle compared to Yukon chum at $1.10/lb., FOB-Seattle. In 1998, due to booming chum production in B.C., these chums were being sold in Seattle at only $0.20/lb. compared to Yukon chums at $1.25/lb.

—substantial displacement of Yukon chum salmon roe (caviar) to Japan. Since all of Japan's chum salmon production is of hatchery origin, many of the fish are harvested in terminal bays. This means that the fish are sexually mature and the roe is harvested for processing into ikura caviar. In the middle and upper Yukon, harvests of summer chum and fall chum have dwindled as the wholesale price for chum salmon roe has fallen due to the dramatic growth in Japan's hatchery chum salmon returns. Ex-vessel prices to Yukon fishermen have fallen from a normal price (ca. 1990) of $4/lb. down to $1/lb. in 1998. Production of British Columbia chums also act to drag down the wholesale price of salmon roe.

FEDERAL SUPPORT FOR YUKON RIVER SALMON MARKETING CAN HELP THE U.S. REGAIN DOMESTIC AND FOREIGN MARKET SHARE.

It is clear that foreign competition has dramatically hurt harvests and sales of Yukon River salmon. This competition has caused severe economic losses to the 940 commercial salmon permit holders and the 12–15 companies that buy and process salmon annually on the Yukon. Annual incomes have declined steeply and in some fishing areas processors have not bought any salmon from the fishermen due to the low wholesale prices caused by the glut of foreign salmon.

However, as the results of YRDFA's own marketing efforts in the Pacific Northwest show, it is very possible for Yukon River salmon to develop additional market niches in areas such as Europe and in select high-end markets in the United States.

European market potential

After many years of market domination by Norwegian and U.K. farmed salmon, European salmon consumers are beginning to look for something different. Concerns over the ecological effects of farmed salmon production as well general consumer trends towards more "natural" and "organic" foods have led to renewed interest in wild salmon. German consumers in particular are fascinated with things Alaskan as the high percentage of German tourists visiting Alaska indicate.

Concentrated efforts in the high-end, gourmet market could create a market niche for fresh and flash-frozen Yukon River salmon fillets, smoked Yukon River salmon and Yukon River salmon caviar. Marketing and promotional efforts would emphasize the health and nutrition benefits of Yukon River salmon which is all-natural and organic wild salmon compared to farmed salmon which live in pens, are fed pellets and are occasionally given antibiotics.

Japanese market potential

Japanese consumers have a long familiarity with Yukon River salmon. Yukon River king salmon already have a unique market niche in Japan due to their high oil content and Japanese corporations continue to buy the majority of the annual Yukon king salmon harvest. However, as described above, imports of Yukon chum salmon and Yukon caviar have slipped due to the glut of hatchery chum salmon on the market. YRDFA's promotional efforts will therefore concentrate on developing a market niche for these underutilized chum by building on the customer loyalty already shown for Yukon king salmon.

Regaining Yukon salmon market share in the domestic marketplace

As YRDFA's success in the Seattle market shows, once customers are educated as to the unique attributes of Yukon River salmon they are willing to pay the higher costs rather than purchase a generic, farmed salmon. Although U.S. retail and foodservice operations have come to rely on steady deliveries of farmed salmon, they recognize that they need wild salmon to generate customer foottraffic and market excitement and hence overall increased sales of salmon and non-salmon items. YRDFA will seek to expand its domestic marketing outside the Pacific Northwest to high-end restaurant and gourmet shops that are seeking to diversify their menu and product offerings.

Budget Estimate (October 2000-September 2003):

Marketing Personnel & Office Expenses	$300,000
Travel & Tradeshows	150,000
Advertising & Educational Materials	100,000
Quality Improvements & Inspections	210,000
Customer Development & Promotions	200,000
Legal counsel & Trademarking	40,000
Total	1,000,000

If this appropriation is funded, YRDFA's intent would be to implement a four-year program to regain market share lost to foreign competition. In addition to tradeshows, advertising and promotional expenses to secure and support customer use of Yukon River salmon, YRDFA will also institute a rigorous quality assurance program amongst Yukon River salmon fishermen and processors to ensure that the customer gets only top-quality salmon product.

We hope that the Congress can fund this request. The livelihoods of 1,000 Yukon River commercial fishermen and crew and their families are in the balance, and if we cannot compete against this foreign salmon production our industry will die.

Thank you for this opportunity to submit written testimony.
