AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2000

TUESDAY, FEBRUARY 9, 1999

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10 a.m., in room SD–138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.

Present: Senators Cochran, Bond, Burns, Kohl, Harkin, Dorgan, Feinstein, and Durbin.

DEPARTMENT OF AGRICULTURE

OFFICE OF THE SECRETARY

STATEMENT OF DAN GLICKMAN, SECRETARY

ACCOMPANIED BY:

RICHARD ROMINGER, DEPUTY SECRETARY
KEITH COLLINS, CHIEF ECONOMIST
STEPHEN B. DEWHURST, BUDGET OFFICER

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

Today we begin the hearings on the fiscal year 2000 budget submitted by the President for agriculture, rural development, and related agencies.

We are very pleased this morning to have as our first witness the Secretary of Agriculture, Mr. Dan Glickman. We appreciate, Mr. Secretary, your being here with us today and having those who are accompanying you: Richard Rominger, Deputy Secretary of the Department of Agriculture; Keith Collins, the Department's Chief Economist; and Stephen Dewhurst, the Budget Officer of the Department.

This subcommittee has jurisdiction for all appropriations, programs, and activities of the Department of Agriculture, with the exception of the Forest Service which is funded by the Interior appropriations bill.

The President's fiscal year 2000 appropriations request, which is before the committee this morning, is $60.6 billion, a net increase of $5.8 billion from the fiscal year 1999 enacted level. This excludes the $5.9 billion in emergency spending for USDA programs provided by the fiscal year 1999 Omnibus Appropriations Act.

Over three-fourths of the total fiscal year 2000 budget request, a total of $47 billion, is for appropriations that are mandated by law. So, the President's total fiscal year 2000 discretionary appropriations request is $13.2 billion, an increase of $275 million from the fiscal year 1999 level.

The total request is actually understated if you extract savings from legislative proposals and questionable scoring tactics. The budget request relies, for example, on the adoption of new user fee legislation to generate an additional $532 million in collections for fiscal year 2000. These same user fee proposals, such as user fees to cover the costs of meat, poultry, and egg product inspections, have been rejected by previous Congresses, and I suspect that will be the case again.

While the appropriations request of the affected agencies does not reflect the savings from these fee proposals, the savings, nonetheless, are taken from our bottom line. They're used in the President's budget as offsets to comply with the Balanced Budget and Emergency Deficit Control Act caps on discretionary appropriations.

Furthermore, not only does the budget propose to redirect funds from ongoing programs and activities to fund program increases and new requirements, the appropriations request relies on additional savings from legislative proposals to shift programs to the mandatory side of the ledger, to save $200 million by funding fiscal year 2000 rural rental assistance requirements over 2 years, and to double count $180 million in savings used to offset fiscal year 1999 appropriations.

I believe it is fair to say that this subcommittee will not have the luxury of being able to count on the availability of this savings or approve many of the proposed shifts in funds from existing priorities of the Congress. The reality, Mr. Secretary, is that we will have to operate under more constrained spending limitations than those in this budget.

We have your statement that you have prepared, Mr. Secretary, and we will make it a part of the record in full. We encourage you to proceed to summarize it and make whatever additional comments you think would be helpful to the subcommittee, and then we will have an opportunity for questions from the subcommittee members.

But before hearing your comments, let me yield to the distinguished Senator from Wisconsin, the ranking minority member of this subcommittee, whom we welcome in this new capacity. He has been a member of the subcommittee and has been a very effective and helpful member in our deliberations. Senator Kohl.

STATEMENT OF SENATOR KOHL

Senator KOHL. Thank you, Senator Cochran. It is a great pleasure for me to join you this morning in welcoming Secretary Glickman, Secretary Rominger, and our other distinguished guests from the Department of Agriculture.

Mr. Chairman, let say that I look forward to working with you and all of the members of the subcommittee this year to develop the fiscal year 2000 appropriations bill for the Department of Agri-

culture, the Food and Drug Administration, and the other agencies under this subcommittee's jurisdiction.

It is also a pleasure to see you and we look forward to hearing your remarks, Mr. Secretary, regarding the USDA budget for the coming year. Programs administered by the Department of Agriculture touch all of our lives in many ways. In Wisconsin and across the Nation, farmers, school children, and consumers from every walk of life rely on your Department for a wide variety of services ranging from commodities produced on farms to the commodities served at the dinner table. Rural communities have come to rely on programs of USDA to meet housing, utility, and economic needs. The conservation programs at USDA serve to help us protect our soil, water, and wildlife resources not only to improve our own quality of life, but the quality of life of our children and our grandchildren.

U.S. agriculture today faces many challenges. Market prices continue their volatility and there is no guarantee that the dairy prices of today will be the dairy prices of tomorrow. I, in fact, remain very concerned that the problems facing dairy farmers rest beyond the markets and in part with USDA dairy programs themselves, such as regional dairy compacts.

One of these programs, the milk pricing laws, for example, has created an unfortunate cast of winners and losers, with family farmers having the most at stake. Federal milk marketing orders must demand equity and simplicity as necessary tools to eliminate the inherent inefficiencies and unfairness of arbitrary regional differences. Without reform, Wisconsin will lose half of our family dairy farmers over the next 5 to 10 years, which of course to me and I am sure to you is an unacceptable result of a totally failed policy.

The face of agriculture is changing as we witness the challenge of large corporate interests competing with the sustainability of small, independent, family-size operations. American consumers have grown accustom to available and affordable food items that previous generations could not even imagine. When Wisconsin pioneers sat down to eat their evening meal, they had no concept whatever of E. coli, Salmonella, and any other cause for foodborne illness. They took their chances, but today we rely on USDA to provide not only the most bountiful food supply in the world, but also the safest.

So, Mr. Secretary, we are glad to have you here today. We look forward to your remarks, and we have a few questions to ask after you make your remarks.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Senator Bond.

STATEMENT OF SENATOR BOND

Senator BOND. Thank you, Mr. Chairman. I will be very brief.

I want to join you in welcoming Senator Kohl as the ranking member. I know he will be great in the leadership team.

But most of all, Mr. Chairman, I begin by commending you for your knowledge, your dedication, and your hard work on this committee. You really are the most effective chairman of any of the ap-

propriations subcommittees. I say that as an admission against interest. [Laughter.]

And your knowledgeable explanation of the budget shenanigans that we have to deal with in this committee and others is very important because we are not going to be making these savings or shifts. So, we have a tough job to do in this subcommittee.

As I mentioned to the Secretary, as I was coming in, there are some real crises. I have got some cattle producers back home who wonder if it is going to take Patton's 3rd Army to liberate Europe so Europeans can eat U.S. beef. The Europeans have not had a good steak in 10 years. [Laughter.]

Senator Baucus and I have finalized the letter to you, Mr. Secretary, and I think we have about 41 Senators on it, asking you that you begin now to be ready to retaliate if the May 13th deadline is not met. I know you have watched, as we have. They find lots of ways to diddle and dawdle and refuse to take the steps they need to, and I hope that you are ready on May 13th or May 14th to pull the trigger and move ahead.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Senator Burns.

STATEMENT OF SENATOR BURNS

Senator BURNS. Thank you, Mr. Chairman. I will just submit a statement, and I want to hear from our witnesses today.

I think as you look at this budget and look at the appropriations as requested by the Secretary of Agriculture—and we want to welcome him this morning. I have got a whole litany of things here. I will get them to you. You will spend the rest of the day musing over them.

But I think in my opinion the discretionary funds that the chairman has talked about this morning—there is nothing wrong on the farm or ranch today excepting the price. I think that was noted in a hearing held in the Agriculture Committee. Out of that emanated what Senator Bond and Senator Baucus are trying to do.

But here is the challenge ahead of us. Auburn University Professor C. Robert Taylor noted that farmers are making 4.5 percent return on their equity in the 1990's, while retail food chains are raking in 18 percent; food manufacturers, 17.2 percent; even agricultural banks at 10.8 percent. The price consumers paid for food has risen 2.8 percent since 1984, while prices paid to farmers has declined 35.7 percent. Retailers' marketing costs have tumbled some 14.9 percent. And then you wonder why we have got a problem on the farm.

I do not know what we are going to spend our money for, but I think we should be looking at this problem right here. We keep talking about this great and wonderful exploding economy, and if you want to go through farm country and look at the auctions, they ain't going out of business because they want to. And this is the problem. This is the problem.

PREPARED STATEMENT

So, instead of doing all of this stuff that does not mean anything, we had better start concentrating and spending that money and

getting some people down there that are advocates for the producers so that we can increase that percentage of the consumer dollar getting back to the people who actually produce it. That is our challenge, and I think that is the direction in which we are going to have to proceed.

Thank you, Mr. Chairman.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman.

I would like to thank the Chairman for the prompt and timely manner in which he has called the first hearing on the fiscal year 2000 budget for Agriculture, Rural Development and Related Agencies. I think it is extremely important to get the ball rolling early this year so that we can have a timely and effective process for this Subcommittee. I would also like to acknowledge the presence of Senator Kohl as ranking member of the Subcommittee this year. I look forward to working with you both, as well as all the members of the Subcommittee this year for the benefit of the greatest agriculture producers in the world—the American farmer and rancher.

Well enough of the niceties, it is time to get down to the business at hand, a discussion of the budget proposal put forth by the Administration for the Department of Agriculture. I was hoping after what we all had to go through last year in this hearing room with Secretary Glickman, that this year we would have seen some improvement in the budget proposal put forth this year. But I guess I was expecting too much.

A year ago I questioned whether there was an advocate for the producer in the Department of Agriculture, and as I looked through the budget for the coming year I have found that I no longer need to ask, the answer is clear. NO, there is not an advocate in the Department for the producer. Questions and issues that clearly could have been addressed were left out in the cold. A solution which would have benefited the man and woman in the field was left unaddressed, as in the case of serious crop insurance reform.

Mr. Secretary in my mind that one issue is just the very tip of the iceberg which I am afraid is about to puncture the hull of the good ship USDA. The people in their tractors and on horseback in Montana no longer have faith in the Department to assist them in any way which will help them move their products in the market place, or in finding realistic and meaningful ways to increase the certainty of their future.

So many of the actions that this Administration and the people within your Department have taken in Montana have placed additional burdens on these hard working citizens. Although not related to this budget, just last week the Chief of the Forest Service went to Montana to remove over 400,000 acres of land from any future mineral exploration. Although I have not yet decided if mining in this area is the best thing to do at this time, I am sure that if you close it for 20 years, as the Chief has determined, we will not get in there at anytime to do anything which will assist the people of the state of Montana. Close it for 20 years and you close it forever, no matter what sound and scientific technology may be developed for the extraction of the minerals in this area.

Mr. Secretary, it started with timber, then oil and gas, now minerals. What is next Mr. Secretary? I can already see the attack on the recreationalists and those people that graze cattle on these lands. Although these are public lands and many special interest groups will argue that these natural resource providers have no rights to these lands, these same people must remember that people who make their living off the land are also citizens of this nation.

Let me get back to the topic at hand however, issues that are directly related to agriculture production. Last year this committee appropriated a set sum of funds to provide for the Department to settle certain lawsuits as a result of discrimination. I am in favor of assisting anybody who has been unjustly treated due to their race, religion or sex. However, it seems that we may have a problem resolving all these problems.

I want to commend the USDA, Office of Civil Rights, for their recent action to settle the discrimination suit brought by African-American farmers against the USDA. However, I firmly believe that much remains to be done. According to information posted on the Office of Civil Rights Internet site as of March 1998, Montana had at least 19 cases of discrimination pending with the USDA, placing Montana in the same category as highly populated states such as Florida and New York.

One young woman has a case that has been awaiting decision at various levels of appeal since 1995. She cannot make good management decisions or create viable farm plans until this situation is resolved. The stress of this wait has caused serious medical problems. In another case, a farm family has lost everything except their dignity. Now, they wait in a rented house to find out what their future will hold.

These people deserve better than this from an agency that was supposedly established to help American agricultural producers. I want to know when the people still in the process can expect prompt, responsive, and efficient handling of their complaints, not the foot- dragging, hurry-up-and-wait treatment they have received up to this point?

As I looked at the budget for the Department, at least two very striking areas arose in my mind. I can tell you that numerous other issues came up, but none quite as striking as the amount of dollars I see being expended in terms of research and in the area of the Foreign Agriculture Service.

In terms of research I cannot believe that we are content with what is being done today to assist our producers. It appears to me that we are doing a great deal to assist those people in the next couple of layers in getting the product safely to the consumer. These next couple of layers are the people that can afford to expend the dollars to assist their enterprises. But the producer who is out there working in the field cannot find the assistance from this Department to make them better producers.

Mr. Secretary, the biggest problem we have right now in the world of agriculture is getting a fair share of the consumer dollar back to the producer. Somewhere between the time the producer sells the product and the time it reaches the table, there is a serious disconnect. I've talked to the man and woman on the ground, the processor and all the way to the grocers. Now according to these people not one of them is making any money in the food production business. So can somebody tell me why I spend three times as much for a pound of Wheaties as the farmer gets paid for a sixty pound bushel of wheat. And why is it that a rancher out there is selling his steer for $65 a hundred and I pay over $5 a pound for good steak. Something is wrong here.

Mr. Secretary, I would like to provide you with some figures that came up during the recent hearing before the Senate Agriculture Committee. I quote Auburn professor C. Robert Taylor, who noted that farmers are only making a 4.5 percent return on equity in the 90's, retail food chains 18 percent, food processors 17.2 percent and even agriculture banks are getting 10.8 percent. Taylor also brought up the fact that the price consumers pay for food has risen 2.8 percent since 1984 while the prices paid to the farmer has fallen by 35.75 and retail marketing costs have tumbled 14.9 percent.

This is where we need to do the work, getting that dollar back to the producer. And it may fall on this committee to look at a resolution to this problem. I commit my support and my efforts to the Chairman and ranking member as well as to the producer in Montana and the nation to work on this issue with them in the coming year.

Part of it deals with the fact that our producers cannot count on the Department to assist them in securing the future. Research is the vision of the future, and according to this budget we have a limited vision of what the future is and where our food will come from. Mr. Secretary, you have heard this same speech from me for at least the past two years, and as long as you and your Department treat the best producers in the world in the manner that you do, you can count on hearing more and more of the same from me.

Last year I attempted to get some funds to look to the future and ran into a roadblock in getting the funds for a very important project. As we continue to see increases in the interaction between livestock and wildlife we will continue to see problems arising related to the diseases which wildlife may carry which could be detrimental to livestock. We already are experiencing just such a problem in Montana between the bison and domestic livestock. Yet I could not get the backing of the Administration to address the issue, but instead have to look at this competition between established research devoted to contained livestock. I have to be honest with you that if we don't address this problem at the root cause that we will need the research on contained livestock. I hope to work with members of this committee to see what we can do to address this potentially dangerous problem this coming year.

I cannot believe, that during this past year when we fought so hard in Congress to get the Administration to open their eyes to the plight of the producer in field, as they attempt to compete on world markets that you would endorse cutting the budget that will help us compete. The cuts are short sighted and do nothing to make

our producers feel that the government, the same government they pay taxes to, is helping them in any way.

I have a difficult time going back to Montana and telling my producers that this Administration will take care of them the next round of negotiations on the world trade market. They have heard that for too long. It appears that when our negotiators go the trading table they are more than willing to slide agriculture off the table as it is not a high ticket enough of an item. The balance of trade cannot reflect a closer balance when we trade food as compared to high ticket high technology. It just appears that cutting the deal is more important than what is contained in the deal. I know this is not all your doing, but Mr. Secretary by cutting the funds for the Foreign Agriculture Service does not send a signal that you are concerned. Additionally, you have a position of authority in this Administration and you can use your influence to make sure that the trade negotiators make agriculture an important share of our international trade.

There appears to be at least one program out there where there seems to be some success in dealing on foreign markets, that is the Foreign Market Development Cooperators Program, yet the Foreign AG Service with your okay, always seems to find a way to cut or at least reduce the funding for this program. It just doesn't make sense to me.

I have even heard rumors about the hill that the Department is in the process of developing language that would remove the statutory language in the '96 Farm bill for this program. I can't believe this since it is a program that is basically being successful in nature. I am a little proprietary in nature since this is language I had placed in the Farm bill four years ago.

I am concerned as well with the continuing fight that seems to be taking place on exporting our beef to the European Union. I have joined with a number of Senators in sending a letter to you asking that you be prepared to take whatever measures are necessary to protect American beef from the unrealistic demands placed on it by our so called trading partners. We need to begin to use the muscle we have as a trading partner on the world market and bring those countries which we count on for trade to the table to bargain and deal in good faith.

I also have a little problem back in Montana that I know you Mr. Secretary are familiar with in a very close sense. The bison continue to leave Yellowstone National Park, and Montana continues to protect its' investment in the livestock industry. As you are aware I have always been a strong proponent of the Animal, Plant Health Inspection Service (APHIS) and I continue to strongly support their efforts in terms of keeping America clean from biological agents from outside our borders, but in terms of the work and effort that they have put into the bison problem I am having my doubts, as is much of Montana. More times than not, it appears that they are no longer working with us but instead they seem to appear to have lost sense of their mission statement in terms of animal health.

I have taken more than enough time today to discuss my displeasure both in this Administration and the manner in which the Department is responding to the needs of producers. I am sure I will hear the standard answers that I have heard for the past nine years, but rest assured that I am not going to sit by and watch the producers in Montana and this country be taken advantage of any longer. Thank you again Mr. Chairman, I look forward to hearing from the Secretary, and more importantly working with you in the coming year for American agriculture.

Senator COCHRAN. Thank you, Senator Burns.

Senator Durbin.

STATEMENT OF SENATOR DURBIN

Senator DURBIN. Thank you, Mr. Chairman. It is a pleasure to be a member of this subcommittee. It was my honor to serve for 12 years in the House of Representatives as a member of this same subcommittee, going back to the days of Jamie Whitten, who was my teacher in the art of appropriations.

I also recognize the team at the table here. Though I have been gone for 2 years, they clearly are still at their posts and doing their job. Secretary Glickman, thank you for coming. Mr. Rominger, good to see you again. Mr. Collins, as always I am sure you will present us with some valuable economic information based on your re-

search. And the long-suffering Steve Dewhurst, who has been the Budget Officer for as long as I can remember, welcome. [Laughter.]

Through thick and thin and changes in Secretaries, you have been here, and I thank you for your contribution. I welcome you all and I thank you for the opportunity to be part of this hearing.

I have a number of issues of interest in the proposed budget. I see that you have made some substantial cutbacks in outlays, which undoubtedly will be visited on many different aspects of this budget. I am concerned about some of the decreases in the ARS construction account, particularly as it affects my home State of Illinois in Peoria, as well as in Champaign-Urbana. I will be submitting some questions on specific elements there.

I would like to, if I can, focus on one thing in particular, and I would hope, Mr. Secretary, that you would reflect on this as well. We are now near the close of the Clinton administration with 2 years left, and many will want to leave a legacy in this Department of the kind of foresight and vision that really will be an inspiration to future generations. The one issue that has been investigated and scrutinized at great length for a great period of time is the whole question of food safety.

If you look back to Government Affairs hearings in the 1970's, hearings that were attended by Senator Percy of Illinois and others, they talked about the fact that we could not rationalize the fact that so many different Federal agencies were in the food safety inspection business. Some estimate that today there are as many as 12 different Federal agencies in that business, 6 major agencies, some 35 different pieces of legislation.

I believe that we are captives of politics at the congressional level. We are captives of the businesses who are loathe to see change which they're uncertain of. We are captives of the unions who have the same fear. And frankly, we have to do something.

I have worked on legislation in the last session, and I would like to invite my colleagues to join me this year to try to come together with one unified, independent food safety inspection agency that is guided by science, rather than politics, that can restore any doubt in the mind of the American consumer that we are doing everything in our power.

Now, I know HACCP has brought us a long way, and I congratulate you for that. But let us take the next step. Let us bring this all under one roof. Let us not be afraid of a turf battle here and really dedicate ourselves in the next 2 years to address it.

I want to also say that I am sorry to see user fees in this budget again. Every year the budget folks put this in with the full knowledge that it will never take place. They count the money and then we have to try to rationalize making up the difference. It has just become a ritual, and unfortunately it is a painful one.

I know other Senators, including Senator Kohl, have addressed the problems in the pork industry. I hope that we can find a way to look at the point raised by Senator Burns earlier that the producers many times are the losers. It seems that the concentration of power in processing and marketing has really created some serious problems for those who are struggling to be good producers and ranchers across America.

Finally, a very parochial thing. Thank you, Mr. Secretary for coming to Chicago last year. When I mention this, most people are going to chuckle, but we have got a little problem that is turning into a big problem. Somehow or another a pest known as the Asian long-horned beetle has arrived in Chicago, and it is eating up our trees right and left. We are not quite sure where it came from, but it is a serious threat. And we are now chopping down trees in every direction. It will take years for us to replace them. Thank you to the Department of Agriculture for their interest in this, and I hope we can continue to work on that.

Mr. Chairman, thank you for allowing me to make an opening statement.

Senator COCHRAN. Thank you, Senator Durbin. Thank you.

Senator Feinstein, we welcome you to the committee and appreciate your attendance at this hearing. We have all made opening comments welcoming the Secretary, and I will recognize you now for that purpose.

STATEMENT OF SENATOR FEINSTEIN

Senator FEINSTEIN. Well, thank you very much, Mr. Chairman. I am delighted to be a member of this committee. I guess I am the freshman on the committee. But because California has by far the largest agricultural industry in the United States, it is a very important one to us, so I am delighted to be here.

I want, in particular, to thank Secretary Glickman for his response to the citrus freeze in California. The damage to that crop is to date more than $650 million, and that includes about $458 million to the orange crop and about $101 million to the lemon crop. I want to just thank you very much for declaring an emergency as promptly as you did in the six counties in which you did, and I want you to know that that is well respected in California.

The wipe-out, where it took place, is all but total and the real problem remaining is also one for the workers who do not have additional jobs, at least for the first 6 months of this year. So, any help that can be given with respect to food stamps and those kinds of things is very, very much appreciated.

I have asked the administration to help provide some temporary housing and unemployment assistance, as well as some individual and family grants to those who have lost their jobs. I would hope that in your remarks you might be able to respond to that and let us know—I think I put that in writing to you as well—what might be able to be done in that regard.

I want to quickly—I did not mean to interrupt you——

Secretary GLICKMAN. No. We were asking about food stamps.

Senator FEINSTEIN [continuing]. Mr. Secretary, I bring to your attention the growing concern about USDA inspections at the United States-Mexico border. I know you just recently held some hearings with respect to the importation of Argentinean crops into California and the very real concern about pest controls. I would have to say that the phytosanitary controls are really one of the major concerns about California agriculture. As you know, we went through a period of the med fly in California and we saw that sufficiently deter exports into other countries. That is now under control.

I feel very, very strongly that controls have to be in play. We are a huge exporting State now of agricultural produce. I mean, it is enormous, and if we are going to begin importing, we have all got to play by the same rules. What is sauce for the goose is sauce for the gander. And if we have these tight controls in our country, they also have to exist for crops coming into our country.

I have been told by California agriculture that there is a serious need for more USDA inspectors at the border to do the inspections and to safeguard California's ag industry from the exotic fruit fly pests. I am told that the number of inspectors at the Otay Mesa, San Ysidro, and Tecate ports of entry is about one-third of what is recommended by agency guidelines.

Recent infestations in San Diego, in Orange County, and Los Angeles have really heightened concerns about the need for additional resources at the border. Since last summer, a 70-square-mile area of San Diego County has been under quarantine because of a Mexican fruit fly infestation, and the impact of these quarantines are now being felt. Australia and Taiwan have banned export to their countries for the affected crops, not only for the quarantine area but also a 50-mile buffer zone around the area.

Now, I note that the administration's budget funds a $6 million increase in the ag quarantine inspection program, and I am very hopeful, Mr. Chairman and Mr. Secretary, that this can be addressed, and at the appropriate time, I would like to ask the distinguished Secretary for a response to this problem and see if some of that cannot go to quell what is a burgeoning problem in California.

Senator COCHRAN. Thank you, Senator Feinstein.

Mr. Secretary, we welcome you again and invite you to proceed.

STATEMENT OF DAN GLICKMAN

Secretary GLICKMAN. Thank you very much. It is an honor to be here with all of you who I have known well, and particularly my friend, Dick Durbin, with whom I served in the House for so many years. Thad, I thank you very much for having me here.

I again want to introduce Rich Rominger from California, our Deputy Secretary. He has been here many times. Keith Collins, our Chief Economist, and as Mr. Durbin pointed out, our venerable Budget Officer, Steve Dewhurst. We believe that we have the premier budget officer in the entire Government, and we are delighted that he is here.

I would like to summarize my statement and request that the entire statement be made part of the record.

There is an interesting dichotomy between the strongest general economy in a generation and the farm economy. You have heard it all, from low interest rates, low unemployment, highest home ownership, lowest inflation, highest job creation. I mean, it is extraordinary—since the Second World War. So, we see generally speaking things doing well in the general economy.

Then you look not only at the farm economy but to some extent, you look at the natural resource economy. It is not just production agriculture, but it is energy, it is minerals, it is the production type of things that go into building things and making things, and these areas are not so great.

It reminds me of a story. Senator Burns is not here, but it is a story about a man and his young son going up Constitution Avenue, and the father wants to buy his son a hotdog. So, he goes down the street and he sees the vendor, and the vendor is selling hotdogs and he says, get your hotdogs here: one end soybeans, the other end beef.

So, the boy says to the vendor, I have been to a lot of places, but I have never seen a hot dog that is one end soybeans and the other end beef. And the vendor says, well, these are tough times, and when you have tough times like this, it is hard to make both ends meat. [Laughter.]

The fact is that there are those tough times, although soybeans are not a bad thing, right, Mr. Durbin? [Laughter.]

FARM ECONOMY

The fact is that the farm economy is under stress. Exports are down about $9 billion from the 1996 peak to $50.5 billion forecast in 1999. All parts of the economy are affected by this. California, being the largest exporting State, is being hit by it, but so are many other States. The real problem, of course, is Asia, the Asian markets, and the strength of the dollar.

Net cash farm income is expected to be down from $59 billion in 1998 to $55.5 billion in 1999, and that is notwithstanding a lot of Federal assistance that this Congress generously provided. Many producers have faced both low prices and adverse weather, which is a double hit. I see Mr. Dorgan has just walked in and his State has probably been hit more than any other.

So, the outlook for the farm economy is not as promising as I would like to see.

FARM ASSISTANCE

At the same time, farm assistance that this Congress has provided has helped. As you recall, the Congress passed, with a presidential push, a $6 billion emergency assistance program in 1999, about half of that money in direct payments and the other half of that money in natural disaster assistance, a program that to some extent I think was started by our colleague from North Dakota in a far smaller amount that grew because of the fact the problem was so severe all over the country.

We have also increased loan deficiency payments. There are nearly $2 billion this year. These are the payments that were never supposed to trigger because the prices were never supposed to be low enough, and now we are seeing that they have triggered for most of the major commodities.

We have provided direct payment to pork producers, using an authority that we have not used in a very long time. It is not a lot of money. It is about as much money as we could find out of our section 32 account, and we targeted it to smaller producers.

FOOD AID INITIATIVE

The President's food aid initiative is over 5 million metric tons. I just came back from Russia where we signed an agreement with the Russians and they are going to be purchasing and/or being

given, under humanitarian assistance, large quantities of wheat and meat and other products.

The total farm assistance provided by the Government is estimated to be $18 billion in 1999. So, there is no question, Uncle Sam, through the good efforts of this Congress, did a tremendous amount to keep agriculture alive, and many, many farmers and ranchers would be not surviving without that assistance.

I will have to tell you that if prices remain at their low levels, the stresses will keep the workload heavy on our offices. We are already getting a lot of calls from Members of Congress about long lines at county offices. But the fact of the matter is that the emergency assistance, on top of the normal servicing requirement, has caused delays.

COUNTY OFFICE WORKLOAD

The number of these LDP's I mentioned, loan deficiency payments, rose from 0 in 1997 to nearly 400,000 in 1998 to about 1.3 million in 1999, and we do not know the number for the year 2000 but it is probably going to be a lot. These are individual visits to our county offices in many cases that have to take place in order for farmers to get this kind of assistance. It is an extraordinary change in the amount of work that is required in every one of these offices.

So, we are looking at our salaries and administrative expenses to see if there are better ways to handle this workload, but it is monumental. The 1996 farm bill created this program to put a floor on prices. It is working pretty well, but it requires an extensive amount of workload to keep up.

The 1996 farm bill has some shortcomings in dealing with low prices and disaster related events. We are not trying to revise course or micromanage farmers in this appropriations bill, but we have a role to help farmers weather tough times and adjust to adverse economics. In my judgment, the 1996 farm bill does not work very well when prices are low. That is the situation we are in right now.

FARM SAFETY NET

As the President said in his State of the Union address, we need to find a bipartisan way to improve the farm safety net by reforming crop insurance. Last year's emergency supplemental indicates that we need a long-term fix. That was a $6 billion program. These actions are undependable and are rather costly.

We made a $400 million down payment as a first step to improving risk management by reducing the cost of farmer premiums for crop insurance this year by about one-third, 30 percent. So, your farmers who are out there buying crop insurance this year will pay about 30 percent less for their premiums as part of the package that you passed last year. We took a bit of that money and put it in there as kind of a first step to encourage more people to actually buy crop insurance.

We also issued a white paper on principles and proposals for crop insurance reform. That has been sent to you. In order to deal with how to cover crops where there are repeated crop disasters, multiyear disasters, new crops, all sorts of different circumstances, we

are going to hold three regional forums this year on the issue of risk management. I would like to achieve bipartisan agreement with Congress on crop insurance reform this year.

We have been criticized for not putting a specific amount in the budget for crop insurance, but to be honest with you, until we have a reasonable bipartisan understanding of what we want to do with the program, I did not want to provide a specific estimate. It could cost anywhere between several hundred million dollars to several billion dollars a year. I think we need to figure out how we are going to fix the program before we put the amount in the budget. But I have said, with the way the congress and the administration worked together to put $6 billion in the budget last year, if we can reach agreement, I believe we can find the money to appropriate the necessary dollars.

FARM CREDIT

In the area of credit, farmers and ranchers also need access to adequate credit if they are to remain in business. This budget provides $3 billion in farm loans and guarantees, but with a subsidy cost of $52 million less than last year due to the lowest interest rates in over a generation.

Our farm credit programs are facing an increased demand this year, and we will shortly be running out of money for some of those credit programs. We are going to have to review that situation for a possible fiscal year 1999 supplemental request.

I would also say that one of our major accomplishments is that we are in the process of settling a major civil rights class action lawsuit against the Department of Agriculture, and we are pleased that Congress last year waived the statute of limitations for claims by black farmers. So, we were able to accomplish what I believe is one of the most profound things from the standpoint of justice that this Department has been able to accomplish for a very, very long time, and we thank you for your efforts there.

U.S. EXPORTS

I would now like to talk about exports. The events of the past year have demonstrated that strong export markets are a critical component of the farm safety net, but they have also demonstrated that exports alone are not the only safety net. We have had market disruptions in Asia, in Latin America, in Russia, and elsewhere.

We increased the programming of export credit guarantees to Asian markets, sales registrations were up 40 percent last year, and we are also taking strong efforts on the trade policy front. This includes exactly what you said, Senator Bond, to ensure that people comply with their WTO commitments based on sound science and based upon an international set of rules that everybody should be following, and also preparing for a new round of multilateral trade negotiations.

This budget provides a total program level of nearly $6.5 billion for USDA's international programs. This includes $4.5 billion for the heart of our programs, which is CCC export credit guarantee program. But we will use more than that if necessary to keep our sales going around the world.

But I repeat, even with all the export promotion efforts that we have done for many commodities, that is only part of the safety net, and that is why you do need some domestic program protection in the event that trade is not as positive as we would like.

MARKETING AND DOMESTIC PROGRAMS

In the area of marketing, domestic marketing programs are also important to the economic health of U.S. agriculture. There are continuing concerns about market concentration, and we are strengthening enforcement against anticompetitive practices, particularly in the livestock markets. We are examining the hog price decline and the Cargill-Continental merger. We have seen concentration in other aspects of the U.S. economy, health care, transportation, telecommunications, but agricultural concentration has been I think in many cases particularly difficult to cope with in rural America and small towns where you do not have a lot of competition naturally.

We have asked for budget increases in pest detection, disease prevention, and border inspections. Senator Feinstein, I would be glad to talk more about this particular area. I happen to believe that the highest priority of Government is protecting our own people from health and safety risks both from the standpoint of their own physical health and safety as well as economic health and safety.

We are working on an organic certification program. We have asked for additional monies for the program. Organic agriculture is growing rapidly, and we hope to have a rulemaking out this year to deal with that.

We have also asked for budget increases in the pesticide data program, which we desperately need as a result of the Food Quality Protection Act and other statutes.

In the area of rural development, rural Americans should have the same opportunities for economic growth that exist in urban areas, and that goes for housing, running water, electricity, telecommunications, and job opportunities. This committee deserves great praise for its help in ensuring that water systems and sewer systems are provided all over this great country of ours.

RURAL DEVELOPMENT

I recall, Senator Feinstein, that I visited the town of Orange Cove, California, which has one of the highest poverty rates of any community. USDA provided some assistance—and it is now one of our enterprise communities. This town never had the necessary resources. One of our prime functions is to make sure that towns like this get that assistance.

The rural development budget will support almost $11 billion in loans, loan guarantees, grants, and technical assistance—and that is $800 million more than last year. But, due to lower interest rates, the cost to taxpayers will be $400 million lower than last year. So, this is interesting. We are going to be able to budget $800 million more in the rural development programs at a cost to the Government of $400 million less. This is not a shell game. This is due largely to the fact that we have low, sustained interest rates, which under our budget process has made this benefit possible.

The budget will provide $1 billion in guaranteed and direct loans to help rural businesses, $4.3 billion in direct and guaranteed loans to bring single family housing to 50,000 rural Americans, and a 12 percent increase in funding for the President's Water 2000 initiative, to help about 1 million rural Americans have safe drinking water.

RESEARCH AND FOOD SAFETY

Research, obviously, undergirds the future of what we do in this Department. The budget provides an increase of nearly 10 percent for research from the comparable 1999 level. This is the first substantial inflation-adjusted increase for these programs, whether it is research on food safety, research for preserving our natural resources, or research to help farmers be more productive. I am sure that we will provide more specifics on our research programs but I would like to focus on food safety for a moment. Senator Durbin raised this issue.

The budget includes an additional $67 million, almost two-thirds of a Government-wide increase of $107 million for food safety activities aimed at reducing microbiological contamination of foods. The increases are directed to the President's Food Safety Initiative and inspection modernization activities of the Food Safety and Inspection Service.

This is the first year anniversary of HACCP implementation in large meat packing plants. Recent studies demonstrate there has been a significant reduction in the prevalence of Salmonella due to the implementation of HACCP—significant, in some cases as much as 50 percent. We are working now to bring the small plants in to HACCP and then, of course, the very small plants in to HACCP. There are different problems associated with each, but this budget I think will provide us help in dealing with that issue.

We are also working to meet the goals of the Food Quality Protection Act by addressing environmental and public health risks associated with the use of pesticides.

NUTRITION

In the area of nutrition, the budget reflects full funding for food stamps, child nutrition, and the WIC program. The budget restores food stamp eligibility to 15,000 elderly legal immigrants.

And I say again to Senator Feinstein that one of the problems we have, of course, in dealing with the issue of a lot of the folks who are out of work is that because of the rules against providing food stamps for undocumented workers or illegal immigrants, our hands to some degree are tied, although we are working with our colleagues in other agencies on this point.

Funds are also provided to improve the integrity of our food programs, evaluate effects of a universal free school breakfast pilot project and expand the WIC farmers' market program.

GLEANING AND FOOD RECOVERY

The budget includes a new $15.8 million gleaning and food recovery initiative. We throw away 95 billion pounds of food every year into garbage cans. It is not eaten. It is not used. Hotels, hospitals,

restaurants, you name it. It is thrown away. The Congress passed a law 2 years ago called the Bill Emerson Good Samaritan Act which says you can donate food without fear of legal liability. Communities all over the country are doing this. So, we include this new gleaning and food recovery initiative to provide community-based grants to help neighborhood organizations recover edible food and use it to help alleviate hunger.

I just have a couple more things to cover.

In the area of conservation, USDA's conservation mission has dramatically expanded as a result of the 1996 farm bill. That was the strongest conservation farm bill ever in my judgment, certainly since the 1930's.

The budget protects and strengthens the core conservation technical assistance and watershed work that NRCS carries out.

It supports implementation of the Administration's Clean Water Action Plan to protect rivers and streams.

CONSERVATION PROGRAMS

It increases funding for the EQIP program, the Environmental Quality Incentives Program, to $300 million.

The budget also funds the Lands Legacy initiative which will help USDA address the serious problem of prime farmland loss. The Farmland Protection Program would be reauthorized for this purpose.

Other conservation and land retirement programs, particularly the CRP, Conservation Reserve Program, Wetlands Reserve Program—and those are programs that I know Senator Cochran has had great interest in—are also continuing to have a positive impact on the environment.

The budget also supports the administration's global climate change initiative.

Finally, I want to talk just for a moment about customer service and program delivery.

CUSTOMERS SERVICE AND PROGRAM DELIVERY

Improving customer service and program delivery remain high priorities for what Abraham Lincoln called the "People's Department". We were set up to run in a decentralized way. We have offices all over this country. In some cases, we have done a great job. In some cases, I think for minority farmers and a lot of small farmers and there have been some other traditionally underserved farmers in our farm and rural development programs, we have not done such a good job over the years, and improving customer service for all farmers is a high priority for me and for the Department.

Streamlining and collocating the county-based agencies in one-stop USDA service centers is a prime focus. We are having some very good success here under the leadership of Deputy Secretary Rominger.

Administrative convergence is underway to consolidate administrative support functions for the county-based agencies and modernize program delivery.

A common computing environment is being implemented to improve our efficiencies across the agencies.

And we have tightened our belt to become more efficient in response to constrained or reduced funding. We at USDA have 22,000 fewer employees today than 1993. The fact is there has been significant downsizing in the Department of Agriculture, and we are doing that and we are struggling to keep up with the continued heavy workload, particularly as we relate to the responsibilities under the 1996 farm bill. We want to provide a high level of customer service and if we are not treating our people out there in the countryside very well, we are not doing our job.

So, it may be that funds will be needed to meet our workload and customer service requirements, particularly in farm program area, and that is something that we will address if we decide that a supplemental request is necessary in addition to some of the other things that we may have in mind.

PREPARED STATEMENT

So, our goal is to do the best job we can in delivering the programs that Congress has put in place under this committee's leadership. You have taken the lead to do that.

I thank you very much for allowing me to make this statement.

[The statement follows:]

PREPARED STATEMENT OF DAN GLICKMAN

Mr. Chairman, Members of the Committee, it is a privilege to appear before you to discuss the 2000 budget for the Department of Agriculture (USDA).

Even though the Federal Budget is now in surplus for the first time in 30 years, USDA's 2000 budget is still governed by the constraints put in place by the Balanced Budget Act of 1997. Thus, we are faced with another year of very tight funding. However, we have tried to provide the necessary resources that will enable USDA to achieve the basic goals and objectives of its strategic plan as well as focus on some key Presidential initiatives on food safety, nutrition and food assistance, global change, and conservation and the environment. And, as the President indicated in his State of the Union message, we must work with lawmakers of both parties to create a farm safety net that will include crop insurance reform and farm income assistance.

The Presidential initiatives that involve participation of USDA agencies, include:

A continuing Food Safety initiative for improving the Federal food inspection system from farm-to-table, through increased inspection, expanded research and consumer education, better surveillance of foodborne illness, and improved Federal, State, and local coordination.

A Lands Legacy initiative to develop a national program to protect great places and to provide the tools for localities, States, Indian tribes, and non-profit corporations and cooperatives to plan Smart Growth, open space preservation, and land use management. $268 million of the $1 billion governmentwide program would be provided to USDA.

A Global Change Research initiative aimed at investigating mitigation tactics to minimize the adverse effects of climate change on agricultural production, and inventory soil carbon levels, research how soils absorb carbon, and expand biomass research.

A Climate Change Technology initiative to develop technology for predicting and adapting agricultural production to global change impacts and to demonstrate and test various greenhouse gas mitigation strategies and monitoring mechanisms.

A Clean Water Action Plan to improve water quality on the Nation's forested lands and to address water quality issues, such as waste management and grazing practices on private lands. It also includes new research on hypoxia, pfiesteria, and related problems.

The budget also focuses resources on the following priority areas:

Providing adequate funding for Food Stamp, Child Nutrition, and WIC Programs, increased funding for program integrity initiatives, a new gleaning and food recovery initiative, a school breakfast research pilot, and restoration of food stamp benefits for elderly immigrants.

Meeting the urgent needs for water and housing in rural communities.

Supporting research to improve the productivity and competiveness of our farmers, to help solve environmental problems and to provide safe, nutritious food for all Americans.

Strengthening our risk management programs, providing small farm assistance, and modernizing farm program delivery.

Expanding domestic and overseas markets through aggressive promotion and a reduction in impediments and restrictions to trade.

Carrying out an aggressive civil rights policy to correct past weaknesses and fairly implement new program proposals.

The discipline imposed on the 2000 budget has forced us to make difficult decisions to restrain, reduce, and redirect resources to focus on the priority goals we established. We again propose user fees and contain and absorb certain costs. We are continuing to scrutinize our employment and business practices. As a part of the Department's continuing reorganization, we are implementing a field office streamlining plan which collocates the county-based agencies in one-stop USDA Service Centers and to consolidate administrative support functions in a new Support Services Bureau and modernize program delivery. We are implementing a common computing environment for these agencies to optimize the use of data and equipment and improve our efficiencies across the agencies. These efforts, combined with program reductions and reforms taken in prior years, have made a significant positive contribution to the current favorable Federal budget situation.

The President's budget proposes $55.1 billion in budget authority for 2000 for USDA compared to a current estimate of $67.5 billion for 1999. Budget authority for discretionary spending, which accounts for about 28 percent of USDA's total budget authority, declines from $15.8 billion in 1999 to $15.2 billion in 2000. The request before this Committee for discretionary budget authority is $13.2 billion.

The budget again proposes legislation that could affect the appropriation for the Department, including user fees for the Food Safety and Inspection Service; the Animal and Plant Health Inspection Service; and the Grain Inspection, Packers and Stockyards Administration. This proposed legislation will be sent to the authorizing committees, and the request before this Committee is not adjusted for the passage of this legislation. Upon enactment of fee authorizations, we would forward you our revised appropriation request. However, the appropriations request will include a proposed assessment on tobacco marketings similar to the expiring marketing assessment established by the Budget Reconciliation Act of 1993.

The budget also proposes legislative changes in some mandatory programs, e.g., restoring food stamp benefits to elderly legal immigrants, reauthorizing and funding a range of conservation programs, providing mandatory funding for the Foreign Market Development Cooperator Program, providing rural development grants and direct Treasury rate electric loans.

I also want to emphasize the importance that the President and I have placed on USDA civil rights issues; this priority is reflected in the budget. The President's budget provides the necessary funding to continue to carry out the recommendations of the Civil Rights Action Team (CRAT) as well as the recommendations of the National Commission on Small Farms which support our civil rights agenda.

FARM AND FOREIGN AGRICULTURAL SERVICES

The mission of the Farm and Foreign Agricultural Services area to secure the long-term vitality and global competitiveness of American agriculture, has surely been tested by the tough times farmers and ranchers are now facing. While planting flexibility provisions of the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act), strong export and trade policy programs, and other program initiatives already underway have helped many crop and livestock producers, it is clear, as the President indicated, that the farm safety net still needs some reinforcement.

The Administration and Congress worked together last year to support farmers in areas hit hard by declining prices and successive years of reduced yields. This year we will continue our efforts to expand and improve programs which help producers manage risk, and we look forward to working with Congress to further reform the insurance programs for crop and livestock producers. We are also working hard to expand opportunities for small farmers and others who traditionally have been under served in our farm programs. The class action settlement with African American farmers I announced last month closes a painful chapter in USDA's history but does not complete our civil rights initiative. We still have more to do to ensure all of our customers and our employees are treated with dignity and respect.

The weakening farm economy has challenged our efforts to improve customer service while improving efficiency in the Farm Service Agency (FSA) and the other

county-based conservation and rural development agencies. While additional funding provided in the Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations Act, 1999 (the 1999 Act) allowed FSA to maintain current staffing levels, the increasing demand for Commodity Credit Corporation (CCC) Marketing assistance loan programs and disaster assistance has dramatically increased workload and placed new burdens on county staff. The higher workload, particularly for the marketing assistance programs, is projected to continue at least through 2000. The need to find new ways of doing business in the service centers is underscored by findings of the independent study of county-based agencies conducted by Pricewaterhouse Coopers. The recently completed study recommends further steps to improve the efficiency of program delivery and field office operations of the county-based agencies. It also supports on-going efforts by the Department to streamline offices, establish a common computing environment, converge administrative services. We are currently evaluating the results of this study to determine how best to take it into account in our on-going efforts.

Farm Service Agency FSA Federal and county staffing since 1993 has declined by about 6,000 staff years, from over 22,500 staff years at the end of 1993 to about 16,400 staff years at the end of 1998. Additional funds appropriated for 1999 in the 1999 Act have allowed the agency to avoid reductions-in-force this year and to hire additional temporary staff. The proposed program level in 2000 for salaries and expenses of $1 billion is estimated to support a ceiling of 5,745 Federal staff years, and 10,048 non-Federal county staff years, assuming legislation is enacted allowing for CCC to cover a portion of FSA's computer operations and maintenance costs for the farm programs.

Farm Loan Programs Traditionally, USDA's role in the farm credit market has been to be the "lender of last resort." Currently, the Department supplies only about 5 to 6 percent of the credit used by farmers the rest is supplied by private lenders, including the federally-chartered Farm Credit System. However, the Department's role is important because it provides opportunities for farmers who experience financial difficulty to stay in business, and fills credit gaps, particularly for socially disadvantaged and beginning farmers.

Because the programs operate at the margin of the credit market, they are vulnerable to changes in market conditions and sometimes it is very difficult to predict changes in demand for program assistance. Right now, there is a great deal of uncertainty as to the impact recent declines in farm prices and income may have on repayments of past debts and the willingness of private lenders to make new loans. Even small changes in these factors can have a proportionally larger impact on the number of applicants seeking program assistance and the amount of their requests. USDA is keeping a very careful eye on the situation as it develops, not only for year 2000, but also for meeting the more immediate needs in 1999.

The 2000 budget request reflects a fairly optimistic projection one that envisions a reasonably good supply of farm credit provided by private lenders. The Administration believes that this is a good starting point. But, I will not hesitate to request additional funding if conditions deteriorate and there is evidence that additional program assistance is needed.

Specifically, the budget request includes about $3 billion in farm loans and guarantees slightly more than the $2.8 billion available for 1999. Because interest rates continue to decline, thereby reducing the subsidy costs, the higher program level for 2000 can be supported with far less budget authority than was necessary in 1999 ($77.3 million compared to $121.1 million).

For farm operating loans, the 2000 budget includes $1.7 billion in unsubsidized guarantees, $500 million in direct loans, and $97 million in subsidized guarantees. This mix reflects a shift to more unsubsidized guarantees. Favorable interest rates should help more farmers qualify for such credit and USDA's recent publication of a final rule for streamlining the guaranteed loan program and establishing a preferred lender program should encourage private lender participation.

For farm ownership loans, the 2000 budget includes $128 million in direct loans, compared to $86 million available for 1999, and $431 million for unsubsidized guarantees, which is about the same as 1999.

In addition, the 2000 budget includes $100 million in loans for the boll weevil eradication program and $53 million in emergency loans. The Administration plans to review gaps in the emergency loan program which deny credit to farmers and agriculture-related businesses that is otherwise available to non-farmers through the Small Business Administration (SBA). It intends to propose legislation to eliminate such gaps.

The 2000 budget also includes $4 million in grants for the State mediation program, double the amount available in 1999. This program provides a valuable serv-

ice in resolving disputes over the administration of the farm credit and other USDA programs.

Commodity Credit Corporation Changes over the last decade in commodity, disaster, and conservation programs have dramatically changed the level, mix, and variability of CCC outlays. CCC outlays are projected to increase from $10 billion in 1998, to $18 billion in 1999, and then to decline again to about $12 billion in 2000. The increase in spending between 1998 and 1999 is accounted for by higher marketing assistance loan program outlays, expenditures related to the President's International Food Aid initiative, and by emergency spending authorized for disaster assistance programs authorized by the 1999 Act. The disaster assistance provision expenditures authorized in the 1999 Act total nearly $5.9 billion, including $3.1 billion for market loss payments, $2.4 billion to compensate producers for crop losses, and $0.2 million for livestock feed assistance. In 2000, commodity program outlays account for about three-fourths of the total CCC outlays, with production flexibility contract payments and loan deficiency payments accounting for nearly all of the commodity program outlays.

Conservation program outlays account for most of the remaining CCC expenditures in 2000. The 1996 Act authorized direct CCC funding for the Conservation Reserve Program (CRP) administered by FSA and several new conservation programs administered by the Natural Resources Conservation Service (NRCS).

CRP provides landowners annual payments and half the cost of establishing a conserving cover in exchange for retiring environmentally sensitive land from production for 10 to 15 years. The 1996 Act authorized the program through 2002 and set maximum enrollment in the program at 36.4 million acres. About 30.3 million acres were enrolled in the program at the end of 1998. The 2000 budget assumes nearly 6 million acres will be accepted in the 18th signup, conducted in October through early December 1998. In addition, the continuous, non-competitive 17th signup has been underway to enroll land in filter strips, riparian buffers, and similar special conservation practices.

Other conservation programs funded by CCC but administered by NRCS include the Wetlands Reserve Program (WRP), the Environmental Quality Incentives Program (EQIP), the Wildlife Habitat Incentives Program (WHIP), and the Farmland Protection Program (FPP). WRP offers landowners the opportunity to receive payments for restoring and protecting wetlands on their properties. For 2000, approximately 200,000 acres are proposed for enrollment resulting in a cumulative WRP acreage enrollment of 975,000 acres, the maximum enrollment level mandated by law. This program is a cornerstone supporting the Clean Water Action Plan. EQIP gives producers incentives to implement long-term comprehensive farm plans and the budget proposes to increase the annual program level from $174 million in 1999 to $300 million beginning in 2000. WHIP provides cost-share assistance to landowners to implement management practices improving wildlife habitat and FPP provides for the purchase of easements limiting nonagricultural uses on prime and unique farmland. Under proposed legislation, WHIP and FPP would be funded annually through CCC at $10 million and $27.5 million, respectively, beginning in 2000. FPP is also slated to receive $50 million in discretionary funding from the Vice President's new Lands Legacy initiative.

Finally, provisions of the Commodity Credit Corporation Charter Act (the CCC Charter Act) limit CCC expenditures for computer equipment and cap, at the 1995 expenditure level, total allotments and transfers to State and Federal agencies under Section 11 of the Act for administrative support services. These provisions impose significant restrictions on the availability of CCC funds for transfers and reimbursable agreements used to fund conservation technical assistance and other support services for the conservation, commodity, and export programs.

By 2000 the amount available under the computer cap will be nearly exhausted preventing needed investment in our streamlining and Service Center initiatives and prohibiting the Department from investing in much-needed technology for business process reengineering efforts. USDA needs these investments to improve service to our customers and reduce program delivery costs.

The budget for 2000 includes a legislative proposal to raise the limit on CCC expenditures for computer equipment by a total of $105 million for the period 2000 through 2002. The increase in the multi-year cap will cover a portion of FSA's computer operations and maintenance costs for the farm programs, and will be offset by an equivalent reduction in authorized spending for the Export Enhancement Program (EEP). Additional reductions in EEP will be proposed to offset increased spending for EQIP and to offset proposed CCC funding for the Foreign Market Development Cooperator Program and for a "quality samples" proposal to boost the promotion of U.S. exports.

Risk Management Agency The need for supplemental funding in the 1999 Act for production losses and price declines in the farm economy certainly provides a chilling example of shortfalls in the program. Nonetheless, the facts are that since the 1994 reform of the crop insurance program, producers have had the opportunity to obtain protection against production losses free of cost, except for a processing fee, for catastrophic losses and at a subsidized rate for higher levels of coverage. Over 60 percent of insurable acres has been covered. There could be a substantial increase in participation in this crop year due to an additional 30 percent subsidy of premium rates that is being provided as part of the 1999 supplemental funding.

A key element in the success of the crop insurance program is the partnership with the private insurance industry, which not only delivers the program but shares in the risk. This partnership has resulted in innovative changes such as the development of revenue insurance. There are 17 private insurance companies of various sizes participating in the program. They provide delivery, mostly through their own sales agents who work on a commission basis. Loss adjustment is usually done by independent contractors. Companies are reimbursed at a rate of 24.5 percent of premium, which is the maximum fixed by law. They also may receive underwriting gains for favorable loss experience.

Within USDA, the program is administered by the Risk Management Agency (RMA) and is carried out through the Federal Crop Insurance Corporation which has a Board of Directors composed of both Government and private sector members.

Legislation enacted last year authorized the shift of delivery expenses paid to private companies from discretionary to mandatory spending, which also includes premium subsidy and other program costs. The 2000 budget requests an appropriation of "such sums as necessary" for the program's mandatory spending. Such an appropriation is similar to previous years' appropriations, and provides the assurance of full funding for increases in sales volume and potential losses.

For discretionary spending, which includes salaries and expenses for RMA staff, the budget requests $71 million an increase of $7 million over 1999. This increase would allow RMA to strengthen its efforts in research and development, to extend its risk management education program, and to enhance its civil rights activities and to provide public outreach.

The Administration intends to continue working on improving the crop insurance program. It believes that there is widespread support for the program because producers appreciate the assurance of risk protection the program provides rather than the uncertainty of ad hoc disaster assistance. Further, it believes that such protection offered on an actuarially sound basis, with producers sharing in the cost, is consistent with production efficiency. The Administration will do everything possible to encourage program participation, to correct any inequities in the structure of premium rates, yield guarantees, or other program provisions, to make the program user-friendly for companies and producers alike, and to facilitate new product development and other program innovations. As a strong first step in improving and energizing the program, last year's emergency supplemental has allowed us to make a $400 million down payment this year in helping farmers meet their crop insurance needs. These funds will be used to reduce 1999 insurance premiums by 30 percent.

The Administration stands ready to work with the Congress on improving the safety net for farmers. We have already announced the Administration's principles and preliminary proposals for strengthening the farm safety net by reforming the crop insurance program and we plan to hold 3 regional forums around the country to receive input from farmers and other interested parties. A white paper on the subject can be viewed at the USDA website on the internet. Through the forums and discussions with Congress, the Administration intends to build upon our proposals to forge a bipartisan agreement on crop insurance reform.

International Trade and Export Programs Developments in overseas markets during the past year have certainly demonstrated that the health of the American farm economy is inextricably linked to the global economy. As markets in Asia, Latin America, Russia, and elsewhere experienced financial turmoil and their imports of food and agricultural commodities were cut back, the effects of those developments were felt throughout rural America.

Strong export markets are an important component of the agricultural safety net, and we are committed to helping our farmers and ranchers broaden their access to overseas markets and maximize export sales. Faced with the challenges posed by last year's disruptions in global markets, we have responded aggressively by utilizing our export program authorities to ensure the continued flow of U.S. agricultural exports. We have expanded substantially the level of CCC export credit guarantees made available to markets in Asia, which otherwise would have been unable to obtain financing for their food and agricultural imports. As a result, sales reg-

istrations under the guarantee programs exceeded $4 billion in 1998, an increase of 40 percent above the previous year.

In July, President Clinton announced his Food Aid Initiative under which the United States is providing as much as 5 million metric tons of wheat and wheat products to assist needy countries. Moreover, we have developed a package of food assistance for Russia, which will provide over 3 million metric tons of commodities, once fully implemented.

We also have continued our efforts to open and expand markets through a wide range of trade policy activities. For example, last February the United States and Taiwan signed a market access agreement which provides for Taiwan to lift its import bans and allow access for U.S. pork, poultry, and variety meats. Upon Taiwan's accession to the World Trade Organization, Taiwan will cut tariffs and open tariff-rate quotas on numerous agricultural products.

We continue to prepare for the new round of multilateral trade negotiations which is set to begin later this year and presents an opportunity to further strengthen disciplines on agricultural trading practices. We are pursuing market opening agreements on a regional basis as well, including negotiations for the Free Trade Area of the Americas and within the Asia Pacific Economic Cooperation forum. And, we continue to respond to the growing challenges posed by technical barriers to trade, such as sanitary and phytosanitary barriers that are not scientifically based.

In order to ensure we are able to continue these activities and our export promotion objectives can be achieved, our budget proposals provide an overall program level of nearly $6.5 billion for USDA's international programs in 2000. For the CCC export credit guarantee programs, the largest of our export activities, the budget includes program levels of $4.7 billion for 1999 and $4.5 billion for 2000. These levels continue the higher level of guarantee programming which was established last year in response to developments in Asia. However, the actual level of guarantees to be issued will not be limited by the budget estimates, but instead will be determined by market conditions and program demand.

The Department carries out a number of market promotion programs which play a crucial role in efforts to develop and expand overseas markets. The Market Access Program (MAP) has been particularly instrumental in helping small and new-to-market companies build new markets overseas. To further those efforts, all MAP assistance for brand promotions is now reserved for small businesses and cooperatives. For 2000, the budget provides funding for MAP at the maximum authorized level of $90 million, which is unchanged from 1999.

The Foreign Market Development Cooperator Program, a mainstay of USDA export promotion efforts since 1954, provides cost-share assistance to nonprofit commodity and agricultural trade associations to support market development activities designed to remove long-term impediments to increased U.S. trade. Beginning in 2000, the budget proposes that the Cooperator Program be funded by CCC rather than the FAS appropriation. However, funding for the program will remain at its current level of $27.5 million per year. This proposal is consistent with the CCC Charter Act which authorizes the Corporation's funds to be used for market development activities. By providing a permanent authorization for CCC funding, the proposed change will provide greater stability for future program activities and will thereby enhance long-term planning by program participants.

The budget also includes funding to implement a new market promotion activity, the Quality Samples Program. Under this initiative, samples of U.S. agricultural products will be provided to foreign importers in order to promote a better understanding and appreciation of their high quality. The program will be carried out under existing authorities through commodity organizations and agricultural trade associations, similar to the Cooperator Program, and on a pilot basis will be funded by CCC at an annual program level of $2.5 million.

The budget provides funding to continue both of the Department's export subsidy programs the Dairy Export Incentive Program (DEIP) and the Export Enhancement Program (EEP). In the case of DEIP, the budget assumes a program level which continues programming near the current level. For EEP, a program level of $494 million is proposed for 2000, which is below the authorized level of $579 million. Proposed legislation to limit EEP programming will be submitted in order to provide PAYGO savings which are needed to help offset the costs of other initiatives in the budget which will increase mandatory spending for agricultural programs. Although EEP will be limited to the $494 million level, the program will remain in place and the awarding of bonuses can be resumed whenever market conditions warrant. The Administration will also propose to permit unobligated balances of EEP funds to be transferred to other foreign food assistance programs, such as Public Law 480, toward the end of each year.

For Public Law 480 foreign food assistance activities, the budget provides an overall program level of $987 million. This is projected to provide approximately 3.2 million metric tons of commodity assistance to recipient countries. In 2000, this tonnage level is expected to be supplemented by additional food assistance to be provided under the Food for Progress Program and section 416(b) of the Agricultural Act of 1949.

For the Foreign Agricultural Service (FAS), the budget provides appropriated funding of $115 million. This is $25 million below the 1999 enacted level due to the proposal to fund the Cooperator Program through CCC rather than the FAS appropriation. The budget provides funding for several new initiatives for FAS, including the opening of a new Agricultural Trade Office in the southern Africa region and implementation of a Reverse Buying Missions Program. The latter will bring buying missions of foreign importers, retailers, and trade officials to the United States to orient them on the quality and diversity of U.S. agricultural products. The program will be focused on markets in which the United States is generally competitive and has a clear potential for expanding commercial sales.

RURAL DEVELOPMENT

USDA's rural development programs provide decent, safe and sanitary housing as well as amenities such as safe drinking water, waste disposal, electrical and telephone service. They also provide jobs both for the construction of projects and employment within those projects, and for improved employment opportunities that result from the strengthening of rural economies. Rural America remains diverse. There are prosperous rural communities centers of local economic activity, communities that are attractive for recreation or retirement, and some that have been remarkably successful in bringing in high technology and other modern day businesses. However, there also are numerous areas with severe poverty and economic depression places that have lost their economic base of farming, forestry, mining or other traditional enterprises. These communities have high rates of poverty, limited opportunities, and lack even basic necessities. USDA's rural development programs help alleviate these inequities, so that the people who live in rural communities may have the same opportunity to share in the benefits of the Nation's prosperity.

The 2000 budget includes almost $11 billion in loan, grant and other assistance for rural development. This represents an increase of almost $800 million over the amount available for 1999. The higher program level can be supported at about the same cost to the Government roughly $2.2 billion in budget authority, including $200 million in budget authority that is being forward financed into 2001 due primarily to a reduction in subsidy costs for direct loans, which reflects the overall decline in interest rates.

USDA's rural development programs support a number of long-standing initiatives of the Administration including the President's Homeownership Initiative, Water 2000 and the Empowerment Zones and Enterprise Communities (EZ/EC) Initiative. In 2000, Rural Development would also contribute to the Smart Growth Partnership by helping to administer a $50 million loan program which is included in the budget for the Forest Service.

Over $3 billion in loans and grants ($670 million in budget authority) would be budgeted under the Rural Community Advancement Program (RCAP) which allows flexibility to transfer funds among programs to meet State and local priorities. These priorities must be based on strategic plans to help guide the development process. RCAP was authorized in the 1996 Act, but recent appropriations acts have restricted its full implementation although the 1999 Appropriations Act provided more flexibility than in prior years. The 2000 budget would allow RCAP to be fully implemented.

The Administration will propose legislation to provide $15 million, annually, in grants to the rural communities that were selected in the second round of the EZ/EC initiative. The 2000 budget also provides for the targeting of about $200 million in loans and grants under USDA's rural development programs to the EZ/EC initiative. In addition, a number of the EZ communities receive certain tax benefits. The EZ/EC initiative has encouraged communities to develop strategic plans to meet their goals and objectives. It has created jobs and economic growth, and has served as a model for non-EZ/EC communities to meet the challenge of planning for their future.

USDA's rural development programs are administered through State and local offices, all located within USDA Service Centers. The 2000 budget includes just under $542 million for Rural Development salaries and expenses. This funding level is approximately $27 million over 1999 and is expected to be sufficient to maintain staffing at current levels.

Rural Utilities Service The programs administered by the Rural Utilities Service (RUS) provide financing for electric, telephone, and water and waste disposal services. These programs have a long history of significant contributions to rural America literally lighting up rural households, allowing those households to communicate with the rest of the world, and bringing running water for indoor plumbing. While almost all of rural America now have these basic necessities, the challenges in recent years has been to maintain and upgrade the facilities that provide service, to ensure that rural America does not fall behind in the fast-paced world of high-tech communications, and to address the increasing risks of unsafe or poor quality water.

The 2000 budget would support over $1.6 billion in electric and telephone loans, which is about $75 million less than 1999. The Administration will submit legislation to authorize direct electric loans at a Treasury rate of interest. Under the proposed legislation, $400 million in such loans would be shifted from FFB directly to RUS.

The 2000 budget also reflects additional direct loan activity under the Distance Learning and Telemedicine program. This program was initially designed to provide only grants. However, there has been an overwhelming request for assistance due to the awareness of rural communities that the high-tech world of communications offers their best chance to receive enhanced learning and medical services and connect to the information-based economy. In order to serve more of these communities, the program was expanded in 1996 to include loan as well as grant assistance. RUS expects to see substantial progress in loan activity. In anticipation, the 2000 budget provides for an increase in the loan program to $200 million in loans. It also provides for an increase in grants from $12 million available in 1999 to $20 million in 2000.

The 2000 budget includes $503 million in grants and $975 million in loans For the water and waste disposal program together representing an increase of $156 million over the amount available for 1999. The program will continue to be targeted, under the Water 2000 initiative, to communities with the most serious needs for assistance which means that they lack service, are at risk of health due to unclean water or unsanitary conditions, cannot afford to pay the full cost of service due to high incidence of poverty.

Rural communities benefit not only directly in terms of the services their residents receive from the facilities financed by water and waste disposal loans and grants, but also, in terms of the jobs and overall economic growth that can result from those services being provided to commercial users. The secondary impact can, in fact, turn rural communities around giving them the means to attract industry to diversify their economies.

Rural Housing Service USDA rural housing programs have played a key role in providing affordable homeownership and rental opportunities in rural America since the 1960's. The programs serve very low to moderate income families who cannot obtain conventional credit and cannot otherwise afford decent, safe and sanitary housing. Interest and rental payment assistance reduces the cost of such housing to the families' ability to pay, based on income and other factors. The overall decline in interest rates has made it possible to operate the direct homeownership program at relatively modest cost for 2000, less than 10 percent per dollar of loans. The 2000 budget would support $1.1 billion in direct (single-family) homeownership loans compared to $965 million in 1999.

In addition, the 2000 budget would support $3.2 billion in guarantees $200 million more than in 1999. The loan guarantee program has operated for only a few years and has proven to be helpful in filling gaps in the commercial credit market where lenders are reluctant to make loans on their own. The program offers no interest payment assistance, so borrowers must be able to pay commercial rates of interest. However, the subsidy cost of the guaranteed program is only about 1 percent per dollar of loan guaranteed. The combined total of $4.3 billion in homeownership loans and guarantees is expected to serve over 50,000 rural families.

The 2000 budget provides for $100 million in direct loans and $200 million in guarantees for rental housing, $100 million of which would be contingent on legislation to eliminate the statutory requirement that 20 percent of the units in projects with guarantees receive interest payment assistance. The guaranteed program for rental housing is relatively new and uses other sources of funds and financial incentives, such as tax credits. Experience has shown, that the program can be operated without interest payment assistance and still serve low income families due to the combination of other incentives.

In the direct rental housing program, RHS currently has a portfolio of about 18,000 projects with approximately 245,000 units receiving rental assistance payments. In year 2000, it is anticipated that about 41,800 of these units will require renewal at a cost of $603 million. Some additional units in existing projects will be

provided for servicing purposes and a small number of units are expected to be provided in new projects, including those for farm labor housing. In total, the 2000 budget includes $640 million for rental assistance payments, of which $440 million would be available beginning in 2000. The remaining $200 million would be available beginning in 2001. The budgeting of 2000 program needs over 2 years will not affect the flow of funds to project sponsors or impact occupants in such projects.

RHS also administers several housing programs that serve specific needs, including farm labor housing, self-help housing for families who trade their sweat equity for a chance to own their own home, and very-low income repair loans and grants. The 2000 budget provides for the continuation of these programs at sightly higher levels than available for 1999.

In addition, RHS administers a program of direct and guaranteed loans and a limited amount of grants for essential community facilities. In recent years, the priority has been to serve children and the elderly through child care centers and health facilities; however, a wide range of projects have received this assistance, to reflect the diversity of State and local priorities. The 2000 budget would support $250 million in direct loans $80 million more than available in 1999. Guaranteed loans would remain at the same level as in 1999 $210 million. In addition, the 2000 budget includes $15 million for grants, $5 million of which would be used for early warning systems for hazardous weather conditions.

Rural Business-Cooperative Service Many rural communities need a more diversified economic base one that will provide good-paying jobs and withstand the fast-paced challenges of a high-tech global marketplace. The Administration has undertaken initiatives such as EZ/EC which requires communities to develop strategic plans in the process of competing for designation. Implementing these plans, requires significant financial resources. The primary source of capital must be the private sector and there are many ways to encourage private lenders to be more responsive to unmet needs, such as through tax credits and other incentives. Programs that offer guarantees and, in some cases, direct loans also contribute to the supply of credit. Within USDA, these programs are administered by the Rural Business-Cooperative Service (RBS).

RBS' largest program is the business & industry loan guarantee program which has operated at a level of about $1 billion for the last few years, and would be continued at that level in the 2000 budget. This level of funding is expected to produce almost 38,000 jobs in rural America. In recent years, the program has had very few losses and the cost to the Government has been minimal.

The 2000 budget continues the direct business & industry loan program at a $50 million level. This program is particularly helpful in filling gaps in the credit market, particularly in areas that are underserved by private lenders. In addition, the 2000 budget provides for $52 million for the intermediary relending program $19 million more than 1999. This program allows intermediaries to develop their lending capacity. Currently, each dollar loaned to an intermediary circulates about 3 times over its lifetime. Further, the experience intermediaries gain in loan making improves their prospects for gaining access to other sources of funding.

The rural business enterprise grant program would be funded at $36 million about the same as available for 1999. In addition, there would be $5 million for the new partnership technical assistance grant program. This program provides communities with assistance for strategic planning and would help them better coordinate and leverage Federal, State, and private funding.

The 2000 budget also provides $5 million for rural cooperative development grants ($3 million more than available in 1999), $2 million for the appropriate technology transfer program, $700,000 more than the 1999 level, $2 million for cooperative research agreements (the same as in 1999), and $10 million for the Alternative Agricultural Research and Commercialization Corporation (compared to only $4 million available for 1999).

As noted earlier, the Administration will be proposing legislation to provide mandatory funding of $15 million each year for the second round of rural EZ/EC's that were announced recently. In 2000, RBS will also administer a new $50 million loan program in support of the Smart Growth under the Lands Legacy initiative. Funding for this program is included under the Forest Service budget and would be administered by RBS under the authorities used to establish the intermediary relending program.

FOOD, NUTRITION AND CONSUMER SERVICES

America has the most affordable, safest food supply in the world, thanks to its hard-working farmers and producers. However, with nearly 36 million Americans living in poverty, millions of Americans still need nutrition assistance. USDA's nu-

trition assistance programs are part of the national safety net. Proper nutrition and sufficient food is as essential to the successful transition from Welfare to work as child care and health insurance. The importance of nutrition support does not diminish as families leave welfare. A family working full-time throughout the year at the minimum wage can lift themselves out of poverty, but only with the assistance of food stamps. The budget requests an appropriate level of funding for this effort for Food Stamps, Child Nutrition, and the WIC program, the Nation's primary means for carrying out food assistance policy. Over two-thirds of the $36.5 billion requested will help low-income children, school age or under, receive the nutrition they need.

The Food Stamp Program is budgeted at $22.5 billion in 2000, which includes a $1.0 billion contingency fund to cover unforeseen needs, and is predicated on a participation estimate of some 20.1 million people. While this level is higher than 1999 estimated participation of 19.7 million, this is just cautious budgeting. The economy is expected to remain strong. In fact, food stamp participation is down over 9 million from its peak of 28 million participants in March of 1994. This trend began before welfare reform was enacted and intensified as welfare reform began to work. With the strong economy, unemployment is at the lowest peacetime level since 1957. Increases in child support payments from absent parents achieved via Administration initiatives are also helping low-income households reduce dependency on food stamps. The Department will watch fluctuations in participation levels carefully to ensure that food stamp eligibles are not denied access to the program if they or their children still require nutrition assistance.

The budget includes several legislative proposals and initiatives for the Food Stamp Program. While Americans are committed to a society where work and responsibility are rewarded, current law does not permit many immigrants who have been legal residents of the United States since before welfare reform, to receive food stamps even after reaching age 65. The Department proposes to level the playing field with legislation that would allow such humanitarian assistance to these hard-working, long-time legal resident immigrants who fall on hard times when they are over age 65.

The budget also includes a small amount of funding for nutrition education and technical assistance. This will make sure program eligibles understand how to get nutrition assistance and what assistance is available if they want it; and it will help educate them on how to achieve a better diet. Finally, in addition to the continuing effort to modernize benefit delivery via nationwide use of Electronic Benefit Transfer, USDA is developing a plan to reduce error. A $6 million increase is requested as part of the plan to crack down on retailer and participant abuses, as well as reduce program errors causing overpayments.

For the Child Nutrition Programs, including the National School Lunch, Breakfast, Child and Adult Care Food, Summer Food Service, and Special Milk Programs, the current law budget request is $9.6 billion, about $0.4 billion more than the 1999 level. The request assumes continued full funding for all of these programs, support for Team Nutrition and $2 million is requested for Nutrition Education and Training. The National School Lunch Program touches almost all school children during the year and can help them achieve a better diet, especially with this effort in nutrition education. USDA is also developing an integrity plan to assess and address error in the school lunch program for which another $2 million is requested. We will increase USDA's visibility at the State and local level to ensure program integrity. Finally, the William F. Goodling Child Nutrition Reauthorization Act of 1998, Public Law 105–336, (the Goodling Act) authorized demonstration projects in 6 school districts that would allow the Department to evaluate the effect of providing breakfasts free to all elementary school children regardless of income. The budget includes $3 million to pay for the meal costs, and $10 million for a 3-year evaluation of the effects on participation, academic achievement, attendance, tardiness, and dietary intake.

For WIC, the budget request calls for an increase of $181 million, bringing the total to $4.1 billion for 2000. This level of funding will support a monthly average of 7.5 million participants over the year. The program is widely credited with reducing anemia and improving other key indicators of early childhood health. Over 46 percent of the infants born in America are WIC participants. USDA is working to implement the changes in the Goodling Act, many of which would increase program integrity. The Department is also working with the States to improve program integrity and efficiency, to make sure the program makes as much difference as it can for needy program recipients. Further, as part of our Commodity Assistance Program request, the Department seeks $20 million for the WIC farmers' market program, a $5 million increase. This program brings WIC recipients together with

small, local farm producers and encourages the consumption of fruits and vegetables, a priority in nutrition promotion.

The budget proposes an increase of $10 million for the Emergency Food Assistance Program (TEFAP). The Commodity Supplemental Food Program is funded to maintain the current program levels, although it is anticipated that caseload will continue to shift toward greater elderly participation. The Nutrition Program for the Elderly is increased by $10 million, to $150 million to increase subsidized meals provided to persons aged 60 or older at low-income elderly centers and through "meals on wheels" programs.

Finally, the Department will also increase its efforts to promote the new Dietary Guidelines to be issued in 2000 to help all Americans achieve a better diet via the Center for Nutrition Policy and Promotion. An important principle of nutrition education is that all Americans can benefit, whether they participate in nutritious assistance programs or not. Our concern is greatest for those in need, but nutrition education helps everyone.

FOOD SAFETY

As the safety of the food supply has become more important to the success of American agriculture and the health of consumers, the Department has stepped up its efforts to provide the leadership and expertise necessary to address the complex domestic and international food safety issues facing us today.

On July 25, 1996, a milestone was reached in our strategy for making significant gains in improving the safety of America's food supply. On this date, the final rule for Pathogen Reduction and Hazard Analysis and Critical Control Point (HACCP) Systems for meat and poultry products was published. This rule modernizes a 90-year-old inspection system and lays out the Administration's commitment to improve food safety and reduce the incidence of foodborne illness by 25 percent by the year 2000 as stated in the Department's strategic plan.

Two more milestones were reached: in January 1998 when approximately 300 large plants entered the program, accounting for 75 percent of the volume of meat and poultry production in the United States; and in January 1999 when over 2,800 small plants accounting for another 15 percent of meat and poultry production implemented HACCP. Implementation in large plants has been smooth thanks to the efforts of both industry and Government. Large plants had approximately a 92 percent compliance rate during the first 9 months of implementation. Where a few problems did occur, enforcement actions were implemented and establishments responded by modifying and strengthening their HACCP plans. As of January 25, 1999, small establishments, defined as having between 10 and 500 employees, were required to meet the HACCP requirements. All other establishments must implement HACCP requirements on January 25, 2000.

Recent results demonstrate that 90 percent of large HACCP establishments, for which there were adequate data, met the Government's Salmonella performance standards. Those establishments that did not meet the standards were required to take immediate corrective action. Data also indicate that there was a significant reduction in the prevalence of Salmonella due to the implementation of HACCP. The performance standards for Salmonella represent the first time USDA has set microbial standards for raw products on such a broad scale and is the first step towards a greater reliance on performance standards for specific pathogens.

These data, while preliminary, indicate that the Administration's science-based inspection system has already had a significant effect on the safety of food American families eat by reducing the prevalence of Salmonella. Salmonella is a potentially deadly bacteria that in the past had sickened as many as 3.8 million Americans a year and cost billions of dollars in lost productivity and medical costs annually.

The positive results from the implementation of HACCP underscores the important role Government plays in promoting public health, but the final rule is only part of our overall strategy to improve the safety of our meat and poultry supply. On January 25, 1997, the President announced the National Food Safety initiative. The initiative includes seven components for improving the Federal food inspection system from farm-to-table. Key components include expansion of the Federal food safety surveillance system, improved coordination between Federal, State, and local health authorities; improved risk assessment capabilities; increased inspection; expanded research, consumer education, and strategic planning. The initiative reflects a high level of coordination among agencies within USDA, the Department of Health and Human Services, and the Environmental Protection Agency (EPA). For 2000, the plan is to build on these investments, which Congress has generously supported in both 1998 and 1999.

For 2000, the budget proposes an appropriated level under current law of $653 million, a net increase of $36 million over the 1999 current estimate. The budget includes an increase for pay costs to meet our statutory obligation to provide inspection services and a programmatic increase to implement our farm-to-table food safety strategy. The 2000 budget includes increases to help the FSIS inspection workforce make the transition to a new HACCP environment, including conversion of 388 current inspection personnel and hiring of 250 new personnel as Consumer Safety Officers. In these new positions, these employees will be responsible for conducting scientific testing and inspections through the farm-to-table continuum. Some of these personnel will be redeployed to cover critical inspection vacancies in nearly 3,000 very small establishments. These redeployments and upgrades will increase the professional qualifications of the inspection workforce and cover a broader segment of the farm-to-table continuum. In support of the President's Food Safety initiative, the budget for FSIS includes increases to address food safety risks from farm-to-table, including: emergency response coordination with the States in investigating foodborne illness outbreaks; validation of the ability of State laboratories to meet HACCP pathogen testing requirements; and pathogen testing in Federal laboratories of State- inspected product.

The 2000 budget request includes again this year a legislative proposal which would provide authority to recover the full cost of providing Federal meat, poultry, and egg products inspection. We estimate that this proposal would generate approximately $504 million in new revenues in 2000 and $606 million thereafter. The proposal would require $149 million in appropriated funding to convert the program to user fees and to maintain State inspection programs. States administering their own inspection programs would continue to be reimbursed by the Federal Government for up to 50 percent of the cost of administering their programs and the special assistance beginning in 1999.

NATURAL RESOURCES AND ENVIRONMENT

Public awareness and concern for the Nation's natural resources has continued to grow as we gain a better understanding of soil and related resource problems and how best to address them. The importance of maintaining a healthy environment and a strong natural resource base becomes even more vital when considering the present economic state of rural America and the uncertainties that will be facing agriculture in the next century. The need to stem the decline of our important prime farmlands and address the problem of urban sprawl will require a greater Federal investment in "Smart Growth" programs. Understanding and demonstrating new methods of mitigating the adverse effects of global climate change on agriculture is another area to which the Federal Government should devote more resources. In addition, the plight of small, limited resource farmers has become more widely known as we begin to appreciate the vital role they play in American agriculture and the environmental and economic challenges that they face.

The Administration has also targeted water pollution as a serious threat to the environment and has demonstrated its commitment to addressing this problem with the publication of the President's Clean Water Action Plan in February 1998. This important document comes 25 years after passage of the Clean Water Act and outlines key Federal actions that will attempt to address the pollution problems of the next generation. USDA is called on to play a significant role in helping to implement this plan.

These initiatives have put more pressure on the Department's unique conservation partnership and has led to an increased demand for financial and technical services that we provide to farmers and communities. The budget request for 2000 recognizes this and proposes an appropriated funding level of $866 million for NRCS. This includes $585 million for conservation technical assistance, the program that constitutes the backbone of the Department's partnership with conservation districts and farmers, as well as the primary tool by which the Department addresses many of the Administration's environmental priorities.

The technical assistance proposal will assist in implementation of the Administration's Clean Water Action Plan and provides $20 million, including an $8 million increase, for technical assistance to owners and operators of animal feeding operations (AFO) to help them develop and implement waste management plans. Financial assistance that AFO operators might need to implement the plans will come from a $126 million increase requested for EQIP which is funded through CCC. NRCS will direct $20 million to competitive partnership grants to enable locally-based organizations, such as conservation districts or watershed councils, to provide coordination of locally-initiated conservation efforts in problem identification and

goal setting. Finally, an additional $3 million is provided for monitoring work to help target resources and document baseline conditions and performance.

In support of the Administration's Global Climate Change initiative, the budget includes an increase of $12 million to develop accurate baseline soil carbon data and to determine the impacts of Federal programs on soil carbon stocks at the national, regional and field levels. In addition, NRCS will devote $3 million to fund demonstration and pilot projects to test various carbon sequestration and greenhouse gas mitigation strategies and monitoring mechanisms.

Another Administration priority is the need to protect productive farmland and preserve open space. The President's Lands Legacy initiative will seek to accomplish this through a $50 million increase in discretionary spending for NRCS' Farmland Protection Program (FPP). Since funding authority for this program was fully expended in 1998, the NRCS budget also proposes new CCC legislative funding authority of $27.5 million. These two sources of funding for FPP will help meet the high demand for this program and ensure that solutions to problems of urban sprawl and loss of prime farmland are achieved.

Rural America is now facing serious economic hardships as a result of the declining farm economy. Nevertheless, farmers must still meet numerous environmental challenges and this places the greatest burden on the smaller operators. To address this, the budget includes $5 million to more fully implement the Debt for Nature program which will provide technical and financial assistance to financially strapped USDA borrowers who also have lands that require conservation treatment. At a time when many of these small operators are facing foreclosure, this program will offer some financial relief while at the same time implementing state-of-the-art conservation stewardship practices.

Funds will again be limited in the watershed planning and construction area where allocations will be made only to those projects that demonstrate cost effectiveness and clear environmental need. We will also work closely with our partners to get a better understanding of the overall condition of the more than 10,000 project dams that have been installed with USDA funding over the past 50 years. Many of these older projects are now approaching the end of their projected life span and concerns about public safety are being raised. NRCS will devote $1 million to providing educational assistance to communities on the need to inspect and possibly repair older dams.

Finally, the Department's 2000 budget will continue to support the 315 authorized Resource Conservation and Development areas. This ongoing program will continue to improve State and local leadership capabilities in planning, developing and carrying out resource conservation programs.

RESEARCH, EDUCATION, AND ECONOMICS

The 2000 budget represents the Administration's first comprehensive set of recommendations for investments in agricultural research and related technology since the Agricultural Research, Extension, and Education Reform Act was enacted in June 1998. The Research Reform Act called for a major infusion of funding in research and technology in areas that will enable American agriculture adapt to changing conditions in the global economy and in the domestic production environment. The 2000 budget proposes total funding for the four REE agencies of $2.1 billion, an increase of over 10 percent from the comparable 1999 level and the first substantial increase for these programs since 1992. Advances in research and technology are the keys to many of the most challenging problems we face in agriculture today and provide the basis for solutions to tomorrow's problems. The proposals put the Department in the ranks of the Federal Government's leading science agencies.

The REE budget proposal reflects the priorities outlined in the Research Reform Act. Mandatory spending of $120 million in 2000, and $600 million over the next 5 years is provided for the Initiative for Future Agriculture and Food Systems under Section 401 of the Research Reform Act, for competitive research, education, and extension grants to address critical and emerging agricultural issues. Grants of up to 5 years will be awarded to address priority research topics targeting enhanced agricultural productivity, food safety and human nutrition, and natural resource management. Mandatory funding is also available under the Fund for Rural America, where approximately one-half of the $60 million total is to be provided for a wide range of research and education activities in 2000.

The 2000 budget of $881 million for the Agricultural Research Service (ARS) includes a $51 million net increase for ARS research programs above the comparable 1999 enacted level. Within that total, the agency will fund increases of $76 million in support of major Presidential Initiatives and other high priority research projects. In addition, $10 million is provided to partially offset increased pay costs. Of the

total increase, $35 million will be funded through savings achieved from the termination of lower priority projects at select locations.

The discretionary budget request for CSREES of $948 million is up by $24 million or 2.6 percent, with a shift within this total to programs where funds are distributed competitively to address the most critical needs of the agricultural community. The 2000 budget proposes an increase of $81 million for the National Research Initiative (NRI), a 68 percent increase over the 1999 appropriated level. NRI supports both fundamental and mission-linked research through a competitive, peer-reviewed process that is open to all of the Nation's top scientists, including those at land-grant institutions. The proposed increase will target a wide range of environmental, economic, human health, and nutrition concerns through additional investments in breakthrough research that aims to address the most pressing concerns faced by the agricultural community.

The 2000 budget for the Economic Research Service (ERS) and the National Agricultural Statistics Service (NASS), in total, $140 million, up $6 million from comparable 1999 levels. Increases are proposed to support important departmental initiatives while reductions reflect the cyclical funding needs for the Census of Agriculture and the proposal to fund food program studies through the Food and Nutrition Service.

The budget includes $120 million, an increase of about $25 million, for REE research and education in support of the President's Food Safety Initiative. Of the total, about $7.3 million is provided to ARS for pre-harvest food safety research to study animal pathogen resistance to antibiotics, reduce pathogen infestation in animal waste, and examine the risks associated with the transmission of zoonotic pathogens from animals to humans. The ARS budget includes an increase of $4.4 million for post-harvest research to enhance detection and measurement of microbial pathogens during handling, distribution, and storage of fresh fruits and vegetables to determine the sources of contamination and risks of disease transmission. An increase of $3 million provided in the Cooperative State Research, Education, and Extension Service (CSREES) budget for competitive grants for integrated research and extension, food safety activities grants will complement the ARS research efforts. The extension programs carried out by CSREES will provide the necessary training to small retail establishments in helping them to implement HACCP. Additionally, about $21 million of the total of $200 million proposed National Research Initiative (NRI) competitive grants will go for food safety related projects. An increase of about $0.5 million is provided to support activities carried out by ERS in collaboration with other Federal and USDA agencies to assess the costs of foodborne illness and the economic implications of different options to improve food safety. An increase of $2.5 million is included in the NASS budget for a baseline survey of good agricultural practices of fruit and vegetable growers.

The ARS budget also contains an increase of $8 million for research to reduce the incidence of emerging diseases and exotic pests that threaten the safety and competitiveness of the U.S. food supply at home and abroad. Of the total, about half will be used for developing diagnostic tests, vaccines, and other preventive measures to control emerging and infectious diseases afflicting animals. The remaining amount is provided for research on emerging and exotic plant diseases, insects, and weeds that negatively impact crop quality and yield.

An increase of $3 million is provided in the ARS budget for genetic research aimed at enhancing U.S. agricultural competitiveness by improving the quality of plant and animal food products. The increase is provided to enhance crop production through research on genetic vulnerability of plants to pests and diseases and to improve the quality and safety of animal products through more accurate information on genes responsible for animal diseases and parasites.

The ARS budget also includes a $20.3 million increase in support of the President's Human Nutrition initiative. The overall goal of the initiative is to promote health and reduce health care costs by identifying the relationship between diet and health and to improve the scientific basis for more effective food assistance programs.

An increase of $3.0 million will support the development and application of new technology and management practices to replace the traditional pest controls that are at risk of being restricted or prohibited due to the Food Quality Protection Act of 1996 (FQPA). Of the total, about half of the amount is provided for technical and administrative support to the Office of Pest Management and Policy which is responsible for coordinating all pest control activities in the Department and collaborating with EPA on all pesticide-related issues. Additional funding is also provided in the CSREES budget in support of FQPA, including $10 million in new funds for long- term development and implementation of innovative pest management systems for major acreage crops, fruits, and vegetables, and $3 million in new funds

for the development of alternative pest controls for fruit and vegetable crops to replace the pesticides at risk of not meeting the new regulatory requirements. The budget includes a proposal for a new $5 million program of integrated research and extension grants for development of practical management alternatives and technologies for commodities affected by the methyl bromide phase-out. Additional funding is also provided for a number of programs aimed at preserving the Nation's natural resource base. An increase of $11 million is provided in the ARS budget for research and development of viable management strategies to achieve sustainable ecosystems. Specific efforts will include reducing nutrient build-up and transport to control hypoxia and harmful algae blooms, developing an Integrated Pest Management system for invasive weeds such as melaluca, leafy spurge, and yellow star thistle, and developing integrated strategies and technologies for conservation and restoration of ecosystems.

An increase of $15 million is provided for ARS global change research activities, with particular emphasis on utilizing management and conservation strategies to store carbon in soil, mitigating the impacts of climate change on agriculture and food availability, and developing new technology for predicting effects of global change on management and conservation of natural resources. The ERS budget is increased by $1 million for global climate change work, including identifying the economic implications of various alternatives for reducing greenhouse gases. Funds are also proposed to support USDA participation in the U.S. Global Change Research Program National Assessment activities in which several agencies collaborate to provide better understanding of potential climate changes for the Nation and to examine options for adaptations to these changes. An additional $2 million is provided for ARS research to develop measures to control particulate matter in compliance with EPA's new ambient air quality standards mandated by the Clean Air Act.

An increase of $2 million is proposed in the ARS budget so that the National Agricultural Library can enhance the availability and delivery of information to rural areas through the Internet. Additional support is provided to land-grant universities to establish "Centers of Excellence" on subjects of critical importance to the agricultural community, including food safety, pest management, water quality, and agricultural productivity.

The budget also includes $45 million for facility construction and modernization projects at 7 ARS locations, a reduction of $12 million from 1999. Of the total amount, $13 million is provided to support the first phase of a new addition to the Beltsville Human Nutrition Research Center and other small projects at the Beltsville Agricultural Research Center. Additional funding is also provided for modernization projects at ARS regional research centers, including $6 million for the Southern Regional Research Center at New Orleans, Louisiana; $4 million for the Eastern Regional Research Center at Philadelphia, Pennsylvania; $3 million for the Western Regional Research Center at Albany, California; and $2 million for the National Center for Agricultural Utilization Research, at Peoria, Illinois. Additional funding totalling $8 million is also provided for continued modernization of the Plum Island Animal Disease Center in New York and $9 million for construction of a relocation facility for the Western Human Nutrition Research Center in Davis, California.

Increases are also proposed in the CSREES budget for two innovative efforts to empower communities to reduce hunger and improve nutrition at the grass roots level. One of my highest priorities as Secretary is fostering partnerships between the public, private, and non-profit sectors to improve community food security, help individuals move towards self-sufficiency, and increase the amount of excess, wholesome food that is distributed to hungry Americans rather than discarded. Such coordinated efforts are particularly important at a time when nonprofit feeding organizations throughout the Nation are reporting an increased demand for food, particularly among working poor families. For these reasons, $776,000 is proposed to increase technical assistance to local anti-hunger and nutrition activities. In addition, as part of that initiative, $15 million is requested to increase the amount of excess food distributed by nonprofit feeding organizations by awarding grants to expand community infrastructures for food recovery and gleaning activities. The goal is to increase food recovery by 33 percent or 500 million pounds, which would provide approximately 500,000 low-income individuals with 3 pounds of nutritious food a day. An increase of $2 million above the 1999 level is also proposed to support nutrition education programs aimed at assisting individuals below poverty levels in improving basic nutrition and resource management practices.

An increase $4 million is proposed in the CSREES budget for competitive research, extension, and education grants to support the Small Farms initiative. The main goal of the Initiative is to enhance agricultural production on small farms by

developing and facilitating networks between small farmers and trained professionals in the public and private sectors.

Stable funding is provided for CSREES' higher education programs to continue ongoing efforts to support graduate and undergraduate education aimed at improving instructional capabilities in food and agricultural sciences. Funding is also held constant for the 1890 Capacity Building Grants Program which supports partnerships between the 1890's Historically Black Colleges and Universities and USDA agencies to improve research and instruction programs at these schools. The budget also continues to support the recommendations proposed by CRAT. Proposed increases include an additional $4 million for 1890 facilities projects for building renovation and construction, an increase of $3 million to support 30 additional extension agents on Indian reservations in 19 States, and an increase of $1.4 million to expand extension capacity at the 30 Native American land-grant institutions.

In addition to the food safety and global climate change increases noted previously, the ERS budget includes increases to support economic analysis on other priority issues. The budget includes additional funds to enhance commodity market analysis, particularly through alliances with the land-grant university system, and electronic dissemination of this and other ERS analysis to producers, processors, and others that use the information. An increase is also included to assess the varying information needs of different types of farming operations, how well USDA and private information services meet the needs of small farmers, and what modification of the Department's current information programs are needed to better serve small farmers. Finally, an increase is provided to support research on electric utility deregulation in order to assess the potential impacts of deregulation on the competitiveness of rural businesses, communities, and households.

The National Agricultural Statistics Service (NASS) is also an important source of information that is relied upon by a wide range of participants in the agricultural economy. The changes brought about by the 1996 Farm Bill make reliable and timely information about production, supply and prices even more critical to participants in agricultural markets. The budget request for NASS reflects a net decrease of $3 million, which includes a $9 million reduction due to the cyclical funding needs of the Census of Agriculture. The budget includes increases for a number of priority NASS efforts.

An increase is included to establish a permanent office in Puerto Rico in collaboration with the Puerto Rico Department of Agriculture to enhance collection of agricultural-related data. Funding is requested to conduct the decennial Agriculture Economics Land Ownership Survey which provides comprehensive data that are used to assess changes in farm structure, farm financial health, land ownership patterns, and landlord contributions to agricultural production. An increase is included for increased data collection to assist in the setting of safe pesticide use standards and in defining good agricultural practices to promote food safety. Lastly, an increase is requested to expand coverage of the program to measure chemical usage on cropland information vital to understanding stresses on cropland and environmental changes.

MARKETING AND REGULATORY PROGRAMS

The Marketing and Regulatory Programs facilitate domestic and international marketing of U.S. agricultural products by: (1) reducing international trade barriers and assuring that all sanitary and phytosanitary requirements are based on sound science; (2) protecting domestic producers from animal and plant pests and diseases; (3) monitoring markets to assure fair trading practices; (4) promoting competition and efficient marketing; (5) reducing the effects of destructive wildlife; and (6) assuring the well-being of research, exhibition, and pet animals. Consumers, as well as farmers, ranchers, handlers, processors, and other marketers in the agricultural sector, benefit from these activities.

The budget includes an increase of $13 million for the Agricultural Marketing Service (AMS) for a number of important activities. It would be used to: (1) expand market news reporting; (2) finalize the National Organic Program; (3) enhance the rapid response capability of the Pesticide Data Program (PDP) necessary to support the Department's responsibilities to meet EPA's data requirements for agricultural pesticide residues under FQPA; and (4) expand the operating program for microbiological testing of fruits and vegetables to support the President's Food Safety initiative.

For the Animal and Plant Health Inspection Service (APHIS), the budget proposes a number of significant changes in priorities, but only a $10 million overall increase in appropriations for the salaries and expenses account. Program successes in brucellosis eradication will allow a redirection to higher priority activities such as im-

proved animal and plant health monitoring to reduce the likelihood of dangerous and costly infestations. APHIS anticipates that all 50 States will reach brucellosis Class "Free" Status by the end of 1999. The budget proposes increased cost sharing from beneficiaries of Wildlife Services activities, particularly in States which support less than half of the program costs. Also, savings in the APHIS budget for boll weevil eradication can be achieved because FSA has established a successful loan program to assist producer-operated foundations to eradicate this menace to our agriculture. These reductions enable budget priorities to increase in the following areas: (1) detection and exclusion of pests and diseases including fruit flies, emerging plant pests, invasive alien species and Agricultural Quarantine Inspection at the borders where upwards of 85 million passengers potentially carry banned agricultural products into the United States; (2) more timely and accurate surveillance information on animal health; (3) emergency preparedness against acts of bioterrorism; and (4) important data gathering and risk analysis used in negotiations concerning sanitary and phytosanitary trade barriers and restrictions on genetically engineered products entering world markets. In addition, legislation will be proposed to increase license fees on the entities regulated under the Animal Welfare Act to recover the field level costs of administering the Act and to increase biotechnology permit fees to recover the cost of providing such services.

The budget requests no net increase for the Grain Inspection, Packers and Stockyards Administration. The one-time appropriation of $2.5 million in 1999 to restructure the Packers and Stockyards (P&S) activities is being used to strengthen P&S programs' ability to investigate anti-competitive practices and provide greater flexibility and efficiency in enforcing the trade practice and payment protection provisions of the Act. In 2000, a similar amount of funds would be used to: (1) hire additional staff to monitor and analyze packer competitive practices and the implications of structural changes in the meat packing industry; (2) expand poultry compliance resources; (3) install electronic filing equipment to reduce financial reporting costs for stockyard owners and packing house operators, (4) develop new cost-saving methods of grain inspection, (5) develop specific tests for grain varieties, and (6) develop automation techniques for mycotoxin testing. Legislation for new license fees from livestock marketing firms will be proposed to recover the cost of administering the Packers and Stockyards Act and to increase fees for grain inspection to recover the cost of developing grain standards.

DEPARTMENTAL MANAGEMENT ACTIVITIES

Although few support activities have high visibility, they are, nevertheless, vital to USDA's success in providing effective customer service and efficient program delivery. The 2000 budget proposes a number of increases for USDA's central offices and management functions to strengthen Departmentwide management oversight, leadership, coordination, and administrative support in keeping with the Department's Strategic Plan Management Initiatives to: ensure that all customers and employees are treated fairly and equitably, with dignity and respect; improve customer service by streamlining and restructuring the county offices; create a unified system of information technology management; and improve financial management and reporting.

The request reflects a number of priority funding increases to continue activities to improve civil rights enforcement throughout USDA. In recent years the Congress has increased funding specifically for civil rights activities within Departmental Administration. I appreciate this support and these activities will continue. The 2000 budget includes an increase of $3.9 million to build on these improvements. I want to be sure that we have the necessary resources to meet our Strategic Goal of ensuring that all employees and customers are treated fairly and equitably with dignity and respect. The funds will support additional staffing in the Office of Outreach to strengthen and expand leadership and coordination capabilities and expand outreach to minority and limited resource farmers; additional staffing for the Office of Civil Rights to handle increased workload in discrimination complaints and enhance complaints tracking to provide increased accountability; and additional staffing for the Office of Small and Disadvantaged Business Utilization to support an ongoing project to create new jobs in rural America.

The budget also includes an increase of $7 million for the Department's Socially Disadvantaged Farmers Outreach Program. The program, authorized by Section 2501 of the Food, Agriculture, Conservation, and Trade Act of 1990, is designed to assist socially and disadvantaged farmers and ranchers in participating in USDA programs and be successful in their operations by providing outreach and technical assistance. The proposed increase will enable support of approximately 35 projects that will serve more than 10,000 small producers with the goal of turning them into

solvent enterprises and stemming the continual reduction of the number of minority farmers and ranchers.

The challenge of providing improved customer service with improved efficiency as resource constraints are tightened remains a major focus of the Department's county-based agencies including FSA, the RD mission area, and NRCS. An initial administrative convergence plan has been developed to create the Support Services Bureau (SSB) which combines the administrative structures of these agencies into one unit to deliver better services to local customers and employees, provide a new consistency in administrative policy and operations, make better use of limited resources, and help preserve limited budget resources for program delivery. Thus, the budget includes funding for the new consolidated organization, SSB, to provide administrative services, including information technology activities, to these agencies. The salaries and expenses of the new bureau will be financed through direct appropriations and transfers from the serviced agencies.

The new SSB will support the Department's ongoing Service Center Implementation initiative. In 2000, a total program level of $90 million is proposed to continue Service Center Implementation activities, including further development and implementation of the common computing environment (CCE). One of the keys to success of improved customer service, while streamlining the field structure, is the replacement of the aging business and technology systems of the field service agencies. A collective re-engineering of business processes for administrative services and program delivery is underway, along with testing information technology alternatives. Common information shared by the partner agencies will reduce the redundant requests made of program participants, as well as customer office visits and paperwork burden, and ease workload for internal staff. CCE will enable the county-based agencies to: optimize the data, equipment, and staff sharing opportunities at the USDA service centers; overcome the extreme limitations of the current legacy information systems; and enhance customer service.

The Office of the Chief Information Officer (OCIO) provides policy guidance, leadership, and coordination in USDA's information management and technology investment activities. The proposed increase for 2000 includes $2.4 million to enhance USDA's infrastructure security and OCIO's emergency response capabilities; continue oversight of the Department's Service Center Implementation initiative; and continue implementation of critical Clinger-Cohen activities including further development of the Department's Information Technology Capital Planning and Investment Control program, the USDA Information Architecture, and workforce planning activities to ensure USDA maintains a highly qualified IT workforce.

Supplemental funding of $37.8 million was provided to OCIO in 1999 to support an aggressive program of remediation activities to address Year 2000 computer and embedded chip problems in the Department. I appreciate this support provided by the Congress and we are diligently working to ensure uninterrupted delivery of USDA programs and services in 2000.

The Office of the Chief Financial Officer provides overall direction and leadership in the development of modern financial management structures and systems in the Department. The budget proposes an increase of $2 million to restore the Department's financial credibility and accountability including successful implementation of legislative mandates such as the Government Performance and Results Act, debt collection and cost accounting. Increases in the Department's Working Capital Fund will enhance implementation of our new USDA-wide financial accounting system.

The Office of the General Counsel (OGC) provides critical legal support and advice to the Department and its agencies. An increase of $3.5 million is proposed to strengthen OGC's ability to provide timely response to requests for legal assistance, especially in the areas of trade practices, natural resources, and general law. Funds area also included to provide information technology improvements to enhance the efficiency of the office.

The Department's Office of Communications (OC) plays a critical role in disseminating information about USDA's programs to the general public. The request includes an increase of $1.2 million to enable OC to utilize new technology to reach audiences in a more timely and effective manner, and to lead Department-wide communications outreach efforts to reach underserved populations.

The request includes additional funds to continue the ongoing implementation of the USDA Strategic Space Plan for the Washington Metropolitan area. This plan has been tailored to meet the needs of USDA based on the projected staff levels at the Washington Headquarters and to provide a safe, efficient workplace for our employees. Occupancy of the Beltsville facility is scheduled to be completed during 1999. The work required in the renovation of the South Building includes fire protection systems, abatement of hazardous materials such as asbestos; replacement of old, inefficient heating, ventilation and air conditioning systems; upgrade of elec-

trical and plumbing systems; improved accommodations for disabled persons; and accommodation of modern telecommunications systems. The construction contract for Phase 1 of the modernization was awarded in July 1998. The design for Phase 2 is substantially complete and the 2000 request includes funds for the construction of Phase 2.

The Department's Hazardous Waste Management program provides leadership and funding for compliance with the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act, the Resources Conservation and Recovery Act, the Oil Pollution Act and the Pollution Prevention Act for facilities and lands under USDA's jurisdiction. An increase of $7 million is requested to minimally comply with necessary investigative and cleanup activities to protect human health and the environment and support increased efforts to identify and bill other responsible parties in the cleanup of hazardous waste sites.

OFFICE OF INSPECTOR GENERAL

The Office of Inspector General (OIG) conducts and supervises audits and investigations relating to programs and operations of the Department, reviews and makes recommendations on existing and proposed legislation and regulations, and recommends policies and activities to promote economy and efficiency and to prevent and detect fraud and mismanagement in USDA operations. The budget includes an increase of $3.1 million to maintain these activities and enhance the information technology capabilities of OIG.

That concludes my statement, I am looking forward to working with the Committee on the 2000 budget so that together we can meet the needs of our clients.

Senator COCHRAN. Mr. Secretary, we appreciate this overview of the budget submitted for the Department of Agriculture, and we will endeavor to work closely with you and the Department to help solve these problems in agriculture and make sure that we put the money where the problems are and help ensure that the programs are administered efficiently and effectively.

CROP INSURANCE REFORM

In that connection, I noticed that you mentioned some farm bill shortcomings and specifically addressed the problem of crop insurance reform as something that needs to be undertaken. It is troubling, therefore, to observe that there is no money in this budget request for crop insurance reform. A white paper is not going to be enough in my judgment to solve the problem. We all know a good bit about the problem, but we need to have some more definitive work and proposals from the administration to consider in the Congress and specifically a budget request that will provide funds to help fund a crop insurance reform effort. What is your reaction to my comment on that?

Secretary GLICKMAN. Well, Senator, I think it is a fair question. I would say this, that this is a multi-billion dollar problem. We talked about whether we should put a placeholder in the budget and then find enormous offsets other places in the budget to pay for it, perhaps significantly reducing existing farm program payments or other parts of the USDA budget. And we decided, no, because we are really talking about a replacement for the disaster programs that we have every year.

In the late summer/early fall, this Congress responded with first $4 billion. The President vetoed the bill, and Congress responded with $6 billion of emergency payments, disaster payments that were not heretofore budgeted because they were, in fact, true emergencies.

While the crop insurance issue is not a classic emergency from the standpoint of the budgeting requirements, we have taken the

position that, in effect, it is very much like that. So, we want to work with Congress to see if we can come up with a substantive legislative proposal that would effectively more truly replace the ad hoc disaster assistance proposals, and if we do that, I am confident that we will come up with the offsets that will pay for it.

SUPPLEMENTAL APPROPRIATIONS

Senator COCHRAN. I noticed also that you mentioned the possibility of a supplemental for programs, specifically loan programs where there are not enough monies available now to meet loan application requests that are coming in for farm operating loans or ownership loans, guaranteed and direct loans. There is not included in this budget request any supplemental requirements for fiscal year 1999 even though, as you state, the need is obvious, and I think you said shortly some of these programs will be running out of money.

How much is needed for these farm operating and guaranteed loan programs, and are there other needs for which will be submitted in a supplemental request? If so, when will it be submitted, and how much will it request?

Secretary GLICKMAN. I am going to ask Mr. Dewhurst to respond specifically, but I would say this, that we will run out of funding for emergency loans fairly soon.

The funding for farm loans did increase from $2 billion in fiscal year 1998 to $2.8 billion in 1999 to $3 billion in 2000. Demand is outrunning our funding.

Funding for guaranteed operating and ownership loans will be exhausted in the next few weeks. What is happening is a lot of producers and a lot of banks are turning to us to help refinance existing debt as prices fall. We are either the lender of last resort or our guaranteed program has become extremely popular with banks who might not heretofore have wanted to use us in some of these loans.

But perhaps Steve may want to comment more specifically on that.

Mr. DEWHURST. Well, as the Secretary said, we are looking at the needs for supplemental appropriations with the hope that we will be sending something forward in the executive branch in the next few days. There are essentially four program areas we are looking at. One is the one that Senator Cochran brought up, which is farm credit. It is clear to us that with respect to emergency loans, as well as with respect to guaranteed operating and ownership credit, there are shortages in all of those areas. The current estimate of need could be as much as $1 billion in loan authority, which translates into roughly $100 million in budget authority to finance them.

But I want to emphasize that one of our problems is these numbers keep changing and we are trying to get the best numbers we can to make sure we cover the problem.

We are also looking at the emergency conservation program. As you know, that program runs through the Farm Service Agency and provides farmers with some cost-share money to put land back in productive condition following natural disasters. We are working with a tentative estimate of about $30 million in that area. At the moment the largest single need that we see is in Puerto Rico due

to Hurricane George. There is an $8 million requirement in that territory alone because of hurricane damage.

We are also looking at the emergency watershed program. The Natural Resources Conservation Service works with local jurisdictions to clear channels and restore streams after natural disasters. They have given us an initial estimate of roughly $100 million, but we are still looking at that.

Finally, there's rural development. We have some housing needs due to natural disasters again in Puerto Rico, as well as a number of other States where storms have damaged USDA financed rural housing, and there may be a need for us to provide some additional loans and grants to help restore that housing. That is a fairly small area. We think it might amount to $6 million in loans and grants.

So, those are four areas we are looking at. We do hope to have something forward the next few days, but we are trying to get the best numbers that we can.

Senator COCHRAN. Thank you.

Senator Kohl.

LONG-TERM DAIRY PRICES

Senator KOHL. Thank you, Senator Cochran.

Mr. Secretary, dairy farmers in my State of Wisconsin and across much of the Nation have recently benefitted from good prices. However, we are very concerned about projections for dairy prices in the coming months. I would like you or perhaps Mr. Collins to provide your views on the near and long-term prices dairy farmers may expect to receive.

Secretary GLICKMAN. Well, if they were going up, I would do it, but I am going to have Mr. Collins respond. [Laughter.]

Mr. COLLINS. Thank you, Mr. Secretary.

Secretary GLICKMAN. I think last year I did do it.

Senator KOHL. They were going up.

Mr. COLLINS. Mr. Kohl, as you did comment, we have had an unusual situation over the last couple of months. The basic formula price in December was $17.34 per 100 pounds of milk which was an all-time record high. I do not think many people expected that to continue; at least not many economists expected that to continue.

In 1998, we had some serious weather problems that affected milk production around the country, California in particular, having wet weather in the spring and then drought during the summer. We only had a very small increase in milk production at a time when cheese demand was strong and milk fat demand was strong.

Over the last 3 months of 1998, though, things have started to change. Milk production was up 2 percent. That is the first sustained increase we have had in milk production since 1995. As a result of that, we are now seeing more cheese production, and we have seen cheese prices drop rather dramatically. They were record high, $1.90 a pound in December. They fell all the way to $1.25 the third week in January, and they went up a little bit last Friday to about $1.32.

But as we look out, we are probably going to see a basic formula price, when we announce it on March 5th, dropping to the range

of between $12 and $13 per 100 pounds, down from the $17.34 record in December, and I think we announced about $16.28 last week for the January basic formula price.

Just to finish this, for the year as a whole, we would see the basic formula price average about $12.75 per hundredweight in 1999 which would be down from about $14.20 in 1998. But it would be better than what we had in 1997 when it was only $12.05, and producers will face lower feed costs than they did in 1997. So, we should have a year about between the last 2 years of 1997 and 1998.

Senator KOHL. All right. So, we are expecting a serious decline in prices this year relative to last year.

Mr. COLLINS. Yes, sir.

EMERGENCY FUNDING

Senator KOHL. Last fall, Mr. Secretary, Congress provided, as you know and stated, nearly $6 billion in emergency funds to bolster farm prices. Included in that amount was $200 million to help dairy farmers. In fact, Mr. Secretary, I have written you a letter, as you know, on this matter.

Since Congress has already acted and an economic disaster for dairy farmers is expected in the near term, can you assure dairy farmers in Wisconsin and other States that that money will be available and will be used to offset the effects of the crisis that we expect?

Secretary GLICKMAN. Yes. This $200 million fund needs to be out there sometime mid to late spring. We have not yet finalized the formula for doing it, but the appropriations bill requires us to spend $200 million and I am advised that it has got to be spent this fiscal year. So, that means the money must and will be spent.

The other thing I would tell you is that without knowing exactly what we are going to do on dairy, we did do the $50 million hog program which was kind of a special program. On that one, we targeted it to basically smaller and mid-size producers. While we have not finalized the dairy program yet, it would be my hope that there would be some targeting in this area as well.

MARKET CONCENTRATION

Senator KOHL. All right. Mr. Secretary, you have noted in your remarks your commitment to the small farmer and ongoing efforts at USDA to help ensure that highly concentrated market power in the hands of a few will not serve to the detriment of the American farmer or the American consumer. Mr. Secretary, if concentration within the U.S. agriculture sector continues to grow, what do you see as the long-term consequences of this concentration?

Secretary GLICKMAN. That is a question that I am very worried about. It is the question that I get when I am out in the country more than any other question. It has to do with the structure of agriculture, particularly in the livestock sector, particularly in poultry and hogs, but there is also a lot of concern about ownership on the slaughter side, the beef side of the picture.

Now, we have, to use the colloquial expression, beefed up our enforcement and our staffing functions of the Grain Inspection and Packers and Stockyards Administration. It is in our budget to pro-

vide more resources to do both studies and to take on cases. These cases, antitrust cases, are very complicated and they are intensely litigious.

One of the first things that I did when I came on board is we sued IBP, the largest meat packing company in the world, for preferential pricing practices. We got a result which was partially positive, partially negative, but it is something that we need to do more of, which is to challenge unfair practices where they exist. We have our own statute, the Packers and Stockyards Act, which was adopted as basically an unfair practices statute.

We also created a National Commission on Small Farms. It has made several recommendations that we have implemented.

I would also point out that in recent weeks the White House has put together a team of us and the Department of Justice to examine larger consolidation issues involving agriculture. Senator Harkin and others have been asking that we do that as well.

But there is some additional money for enforcement of our Packers and Stockyards Act.

CONSERVATION FARM OPTION

Senator KOHL. Mr. Secretary, Wisconsin is a State rich in natural resources. In fact, by reasonable accounts, modern day conservation was born in Wisconsin.

Today, however, we face serious challenges to water quality and soil degradation from many sources, including agriculture. I note the budget request calls for increases in many important conservation programs, but at the expense of some others. For example, we note that the Conservation Farm Option program is not funded at all, even though farmers in Wisconsin have been asking for this program since passage of the 1996 farm bill.

Can you explain why you chose new conservation programs over ones not yet funded, such as the Conservation Farm Option?

Secretary GLICKMAN. I believe, if I am not mistaken, Congress cut the funding for this program last year. So, quite frankly, the administration made its priorities based on a lot of factors, including that. But we think the Conservation Farm Option is an important program and we certainly would not resist Congress putting money into it.

Senator KOHL. Thank you.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Kohl.

Senator Bond.

Senator BOND. Thank you very much, Mr. Chairman.

Mr. Secretary, I am glad to hear you are going to be focusing on the concentration issues because those are of great concern to us.

I appreciate also your strong support for research which is the future.

I would share the chairman's concern about the failure to come forth with a plan, any plan, on crop insurance and begin to make a realistic budget set-aside for that. To be quite harsh, Pro Farmer I read says, basically USDA has punted on crop insurance reform. They have laid the entire matter at the feet of Congress. I do not want to be harsh, but there is that view.

SUPPLEMENTAL REQUEST

I would point out one other thing that we are concerned about. When you talk about the supplemental requests, I hope that you will also be providing us with your suggested offsets. The President has said we are going to save Social Security by devoting the surplus to it, and certainly we would not expect to have supplemental requests that are not funded.

With respect to the program you addressed, disaster assistance, Congress did provide $2.4 billion to compensate for crop losses and it was signed 100 days ago. There are some who do not think the $2.4 billion is enough. But we still do not have a signup and farmers are asking when they can have the assistance in hand.

What is the target for getting that ready?

Secretary GLICKMAN. The signup did actually start I think last week, February 1.

Senator BOND. We do not have the information. Our offices do not have it. I mean, that is what we are hearing from back home. They do not have that.

Secretary GLICKMAN. Well, we will make sure that the Missouri State office has all the information by this afternoon.

But the signup started. Again, this is different than the first part of the $6 billion program of assistance where we just could send checks based upon previous farm programs. In this case, farmers have to come in to the county offices and do the appropriate amount of paperwork and provide proof of loss. We are trying to minimize paperwork as much as possible. We just added some California relief based upon the freeze as well, and then you have to allocate the total dollars based upon the total amount of applications. But we need to get that relief out this spring, late winter or early spring certainly.

Senator BOND. Well, we appreciate your doing that, and I would put in a good word for the USDA organization in our State. They are doing a good job.

COTTON LOAN DEFICIENCY PAYMENTS

On a parochial matter, I need to call to your attention to the fact that there are over 1,000 appeals awaiting decisions in response to a USDA mistake inadvertently in implementing the cotton loan deficiency payments down in the Boothill in southeast Missouri. Apparently the local FSA did not get word from Washington, and we need FSA to allow form CCC–709 to be amended. You have been hearing from a lot of people about that. It is one of those technical difficulties. If you can get that solved, you will be a hero in the Boothill and we all will. We appreciate your looking at that.

FOOD QUALITY PROTECTION ACT

One final challenge for you that I offer up to you for any comments you have. On the off chance that you have some influence over Administrator Browner at the EPA, since Congress does not seem to have any, I would ask if you are able and willing to speak the language of science and agriculture in EPA regarding the implementation of the Food Quality Protection Act. Is USDA participating? Are you making the science and the agricultural knowledge

that you have available in a meaningful way in the discussions at EPA with respect to FQPA?

Secretary GLICKMAN. The answer is yes. And Senator, I am going to ask Deputy Secretary Rominger to comment on this, but let me just make a couple of points.

One is that the Deputy Secretary and I met with Carol Browner last week for almost 2 hours to discuss the practical implementation of the Food Quality Protection Act. This is a concern out in the countryside: Is USDA engaged as we deal with pesticides and organophosphates and other things that either have to be removed or usage changed or modified? I am extremely comfortable with our relationship with the EPA and Carol Browner. In the countryside sometimes when I say that, people kind of say, well, we are hearing other things, but it is not true.

The other thing. This is a statute that is extremely complicated. It is a statute—at least in the initial implementation—which is basically a child-based statute. That is, the things to be removed from the marketplace are those things that affect children as they consume foods like apple juice and other kinds of things.

So, it does require a great deal of good, sound, objective science, and we have the best scientists in the world at our Agricultural Research Service and they will be used. I can promise you that.

Senator BOND. Well, Mr. Secretary, we are delighted to hear that assurance, but as you know, I am from Missouri and so the only thing we have got to say is, show us and we will look forward to seeing——

Secretary GLICKMAN. Perhaps the Deputy Secretary may want to respond.

Senator BOND. OK.

Secretary GLICKMAN. He has been more involved in it too.

Mr. ROMINGER. We are involved with EPA. We have been involved and we will continue to be involved. I co chaired the advisory committee that we set up. I co chaired it with the Deputy Administrator of EPA. And that was a 50-person advisory committee and agriculture is well represented on that committee. We had several meetings last year. We will be scheduling another meeting soon.

Our scientists are involved in this reassessment and EPA will soon be coming out with the first of what we call the refined assessments. They put out some preliminary risk assessments. That did not include our information, but they are now using our information and will be coming out with some refined assessments. We believe those assessments will look much better from an agricultural viewpoint, although I think we all recognize there are going to be some uses of some of these materials where we are going to have to look at ways to mitigate some of the exposures that are out there.

Senator BOND. Well, I thank you. We just expect that sound science be used. We will be counting on you and we will be watching.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Bond.

Senator BOND. Thank you, Mr. Secretary.

Senator COCHRAN. Senator Harkin.

Senator HARKIN. Thank you, Mr. Chairman. I apologize for being a little late.

SUPPLEMENTAL APPROPRIATIONS

Mr. Secretary, I understand you made some statement earlier about a supplemental. Could you just cover that for me briefly? I hate to have you go over it.

Secretary GLICKMAN. Well, we have not yet made a formal request to OMB for supplementals. So, I want to make it clear.

But what I did say was in the area of farm loans we are close to running out of emergency loan money. We also have needs in guaranteed loans and some of our direct loans. It could be as high as $1 billion worth of loans, which has a budget exposure of about $100 million. We do not have the absolute final numbers yet. Steve says it will be about a week or so. But that would be one of the things we would need to have.

The reason for that is that the utilization of our loan programs keeps going up because, as you know, we are the lender of last resort. More and more banks come to us because they want our guarantee. Prices have not been so hot. The collateral has not been as good, and so people have been coming to us in greater numbers.

Then Steve mentioned a few other things such as emergency conservation, emergency watershed, and rural development. Most of that is related to disasters in Puerto Rico and some other natural disasters.

I would mention one other thing. The fact of the matter is—and I said this before—that when we passed the 1996 farm bill, we did not expect prices to tumble—well, some did not expect prices to tumble quite as aggressively. Nobody would ever want that to happen. That triggered the loan deficiency payment.

Senator HARKIN. That is right.

Secretary GLICKMAN. And we anticipated initially virtually no applications for LDP's. We will have 1.3 million applications for LDP's. Mind you, that is farmer X going into the local office and saying, I need this program and I need this assistance. Some are saying that that could increase if soybean prices fall and other kinds of things happen. So, in many parts of this country, we are faced with a situation now where there are lines of farmers seeking assistance. There is a waiting period. People are not getting their program payments as fast as they would like. And this is not just only in the FSA. It is also in the NRCS because of the increased workload required under the 1996 farm bill as well.

Now, I do not know if that is going to be part of a supplemental or not, but I did want to tell you that—and a lot of these problems have been created in the last 2, 3 months. They have really become much worse.

Everybody hopes prices will move back up. It is hard to plan a budget anticipating declines. Nobody wants to see that, but we have got to serve people because as problematic as some of the provisions of the 1996 farm bill are, this LDP provision does protect people against catastrophic reductions in market prices, and we have got to be out there providing those payments.

Senator HARKIN. I appreciate that, Mr. Secretary. Again, I urge you to do that with all dispatch. I am hearing more and more from

out in Iowa that the farmers' balance sheets, when they go into the local bank, just do not add up because of these depressed prices and the forecasts. So, I think you are going to have a big demand for this coming up. So, I just hope that you would send a supplemental request up here as soon as possible, knowing that it takes us a while to get things done here too. But I would think February, March—man, we have got to hurry and get that done. But I appreciate your focusing on that and I just hope that does come up here.

PSEUDORABIES PROGRAM

Let me again compliment you, Mr. Secretary, on responding as vigorously as you have been to the problems in the pork industry. First of all, I again commend you for what you have done on the pseudorabies program. That is three bangs for the buck there. Not only do you get rid of some hogs—it helps market prices—but you help more States to become pseudorabies free. That saves farmers a lot of out-of-pocket money. And third, it enhances our exports especially to Canada where I know you have also done some great work in getting the Canadians to back off of their quarantine. I believe that has already happened, if I am not mistaken.

Again, I compliment you for that, to get that done, which you have done also with Argentina in getting more exports to Argentina. Both the Canadian and the Argentine issue you have handled very well, and we really appreciate it very much.

MARKET CONCENTRATION

On the issue beyond that of concentration and stuff, I think our authorizing committee is really going to have to really take a look at this and see what we want to do about this whole issue of concentration. Again, it comes back to the price reporting. If you are going to have a market that operates, it seems to me it has got to be transparent. I have always said for a free market to operate, you have got to have a lot of players and it has got to be transparent. Otherwise, you do not have a free market. So, what do we have now in agriculture? A few players and no transparency. How can that be a free market?

So, I am hopeful that we can do something to provide for price reporting. Now, we had that in the bills last year and it did not make it. I am hopeful that we can get something done on it soon. Some people say, well, it may not do that much. Well, I am not so certain. It may do quite a bit. I mean, anything. If it adds up to just a few pennies a pound, that is not bad. Everything helps to get that price of pork up and give the farmers a little bit better shake.

I just saw the article in the Wall Street Journal the other day that said that IBP's profits for the fourth quarter quadrupled. I am preaching to the choir, but I mean, you know how that rubs farmers. Their profits quadrupled and here farmers in December in Iowa got the lowest prices for their pork than they got even in the depression. If you factor in inflation, they got lower prices for their pork than what my father used to tell me about 4 cent hogs, nickel hogs. That is true.

We figured this out, Mr. Chairman. We had 8 cent hogs in December. Well, in the depression, the lowest was 4 cent hogs. But

if you factor back for inflation, take that 8 cents back, in 1933 prices, it would have been two-thirds of a penny a pound. That is just mind-boggling when you think about it.

All the things you are doing, I am just saying, Mr. Secretary, are good and it is moving us in the right direction. If we can get the price reporting and get your help on this concentration issue to move that ahead also.

On the cash assistance, now you did do something that you have not done for a long time, and that is give direct cash assistance to pork farmers. That is good. To the small ones, they needed that. But I know the pot is not an endless pot there. I assume we cannot expect any more. I do not know. Can you speak to that? I do not know how much more we could expect on that.

Secretary GLICKMAN. Certainly it would not be prudent to expect any more out of that particular pot of money. This is section 32, a statute that was passed in the depression. Most of that, of course, is what we use to buy product that is in surplus supply for our commodity distribution programs, such as the National School Lunch Program.

The language in one of the parts of that legislation says that I can basically go out in the marketplace and buy surplus commodities or can use the authority of the program to make payments to farmers. I think the section indicates that one of the things I can do is reestablish farmers' purchasing power by making payments in connection with the normal production of any agricultural commodity for domestic consumption. Determinations by the Secretary as to what constitutes diversion and what constitutes normal channels of trade and commerce and what constitutes normal production for domestic consumption shall be final. A different era. [Laughter.]

But section 32 is primarily used to purchase commodities. So, we used about $50 million worth of it for direct payments to farmers. We have been criticized in some sectors for not coming up with enough money, but quite frankly, we have got to reserve most of that for the purchases for our programs, our nutrition programs.

Senator HARKIN. Sure, sure.

SBA RURAL ASSISTANCE

Last, Mr. Secretary, I remember back in the 1970's—I may be off a little bit. Have your people research this. SBA got involved with helping farmers with USDA. I do not exactly know how that arrangement was set up. Some of your historians or something could tell you that. I will get my staff looking at it too. But SBA came in in the 1970's and helped farmers out, and it was some kind of a joint effort between SBA and USDA.

Now, what I am thinking about here and what I am getting at is that not only farmers are hurting, but we have got a lot of retail stores in our small communities and stuff that are facing the same kind of balance sheet problem as farmers. And it is not just implement dealers. It is a lot of other ancillary type of businesses that relate to the rural sector. Now, they are going to their banks and their banks are saying, gee, you are not looking too good here.

So, while it may take a while for us—I hope not. We hope that prices come up very rapidly, but we have to be realists about this

and understand it may take some time. Is there any kind of arrangement that can be made with SBA—and I do sit on the Small Business Committee. Senator Bond heads that committee—to see if there may not be some role for SBA to play not so much for farmers but with these retail businesses in these small communities and for USDA to work with them on it.

I just throw that out there. I do not know.

Secretary GLICKMAN. Well, I think it is a good suggestion. James Lee Witt, head of FEMA, who has done a tremendous job of dealing with disasters, tells me that SBA has much more authority, lending authority in the case of disasters, in terms of who they can lend to than we do. For example, we cannot make a business loan as much as they can. They cannot lend to farmers. There is a regulatory kind of hold there. He has repeatedly said it is something that may need to be fixed legislatively.

I would have to say that we did announce, actually earlier this week, a new rule making it easy for banks to become preferred lenders from the standpoint of participating in our guarantee programs. They would not have to go through a lot of the paperwork. It was alleged—and it was a fair allegation—that we put banks through much greater hoops than SBA did in terms of qualifying for accelerated assistance, and we did make some changes there this week.

Senator HARKIN. I appreciate that.

I just think, Mr. Chairman, Mr. Secretary, if there is some way that we—I am going to have a look at that. I think it was 1977 or 1978 or somewhere in that range. It had to be because that is about when I got here and I remember that. The 1977 drought my staff tells me. So, we ought to see if there is some model there that we can use. That is all I suggest to you.

But, again, thank you for all the help you have been to our pork farmers. I appreciate it.

Secretary GLICKMAN. We will research that as well.

Senator HARKIN. Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

RURAL DEVELOPMENT

Mr. Secretary, one area that you mentioned in your remarks and that I have a great interest in as well because of our State's dependence upon rural communities and infrastructure in small towns, and the problems that go along with trying to sustain that infrastructure, is the availability of money for water and sewer systems. That is very important in our State and throughout the country.

I am curious to know whether we are taking into account in the administration of these programs the deterioration of some of the systems that have been in place for a number of years now. In our State, we are seeing maintenance problems develop, the need to replace parts of systems that are just flat worn out. Are we doing anything in the administration of these programs to try to deal with those problems and help rural communities refinance or modernize these systems? We still have some areas where they do not have systems, and I am not suggesting that we ignore those, but

this maintenance problem and the deterioration of existing systems is getting severe in a number of areas in our State.

Secretary GLICKMAN. The short answer is yes. The repair and modernization of old systems is one of the priorities. But I will have to tell you I am going to go back and talk to our Under Secretary Jill Long Thompson to see about the specific targeting in this area. Once you get a system that is 20 or 25 years old, built with our money, it may need a heavy dose of repair, and if we have this extra money this year because of, as I said, the interest rate phenomenon, it may be appropriate for us to examine some sort of a major repair initiative. I would like to talk to her about it. She may have something in mind there.

FOREIGN MARKET DEVELOPMENT COOPERATOR PROGRAM

Senator COCHRAN. One area in your statement you did not talk about was the change in the funding of some of the marketing programs overseas. The Cooperator program for example, instead of funding it through the Foreign Agriculture Service, you are proposing legislation to shift that to the Commodity Credit Corporation. The budget proposes some other changes of that kind.

Are we at a point now where the decision is being made that exporters and the private sector can do this on their own, or is the Department of Agriculture just slowly backing out of its partnership with farmers and exporters to try to increase market share abroad and make sure our export programs are being treated fairly in foreign markets?

Senator Bond talked about the beef problem in the European Community.

It seems to me that rather than doing less in this area, we need to look for ways to do a better job and a more aggressive job expanding markets and increasing market opportunities overseas.

Secretary GLICKMAN. Well, again, I think it is a fair question, and the answer is no. It is not an intention to do less. The fact is that it is a dog-eat-dog, competitive world out there, particularly when prices are so weak.

I would like Mr. Dewhurst to respond specifically to your question on the funding of this program.

Mr. DEWHURST. Well, as you have said, the discretionary budget in the Department is under great pressure, and one of the proposals made in this budget is to take the FAS Cooperator program which has been funded on the discretionary side of the budget and ask the Congress to pass some legislation which would have the effect not of cutting the program, but of simply moving the funding for it to the mandatory side of the budget, funded out of the Commodity Credit Corporation from year to year.

The logic for that is simply that the Cooperator program is part of our overall export portfolio and the vast majority of that portfolio is already financed out of the Commodity Credit Corporation. So, it seemed a logical step to move the Cooperator program over there and the truth is it would just relieve some pressure on the discretionary budget.

COCHRAN FELLOWSHIP PROGRAM

Senator COCHRAN. There is one program that you usually mention but you did not this year, and I wonder if there is any problem. Did you fund the Cochran fellowship program in this budget request? [Laughter.]

Secretary GLICKMAN. I certainly hope so. [Laughter.]

Mr. DEWHURST. It is unanimous we did.

Secretary GLICKMAN. Yes.

Senator COCHRAN. I think Mr. Dewhurst said it is unanimous you all hope you did. [Laughter.]

Secretary GLICKMAN. As a matter of fact, I have to tell you that I have met personally several Cochran fellows. I am going to go back to South Africa next week. The Vice President has a joint meeting with Mr. Mbeki. It is one of the places where we have used the program most aggressively. The budget numbers are actually up slightly, or am I wrong?

Mr. DEWHURST. The Budget is about the same. We have $3.5 million requested in appropriations for that program which is the same level as fiscal year 1999. We also add some Commodity Credit Corporation funding to that program and some funding we get from AID over in the State Department, so that the total program is $6.3 million in the 2000 budget.

Senator COCHRAN. That is good.

Tell me about your South African experience.

Secretary GLICKMAN. Well, there was a young man who came over to this country to learn about viticulture and went back to South Africa and now operates I think a successful vineyard. That is just one example of how this program created an entrepreneur in South Africa, and I am sure it is replicated in other places.

Senator COCHRAN. With close business ties to the United States now.

Secretary GLICKMAN. That is correct.

Senator COCHRAN. Well, I think that is the purpose, to try to help develop closer relationships between people who are getting involved in agriculture and agribusiness operations, developing ties with them, letting them know how our system works, free enterprise, the market-oriented economic system. Hopefully this means closer cooperation and friendlier relations throughout the world, particularly in developing and emerging democracies.

Eastern Europe is another example of an area where the program has been very popular, and we have had a large number of people come from Poland and other countries to the United States, spend a few weeks or several months, or for whatever period the program allows these individual applicants to participate. And then they take with them these experiences, and it has a catalytic effect in their home communities. That is what we have learned in the past.

We appreciate your support.

Mr. Rominger.

Mr. ROMINGER. I just wanted to add that it is a very popular program. The Minister of Agriculture from Romania was just here this week, and that was one of the things that he asked about, whether they could participate in the program because they have heard

about it and would like to participate as they try to move more to a market oriented economy.

Senator COCHRAN. That is good to hear.

ADDITIONAL COMMITTEE QUESTIONS

Well, thank you very much for your attendance and your cooperation with the committee and the presentation that you made so we can more fully understand this budget request.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

USDA INFORMATION MANAGEMENT SYSTEMS/SUPPORT SERVICES BUREAU

Mr. Secretary, your prepared statement indicates that the statutory cap on Commodity Credit Corporation (CCC) expenditures for computer equipment will be nearly exhausted by 2000 "preventing needed investments in the Department's streamlining and Service Center initiatives and prohibiting the Department from investing in much needed technology for business process re-engineering efforts".

The budget requests an appropriation of $74 million for computer investments of the proposed new support Services Bureau, that the remaining $16 million in CCC expenditures under the existing cap be transferred to the Bureau, and that legislation be passed to raise the limit on CCC expenditures for computer equipment by a total of $105 million for the next three fiscal years.

Question. Would the $16 million in available CCC funds be greater had the Department not proposed to reduce these funds in order to pay for the cost of waiving the statute of limitations for certain discrimination cases filed against the Department?

Answer. The 1996 Farm Bill set a cap of $275 million for CCC-funded ADP obligations for fiscal years 1997 through 2002. Subsequently, the Agricultural Research, Extension, and the Education Reform Act of 1998 reduced the CCC ADP cap to $193 million. The fiscal year 1999 Appropriations Act again reduced the CCC ADP cap to $188 million. If the cap had not been reduced from $193 million to $188 million, instead of $16 million remaining under the cap at the end of 1999, there would be $21 million remaining under the cap at the end of 1999.

Question. If so, how much money from the CCC would be used?

Answer. All of the $21 million remaining under the cap would be used in fiscal year 2000 for CCC ADP expenditures.

Question. Mr. Secretary, does this not violate your commitment to me that any funds used from the CCC computer account to pay for the waiver of the statute of limitations would not have to be made up in future year appropriations?

Answer. The funds remaining under the CCC cap on ADP expenditures would be insufficient under either the current or prior cap. Legislation lifting the cap would be needed in either case. We are proposing to fully offset the increase of $105 million in the current cap by an equivalent reduction in the level of funding authorized for the Export Enhancement Program in fiscal years 2000 to 2002.

Question. Please tell us about the importance of your administrative convergence initiative and the fiscal year 2000 $74 million appropriations request for a new Support Services Bureau.

Answer. Since 1993, the county-based agencies (Farm Service Agency, Natural Resources Conservation Service and the Rural Development mission area) have been implementing streamlining plans to cut red tape and collocate field offices, with the goal of providing "one-stop service" for customers. The next phase of this streamlining involves converging the administrative organizations of these agencies. An initial administrative convergence plan has been developed to create the Support Services Bureau (SSB). This plan combines the administrative structures of these agencies into one unit to deliver better services to local customers and employees, provide a new consistency in administrative policy and operations, make better use of limited resources, and help preserve limited budget resources for program delivery. The SSB will provide human resources, civil rights, financial management, information technology and administrative services. The salaries and expenses of the new bureau will be financed through direct appropriations and transfers from the serviced agencies. The Secretary has named an acting Director of the SSB to de-

velop implementation plans so that the new consolidated organization will be operational by October 1, 1999.

The $74 million appropriations request provides funding for the Service Center Modernization Initiative (SCMI). The SCMI supports the on-going change management, customer service, business process reengineering, and enabling technology projects. For the past several years, this effort has been funded by individual appropriations to the partner agencies. However, fiscal year 2000 agency budgets do not include funding for this initiative. This account will replace those individual funding sources and provide for improved management and accountability as this initiative moves forward with major activities to reengineer business processes, acquire a common computing environment, and create "one-stop service" for customers.

FOREIGN MARKET DEVELOPMENT COOPERATOR PROGRAM

Question. In past years, this Administration proposed that the Foreign Agricultural Service directly fund certain costs supported by the Commodity Credit Corporation (CCC), proposing that the Foreign Market Development Cooperator Program be reduced to offset these and other increased appropriations requirements. Now, the President's fiscal year 2000 budget proposes that the Cooperator Program be funded by the CCC rather than the FAS appropriation to provide stability for future program activities. Why is there a reversal in position, both as to which costs should be borne by the CCC and the level of funding for the Cooperator Program?

Answer. It is correct that several recent President's budgets proposed that funding for certain FAS activities be shifted from CCC to the FAS annual appropriation. These proposals were primarily related to funding for the operating costs of the CCC Computer Facility, which supports FAS' data processing activities, as well as for other FAS information resources management (IRM) costs. These proposals were based on the view that it is more appropriate to support these types of expenditures through discretionary funding, in this case the FAS appropriation, rather than through mandatory funding such as CCC.

At the same time, it is entirely appropriate to fund market development activities, including those carried out through the Foreign Market Development Cooperator Program, through CCC. In fact, the Market Access Program, which also helps to build foreign markets, is already funded through CCC. In addition, the CCC Charter Act specifically authorizes the use of CCC funds for market development activities, such as those supported by the Cooperator Program. A permanent authorization for CCC funding of the Cooperator Program, would provide stability to the program and enhance long-term planning as noted in the question.

It should be pointed out proposals in past years' budgets to reduce funding for the Cooperator Program were prompted in part by large carryover funding balances in the program and were a means of reducing those balances. Also, there was a concern that perhaps the program had become static and less effective. As a result of changes adopted by FAS in recent years, including implementation of a competitive application process, it is fair to say that those concerns have now abated to a considerable extent. Consequently, the 2000 budget continues funding for the program at this year's level.

YEAR 2000 (Y2K)

Question. I note that the Department of Agriculture continues to be listed as a Tier Two agency ("making progress, but with concerns") in OMB's most recent quarterly Y2K report to the Committee. The concerns cited continue to be: (1) the need to increase the pace of work to meet government-wide goals; and (2) the need to work out many "data exchanges" issues.

What is being done by the Department to address these concerns?

Answer. USDA currently projects near total compliance for mission critical systems by the March 31, 1999 government-wide implementation deadline. We are now tracking 353 mission critical systems, of which 76 percent are compliant. Of the 263 mission-critical systems being repaired, 257 (98 percent) are now renovated, 241 (92 percent) are now validated and 219 (83 percent) are now compliant. There are 44 mission-critical systems scheduled for repair which have not completed the entire repair process. Of these, 22 have completed testing and are on schedule for implementation, six are in renovation and 16 are in validation. All are expected to be implemented by March 31, 1999. There are 35 systems remaining to be replaced. Of these, 20 are in final testing. Fifteen are in development. All but six are expected to be implemented by March 31, 1999.

For data exchanges, USDA has inventoried its data exchanges and has identified exchanges with federal, state, local government, private sector, and foreign federal and private partners. Departmental agencies are actively engaged in dialog with

their partners to ensure compliance. Overall, USDA is responsible for 467 data exchange files representing 1,480 exchange partners. 98 percent of the 467 USDA data exchanges identified have been renovated; 96 percent of the 1,480 partners have been contacted, 80 percent have written agreements on date format and 22 percent of partners have successfully tested exchanges.

Of the 331 federal exchanges, the National Finance Center (NFC) is responsible for 262, representing 682 partners, primarily payroll and finance offices. USDA tracks these exchanges individually because of their importance to payroll, personnel and the Thrift Savings Plan. USDA agencies are continuing to work with their partners to test exchanges, including end-to-end testing.

USDA agencies are also working with their private sector partners to ensure compliance. Certifications and contingency plans are being received from some companies. Follow-up is being done with those companies who have not reported. Some company reports indicate a deep level of commitment to successful processing in 2000. In addition, contingency plans indicates companies have a clear plan for maintaining business continuity through the date change

Question. How would you characterize the status of the Department's activities to achieve Year 2000 compliance?

Answer. USDA has given strong management attention to Year 2000 compliance and is working to ensure the uninterrupted delivery of Department programs and services. Mission critical systems are well on their way to compliance, as noted above. Significant attention is being given as well to non-mission critical systems, embedded technologies, facilities, and telecommunications. We will continue to do testing and we are devising business continuity and contingency plans.

Question. The Fiscal Year 1999 Omnibus Appropriations Act provides contingent emergency funding for Year 2000 computer conversion activities. USDA has already received two allocations totaling $37.8 million of the emergency funds reserved for non-defense activities.

Has the Department completed a full assessment of its Y2K requirements? What additional funding do you estimate to be required?

Answer. Assessment of Y2K requirements are continuing. While mission critical systems have been identified and virtually all will be compliant by March 31, 1999, assessment of embedded systems and telecommunication systems are ongoing. Additional funding is likely to be required for system remediation, testing, independent verification and validation, technical assistance and business continuity planning

Question. Has OMB allocated the full amount requested by the Department to date? If not, what did USDA request over and above the allocations provided? Why were these requests not met?

Answer. The majority of USDA requests were supported by OMB. In some isolated instances there was a determination that the request went beyond basic Y2K requirements and should be addressed through base level appropriations.

Question. Do you anticipate to request additional emergency funding allocations to cover the full amounts estimated to be required?

Answer. As USDA identifies new requirements, supplemental funds will be requested.

Question. Does the President's fiscal year 2000 budget request any additional funding for the Department's Y2K compliance activities? How much is requested, by agency?

Answer. Agencies have identified $10,186,000 for Y2K compliance activities for fiscal year 2000. I will provide a breakdown of these costs by agency.

[The information follows:]

USDA Year 2000 Fiscal Year 1999–2000 Costs

[Dollars in thousands]

Agency	*Total Fiscal Year 2000 Costs*
Foreign Agricultural Service	$70
Farm Service Agency—KC	2,130
Farm Service Agency—HQ	
Risk Management Agency	
Farm and Foreign Agricultural Services	2,200
Food and Nutrition Service	
Food, Nutrition and Consumer Services	
Food Safety and Inspection Service	85
Food Safety	85
Agricultural Marketing Service	30
Animal and Plant Health Inspection Service	2,196

Agency	*Total Fiscal Year 2000 Costs*
Grain Inspection, Packers and Stockyards Administration	
Marketing and Regulatory Programs	2,226
Forest Service	200
Natural Resources Conservation Service	110
Natural Resources and Environment	310
Agricultural Research Service	205
Cooperative State Research, Education and Extension Service	280
Economic Research Service	60
National Agricultural Statistics Service	100
Research, Education and Economics	645
Rural Development	
Offices	
Departmental Administration	500
National Appeals Division	
Office of the Chief Financial Officer—NFC	1,000
Office of the Chief Information Officer	2,920
Office of Communications	300
Office of the Chief Economist	
Office of the Inspector General	
Office of Budget and Program Analysis	
Office of the General Counsel	
Subtotal	4,720
TOTALS	10,186

Question. To what extent, if any will the Department require additional funding in future years to replace base information technology resources diverted from non-Y2K mission critical elements?

Answer. The Department has deferred IT investments to the maximum extent possible. The Department has worked to leverage investments required by Y2K to support modernization objectives. Necessarily, however, some projects have had to be deferred as Y2K efforts took priority. Base level resources will be rededicated to continuing these efforts after we have satisfied the Year 2000 requirements.

Question. What is being done to make sure that state-operated systems essential to the uninterrupted deliver of Federal programs, such as Food Stamps, are Year 2000 compliant?

Answer. Food and nutrition programs are vital to the availability of food for millions of Americans, and a priority for USDA. The Food and Nutrition Service (FNS) is tracking and reporting Year 2000 progress from its 50 state partners, Guam, Virgin Islands, Puerto Rico and the District of Columbia for the Food Stamp Program (FSP) and the Supplemental Program for Women, Infants, and Children (WIC).

The role of the states in the delivery of Food Stamp, WIC and Child Nutrition Program is to administer the programs, determine eligibility and provide benefits and necessary service to the public.

The Special Nutrition Program Directors in the FNS Regional office have contacted State agencies which administer School Lunch Program and other Child Nutrition Programs to determine the status of their preparations for the Y2K conversion and their plans for additional compliance activity and for back-up systems to cover possible Y2K related systems failures. FNS is coordinating with the Department of Education on developing a Y2K status report for state education systems which include school food service. FNS has concentrated information outreach to state agencies and local cooperators through professional conferences and newsletters.

States must certify to FNS that they are Year 2000 compliant in three areas: software, hardware, and telecommunications. States reporting that they will not be compliant by March 31, 1999 must certify in writing that they have a working contingency plan in place which will assure the delivery of benefits to FSP and/or WIC recipients.

FNS will be closely monitoring those states reporting Year 2000 compliance after March 31, 1999. FNS will offer technical assistance to states requiring help and will follow up with on-site reviews for those states reporting that they will not be compliant until after March 31, 1999.

ASSISTANCE TO HOG PRODUCERS

In early January of this year, $50 million in direct cash payments under the Section 32 Program were extended to small hog producers to help them weather the current economic crisis. The statutory authority used to make these payments I understand has been used on only four other occasions in the past. It authorizes the Secretary to "reestablish farmers' purchasing power by making payments in connection with the normal production of any agricultural commodity for domestic consumption".

Question. Will you also exercise this authority to provide assistance to producers of other commodities in similar circumstances?

Answer. In the event of future economic crises, we will consider all the options available to us for assisting producers, including the authority use of section 32 to reestablish farmers' purchasing power.

Question. What assistance have you extended to hog producers to date and how has this additional assistance been funded?

Answer. We have been very busy the past few months addressing the pork industry's very critical situation. On January 8, Vice President Gore announced that the Department of Agriculture will provide $50 million in direct cash payments to small, family hog farmers. This is the first time in nearly four decades that USDA has made such payments. Since February 1998, the Agricultural Marketing Service (AMS) has purchased more than 123.9 million pounds of pork worth $116.5 million to provide nutritious food for Federal food assistance programs. AMS has improved its live hog market reports for 1999, and at meetings with major hog slaughterers and processors, I have encouraged greater voluntary cooperation with AMS market news reports. The Animal and Plant Health Inspection Service accelerated its voluntary pseudorabies eradication program, helping to remove up to 1.7 million hogs from the market.

An emergency transfer of $80 million will pay farmers fair market value for lost hogs, as well as cover the cost of destruction, disposal, and transportation costs. The president had established an interagency working group to look at concentration issues at different stages of production. The work is led by the White House National Economic Council and USDA, and it includes representatives from the Federal Trade Commission and the Department of Justice. We want to be sure that, at a minimum, we have a baseline of information to examine the effects of the changes that are going on in the industry and an analytical basis for comparing what is going on in the hog industry to that of other industries. And, the Administration successfully opened two new markets for U.S. hogs and pork in late 1998. Canada eliminated the quarantine and testing requirement for U.S. hogs originating in 33 States free of the disease and Argentina began allowing entry of U.S. pork with certain controls. The Argentine market is expected to be worth between $5 to $10 million annually. In addition, as you know, USDA announced the a 50,000 tons of pork will be included in the food aid package for Russia.

Question. Will additional assistance to these producers be provided?

Answer. Currently we do not know. However, we will continue to monitor the situation closely, and there are several Bills pending that provide for additional assistance to hog producers.

Question. Mr. Secretary, the USDA has announced that 1.9 million head of hogs will be rendered/slaughtered because of the accelerated pseudorabies eradication program. This will require may hog processing plants to work overtime including weekends. Has the Department issued the Food Safety Inspection Service a waiver for overtime pay for Federal inspectors beyond the first shift of overtime? If not, why?

Answer. FSIS has not issued a waiver for the collection of inspector overtime beyond the first shift. FSIS would be unable to absorb the cost of performing the additional inspection services being requested.

TOBACCO ASSESSMENT

Question. Mr. Secretary, your prepared statement indicates that the "appropriations request will include a proposed assessment on tobacco marketings similar to the expiring marketing assessment established in the Budget Reconciliation Act of 1993." We do not find this proposal in the President's budget. Has this proposal been submitted to the Congress? Please explain. Also explain why this will be an appropriations proposal and not a legislative or tax proposal.

Answer. I understand that the President's Budget documents mention that a tobacco assessment will be proposed, but the actual language for the proposal was omitted from the appropriations language submitted with the budget. The Office of Management and Budget (OMB) plans on sending proposed provisions for this as-

sessment in a budget amendment or alternatively in the form of proposed legislation supporting the proposal in the budget. The proposal would provide for collection of $60 million in marketing assessments on price supported tobacco and similar imported tobacco in fiscal year 2000. The portion of the assessment placed on producers would be held at levels near those of the expiring marketing assessment while purchasers and importers would be required to pay a higher rate.

The intent of the proposal is to place this assessment in the appropriations language or provide some alternative mechanism to permit the collection to offset discretionary spending for the budget scorekeeping purposes. We recognize that an approach using only appropriations language restricts the assessment collections to the fiscal year which does not correspond precisely with the marketing year for fluecured tobacco.

CREDIT PROGRAMS

Question. Primarily due to low interest rates, the subsidy cost of appropriations required to support agriculture, and rural development and housing programs are projected to be less in fiscal year 2000. This has enabled the Administration to propose program level increases for farm credit and rural development and rural housing programs at the same or less cost than in fiscal year 1999. For example, the budget proposes a $3 billion loan level for farm assistance, $183 million more than the loan level supported by the fiscal year 1999 appropriations, but at a lower subsidy appropriation ($77 million versus $121 million).

If farm and rural credit programs were held at fiscal year 1999 program levels, what savings in subsidy costs requirements for these programs would result from fiscal year 1999 to fiscal year 2000?

Answer. If the farm credit programs were held at the fiscal year 1999 program level, the subsidy cost for the program would increase $22 million in fiscal year 2000. Subsidy rates have dropped for most of the loan programs or in a few cases risen by less than one percent. However, due to the combination of the mix of loan levels for the various programs in fiscal year 1999 versus fiscal year 2000, and the differences in the subsidy rates for the various programs which range from less than one percent to over 15 percent, the net effect of funding the fiscal year 1999 loan levels at the fiscal year 2000 subsidy rates would be an increased subsidy cost in fiscal year 2000.

On the other hand, the cost of funding the Rural Development loan programs at the fiscal year 1999 program level using the fiscal year 2000 subsidy rates would be $124 million less than the current fiscal year 1999 subsidy costs for these programs. It should be noted that overall for the Rural Development mission area, the proposed fiscal year 2000 program level is about $800 million higher than the fiscal year 1999 level ($10.2 billion versus $10.9 billion), at a cost of $181 million less than in fiscal year 1999 ($2.2 billion versus $2 billion.)

Question. How much of this savings is allocated to program level increases for USDA credit programs in the President's budget and how much is used to offset other proposed discretionary program increases?

Answer. There is no direct connection between the savings in the credit programs and increases in other discretionary programs. The President's budget was developed to be consistent with certain spending ceilings, and all programs had to compete for funds. However, the process did not pit specific programs one against one. Rather, savings or increases in any one program affected the amount that was available for all other programs. Further, decisions on program levels were based to the extent possible on demonstrated need rather any allocation of funds that remained available. It is noteworthy to add that USDA's credit programs in most part are budgeted at or above their 1999 level, which suggests strong support for these programs in light of some very tight budget constraints.

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

Question. The President proposes an increase in funding for the WIC program for fiscal year 2000 to cover food and administrative cost increases, as well as participation increases. What is the basis of each of these assumptions?

Answer. FNS inflates the food cost estimate using the inflation rate of the Thrifty Food Plan index (from the Food Stamp Program) which is projected by OMB. FNS adjusts the Nutrition and Administrative Services by OMB projections of the State and Local Consumption, Expenditures and Investment Price index projections provided by OMB. As for participation, we believe that an average of 7.5 million participants will be assisted in 2000. Although participation is around 7.4 million right

now, over the past year or so the program has already achieved 7.5 million participants in some months.

ASSUMPTIONS SUPPORTING THE WIC REQUEST

Question. The President's fiscal year 2000 budget proposes to increase the WIC appropriation from $3.924 billion for fiscal year 1999 to $4.105 billion for fiscal year 2000. The President's budget indicates that the out-year requirements for the WIC program will remain at the $4.105 billion level for each of fiscal years 2001 to 2004. What assumptions are these out-year projections based on, with respect to program participation levels and food package and administrative costs?

Answer. The WIC budget projections for 2001 to 2004 do not reflect specific detailed assumptions regarding participation levels and per-person food costs. Rather, the out-year estimates are merely a straight-line of the fiscal year 2000 request.

DOD WIC PROGRAM FOR OVERSEAS PERSONNEL

Question. I understand the Secretary of Defense has the discretionary authority to carry out a program to provide special supplemental food benefits to members of the armed forces on duty at stations outside the United States and to eligible civilians serving with, employed by or accompanying the armed forces outside of the U.S.

Has the Department of Defense (DOD) discussed the delivery of WIC benefits to its personnel stationed overseas?

Answer. Yes, as you may know, DOD's authority to run a WIC-type program may be found at 10 U.S.C. 1060a.

COST OF WIC FOR OVERSEAS DOD PERSONNEL

Question. What additional funding would be required to deliver WIC benefits to DOD and civilian personnel stationed overseas? What number of persons do you estimate would be eligible for these benefits?

Answer. I am told that DOD has estimated that for fiscal year 2000 the post exchange system would deliver WIC commodities for an average of about $29 per recipient per month. This compares favorably with the stateside cost estimated to be about $33 in 2000. Overall, they believe participation could be somewhere in the 32,000 range, so it is reasonable to anticipate a food cost of around $11 million a year. In general, the non-food costs of running a WIC type program for DOD overseas—nutrition education, referrals for medical care, and client and store management—are largely already included in existing, funded activities. Let me look into this and provide some additional detail later.

DOD faces uncertainties in predicting likely participation overseas, just as USDA does for the WIC program stateside. As for participation of military family members overseas, DOD has estimated that based on pay levels and family configurations for persons posted overseas, there are as many as 31,173 income eligible infants and children under the age of 5 in households of military personnel posted overseas. Assuming that nutritional risk is the same as for the regular Stateside WIC program, i.e., about 81 percent of income eligibles would have nutritional risk, the outside maximum participation could be 31,782. Actual participation could be lower, DOD reports, because this figure does not take into account spousal incomes; it includes some family members who are not, in fact, living overseas; and it assumes 100 percent participation.

DOD WIC DELIVERY SYSTEM OVERSEAS

Question. Is there a delivery system in place for the provision of these benefits?

Answer. As we understand it, the delivery system is essentially in place. Since medical services are provided, DOD apparently believes that it already can determine which women, infants and children are at nutritional risk; they provide some nutritional guidance; and they provide medical services. Food packages would be prescribed and then provided through the DOD post exchange system. Adding food packages to DOD's existing activity would drive home the nutritional messages and help assure good nutritional outcomes, just like it does for the regular WIC program. DOD says that this will help focus the military medical and family support services more directly on helping these needy families, and the post exchanges would make sure the right foods were available, substitutions were not allowed, etc.

RESPONSIBILITY FOR WIC BENEFITS FOR DOD OVERSEAS

Question. Who would be responsible for the cost of delivering these benefits—USDA or DOD?

Answer. Current statute would appear to permit use of funds from DOD or USDA. USDA could fund the food portion of the DOD WIC program if USDA appropriations language explicitly provides such authority. Nutrition services and administration costs are the responsibility of DOD.

DIFFERENCE IN NATURAL VERSUS REFINED SUGAR

Question. Are you aware of any new scientific evidence that indicates that all forms of sugar are metabolized by the human body in the same way, that is, the human body cannot distinguish the difference between the sugar contained in fruit and sugar found in other forms, such as refined crystals of honey?

Answer. I am told that the Dietary Guidelines Review Committee is going to take a look at the recommendations made for sugar that will appear in the Dietary Guidelines 2000. I am not aware that there is new information in the area, but will be interested to see any recommendations that come from the Review Committee.

As far as how sugar is metabolized, it is my understanding that the cells use principally glucose, so that almost all the sugars must be digested down to glucose before it is absorbed by the cells and then metabolized. So, I think it is generally correct to say that the body cannot distinguish the source of glucose when it is metabolized. Let me follow-up with a little more technical information on this.

As far as digestion goes, I don't know that it would be correct to say that each type of sugar is digested in exactly the same way. In any case, nutritionists generally prefer that people acquire sugars from a variety of fruits, vegetables and grains—foods with no added sugars—because such foods provide other important vitamins and minerals.

Almost all the sugars must be converted to glucose before they are used by the cells for energy, i.e., metabolized. The products of digestion of sugars, "natural" or "added," as well as carbohydrates, are approximately 80 percent glucose, and 20 percent fructose and galactose. The fructose and galactose are absorbed into the blood stream and then converted into glucose by the liver, so that more than 95 percent of sugars are present in the blood as glucose. Consequently, it appears reasonable that the body cannot distinguish the source of glucose or fructose when it is metabolized and used to produce energy.

SUGAR IN THE WIC PACKAGE

Question. What is the total allowable sugar content of the WIC food package?

Answer. USDA does not set limits on the total amount of sugar allowed in a WIC food package. Federal WIC regulations do limit the total amount of sugar permitted in WIC adult breakfast cereals to no more than 6 grams of total sugars per dry ounce of cereal, including both naturally occurring and added sugars.

Sugar occurs naturally in many foods, including WIC foods such as milk and fruit juices. Sugar is added to many foods, including WIC foods such as adult breakfast cereal and peanut butter. With seven different WIC food packages and choices within them, calculating the total sugar content of the packages would be complicated and a little speculative. However, USDA's Center for Nutrition Policy and Promotion (CNPP) recently completed a comprehensive review of how well the WIC packages meet the needs of the WIC target population. A final report is expected to be available soon, which I will be glad to share with Members of Congress. The report provides some ideas on sugar, so I will ask for some additional information on the topic.

There are seven WIC food packages, each designed to supplement the nutritional needs of different categories and ages of participants. The types and amounts of foods vary among the food packages and choice of foods in the packages may also be exercised at the State and clinic levels, and of course, by the client when she redeems the WIC vouchers in the store.

While the sample sizes in existing data sources used for the WIC package study were not ideal, they were adequate to estimate that WIC foods provide about 1 teaspoon of added sugar to the diets of women and children a day. One teaspoon is about 4 grams of sugar. Total daily added sugar intake from all foods for WIC children and women ranged from about 12 to 23 teaspoons per day, with older children and women toward the high end of the range. Each target subgroup consumed more added sugar than recommended in their total diet. However, total calorie consumption did not appear to be a problem in this review.

WIC foods include: iron-fortified infant formula, special infant formulas and certain medical foods, iron-fortified dry infant cereal, infant juice high in vitamin C, 100 percent fruit and/or vegetable adult juice high in vitamin C, hot or cold adult breakfast cereals high in iron and low in sugar, milk, cheese, eggs or dried egg mix, peanut butter, dry beans or peas, canned tuna, and carrots. Further, fresh fruits

and vegetables are available through the WIC farmers' market program, where it is available.

CIVIL RIGHTS SETTLEMENT

Question. It is my understanding that settlement payments under the class action discrimination lawsuit against USDA will be paid from the settlement fund for members of the class who choose option A. For those who chose option B, any damages they are awarded will be paid by USDA. I also understand that USDA may incur other costs of the settlement.

Please provide an estimate of the total costs to the Department for the settlement. Break down the costs by agency, the fiscal year the cost will be incurred, a description of the cost, and whether the President's budget accommodates these costs and, if not, how the costs will be paid.

Answer. All settlements under the Consent Decree, both tracks A and B, are to be paid from the Judgement Fund described in 31 USC Sec 1304. The Farm Service Agency (FSA) administers all of the programs covered by the class action suit so FSA will incur most of the administrative costs. The costs will be incurred during fiscal year 1999 and fiscal year 2000, and it is anticipated that they will be taken from budget allocations. At this time we do not know the number of farmers who will choose to participate in the Consent Decree nor can we determine the number of farmers who will choose to opt out of the Consent Decree and engage in negotiated settlements. Given the above it is difficult to estimate what the cost will be. We will provide an estimate of the costs to the Subcommittee once more information is available.

CIVIL RIGHTS OFFICE ADDITIONAL RESOURCES

Question. The fiscal year 2000 budget requests additional resources for the Office of Civil Rights to handle the increased workload in discrimination complaints. Would you please give us a status report on this—the reduction you have made over the past two years in the backlog of discrimination complaints, the additional workload resulting from the waiver in the fiscal year 1999 Appropriations Act of the statute of limitations for certain complaints filed, and the level of new complaints filed with the Office.

Answer. There were 1,088 program discrimination complaints in the backlog. All of those cases have been resolved with the exception of 10 cases where complainants did not accept a resolution offer, eight cases that are being resolved through further investigation, and the class member cases. Of the 497 new cases filed since November 1, 1997, 285 have been resolved and 212 remain active.

There were 2,142 cases in the employment backlog. Of those, over 1,500 have been resolved. Of the 1,234 new employment cases filed, 236 have been closed and 998 remain active.

As a result of the waiver of the Statute of Limitations the Office of Civil Rights currently has 194 eligible cases under review. It is anticipated that several hundred additional cases will be submitted for Statutes of Limitation processing.

DEVELOPING TECHNOLOGIES FOR USE IN AGRICULTURE

Question. Mr. Secretary, I understand that you and the Administrator of the National Aeronautics and Space Administration (NASA) signed a Memorandum of Understanding indicating your intention to cooperate in developing technologies for use in agriculture. It is my further understanding that NASA has designated the Stennis Space Center in Mississippi as the lead site for agriculture application research in remote sensing. Can you tell me of any progress that has been made in implementing this Memorandum of Understanding?

Answer. The U.S. Department of Agriculture (USDA) and NASA signed a Memorandum of Understanding in 1998 to enhance agriculture applications research in remote sensing. The Agricultural Research Service (ARS) has promoted joint efforts between the Stennis Space Center and the Remote Sensing and Modeling Laboratory in Beltsville, Maryland, in cooperation with Purdue University at West Lafayette, Indiana. Through a grant from the Stennis Space Center, we are developing more advanced remote sensing technologies for agricultural applications. The Remote Sensing and Modeling Laboratory has also developed a Small Business Innovation Research (SBIR) grant with 3DI, a small company based in Maryland, to evaluate remote sensing applications in the Mid-Atlantic States; a prominent NASA scientist has also been stationed with this laboratory to assess the capabilities of remote sensing to detect drought and crop water stress conditions. In addition, six ARS locations (Phoenix, Arizona; Shafter, California; Ames, Iowa; Beltsville, Maryland; Lincoln, Nebraska; and Lubbock, Texas) have a cooperative project with Re-

sources 21, a private company, in which remotely-sensed crop growth and production data has been successfully collected from five sites throughout the United States in 1998. USDA continues to coordinate and develop new opportunities to interact with NASA, the United States Geological Survey (USGS), and the National Oceanic and Atmospheric Administration (NOAA) with the goal of reducing the cost and increasing the performance of future Landsat-type satellites which could provide remote sensing data that can be used to improve the management and protection of agricultural lands.

Question. I understand that Dr. Miley Gonzalez, Under Secretary for Research, Education, and Economics, has had some input and conversations with NASA personnel and with representatives of some commodity organizations about research and application programs in remote sensing technologies for crop production. Could you please provide for the record a summary of the current plan to move forward with NASA in a joint effort?

Answer. Dr. Gonzalez hosted a meeting on January 27, 1999, that included representatives from the National Cotton Council; American Soybean Association; Integrated Technology Development; NASA's Stennis and Goddard Space Centers; the Cooperative State Research, Education, and Extension Service (CSREES); and ARS. The focus of the meeting was to develop an integrated strategy for transferring the benefits of remote sensing techniques to food and fiber producers. Dr. Gonzalez agreed that USDA—Research, Education, and Economics (REE) is willing to provide leadership to a remote sensing initiative in partnership with other interested parties to determine the critical needs and priorities for successfully commercializing remote sensing. A major workshop will be held during the summer of 1999 to launch the initiative on the applications of remote sensing to agriculture. A planning committee will be identified with representatives from NASA, CSREES, ARS, and private industry.

GLOBAL CHANGE RESEARCH AND INITIATIVES

Question. Please explain the importance of the President's Global Change Research and Climate Change Technology initiatives for U.S. agriculture.

Answer. The USGCRP was created as a Presidential Initiative in 1989 and formalized in 1990 by the Global Change Research Act of 1990. The Global Change Research Program provides a well-founded scientific understanding of the Earth system to ensure the availability of future resources essential for human well-being, including water, food, fiber, ecosystems, and human health. The U.S. Global Change Research Program (USGCRP) provides the foundation for improving predictions of seasonal to-interannual climate fluctuations (which can bring excessively wet and dry periods) and prediction of long-term climate change. The USGCRP also sponsors research to understand the vulnerabilities to changes in important environmental factors, including changes in climate, ultraviolet (UV) radiation, and land cover. Scientific knowledge is essential for informed decision making and to ensure the social and economic health of future generations.

USDA has been a part of the USGCRP since its inception, with the research focus on understanding terrestrial systems and the effects of global change (including water balance, atmospheric deposition, vegetative quality, and UV-B radiation) on food, fiber, and forestry production in agricultural, forest, and range ecosystems and examines how agricultural and forestry activities can contribute to a reduction in greenhouse gases. USDA research provides policy-makers and agricultural producers with useful, scientific data and information.

Although listed under a global change banner, this research is integral to USDA's critical mission—ensuring an adequate and affordable supply of food and fiber while protecting the resource base for future generations. For example:

—*Interactions between terrestrial ecosystems and the atmosphere*.—Understanding the controls on gaseous exchanges between plants and the atmosphere will improve our ability to manage production because it is these very exchanges that determine net crop yield.

—*Methane generation and nitrous oxide release*.—An improved understanding of processes controlling the uptake and release of these radioatively active trace gasses is also of benefit in other sectors of the agricultural enterprise as it will help to resolve multiple agricultural management problems resulting from climate change.

—*Soil properties*.—Although much emphasis is being placed on the potential for forest, range and agricultural soils to serve as carbon sinks, this very characteristic of soils has always been a critical consideration in agriculture. Losses in soil carbon are related to losses in soil fertility, reduced efficacy of added fer-

tilizers, reduced moisture holding capacity, reduced capacities for pathogen management, and increased soil losses due to erosion.

—*The relationship of climate with production*.—The relationship between weather, climate and production losses from forest and range fires, insects, and plant pathogens has long been documented. The improved understanding of climate variability that results from global change research will enhance our ability to both predict weather events at the local and regional scales and to develop response strategies that will balance agricultural demands with those of other sectors.

—*Contributions of agricultural sources of methyl bromide to stratospheric ozone depletion (and possible alternatives and substitutes for this fumigant)*.—We already know that methyl bromide causes damage to the earth's ozone layer. Our research in this arena is necessary to diversify our options for environmentally-friendly pathogen control.

In fiscal year 2000, USDA is requesting a $34.1 million increase in it global change research programs. Of this increase, $23.7 million is focused on increasing our carbon cycle research program. As part of an interagency effort, USDA will collaborate with other Federal agencies to conduct research to better understand how agricultural practices affect the net carbon balance and develop methods which will assist farmers, ranchers, and forest landowners to increase carbon sequestration. Special emphasis will be given to measurement of the effects of management and conservation practices on carbon storage in cropland and grazing lands.

Climate Change Technology Initiative.—In the fiscal year 2000 budget, the President is proposing a 34 percent increase for R&D in energy efficiency technology and renewable energy; A new Clean Air Partnerships Fund to boost state and local efforts to reduce greenhouse gases and air pollution; a five year-year package of tax incentives to spur clean energy technologies; substantial new funding to focus on ways farmers and forests can reduce and offset greenhouse gas emissions. USDA's CCTI programs focus on carbon sequestration and biomass demonstration projects, and on developing new technology for predicting and adapting to global climate impacts.

Carbon Sequestration ($3.0 million, NRCS; $3.0 million, FS).—NRCS will carry out pilot projects for delivery of carbon enhancing conservation systems. Pilot projects will be conducted on croplands, grazing lands, and animal feeding operations, using existing financial and technical assistance programs. FS will: develop and demonstrate the following: pathways for optimizing biomass standing stock for carbon sinks: low impact harvest options and soil management techniques that conserve carbon and increase water production capacity; and management options for improving direct sequestration of carbon in forest soils.

Biomass (FS, $3.0 million; ARS, $3.0 million).—FS will develop and demonstrate management practices for short-rotation woody crop production systems that provide near zero net carbon release and are sustainable across a range of geobiological systems. FS will identify barriers, economic benefits, and management regimes for farmers to grow tress for energy and carbon sequestration. ARS will develop databases for determining the potential of selected pastures and rangeland renovation practices, growth of biomass crops such as switchgrass, and conventional forage production systems for storing soil organic carbon.

Technology for Predicting and Adapting to Global Climate Impacts ($4.0 million, ARS).—ARS will focus on the development of new knowledge and modeling technology designed to help agriculture adjust to a changing climate. ARS will develop models at basin and ecosystem scales and using remotely-sensed data will be developed. Climatic and weather phenomenon (such as El Nino) simulation models will also be developed to determine the effects of climate change on insects, crops, water resources, rangelands, etc. Field experiments will be established to generate response functions for range, pasture and crops to changes in carbon dioxide, temperature, and water availability related to climate change impacts.

U.S. AGRICULTURAL EXPORTS

Question. What actions have been taken by this Administration over the past year to help U.S. farmers and ranchers by maximizing export sales and expanding their access to overseas markets?

Answer. In response to weakened foreign demand, we have taken a number of important steps over the last year to bolster exports and maintain access to key foreign markets. In response to the Asian financial crisis, we increased substantially the level of export credit guarantees made available by CCC. Sales registrations under the programs during fiscal year 1998 were 40 percent higher than the year

before. We anticipate this expanded level of programming will continue in both 1999 and 2000.

We are implementing the President's Food Aid Initiative, under which 5 million metric tons of wheat and wheat products are being made available for donation overseas. Also, we have developed and are carrying out a major package of food assistance for Russia in order to assist that country and maintain access for our products. Russia is an important market for U.S. grains, poultry, pork, and beef, and we want assist it regain its status as a commercial purchaser.

Over the long term, the best means of ensuring expanded access to overseas markets for our farmers and ranchers is through the negotiation of improved market access and a reduction in trade barriers. Therefore, we have worked vigorously to open and expand markets through a wide range of trade policy activities. Last February, the United States and Taiwan signed a market access agreement which provides for Taiwan to lift its import bans and allow access for U.S. pork, poultry, and variety meats. Upon Taiwan's accession to the World Trade Organization, it will cut tariffs and open tariff-rate quotas on numberous agricultural products.

We also have begun preparation for the new round of multilateral trade negotiations which is set to begin later this year. These negotiations present an important opportunity to strengthen disciplines on agricultural trading practices and gain improved access to world markets for our products. We have pursued trade liberalization on a regional basis as well. These activities include negotiations for the Free Trade of the Americas and within the Asia Pacific Economic Cooperation forum.

ECONOMIC CONCENTRATION

Question. Mr. Secretary, in your oral remarks you commented on issues related to profits of certain meat packers relative to the price received for live cattle. What are the Department's estimates of the fixed costs that packers have (such as labor, equipment, and overhead) and their proportional share of overall operating costs, including the price of cattle purchased?

Answer. Recent research by the Economic Research Service analyzed Census of Manufacturers data on 1992 cattle-only slaughter plant costs in four broad categories. It found livestock and meat purchases accounted for 86 percent of total costs; labor and all other materials between 5 and 6 percent each, and capital about 3 percent.

PUBLIC LAW 480 PROGRAM FUNDING

Question. The President's fiscal year 2000 budget proposes to reduce funding for the Public Law 480 Titles I and II programs, and to eliminate funding for the Title III program. The fiscal year 2000 request is estimated to support 3.2 million metric tons of commodity assistance to recipient countries, versus 3.6 million in fiscal year 1998 and 5.4 million in fiscal year 1999. The fiscal year 1999 level includes 1.8 million metric tons of assistance for Russia funded by the transfer of CCC funds to Public Law 480 Title I.

The justification for elimination of Title III funding is that funds from the Titles I and II programs can be transferred if required. In addition, the USDA budget summary indicates that it is proposing to transfer unused Export Enhancement Program (EEP) funds to foreign food assistance programs, such as Public Law 480, toward the end of the year.

Why is the Administration proposing to reduce Public Law 480 for fiscal year 2000 and to use mandatory funds to "back-fill" the program if necessary?

Answer. It should be noted that the reduction in Public Law 480 programming proposed for 2000 is exaggerated because of the Title I assistance being programmed to Russia this year. If the assistance to Russia, which results from some extraordinary circumstances, is excluded from this year's Public Law 480 program level, the reduction is considerably less. Nevertheless, as noted, the President's budget does include a reduction in funding for Public Law 480 for 2000. This is due to the very constrained targets that have been established for discretionary spending government-wide in conjunction with efforts to balance the Federal budget. A higher program level for Public Law 480 might have been preferred, but it was not possible given the spending targets that must be complied with.

The proposal to authorize the use of unobligated Export Enhancement Program (EEP) funds for certain food aid activities is designed to provide greater flexibility to program managers so they may respond to changing program needs and world events during the course of the year. Clearly, there is a tremendous need for foreign food assistance at the present time.

At the same time, funding authorized for EEP has barely been used in recent years. It seems prudent, therefore, to authorize alternative uses for that funding,

particularly when discretionary funding is so tight. Farm groups in recent years have called on the Department to use EEP funding for other purposes if it is not being fully used for EEP bonus awards; this proposal responds to their concerns.

The funding proposed for Public Law 480 programs in the budget does not specifically assume that unobligated EEP funds will be used to support Public Law 480 programming in 2000. Nevertheless, for the reasons just cited, it would be extremely useful if the authority do so when circumstances warrant were provided by Congress.

Question. The authorizing statute has always permitted the transfer of funds between titles of the Public Law 480 program. Why is the Administration now proposing to eliminate specific funding for Title III grants and to fund these grants by the transfer of funds from Titles I and II of the program?

Answer. No additional funding was requested for Title III activities because of tight budget constraints and a higher priority placed on funding other U.S. foreign assistance activities, particularly the development assistance activities administered by the Agency for International Development. As noted in the question, program managers could consider a transfer of funds from either Title I or Title II should a particular country's food aid needs be appropriate for Title III. However, such a decision would only be made during the course of the fiscal year, and the budget does not assume that it will or will not occur.

FORESTRY INCENTIVES PROGRAM

Question. I understand that OMB has proposed that the additional $10 million in emergency appropriations for the Forestry Incentives Program appropriated in the 1999 Appropriations Act should all be given to one state, Florida. Others states have indicated a need for these funds. Is this true or will these funds be available to address the needs of other states?

Answer. It was determined that assistance should be provided to other States as well as Florida based on an agreement between the Department and OMB. $9 million in Forestry Incentives Program (FIP) funds were allocated to 17 States to address reforestation needs caused by wildfires and other natural disasters in 1998. Florida's $3 million State allocation was the largest. A $1 million reserve is being retained for future assistance, primarily for tree planting needs in Florida.

Question. When does the Department plan to distribute these funds?

Answer. The Department distributed these funds to the States on February 16, 1999.

LOWER MISSISSIPPI DELTA REGION

Question. In fiscal year 1999 the Committee included a general provision in the bill providing the Secretary of Agriculture the authority to transfer up to $26,000,000 of the total discretionary spending appropriated by the act for programs and activities for the benefit of the Lower Mississippi Delta region.

What monies are currently being used for programs and activities of benefit to the Delta region?

Answer. The counties in the Lower Mississippi Delta Region have received significant funding from a variety of Rural Development programs in prior years, including $100 million in fiscal year 1996, $134 million in fiscal year 1997 and $164 million in fiscal year 1998, and this does not include the housing programs. The counties in the Delta Region are one of the targeting priorities for Rural Development funding and because of the widespread poverty throughout the region these counties do very well in competing for funds.

We do not plan to use the authority because of the other critical needs that need to be addressed with the funding appropriated for those uses.

Question. Has the Department worked with other Federal Departments and agencies to bring government-wide attention to the special needs of this region as the Committee encouraged in the fiscal year 1999 Conference Report? Has the Department consulted with local organizations, such as the Lower Mississippi Delta Development Center, Inc.?

Answer. the Office of Community Development (OCD) within Rural Development provides technical assistance to a group called the Southern EZ/EC Forum. The Forum originally consisted of the rural and urban Empowerment Zones and Enterprise Communities in Arkansas, Mississippi, and Louisiana. OCD encouraged the Forum in 1997 to expand to cover the EZ/ECs in the states of Illinois, Kentucky, Missouri, and Tennessee. The expanded Forum joined with the Lower Mississippi Delta Development Center to form a regional initiative to revitalize the 219 counties that were the subject of the Lower Mississippi Delta Development Commission Report issued in 1990. These organization have been joined by the Enterprise Corpora-

tion of the Delta, and the Foundation for the Mid-South to form the Delta Initiative Partnership. This partnership agreement was signed in April, 1998 in the presence of the Vice President, Secretary Glickman, and Secretary Slater.

In July 1998, OCD cooperating with the Department of Transportation in organizing a conference in Memphis, Tennessee to organize a Federal interagency working group to focus resources on the 7 states and 219 counties that were the subject of the original Delta Commission. Signatories to that Memorandum of Understanding are Secretary Slater, Under Secretary Jill Long Thompson and representatives form the Department of Housing and Urban Development, Department of the Interior, Department of Health and Human Services, Department of Commerce, Department of Labor, Department of Education, the Small Business Administration, and the Environmental Protection Agency.

In addition, the Department has worked closely with the Mississippi Department of Economic and Community Development, HUD, Fannie Mae, the Fannie Mae Foundation, Bank of America, LISC, Mississippi Home Corporation (Housing Finance Authority), Children's Defense Fund, non-profit organizations, the Housing Assistance Council, and a number of others to provide financial and technical to the Lower Mississippi.

Question. Mississippi's State Director for Rural Development has contacted my office about two projects that he plans to recommend to the agency to be funded from the $26 million available for transfer. (The Children's Defense Fund has presented a grant to Meyersville for the renovation of a church which serves as City Hall and to provide teen health services for children. Meyersville has no capacity to provide matching grant monies. The Mississippi Department of Education along with Fannie Mae and Rural Housing plan to provide housing for teachers in West Tallahatchie county.)

How do you predict the Department will handle these recommendations given this authority to transfer money for the funding of projects in the Lower Mississippi Delta area?

Answer. The Department does not plan to use this transfer authority. With limited resources it is unfortunately not possible to fund many eligible projects. Rural Development staff is working with the appropriate people in Mississippi to identify possible alternative resources which might be tapped for these projects.

WORKLOAD STUDY

Question. USDA contracted with PricewaterhouseCoopers to conduct a study of the farm and rural program delivery system of the Farm Service Agency, the Natural Resources Conservation Service, and Rural development. This study was scheduled to be completed on September 18, 1998.

What findings were reported on the three agencies studied?

Answer. The study provided findings on a wide range of topics concerning the organization, operation, workload, clientele demands and purposes of the county based agencies. While the detailed findings are too voluminous to adequately summarize, highlights include the following. The study concludes there are some imbalances between program authorities or legislative mandates, funding limitations, and agency business strategies which constrain the agencies' ability to deliver programs and meet customer demands. The study also found that recent changes in legislation and reduced funding and staffing have led to some structural problems impeding efficient and effective service delivery. It noted that USDA cannot effectively respond to trend changes in customer demand when constrained to locating offices according to political boundaries.

The study noted opportunities to improve efficiency by minimizing "back-office" activities. The findings were supportive of the administrative convergence initiatives. Likewise, the study concluded that the Department's Service Center Initiatives will succeed in achieving some efficiencies. However, the report concludes that further efficiencies from administrative convergence and service center initiatives could be gained by removing the current "smoke stack" structure in the county based agency delivery system. Another finding was that there is a critical need for information technology improvements. FSA county offices were found to probably be somewhat more disadvantaged than NRCS and RD although IT capabilities varied. Few substantive findings were reported about agency workload, although FSA was cited as the only county based agency with a formal work measurement system at the time of the study. The report recommended development of workload measurement system for all the county based agencies. (And NRCS is putting a system in place this year.)

The Department is still reviewing the study findings and recommendations and while not all of the recommendations appear feasible or well founded, the Com-

mittee should be aware that important elements of the fiscal year 2000 budget are consistent with the contractor's findings. These include the proposed Support Services Bureau to implement administrative convergence for these agencies and the proposal to increase the limitation on CCC spending for ADP which was one of the imbalances cited by the study which has contributed to inadequate resources for IT.

Question. How will the Department use these findings? Are these findings incorporated in the President's fiscal year 2000 budget request? If not, why?

Answer. As stated earlier, the Department is still reviewing the study findings and recommendations and while not all of the recommendations appear feasible or well founded, the Committee should be aware that important elements of the fiscal year 2000 budget are consistent with the contractor's findings. These include the proposed Support Services Bureau to implement administrative convergence for these agencies and the proposal to increase the limitation on CCC spending for ADP which was one of the imbalances cited by the study which has contributed to inadequate resources for IT.

NRCS' STRATEGIC PLANNING

Question. NRCS briefed my staff on its progress with the development and implementation of the agency's strategic planning process. What is the status of the other [county-based] agencies' progress in implementing the strategic planning process?

Answer. NRCS has made significant progress in use of the internet in charting performance goals, indicators, workload, and accomplishments. FSA and RD are similarly using the internet effectively to broaden public access to program information and application materials. The county-based agencies are all actively exploring further opportunities to improve services while reducing costs through streamlining, restructuring, and modernizing technology. RD management initiatives, for example, focus on quality customer service in support of the USDA initiative to improve customer service by streamlining and restructuring county offices, while the FSA performance plan notes progress in collocating offices, developing a common communications and computing platform, and converging administrative structures of the county-based agencies at the county, state, and headquarters levels. USDA is completing an overview of the annual performance plan and will shortly be submitting the agency plans and overview to Congress.

Question. Will the workload study contracted with PricewaterhouseCoopers affect this process? If yes, how?

Answer. The study provides direction for reforming the existing FSA workload measurement system and supports efforts in the other agencies to establish or upgrade existing measurement systems. The study also recommends development of a common workload measurement system for the service centers. We are incorporating recommendations of the study where appropriate in order to improve the usefulness of the workload measurement system in allocating staff, restructuring offices, and in other management determinations. Beyond workload issues, while we have no current plans to merge the field operations of the agencies, as recommended in the study, the study clearly supports the management initiatives included in the strategic plans of the agencies to capture efficiencies through administrative convergence, streamlining, and modernization.

WORKLOAD STUDY

Question. Please make a copy of the PricewaterhouseCoopers study available to the Committee.

Answer. The completed study consists of several volumes. We will provide a copy to the Committee.

FARM SERVICE AGENCY OFFICE STAFFING

Question. Mr. Secretary, your prepared statement indicates that the Farm Service Agency (FSA) has been downsizing its staff since 1993. Staffing has declined by about 6,000 staff to about 16,400 staff years at the end of 1998. The proposed program level for salaries and expenses in fiscal year 2000 is an estimated $1 billion to support a ceiling of a total of 15,793 federal and non-federal county staff years. You say there will be no reductions in force in fiscal year 1999. Why the decline in staff years, from 16,400 in 1998 to 15,793 in 2000 given the increased funding requested (+$80 million) in fiscal year 2000.

Answer. First, the increase in funding requested is $40.5 million from the 1999 enacted level, not $80 million. Although the fiscal year 2000 budget request is an $80.0 million increase from the fiscal year 1999 President's Budget request, it is a $40.5 million increase from the enacted fiscal year 1999 appropriation. This is worth noting because the $40.0 million enacted as part of the emergency provisions of the

1999 Appropriations Act is being used to support essentially the same level of staffing in fiscal year 1999 as the 16,400 staff years you cite for fiscal year 1998. Next, most of the $40.5 million increase being requested for fiscal year 2000 is for pay and related costs of existing personnel. FSA has several sources of funds other than new appropriations to support staffing levels, including funds carried forward from the prior year under authority of a general provision in the annual appropriation act. The total available funds for non-Federal county office activities in fiscal year 2000 includes no funds carried forward from the prior year, whereas in fiscal year 1999, FSA has $32.1 million in fiscal year 1998 carryover balances to finance fiscal year 1999 staffing costs. Therefore, there is a reduction of $32.1 million in total available funds for staffing in fiscal year 2000, which means that the net increase in funding is actually only $8.4 million. Given the pay cost needs previously cited, this requires a staffing reduction.

Question. How many offices have been closed because staffing reductions left only 1 to 2 employees in the office in 1998?

Answer. There were 34 offices closed in 1998 which had 2 employees or less.

Question. How many will be closed in 1999?

Answer. There are no office closings currently scheduled for fiscal year 1999, but if the economics of maintaining certain small offices is disadvantageous to efficient program delivery, then some closings likely will be done, which is a normal occurrence.

Question. Where are these offices located by county and state?

Answer. Once the Agency further analyzes the impact of workload estimates and identifies the criteria for determining the most efficient use of office staffing and considers the impact of prospective administrative and program efficiencies on county office operations, FSA will be in a better position to identify specific locations of any closures. Congressional delegations will be advised before any closures are effected.

Question. Does the Department intend to inform Congress of any additional staff reductions?

Answer. Yes, FSA will inform Congress of any additional staff reductions. However, FSA needs every available employee in order to operate under its current heavy workload. Any significant staff reductions will be done only as a consequence of funding constraints.

Question. Why have we not been informed of the prior staffing reductions in 1998 and those planned in 1999?

Answer. Both the fiscal year 1998 and fiscal year 1999 President's Budget submissions included clear references to staffing reductions. In the fiscal year 1998 Explanatory Notes, FSA's fiscal year 1998 Budget included estimates for relatively large numbers of buyouts and RIF's to occur in fiscal year 1998 in order to inform Congress of staffing reductions planned for that year. These references are found on pages 18–65 and 18–66. Use of unanticipated carryover balances in fiscal year 1998 mitigated the actual number of separations that were ultimately necessary. The original plan to RIF 855 county personnel and 255 federal personnel in fiscal year 1999 was also indicated in the fiscal year 1999 Explanatory Notes on pages 18–48 and 18-50. As you know, the $40 million enacted under the emergency provisions of the 1999 Appropriations Act allowed FSA to avoid those budgeted staffing reductions.

FSA OFFICE STAFFING

Question. The Congress appropriated an additional $40 million for FSA for salaries and expenses to maintain staffing levels to meet increased workload demands expected from the emergency farm aid provided for fiscal year 1999. In the prepared statement, you indicate that this appropriation allowed the agency to avoid reductions-in-force this year and to hire temporary staff. Is the $40 million sufficient to deliver payments to farmers in a timely manner?

Answer. The emergency funding of $40 million included in the 1999 appropriations act has allowed FSA to maintain approximately the same staffing level in 1999 as in 1998, with some increase in temporary staffing early in the fiscal year, which could not be sustained with available funding. However, it did not provide for significant additional staff to handle the large workload increases associated with the new emergency disaster assistance programs or other market-driven workload. The additional programs have strained FSA delivery in many States. This has compounded backlogs associated with the increased activity in loan deficiency payments, marketing loan assistance, other assistance activities stemming from low prices, and disaster assistance.

Question. Were you able to increase FSA Federal and non-Federal county permanent staff? If so, by what number of full-time equivalents?

Answer. No, we have not been able to increase FSA permanent staffing because of budget levels and five years of downsizing. However, the agriculture economic crisis beginning in 1998 accounted for a significant short-term increase in temporary non-Federal county office employees towards the end of fiscal year 1998 and into the first quarter of fiscal year 1999. Federal employees have remained at essentially constant levels throughout this same period. [Actual employment follows:].

FSA NON-FEDERAL COUNT STAFFING

Items	Fiscal Years (as of 09/30/98)	
	1998	1999
Permanent Employees	9,522	9,425
Temporary Employees	2,522	4,111
Total Employees	12,670	13,536

FSA FEDERAL STAFFING

Items	Fiscal Years (as of 09/30/98)	
	1998	1999
Permanent Employees	5,633	5,635
Temporary Employees	335	328
Total Employees	5,968	5,963

Question. I have heard that employee reductions of "right-sizing" occurred even though the additional monies were appropriated. It was the Committee's understanding that this would prevent additional staff reductions beyond those expected. Did reductions occur, and if so, what were they?

Answer. FSA began a right-sizing initiative in October of 1998 that references relative imbalances of employees to the workload needs in individual states. Between October, 1998 to December, 1998, the Agency reduced 94 county employees through the process of lowering FTE ceilings in overstaffed locations, attrition, and the implementation of additional shared-managed field offices. This selective process reflects prudent management and allows the hiring of employees at understaffed locations within available funding.

Question. The President's fiscal year 2000 budget request proposes a program level of $1 billion, estimated to support a ceiling of 5,745 Federal staff years and 10,048 non-Federal county staff years. This proposal is contingent on the passage of legislation which would allow for the Commodity Credit Corporation (CCC) to cover a portion of the Farm Service Agency's computer operations and maintenance costs for the farm programs. Since the passage of this language does not fall under this Committee's jurisdiction, the salaries and expenses account may possibly have a shortfall if this proposal is not authorized. What shortfall in funding for FSA salaries and expenses will occur if this legislation is not authorized?

Answer. That has not been determined because the size of any shortfall would depend entirely on what the Agency decides it could forego in essential ADP systems and equipment maintenance costs and for automated program delivery application costs that service producers. Without the requested CCC ADP cap increase, FSA would have no baseline funding for its basic ADP operations for farm programs because these have historically been funded by the CCC for CCC programs administered through FSA. The existing cap will be exhausted by the beginning of fiscal year 2000. Therefore, assuming $35 million would be available annually by increasing the cap for a 3-year period, the shortfall could range from a highly unrealistic zero-where no maintenance contracts are renewed on ADP equipment for example—to $35 million, where the agency would decide that it basically cannot operate without minimum essential ADP support costs and would reduce personnel in order to fund these costs.

Question. What additional Federal and non-Federal county staff year reductions will result from this shortfall?

Answer: I would refer you to my previous answer.

FSA STAFFING PLAN

Question. Why hasn't the Department revised its FSA staffing plans that were initially based on the 1994 reorganization plan since installation of the information technology system has not yet occurred?

Answer. Despite our inability to get oversight and Congressional approval of the equipment needed for the Common Computing Environment (CCE), which would allow us to more closely align personnel to the 1994 plan, we have to do the best we can for the time being with the resources we are given. Until the mid-part of fiscal year 1998, when the economic crisis in agriculture began to drive FSA workload upward, FSA had managed to basically balance workload with staffing due to the lower workload requirements of the 1996 Farm Bill, despite the lack of a CCE. This is no longer the case, unless commodity prices improve dramatically. The need for a CCE for the county based agencies remains a top USDA priority.

CCC COMPUTER CAP INCREASE

Question. The CCC computer cap increase is contingent on savings gained from a reduction in the authorized level for the Export Enhancement Program (EEP). This savings is not likely to be scored by CBO. Do you have an alternative PAYGO offset?

Answer. We do not have a specific alternative offset identified at this time, however, if necessary we will work with the Congress to attempt to identify potential offsets.

FSA INCREASED WORKLOAD

Question. In the past year what sort of increase in workload have you seen at the Federal and non-Federal staff level?

Answer. With low grain prices and several years of disaster conditions, county office workload has increased in the areas of loan deficiency applications, marketing assistance loans and the implementation of about $6 billion in new disaster assistance program legislation. Also, the depressed economic conditions in the agricultural sector of the economy are forcing many farmers who normally obtain commercial credit to seek direct operating and other loan assistance, thereby increasing the workload of the federal farm loan program staff that is already stretched too thin, especially in performing loan servicing functions.

Question. What portion of this workload increase results from the administration of disaster payments and loan deficiency payments?

Answer. Compared to the fiscal year 1999 workload estimates included in the Administration's fiscal year 2000 budget, FSA is projecting a need for an additional 562 FTE's to assist with loan deficiency payments, 946 FTE's to assist with the disaster activity, and 32 FTE's for additional workload associated with the non-insured assistance program.

Question. Is there enough staff to handle this workload?

Answer. Clearly, there is not. FSA faces the probability of program delivery failure during fiscal year 1999 without additional resources. Present county office employees, already dealing with heavy workload demands, are under extreme stress trying to keep current and attempting to minimize delays in accepting producer applications and finalizing payments.

WATERSHED PROJECTS

Question. Under the Public Law 534 and Public Law 566 programs, the federal government provides local sponsors with 100 percent cost share for the construction of flood control projects. The sponsors are responsible for acquiring the necessary land rights and for operating and maintaining structures based on a signed agreement. In many states the sponsors across the country have carried out their responsibilities with funds obtained through local taxes. However, some areas have not been able to do this, like Mississippi. USDA has proposed in the fiscal year 2000 budget request that $1 million be used for educational assistance to notify watershed sponsors about the need to inspect and rehabilitate the aging dams built during the past 50 years. Please explain how this educational assistance will be implemented.

Answer. The issue of the aging watershed infrastructure is a growing concern because of potential safety and health risks to the public. Between the 1940's and 1960's local sponsors, with assistance from USDA, constructed over 10,000 flood control dams that were designed to last 50 years. In the next 10 years (2000–2010) over

1,300 of these dams will exceed their design life and require major renovation or breaching. In addition, many of these dams and others of newer design are in a higher risk category due to downstream development and will also require major work.

In order to make the public and sponsors aware of these issues, USDA will utilize appropriated funds from the Watershed Operations account to conduct multi-state seminars, develop educational materials, produce videos and printed materials and send letters to sponsors informing them of their responsibilities as owners of dams built under the Small Watershed Program. We would utilize conservation partners such as state dam officials and private contractors for the majority of these efforts.

Question. Is this the only option considered in the fiscal year 2000 budget request to working with these communities to address this problem nationwide?

Answer. Yes, the sponsors of dams built under the Small Watershed Program are responsible and liable for operation and maintenance, as well as compliance with all state and federal laws involving dam safety and environmental permits. As a condition of federal funding, the sponsors entered into a contract with the agency to operate and maintain the structures. Since USDA presently has no statutory authority to provide financial assistance for rehabilitation, the fiscal year 2000 budget proposes to provide educational assistance.

Question. Does the Administration have a proposal so that sponsors can obtain funding to improve the conditions of these structures?

Answer. No. However, USDA is exploring ideas on how to assist in addressing the problem within current authorities.

Question. I understand that the Department's position has been that should federal funds be provided to those states that did not maintain their structures, inequities would exist with sponsors in communities in states who fulfilled their responsibilities by providing local funding for maintenance.

Has the Department assessed the number of projects that have not been maintained? If yes, please list the states where projects exist, the number of projects per state, and cost associated with the maintenance of these projects.

Answer. The issue of the aging watershed infrastructure is primarily related to dams exceeding their design life, but operation and maintenance of all structures is a part of the issue. The Department has not completed a detailed study of the condition of each of the more than 10,000 dams built under the Small Watershed Program since the dams are not owned, operated nor maintained by the Department. The cost to do such a study would be considerable, perhaps as much as $10-$12 million.

However, it is my understanding that USDA/NRCS is currently conducting an assessment of rehabilitation needs of dams built under the Small Watershed Program in a number of states. This assessment, which is only a compilation of known rehabilitation needs, will hopefully provide stakeholders with some valuable information on how to proceed in the future. I will provide additional information on this assessment for the record.

[The information follows:]

RAPID ASSESSMENT OF KNOWN DAM REHABILITATION NEEDS

[Includes only dams built under Public Law 534, Public Law 566, Pilot Projects, and Resource Conservation and Development authorities of USDA]

State [1]	Number of Dams Needing Immediate Rehabilitation	Estimated Cost [2] (millions)
Alabama	71	$24
Arkansas	77	21
Colorado	49	28
Georgia	334	92
Illinois	36	11
Indiana	41	18
Iowa	284	20
Kansas	97	20
Kentucky	101	20
Mississippi	608	34
Missouri	244	21
Nebraska	294	4

RAPID ASSESSMENT OF KNOWN DAM REHABILITATION NEEDS—Continued

[Includes only dams built under Public Law 534, Public Law 566, Pilot Projects, and Resource Conservation and Development authorities of USDA]

State [1]	Number of Dams Needing Immediate Rehabilitation	Estimated Cost [2] (millions)
New Mexico	17	23
New York	53	2
Ohio	46	7
Oklahoma	190	53
Pennsylvania	7	1
Tennessee	43	13
Texas	283	84
Virginia	16	10
West Virginia	34	53
Wisconsin	42	3
Total for these states only	2,967	562

[1] These 22 states have 10,188 of project dams
[2] Does not include Operations and Maintenance costs.

RURAL DEVELOPMENT

Question. For the guaranteed multifamily housing program, the budget proposes to eliminate the statutory requirement that 20 percent of the loans guaranteed must receive interest assistance. This legislative change would allow for the program's expansion to $200 million, which is $125 million over 1999.

Should this statutory requirement not be adopted, what additional funding will be required to hold the program level at the fiscal year 1999 level for fiscal year 2000 and how many rental units would be built at this funding level?

Answer. Assuming that the proposed legislative change is not enacted, in fiscal year 2000, $359,000 in budget authority will be required to maintain the Section 538 rural rental housing guaranteed loan program at its fiscal year 1999 program level of $74,839,000. This amount of budget authority represents a decrease of $1,961,000 from the 1999 level of $2,320,000. A program level of $74,839,000 will build approximately 2,010 new apartment units in fiscal year 2000.

Question. The fiscal year 2000 budget request proposes a total of $640 million for rental assistance, of which $440 million will be available in 2000 and $200 million will be available in 2001. This sounds like some sort of budget gimmick, Mr. Secretary.

A. Why has the Department proposed to fund this program over two years when it has not done so in past years?

Answer. The Administration's proposal reflects full funding of the rental assistance needs for fiscal year 2000. As you note, the budget authority for this funding is spread out over two years, specifically $440 million for fiscal year 2000 and $200 million for fiscal year 2001. The way payments are made under the program—in five year contracts—allows this form of budgeting. This is a reflection of the true cost of the program, which is expressed in the Administration's baseline estimates.

B. Will this proposal affect the delivery of this assistance? If not, why?

Answer. Rental assistance payments are made under five-year contracts, and budgeting these payments over two years will not affect the flow of rent reductions for the tenants who occupy RHS Section 515 and Farm Labor Housing complexes.

Question. The fiscal year 2000 budget also proposed legislation authorizing $400 million in direct Treasury rate electric loans. This proposal would possibly replace the need for increased funding for the highly subsidized direct 5 percent and municipal rate loans.

A. What demand is there for direct Treasury-rate electric loans?

Answer. RUS began fiscal year 1999 with a backlog of loan applications from electric distribution borrowers totaling $1.2 billion. Based on past experience, we anticipate receiving approximately $800 million additional applications during fiscal year 1999. The fiscal year 1999 appropriations provides $700 million in funding for distribution borrowers. This means RUS will begin fiscal year 2000 with a backlog of approximately $1.3 billion in loan applications for distribution borrowers. We believe

there will be a large demand for Treasury rate loans to augment, not replace, the municipal rate and hardship rate loans in order to meet the capital requirements of the electric distribution borrowers. There will be a continuing need for hardship loans in the future.

B. If this legislative proposal is not adopted, what is the anticipated program level need for direct and municipal rate loans for fiscal year 2000?

Answer. The fiscal year 2000 Budget includes $50 million for direct 5 percent interest rate loans, $250 million for municipal rate loans, $300 million for guaranteed loans and $400 million for treasury rate loans for a total of $1.0 billion.

EARLY WARNING SYSTEM

Question. Please explain the fiscal year 2000 Budget request for $5 million to fund the early warning system community facility grants that would allow rural areas to reduce the loss of life resulting from inadequate warnings of hazardous weather.

Answer. The request for $5 million is to finance the installation of radio towers, where necessary, and transmitters connected to the NOAA National Weather System radio service which would trigger warnings of approaching hazardous weather. Many rural areas are without early warning of rapidly approaching weather systems such as the storms that hit Mississippi, Tennessee and other areas in January of this year. It has been demonstrated that if sufficient warning had been available in sites devastated by tornados in the past several years, hundreds of lives can be saved and an equal number of injuries avoided. We estimate the total cost of providing coverage to 95 percent of the rural areas in need to be about $50 million.

CONSERVATION INITIATIVES

Question. The fiscal year 2000 budget request includes a $15 million increase in the Conservation Operations account of the Natural Resources Conservation Service. This funding will help support the USDA share of the Administration's global climate change initiatives. An increase of $3 million will be used to fund demonstration and pilot projects to test various carbon sequestration and greenhouse gas mitigation strategies and monitoring mechanisms.

How is this different from the research projects on the greenhouse effect that have been ongoing for years now?

Answer. The $15 million budget request is a substantial increase which will allow the agency to begin to develop a soil carbon database that represents actual local soil carbon levels under the various management and conservation systems that farmers and ranchers apply across the nation. This effort will establish the foundation for models and inventories that can track actual changes in soil carbon stocks, and anticipate changes that might result from potential conservation policies. NRCS' ongoing research projects on the greenhouse effect, funded at $1.5 million in earlier years and at $1.2 million in fiscal year 1998 and fiscal year 1999, focused on the impacts of climate on the soil environment.

Question. How will these projects, if funded, help our nation's farmers in the conservation area?

Answer. The proposed pilots will test and demonstrate not only carbon planning and monitoring methodologies under development, but they will also test and assess an array of policy and programmatic delivery options to help structure future policies and programs to more efficiently enhance carbon sequestration. This, in turn, will increase rainfall infiltration and water-holding capacity, and improve soil fertility, microbial activity and soil structure. These factors improve water quality, reduce erosion, reduce the amount of fertilizer inputs required to produce a crop and increase resistance to drought.

DIGITAL EARTH

Question. The Administration's fiscal year 2000 request also proposes an increase of $5 million as a part of the Administration's "digital earth" vision to enable access and standardization of geospatial data supporting Federal, State and local governmental programs. What is this initiative? Why is an increase proposed and how will these funds be used?

Answer. This initiative is designed to make geospatial data accessible to governments, businesses, academia, and citizens for use with innovative tools such as a geographic information system (GIS) to address everyday and long-term community issues. Geospatial information is key to helping communities analyze complex economic, social and environmental concerns in making more informed decisions and adopting strategies to support issues such as land-use planning, water quality, emergency response planning, environmental management and urban sprawl.

NRCS would use the $5 million to develop cooperative agreements and grants with state and county governments to develop geospatial data. The agreements would have two primary purposes. The first would be to develop geospatial data layers such as hydrography, roads, watersheds, county boundaries, township boundaries, land parcels, and public land surveys at a resolution acceptable for use at the local level. The second purpose is to assist the state or county in establishing an internet web-server in compliance with FGDC Clearinghouse standards. These public access web-servers can provide geospatial data to the USDA county-based offices and to the public as part of the overall National Spatial Data Infrastructure.

DEBT FOR NATURE

Question. The fiscal year 2000 budget request includes a $5 million legislative proposal to help implement the "Debt for Nature" program. This program will provide technical and financial assistance to USDA borrowers with serious cash flow problems who also have lands that require conservation treatment. Will you please explain how the Department will implement this new program?

Answer. The Debt for Nature program is not a new program but it has never been fully carried out. The $5 million is being requested to provide financial and technical assistance to financially stressed participants to help them establish conservation and wildlife measures that may be required in their conservation plan. The program will be implemented jointly between FSA and NRCS with NRCS being responsible for technical decisions related to the program and FSA being responsible for administrative policy and loan-servicing. The agencies will work together to establish policies, procedures and direction regarding planning, implementation and training.

Question. Another new program is proposed in the fiscal year 2000 budget request—a $50 million discretionary Farmland Protection Program. This supplements the mandatory program which ran out of money last year. The Administration also requests funding authority of $27.5 million for 2000 for the mandatory program.

At a time when discretionary money is scarce, why is the Administration proposing to supplement the existing Farmland Protection Program with discretionary money? Why not an additional $50 million increase in mandatory funds?

Answer. In response to the nationwide surge of public interest in preserving landscapes and communities, the Administration is proposing the Lands Legacy initiative which would be funded from the Land and Water Conservation Fund. As part of the Lands Legacy initiative, $50 million in discretionary funds are proposed for the Farmland Protection Program. Additional mandatory funds for the Farmland Protection Program would require an offset from the other mandatory programs funded by the CCC account.

Question. In your statement, you say the program is slated to receive $50 million in discretionary funding from the Vice President's new Lands Legacy Initiative. What does this mean?

Answer. One billion dollars are proposed in the Vice President's Lands Legacy initiative to strengthen the federal government's role as a partner with state and local efforts to build livable communities. Most of the programs in this initiative focus on urban revitalization and sustainable development. The Farmland Protection Program is one of the components and would address urban sprawl issues affecting strategic agricultural land. It also is a valuable tool to enhance other sustainable development priorities of communities.

Question. Does this request include technical assistance as well as financial assistance?

Answer. Yes. Included in the $50 million Farmland Protection component of the Lands Legacy initiative is $2 million (4 percent) for technical assistance.

FOOD QUALITY PROTECTION ACT

The Environmental Protection Agency (EPA) is currently writing regulations to implement the Food Quality Protection Act (FQPA). It is very important that this law is implemented in such a way that it does not negatively affect our nation's farmers.

Last year, Vice President Gore issued a directive that EPA and USDA work together to implement FQPA. In fact, report language was included in the fiscal year 1999 conference report concurring with the Vice President's memorandum and directing USDA to keep us abreast of its activities with EPA. USDA has determined chemical field data over the years for farmers and this Committee has provided the needed resources to collect that data on chemical use.

Question. When do you plan to give us a report on your activities with EPA to implement FQPA?

Answer. The report is now being completed by the Department and will be provided to you in March. The report will describe our on-going activities and additional activities planned for fiscal year 2000.

Question. Does EPA use the data that USDA has collected when determining how farmers use crop protection products?

Answer. The data are critically important to EPA and are used by EPA in assessing possible pesticide risks. The data are equally important for planning workable risk mitigation measures. When cancellation of a chemical or certain uses of a chemical is the only viable approach to reducing risk to acceptable levels, USDA data and our land grant partners will be of central importance in the process of developing transition strategies.

Question. What role has the Department played in the implementation process of this law? How closely have you worked with EPA?

Answer. EPA Administrator Browner and I met on February 5, 1999, to discuss several aspect of FQPA implementation including the need for science-based data. We agreed that it was critical for all risk assessments and regulatory decisions to make full use of sound science and the best possible data. USDA data concerning pesticide use patterns and residue levels along with food consumption constitute critical information.

Question. Are you aware that EPA plans to release "Interim/Preliminary" Re-registration Eligibility Documents (REDs) to the public on the internet using default assumptions?

Answer. One of the first actions of the Tolerance Reassessment Advisory Committee (TRAC) was to agree to a pilot effort to make the EPA risk assessment process more transparent and to involve more stakeholders. Until now, only the chemical registrants had the opportunity to review draft risk assessments and influence the decision-making process at the early stages of review. Growers and others believed that their interests were not adequately represented at certain critical decision points. Early examination of the assessments will allow for early identification of the needed revisions and substitution of actual data to replace default assumptions.

Question. If I understand this correctly, EPA has not finalized the nine-science policies currently being developed by the Tolerance Reassessment Advisory Committee (TRAC) that will be used to implement FQPA. It concerns me that EPA plans to release these REDs prior to the finalization of these policies since it could eventually impact the outcome of the regulations. Did EPA consult with the Department before this decision was made to release this preliminary information prior to the finalization of the science policies?

Answer. As outlined above, the decision was made as part of the TRAC process. As you know, Deputy Secretary Rominger co-chairs that Advisory Committee with the EPA Deputy Administrator. It should be noted that the preliminary risk assessments are publicly available under the Freedom of Information Act. Because not all stakeholders in the review process routinely sought copies under FOIA, TRAC participants that it was reasonable to make access more convenient for all.

Question. Why is the preliminary information being publicly released? Wouldn't it be more prudent to wait until the science policies are completed.

Answer. Because many of the science policies will not be finalized for some months, the process of refining the risk assessments will include a sensitivity analysis to determine the impact of alternative policy choices on the assessments. These will be shared with the public and should assist all interested parties in establishing final policies.

The Vice president in his April 8, 1998 directive to EPA and USDA concerning implementation of FQPA set forth the following principles:

(1) Regulatory decisions should be based on the best science and data that are available.

(2) EPA should continue to seek peer review and public review of its methods and approaches for analyzing potential risk under the new law.

(3) In translating sound science into regulatory approaches, EPA and USDA should ensure that the decisions and positions of the two agencies are transparent to affected constituencies.

(4) Approaches must be clearly and fully communicated in a manner that facilitates informed review by all affected constituencies.

Question. The TRAC process has two more scheduled meeting. The development of the most sound science and data have not been finalized, and EPA has historically allowed the registrants of chemicals to review draft REDs prior to them being released to the public. However, this is not the case. Based on this information, doesn't the release of the REDs go against the principles set forth by the Vice presi-

dent in the April 8, 1998, directive to EPA and USDA concerning implementation of FQPA?

Answer. Release of the preliminary risk assessments, with the careful understanding that the assessments are preliminary and draft conclusions are theoretical, answers the Vice President's directive for transparency in the risk assessment process.

Question. How do you propose we proceed in stopping this premature release of the REDs to the public?

Answer. EPA and USDA have stressed that preliminary risk assessments do not represent final conclusions and often are based on outermost assumptions. These caveats need to be stressed in future releases of preliminary risk assessments.

HONEY

Question. Section 1122 of the fiscal year 1999 Agriculture Appropriations Act provides for the reinstatement of marketing loans for honey producers. Congress approved this program because honey producers, like those of many other commodities, faced disastrously low prices. Yet, the Department has delayed implementing this program for months, well beyond the harvest time. These delays have rendered this loan program virtually useless. When Chairman Skeen and I learned of the Department's misperception of our intent in implementing the program, we wrote you to clarify this issue, hopefully ending the delays. However, not only have we not received a reply to our letter, the regulations implementing this program remain unpublished. What is the status of these regulations?

Answer. We anticipate the final rules implementing the honey program will be published within several weeks, and that eligible producers will be able to obtain honey recourse loans by requesting loans through a period ending 60 calendar days after publication of the regulation in the Federal Register.

Question. How does the Department justify the delays in implementing this program which was mandated by Congress, while assisting producers of other commodities more expeditiously and without specific mandates to do so?

Answer. Many decisions needed to be made in regard to the Honey program which required additional research and legislative interpretation. For instance, the Appropriation's Act required that the program be operated on a no-net-basis, and that repayment of the loans would include interest and administrative costs. The research required to define a no-net-cost loan which included administrative costs delayed the implementation of the program. Additionally, loan rates, regulations, and operating procedures for field offices also had to be developed to adequately administer the program.

DISASTER/MARKET LOSS ASSISTANCE

Question. The disaster program enacted in the Omnibus Appropriations Act provides the Department with tremendous flexibility to design a disaster program which was fair to all commodities in all parts of the country. While I appreciate the magnitude of your responsibility, I also understand that this was suppose to be an emergency program. Do you consider the six months that it will take between passage of these funds and when producers will likely receive their checks as an acceptable time to deliver "emergency" funds?

Answer. The fiscal year 1999 omnibus appropriations bill created seven new programs for the Department of Agriculture (USDA) to administer, and of those, the most complex is the crop loss disaster assistance program (CLDAP)—the $2 billion earmarked for assisting farmers who have suffered crop losses over multiple years before 1998 or who had losses only in 1998. It is far more complex than past natural disaster assistance programs. Consequently, and due to the heavy demand from farmers, USDA is taking longer than we anticipated to implement it fully. Nonetheless, I want to assure you that getting these payments out as expeditiously and as fairly as possible is a top personal priority for me.

Question. It is my understanding that as of last week, county offices did not have the necessary forms for producers to apply for these disaster funds. Further, it is my understanding that many county offices may not have the necessary computer software to process these applications today. How does the Department justify this?

Answer. Applications have been available in the county office and on the internet since the first week of signup and manual forms were available to calculate 1998 single year payments for noninsurable and uninsured crops. However, information was not available for each producer to enable the county offices to calculate an estimated 1998 single year payment for insured crops without asking the producers for production information. A significant amount of time has been devoted to providing county offices with producer loss information from RMA and FSA's national data

base to reduce the burden on producers of having to provide the information for the disaster programs and to determine eligibility for multi-year payments. Millions of RMA and FSA records are being downloaded to county offices. We believe that the start up time was essential to provide better service to the producers.

Question. Milk prices to farmers are expected to decline about 30 percent over the next several months. When will you announce the plan for disbursing the $200 million in dairy market loss assistance funds?

Answer. The fiscal year 1999 appropriations act requires that the assistance be made "as soon as practicable", but does not specify what form the assistance should take, nor how the funds should be distributed. The law does stipulate however, that the payments shall not affect any regulatory decision on milk marketing order reform. A full range of possibilities for efficient use of the funding is under consideration. The expected record decline in the February basic formula price and the resultant record decline in farmers' milk checks in April has accelerated the Department's development of the program. The program may be announced in March.

Question. In fiscal year 1999 Agriculture Appropriations Act, there was emergency feed assistance funding. According to reports from farmers, the deadline date has been extended twice already this year. When can farmers expect to receive this assistance?

Answer. On November 12, 1998, USDA announced the Livestock Assistance Program (LAP) and began taking applications on November 23, 1998. To accommodate the extremely high demand for LAP, USDA extended the sign up for this program and now plans to close enrollment on March 25, 1999. USDA will issue payments shortly thereafter. We estimate that the $200 million Congress appropriated for livestock assistance will be heavily over-subscribed and USDA, consequentially, will be able to pay only a portion of the total request.

Question. It is my understanding that producers who apply for USDA disaster loans have had their loan proceeds reduced by the amount of crop insurance indemnity payments they have received. Is this true?

Answer. Yes. The amount of a Farm Service Agency (FSA) emergency loan received by a family farmer is reduced by the amount of crop insurance payments that have been received.

Question. How does this help producers who need these loan proceeds to finance their operation?

Answer. A family farmer who receives crop insurance indemnity payments and a FSA emergency loan has been totally compensated for their loss by the combination of a loan and direct payments. Additional financing needs can be met with either a loan guarantee or a direct loan from the FSA.

COMMODITY PRICES

Question. Mr. Secretary, one of the factors which led Congress to pass the agriculture assistance package last year was the state of commodity prices for almost every crop. Current estimates do not appear to be much better for 1999. The President's budget makes no specific recommendations on how to improve the current crop insurance system to give farmers price risk protection. Further, any change in the law enacted by Congress will not likely be able to help farmers for the 1999 crop. What changes do you specifically propose to improve crop insurance?

Answer. On February 1, 1999, the Department released a white paper entitled "Strengthening the Farm Safety Net: The Administration's Principles and Preliminary Proposals for Reforming Crop Insurance." A copy of this paper is submitted for the record. The Administration proposes a dialogue with the Congress with regard to strengthening crop insurance in several key areas. Briefly, these are:

—Speed new, more flexible risk management tools to market by providing incentives to commercial insurers to develop insurance policies that meet the needs of producers.

—Make the level of protection under the catastrophic insurance coverage and the Non-insured Assistance Program (NAP) more meaningful in terms of replacing farm income in disaster years.

—Increase the incentives for producers to purchase higher levels of insurance protection.

—Cover multi-year disasters so that the cumulative effects of several disasters within a short number of years are mitigated.

—Extend insurance protection to livestock.

—Improve the NAP program by making the determinations more flexible than is possible with the current area trigger.

—Provide better information and services to farmers and ranchers so that they will better understand and manage the risks that confront them.

Question. How can the rating inequities that disadvantage southern farmers be eliminated?

Answer. Premium rates are calculated by the Federal Crop Insurance Corporation (FCIC) from the experience it has accrued in a county. High premium rates result from high losses paid in the past. For many reasons, losses have been claimed by producers in the South more frequently and at much greater levels of crop loss than has been observed in other sections of the country. While some may view the resultant high premium rates as an inequity, insurance principles dictate that the premium rate be commensurate with the level of expected losses.

Many in the South allege that the insurance experience on which the present rates are based is not representative of the "good" farmer—that it is based on producers who deliberately made false reports of losses. FCIC did eliminate losses attributed to persons identified under its former Non-standard Classification System from the experience used to calculate premium rates for the remaining producers. However, losses still remain higher than is typical for other areas and crops.

USDA is willing to work with the Congress to find a solution to this persistent problem. If farmers are aware of individuals who are inflating losses, we would appreciate such information. Insurance fraud will not be tolerated, as it costs all producers.

Question. The Budget makes no recommendations for offsets to pay for any changes to crop insurance statutes. I understand that several billion dollars will be necessary. How does the Department propose to pay for these improvements?

Answer. In its white paper "Strengthening the Farm Safety Net," the Administration states its intentions to seek a consensus among producers, the Congress, and other stakeholders as to the nature of the changes needed. Once that consensus is built, agreement will be needed on the difficult task of finding the best way to finance those improvements. We plan to work with Congress in a responsible manner regarding this issue.

Question. What other action outside of crop insurance does the Department propose to improve commodity prices?

Answer. While crop insurance is the centerpiece of the Administration's effort to improve the safety net for farmers, the Department is looking at a broad range of other ideas, including allowing farmers to extend the due dates on market assistance loans and paying for on-farm storage facilities. There are a number of additional proposals, most requiring Congressional action, some of which may have been debated in the not too distant past which may be worth a reexamination such as modification of the caps on marketing loan rates. And, perhaps, there is interest in recent proposals by members of Congress to develop additional short to intermediate term land retirement programs which could be tailored to address multiple objectives including crop disease contract and investments benefits which would be removing crop acreage from production. Many of these efforts would involve significant costs.

Strong export markets are another important component of the agricultural safety net and are critical for the support they lend to domestic commodity prices. In response to weakened foreign demand, we have taken a number of important steps over the last year to bolster exports and maintain access to key foreign markets. In response to the Asian financial crisis, we increased substantially the level of export credit guarantees made available by CCC, and sales registrations under the program during fiscal year 1998 were 40 percent higher than the year before. We anticipate this expanded level of programming will continue in both 1999 and 2000.

We are implementing the President's Food Aid Initiative, under which 5 million metric tons of wheat and wheat products are being made available for donation overseas. Also, we have developed and are carrying out a major package of food assistance for Russia in order to assist that country and maintain access for our products. Russia is an important market for U.S. grains, poultry, pork, and beef, and we want to assist it in regaining its status as a commercial purchaser.

Over the long term, the best means of ensuring expanded access to overseas markets for our farmers and ranchers is through the negotiation of improved market access and a reduction in trade barriers. Therefore, we are working vigorously to open and expand markets through a wide range of trade policy activities. Most note worthy of these is our preparation for the new round of multilateral trade negotiations which is set to begin later this year. These negotiations present an important opportunity to strengthen disciplines on agricultural trading practices and gain improved access to world markets for our products.

DAIRY

Question. In January 1998, the Department published its proposed rule for the Federal Milk Marketing Order system. Sixty-one members of the Senate and 238 members of the House of Representatives have written you to oppose your endorsement of the so-called option I-B and supporting the implementation of option I-A.

Congress thoroughly debated the elimination of class-I differentials during consideration of the 1996 farm bill and rejected their elimination. In addition, Congress mandated the release of the final proposal for early this year in order to ensure Congress has the opportunity to review the proposal while it is in session.

Question. How do you justify the adoption of option I-B when the Department's own analysis showed that option I-B would reduce farmer income?

Answer. In January 1998, USDA issued a proposed rule that consolidated the current 31 Federal milk orders into 11 orders, set forth two options for replacing the Class I price structure, and proposed replacing the BFP. USDA indicated a preference for the Class I price surface identified at option I-B when the proposed rule was published because as stated in the proposed rule "It is expected that the additional market orientation offered by option I-B will promote market efficiencies and lead to better allocation of resources over time." Since option I-B lowered farm income relative to the current Class I price structure, USDA also proposed several transition alternatives that would have phased in the option I-B price surface over several years, lessening the effects of adopting option I-B on farm milk prices and farm income.

Question. Do you still support option I-B, given the Congressional support that has been expressed for option I-A?

Answer. All the comments are being considered in arriving at the final decision.

Question. What is the timetable for publication of the final proposal?

Answer. The final decision on Federal order consolidation and reform, which will be released on or before April 4th, will be based on the comments received on the proposed rule.

DETAILEES

Question. Provide a list, by USDA agency, of each employee detail or assignment (by employing agency, title, and position) in each of fiscal years 1998 and 1999 to date for a period of up to 30 days, and identify the agency to which that detail or assignment was made and the purpose of the detail assignment. Provide this same information for employee details/assignments made for a period of more than 30 days, and indicate the dollar amount of reimbursement made to the employing agency for each detail/assignment.

Answer: We will provide that information for the record.

[The information follows:]

DETAILED FOR MORE THAN 30 DAYS—FISCAL YEAR 1998

Position/agency	Detailed to	Date/length	Purpose	Reimbursed
William Digdo (GIPSA)	APHIS	15 days	APHIS Medfly	$3,837
Michael Haley (GIPSA)	APHIS	15 days	APHIS Medfly	$3,934
James Ledoux (GIPSA)	APHIS	20 days	APHIS Medfly	$2,993
Bradley O'Neal (GIPSA)	APHIS	15 days	APHIS Medfly	$3,118
Robert Simpson (GIPSA)	APHIS	2 days	APHIS Medfly	$411
Dan White (GIPSA)	APHIS	2 days	APHIS Medfly	$441
Sylvia Magbanua (NASS)	Office of Civil Rights	28 days	Civil Rights training program	
N. Blair (FS)	Office of the Secretary	10/6/97 to11/6/97	Civil Rights Action Team	
G. Renteria (FS)	Office of the Secretary	11/3/97 to 11/20/97	Civil Rights Action Team	
M. Warren (FS)	Natural Resources and Environment	10/01/97 to 10/24/97	Support	
Special Assistant to Adm. (FSA)	White House	10/01/97 to 9/30/98	Personnel liaison for all White House personnel of Cabinet agencies and Boards and Commissions within assigned portfolio.	$73,638 Est. Reimb. limited by 3 U.S.C. 112)
Computer Specialist (FSA)	OSEC/Modernizatio n of Admin. Processes Program MAPP).	01/19/98 to 5/09/98	To provide Agency expertise to MAPP project managers	$20,519 Est.
Management Analyst (FSA)	U.S. Environmental Protection Agency	10/01/97 to 11/22/97	Assisted in the Information Resources Management Policy area involving contract resources.	$15,409
Confidential Assistant to Administrator (FSA).	Rural Development, Office of Community Development.	10/01/97 to 9/30/98	To assist the Empowerment Zone initiative in helping the program/communities achieve economic and sustainable development.	$88,500 Est.
Confidential Assistant to Administrator (FSA).	Office of Communications, Photography Division.	10/01/97 to 9/30/98	Provide Agency expertise to the Photography Division	$52,000 Est.
Director, Performance Engineering and Analysis Group (FSA).	NASA, Ames Research Center	02/01/98 to 5/23/98	Provides assistance on the planning, technical guidance, and direction of the Independent Verification and Validation (IV&V) facility operations..	$33,000 Est.
Robert Cummings (FAS)	Office of the U.S. Trade Representative	2 years 6/97—6/99	Work on agricultural trade issues	Non-reimbursable
Nancy Hirchhorn (FAS)	The World Bank	1 year 7/97—7/98	Articulate USDA interests on project activities	Non-reimbursable
Stephen Huete (FAS)	Inter-American Development Bank	1 year 8/97—8/98	Articulate USDA interests on project activities	Non-reimbursable
David Schoonover (FAS)	Office of the U.S. Trade Representative	2 years 6/97—6/99	Work on agricultural trade issues	Non-reimbursable

Question. Provide a list of advisory committees, panels, commissions and task forces funded in each of fiscal years 1998, 1999 (planned) and 2000 (planned), by agency, and the amount of funds allocated for each.

Answer. I am providing a table that lists planned activities funded in fiscal year 1998 and fiscal year 1999, and proposed activities as well as assumed funding for fiscal year 2000.

Question. Please provide a list of the advisory committees, panels, commissions and task forces proposed to be funded for fiscal year 2000, by agency, and the amount of funds assumed for each.

Answer: Information on the fiscal year 2000 costs of these committees was provided in response to question 61.

[The information follows:]

QUESTIONS SUBMITTED BY SENATOR GORTON

DISASTER ASSISTANCE

Question. Last year, Congress provided nearly $6 billion in agriculture relief in the form of payments to farmers due to disaster and poor foreign market conditions. What, in the President's budget, assures us that another disaster package won't have to be established again this year?

Answer. Last year's assistance package is helping to maintain farm income and limiting financial hardship for many producers. At least in the short term, prices are too low for farmers to make a decent living without additional government support beyond what is provided for in the Farm Bill. Unfortunately, exports and prices will probably remain at low levels in 1999, causing increased farm financial stress, and family farmers may need additional financial support. More money will be needed in 1999 to provide direct and guaranteed loans. Funds are nearly exhausted for

some key credit programs, and we will be submitting a request for supplemental funds soon.

With regard to the budget for fiscal year 2000, our request was formulated in the context of continued constraints on Federal spending under the Balanced Budget Act of 1997, and thus reflects some difficult choices. We recognize recovery will occur at a very gradual pace over the next several years, and we are committed to making the utmost use of available authorities and program resources to help producers through these tough times. And we are committed to working to strengthen the farm safety net to help farmers prosper in good times and bad without the need for repeated *ad hoc assistance.*

Question. What in this budget provides what you've referenced as a 'safety net' for farmers?

Answer. While improvements to the crop insurance program are key to strengthening the safety net, the budget provides for a broad range of programs which help farmers manage risk. We are requesting significant levels of funding for commodity, credit, insurance, and export programs. Each of these programs, as well as many programs in the other mission areas of the Department, contributes significantly to the safety net for farmers and ranchers.

EXPORTS

Question. Farmers in the State of Washington rely heavily on export for survival, and in the past year, most national farm organizations have made it quite clear that in order to increase the prices paid for U.S. commodities, additional markets and more avenues for exports need to be available. Why then, has the Administration cut export programs?

Answer. During the past year, USDA has responded vigorously and creatively to developments in world financial and commodity markets. As a result, the level of programming for many of our export activities has increased substantially. For example, in response to the financial crisis in Asia, USDA expanded the level of CCC export credit guarantees made available. As a result, sales registrations under the guarantee programs were 40 percent higher during 1998 compared to the previous year. The expanded level of guarantee programming is expected to continue in both 1999 and 2000.

This fiscal year, USDA has greatly expanded the level of foreign food assistance programming, and the overall level of U.S. foreign food assistance will total as much as 10 million metric tons this year. This increase results from the President's Food Aid Initiative under which 5 million metric tons of wheat and wheat products will be made available to needy countries. It also reflects a major package of food assistance for Russia which will total more than 3.1 million metric tons, including 1.5 million metric tons of wheat to be made available under the President's Food Aid Initiative.

These actions demonstrate that the Department is responding to changing conditions in overseas markets and is applying resources as needed to maintain access to those markets. Although the budget shows a reduction in the overall program level for USDA international activities in 2000, this is primarily due to the sizeable increase in food aid programming during 1999. For 2000, the budget assumes food aid programming will return to a more traditional level. On the other hand, the 2000 budget provides a total program level of $6.5 billion for USDA international activities; this is considerably higher than the actual level for 1998 of $5.7 billion. Thus, the program level for 2000 is approximately $800 million above the level of just last year.

Question. What are USDA's plans for increasing foreign markets for U.S. commodities?

Answer. USDA is committed to moving forward with greater reform in world agricultural trading practices in the next round of world trade talks which is set to begin later this year. Our goals for the upcoming WTO negotiations include: elimination of export subsidies; substantially cutting, and where possible eliminating, tariffs on farm products; tightening rules on domestic subsidies; reforming state trading enterprises, and tightening rules on technical barriers that unjustifiably restrict trade. In addition, we will continue to work to resolve the contentious bilateral trade issues that hinder our exports, such as the EU ban on U.S. beef, restrictive Canadian import policies for livestock and wheat, and unfair Chinese restrictions on U.S. wheat.

In addition to the export credit guarantee and foreign food assistance activities mentioned above, USDA continues to carry out other important export promotion and market development programs, including the Foreign Market Development Cooperator Program and the Market Access Program. For 2000, the budget proposes

the implementation of two new market development activities. The first is a program of Reverse Trade Missions which will bring buying missions of foreign importers, retailers, and trade officials to the United States to orient them on the quality and diversity of U.S. agricultural products. The second is a new Quality Samples Program under which samples of U.S. agricultural products will be provided to foreign importers to promote a better understanding and appreciation of their high quality.

REGIONAL RESEARCH PROGRAMS

Question. For the past three years, all regional research programs have been eliminated in the President's budget. Explanations in the past have noted that these programs are zeroed out in order to focus on 'national research programs of significance'. What research programs are considered 'national research programs of significance'?

Answer. The Fiscal Year 2000 Budget Request for the Cooperative State Research, Education, and Extension Service (CSREES) reflects the Administration's commitment to improving the science base for agriculture through the competitive grants programs of the National Research Initiative and targets high priority activities such as small farms, water quality, food safety, sustainable agriculture, global change, and improved pest control programs. In keeping with the Administration's goal to focus on these high priority research programs, projects earmarked for specific institutions were proposed for elimination. Alternate funding from formula programs, State and local governments, and private sources could be use to support aspects of this program deemed to be of a high priority at State and/or local levels.

FOOD SAFETY

Question. I understand that the Food Safety and Inspection Service has announced a plan to test moving their food inspectors out of the Federal slaughter and processing plants and moving them into retail such as into grocery stores. Grocery stores are already under inspection by FDA and the State and local public health departments. This doesn't seem very efficient or productive given that other areas are in greater need of food safety inspection. For example, I understand that there is a greater need for inspection at ports of entry instead of in grocery stores. Does the budget for USDA reflect FSIS' desire to implement such a program in grocery stores, or does USDA intend on focusing on the problems surrounding some imported foods?

Answer. The 2000 budget for the Food Safety and Inspection Service (FSIS) includes an increase of $10.8 million to help the FSIS inspection workforce make the transition to a new Hazard and Analysis and Critical Control Point (HACCP) environment, including the conversion of 638 positions to Consumer Safety Officers. In these new positions, inspection personnel will be responsible for conducting scientific testing and inspections throughout the farm-to-table continuum. FSIS intends to redistribute its resources in ways that permit FSIS to more efficiently and effectively verify that the industry meets its responsibility to produce safe and wholesome products. Some personnel will be redeployed to cover critical inspection vacancies in very small establishments. If it appears that inspection sources should be increased at import re-inspection locations, FSIS managers will assign personnel as needed.

FOOD QUALITY PROTECTION ACT

Question. A consistent concern relayed to me by the agriculture community in Washington state is the implementation of the Food Quality Protection Act and USDA's involvement with EPA. How has USDA been working in conjunction with EPA and what are the Department's predictions regarding implementation and the potential loss of tools necessary for production?

Answer. We have established a close working relationship with EPA. One of the most important procedures that we have established with EPA involves the development of Transition Strategies. When final risk assessments indicate that a chemical or a use of a chemical must be canceled to meet the stringent new FPA standards, USDA will take the lead in the development of the Transition strategies. These strategies will be developed in partnership with EPA and with broad stakeholder involvement. We are doing our best to meet our regulatory obligations under FQPA while making sure that we have the pest control tools necessary for production.

QUESTIONS SUBMITTED BY SENATOR BURNS

E. COLI TESTING

Question. FSIS has been testing ground beef for E. coli 0157:H since 1996. Out of 26,088 samples, they have found only 25 positive. How much is it costing USDA to look for something they only find 0.09 percent of the time, or less than once in every one-thousand samples tested? None of these samples were connected to an outbreak or illness-so what is the value of this testing?

Answer. The Food Safety and Inspection Service (FSIS) spends approximately $10.4 million per year on testing meat and poultry products for 9 potentially deadly pathogens, including E. coli O157:H7, Salmonella, Campylobacter, and Listeria. The testing program for E. coli O157:H7 began after the tragic outbreak of foodborne illness associated with this pathogen in the State of Washington. USDA estimates that over 10,000 illnesses per year result from consuming foods contaminated with E. coli O157:H7. As the Washington outbreak demonstrated, the most susceptible to this pathogen include children, the elderly, and the immune compromised. Testing programs like that for E. coli O157:H7 assists us in controlling deadly pathogens by identifying contaminated product in time to remove it from the market before it can cause foodborne illness.

Question. Most of these 26,000+ samples were collected from grocery stores. How can testing at grocery stores for E. coli 0157:H7 or any pathogen contribute to the protection of the public's health if the consumer has already eaten the food by the time you get test results back?

Answer. The testing program is targeted to detect contamination problems at the retail level, because many retail stores further process ground beef after receiving it from a federally inspected facility. Detection and removal of pathogen-contaminated foods at any point of distribution will serve to protect the public from foodborne illness. In addition to removing contaminated product from the market, knowledge of food contamination problems promotes corrective actions on the part of producers, and serves to prevent future foodborne health hazards.

Question. Shouldn't the testing be done before the food reaches the stores?

Answer. Currently, the FSIS collects approximately 60 percent of the samples from retail stores and approximately 40 percent of the directly from processing plants. Further, FSIS conducts a variety of monitoring programs for several foodborne pathogens in ready-to-eat products, and all of these monitoring samples are collected at the processing plant level prior to distribution at the retail level.

Question. FSIS has announced a plan to test moving food inspectors out of the Federal slaughter and processing plants and moving them into retail such as into grocery stores. Grocery stores are already under inspection by FDA and the State and local public health departments. This doesn't seem efficient or productive given the other areas are in greater need of food safety inspection. For example, Senator Collins and the Government Accounting Office have identified a real need for increased inspection of imported foods at the ports of entry. Why not put these inspectors there is a need rather than where you will just be duplicating effort?

Answer. Traditionally, FSIS has assigned the great majority of its resources to inspection activities within slaughter and processing plants. Consistent with the modernization and farm-to-table initiatives, FSIS intends to redistribute its resources in ways that permit FSIS to more efficiently and effectively verify that the industry meets its responsibility to produce safe and wholesome products. If it appears that inspection resources should be increased at import re-inspection locations, FSIS managers will assign personnel as needed.

Question. Do you have any data to show that grocery stores need more inspection that imported foods?

Answer. FSIS is developing a plan for redeploying some inspectors currently assigned within establishments to monitor, sample, and verify the safety and wholesomeness of meat and poultry in the storage, transportation, and retail sale stages of the food production chain. FSIS has held a number of public meetings to gain input from the public on the plan and proposed inspection models. Once the plan is pilot tested and evaluated, FSIS will share the results with the public. The Agency will not make any changes to inspection procedures until it has adequate data, public input and has completed a thorough rulemaking process. If it appears that inspection sources should be redeployed differently, FSIS managers will assign personnel as appropriate.

Question. Recently there have been several errors made by FSIS in relation to its testing program and recalls. For example, there was a recall that may have actually been a mistake since the laboratory in Florida could not "find" the E. coli 0157:H7 after they said it was in the meat: in another case, FSIS issued a press release list-

ing the wrong products, telling consumers to return products that were not even contaminated to their grocery stores. Most recently, FSIS issued a "policy clarification" that literally backfired—it had the opposite effect of making industry abandon E. coli testing programs that were designed to protect the consumer. What are your plans for addressing these problems?

Answer. We are working closely with the industry to ensure that the implementation of the E. coli O157:H7 testing program is accurate and effective in improving the safety of the products we regulate.

YELLOWSTONE BISON

Question. APHIS has continued to promote a "low-risk definition" was regards to bison from Yellowstone National Park which migrate into Montana. The definition has not been agreed upon by the State of Montana due to APHIS's lack of willingness to get the U.S. Animal Health Association's (USAHA) concurrence on the definition or to agree to financially compensate producers if restrictions are placed on the movement of Montana livestock as a result. How does USDA plan to address the issue of "low-risk definition"?

Answer. In a collaborative effort between the National Park Service and APHIS, the low-risk bison definition was developed in the interest of minimizing lethal control of bison while obtaining the optimum safe balance between maintaining a viable bison herd in the Park and protecting Montana cattle from the threat of brucellosis. Since the original definition was proposed, additional data has been collected from the Yellowstone bison which provides new information about the risk of brucellosis in bison. In light of this data, we plan to meet with representatives of the National Park Service and the Montana Department of Livestock to determine whether the definition of low-risk needs amending. If the definition is amended, the revised definition will then be presented to USAHA for consideration. APHIS remains committed to working cooperatively with the State of Montana and other cooperative agencies towards a resolution of the brucellosis problem in Yellowstone National Park.

BRUCELLOSIS

Question. Does APHIS still support the goal of eradicating brucellosis nationally and what role do the State veterinarian play in this goal?

Answer. APHIS has a firm continued commitment to eradicating brucellosis caused by *Brucella abortus* in the United States. In 1997, an Emergency Action Plan (EAP) for brucellosis was initiated. According to the EAP, all activities involving brucellosis surveillance and management of new cases are conducted as an emergency action. Personnel and fiscal resources are made available where needed to achieve the goal of eradication. The EAP is still in place, and APHIS continues to actively pursue elimination of the disease.

The Brucellosis Eradication Program in the United States has been a State-Federal cooperative program, and State Veterinarians have worked with APHIS to eradicate brucellosis in their states. State veterinarians have the responsibility of protecting the health of livestock in their state, and they may take whatever additional steps they feel are necessary, beyond those set as minimum standards in the Brucellosis Uniform Methods and Rules, to ensure the health of livestock in their state.

Question. We understand Federal officials are considering the relocation of disease-exposed bison from Yellowstone National Park to the State of South Dakota or the Congressional delegation of South Dakota about this proposal?

Answer. APHIS is not aware of any plans to relocate disease-exposed bison from Yellowstone National Park to South Dakota. In addition, APHIS would be opposed to any such action, unless the bison had completed a quarantine and testing protocol as outlined for the Bison Quarantine Facility in the Brucellosis Uniform Methods and Rules, and the above named officials had been notified and approved of the legal movement of these animals.

WILDLIFE TRANSMISSION OF DISEASE

Question. How does the USDA look to address the issue of wildlife transmission of diseases to domestic livestock?

Answer. APHIS is working cooperatively with State and Federal wildlife agencies to investigate, study, and evaluate disease conditions in wildlife; to conduct risk analyses to determine the risk to domestic species and other wildlife populations; and to conduct pathological studies in wildlife populations. Recent examples of wildlife disease conditions in which APHIS has been involved include tuberculosis in white-tailed deer in Michigan; brucellosis in feral swine and the bison of Yellow-

stone National Park; chronic wasting disease in elk; and VVND in cormorants. State wildlife agencies have expressed an interest in APHIS providing assistance in disease management issues (including disease surveillance and diagnostic support) involving wildlife and advice in handling wildlife infected with zoonotic diseases.

Question. Are there currently any discussions between the Department of the Interior and USDA to address this issue in the coming years, due to the increased amount of land that the Federal Government is managing in addition to the increased numbers of wildlife having interaction with domestic livestock in these areas?

Answer. Discussions are ongoing with the Department of Interior (DOI) to address wildlife issues. APHIS, the Agricultural Research Service (ARS), and DOI are working collaboratively to determine and prioritize research needs in the area of wildlife disease management. APHIS also works with the DOI's Natural Park Service in the management of brucellosis-affected and exposed bison in Yellowstone National Park and DOI's Bureau of Land Management (BLM) in the management and capture of wild horse on BLM land. APHIS provides veterinary advice for the BLM program in which wild horses are captured from 10 states and provided for adoption. APHIS will continue to work with DOI on collaborative efforts regarding the disease management of wildlife.

CANADIAN COMPLIANCE WITH LIVESTOCK TESTING

Question. A number of international trade disparities exist, among them unfair testing requirements on livestock for diseases like brucellosis, anaplasmosis, bluetongue, vesicular stomatitis and tuberculosis between the U.S. and Canada. What does USDA plan to do about Canadian compliance on livestock testing?

Answer. We appreciate the opportunity to clarify this issue. Differences in animal health status between the United States and Canada do exist and offer legitimate reasons for requiring testing and/or certifications. Canada is free of 4 of the diseases including brucellosis, anaplasmosis, bluetongue, and tuberculosis, while the United States is not free of these diseases. Canada's import requirements for these diseases are in accord with the international standards, which is the OIE International Animal Health Code. There are no requirements for vesicular stomatitis testing for livestock exports to Canada.

The United States continues to work with Canada to eliminate as many animal health requirements as possible. In December 1998, the two countries reached an agreement that addressed several animal health issues. In this agreement, Canada confirmed that 26 states are eligible for consideration under the restricted feeder cattle requirements. Information on participation in this program was sent to all the states. Another significant point in the agreement was Canada's commitment to amend their animal health regulations to allow for recognition of regions or zones. This will allow for recognition of States that are free of certain diseases such as tuberculosis or bluetongue. Canada will need to revise their regulations to do this. Canada has committed to completing the regulatory process within 2 years.

EU BAN ON U.S. BEEF EXPORTS

Question. Another major livestock concern is the non-scientific trade barriers the EU has employeed to ban U.S. beef and their non-compliance with the WTO. What role will the USDA take in encouraging the EU to comply with WTO rules. Additionally, if they will not comply what will the USDA do to make certain the EU takes the United States seriously as a trading partner?

Answer. The United States has strongly indicated to the EU that we expect the EU to comply with the WTO rulings on the Hormones case by the May 13 deadline. We have emphasized to the EU the importance of this issue to our beef industry as well as to the integrity of the WTO SPS Agreement. The European Commission has adopted a "Communication on Options Regarding the WTO Decision on the EU Hormone Ban". We view this paper as a positive move on the part of the Commission, and were encouraged to see that one of the options put forward was the removal of the ban coupled with a suitable labeling scheme. To that end, Ambassador Barshefsky and Secretary Glickman proposed a beef labeling system to the EU as a way of resolving this issue. We will work with the EU on resolving this issue, and will be prepared to take the necessary action if an acceptable resolution is not reached.

EXPORT RESTRICTIONS

Question. Restrictions on the export of agricultural commodities should be eliminated except in extreme cases of war or multi-national security. Non-tariff trade barriers and those that are not scientifically based must be removed in order for

the U.S. to compete in the world market. What will USDA do to ensure the U.S. remains a viable trading partner?

Answer. The Administration has made clear that commercial exports of food and other human necessities should be excluded from future unilateral sanctions as a matter of general principle and is in support of legislation to accomplish that goal. With regard to lifting current sanctions, the Administration is considering a recent request for export of agricultural commodities to Iran. Commercial and foreign policy considerations are being assessed as the decision-making process moves forward. Recently, the Administration took a modest first step to lift sanctions on the sale of "foodstuffs" to private entities in Cuba. USDA will continue to work within the Administration to support the lifting of unilateral sanctions on food where this step is appropriate.

USDA, working with the Office of the U.S. Trade Representative (USTR), the Department of State and other U.S. governmental agencies, actively monitors our trading partners' technical standards to assure that they comply with international agreements. Technical issues, such as sanitary and phytosanitary (SPS) standards, are discussed in bilateral and multilateral fora and are generally resolved at either the technical or political level depending on the issue.

The Department's SPS Technical Working Group meets every week to document new issues and to receive updates on outstanding barriers that either threaten or are currently impeding U.S. agricultural exports. Most of the issues addressed by the group are highly technical and require follow-up by subject experts from various regulatory agencies. For example, the TWG was actively involved in resolving Egypt's proposed mandatory pre-shipment testing and certification program for apples that would have slowed U.S. apple exports to this small, but growing market. In contrast, high profile and time-sensitive technical issues that can have a significant impact on trade, such as Mexico's proposed rule on avian influenza, are normally dealt with outside of the TWG and are elevated to higher levels within the Department.

STATE TRADING ENTERPRISES

Question. U.S. producers are concerned that the Canadian Wheat Board (CWB) is unfairly subsidizing its farmers and thus presenting them with an unfair advantage in the world market. State Trading Enterprises undercut competitors without concern for profit or loss and thus produces inefficiencies, distorts trade and diminishes prices for all producers. What will USDA do to eliminate State Trading Enterprises?

Answer. We are considering several approaches for dealing with exporting STEs in the next round of WTO agriculture negotiations, including increasing the transparency of STE operations and expanding competition by seeking the removal of statutory monopoly export authority and statutory monopsony purchasing authority. Additionally, as countries agree to open their markets to imports, importing State Trading Enterprises have also come under increased scrutiny. While the importing STEs in many cases are among our best customers, the ability of importing countries to use control over their STEs to restrict imports is a serious issue that must also be addressed through the WTO.

CANADIAN PESTICIDE ADVANTAGES

Question. Sanitary and Phytosanitary Standards have long been a point of contention between the United States and Canada. While Canadian producers are allowed to use certain chemicals on their commodities and market them in the United States, U.S. producers are not allowed to even purchase those same chemicals. What action does USDA plan to take to ensure American producers have the same advantages as Canadian producers?

Answer. In the December 4, 1998 Record of Understanding between the United States and Canada, both sides agreed to meaningful commitments to help level the playing field on chemical use. Details on the Action Plan for Pesticide Trade Issues will be submitted for the record.

In addition, USDA has coordinated with FDA and EPA to respond to claims by U.S. producers regarding Canadian wheat entering the United States with prohibited chemical residues. As a result, FDA and EPA have researched the registration and monitoring status of 22 chemicals of concern. FDA has agreed to collect 30 samples of Canadian wheat entering the United States and evaluate them for residues of all chemicals it has the ability to test for. The data, which should be available in 2–3 months, will indicate whether additional monitoring of Canadian wheat is warranted.

[The information follows:]

U.S. Canada Record of Understanding Action Plan for Pesticide Trade Issues

The U.S. Environmental Protection Agency (EPA) and the Canadian Pesticide Management Regulatory Agency (PMRA) will work with growers and registrants in both countries to accelerate bilateral harmonization using the five year North American Initiative developed by the NAFTA Technical Working Group on Pesticides as the framework. As a result of these efforts, there will be great potential for faster and simultaneous access to a wider range of pest control products for both major and minor crops in both countries. However, the success of this initiative hinges on the full and active participation of growers and registrants in both countries.

EPA and PMRA will continue to cooperate with respect to U.S. implementation of the Food Quality Protection Act.

EPA and PMRA are committed to work together to develop a harmonized policy for movement of treated seeds by December 1999.

EPA and PMRA will investigate mechanisms to improve links with state/provincial/territorial officials as a way of providing improved information sharing and a heads up mechanism for potential pesticide/trade issues.

Canadian canola growers have requested Canadian registrants to agree voluntarily to remove canola/rapeseed claims from labels of registered canola seed treatments containing lindane by December 31, 1999. All commercial stocks containing lindane for use on canola and lindane treated canola seed would not be used after July 1, 2001. This is contingent on registrants requesting voluntary removal. EPA, PMRA, growers and registrants will continue to work together to facilitate access to replacement products.

For those specific canola registration reviews undertaken by the EPA on an accelerated basis, EPA and the PMRA will share work on evaluation of pesticide products to the furthest extent possible.

EPA and PMRA will request U.S. and Canadian canola associations to prioritize pesticide registration needs from a list of pesticides now available in either country which are pending approval in the other country. The associations, in consultation with pesticide registrants, would also be asked to identify alternatives to pesticides such as organophosphates (OPs) or others with risk concerns. The resulting list will then be a basis for a longer term strategy to assure adequate, reduced risk pest control tools for canola growers and will fit with current NAFTA efforts to promote a coordinated approach to Integrated Pest Management for canola.

For dry beans (pulses), lentils, and flax (crops grown in rotation with canola), EPA and PMRA will request that growers, in consultation with pesticide registrants in the United States and Canada, identify and prioritize pest control tools and needs for purposes of identifying grower priorities for the agencies. EPA and PMRA will jointly explore efforts to share work on evaluation of pesticide products.

On May 6, The U.S. Department of Agriculture (USDA) and Agriculture and Agri-Food Canada, in conjunction with EPA and PMRA, will convene a high level meeting with Chief Executive Officers of North American pesticide companies to encourage companies to take advantage of the pesticide joint review process and to encourage industry's role in harmonization goals.

USDA and Agriculture and Agri-Food Canada will jointly conduct a study of pesticide price differentials within the United States and Canada to be completed within 6 months.

COUNTRY-OF-ORIGIN LABELING

Question. The USDA stamp on foreign products is a detriment to the producers because foreign countries get the benefit of the grade stamp, without having to pay for it. America's producers need the protection of country of origin labeling to assure that the USDA label really means just that—produced in the U.S. It is a detriment to the consumer because they deserve to know that they are buying American and that they are buying absolutely the safest food supply in the world, which is grown by American farmers and ranchers. What does USDA plan to do about other countries reaping the benefits of the USDA label?

Answer. As directed by the Omnibus Consolidated and Emergency Supplemental Appropriations Act for Fiscal Year 1999, we are conducting a study on the potential effects of mandatory country of origin labeling on imported beef and lamb muscle cuts. As part of this study we will review the regulations and policies governing USDA grading of imported meat. The report will be submitted to Congress in April, as directed.

GRAIN COMPANY MERGERS

Question. Mergers such as the Cargill/Continental proposition are a major threat to producers as they have a great potential to create reduced competition and anti-

trust. Cargill is currently the world's second largest grain company. Their acquisition of Continental makes them an even larger power. Grain producers are already faced with an extremely depressed market and do not need another problem to deal with—fewer marketing avenues and reduced competition. What action does USDA plan to take on agricultural consolidation?

Answer. USDA shares your concern about the potential for mergers and concentration to reduce competition in agricultural markets. I have written to Attorney General Janet Reno strongly urging the Department of Justice to review carefully Cargill Incorporated's plan to acquire continental Grain Company's grain trading business. They need to determine whether the acquisition will notably increase concentration in agricultural and allied industries, causing potential adverse economic effects on farmers, ranchers, and consumers.

PACKER CONCENTRATION

Question. For major packers control 79 percent of the meat packing industry in the United States. The vast majority of livestock producers sell their feeder calves to feeder markets, which are highly concentrated. What action will USDA take on the packer monopoly?

Answer. USDA has stepped up enforcement activities under the Packers and Stockyards Act by the Grain Inspection, Packers and Stockyards Administration. GIPSA will continue to investigate issues of major competitive significance in the livestock, meat packing, and poultry industries. Where anti-competitive practices are found in violation of the P&S Act, GIPSA will pursue appropriate remedies aggressively.

MANDATORY PRICE REPORTING

Question. Price reporting would increase market transparency as well as present producers an accurate view of the market situation each day. It is of utmost importance to have this data accessible to producers so that they may take advantage of the best possible market opportunities available at the most opportune time. What action will USDA take to ensure producers have mandatory price reporting data available?

Answer. In the near future, the Administration will be submitting legislation to the Congress to provide the Secretary of Agriculture the discretionary authority to require the reporting of pricing data for livestock transactions.

PREDATOR CONTROL

Question. $175,000 for predator control under APHIS was cut from Montana Wildlife Services. Montanans are dependent on this funding to operate aircraft for world depredation. If funding is not restored Montana's livestock producers will lose well in excess of the $175,000 that was taken due to predator loss. How does USDA plan to compensate producers for predator loss as a result of this funding cut?

Answer. The budget does not specifically identify where the reductions will need to be taken if APHIS is not successful in increasing the cost sharing for its many efforts in Wildlife Services.

FORT KEOGH RESEARCH STATION

Question. $1 million was cut from the Fort Keogh Research Station in Miles City. This experiment station caries out extremely valuable research on sustainable environment, an area close to this administration's heart. Range research, which comprises most of the studies carried out at this station, promotes a sustainable environment more than any other research method. Research dollars are of utmost importance to educate producers and provide them with new ideas and avenues to market their products. In a depressed market they must find new marketing alternatives. Research and education dollars are a necessity to ensure they receive up-to-date and pertinent information. How does USDA plan to give farmers the necessary advantage to market their products with cuts like these?

Answer. Large amounts of public and private research and cooperation have made US agriculture the marvel of the world. We intend to continue that effective research partnership by investing public research dollars in critical areas, such as sustainable environment where there is a significant public interest and where private industry is unlikely to take the risk. The Administration advocates a broad range of funding mechanisms in support of university-based agricultural research, education, and extension. These mechanisms, including formula programs, competitive grants, special grants and projects, and other programs—such as Smith-Lever 3(d)—

are interdependent and jointly contribute to the success of our knowledge-based system of agriculture.

FARM BILL CHANGES

Question. You have said that one of the changes you would like to see in the current farm bill is a mechanism to help farmers build storage facilities. We believe we should be selling grain and reducing our stocks. What is the rational for this strategy?

Answer. If producers do not have access to adequate storage, they are more likely to sell when prices are low during the harvest period. Access to transportation is also an issue. Marketing opportunities are limited for many farmers due to rail abandonment, so access to additional storage would provide these producers with some additional tools to manage risk.

Question. How can constructing additional storage help producers?

Answer. Much of the storage built during the 1970's is nearing the end of its useful life and may need to be replaced. As storage facilities wear out, farmers will be more likely to market when prices are low during the harvest season or be forced to pay commercial storage rates. If crops are large, and the marketing system cannot move all the grain at once, grain supplies may back up onto the farm and leave producers with no alternative but to store grain on the ground. On-farm storage could help to avoid such problems. Federal assistance in financing storage facilities would also help farmers obtain credit at favorable terms, which can be difficult through commercial sources.

Looking ahead, as customers become increasingly sophisticated in their demands for grain with specific traits and characteristics, identity preservation is rapidly becoming key for suppliers. Increasing storage opportunities, in particular on the farm, will be an integral part of the grain marketing infrastructure that will be developed to market identity preserved grain.

Question. You are also advocating an extension of loans. Won't allowing producers a longer period of time to settle loans tend to build stocks that will continue to depress prices?

Answer. We advocate providing limited discretion to extend commodity loans when there is a breakdown in the marketing system, for example, in the event of a rail strike.

FOOD QUALITY PROTECTION ACT

Question. Implementation of the Food Quality Protection Act (FQPA) has made farmers very nervous about the consequences of pesticide reduction regulations. We urge USDA to work closely with the EPA to take into account the effects this act has on farmers ability to produce a quality product which is competitive on the world market. Will USDA take the lead on this issue and weigh the potential harm the FQPA may cause American farmers and ranchers?

Answer. EPA and USDA have agreed upon processes to ensure USDA involvement in risk assessment, risk mitigation, and other aspects of FQPA implementation. Along with our cooperators at the Land Grant Universities, USDA will take the lead in the development of transition strategies when they are required to reduce risk to acceptable levels. Transition Strategies will be developed in consultation with grower organizations.

ANIMAL FEEDING OPERATIONS

Question. Proposed new rules for Animal Feeding Operations (AFO's) are as detrimental to livestock production as the FQPA is to crop production. Will you assist us in Congress in undoing the EPA's blatant rewriting of the Clean Water Act, ensuring that the result of the Unified National Strategy for AFO rulemaking is fair and maintains our productive capacity at its current level?

Answer. The Unified National Strategy for AFO's is not a rule or a regulation. Any proposed changes to legislation or regulations will have to have to go through the full rulemaking process. One of the guiding principles of the Strategy is to "ensure that measures to protect the environment and public health complement the long-term sustainability of livestock production in the US".

GUARANTEED FARM OWNERSHIP LOANS

Question. Will USDA include in your current and future budgets sufficient money to replenish drained funds for guaranteed ownership loans to farmers and ranchers under the Interest Assistance Program?

Answer. For fiscal year 1999, approximately $425 million was available for the guaranteed farm ownership loan program. FSA estimates that funding for this program will be depleted by mid-March, except for a small amount of funds set-aside for beginning farmer and socially-disadvantaged targets. As a result of low commodity prices, many farmers and ranchers are facing cash flow problems this year, dramatically increasing demand for USDA's farm lending programs. In addition, demand for the guaranteed farm ownership loans, in particular, has increased due to: 1) a large carry-over of applications from last year, and 2) a change made by last year's agriculture appropriations bill which increased the loan limit on farm loans to $700,000 (previously there were separate limits of $300,000 for farm operating loans and $400,000 for farm ownership loans.

The Administration recognizes the serious need for additional funding for this and the other farm loan programs, and we are currently considering a proposal for a supplemental funding request. Additional funding proposed specifically for the guaranteed farm ownership loan program would be about $350 million. We will work closely with Congress to ensure that farmers and ranchers have access to the credit they need to see them through to better times.

CIVIL RIGHTS CASE BACKLOG

Question. Much remains to be done in the area of Civil Rights. According to information posted on the Office of Civil Rights Internet site as of March 1998, Montana had at least 19 cases of discrimination pending with the USDA, placing Montana in the same category as highly populated states such as Florida and New York. These people deserve better than this from an agency that was supposedly established to help American agricultural producers. I want to know when the people still in the process can expect prompt, responsive, and efficient handling of their complaints, not the foot-dragging, hurry-up-and-wait treatment they have received up to this point?

Answer. We are committed to getting existing complaints resolved and to resolving all new complaints in a timely manner. We have issued new Departmental regulations that delineate complaint processing procedures that will get most program discrimination complaints resolved within 180 day. We are adding 30 staff to help us achieve that goal.

FUNDING FOR CROP INSURANCE REFORM

Question. President Clinton vowed to make crop insurance a top priority in the new Congress. However, absolutely no mention of crop insurance or funding of crop insurance is mentioned in the fiscal year 2000 budget. With a risk management plan bankers are more likely to finance producers if they have both their crop and their price covered with a reliable insurance program. Where is the funding to reform crop insurance and how does USDA plan to address this issue.

Answer. The fiscal year 2000 budget provides for an appropriation to the Federal Crop Insurance Corporation Fund of "such sums as may be necessary" for the continuation of the crop insurance program. This appropriation request is based on current law which is the usually manner in which such requests are made. A substantial amount of supporting information has been provided to the Congress to justify continued funding for the program. The improvements the President has vowed to make in the program will require legislation. A "white paper" detailing the Administration's proposals for improving the program was released along with the budget. The Administration has also announced that wants to obtain additional input from the public and to work with Congress on these proposals and other program improvements. There is a wide range of potential costs and various ways for funding the program, including the use mandatory spending. Once agreements are reached on the improvements that need to be made, the funding for these improvements can be worked out. This approach has been used before in developing farm legislation and it has worked well.

As for your comment regarding the importance of risk management protection for both price and production, we agree whole-heartedly, and would note that, over the last few years, new revenue insurance products have been developed and have attracted an increasing portion of the business covered by the crop insurance program. Even under current law, is anticipated this trend will continue. Further, the fiscal year 2000 budget would provide additional funding for risk management education efforts to ensure that producers are informed of the broad range of tools available, such as futures trading and contractual arrangements, to help them manage risk.

QUESTIONS SUBMITTED BY SENATOR KOHL

FARM SAFETY NET/EMERGENCY ASSISTANCE EMERGENCY APPROPRIATIONS

Question. Please provide an overview, to the extent possible by state and commodity, of the levels of emergency assistance provided to producers as a result of the $5.9 billion made available in the Omnibus Appropriations Act of fiscal year 1999.

Answer. The emergency financial assistance to farmers and ranchers who have incurred losses associated with crops due to disasters is composed of several types of payments. The table below identifies each disaster program and it's associated program level.

Summary of USDA Disaster Program Funding In 1999 Budget Agreement and Other Disaster Programs

[In millions of dollars]

Items	*Budget Authority/ Program Level*
Commodity Credit Corporation:	
Market Loss Crop Payments	2,857.0
Market Loss Dairy Payments	200.0
1998 Crop Losses [1] [2]	1,500.0
Multi-year Crop Losses [1] [2]	875.0
(Includes Wheat Scab)	(30.0)
Livestock Feed Assistance	200.0
Salmon, Honey, Mohair	78.0
Food for Progress	25.0
NAP Raisin Provisions	3.0
Dairy Production Assistance	3.0
Cotton Warehouse	5.0
Subtotal, Budget Agreement	5,746.0
Other Disaster Programs Implemented:	
Disaster Reserve Flood Compensation [2]	42.0
American Indian Livestock Feed [3]	8.5
Livestock Indemnity [4]	4.0
Dairy Production Assistance [4]	6.8
Small Hogs Operation Payments [5]	50.0
Total	5,857.3

[1] Up to $400 million reserved for crop insurance buy-up on 1999 crops.
[2] The program will be partially funded under Section 1102 of the 1999 Appropriations Act which authorized the allocation of an additional $30 million to the DRFCP.
[3] Of the total program level of $12.5 million, $8.5 million is anticipated to occur in fiscal year 1999.
[4] Provided for by the 1998 Emergency Supplemental Appropriations Act.
[5] Program is funded by Section 32 funds, but delegated to FSA to administer.

Just over $2.8 billion in Marketing Loss Assistance Payments have been made as of February 12, 1999. These payments include feed grain, wheat, upland cotton, and rice programs. The attached table identifies the States that have received payments.

TIMING AND EFFECT OF ASSISTANCE

Question. Please include any timetables available to indicate when producers may expect to receive assistance plus and analysis of the degree to which the assistance made available by the aforementioned Act will remedy shortfalls in farm income due to either production or market losses in 1999.

Answer.

Within 10 working days of the omnibus bill's enactment, USDA began making income loss assistance payments. By November 21, 1998, USDA had paid 1.4 million farmers more than $2.8 billion.

On November 12, 1998, USDA announced the Livestock Assistance Program (LAP) and began taking applications on November 23, 1998. To accommodate the extremely high demand for LAP, USDA extended the sign up for this program and now plans to close enrollment on March 25, 1999. USDA will issue payments shortly thereafter. We estimate that the $200 million Congress appropriated for livestock assistance will be heavily over-subscribed and USDA, consequentially, will be able to pay only a portion of the total request.

On March 15, 1999, the sales closing date for the 1999 crop insurance program, USDA will have disbursed the $400 million dedicated to lowering crop insurance premiums—the Administration's down payment on its commitment to strengthening the farm safety net by reforming and improving crop insurance.

USDA has implemented the honey and mohair loan programs included in the bill.

In the near future I will announce USDA's plans for the $200 million dairy assistance program.

USDA now expects to make CLDAP payments in June, following a six month sign up program, the same length of time USDA ran the sign up for the 1988 disaster assistance program, the last time USDA had to implement a major, new crop loss assistance program. While USDA was able to use the 1988 program as a template for subsequent programs, we could not do so for this year's program.

The additional resources sought by the Administration and approved by Congress have been instrumental in keeping thousands of farmers and ranchers in business during tough times. USDA is at your disposal to provide any additional information about implementation of these programs.

STATE OF THE FARM ECONOMY

Question. Please provide any information available about the state of health of the farm economy at present and the extent to which producers may not be able to continue viable farming or ranching operations this coming year even with the assistance provided in the fiscal year 1999 Act.

Answer. The farm economic outlook for 1999 is not favorable. In 1998, the farm economy took a sharp downturn when bad weather devastated many production regions from California to Florida, while grain and oilseed prices nosedived as a result of large global supplies, the deepening Asian financial crisis, and weak export demand. Livestock prices also dropped due to large supplies, and hog prices went into a free fall late in the year. Unfortunately, exports and commodity prices likely will be even lower in 1999, causing increased farm financial stress, particularly in grain and oilseed producing areas, such as the Corn Belt States, that up to now have weathered the economic downturn.

U.S. farm exports, for example, are expected to drop to $49 billion in fiscal year 1999—down $4.6 billion from fiscal year 1998 and nearly $11 billion from the peak in 1996. Net farm income is expected to drop to $44.6 billion for 1999, a 7-percent decline from 1998 and a 16-percent drop from 1996. Net income just for key field crops (wheat, corn, soybeans, upland cotton and rice) will be 17 percent below the average for the past 5 crop years for the 1998 crops, and for the 1999 crops, net income is projected to be 27 percent below the previous 5-year average.

USDA's revised baseline projections for the next 10 years indicate that economic recovery will occur at a very gradual pace.

The nearly $6 billion in government assistance enacted last year is helping to maintain farm income and ease financial hardship for many producers. Direct government payments to producers reached nearly $13 billion in calendar year 1998 and will probably total at least $11 billion in 1999. Also, lower interest rates and fuel costs have helped reduce production costs, offsetting some of the decline in cash receipts for many producers.

However, aggregate measures of the health of the farm economy mask a marked erosion in market income in many regions and commodity sectors, and all signs now point to greater farm financial stress in 1999. Net cash income is currently projected to decline $3–4 billion. Land values began declining in a number of Midwestern States during the last half of 1998, after years of steady increases. The drop in income, coupled with declining asset values for many producers, means many will have difficulty obtaining credit, and those who do will use it for variable cash expenses, not investment, and will find themselves squeezed trying to repay debt out of current income. For the many producers who struggled with cash flow in 1998 because of adverse weather and low prices, problems likely will worsen in 1999.

As a result of increased financial stress in farm country, demand for USDA farm loans in fiscal year 1999 has been extremely strong. Many farm families who have been financing their business operations through their own resources or with a minimum of commercial bank debt are now seeking farm loan assistance. Commercial lenders are utilizing Farm Service Agency loan guarantees to restructure the short-term indebtedness of their customers into more favorable long-term rates so that they can continue to provide financing. FSA is using all servicing authorities, including rescheduling and reamortizing, deferring installments, and debt writedowns to assist FSA borrowers.

However, funds are exhausted or will soon be exhausted for key credit programs: all emergency loan funds and non-targeted direct farm ownership loan funds have

been obligated already; non-targeted interest-assisted guaranteed loans and direct farm ownership loans will be exhausted in March; funding for direct farm operating loans will last into April, and guaranteed operating loan funding will be gone by August. Credit is no substitute for income, but adequate credit is essential to maintaining any farm operation.

For many farmers and ranchers the key to weathering the farm crisis is duration: how long the period of low commodity prices will last. According to a 1998 Iowa State University study of 1200 Iowa farmers, those in basically strong or stable financial condition can withstand a year of low prices, but if these conditions were to continue for several years, one-third of the farmers in the study would face restructuring or liquidation.

There are many uncertainties that could affect market demand and prices, and, hence, farmers' well-being over the next 1 to 2 years. Weather is always key; so is the world economy for a farm sector as export-dependent as American agriculture.

DAIRY POLICY REFORM

Question. Would you please provide your observations or suggestions relating to changes in USDA programs to help move toward a more rational and fair dairy policy through either regulatory action or legislation? In particular, would you address steps that might be taken to help find a policy of comity among all regions to eliminate the otherwise unavoidable conflict and turmoil that would result from regional compacts or other tools of geographic disparity?

Answer. On or before April 4th, the U.S. Department of Agriculture (USDA) will issue its final decision on consolidation and reform of Federal Milk Marketing Orders as mandated by the Federal Agriculture Improvement and Reform Act of 1996 (1996 Act) as amended. In the nearly three years since enactment of the 1996 Act, USDA has requested information from all segments of the dairy industry and received nearly 4,500 comments on Federal order reform and consolidation. In addition, USDA established agreements with dairy industry experts in the academic community to analyze specific issues, including the Class I price structure and replacement of the Basic Formula Price (BFP) for milk, and conducted several listening sessions around the country before and after release of USDA's proposed rule in January 1998. We believe this meticulous approach in informing the public and obtaining input from interested parties will yield a final decision that is in the best interests of all segments of the dairy industry and be fair to all areas of the country.

EMERGENCY PRECEDENTS

Question. USDA recently announced the granting of $50 million to hog producers to help offset the dramatic reduction in price. How does the Department intend to address similar requests from producers of other commodities (e.g. beef cattle, aquaculture, minor crops, etc.) now that a precedent appears to have been established?

Answer. Hog producers were hit with the lowest prices in five decades and we made every effort to find a way to help producers. We would hope to be able to help other producers in similar circumstances and are working hard to shore up the safety net for all farmers and ranchers.

RURAL RENTAL HOUSING ASSISTANCE

Question. The budget request for 2000 would reduce the amount available for Rental Assistance, in part, by deferring a portion of the funds until October 1, 2000. What effect would this action have on current tenants of eligible housing facilities and on the USDA housing programs generally?

Answer. The manner in which the budget is requested for rental assistance will have no effect either on the flow of funds to the borrowers or on the tenants of the units. These funds are provided through five-year contracts and this permits spreading the budget authority over tow years.

EFFECTS OF CLIMATE CHANGE

Question. To what extent is climate change having an impact on USDA policies? Recent weather events lead to a conclusion that adverse conditions are affecting agriculture more severely and more significantly than in earlier decades, resulting in more volatile markets, reduced farm income, and disruption of consumer expectations. How is USDA responding to these changes in terms of long-term policy and what recommendations would you make for Congressional action in this regard?

Answer. Temperature increases can have both positive and negative effects on crop and forest yields, with the difference depending on location and on the magnitude of the increase. And agricultural and forestry systems are most sensitive to

extreme climatic events such as floods, wind storms, and droughts, and to seasonal variability. Climate change could alter the frequency and magnitude of extreme events and change seasonal patterns. Increases in rainfall intensity pose a threat to agriculture and forestry and the environment because heavy rainfall is primarily responsible for soil erosion, leaching of agricultural chemicals, and runoff that carries livestock waste and nutrients into water bodies. Adjustment costs are likely to be higher with greater rates of change. While climate change is not expected to seriously threaten the U.S. ability to produce enough food to feed itself through the next century, regional production patterns are likely to affected.

Strategies such as changing planting and harvest dates, rotating crops, selecting varieties for cultivation, changing irrigation practices, fertilizers and pesticide use, and choosing cultivation and forest management practices can lessen potential yield losses from climate change and improve yields in regions where climate change has beneficial effects.

We need to improve our understanding of how extreme events could affect agriculture and forestry and develop appropriate management systems for coping with these events. And we need more research to explain and predict how agriculture and forestry will be affected by climate change USDA investment in additional research on the adaptation of appropriate strategies is needed to gain a better understanding of the climatic factors that affect enterprise level adoption such as information flow, access to capital, and the role of global change public programs and policies.

We need Congressional support for our fiscal year 2000 research and climate change technology programs so we can conduct this vital research and demonstrate alternative management practices that not only address the climate challenge but provide significant benefits in the form of improved productive capacity of our soils, improved water quality, and habitat protection. We would also welcome your ideas on how USDA's programs can be augmented to include greenhouse gas abatement and carbon sequestration. And we look forward to working with you to address the international challenge of reducing the atmospheric concentrations of greenhouse gases in the most cost-effective way.

Question. Reduced farm income increases the difficulty of obtaining commercial credit. In many cases, commercial lenders are restricted by state and federal banking requirements in a manner that will adversely affect farmers when cash flow, debt to assets ratios, or other financial conditions can not be met. What role is USDA taking with the financial industry (including federal and state regulators) to help farmers overcome banking regulatory burdens?

Answer. FSA provides substantive guaranteed loan assistance for bank customers who have been affected by the weakened farm economy. With this assistance from FSA, family farmers who otherwise would be prohibited from obtaining commercial credit are able to continue their credit relationship with their home-town banks. USDA has no influence over federal and state regulators. However, issuance of FSA loan guarantees to commercial lenders gives confidence to regulators that exposure to loan losses is reduced.

Question. Does USDA intend to seek additional levels of direct farm credit for Farm Service Agency programs to help offset growing difficulty of farmers to obtain operating capital from commercial lenders?

Answer. FSA will utilize all available resources in the farm loan programs to assist family farmers with their credit needs. Seeking additional funds for these programs is actively being considered.

Question. Does USDA intend to seek additional farm credit funding budget authority for fiscal year 1999?

Answer. Use of loan funds in all farm loan programs is being closely monitored. Deliberation will be given to seek additional funding authority for programs that will be exhausted before the end of fiscal year 1999.

LOAN DEFICIENCY PAYMENT CALCULATIONS

Question. It has come to my attention that differences in points of delivery for certain commodities in WI and MN are working to the detriment of Wisconsin farmers in the calculation Loan Deficiency Payments (LDP's). In other states it has been determined that the existing system for LDP calculations based on posted county prices did not accurately reflect prices received by producers. Please review the situation in Wisconsin and report your findings and actions taken to ensure fair and equitable treatment for Wisconsin producers.

Answer. LDP's are calculated using county loan rates that are established once a year and Posted County Prices (PCP) that may change daily. There is a common misconception that the PCP pricing system was designed to ensure that all pro-

ducers of a commodity have the potential of earning the same marketing loan gain or LDP. In actuality, the primary objective of the PCP system is to determine a value as close as possible to the local cash market price in any given area. The PCP system was designed to provide producers with equitable, but not necessarily equal value for their commodities.

The Kansas City Commodity Office (KCCO) conducts weekly surveys of 187 counties in major production areas throughout the nation to determine if Posted County Prices (PCP's) accurately reflect local market prices. The most recent surveys for corn and soybeans were conducted on March 9 and included four counties in Wisconsin. In general, the results indicate that PCP's in Wisconsin accurately reflect local market conditions for these commodities.

If you have specific questions concerning PCP for a specific commodity or region of Wisconsin, I encourage you to submit your comments to the Farm Service Agency for further review.

STUDY OF DAIRY PRICES AND THE WTO

Question. Section 151 of the Federal Agriculture Improvement Act of 1996 calls for a study and report regarding the United States membership in the World Trade Organization and the potential impact of such membership on domestic dairy prices, federal dairy programs, and other related items. This report was to be provided to the House and Senate Agriculture Committee's no later than July 1, 1997. Please provide information on the status of this report and, if complete, would you please provide a copy to this subcommittee?

Answer. The analysis for the study of the impact on milk prices, producer incomes, and dairy program costs of additional access resulting from U.S. obligations under the World Trade Organization has now been completed and the final report is currently being prepared. We will transmit a copy of the report to Congress as soon as it is completed.

FSIS USER FEES AND FARM INCOME

Question. Please explain if you disagree that any FSIS user fee imposed on meat and poultry companies would not be passed on solely to producers. Do you believe the major meat and poultry companies act more competitively in their relationship with consumers than producers? If so, please explain?

Answer. We do not estimate that the impact of the user fees will be passed down to producers in the form of lower prices paid. We estimate that most of the fees will passed on to consumers in the form of higher retail prices. We estimate that the cost will be passed onto consumers, because they are less likely to decrease the amount of meat and poultry they consume as result of higher the higher prices created by the proposal. The overall impact on retail prices would be less than one cent per pound.

Question. If so, why is there so much concern expressed by the Department and elsewhere about concentration with the agricultural industry, especially in regard to the livestock sector and the effect of concentration on farm prices?

Answer. There is much concern about concentration in the livestock sector, because in 1997 the top 4 firms slaughtered 80 percent of the steers and heifers, 54 percent of the hogs, and 74 percent of the sheep and lambs. USDA has placed a high priority on addressing issues surrounding the high levels of concentration in the meat packing industry. Where anticompetitive practices are found in violation of the Packers and Stockyards Act, USDA will pursue appropriate remedies aggressively.

EMERGENCY FORESTRY ASSISTANCE

Question. Emergency Forestry Assistance. The fiscal year 1999 Appropriations Act included $10 million in emergency funding through the Forestry Incentives Program (FIP) related to forest fires in Florida and disasters in other states, including Wisconsin. What is the status of providing this assistance and what plans for distribution of benefits do you intend to use? Additionally, what timetable do you envision for delivery of this assistance? Since the identified need in Wisconsin is nearly $1.3 million for disasters in 1998, and since $10 million provided nationally will not cover all identified needs, will the Department reflect these shortfalls in emergency funding to states based on an appropriation of FIP funding for fiscal year 2000?

Answer. On February 16, 1999, $9 million in Forestry Incentives Program (FIP) funds were allocated to 17 States to address reforestation needs caused by wildfires and other natural disasters in 1998. A $1 million reserve is being retained for future assistance, primarily for tree planting needs in Florida. USDA's Natural Resources Conservation Service (NRCS) and Forest Service, along with State foresters, are

currently delivering the services associated with this funding. The Administration's fiscal year 2000 budget currently does not request funding for the FIP program in fiscal year 2000.

SANCTIONS

Question. Please provide an update on U.S. negotiations regarding the lifting of sanctions against countries such as Cuba and Iran in terms of the implications for agriculture. Please provide any information relating to the effect the lifting of such sanctions would have for U.S. producers.

Answer. In the case of Cuba, last January, the President announced an initiative to enhance U.S. support of the Cuban people and to promote a peaceful transition to democracy. As part of this initiative, the United States is implementing certain "new measures" including allowing exports of food and certain agricultural commodities to Cuba. Exports are limited to non-governmental entities in Cuba so that eligible recipients are effectively small "mom and pop" shops, private farmers and restaurants. While this represents an important first step, the immediate impact on the level of exports of agriculture products to Cuba is likely not to be great. USDA will continue to work with the Commerce Department in drafting the regulations that will govern these sales.

If sanctions on Cuba were lifted, the United States could reasonably expect to supply about half of Cuba's agricultural imports or about $350 million annually. According to some analysis, Cuba has the potential to become a $1 billion market for agricultural exports after substantial investment occurs, which would make Cuba the second largest U.S. agricultural export market in Latin America.

With respect to Iran, in December, the Treasury Department received a request for approval of a license to broker a sale of approximately $500 million in agriculture exports to Iran. While a sale of this kind is currently prohibited under the terms of the comprehensive embargo against Iran, the request is being given serious consideration by the Administration. USDA is working to ensure that all points of view are represented in the decision-making process.

Despite heavy competition from Australia, Canada and South America, if normal relations were resumed with Iran, it is not unreasonable to expect that U.S. agricultural exports to Iran could reach $300 million in a relatively short period of time and perhaps twice as much within five years. Principal gains for U.S. exports would be in grains and oilseed products.

ASSISTANCE TO RUSSIA

Question. There have been recent claims that Russia has executed sales of wheat to Iraq. Although there appears to be no evidence that these sales involved the conveyance of commodities originating in the U.S. (notwithstanding the fungibility of commodities such as wheat) these allegations do raise certain questions about the role of U.S. assistance in Russia. Please provide information that outlines the steps the U.S. is taking to ensure that food assistance to Russia is actually being delivered to the populations intended.

Answer. First, it is important to note that Russian government officials have assured USDA that such shipments are not being considered.

Second, USDA is taking extraordinary steps to oversee the Russian food aid package and thereby ensure that the assistance is provided to the targeted population. To avoid any mishandling of the commodities, USDA has set up a broad system to monitor compliance of the Russian government with its commitments under these food aid agreements. Monitoring will be necessary in two broad areas: (1) the importation, distribution and sale of the commodities and (2) the deposit of commodity sale proceeds into the "Special Account" by the Russian Government and subsequent transfer into the Russian pension fund. USDA monitoring of the agreements will be designed to minimize the potential for fraud and abuse in the distribution and sale of food aid commodities, and to ensure that appropriate reporting and monitoring systems have been designed to ensure that such problems do not occur.

A key item in the process is the establishment of a U.S. Russian working group in Moscow to identify and resolve any irregularities. The working group is under the supervision of the Minister Counselor for Agricultural Affairs, and bears responsibility for approving the Russian work plans, reviewing logistics and financial reports, estimating the ruble value of commodity shipments, and recommending to the Minister Counselor disbursements from the Special Account to the Pension Fund of the Russian Federal Budget.

On the logistics side, USDA is requiring detailed work plans from Russian authorities about how and where commodities will be distributed, and the Russian government will be required to report on its fulfillment of those work plans.

On the financial side, all records of the Russian Government and its agents must be made available for inspection by USDA monitors. In addition, a bi-weekly financial report submitted by the Russian Government will be reviewed by the working group.

In addition, USDA has established a monitoring group within the U.S. Embassy. At least four individuals from USDA will be detailed to Russia on a full-time basis to assist in this effort. The staff will be placed in both the U.S. Embassy, Moscow and the U.S. Consulate, Vladivostok. At any one time, at least two of these individuals will be traveling to the regions to meet with local officials and organizations, perform spot checks on the deliveries of commodities, and investigate any allegations of fraud or mishandling of the commodities. Data on the progress of shipments will be tracked in Moscow using a sophisticated database created specifically for this purpose.

Besides the joint U.S.Russian monitoring effort and these independent U.S. activities, the Russian government has established its own audit and control operations. The economic crime control unit of the Ministry of Internal Affairs will be tracking the commodities as they move within the country, from discharge at the port or point of entry to purchase within the regions. In addition, the State Customs Committee and the Ministry of Railways have established their own joint committee to track the food aid shipments.

USDA believes these actions will greatly help to assure our food aid benefits a broad spectrum people in Russia who are experiencing a very difficult situation.

PAKISTAN

Question. Last year, Congress took action relating to sanctions against Pakistan in order to help protect U.S. agricultural interests in that country. Now, we hear an opportunity exists to provide an additional 200,000 tons of wheat to Pakistan, but since that nation is in default on GSM loans, that sale (or any other) is in jeopardy. What is USDA doing to help protect markets such as this?

Answer. To help Pakistan meet its wheat import needs and preserve U.S. access to that market this year, USDA has donated a total of 300,000 metric tons of wheat under the authority of section 416(b) of the Agricultural Act of 1949. The wheat will be shipped this spring. In addition, USDA is providing to Pakistan $15 million worth of additional wheat and $10 million worth of soybeans under the Public Law 480 Title I concessional sales program. These food aid activities are not precluded by the default under the CCC export credit guarantee program.

Question. To what extent is the Pakistan problem related to the general financial pressures in that part of the world?

Answer. The Asian financial crisis is a contributing factor to Pakistan's current financial woes, along with the economic sanctions imposed after the nuclear tests in May, and Pakistan's own difficulties in managing its economy effectively. The extent to which financial problems in Asia have affected Pakistan's finances in general and its ability to buy U.S. wheat in particular is difficult to quantify.

For example, the value of cotton and textiles exports, which constitute about two-thirds of Pakistan's $7.5 billion annual export earnings, is down about 15 percent this year compared to last. This is partly due to reduced exports to Far Eastern markets as a result of the economic downturn there and partly due to depressed prices in general as a result of the global economic situation. At the same time, worker remittances (a major source of foreign exchange) have virtually dried up since the Government of Pakistan's hard currency bank accounts were frozen last May following the nuclear tests.

Question. How many other trading partners, or potential trading partners, are in similar situations?

Answer. Pakistan has managed to remain current on payments to the Australian and Canadian wheat boards, so those agencies do not face the same situation as the United States.

DAIRY EXPORT INCENTIVE PROGRAM

Question. The fiscal year 2000 budget reflects a decrease in this program. Please provide information relating to this program's use in fiscal year 1999 and the reasons for the projected reduction in 2000.

Answer. The President's budget assumes that bonus awards under the Dairy Export Incentive Program will reach $99 million in 2000, which is just slightly below the level of $102 million projected for 1999. However, these numbers are only projections of program activity. The actual level of DEIP bonus awards in both 1999 and 2000 will be determined by market conditions and the Uruguay Round Agreement subsidy reduction commitments.

BANANA REGIME ISSUES

Question. A February 3rd article in the Journal of Commerce discusses the relationship of the current Banana Regime issue with the overall economies in the Caribbean Basin and suggests that a U.S. victory at the WTO may ultimately cause the U.S. more harm than good. Would you please comment on that statement and provide an overview of the implications of the Banana Regime issue on U.S. agricultural trade?

Answer. The issues in the EU Banana Regime case ultimately test whether the EU will provide access to its market on a fair and non-discriminatory basis. While the Banana case does not present a situation in which U.S. agricultural products are being denied access, it does present a situation in which U.S. businesses that supply or service agriculture (e.g., U.S. farm equipment manufacturers, fertilizer producers, marketing firms, etc.) have suffered injury because of discriminatory practices. Maintaining the principles of fair access to the EU market is an important issue for U.S. agriculture in general.

The Banana case also tests whether the EU will comply with its obligations under the WTO or will ignore the Dispute Settlement Body (DSB) Panel rulings. If it ignores the DSB rulings, the benefits of the Uruguay Round will be put at risk for all members.

The United States, and U.S. agriculture in particular, has a strong interest in an effective WTO dispute settlement mechanism. Since the WTO was established in 1995, the United States has received favorable decisions in three agricultural cases and has three other cases pending where preliminary findings have supported our positions. In addition, the United States has resolved a number of agricultural issues through the WTO consultation mechanism without going to a panel.

FOOD SAFETY

BIO-TERRORISM

Question. Please explain the steps USDA is taking, along with other Federal agencies, regarding the threat of intentional contamination of our food supply as either part of an international terrorism threat or any other means. To what extent does the President's Food Safety Initiative address this issue?

Answer. APHIS has requested $1.2 million in the fiscal year 2000 President's Budget to develop a national emergency management system to meet the needs of emergency disease outbreaks and emerging animal health issues including microbiological residues, manure management, transmissible spongiform encephalopathies, and biological terrorism. Components of the system would include prevention activities such as surveillance and a national disease reporting system; preparedness activities such as training and the development of response plans; and response and recovery activities. Of the $1.2 million, approximately $700,000 would be used to survey for significant animal health events including biological terrorism. APHIS would also conduct 4 training sessions for Agency and State employees and industry representatives regarding biological terrorism, decontamination procedures, and other animal health events. The remaining $500,000 would be used to complete a master plan for the new system and to develop a National Animal Disease Reporting System and Geographical Information System. The President's Food Safety Initiative does not include any funds for bioterrorism activities.

HACCP

Question. Please provide information regarding the effect HACCP implementation is having on small firms. Since implementation of HACCP at the small firm level is very recent, have there been any unanticipated problems that should be considered by the Appropriations Committee that might not have been known at the time the fiscal year 2000 budget request was being developed?

Answer. Approximately 2,200 small establishments were required to implement Hazard Analysis and Critical Control Point (HACCP) systems by January of this year. At this time we have not encountered any serious problems.

PESTICIDE DATA PROGRAM

Question. Please provide information explaining the role of the Pesticide Data Program (PDP) within the context of food safety. Also, please provide information that directly links the PDP to the availability of pesticides for producers, especially for producers of minor crops.

Answer. The Pesticide Data Program (PDP) provides data on pesticide use and residue detections for a variety of commodities as close to the point of consumption

as possible. The program was created to strengthen the Government's ability to respond to food safety concerns, to protect public health, and to provide the Environmental Protection Agency (EPA) with the data needed to assess the actual dietary risk posed by pesticides. The availability of this data has become more critical with the passage of the Food Quality Protection (FQPA), which established more stringent health-based standards for pesticide residues to assure protection of the public, especially for at risk populations, such as the elderly and children. Without actual residue data, risk assessment studies for pesticides are based on a theoretical maximum amounts of pesticide use. Such studies may greatly overstate the exposure to consumers and may jeopardize EPA's registration of pesticides important to agriculture. The Food and Drug Administration (FDA) utilizes the data to more accurately identify and respond to instances in which pesticide residues exceed established tolerances.

About 88 percent of PDP data are for pesticide residues on minor crops. These data have been extremely useful in conducting evaluations necessary to retain the pesticide registration for pesticides needed to sustain minor crops.

INCOME, MARKETS, AND RESOURCE PROTECTION

INVASIVE SPECIES

Question. Please provide information relating to potential cost to the national economy due to the existing and potential introduction of alien species for which USDA has regulatory jurisdiction. In what areas of the nation are these problems the most serious?

Answer. On February 3,1999, the President announced an Executive Order to expand the effort to address the growing environmental and economic threat of invasive species. This order establishes an interagency Invasive Species Council with the Department's of Agriculture, Commerce and Interior with the Secretaries as co-chairs. Experts estimate that invasive species already infest over 100 million acres of the United States and is growing at a rate of 3 million acres annually. The costs to the U.S. economy are about $123 billion annually.

Question. Is there any way to better protect areas into which these species may migrate in the immediate future?

Answer. The Council will develop a comprehensive plan to minimize the economic, ecological, and human health impacts of invasive species and determine further steps to prevent the introduction and spread of invasive species.

Question. From a budgetary perspective, keeping in mind the constrains on this subcommittee, what are the best strategies to control the threat from these pests?

Answer. The USDA budget includes an increase of $16 million for programs to combat invasive species by preventing entry, improving monitoring and detection, providing rapid assessment and eradication, increasing crosscutting research and technology, and developing partnerships directed at education and outreach.

ORGANIC CERTIFICATION

Question. Please provide information regarding finalization of the Organic Certification program. In which areas of the nation do you believe this program will be the most important from both a producer and consumer perspective?

Answer. USDA is currently working with the organic community and consumers to develop a regulation that responds to the 275,000 comments received in response to the proposed rule. Since publication of the rule, USDA has published several issue papers to gather further input on animal confinement, animal medications, and procedures for termination of producer certification. USDA's goal is to establish clear, consistent regulations that stimulate the growth of the organic livestock sector, satisfy consumer expectations and allow organic livestock producers flexibility in making site-specific, real-time management decisions. Although some areas of the country may produce more organic product than others, both producers and consumers Nationwide will benefit from the uniform standards established by this rule.

WETLANDS RESERVE PROGRAM

Question. Will the expected enrollments in the Wetlands Reserve Program (WRP) in fiscal year 2000 bring total enrollments to the fully authorized level?

Answer. Yes, the requested enrollment for fiscal year 2000 would bring the total WRP enrollment up to the 975,000 acre enrollment cap.

Question. In the event the WRP enrollment authorization is met, does USDA intend to request additional authorization? If so, when and to what levels?

Answer. Once the cap is reached, USDA would have to seek new authority to enroll additional acres. The President's Clean Water Action Plan recommends that up to 250,000 acres be enrolled in the WRP each year over a five-year period.

WATERSHED INFRASTRUCTURE RELIABILITY

Question. Watershed Infrastructure Reliability. Since many watershed structures are reaching their life expectancy, what does USDA plan to do to help avoid continuing deterioration of these structures beyond educational activities?

Answer. Beyond the one-time educational program, USDA has no firm plans to address the continuing deterioration of the structures built under the Small Watershed Program. However, USDA is exploring ideas on how best to assist sponsors in addressing the problem within current authorities and budget constraints.

Question. To what extent does the current status of these structures present a threat to public safety?

Answer. In some instances, especially with older watershed structures that have not been properly maintained, there has been significant deterioration which could create an imminent threat to public safety. While downstream developments are also placing people at risk, there have been no examples where failure of an NRCS assisted structure resulted in loss of life.

Question. Please explain if you believe the level of activity needed to correct the problem of deteriorating infrastructure does not rise above the normal maintenance requirement, and thereby places burden of repair solely on local watershed organizations.

Answer. The problem of deteriorating dams after they reach their designed life is more complex than sponsors merely not maintaining the dams. However, it is our current position that the sponsors of dams built under the Small Watershed Program are responsible and liable for the operations and maintenance, as well as compliance with all state and federal laws involving dam safety and environmental permits. Currently, USDA has no statutory authority to provide financial assistance for operations, maintenance nor rehabilitation.

RESOURCE CONSERVATION AND DEVELOPMENT

Question. Do you believe Resource Conservation and Development (RC&D) districts should be expanded in number or should the areas be expanded geographically? Should the RC&D program contain a "graduation" requirement which would allow new districts to come into the program as others leave due to either completion of RC&D goals or inactivity?

Answer. At current funding levels, we can only adequately support the 315 existing RC&D areas and could not afford any program expansion. There are currently 37 applications for new area authorizations on file with an additional 20 councils being formed.

The RC&D program should only contain a "graduation" requirement for those RC&D Councils found to be inactive or performing below a minimum level. This would be a 'de-designation' of a RC&D area. USDA, in consultation with the National Association of RC&D Councils, Inc. has developed minimum performance criteria for RC&D Councils. The 315 existing designated area councils will be requested to assess their performance using this criteria this fiscal year and identify actions to improve where needed. Inactive or limited performance councils would be provided the opportunity to revise their area plan and strengthen results. USDA could then determine to withdraw assistance if insufficient progress occurs. We expect that this would rarely occur.

RURAL HOUSING RENTAL ASSISTANCE

Question. The budget request for 2000 would reduce the amount available for Rental Assistance, in part by deferring a portion of the funds until October 1, 2000. What effect would this action have on current tenants of eligible housing facilities and on the USDA housing programs generally?

Answer. The 2000 budget actually provides for an increase in rental assistance, from $583 million that was appropriated for 1999 to $640 million for new and expiring contracts in 2000. Rental assistance is provided through 5 year contracts and dispersed over the period of these contracts. Therefore, it is not necessary to have the total amount of funds to support these contracts available in the fiscal year they are made. While the 2000 budget reflects a change in the way rental assistance is budgeted, making some of the funding available in a subsequent budget year, this change is not expected to have any impact on program recipients. The 2000 budget provides sufficient funding for the renewal of all existing rental assistance contracts that are expected to expire in 2000, and for new contracts to support the loans and

grants expected to be made for farm labor housing and the on-going rural rental housing loan program.

FORMULA RESEARCH FUNDING

Question. For the first time in many years, Congress in fiscal year 1999 appropriated funding level increases for many of the Formula Funded research programs, such as Hatch Act, Smith-Lever, and other programs important to states and rural areas. However, the fiscal year 2000 budget request, again, calls for significant reductions in these accounts. Please explain the rationale for these reductions, the anticipated effect it will have on state and country based research and extension activities, and the extent to which USDA consulted with its state and local partners in this decision.

Answer. The Administration advocates a broad range of funding mechanisms in support of university-based agricultural research, education, and extension. These mechanisms, including formula programs, competitive grants, special grants and projects, and other programs—such as Smith-Lever 3(d)—are interdependent and jointly contribute to the success of our knowledge-based system of agriculture. Although some states may be impacted by the cut in formulas, the vast majority continue to match federal dollars at a rate of four state dollars to every federal dollar. The priorities which define Federal support for programs in agricultural science and education are developed through a collaborative, State/Federal process of consultation with stakeholders, mutual planning, and in almost all cases, joint investment.

METHYL BROMIDE

Question. Please provide information regarding USDA activities in fiscal year 1999 and in the fiscal year 2000 budget relating to methyl bromide alternatives, including your expectations on finding an acceptable alternative in the near term, and please note any changes in program activities that may have resulted from last year's extension of production phase-out from 2000 until 2005.

Answer. In fiscal year 1999, ARS has nearly $14,400,000 appropriated for research on methyl bromide alternatives. The funds currently are distributed among 20 ARS locations (see table). About half of the funds are in the two states that are most impacted by the impending loss of methyl bromide—California ($4,374,000) and Florida ($3,029,000). The Honolulu, HI, and Weslaco, TX, locations, where research on methyl bromide alternatives for quarantine purposes is conducted, account for an additional 25 percent of the funding ($3,168,000).

ARS Funding for Methyl Bromide Alternatives Research is as follows:

Location	Fiscal Year 1999	Fiscal Year 2000
Davis, CA	$ 226,000	$ 226,000
Fresno, CA	3,485,400	3,485,400
Riverside, CA	126,600	126,600
Salinas, CA	535,900	535,900
Washington, DC	241,200	241,200
Gainesville, FL	213,000	213,000
Miami, FL	1,219,300	1,219,300
Orlando, FL	1,597,100	1,597,100
Byron, GA	83,900	83,900
Tifton, GA	462,200	462,200
Honolulu, HI	1,684,700	1,684,700
Manhattan, KS	70,800	70,800
Beltsville, MD	1,048,200	1,048,200
Stoneville, MS	182,200	182,200
Corvallis, OR	487,400	487,400
Charleston, SC	330,600	330,600
Weslaco, TX	1,482,900	1,482,900
Wenatchee, WA	209,200	209,200
Yakima, WA	258,000	258,000
Kearneysville, WV	435,000	435,000
Total	14,379,600	14,379,600

Other USDA agencies with methyl bromide alternatives research projects are the Forest Service (FS) and Cooperative State Research, Education, and Extension Service (CSREES). The Forest Service (FS) has reestablished nursery programs at Athens, Georgia, and St. Paul, Minnesota, with the goal of developing integrated pest management programs that will ensure high quality seedlings. In the postharvest area, FS, together with the Foreign Agricultural Service(FAS)and the Animal and Plant Health Inspection Service (APHIS), has been successful in negotiations to get U.S. heat-treated coniferous wood accepted into Europe and kiln-dried lumber into Korea in lieu of fumigation with methyl bromide. CSREES, which administers the NRI competitive grants, has funded research on biological control of soilborne diseases.

An increase of $5 million is proposed in fiscal year 2000 for a new competitive grants program in CSREES aimed to support the discovery and implementation of practical pest management alternatives for commodities affected by the methyl bromide phase-out. The new program will focus on short- to intermediate-terms solutions for all commodities at risk. Activities will involve research designed to deliver and demonstrate the practicality and economic feasibility of new technologies.

An acceptable alternative must allow growers to raise a profitable crop reliably from year to year. In the short term, it is clear that acceptable alternatives will have to come from among those already under development and testing. Because methyl bromide is effective over a wide range of soil types, climates, and crops, no single alternative is available to replace all the uses. The most likely short-time alternatives will be replacement fumigants that are already registered. Other kinds of alternatives, such as resistant varieties, biological control, and cultural improvements, show promise; but there is not enough time to develop and adapt them to acceptable cropping systems before the phase-out. Even for replacement fumigants, results are mixed and not as consistent as methyl bromide—probably why the replacements have not been widely adopted as long as methyl bromide is available.

Although there are likely to be short-term replacements for some uses of methyl bromide, in most cases, the alternative is likely to cost more and be less effective. Serious economic consequences and shifts in agriculture within states and among foreign countries are expected.

The strategy for finding alternatives is not expected to change because of the extension of the phase-out; there will just be more time to look for solutions. The strategy remains to identify and develop alternatives in laboratories and small plots, then test the most promising ones in larger plots under a variety of conditions, and finally to select the most effective and validate their effectiveness in commercial field-scale settings. The final stages are done with the cooperation of the agriculture industries and growers, many times on grower land.

USER FEE OFFSETS

Question. Section 754 of the fiscal year 1999 Appropriations Act directed that any submission of unauthorized user fees in the fiscal year 2000 budget request before this subcommittee would have to include certain additional information if the revenue for those fees was necessary to meet the President's budget authority requirements. While the budget authority request for FSIS appears to include the full amount necessary for inspection and related activities in fiscal year 2000, the table found on page 379 of the Budget reflects a total discretionary requirement for this subcommittee that assumes the $504 million in proposed revenues from unauthorized user fees for FSIS activities. Please list by USDA agency and by amount any assumptions of revenues from unauthorized user fees to achieve the discretionary spending found on page 379 and, consistent with Section 754 please note the funding levels currently in the budget request recommended for reduction in the event the fees in question are not authorized prior to the convening of a committee of conference for the fiscal year 2000 appropriations bill.

Answer. We will provide the information for the record.

[The information follows:]

FISCAL YEAR 2000 FEE PROPOSALS WHICH IMPACT DISCRETIONARY SPENDING

[In millions of dollars]

Agency	Proposal	Budget Authority
Food Safety and Inspection Services	Salaries and Expenses. This proposal would charge fees for the full cost of providing Federal inspection of meat, poultry, and egg products. The user fees exclude Grants to States and Special Assistance to State Programs..	−504
Animal and Plant Health Inspection Service	Salaries and Expenses. This proposal would establish user fees for costs for animal welfare inspections and issuance of biotechnology certificates..	−9
Grain Inspection, Packers and Stockyards Administration.	Salaries and Expenses. This proposal would establish a fee for grain standardization and a licensing fee to cover the costs of administering the provisions of the Packers and Stockyards Act relating to meat packing and stockyards activities..	−19

COUNTY AND STATE OFFICE STREAMLINING

Question. To what extent are total agency costs in the office consolidations considered? For example, would USDA require relocation of a state office for one agency in order for all state agencies to be in a single location if the cost for the relocation exceeded the costs of current locations?

Answer. FSA with NRCS and RD will be establishing a working group comprised of representatives from management and the unions to develop a plan for implementing office consolidations where these are not already in place. The working group will be looking at every aspect of plans to achieve savings under current budget resources. It is possible that the benefits to producers and field offices of a common state office location could outweigh a somewhat higher cost, yes.

EMPLOYEE REDUCTIONS AND OFFICE CLOSURES

Question. Since budget constraints are resulting in lower service levels in field offices due to increased workload and a reduced workforce, has USDA conducted an evaluation to determine when the continuation of a county office in a given location is of less importance to the customer than the maintenance of "service" in the area? At what point does the presence of a workforce in an area become more important than the existence of a field office regardless of whether that office can meet workload requirements?

Answer. The Agency is continually monitoring workload in States to determine areas of increased workload and moves both human and monetary resources to those areas based on availability to provide the most effective and efficient service to its customers. State Executive Directors have been charged to use all management tools available to ensure that producers are served as expeditiously as possible using details, directed reassignment of employees, shared management and office collocation and consolidation to get the work accomplished. When the cost of keeping a service center in operation exceeds the benefit of service provided at the counter, States consider closure and consolidation of operations to improve efficiency but only with Congressional concurrence.

FARM SERVICE AGENCY FEDERAL AND COUNTY EMPLOYMENT STATUES

Question. Please provide an update on activities relating to the conversion of Farm Service Agency (FSA) county personnel to Federal status.

Answer. No further discussion or action has been taken in converting FSA county employees to Federal status. Currently, the Secretary is on record as being in favor of this conversion. No Congressional action has been taken to enact this proposal. However, on October 21, 1998, the President signed Public Law 105–277 which contained a section to provide permanent FSA County Office committee employees with Federal Civil Service status for only the purpose of applying for USDA Civil Service vacancies.

FARM SERVICE AGENCY SALARIES AND EXPENSES

Question. The fiscal year 2000 request for FSA Salaries and Expenses includes an $80 million increase, although that increase does not take into account the additional $40 million provided as emergency spending in fiscal year 1999 which reduces the actual increase to $40 million. To what extent has the FSA Salaries and Expenses account been supplemented by carryover balances in past years and how much will be available in fiscal year 2000?

Answer. Historically, there has been carryover in past years. FSA has both Federal offices and Non Federal County Offices, and the ability to obligate administrative funds for carryover workload is authorized by a general provision in each year's appropriation act, which is only applicable to the non Federal county offices. Funds obligated for carryover workload expenses are normally kept at a minimum. Funds made available to county committees in a fiscal year are based on actual and estimated workload and staff year requirements according to the FSA County Office Work Measurement and Funding Allocation System. Requirements are updated during the year to take into account changing conditions. Programs administered by county committees are highly volatile in nature and subject to rapid changes. Such changes include weather conditions, domestic market prices, export sales, legislative and policy changes. Many emergency programs end up being quickly administered at mid-fiscal year or late in the fiscal year. In a disaster situation the top priority is to furnish a check to a farmer or rancher as quickly as possible, so most county offices must end up delaying or completing the process of all necessary paperwork according to required procedures in order to comply with Agency procedures as well as satisfy general and specific audits by OIG and/or GAO.

In past years, for example, obligated carryover in fiscal year 1997 amounted to $63.8 million of which $50.8 million was designated for use in fiscal year 1998 and $13 million for use in fiscal year 1999. The ending obligated carryover for fiscal year 1998 was actually $32.1 million which includes the $13 million brought forward from fiscal year 1998 and programmed for fiscal year 1999. The $32.1 million is for carryover workload expenses to be completed in fiscal year 1999. There is currently no expected carryover estimate for fiscal year 2000, given 1999 funding enacted.

Question. To what extent will the $80 million increase described in the fiscal year 2000 budget request actually reflect an increase in funding available to a maintain personnel?

Answer. The increase is actually $40.5 million. The 1999 funding level includes the additional $40 million provided by the emergency appropriations title of the 1999 Act. This funding identified as administrative support for the emergency programs allowed FSA to maintain fiscal year 1998 staffing levels into fiscal year 1999. An increase of approximately $40.5 million over the fiscal year 1999 enacted level is required to sustain critical program delivery, including pay costs at a reduced staffing level, offset by some decreased operating costs. After adjusting fiscal year 1999 for $32.1 million in obligated carryover funding, the actual net increase for fiscal year 2000 amounts to only $8.4 million. Therefore, the small increase in total availability actually requires a decrease in staffing because of pay and related costs.

Question. In what manner does the agency expect to reduce the staffing levels to those included in the budget documents by the end of fiscal year 2000.

Answer. fiscal year 2000 Explanatory Notes reflect a decrease of 752 staff years for Federal and non-Federal staffing level, from fiscal year 1999 staffing of 16,545 FTE's to fiscal year 2000 staffing level of 15,793. FSA has no buyouts or RIF's planned for fiscal year 2000. The Agency hopes to achieve the 752 decrease in staff years through attrition, which will be difficult.

Question. What effect will this have on the administration of programs and the level of service afforded to customers?

Answer. Because workload, particularly for marketing assistance loans, loan deficiency payments and farm loans, is expected to increase in fiscal year 2000, the proposed reduction of 752 staff-years proposed will pose a formidable challenge to FSA The Agency will strive for maximum efficiency in program delivery as it continues with its reengineering efforts for program and administrative services. But ultimately, these reductions will negatively impact program delivery in terms of delays in delivering payments to farmers, and in implementing emergency and disaster programs across the nation, particularly in locations already minimally staffed as a result of previous agency downsizing.

CONSERVATION TECHNICAL ASSISTANCE

Question. To what extent will the restrictions on Commodity Credit Corporation (CCC) Section 11 reimbursements affect the administration of conservation programs in fiscal year 2000? Does USDA plan any action, either administratively or

through requests to Congress, to correct any serious problem posed by the Section 11 limitation?

Answer. Section 161 of the 1996 farm bill amended Section 11 of the CCC Charter Act to limit the uses of CCC funds for reimbursable agreements and transfers and allotments of funds to State and Federal agencies. In fiscal year 2000, after adjusting the cap to remove the Emerging Markets Program from the base, the total expenditure of CCC funds for such uses may not exceed $36.2 million. The budget projects obligations under the revised cap for reimbursable agreements will total $36.2 million in fiscal year 2000, excluding funding for technical assistance for the Wetlands Reserve Program (WRP) and the Conservation Reserve Program (CRP). Technical assistance needs in fiscal year 2000 for the WRP are estimated to total $18.3 million, with $2.0 million provided from unobligated prior year appropriations and $9.8 million from funds available under the Section 11 cap, leaving a shortfall of $6.5 million. Technical assistance needs in fiscal year 2000 for the CRP are estimated to total $18.1 million. However, no funds for CRP technical assistance in fiscal year 2000 are available from unobligated prior year appropriations, no CCC funding has been provided for, and we are therefore attempting to determine appropriate actions to resolve the funding shortfall.

FOOD GLEANING SAVINGS

Question. As efforts at Food Gleaning become more successful, will there by any anticipated future savings for USDA feeding programs? If so, when might these be realized and to what levels might they reach?

Answer. Gleaning provides America the opportunity to save, and to provide to low income people, huge quantities of food that would otherwise go to waste. While it is reasonable to anticipate that, overall, this could affect demand for Federally funded nutrition assistance, we anticipate that the effects will be small and very much at the margins. Mostly the gleaning effort will help people who don't otherwise get enough to eat, some of whom are program participants, and many who are not. However, gleaning in no way is seen as supplanting, even partially, the need for the Nation's nutrition safety net. It will augment it. It will reduce waste and augment nutrition assistance at very little cost compared to the value of the food that can be saved for human consumption.

USDA AGRICULTURAL POLICY ADVISORY COMMITTEE (APAC)

Question. Please provide an update on the status of nominations to the USDA Agricultural Policy Committee (APAC). Wisconsin has a candidate that represents the small and medium-sized family dairies that are prevalent in the Midwest. What is the Department's status on completing those nominations?

Answer. We are in the final phases of the review process and anticipate the process will be completed by the end of March.

QUESTIONS SUBMITTED BY SENATOR DORGAN

DISASTER PROGRAM SIGN-UP

Question. Not only do we have a farm program safety net that is not working, but our delivery system is also facing serious problems. Sign up for the 1998 and multi-year crop disaster assistance programs were scheduled to start a week ago Monday (Feb. 1). Last week, it was announced that farmers should wait a week before coming in, because our county offices didn't have all the materials available to sign farmers up. Yesterday, I was informed that our farmers would have to wait another week until a computer download could be completed. We have also had a serious backlog in processing of farm credit applications.

While I recognize that FSA staff has been working extremely hard to get disaster aid to our farmers, the fact is that there has not been adequate staffing to effectively deliver the programs on a timely basis to our producers. This is a critical time for our farmers. They are in the midst of arranging financing for this year's crops. For many, the disaster payments will make the difference between whether they are able to farm this spring. Yet, the proposed budget is still recommending a reduction in FSA staffing. What is the Department's future plans so that farmers can be assured that they will receive timely delivery of USDA service through FSA?

Answer. FSA county staffing has declined by 28 percent from 1993 to 1998 as a result of appropriations actions, field office streamlining and workload reductions resulting from the 1996 Farm Bill. The emergency funding of $40 million included in the 1999 appropriations act has allowed FSA to maintain approximately the same staffing level in 1999 as in 1998. However, it did not provide for any additional staff

to handle the large workload increases associated with the new emergency disaster assistance programs. The additional programs have strained FSA delivery in many States. This has compounded backlogs associated with the increased activity in the loan deficiency payments, marketing loan assistance, other assistance activities stemming from low prices, and the disbursement of disaster payments.

The proposed fiscal year 2000 staff reductions may affect program delivery and service to producers, particularly in locations already minimally staffed as a result of previous agency downsizing. Without significant improvement in commodity prices, these proposed staffing reductions may not be consistent with the economic realities we are facing and the resultant workload. We will be reassessing our needs in order to deliver assistance to farmers timely.

FARM CREDIT ASSISTANCE

Question. Yesterday, Vice-President Gore announced that a Federal rule change would be issued later this week to streamline the procedures for the handling of guaranteed farm ownership and operating loans. This is welcomed news. But, a streamlined process doesn't help when the program is out of funds. In North Dakota, the allocations for a number of categories of guaranteed FSA loans are already fully used. What additional amounts of FSA credit will be needed to meet the needs for this spring and when will USDA submit such requests to Congress?

Answer. FSA intends to pool and redistribute unused funds in March for the guaranteed operating with interest assistance and farm ownership loan programs. This action will help alleviate, but not eliminate, funding shortages in North Dakota. The option of seeking additional farm loan funding authority from Congress is under review.

Question. In addition, what changes would you recommend to current FSA credit authorities so that you can provide appropriated credit to serve the needs of family farmers in this period of distress?

Answer. FSA is confident that existing loan programs, if fully funded, will meet the needs of family farmers affected by low commodity prices. FSA farm loans provide low-interest rate assistance in the direct and guaranteed operating with interest assistance programs. Lenders are able to restructure the indebtedness of their customers with FSA guaranteed operating and farm ownership loans.

FLOODED LANDS RELIEF

Question. Last year, you announced a $12 million program under the Disaster Reserve Assistance Program to assist livestock producers who experienced flooding due to natural disasters. In addition, $35 million was allocated for flooded agricultural lands as part of the $2.4 billion disaster assistance package. These programs are urgently needed in our region, particularly in the Devils Lake area which has suffered for the past six years with flooding. When will USDA have these programs ready so that farmers can begin signing up for them and receiving assistance from them?

Answer. The regulation is currently going through departmental clearance. Immediately upon OMB clearance and publication in the Federal Register signup will begin. We have been working with the impacted states to determine the length of signup needed. Input from the states indicates that a six week signup period is needed. Data will be uploaded to determine a factor and issue payments.

FSA BUDGET PRIORITIES

Question. At a time when FSA is having difficulty maintaining adequate staff and county offices to deliver farm programs to our farmers, I am greatly concerned about the Agency's priorities. While I do not oppose the co-location of USDA state offices, I am greatly concerned that our FSA state office may be required to move its office to Bismarck with moving costs estimated at almost $1 million. In addition, since there is not adequate space in the current federal building in Bismarck in which USDA offices are currently housed, it would also mean the construction of a new facility. Based on projected costs savings, it would take almost a dozen years for FSA to recover enough in savings to pay for this move.

At a time when FSA is seriously behind in its workload and has been cutting staff at the county level in recent years, it would make more sense to use existing funds for providing direct service to producers, rather than moving offices. I would request that the Department conduct a thorough review of this proposed move and report its findings to this subcommittee prior to taking any further action on this matter.

Answer. As part of the 1994 reorganization, the Department of Agriculture has been consolidating administrative organizations that provide support to program managers. Currently three separate administrative structures provide support to

the Natural Resources Conservation Service, and the Farm and Foreign Agriculture Services and Rural Development mission areas—down from nine such organizations in 1993. The Department has combined these three structures into one unit which will be known as the Support Services Bureau, and by delegating the authority to conduct most administrative functions to the state level, closer to the customer.

This action was implemented due to the following reasons:

—A consolidated structure will deliver better services to our local customers and employees.

—A consolidated structure will provide for a new consistency in administrative policy.

—A consolidated structure will make better use of limited administrative resources.

—A more efficient administrative structure will help to preserve limited budget resources for program delivery.

The proposal to consolidate the Bismark FSA State Office with the other agencies is part of this plan. FSA, NRCS, and RD will be establishing a working group comprised of representatives from management and the unions to develop a plan for implementing the administrative convergence. The working group will be looking at every aspect of the plan to achieve savings under current budget circumstances, but will certainly take into consideration the balancing of moving costs necessary to achieve the convergence plan with any diminished service level to producers. We will advise the subcommittee prior to consolidating the offices at Bismarck.

TRADE & POLICY RESEARCH CENTER

Question. USDA's budget for fiscal year 2000 includes funding for the Trade and Policy Research Center at North Dakota State University. The budget states that the project will contribute primarily to the Department's Strategic Goal 1, "An agricultural production system that is highly competitive in the global economy," and Goal 5, "Enhanced economic opportunities and quality of life for families and communities." Please provide for the record a statement on the longer-term need for the research and analysis which will be provided by the Trade and Policy Research Center for the Northern Plains Region, and how this would complement and supplement research conducted by the Food and Agricultural Policy Research Institute (FAPRI).

Answer. The Northern Plains Policy and Trade Research Center (NPPTRC) at North Dakota State University has been a member of the Food and Agricultural Policy Research Institute (FAPRI) consortium for several years and provided important analytical input that is unique to the large northern plains region of the United States. Most other consortium members receive federal funding for the work they do on behalf of several states in their respective regions while NPPTRC has been representing the northern plains states primarily with its own resources. The proposed research project will greatly enhance the quality of policy and trade research in the northern plains and improve the FAPRI agricultural forecasts. The NPPTRC global wheat model and global sugar model currently interact with the FAPRI model in evaluating agricultural outlook for wheat and sugar. The proposed program will enhance the quality of these models as well as develop new analytical tools that capture the unique resource endowment, climate, crop mix, and marketing environment of the northern plains and provide timely analyses of major trade issues and policy changes for private and public decision makers.

USDA EPSCOR

Question. Congress for a number of years has directed USDA to use 10 percent of its National Research Initiative Competitive Grants Program (NRI) funding for an Experimental Program to Stimulate Competitive Research (EPSCoR). USDA EPSCoR strengthens our nation's research capability and helps ensure that quality research in the agricultural sciences is a nationwide commitment. Using the three most recent years for which data is available, what percentage of NRI funding was committed to researchers in the USDA-EPSCoR States?

Answer. The percentage of NRI funding committed to researchers in the USDA-EPSCoR states for the three most recent years for which data are available is as follows: 1996 = 12.7 percent; 1997 = 12.6 percent; 1998 = 15.2 percent.

Question. Please provide a chart listing, by state, the number of proposals submitted to each of the four USDA EPSCoR award areas (Research Career Enhancement Awards, Equipment Grants, Seed Grants and Strengthening Standard Project Awards), and the number of those proposals which received funding.

Answer. The number of proposals submitted by and awards made to USDA-EPSCoR states in the NRI Research Career Enhancement Awards, Equipment

Grants, Seed Grants and Strengthening Standard Project Awards programs are as follows:

NATIONAL RESEARCH INITIATIVE COMPETITIVE GRANTS PROGRAM

State	Research Career Enhancement Awards		Equipment Grants		Seed Grants		Strengthening Standard Research Project Awards

QUESTIONS SUBMITTED BY SENATOR FEINSTEIN

CITRUS FREEZE

Question. How are the fiscal year 1999 Disaster Supplemental funds being allocated?

Answer. Producers who suffered losses to their 1998 crops and their 1999 crops for which harvest began in December, 1998 are provided the option of receiving single year loss benefits on either their 1998 or 1999 crop, but not both. To determine multi-year benefits, the 1998 crop insurance indemnities will be used to determine eligibility.

Question. Will there be sufficient funding to cover the additional cost imposed on the funding by the citrus freeze?

Answer. The 1999 Appropriations Act, Public Law 105–277, provided a total of $2.375 billion for crop loss disaster assistance. If the value of applications received ultimately exceeds available funds, then payments to producers would need to be prorated.

Question. Unlike other farm workers, California's citrus workers are permanent residents in the areas where they work. What steps can the USDA take to address the needs of California's farm workers who lost their only source of income due to the freeze?

Answer. To date, The Department has made available $1.8 million for emergency rental housing for farm workers displaced due to the December freeze. The Department is reviewing a range of possible options which could be used to assist farm workers affected by the citrus freeze. This includes review of funding options within the Rural Development area as well as existing legislative authorities. For example, Section 2281 of the Food, Agriculture, Conservation and Trade Act of 1990 authorizes up to $20 million annually in emergency grants to public agencies or private organizations with tax exempt status to assist seasonal farmworkers that have lost income due to natural disasters, however, no funds are currently available under this authority. In 1992, following Hurricane Andrew, use of Commodity Credit Corporation funds was authorized in emergency supplemental legislation for farm worker housing in south Florida. The funds were used to purchase and install trailers.

FREEZE IN CALIFORNIA

Question. Are you planning to extend the same waivers relating to food stamps that were granted to Tulare County to the other counties impacted by the freeze?

Answer. Tulare and Fresno County have requested certain waivers and they were provided. The California State Agency has advised the other disaster affected counties that waivers are available, but the counties have not requested any at this point.

We have shipped about 40 extra truckloads of food into these counties, to date, coming from State and Federal inventories. And we are keeping a close eye on developments there to make sure we do all that we can.

BORDER INSPECTIONS

Question. What steps are you taking to address the recent fruit fly and pest infestation problems at the border in San Diego and other ports of entry?

Answer. USDA and the California Department of Food and Agriculture (CDFA) are working cooperatively on three Mediterranean fruit fly (Medfly) and Mexican fruit fly (MFF) emergency eradication programs in California. The Medfly operations are located in Orange, San Diego and Riverside Counties. The MFF operations are in several areas of San Diego County such as El Cajon, Oak Park and Stockton. All emergency efforts include regulatory activities, pest control, and surveys. In addition, an areawide sterile MFF release program was implemented in January 1999 to prevent outbreaks due to natural or illegal movement of the exotic insect. The release area encompasses the three infested areas and most populated areas of San Diego south of Interstate 8 to the US/Mexican border. We plan to continue the areawide release program until June, 1999.

Question. Reports have indicated that the actual staffing levels at the border are well below what are recommended in agency guidelines for USDA inspections. How many inspectors are currently working at the major California points of entry?

Answer. There are currently 65 authorized positions at the major California points of entry: Calexico, CA (22); Andrade, CA (2); and San Diego, CA (41).

Question. How many inspectors are recommended by USDA guidelines?

Answer. The USDA guidelines for fiscal year 1999 recommend 65 inspector positions at major California points of entry.

Question. The fiscal year 2000 budget requests an increase in the AQI program. Will any of this increase will go towards correcting the staffing shortage at the US/Mexico border?

Answer. The proposed fiscal year 2000 increase for the AQI appropriated program supports additional staffing of 15 inspectors along the US/Mexican border. We plan to allocate 3 of the new positions at California points of entry: Andrade, CA (2) and San Diego, CA (1). The balance of the positions will be located along the Mexican border in Arizona and Texas.

Question. How much additional funding is necessary to bring the number of inspectors up to USDA standards?

Answer. The proposed fiscal year 2000 increase of $3.9 million for the AQI appropriated supports additional inspection personnel necessary to address the expansion of travel and trade from Mexico, Canada and Hawaii.

Question. How will USDA address the concerns raised by nations such as Australia and Taiwan which have imposed restrictions on importing some agricultural products from the San Diego area?

Answer. USDA is conducting bilateral negotiations to assure these countries that our emergency programs in San Diego, California, including all regulatory, control, and survey efforts, are more than sufficient to guarantee that agricultural products from this area pose no pest risk. In addition, we invited Taiwanese and Australian agricultural officials to visit the emergency project sites to experience the scope and intensity of these programs first-hand. On an ongoing basis, we ensure compliance with all international standards for activities like pest surveillance and notification to promote the credibility of U.S. agricultural products among our various trading partners.

IMPORTATION OF CITRUS FROM ARGENTINA

Question. How is USDA planning to address the concerns raised by the California Department of Food and Agriculture relating to importation of citrus products from Argentina, particularly the problems they raise with citrus black spot and sweet orange scab?

Answer. On October 16, 1998 APHIS extended the public comment period until February 11, 1999. Public hearings were conducted also in Orlando, Florida and Thousand Oaks, California. APHIS is now analyzing the information provided by independent scientists regarding the Argentine petition and the risk mitigation measures advocated by APHIS. It is our intent that these mitigation measures are designed to prevent the introduction into the United States of Citrus Canker, sweet orange scab and citrus black spot.

Question. What is the time line for implementing the rule on importing Argentine citrus?

Answer. We hope to complete our analysis in time for the regulations to be in place for their next crop season.

Question. Does APHIS require additional resources to address this problem?

Answer. No additional funds are needed to complete this analysis.

QUESTIONS SUBMITTED BY SENATOR DURBIN

AGRICULTURAL RESEARCH

Question. Will the amount included for the National Center in the Budget preclude an expeditious completion of this project?

Answer. The amount included in the fiscal year 2000 budget for the National Center for Agricultural Utilization Research (NCAUR) will not preclude an expeditious completion of the North Wing project. The $8.2 million received in fiscal year 1999 will be used for design and construction of the last phase of the North Wing renovation. In the fiscal year 2000 budget, $1.8 million will be needed for planning and design of the Chemical Wing renovation. Planning and design is expected to last 12–18 months. Construction funds for the Chemical Wing renovation will not be needed until fiscal year 2001.

Question. What criteria was used to determine ARS program cuts at facilities like the National Center in Peoria and the University of Illinois at Urbana-Champaign? In particular, please account for the cuts in the following programs at the University of Illinois: Soybean Diseases; Sensors and Systems for Site-Specific Crop Management to Improve Environmental Quality; and Reduced Herbicide Inputs for Effective Weed Management Systems to Improve Water Quality. And, the following programs at the National Center in Peoria: Processing of Natural Polymers; Enhanced Uses of Plant Proteins; Anaerobic Processes in Animal Waste Management; Meadowfoam Research; Bioprocess and Metabolic Engineering Technologies for Biofuels; Biotechnology Research and Development Corporation; and Novel Carbohydrate-Based Materials via Bio Conversion Processes.

Answer. The research projects carried out at the Peoria and Urbana research centers are recognized as important research to the Department and the specific groups, producers and consumers who would benefit from this research. However, these projects have been identified as being less critical to the Nation's broader interests and research needs, such as food safety research, nutrition research, and global climate change. The screening criteria used by ARS officials includes the following elements: the relevance of the research project; the availability of sufficient resources to conduct the research; and the overall impact of research on American agriculture. The projects are numerically ranked according these criteria, and those with the lower rankings are proposed for termination.

Most of the projects proposed for termination in this budget at Peoria and Urbana were identified in prior Administration budgets as less critical and remain in this category. Newly initiated projects not included in the President's requests were also added to the proposed termination list. While these research projects are important, worthwhile, and provide benefits to the agricultural industry and the American public, others of more critical national importance become higher priority.

The funding allocation for discretionary programs in the fiscal year 2000 budget remains exceedingly tight. Choices between better and best are never easy but constraints in this budget made this a necessary process. Let me reiterate that those projects recommended for termination have or will contribute to the solution of agricultural and consumer problems—but they are considered less essential to continue because of a very constrained discretionary Federal budget with competing, higher priority research needs.

FOOD SAFETY

Question. The President stated in early January that of the $105 million increase for the Food Safety Initiative, approximately $65 million would go to USDA. The President indicated that portions of these funds would be used to "introduce HACCP at the 2,700 smaller plants." My understanding is that those plants came on line in January, 1999. How will funds in fiscal year 2000 be used for the above mentioned plants?

Answer. In January, small meat and poultry establishments were required to have implemented Hazard Analysis and Critical Control Point (HACCP) systems. In order to facilitate this transition, we held numerous workshops across the country to provide the operators of these establishments with the technical assistance needed to meet the new requirements. The 2000 budget will provide the resources necessary to maintain these efforts.

Question. How will FSIS funds be used to assist with the "smallest" plants (those employing less than 11) with HACCP implementation in January 2000?

Answer. The 2000 budget includes resources necessary for the Food Safety and Inspection Service (FSIS) to ensure that very small establishments have the technical assistance needed to successfully implement Hazard Analysis and Critical Control Point (HACCP) systems. In addition, funds are requested to redeploy inspection personnel to cover critical inspection vacancies in very small establishments. The 2000 budget also includes funding for initiatives aimed at ensuring that State meat and poultry inspection programs have the capability to implement the HACCP rule. Successful implementation by the States is important, because they inspect approximately 3,000 very small establishments.

Question. In moving towards more "science-based" approaches to food safety inspection, FSIS is proposing changes in the way it uses its inspectors. Has FSIS formed a new interpretation of "continuous inspection" and is there a need for a change in Statutory authority?

Answer. The Food Safety and Inspection Service (FSIS)is beginning to test alternative slaughter inspection procedures in conjunction with the implementation of the Hazard Analysis and Critical Control Point (HACCP) systems regulations. As part of these tests, FSIS personnel will conduct inspection in different ways, but with the same goal of ensuring the safety of all meat and poultry products. This does not connote a new interpretation of continuous inspection. The existing statutory framework for meat and poultry inspection provides FSIS with ample authority and flexibility to build a science-based regulatory system based on these alternatives.

ASIAN LONGHORNED BEETLES

Question. The Administration, USDA in particular, has responded expeditiously and thoroughly in its efforts to combat the infestation of the Asian Longhorned Beetle in the Chicago, Illinois area. Please provide a status report on the efforts taking place in Chicago to combat infestation as well as remove and replant trees. Is there a coordinated approach with other Federal departments and agencies?

Answer. In July and August of 1998, Asian Long-Horned Beetle was discovered at three locations in the Chicago, Illinois area. Over 400 trees have been found to be infested and scheduled for removal. This program is a cooperative effort between APHIS, the Illinois State Department of Agriculture, and the city of Chicago.

Question. What Federal funds are available to assist the City of Chicago, the State of Illinois, and other affected communities?

Answer. In January 1999, $5.5 million was transferred to APHIS from the Commodity Credit Corporation to conduct eradication activities in New York and Illinois.

SUBCOMMITTEE RECESS

Senator COCHRAN. Our next hearing is going to be Tuesday, March 2nd, at 9:30 a.m. in this room, 138 of the Dirksen Senate Office Building. At that time we will hear from Department of Agriculture witnesses on the subject of assistance to producers and the farm economy.

Until then, we stand in recess.

[Whereupon, at 11:25 a.m., Tuesday, February 9, the subcommittee was recessed, to reconvene at 9:30 a.m., Tuesday, March 2.]

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2000

TUESDAY, MARCH 2, 1999

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9:34 a.m., in room SD–138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.

Present: Senators Cochran, Gorton, Burns, Kohl, Dorgan, and Durbin.

DEPARTMENT OF AGRICULTURE

UNDER SECRETARY FOR FARM AND FOREIGN AGRICULTURAL SERVICES

STATEMENTS OF:

KEITH COLLINS, CHIEF ECONOMIST

AUGUST SCHUMACHER, JR., UNDER SECRETARY FOR FARM AND FOREIGN AGRICULTURAL SERVICES

ACCOMPANIED BY DENNIS KAPLAN, DEPUTY DIRECTOR, OFFICE OF BUDGET AND PROGRAM ANALYSIS

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

We welcome our witnesses and our guests at our hearing today.

At this hearing, we will review the budget request for the Department of Agriculture for programs administered by the Department which provide assistance to farmers and ranchers.

In this context, we need to know and we would like to hear from our witnesses about the current financial and economic situation confronting farmers, including farm commodity prices and what the Department is doing to help expand markets and improve farm income.

We would like to know the status of the emergency supplemental funding and livestock and marketing assistance payments that were provided for in the Fiscal Year 1999 Agriculture Appropriations Act and how the Department is administering these programs.

We will also be interested in hearing from our witnesses about the adequacy of the funding for credit programs that finance farmers' activities.

Last year, Congress appropriated one of the largest emergency farm relief packages in history, providing nearly $6 billion for disaster and market assistance for the Nation's farmers and ranchers. Also, additional production flexibility contract payments were disbursed before the first of the year to help farmers.

Those who purchased crop insurance will have a 30 percent reduction in premium costs because of this disaster assistance legislation.

We appreciate very much the presence at our hearing this morning of Keith Collins, who is the Chief Economist of the Department of Agriculture; Mr. August Schumacher, Jr., Under Secretary for Farm and Foreign Agricultural Services, and Mr. Dennis Kaplan with the Budget Office of the Department of Agriculture. There are others who are here accompanying these witnesses and we appreciate your being here and providing assistance to us at this hearing.

We have copies of statements that you have prepared and we thank you for those. They will be made a part of the record in full.

I would invite you now to proceed to make whatever comments you think appropriate and to summarize your statements. We will have an opportunity to ask questions after you complete your remarks.

Mr. Collins, you may proceed.

STATEMENT OF KEITH COLLINS

Mr. COLLINS. Thank you very much, Mr. Chairman, and good morning. Thanks for the invitation to start this hearing by discussing the economic conditions in U.S. agriculture.

There is a great deal of concern about the problems the farm economy experienced in 1998 and a great deal of concern about the prospects for 1999. I am going to start by describing briefly the current situation. Then Under Secretary Schumacher will follow up by providing some detail on the assistance programs that we are providing to U.S. agriculture.

As we all know, the farm economy contracted in 1998. As you indicated, the emergency relief package helped many producers cope with the downturn in the farm economy this past year.

In 1999, unfortunately, farm exports are going to continue to be weak and farm prices likewise will continue to be weak. I think that will cause higher farm financial stress, particularly in some areas of the country that have escaped up to this point, notably areas in the Corn Belt and down into the mid-South.

There are two major causes of the downturn that we are now experiencing. The first is macroeconomic, the slowdown in the world economy which is reducing food and fiber demand. World economic growth in 1998 was about half the level of 1996 and 1997. And, as we look ahead for 1999, it will probably remain at that rate, about half the level of the mid-1990's.

In addition to that, we have had a very sharp increase in the value of the dollar which has encouraged imports. It has also eroded our competitive position in world markets.

A second major cause of the downturn is increased world agricultural production of food and fiber. To give you an example, the 3 highest years of production in world history of grains and livestock

occurred in the last 3 years. So production has been boosted by the high prices that we saw in the mid-1990's.

We have had 3 generally favorable weather years. We have had better technology, which is also boosting yields. We have also had a livestock liquidation occurring in a number of countries around the world, which is increasing meat supplies. And we have had key policy changes, such as in China, which has promoted self-sufficiency there.

This combination of large supplies and slow-growing demand is driving down farm prices. While the decline that we are seeing has all the earmarks of being cyclical, I think there are also some underlying structural changes that suggest for some commodities, such as soybeans and hogs, that lower prices on average may endure into the future.

In 1996, farm exports reached a record high of $60 billion. This year, we are forecasting farm exports at only $49 billion. Grain, cotton, oilseed, beef and poultry exports all have been seriously affected.

In addition to that, our trade surplus in agriculture—something we like to extol—will only be $11 billion this year, which would be the lowest level since 1987.

As a result of this weak export market and decline in demand, farm cash receipts last year fell about $10 billion. They went down to about $198 billion. And I think as we look ahead for 1999, we would foresee them staying at that level, although crops would decline a little more, offset by a little increase in livestock.

Despite all this bad news that I have uttered thus far, there are some positive factors, I think, that are helping a number of farmers withstand the decline, the downturn in the farm economy. Declining interest rates, fuel prices, and feed costs lowered farm production expenses last year. They fell 2 percent. That is the first significant decline in about a decade.

In addition to that, farm interest expenses are in pretty good shape. I would take you back to the early 1980's when farm interest expenses were 14 percent of gross cash income of farmers. This past year they were only 6 percent.

Another factor offsetting the drop in market revenues is government payments, which rose $5.5 billion during calendar year 1998. They were $13 billion in total, and, I think as we look out to 1999, we can see government payments again providing good support. They will probably be at least $11 billion.

Our conservation programs, those plus technical assistance, are also an important part of government support. They provide payments; they provide cost sharing to help farmers maintain their soil productivity and deal with environmental concerns.

These aggregate financial measures that I have just discussed suggest that the farm economy was generally performing financially adequately as we started 1999, mainly due to the increase in government payments and the reduction in production costs.

We had the second highest net cash income in history in 1998, and the farm debt-to-asset ratio has remained steady, at about 15 percent, which is well below the 20 percent or more that we saw in the 1980's.

As we look out to 1999, I think the signs point to increased financial stress. Net cash farm income is expected to decline about $3 billion to $4 billion. While farm real estate prices, by most analyst' expectations, are not going to go down, we have seen some declines in farm real estate prices in some regions of the country in the second half of 1998.

I think many producers will have a greater difficulty obtaining credit in 1999. You may have seen the Farm Credit System's report this week that their nonperforming loans rose 69 percent during 1998. They were a big lender to American agriculture. But I would point out that the share of nonperforming loans for the Farm Credit System as well as other banks is still pretty small in their total portfolio.

More people are turning to USDA for credit. Our farm loan commitments since October are up 65 percent over the year earlier.

Very quickly, let me just comment on a couple of the commodity market situations.

For grains, the current season is one of building stocks. Prices this year for the 1998 crops are at 8- to 10-year lows.

I think when we look at grains, the bottom may be near. For wheat, we are going to see less acreage, as low prices combined with planting flexibility will take acreage out of grains, I believe, in 1999. That should reduce wheat stocks. It should stabilize corn stocks. We might see improved prices for wheat, but not very much because there is still going to be a lot of wheat in the world—maybe a 10-percent increase in prices on the 1999 crop.

For corn, unfortunately, with stocks stabilizing, prices are staying about the same, in the $2 per bushel range.

For soybeans, I think carryover stocks this season will reach the highest level in more than a decade. Our soybean prices will be the lowest since 1986, and I do not have good news to report for 1999.

I think we will see a further increase in stocks and even lower prices. Soybeans are attractive to many farmers because they represent a little bit less risky crop. Soybeans have been resilient in bad weather. They have low out-of-pocket costs, compared to some of the other main crops. Soybeans' marketing assistance loan is a little bit higher relative to some of the other crops, and we have new varieties, such as herbicide resistant soybeans.

All of those factors I think will push more plantings of soybeans in 1999, and we could see the season average price drop well below $5 a bushel.

For cotton, this year's exports are the second lowest in 20 years due to reduced world demand for cotton textiles and apparel. Also, our cotton production is much lower, and we have a lot of polyester on the world market. Since there are very low oil prices, there are low polyester prices. And we lost Step 2 payments.

In addition to that, we have a surge in imported cotton textiles in the United States and that has hurt domestic mill demand for cotton.

In 1999, I think we will see higher U.S. production, and that will continue to keep the pressure on cotton prices.

Turning to livestock, we had record meat and poultry supplies in 1998. That gave us the lowest cattle prices in the 1990's, and it gave us the lowest hog prices since 1972.

While our cattle herd has been reacting to low prices for some years and declining since late 1995, and we think that in 1999 we will see lower beef production, the low prices will also probably reduce hog production in 1999, and we will see strengthening prices for both of those commodities, but not big increases. Increases will probably be on the order of 5 percent to 10 percent—better, but still weak, prices.

As beef and pork production is cut back, I think broiler production will be up fairly sharply, given last year's high prices, and that will contribute to yet another year of record high meat and poultry supplies in 1999.

Milk prices were good news in 1998. We had record high milk prices. Unfortunately, over the last several months, we have seen a big increase in milk production, and that has led to a sharp drop in cheese prices.

On Friday of this week, we will announce the basic formula price for February, and I think it is likely to be down in the neighborhood of 35 percent from January's price. That would be a record large month-to-month drop. But I would point out that it would be coming from a very high level. The January price was the second highest in history.

For all of 1999, farm level milk prices will probably average between the 1997 and 1998 levels. Unfortunately, prices have recently been weaker than we thought, and it looks like they will be closer to the 1997 levels, which was not a good year for dairy producers.

Producers will have some offsets to the lower milk prices, however, from lower feed costs and from the $200 million in relief payments to be made soon.

To conclude, there are sectors in agriculture that are stable and growing. However, there are some that are not. For 1999, field crops will be in the category where producers are likely to face increased financial stress.

As I indicated, red meat markets will get stronger, but they will still be weak. I think that these types of forecasts suggest that the financial difficulties that we saw in some producers in the Southern Plains States, some areas in the Southeast, and some areas in the Northern Plains are going to spread into the Midwest and down further into the Delta States in 1999.

I would end by saying there are lots of uncertainties when economists talk about the future—the weather being one, the macroeconomic performance of the world economy being another, and the policies of countries around the world being yet another one.

But I do want to emphasize that there are a lot of cyclical factors at play in agriculture right now. So, as we look out over the next 2 to 4 years, some of those things will correct. The world economy will start to grow better, and I think at that point we will see stronger export demand and better prices for U.S. farmers.

At this point, however, I would say the recovery looks like it would occur at a fairly gradual pace.

That completes my comments, and I will turn it over now to Mr. Schumacher.

[statement follows:]

PREPARED STATEMENT OF KEITH COLLINS

Mr. Chairman and members of the Committee, I welcome the opportunity to discuss the economic outlook for U.S. agriculture. Over the past year, the near-term outlook changed dramatically as adverse weather reduced farm income in some regions, and the Asian financial crisis and large global commodity production caused a sharp drop in farm prices and the value of agricultural exports. With crop yields at trend levels in 1999, major crop prices will likely remain at low levels over the next year, and record total meat and poultry production is likely to prevent a strong rebound in livestock prices. Increased government assistance enacted in 1998, of nearly $6 billion, is helping to maintain farm income and limiting financial hardship in the near term. But with weak exports and prices in 1999, farm financial stress is likely to rise. Over a 2- to 4-year horizon, economic recession in a number of countries should give way to economic recovery, increased demand for U.S. agricultural products, and a gradual improvement in farm prices and incomes.

MACROECONOMIC OVERVIEW

In 1996 and 1997, positive economic growth in the United States, near record indicators of consumer confidence, and the lowest unemployment rate since 1973 bolstered domestic demand for agricultural products, while an expanding world economy and declining barriers to trade supported expansion in U.S. agricultural exports. In 1998, the U.S. economy remained strong, but the foundation for world food demand deteriorated, as Japan, South Korea, Malaysia, Philippines, Thailand, Indonesia, Russia, Saudi Arabia, and Brazil all saw their economies contract. After rising an estimated 3.4 percent in 1997, the world economy grew only 1.9 percent in 1998, the lowest rate of growth in 5 years.

World economic growth is likely to slip a little more in 1999, growing only about 1.7 percent. The U.S. economy may slow as a strengthening dollar further increases the U.S. trade deficit, but inflation, interest rates, and unemployment remain at low levels. Most analysts do not expect Southeast Asia's economies to turn around until 2000, but recessionary pressures are expected to weaken in 1999, with Japan's economy bottoming out and South Korea poised for recovery. However, economic growth will likely slow in Latin America, pulled down by Brazil's currency crisis. And, the Russian economy will decline sharply in 1999.

OUTLOOK FOR U.S. AGRICULTURAL EXPORTS

Lower world market prices and export volume reduced U.S. agricultural exports to $53.6 billion in fiscal year 1998, 10 percent below fiscal year 1996's record-high $59.8 billion. For fiscal year 1999, the U.S. Department of Agriculture (USDA) forecasts exports to drop to $49 billion, as lower export prices more than offset increased volume. Lower world prices and reduced volume will likely cut the value of oilseed and product exports by almost $3.5 billion. In addition, low supplies and reduced competitiveness will lower cotton exports, and the Russian financial crisis is forecast to lower poultry exports. Reduced exports to Asia account for about 85 percent of the drop in the value of U.S. agricultural exports during fiscal year 1996–99.

Pacific Asia, including Japan, South Korea, and Taiwan, is the most important market for U.S. agricultural products, accounting for one-third of total U.S. agricultural export sales this past year. Over the coming decade, rapid income growth in Pacific Asia will stimulate expansion in demand for U.S. farm products. Other important growth markets include our North American Free Trade Agreement (NAFTA) partners, Canada and Mexico. In fiscal year 1998, these two countries imported nearly $13 billion in U.S. agricultural products accounting for nearly one-quarter of all U.S. agricultural exports.

Generally, USDA does not expect Brazil's economic problems, if contained, to lower greatly U.S. agricultural exports. In fiscal year 1998, Brazil was the 2lst largest market for U.S. agricultural exports, importing $0.6 billion in U.S. agricultural products or only about 1 percent of total U.S. agricultural exports to all destinations. However, for some commodities, such as rice, Brazil is a very important market. In fiscal year 1998, rice exports to Brazil amounted to nearly one-fifth of total U.S. rice exports. USDA forecasts a drop in U.S. agricultural exports to Brazil to $0.5 billion in fiscal year 1999.

Brazil is slightly more important as a source of U.S. agricultural imports, ranking as the 8th largest U.S. agricultural import supplier. Brazil accounts for over one-half of U.S. orange juice imports. Other agricultural imports from Brazil include prepared and preserved beef or veal, sugar, coffee and tobacco. In addition, Brazil is a major U.S. competitor in the soybean market.

AN OVERALL ASSESSMENT FROM THE FARM INCOME AND FINANCE PERSPECTIVE

Cash Receipts and Expenses.—With strong demand and record or near-record market prices for several crops, farm crop cash receipts reached a record $112 billion in 1997. Lower crop prices caused crop cash receipts to fall to less than $105 billion last year. For 1999, USDA projects cash receipts for crops will likely decline to $102 billion, $10 billion below the record and the lowest level in 4 years, as crop prices retreat further. Compared with 1997, corn cash receipts may be down by over $4 billion, wheat cash receipts down by over $2 billion, and soybean cash receipts down by nearly $4 billion in 1999.

Livestock receipts reached nearly $97 billion in 1997. Livestock receipts declined by about $3 billion last year, as record high prices and receipts for milk were more than offset by sharply lower prices and reduced receipts for cattle and hogs. This year, lower red meat production will likely lead to higher prices and receipts for cattle and hogs, while poultry receipts remain about the same and more milk production reduces prices and receipts for milk. Total livestock receipts will likely improve in 1999, as the increase in cattle and hog receipts more than offset lower milk receipts.

Declining interest rates, fuel prices, and feed costs have helped farmers reduce their production costs, offsetting some of the decline in cash receipts. Total production expenses declined 2 percent from 1997 to 1998, the first significant drop in more than a decade. In 1999, USDA forecasts total farm expenses to be $186 billion, up only slightly from last year.

Government Payments.—Legislation passed last year along with provisions of the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act) are helping to offset much of the loss in farm income resulting from crop losses and lower crop prices. USDA's Economic Research Service (ERS) estimates direct government payments, which do not include net indemnity payments under the Federal crop insurance program, to farmers reached nearly $13 billion in calendar 1998 and will total about $11 billion in 1999, up from $7.5 billion in 1997. For the 1990's, government payments exceeded these levels only in 1993, when payments reached $13.4 billion.

In October, Congress passed and the President signed legislation providing about $5.7 billion in additional direct payments to farmers. Nearly $2.9 billion of these payments were paid out as additional Production Flexibility Contract (PFC) payments in late 1998. USDA will distribute the remaining payments during the first half of 1999, with the bulk going to crop producers who suffered 1998 and prior-year crop losses. Congress also passed legislation last year enabling producers to receive 100 percent of their fiscal year 1999 PFC payments before January 1, 1999, rather than receiving half in mid-December or mid-January and the rest by September 30, 1999. This legislation increased calendar 1998 PFC payments by about $0.5 billion and reduced calendar 1999 PFC payments by the same amount.

Under the 1996 Farm Bill, crop producers received PFC payments of $5.7 billion in fiscal year 1998 and will receive $5.5 billion in fiscal year 1999. Other direct payments provided under the 1996 Farm Bill include loan deficiency payments, which are paid to producers when crop prices fall below the announced loan rate, and payments to producers participating in conservation programs. In 1998, loan deficiency payments were record high with producers receiving about $1.8 billion in loan deficiency payments.

Conservation Programs.—Conservation programs are proving to be very helpful in improving the economics of farming. Farmers and ranchers receive about $2 billion in direct payments annually under USDA's conservation programs. The largest of these programs is the Conservation Reserve Program (CRP). Under this program, farmers receive an annual rental payment and partial payment for establishing appropriate cover as compensation for taking fragile land out of crop production. Currently, over 30 million acres are enrolled in the CRP, helping to enhance wildlife habitat, reduce soil erosion, and improve water and air quality. During the 18th signup, 7.1 million acres were offered for enrollment, and USDA expects to announce accepted bids soon. Under the Environmental Quality Incentives Program (EQIP), USDA provides cost-share payments to farmers and ranchers who adopt sound conservation and manure management practices. This and other conservation programs are helping producers reduce soil erosion, enrich soil productivity, improve water quality and wildlife habitat, restore lands damanged by adverse weather, and earn income or reduce costs of conservation practices.

While USDA's conservation work helps producers directly with financial assistance, the technical assistance that is provided is equally important. For example, many livestock owners face increasing regulatory pressures from EPA, and state, and local agencies to improve water quality. This often means having a safe way to use animal wastes. Through our technical assistance, USDA works with pro-

ducers to develop a plan that allows them to apply the manure to land thereby recycling nutrients, reducing the cost of inputs, and helping meet other environmental requirements.

Financial Situation.—It is hard to characterize simply the financial condition of so diverse an industry as U.S. agriculture. Aggregate financial indicators portray a sector with problems in some areas but generally performing adequately entering 1999, due in part to higher government payments authorized last year and lower production expenses. Net cash farm income—gross cash income less gross cash expenses—of $59 billion in 1998 was down only slightly from the record of nearly $61 billion in 1997. Farm debt has risen 2–3 percent per year in recent years, but the value of farm assets has grown faster. Consequently, farm equity has steadily increased and the debt-to-asset ratio has remained steady at about 15 percent, down from over 20 percent in the mid-1980s. In 1999, however, aggregate indicators suggest increasing financial stress. USDA forecasts net cash farm income will fall to $55.5 billion in 1999. U.S. average farm real estate values may rise slightly, reflecting low inflation and borrowing costs, but land values began declining in 1998 in some regions. Meanwhile, farm debt could decline as farmers reduce their borrowing in response to added government payments, low prices, and reduced spending on equipment and other production inputs. However, if farm income declines as projected, farm operators will have less income available in 1999 to meet principal and interest payments. In addition, many producers struggled with cash flow in 1998 resulting from low prices and adverse weather, and these problems will worsen if low prices linger, as USDA now expects.

Looking ahead at individual commodities reveals an unsettling picture. Continued low hog, cattle, and field crop prices will place additional financial pressures on producers who specialize in the production of these commodities and are already highly leveraged. Hog prices could continue to remain below break-even levels for most producers for much of 1999, and cattle prices, which have been low for quite some time, may still not be strong enough to return a profit for some producers for much of the year. For principal crops, net income could fall sharply. In 1999/2000, the net income (production value plus government payments minus total cash expenses) from wheat, corn, soybean, upland cotton and rice production could drop to $17 billion, compared with over $19 billion in 1998/99 and the average of $22.7 billion for the previous 5 years.

OUTLOOK FOR MAJOR CROPS

Wheat and Rice.—The story of the U.S. wheat market over the past 2 years has been rising production, weak exports, rising stocks, and declining prices after successive years of strong prices in the mid-1990's. In 1998/99, U.S. wheat production reached 2.6 billion bushels, as record yields more than offset a 6-percent drop in planted acres from a year earlier. Total wheat supplies—the sum of carry-in stocks and production—increased 12 percent in 1998/99, compared with the prior year, providing the largest supply of wheat in more than a decade. The strong increase in supplies has pressured wheat prices, which USDA forecasts will average $2.70 per bushel for the 1998/99 season, down from $3.38 last year, and will likely end up being the lowest season-average price in 8 years.

Total domestic use is likely to increase about 8 percent in 1998/99, as lower wheat prices this past summer increased feed use. In contrast, weak global demand and strong overseas competition could lower U.S. wheat exports, despite increased donations to Russia and several other needy countries. Exports of soft red winter wheat may be less than half of the 1997/98 level due to larger supplies of similar wheat in several importing and in competing exporting countries. Hard wheats, especially those with higher proteins, have fared better because of strong demand by several countries for blending with their lower quality crops and because of reduced supplies in Canada. Even with the expanding total use of U.S. wheat, USDA estimates that carryover stocks at the end of the 1998/99 season, compared with total use, will be the highest since 1987/88.

On the world front this season, global wheat production is down 4 percent from 1997/98's record, as area and yield each declined around 2 percent. The European Union (EU) harvested a record-large crop in 1998/99 because of record yields. Australia is expecting a larger crop as favorable planting conditions led to expanded area. Argentine producers, however, cut plantings in response to low prices. Canadian producers also cut plantings, but production was about unchanged from 1997/98 due to higher yields. With production down and world consumption up modestly, world wheat carryover stocks for 1998/99 will decline, a positive development for U.S. producers.

Unfortunately, global import demand may be down 9 percent this season because of bigger crops in several key importing countries, such as Pakistan and North Africa. China will again remain a small importer because of another large crop and huge stocks, while large production and government stocks are sharply reducing India's import needs. For Indonesia, the financial crisis and the elimination of the consumer flour subsidy has sharply reduced wheat imports. Latin America may see limited demand growth, but little year-to-year change is likely for East Asia.

For 1999/2000, U.S. fall winter wheat plantings were down 7 percent from a year earlier and the lowest since 1972/73. If spring wheat acres are similar to last year and yields remain near the historical trend, USDA expects a 1999/2000 crop of around 2.2 billion bushels. However, large carry-in stocks will be partially offsetting and supplies may still be the second largest since 1990/91. World stocks may decline again as consumption exceeds production. A tighter but ample U.S. and global stocks situation should raise U.S. prices but only moderately—on the order of 10 percent—in 1999/2000, and USDA does not expect substantial price improvement unless adverse weather lowers global wheat production.

The U.S. rice market has performed surprisingly well compared with expectations prior to enactment of the 1996 Act that generally foresaw declining U.S. rice production. In 1998/99, U.S. rice production exceeded 188 million hundredweight (cwt.), up 3 percent from last year and the second largest crop on record. All States produced larger rice crops in 1998, except California because of adverse weather there in 1998. Supporting the increase in plantings has been strong domestic demand and exports over the past two seasons and firm prices. In 1998/99, USDA estimates the farm price will average $8.50 per cwt., down from $9.70 last year.

Domestic use of rice is likely to remain strong in 1999/2000, but exports will face strong competition. Rough rice sales to Latin America are likely to be affected by economic problems there, and the global long-grain milled market will be very competitive, particularly with lower-priced rice from Thailand and Vietnam. Recently, U.S. long-grain rice has been selling at about a $70–$80 premium to similar grade Thai rice, compared with a typical premium of $25–$40 in many of the high-quality markets in the Middle East, Africa, and Europe. The U.S. price premium could return to more a normal level in 1999/2000, pushing the average U.S. farm price of rice below this season's level.

Corn and Other Feed Grains.—U.S. feed grain production in 1998/99 exceeded more than 271 million metric tons, up 4 percent from last year and the second highest on record. The corn crop rose 6 percent to the second highest level in history, while grain sorghum production dropped 18 percent and barley and oats production were little changed from 1997/98. Drought reduced corn production in Texas and across several Southern States. However, these production losses were more than offset by gains elsewhere, especially in the northern and western edges of the Corn Belt. Minnesota, Kansas, Nebraska and the Dakotas all had record corn crops in 1998.

Corn supplies in 1998/99 are up 10 percent from last year, because of the larger crop and bigger carry-in stocks. The strong increase in supplies has dampened feed grain prices and sharply increased projected carryover levels. While USDA forecasts total use of corn to be the second highest level on record, total use will not approach 1998 production. U.S. ending stocks of corn on September 1, 1999, are likely to be up nearly 500 million bushels from last year to their highest level since 1992/93. As a result, USDA's corn price forecast of $1.95 per bushel for 1998/99 is down from $2.43 last year, and this year's season-average price will likely be the lowest in more than a decade.

USDA expects gains in feed use and expanding use for ethanol and high fructose corn syrup production will push domestic use of corn to a new record in 1998/99. U.S. corn exports are likely to rise from 1997/98's low level as Argentina's crop declines, but stagnant global demand and continued strong competition from South Africa and China will limit the increase in exports. Also, low-priced foreign supplies of other coarse grains, especially barley, are limiting import demand for corn.

Global coarse grain production fell slightly during 1998/99, as smaller crops in the former Soviet Union, Eastern Europe, and Argentina offset higher U.S. production and a rebound in China's corn crop from the drought-reduced 1997 level. Corn production declined in Eastern Europe as yields dropped from last year's high level. USDA expects Argentina's crop to decline as early dry conditions and more favorable prices caused farmers to shift some area to later-planted soybeans. China's corn production rebounded in 1998 and stocks are rising, but low world prices are likely to keep its exports below the 1997/98 pace.

USDA projects global corn imports to be down slightly from last year, despite expanding demand in North Africa, the Middle East, and Latin America, excluding Mexico. A larger crop could reduce slightly Mexico's corn imports, and Asian de-

mand continues to shrink. Indonesia's imports will be minimal as domestic production is sufficient to meet the needs of its sharply reduced poultry industry. Mixed feed production is dropping in South Korea as the financial crisis cuts meat demand.

Assuming trend yields, U.S. corn supplies could be up again in 1999/2000 as sharply higher beginning stocks more than offset a smaller crop. Domestic use will continue to expand, but the year-to-year gains will be less than in recent years because of reduced livestock production. U.S. corn exports are likely to rise in 1999/2000 as import demand continues to rise in North Africa, the Middle East, and Latin America and demand begins to recover in Mexico and parts of Asia. However, U.S. export gains could be limited by stronger Argentine production and exports in 1999. Thus, in the absence of adverse weather, corn production and total use may about balance, leaving U.S. corn carryover stocks at high levels in 1999/2000 and the price outlook for feed grains about unchanged.

Soybeans and Other Oilseeds.—Producers have responded to the planting flexibility provisions of the 1996 Act by expanding soybean acreage and production. In 1998, U.S. producers planted 72.4 million acres to soybeans, up from 70.0 million acres last year and from 64.2 million acres in 1996. U.S. soybean production was record high both in 1997 and 1998.

In 1998/99, total U.S. soybean supplies are record high, approaching 3 billion bushels and up 5 percent from the previous season. However, total soybean use is likely to fall about 3 percent in 1998/99, as domestic use stagnates and U.S. exports face strong competition from Brazil and Argentina. As a result, USDA now expects 1998/99 U.S. carryover stocks to increase to 410 million bushels, more than double last year's level and the highest carryover in more than a decade. The increase in ending stocks is pressuring farm soybean prices, which are expected to decline from an average of $6.47 per bushel last season to $5.20 in 1998/99, the lowest since 1986/87.

Other than China and Mexico, there are few foreign markets that will likely import more soybeans this season. For 1998/99, USDA projects a 3-percent decline in global soybean imports. EU crushers have run down supplies of rapeseed and sunflowerseed. Given the comparatively large stocks remaining in South America, U.S. export commitments continue to trail last year's pace. USDA projects U.S. exports of soybeans, soybean meal, and soybean oil will be down 7, 17, and 15 percent, respectively, in 1998/99, compared with one year ago.

The recent devaluation of the Brazilian real could lead to more pressure on soybean prices this spring and summer as Brazil markets this year's crop more quickly than normal. This would further reduce 1998/99 U.S. exports and add to U.S. carryover. On the other hand, larger Brazilian exports in 1998/99 could help U.S. exports in 1999/2000 by reducing the South American carry-in. In addition, lower world prices in 1998/99 may cause South American growers to reduce oilseed plantings in 1999, reducing competitor supplies.

U.S. soybean planted acreage in 1999 is likely to increase from last year's record, and foreign competition will likely remain intense. Returns from planting soybeans continues to remain strong relative to other crops. The marketing assistance loan rate for soybeans relative to other crops and greater use of herbicide-resistant soybeans, which has cut costs, may encourage some producers to expand soybean plantings. In addition, yield potential has risen sharply in recent years, as producers have expanded plant population counts and used improved soybean varieties adapted to their area. Yields also have been resilient to adverse weather. With trend yields, U.S. soybean production in 1999 could exceed last year's record.

The demand for soybeans and soybean products in both the U.S. and the rest of the world will expand in 1999/2000 but below the growth rates of recent years. Use in Asian countries may stabilize. China's consumption of both protein feeds and vegetable oils should rise 2–4 percent but well below growth in recent years. In both the U.S. and the EU, protein use should expand by 1–3 percent helped by lower protein prices and a small increase in red meat and poultry production. However, the increase in demand is not likely to be enough to avoid a further increase in U.S. soybean carryover and even lower soybean prices, which could average below $5 per bushel, in 1999/2000.

Cotton.—Cotton plantings fell 3 percent in 1998, resulting in the lowest cotton planted area since 1992. However, U.S. cotton production in 1998/99 fell by over 25 percent from last year, resulting in the smallest crop in 9 years, as adverse weather affected all four cotton-producing regions. Drought was especially severe in Texas, where farmers abandoned a record 42 percent of planted acres. Due to the drop in cotton production, total U.S. cotton supplies in 1998/99 are down by over 20 percent, compared with last season. Despite tighter supplies and ending stocks, cotton prices so far this season have averaged below last year as demand has softened.

USDA projects domestic mill use at 10.4 million bales, down 8 percent from last year. The decline in domestic mill use primarily reflects rising cotton textile and apparel imports, which are amply available at low prices because of reduced Asian demand. U.S. imports have risen at an annual rate of 20 percent since the beginning of calendar 1997 and are projected to reach about 14.0 million-bale equivalents this season. The cotton textile trade deficit of approximately 9.5 million-bale equivalents is equal to 45–50 percent of estimated total U.S. end-use consumption of cotton.

Tight U.S. supplies and the loss of Step 2 payments have reduced the ability of U.S. cotton to compete in world markets and increased the prospects for substantial cotton imports later this year. U.S. cotton exports could drop to only 4.2 million bales, down from 7.5 million bales last year and the lowest since 1985/86. USDA forecasts U.S. raw cotton imports of 350,000 bales during 1998/99, down slightly from 2 years ago but up sharply from last season. Imports will surge after the Step 3 quotas trigger.

Both world cotton production and consumption are down in 1998/99. World production is down 7 percent from last season, due mainly to production declines in China and the United States. China's crop is estimated to be down 6 percent from last year. World consumption is projected down 2 percent from last year, the largest year-to-year decline since 1974/75. Reasons for falling consumption include the Asian economic crisis, increased competition with polyester due to surplus synthetic fiber production capacity in Asia, economic problems in Russia and Brazil, and increased competition from textile exports from countries such as Indonesia and Thailand.

Lower prices for alternative crops could keep U.S. cotton plantings in 1999 at near last year's level. While plantings may be about unchanged in 1999, U.S. cotton production could be up about 25 percent with a return to trend yields. A much larger crop would improve U.S. cotton's competitiveness in world markets, thereby reducing imports and increasing exports from this season's projected levels. However, weak world demand could limit export growth and U.S. ending stocks could rise in 1999/2000, further pressuring cotton prices. Textile imports are likely to remain strong in 1999/2000 and limit growth in domestic mill use.

OUTLOOK FOR LIVESTOCK

Cattle.—The average price received for all beef cattle fell 6 percent in 1998. USDA had expected cattle prices to strengthen during the second half of 1998 following steady herd liquidation since late 1995. However, low cattle prices and drought in southern States caused producers to continue to reduce their herds, increasing cattle available for placement into feedlots. In addition, with good northern forage supplies and producers trying to keep animals on grass longer with the hope of receiving higher prices, ranchers placed heavier animals into feedlots raising average dressed slaughter weights from 699 pounds in 1997 to 723 pounds this year. The continuing liquidation and heavier slaughter weights caused beef production to increase by 1 percent in 1998.

The economic problems in Asia and Russia as well as herd reductions in many major beef exporting countries caused the U.S. beef trade balance to worsen in 1998. U.S. beef imports increased about 11 percent, as world trade slowed and more product was moved into the strong U.S. economy. In comparison, U.S. beef exports rose 1 percent with reduced exports of higher value cuts to Asian countries only partially offset by higher exports to Mexico. On a weight basis, however, net imports equal less than 2 percent of U.S. beef production.

Beef production will likely decline in 1999 as slaughter levels and weights fall, and lower production should bolster cattle prices in 1999. Cattle inventories have declined since 1996, and the 1998 calf crop was the lowest since 1952. USDA expects the combination of fewer slaughter cattle and lower dressed weights to reduce beef production in 1999 by about 3 percent to 25.0 billion pounds.

Much of the year-to-year decline in beef production will not occur until the second half of the year. During early January, producers indicated that the number of heifers over 500 pounds that they are retaining for beef cow replacement was 4 percent below a year earlier. This will make almost the same number of heifers available for placement into feedlots through the first half of 1999 as last year. In the second half of the year, USDA expects producers' increased retention of heifers for the breeding herd and lower slaughter weights will reduce year-over-year beef production by 5 percent. For all of 1999, USDA expects fed cattle prices to average $65.50 per cwt. in 1999, compared with $61.48 last year and $66.32 two years ago.

U.S. beef trade is likely to be more in balance in 1999 as import growth slows and U.S. government donations of beef increase. Largely due to food aid to Russia, U.S. beef exports are projected to increase about 8 percent. In comparison, declining

beef supplies in Canada and Oceania are expected to reduce the growth in U.S. beef imports to about 4 percent in 1999.

Hogs.—Hog production increased by 10 percent in 1998, reflecting strong returns the previous 2 years and expansion of large hog operations. Producers expanded inventories to the point that by September 1, 1998, there were 63.5 million hogs on farms, the highest since 1980. Large productivity increases and structural change also fueled the inventory expansion. Increases in pigs per litter, litters per sow per year, and weight per animal slaughtered have combined to raise pork produced per breeding animal by 20 percent since 1988.

The abnormally large year-to-year increase in pork production caused hog prices to tumble from year ago levels. For all of 1998, slaughter hog prices averaged $31.67 per cwt., down from over $51 in 1997 and the lowest since 1972. In December, hog supplies strained processing capacity causing hog prices to drop to the $10 per cwt. range. Weekly hog slaughter frequently reached 2.2 million head during the fourth quarter of the year, with weekday kills of over 400,000 head and Saturday kills of 200,000. Total fourth quarter slaughter reached 27.6 million head, 1 million more than the fourth quarter of 1994, the last time hog prices plunged.

Larger hog imports were a factor in overall price declines in 1998, but not a major factor. The strong U.S. dollar rate of exchange with the Canadian dollar, large hog production, low prices in Canada, and labor problems at Canadian hog packing plants led to U.S. imports of Canadian hogs of 4.1 million head in 1998, about 4 percent of U.S. pork production, and up from 3.2 million head in 1997. Canadian hog imports reached a higher level in late 1997 and early 1998, and they maintained that level so that weekly imports during the low-priced fourth quarter were not much different than during the third quarter.

Despite the weak world economy and the strong U.S. dollar, U.S. pork exports actually increased sharply in 1998. The United States exported more than 1.2 billion pounds of pork in 1998, up 18 percent from last year. In contrast, pork imports rose 10 percent to 695 million pounds in 1998. The United States continued to be a major market for pork from Canada and Denmark in 1998, while the major U.S. export markets included Japan, Russia, Mexico and Canada.

USDA expects continued large hog supplies to pressure processing capacity and prices during the first half of 1999. The market hog inventory on December 1, 1998, was 2 percent above a year earlier. However, pork production could be up about 5 percent during the first half of 1999, as continued low prices provide a further incentive for producers to reduce the breeding herd. In addition, low prices could cause producers to market hogs at heavier weights. Hog prices will likely average in the $25–$35 per cwt. range during the first half of 1999, which would be below breakeven for most producers.

As hog slaughter begins to decline in the second half of 1999, prices should rise above last year's level, particularly in the fourth quarter. Producers have already responded to the exceptionally low prices in the last half of 1998 by reducing the breeding herd, which on December 1 was 4 percent below a year earlier. In addition, producers have indicated intentions to farrow 7 percent fewer sows during March-May compared with a year earlier. This implies a fractional decline in third quarter pork production but a 10-percent drop for the fourth quarter. For all of 1999, USDA forecasts hog prices to average $34 per cwt., 7 percent higher than last year.

U.S. pork exports are likely to increase about 10 percent in 1999, while imports remain steady. Increased pork exports to Mexico, Japan, and other markets are likely to more than offset lower exports to Canada and Russia. The economic crisis could limit U.S. pork exports to Russia to donations under food aid programs, causing exports to Russia to fall below the level achieved in 1998. Exports to Canada may also trend downward, as restructuring and expansion of the Canadian pork industry reduces the demand for U.S. pork products.

Continued low hog and pork prices for much of 1999 will likely limit the growth in pork imports, and U.S. live hog imports could fall below last year. Slaughter capacity increases in Manitoba, the settlement of labor disputes in Canadian hog slaughter plants, and Ontario hogs increasingly moving to slaughter in Quebec under buying agreements may lower U.S. hog imports from Canada in 1999 but only slightly.

Broilers.—The rate of growth in broiler production was only 2 percent in 1998, as production was negatively affected by below-normal egg hatching rates. Consequently, broiler prices for all of 1998 averaged 7 percent above 1997, weakening during the fourth quarter with the loss of the Russian market and higher U.S. production. In response to higher prices and a return to more normal hatching rates, USDA expects broiler production will be up nearly 6 percent in 1999. The increase in production could lower the price of broilers from over $0.63 per pound last year to $0.59 per pound in 1999.

Broiler meat exports will probably remain weak through much of 1999. The loss of the Russian market is unlikely to be offset by gains in other markets, and first-half exports could be 20–25 percent lower than in 1998. Exports in the second-half of 1999 may increase relative to 1998, especially if sales opportunities with Russia reappear.

Dairy.—Farm-level milk prices were record-high in 1998, averaging $15.38 per cwt., compared with $13.34 in 1997. The sharp increase in farm-level milk prices reflected modest growth in milk production and strong demand for milk products. In 1998, milk production was adversely affected by weather in California, Texas, and the Southeast. In addition to high milk prices, lower feed prices boosted dairy producers' incomes in 1998.

Dairy farmers appear to be reacting to the record-high milk prices and low feed costs over the past year by expanding milk production, which is projected to average about 2 percent higher in 1999. After being up only fractionally for most of the year, milk production increased by 3.5 percent from November 1998 through January 1999. In response to the increase in milk production, which supported higher cheese production, wholesale cheese prices fell sharply in January dropping by about $0.60 per pound. The sharp decline in the price of cheese will lead to a steep drop in farm-level milk prices over the next few months. For all of 1999, USDA expects farm-level milk prices to average about $1 per cwt. lower than last year—putting them about halfway between the 1997 and 1998 levels—but the decline could be even steeper if recent monthly year-over-year increases in milk production are maintained through much of 1999.

OUTLOOK FOR RETAIL FOOD PRICES

The Consumer Price Index (CPI) for food increased by 2.2 percent, while the CPI for all items increased by 1.6 percent in 1998. Last year, lower retail prices for beef, pork, eggs, and nonalcoholic beverages were more than offset by higher prices for dairy products, fish and seafood, fats and oils, fruits and vegetables, cereal and bakery products, and sugar and sweets. Retail dairy product prices increased by 3.6 percent in 1998, reflecting the sharp increase in farm-level prices. Strong vegetable oil prices caused the CPI for fats and oils to increase by 3.7 percent, and weather problems in California, Florida, Texas, and some importing countries pushed up retail prices for fresh fruits and vegetables by more than 7 percent last year.

USDA expects the CPI for food will increase by 2–2.5 percent in 1999. Retail prices for fruits and vegetables should be up only modestly in 1999, assuming there are fewer weather problems in the major fruit and vegetable growing areas this year. In addition, continued large supplies of red meat and poultry will likely prevent retail prices for meat and poultry from increasing much in 1999.

Longer Term View.—Looking to the longer term, USDA's recently published agricultural baseline projections to 2008 provide a view of how the global farm economy would unfold over the next decade under a very specific set of assumptions about policy and weather. This ambitious effort is primarily the work of the Economic Research Service. While we can be sure that the projections will turn out wrong because the assumptions never hold, the analysis is extremely useful to understand the possible implications of the underlying trends as we now see them. A few highlights are:

The global macroeconomy takes 3–4 years to recover to a stable, moderately strong rate of growth. The global economic problems mean a prolonged weakness in global demand for farm products. The slow recovery in the world economy and ample supplies in competitor countries results in U.S. agricultural exports not returning to the record level of 1996 until about the year 2003. U.S. planted acreage drops only a small amount, and with trend yields supplies remain large, leading to a slow recovery in nominal farm prices and steadily declining inflation-adjusted farm prices throughout the projection period. In particular, real soybean and hog prices decline substantially compared with other commodities. Recovery in the global economy leads to strong growth in U.S. meat and poultry exports after 3–4 stagnant to slow growth years. U.S. cattle production turns up for several years starting in 2001, but then declines under strong competition from hogs and broilers. Net farm income grows slowly throughout the projection period and does not reach the 1996 record high of $53.4 billion. Loan deficiency payments are made through 2002. The farm balance sheet improves as the overall debt-to-asset ratio slowly declines throughout the projection period in line with the slow declines observed during much of the 1990's.

KEY UNCERTAINTIES IN THE OUTLOOK

There are many uncertainties that could affect markets and the well-being of market participants over the next 1 to 2 years. Three key factors follow:

—*Weather and agricultural production.*—Last year's heavy rain and flooding in California and drier than normal conditions in the Southern Plains and South highlighted the role of weather in crop production and farm financial conditions. The current La Nina weather event is having a limited effect on U.S. agriculture, with the possible exception of the December freeze in California that severely reduced citrus production. La Nina is not expected to be a major factor affecting global or U.S. crop production this year. However, weather forecasting remains imprecise and the possibility remains that adverse weather could cause a major shortfall in world crop production and a strong increase in prices from current levels.

—*Macroeonomic Performance in Asia and Latin America.*—A number of very important markets for U.S. agricultural products fell into recession in 1998, including Southeast Asia, South Korea, and Japan, which account for about one-quarter of the value of U.S. agricultural export sales. Moreover, the Russian economy is expected to sink dramatically in 1999. The current economic problems in Brazil will lead that country into recession in 1999 and could cause major problems for other Latin American countries. If the Asian economies fail to stabilize or the economic problems in Brazil spread to other Latin American countries, which account for one-fifth of U.S. agricultural export sales, U.S. agricultural exports could drop further, placing additional pressure on farm commodity prices over the next 2 years. The engines of growth in the world economy right now are the U.S. and the EU. Should either of these two countries fall into recession there would be a global recession that would further erode world food and fiber demand and U.S. farm exports.

—*China*.—The outlook for U.S. agriculture is very much linked to what happens in China, home to one-fifth of the world's population. USDA expects China's economy will maintain the strongest growth in Asia over the next several years with per capita GDP growth of 7 percent or more per year. As incomes grow, the demand for food is expected to outpace increases in production causing China to expand agricultural imports. However, China's emphasis on self-sufficiency has raised their grain and cotton production, stocks, and exports this year. Although cotton production incentives appear to be coming down, continued emphasis on grain production and maintenance of trade barriers could dampen future growth in world grain trade and grain prices. In addition, the pace of economic growth may be overly optimistic, given the economic problems in China and in several neighboring countries. Alternatively, if the pace of economic and trade liberalization could quicken, China could be integrated in into the world economy more rapidly than anticipated, which would further strengthen world grain markets.

Mr. Chairman, that concludes my testimony, and I will be happy to respond to any questions.

Senator COCHRAN. Thank you very much, Mr. Collins.

Before we proceed to hear from Mr. Schumacher, I think I will yield at this point to my colleagues on the subcommittee for any opening statements or remarks that they would like to make at this time.

Senator Kohl.

Senator KOHL. Thank you, Senator Cochran. I have an opening statement that I will put into the record because I know that will expedite our hearing.

Senator COCHRAN. Thank you. That statement will be in the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR KOHL

Secretary Schumacher, Mr. Collins, and Mr. Kaplan, let me join Senator Cochran in welcoming you. Our hearing this morning addresses "Assistance to Farmers and the Farm Economy". That could encompass anything from land conservation to agricultural anti-trust reform to trade policy. And though our subject matter is broad, in view of current trends in farm prices, it demands our immediate attention.

Mr. Collins, I have reviewed the information in your prepared statement. I must say, you do not provide much encouragement for anyone wanting to go into farming. When Secretary Glickman testified before us last month, he observed that, in spite of a record strong national economy, those industries tied to natural resources, especially agriculture, are suffering dismally. That is bad news for this Subcommittee that has the responsibility of looking beyond Wall Street and into the fields and rural roads of small town America. This nation cannot be strong without strength in all parts.

Let us go beyond generalities for a moment. Mr. Collins, you point out that farm exports dropped to $53.6 billion in fiscal year 1998, a 10-percent reduction from 2 years before, and your projections include a further reduction to $49 billion this year. Further, I must point out, this is occurring in an era when we were all being told that "Trade" was going to be the solution for agriculture's problems! I don't see much of a solution when farm exports are falling and we are still faced with unreasonable treatment from our trading partners.

It sometimes seems difficult to get anyone's attention about the plight of U.S. agriculture. No one can deny the dramatic decline in the farm population over the course of this century. But the farmer's role as provider for our nation and protector of our natural resources remains as important as ever. Nations don't go to war over television sets; they go to war over adequate food supplies. Conservation of our natural resources gets a lot of lip service from our friends in the cities, but it is the farmer whose livelihood is tied to protection of soil and water resources. I want to know what the Department of Agriculture is doing to help farmers meet the challenges of environmental protection that will avoid the sometimes harsh rule of regulation. The responsibility we carry to protect the farmers of America is as important as the responsibility of our nation's farmers to provide for all of us. One cannot and should not ignore the other.

Therefore, I was becoming increasingly alarmed the past few weeks when we failed to see any action by the Administration to propose additional funding for farm programs in the upcoming supplemental that you knew was before Congress. It made many of us wonder if anyone in the Administration really cared about the crisis in rural America and I would welcome any of your comments to put our concerns to rest. When Secretary Glickman appeared before us nearly one month ago, he mentioned several needs which still have not been formalized in the form of a budget request to the Congress.

I hope someone can explain to my satisfaction why there seems to be such a disconnect within the Administration on something as important as protecting the farm economy. It was very well for the President to mention the plight of farmers in his State of the Union Message, but we had hoped to see something of substance to follow his words. We are waiting still.

I hear from my farmers in Wisconsin just as all Senators here listen to farmers in their states. I know that while dairy prices have been high, the outlook is grim. Volatility in farm prices concerns me greatly. It is anticipated that dairy prices are going to fall from record highs earlier this year to record lows in the coming weeks and months. I wonder how many other sectors of the economy could survive the enormous shifts in net income that farmers have to live with year in and year out.

To exacerbate the problem of prices for dairy farmers is the ongoing problem of policy. Secretary Glickman informed this subcommittee that distribution of the $200 million we provided last fall for dairy farmers will be provided in time to help cushion the coming fall in dairy prices. However, let me firmly state that providing dollars to help dairy farmers recover from falling prices must not in any way be connected to the overall dairy policy reforms you are soon to announce. It goes without saying that I will be watching both developments very closely and one must not, under any circumstances, be a quid pro quo for the other.

Secretary Schumacher, among your responsibilities is to provide U.S. agriculture a strong voice in world trade. Historically, agriculture has been the shining light in U.S. trade, but as I stated above, it appears that light cannot continue to shine brightly through the haze of unfair practices by some of our trading partners and uncontrollable financial problems now affecting much of the world. Still, you possess tools to help farmers find their way to new consumers around the world. We must continue those efforts. In addition, I worry about the ability of farmers, especially small family farmers, to survive in an economic climate largely controlled by a few corporate giants. Small farmers, too, need direct access to markets. They need to be their own "middle-men" and keep more profits in rural America rather than corporate board rooms.

Let me close by saying that no one in this room, or watching around the country, wants to see us return to the conditions of the 1980's when foreclosures and bankruptcies were the rule of the day. We need to look at measures to conserve land,

to smooth agricultural price volatility, to protect our farmers from uncompetitive concentration in their industry, to open markets to our quality American agricultural products. These are large tasks, but farmers in Wisconsin and around the nation deserve Federal attention that acknowledges their central place in the history of America's prosperity and way of life.

Senator COCHRAN. Senator Gorton.

STATEMENT OF SENATOR GORTON

Senator GORTON. Thank you, Mr. Chairman.

As you know, last year Congress provided a $6 billion disaster and relief package for U.S. agriculture. This package, as you recall, was drafted and passed with the purpose of aiding the agriculture based regions of the country that experienced natural disaster and market losses. Although this package did relatively little to assist producers in Washington State who have been impacted by the Asian flu, worldwide stockpiles of commodities and certain unilateral sanctions, it certainly signified the concern all of us have regarding our Nation's farm economy.

While there is no question that commodity prices have slipped in this country and many family farms are on the brink of bankruptcy, I question USDA's proposed budget as it addresses these concerns. On-the-ground production agricultural programs appear to be of no real significance in this budget. Research money is allocated for global research and climate change instead of regional programs this subcommittee and this country's commodities consistently request and support.

Funding is not requested for the implementation of prospective crop insurance reforms. Federal private land purchase programs are significantly increased, showing that USDA's interest is in simply buying up land farmers can no longer afford to harvest.

Export programs are decreased, even though almost every major producer organization of the country has requested additional foreign market assistance.

My two greatest concerns as a member of this subcommittee, concerns that growers in Washington State consistently emphasize, are agriculture research and export enhancement. For several years, it has been apparent that the Administration does not agree with growers or me on the subject of regional research. The Administration should recognize the error of its ways and discontinue its attempts to eliminate regional research programs.

Second, with respect to exports, I urge USDA to understand the importance of agricultural exports and to use the upcoming World Trade Organization's negotiations in Seattle to expand and enhance our Nation's agricultural trade. With more than 25 percent of Washington State's commodities being exported, our agricultural community has a unique and important interest in these negotiations.

As the department prepares for the WTO Ministerial, I urge it to consider the importance and significant impact trade has on Washington State and on the entire Nation's agricultural economy.

Senator COCHRAN. Thank you. Strong letter follows. [Laughter.]

At this time I would like to submit Senator Burns, and Senator Feinstein's prepared statements for the record.

[The statments follow:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman.

I look upon this Subcommittee to improve the devastating economic situation for American farmers and ranchers. They need more than a helping hand or a quick fix. They need solutions that will pull them out of this crisis and keep them out from any more like it in the future.

The agricultural producer is drowning in a sea of debt and many in Congress want to continue to send lifeboats. The problem is that once the producer makes it into the boat he cannot seem to get to shore. He just continues drifting, barely afloat, and always paddling to try to make it to shore. I would like to see laws passed this session that will not only provide a temporary lifeboat to farmers and ranchers, but pull them completely out of the water.

I believe one way to do that is through an effective crop insurance program. An operative farm income safety net is paramount to the survival of agriculture. A long-term viable solution will be necessary for a safety net with staying power. There are several ideas for crop insurance reform that are being proposed for Congress this year. This project will no doubt be a huge undertaking and one that may or may not be passed in one session. However, the need for reform is imminent and I believe we can make the Federal Crop Insurance Program, or one like it, more useful to producers.

I believe a truly effective crop insurance plan involves simply three things: private insurance, the federal government and the farmer. The federal government can help facilitate a program to unite the producer and the private insurance company. Privatization with government intervention will ultimately put the control in the hands of the farmer. With a risk management plan, bankers are also more likely to finance farmers if they have both their crop and their price covered, with a reliable insurance program. A lasting solution, such as effective insurance, is imperative to bring producers out of this current economic crisis.

I know that several of my colleagues also realize the importance of crop insurance reform this session. The administration claimed crop insurance reform as one of its top priorities and urged Congress to repair the federal crop insurance system. Why then did the USDA neglect to include any funding for this program in the fiscal year 2000 budget? When questioned, Secretary Glickman stated that USDA will "find" the funds. I realize there is a longer growing season here in Washington D.C. than in Montana, but where I come from $1 billion doesn't grow on trees. The lack of funding provided for crop insurance is a slap in the face to each and every agricultural producer.

Funding for the GLCI (Grass Lands Conservation Initiative) was held level under the NRCS budget rather than being increased. This program is invaluable to ecosystem management, which has been a top priority in President Clinton's environmental agenda. This program provides education and technical assistance to agricultural producers who continue to be the ultimate environmental stewards. Funding for this program should be increased from $15 million to at least $20 million.

The proposed USDA budget claims it will strengthen the safety net for farmers and low income populations while providing economic opportunities for rural Americans. It also alleges it will protect our natural resources and further improve the safety of the food supply. While all worthwhile programs, this budget will have a hard time funding any of them adequately. The decreases reflected in the budget certainly do not help the farmer or rancher, and the program increases are not tailored to help them either. Agricultural producers are the backbone of this country and it is especially these people to whom the United States Department of Agriculture should be held accountable.

I am extremely disappointed with the Farm and Foreign Agricultural Services budget cut. The President promised to bring trade in line with agricultures and Secretary Glickman recently suggested increased exports as a solution to the agriculture crisis. Yet, the Farm and Foreign Agricultural Services budget was cut by nearly $6.5 billion. Two of the main programs for exports, the Export Enhancement Program and the Food for Peace (Public Law 480) program, were reduced by $56 million and $772 million respectively. The Export Enhancement Program has funds that are not being currently utilized. We need to make this money available now to allow producers to export commodities in storage. With 70 percent of Montana's grain sent for export we cannot afford to lose these important programs. This administration wants fast-track negotiation yet they are unwilling to appropriate or use the money for the export programs currently in place.

Several other programs important to export enhancement were also cut. The Commodity Credit Corporation Program was cut by $5.8 billion, the Dairy Export Incentive Program by $15 million and the Food for Progress program by $24 million. With

today's global market situation, producers cannot afford to have the few opportunities they have for export reduced. The CCC provides an important service for private negotiations with other countries. Agricultural producers have an increasing need for avenues to market their products through private entities. The budget cut to the CCC makes them more dependent on the federal government, rather than giving them opportunities to expand marketing channels.

The international trade front continues to be a major problem in Montana and other western states, especially in regards to Canada. Even with programs like the Northwest Cattle Project, far more cattle flood the market from Canada than are exported from the United States. The Canadian Wheat Board, a state trading enterprise, maintains control of the grain market and lowers prices for producers on both sides of the border.

The European Union also continues to be a thorn in the side of agricultural producers. Their non-compliance with World Trade Organization regulations on imports of bananas and beef should make them subject to severe retaliation. However, they are still treated as major players in the world market and have hardly received admonishment. China must also be subjected to more than a slap on the wrist for their non-tariff trade barriers. The barrier on TCK smut is non-scientific and only provides a way for China to prevent access to foreign grain.

Trade inequities will continue to be a huge problem until they are addressed in a manner that means compliance. Mr. Schumacher, when will the Foreign Agricultural Service step in to reduce trade barriers and resolve international trade disputes? I thank you for your staffing and support in negotiations between the United States and Canada in Ottawa recently. However, these are baby steps. What agricultural producers need are comprehensive agreements that help them now.

As a result of legislation passed last year and the FAIR act of 1996, approximately $6 billion in government payments was to be given to farmers and ranchers in strife. This money is to be used to offset loss from crop losses and lower prices. Yet, I have constituents call every day wondering where their payments are. When Congress promises loss payments my people at home expect USDA to disperse those funds in a timely and efficient manner. Endless deadline extensions and hurry up and wait policies by the USDA are not helping the farmer pay the bank or the rancher buy hay for the winter.

The biggest problem we have right now in the world of agriculture is getting a fair share of the consumer dollar back to the producer. The most important end result of any legislation introduced this Congress must be to return to the producer his or her share of the economic dollar. Something is wrong with the big picture. Somewhere between the time the producer sells the product and the time it reaches the table, there is a serious disconnect. I believe this committee needs to take a good look at the big picture and arrive at some effective solutions. I commit my support and my efforts to the Chairman and ranking member as well as to the producer in Montana and the nation to work on this issue with them in the coming year.

Our producers have lost nearly all faith in any assistance the USDA or the federal government promises. If they have to go it alone right now, many will fail. They simply do not have the resources or the back-up funds to allow them the luxury of zero dependence on government programs. This Department gives the impression of wanting to help the agricultural producer, but in reality farmers and ranchers may as well be going it alone. The continued disregard by the United States Department of Agriculture for the producers it should represent forces us to come up with an alternative solution.

Thank you again, Mr. Chairman. I look forward to hearing some answers from the USDA, and more importantly to working with you in the coming year to improve the economic situation for the American farmer and rancher.

PREPARED STATEMENT OF SENATOR FEINSTEIN

I want to thank you for being here today.

California is the leading agricultural producing State in the nation. We also have a significant amount going to export. We export about 20 percent of what we grow and, in 1997, our exports were valued at $6.7 billion.

Six of California's top ten agricultural export markets are Pacific Rim countries. The leading export destinations for California agriculture are: Japan, Canada, Hong Kong and South Korea. Combined, these four markets import over $2.6 billion of California agriculture.

Almost fifty percent of our cotton exports go to Japan and South Korea. Other products being exported to Asia—and other destinations—include table grapes, wine, oranges, cattle and tomatoes.

Clearly, what happens in Asia is going to have a profound impact on California's agricultural economy. Thus far, California exports—including agriculture—have managed to avoid serious fallout from the Asian financial crisis, but the decline in trade with Pacific Rim countries will have a lasting impact if things do not turn around there. I read Mr. Collins' statement.

On another note, before closing I would like to thank the Department for scheduling one of its regional forums on risk management in Fresno. I understand the forum is scheduled for later this month and I just wanted to express my gratitude for recognizing the level of concern in California. California faces a very unique situation in terms of the need for crop insurance reform. Only about one fifth of California's 250 types of crops are even eligible for federal insurance. I am pleased the Department understands this situation and is taking steps to hear input from California's growers. Please let me know if I or my office can provide you any assistance with the meeting.

Thank you.

Senator COCHRAN. Senator Durbin, we are interrupting our witnesses to take in the opening statements or comments that members of the subcommittee would like to make. I will recognize you at this time for that purpose if you would like to make any remarks.

Senator DURBIN. Mr. Chairman, I am going to make my statement a part of the record and not read it in the interest of time.

Senator COCHRAN. OK. Thank you very much.

Mr. Schumacher, you may proceed.

STATEMENT OF AUGUST SCHUMACHER, JR.

Mr. SCHUMACHER. Thank you, Mr. Chairman and your colleagues. Thank you for calling today's hearing. I am certainly pleased to be here with Keith. We have been speaking with each other fairly frequently on this difficult farm outlook that has come before us this year, continuing from last year.

We have Under Secretary Michael Dunn with us today, Mr. Chairman, and also Under Secretary Miley Gonzalez. Also I am delighted that Pearlie Reed, Chief of the Natural Resources Conservation Service, is here along with the three administrators from my mission area. With your permission, I would like to call on them to answer some of the detailed questions you may ask. I believe there is an empty chair here so that any of these people can come forward. Or we can respond for the record.

I am going to keep my remarks very short. With your permission, I would like to put my full statement in the record.

Senator COCHRAN. That will be perfectly all right. We will make that a part of the record in full.

Mr. SCHUMACHER. Just to pick up from Keith's comments on the farm crisis, I think certainly the farm economy is not what we had in mind when we went through the 1996 Farm Bill.

Baseline projections for farm prices and exports were quite different in 1996 than they are today, and I was running the Foreign Agricultural Service when exports reached nearly $60 billion. I think we had some pretty good net cash farm income estimates.

Many in agriculture anticipated growing world demand and higher prices, with farmers maximizing returns with some of the new planting flexibility the Farm Bill provided. The theory was that foreign markets would drive growth and that farmers would respond.

But, unfortunately, as we have seen this year farm exports and prices have fallen for most of the heartland crops and certainly some of the livestock since 1996.

We still are projecting long-term—long-term—growth in exports, but U.S. agricultural exports are now only projected at $49 billion for this fiscal year, 1999. They are not expected to reach the 1996 high of nearly $60 billion for another 5 years.

Prices are not expected to recover significantly until exports do.

Now this could all change if there are major weather problems in North China, Australia, Argentina, Brazil or, God forbid, in the United States. Things can be very cyclical, and the baseline assumes normal weather. But, as we have seen, weather is never normal. So we will have to see how the weather situation evolves.

I would now like also to express my deep appreciation and gratitude to our employees who serve in our mission and who serve USDA widely. With this farm crisis upon us, these employees are really working very, very hard, during some very, very difficult times.

I was down in your State 10 days ago and met many employees just to talk through some of the issues and visited a number of farmers. Things are not looking good.

Let me just briefly touch on the supplemental request that is now here, delivered to both Houses of Congress by the White House last week.

I understand Thursday, Mr. Chairman, the Senate is scheduled to mark up the bill to provide supplemental appropriations. The President's request includes $109.6 million to enable USDA to provide an additional $1.1 billion for financing to farmers and ranchers. The message that I am getting from the countryside is that we desperately need some additional credit, supplemental credit, out there.

Our overall usage, as Keith has said, is up 65 percent. For most farm credit programs, funds have been exhausted or will be exhausted very shortly.

It also includes—and this is a very important issue—$42.8 million for Farm Service Agency temporary staff to meet the overwhelming demand not only for credit and servicing of credit but for all of the new LDP's—loan deficiency payments—that we are working on. We can come back to this in the question period to discuss how we are doing in issuing payments. I think you indicated in your opening remarks that you would like to hear more about that, and I would be very pleased to address that, maybe assisted by Keith Kelly and Parks Shackelford of FSA.

But we certainly appreciate your very prompt action, coming up this week, Mr. Chairman, on this vital supplemental bill.

Before I conclude, let me look a little bit at last year's highlights, again emphasizing the workload in the countryside.

Let's take, for example, LDP's. Since July of 1998, those have gone up a thousandfold. In sheer numbers, we have gone from a little over 2,000 in 1997 to nearly 1.5 million in 1998—in dollar terms, $2.8 million in 1997 to $2.8 billion in 1998. This is an extraordinary increase in that safety net on LDP's.

The number of farmers placing crops under loan also has gone up significantly. In addition to the marketing assistance loans,

farmers have had the option to take 100 percent of their 1999 flexibility payments beginning in November 1998, as provided by statutory change last year. Farmers have opted to receive about 60 percent of total estimated AMTA payments in advance.

Now let's look at the emergency assistance about which you inquired.

I am very pleased that within 10 to 12 days after the President signed your emergency bill last year, the $2.8 billion was sent by bank draft or by check to farmers. So virtually all of that went out before Veterans Day. We worked very hard and the computer systems worked very well to get that $2.8 billion out very promptly.

The signup for the $200 million Livestock Assistance Program, which began last November, was extended due to very heavy demand. Payments should be going out in early spring, very early spring.

Signup for the $2.4 billion crop loss disaster assistance program began February 1 and was recently extended to April 9. Payments should go out in late spring, and I would be pleased to follow up on the details of that if you so wish.

The Secretary will be making an announcement very soon on the $200 million Dairy Income Loss Assistance Program. The program implementation plan is working its way through clearance very quickly, because, as Keith said, the price of milk is going down. That program needs to be announced, and those payments will go out very shortly after the Secretary makes the announcement.

Also, independently of the disaster bill, we have taken a number of actions to help pork producers. Secretary Dunn was very active in that, and he can comment further, if you wish, on the pseudorabies eradication. The signup for the Small Hog Operations Program ended February 12, and those checks should go out later this month.

Then, finally, we will be implementing the commodity loan programs for mohair and honey.

So there has been a major, major full court press to get assistance out.

Let me just briefly touch on crop insurance and the export side before I conclude.

In 1998, Federal crop insurance covered about 182 million acres under approximately 1.2 million policies covering liability of $28 billion.

In 1998, we helped many farmers survive crop losses, whether it was in the Northern Plains, with the wetness, or in the Southern Plains with the drought in May and June of last year. It was the hottest and driest period on the historical record. We paid out about $1.6 billion, together with the private sector, on insurable losses.

We have been aggressively promoting new programs. Ken Ackerman and his fine staff have been working with the private sector in expanding existing programs.

Prior to 1996, no Federally backed revenue insurance was available to farmers. RMA now provides five different types of revenue insurance. Unfortunately, many farmers still remain uninsured or underinsured. As you well know, Mr. Chairman—we have discussed this—we developed and submitted a broad outline proposal

for making crop insurance provide better coverage at more affordable prices. As a down payment under the disaster program, we rolled forward $400 million of that on the emergency relief package to reduce the insurance premiums to buy down the buy-up coverage by 30 percent.

In addition, we have proposals that are coming forward, and there will be a number of hearings in the next week and the week after, both in the Senate and the House, on our risk management crop insurance. Those will be covering making higher loan crop insurance coverage more affordable, to expand the range of crops covered by insurance, to develop policies covering multi-year as well as single year losses, and to raise the floor on catastrophic and NAP coverage. That is certainly something the South has been hearing a great deal about. Also, more importantly, there is the implementing of a pilot revenue program for our livestock producers. Livestock covers a little over 50 percent of our total gross receipts and they are not covered very much by revenue. Also it should provide better information and training.

We are looking very much forward to working with you, Mr. Chairman.

Let me then just conclude on the international side.

We have had a very active year, starting about a year ago, with the Korean GSM and the Asian crisis, when Tim Galvin and Chris Goldthwait, stepped smartly to the plate.

Sales of U.S. commodities under our GSM have risen by 40 percent, from $2.9 billion to over $4 billion. Certainly that got the attention of some of our competitors who had put some interesting press releases out about that activity.

All told, we will ship nearly 10 million tons of food under our food aid authorities. And, as Senator Gorton mentioned, we are working very hard in getting ready for the next agricultural negotiations at WTO. We have a very ambitious set of objectives for this round.

For fiscal year 2000, we have $3.5 million for the Cochran Fellowship, and that is working very, very well. We are expanding the program into Africa, which could be our new growth area in a few years' time.

So, in conclusion, we are going to be asking for many comments as we work through the risk management proposals. It is true that we did not put much money in the budget for this because we want to get a consensus, similar to what we did in 1990 and 1995 on the Farm Bill, where we built a consensus with farmers, ranchers, commodity groups, farm groups, farm organizations, and the authorizing committees, and then work through the budget implications as the year develops.

It is going to be an active year. We are starting off with the tremendous work going on in the supplemental that is going forward, and I thank you for taking that up so promptly. We are then going to be finalizing all the payments that are coming out over the next 2 or 3 months. That should be all done by late May or the latest, late spring. Then we have the risk management proposals coming forward. Then we will have to see how the weather and prices continue and whether we need to do even more as we did last year.

When farmers were in crisis, we all stepped up to the plate and assisted family farmers in getting through this crisis.

Thank you very, very much, Mr. Chairman. I appreciate being here and look forward to answering your and your colleagues' questions.

[The statements follow:]

PREPARED STATEMENT OF AUGUST SCHUMACHER, JR.

INTRODUCTION

Mr. Chairman and Members of the Committee, I am pleased to appear before you today with my colleague, USDA's Chief Economist Keith Collins, to discuss our assistance to producers and our commitment to improving the farm safety net. With me this morning are representatives from the Farm Service Agency, Risk Management Agency and Foreign Agricultural Service within my own mission area, as well as representatives from the Research, Education and Economics and Marketing and Regulatory Programs mission areas and the Natural Resources Conservation Service. Statements of the Agency Administrators detailing their fiscal year 2000 budget requests will be submitted for the record. The mission of Farm and Foreign Agricultural Services is to secure the long-term vitality and global competitiveness of American agriculture. The President described our mission another way in his State of the Union message when he said: "We must work hard to bring prosperity back to the family farm."

Our ability to accomplish this mission is surely being tested during this period of low commodity prices and weak overseas demand.

We will continue to use all of the program and policy tools available to us to help producers whose incomes have dropped substantially because of low prices and weather-related production losses. But while planting flexibility provisions of the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act), strong export and trade policy programs, risk management initiatives, and our farm loan programs have helped many crop and livestock producers, it is clear that the farm safety net needs to be reinforced. This is a top priority.

The Administration and Congress worked together last year to support farmers in areas hit hard by sharply lower commodity prices, severe weather problems, and, in some cases, successive years of reduced yields. This year we will continue our efforts to expand and improve programs which help producers manage risk, and we look forward to working with Congress to further reform the insurance programs for crop and livestock producers. We also are working hard to expand opportunities for small farmers and others who traditionally have been under-served in our farm programs. The recent class action settlement with African American farmers underscores our continued commitment to ensure fair treatment for all of our customers.

The heavy workload associated with the farm crisis is putting increased stress on an already strained farm program delivery system as well. To improve service and cut costs, we are streamlining business processes, establishing a common computing environment, and consolidating administrative services among the county-based agencies. However, savings from these efforts won't be realized immediately. In the interim, it is vital that Farm Service Agency staffing be maintained at sufficient levels to ensure the efficient delivery of service to our customers on a timely basis.

Mr. Chairman, before addressing our specific proposals for strengthening the farm safety net, I would like to describe recent and ongoing efforts underway by USDA to help America's family farmers and ranchers.

COMMODITY PROGRAM ASSISTANCE

As a result of the depressed market conditions in many grain and oilseed production areas, farmers' use of marketing assistance loans and loan deficiency payments (LDPs) has soared dramatically. The Commodity Credit Corporation (CCC) increased benefits under the commodity programs by allowing LDPs for silage and high moisture corn, as well as for below-grade or contaminated commodities.

By the end of January, farmers had requested nearly 1.5 million LDPs for their 1998 crops—more than a 600-fold increase over the 2,182 LDPs made on 1997 crops. Total marketing assistance loan gain (MLG) and LDP outlays on the 1997 and 1998 crops are now projected to total $3.1 billion, with all but $165 million going to 1998-crop commodities. Corn producers have received 36 percent of the total to date, while soybean producers have received 23 percent, wheat producers 20 percent, and upland cotton producers 14 percent. For 1999 crops, total MLG and LDP outlays are forecast to rise to $4.2 billion.

Putting these outlays into perspective, as of January 20, 65 percent of the 1998 wheat crop (1,665.2 million bushels) had been put under loan or received an LDP. That's more than seven times the year-earlier level, and more than six times the entire 1997-crop quantity covered by the program. Year-to-date activity is similarly large for other crops and reflects the extremely heavy county office workload.

In fiscal year 1999, the value of loan placements and LDPs for all commodities is projected to total $10.6 billion, 38 percent more than in fiscal year 1998. In fiscal year 2000, that figure is forecast to be even higher at $13.2 billion, more than 70 percent greater than in fiscal year 1998. Of these totals, the increase in LDPs alone is demonstrative of the low commodity prices farmers are facing. LDPs for all commodities in fiscal year 1998 were under $500 million; in fiscal year 1999 they are projected to reach $1.8 billion, more than a three-fold increase. For fiscal year 2000, LDPs are projected to be over $2.7 billion, about six times the LDP total for fiscal year 1998.

In addition to the marketing assistance loan program, farmers had the option to take 100 percent of their 1999 production flexibility payments (estimated at about $5.5 billion after adjustments for payment limits) beginning in November 1998. As of February 23 of this year, farmers had opted to receive about $3.7 billion, or about two-thirds, of this amount, leaving the remaining $1.8 billion to be paid later this year.

EMERGENCY PROGRAMS

USDA is working hard to implement the emergency programs funded in the 1999 Act, which include market loss payments, 1998 and multi-year crop loss assistance, livestock feed assistance, and other programs.

Market loss payments of $2.8 billion—amounting to a 50-percent increase in 1998 production flexibility payments—were distributed to major crop producers before Thanksgiving. We are now developing program provisions for distributing $200 million in market loss payments to dairy producers this spring.

Provisions of the $2.4 billion Crop Loss Disaster Assistance Program were announced last December, and signup began February 1. There are two basic parts of the program: 1998 single-year crop loss provisions cover crop losses during the 1998 crop year for which either crop insurance or the Noninsured Crop Disaster Assistance Program (NAP) is available; multi-year provisions provide an additional 25-percent payment to producers who have already received either crop insurance or NAP payments in at least 3 of the last 5 years. Producers may receive benefits under either, but not both, of these programs. The program also covers producers whose crops (primarily wheat) have suffered multiple outbreaks of fusarium head blight (scab). Up to $30 million in crop loss assistance and $12 million in disaster reserve funds will be used to assist farmers with crop and pasture land that has suffered long term flood damage.

The Disaster Assistance Tree Loss Program covers the cost of replanting or rehabilitating trees from which crops are harvested that have been damaged by natural disasters during 1998. It will run concurrently with the Crop Loss Disaster Assistance Program. Growers who have received assistance for tree losses under the Tree Assistance Program (TAP) are not eligible to receive assistance under the new program; however, TAP assistance has been extended by the 1999 Act to cover trees and vines damaged by fire blight in addition to other natural disasters.

Signup for the $200-million Livestock Assistance Program (LAP) began last November and has been extended due to heavy demands. County offices have been swamped with applications for this program. As of January 29, more than 23,000 producers have applied for assistance under this program in Texas alone. Nearly 1,200 counties have been approved for LAP. As of February 22, applications totalled well over $640 million, with many counties still processing applications. At the current application rate, we expect requested assistance could reach about $800 million by the end of the signup period. If this level of participation is realized, LAP payments would compensate producers for roughly 25 percent of their livestock grazing losses incurred during 1998.

FSA also has provided assistance to livestock producers under other appropriated programs, including the $4 million Livestock Indemnity Program (Phase II), which covered livestock death losses due to natural disasters which occurred before May 1, 1998, and the $6.8 million Dairy Production Disaster Assistance Program, which covers disaster-caused diminished milk production or dumped milk. The 1999 Act added $3 million to this program.

The American Indian Livestock Feed Program (AILFP) is funded from the sale of feed grains from the disaster reserve. It replaces an earlier and similar program, the Indian Acute Distress Donation Program, which was suspended by the 1996 Act.

However, the need to assist American Indians has not diminished, and AILFP provides direct cash payments to eligible livestock owners. Tribes may apply as livestock owners, and as of February 10, two tribes—the Chippewa Cree Tribe of Rocky Boy's Reservation in Montana, and the Three Affiliated Tribes of Fort Berthold in North Dakota—have been approved. Payments have been issued, and applications from other tribes are now being reviewed.

Since late 1998, USDA has taken several actions to help pork producers—who've seen hog prices fall 75 percent since July 1997—and improve market conditions. As announced by the Vice President, USDA will make $50 million in direct cash payments to family-sized hog producers and will provide $80 million under the pseudorabies eradication program to remove up to 1.7 million hogs from the market. Signup for the Small Hog Operations Payment Program ended February 12.

We've also accelerated pork purchases for Federal feeding programs, increased pork purchases for the Russian aid package, and included pork in the package of export credit guarantees to South Korea. We're encouraging lenders to work with hog producers during the market downturn, and, in addition to credit assistance, USDA is prepared to use all servicing authorities, including rescheduling and reamortizing, deferring installments and debt writedowns to assist those producers who are FSA borrowers.

CCC has issued $9.7 million under the Noninsured Crop Disaster Assistance Program to producers in 14 States for 1998 crop year losses. Since the 1995 crop year, NAP has provided risk protection similar to basic catastrophic crop insurance coverage for producers of uninsured crops. During 1995 and subsequent crop years, 1,108 NAP areas have been approved. To date, $16.0 million in NAP assistance has been provided to producers in 39 States and Territories for 1997 crop year losses; $60.9 million has been issued to producers in 44 States and Territories for 1996 crop year losses, and $30.5 million was provided to producers in 45 States and Territories for 1995 crop year losses.

Other 1999 emergency funds support new recourse loan programs for honey and mohair, for which procedures are being developed.

FARM LOAN PROGRAMS

A big part of the safety net for farmers involves expanding economic opportunity, which includes access to farm credit resources. Traditionally, USDA's role in the farm credit market has been the "lender of last resort." However, the Department's role is important because it provides opportunities for farmers who experience financial difficulty to stay in business, and fills credit gaps, particularly for small, limited resource, socially disadvantaged and beginning farmers.

The emergency provisions of the 1999 Act provide for an additional $541 million in direct and guaranteed operating loans to producers who are unable to obtain credit elsewhere.

Demand for FSA farm loans in fiscal year 1999 has been extremely strong. Depressed farm prices and the natural disasters which affected producers in many parts of the country have led to a 65-percent increase in overall obligations compared to the same time last year. Many farm families who have been financing their business operations through their own resources or with a minimum of commercial bank debt are now seeking FSA farm loan assistance. As a result of the weakened farm economy, especially in the pork industry, these family farmers have lower incomes and reduced financial resources to work with this fiscal year.

Commercial lenders are utilizing FSA loan guarantees to restructure the short-term indebtedness of their customers into more favorable long-term rates so that they can continue to provide financing. FSA has worked with lenders and other stakeholders to completely streamline loan guarantee application procedures, making them more consistent with standard industry practices and making the loan programs more user-friendly and responsive to the needs of lenders and their farm customers. A new Preferred Lender Program (PLP) dramatically reduces the amount of time and effort lenders must spend in obtaining FSA guarantees by allowing lenders with PLP status the maximum authority possible to make and service guaranteed loans.

Obligations under the guaranteed operating loan (OL) with interest assistance program are currently running 159 percent ahead of a year ago at this time, while the number of applications has increased 56 percent. In the guaranteed farm ownership (FO) loan program, obligations have increased 92 percent, and applications by 28 percent over a year ago.

Applications for direct operating loans are up 44 percent from last year at this time, and obligations under this program are running 35 percent ahead of last year. We expect use of direct OL funds will accelerate as planting season nears. Economic

conditions this year are forcing many family farmers who normally obtain commercial credit to seek direct OL assistance, and low commodity prices are creating severe stress for many highly leveraged small farms operated by minority and beginning farmers.

Many direct OL loans are being made in conjunction with emergency (EM) loans to farmers affected by natural disasters. Applications for EM loans so far in fiscal year 1999 are running 397 percent above a year ago at this time, and obligations are running 185 percent above last year. The heaviest use of EM loan funds generally occurs in March through June. As is true for nearly all USDA direct loan programs, funding levels for direct FO loans have historically been less than farmers' demand for them. Many of these farmers are minority and beginning farmers who are without the resources to obtain credit from a commercial lender, even with a guarantee. As part of our ongoing commitment to improving our services to small farmers and to others who have been underserved in the past, USDA's fiscal year 2000 budget request includes $128 million in direct FO loans, compared to $86 million available for 1999—a 48-percent increase. We also are increasing our outreach to previously underserved farmers. In fiscal year 1999, loans made to beginning farmers are up 32 percent and loans to socially disadvantaged producers are up 42 percent from a year ago. These increases mark the third consecutive year that we've increased the number of loans made to these groups of producers. However, providing loan funds to small farmers with limited equity and low incomes is only the first step in helping them to become successful. Many benefit from credit supervision, training, and assistance in managing their farm businesses. Currently, we are providing loan making and loan servicing benefits to these family farmers while achieving a declining delinquency rate on the overall FSA caseload. The default rate on FSA direct loans, as of January 1, has dropped from 23 percent in fiscal year 1995 to 15 percent this year.

We are carefully monitoring the demand for FSA farm loans and the amount of loan funds obligated. In addition to the number of applications, we have a large carryover of unfunded applications from last year, and some States are reporting fund shortages in non-targeted loan categories (portions of loan allocations that are not set aside for beginning and minority farmers until after April 1, 1999) for guaranteed FO and OL loans with interest assistance. The statutory increase in loan limits to $700,000 also means the fiscal year 1999 allocation of loan funds is able to fund fewer applications for guaranteed loans, even as these applications have increased dramatically. Because of the strong increase in demand for farm loan assistance, we anticipate that most funds will be exhausted much earlier than last year.

Beginning farmer (BF) targets for guaranteed loans are lifted on April 1. The BF targets for direct OL are removed on September 1. Socially disadvantaged targets remain in effect until administratively withdrawn, and historically, this takes place in the latter part of the fiscal year.

CONSERVATION RESERVE PROGRAM

Many farmers also benefit from participation in the Conservation Reserve Program (CRP). Although CRP acreage is selected on the basis of the environmental benefits it will provide, conversion of the cropland to permanent vegetative cover does affect crop production, crop prices, and farmers' incomes.

In the eighteenth CRP signup, which ended last December, USDA received 90,000 offers for a total of 7.1 million acres. County offices will soon be notifying producers of bid acceptances.

RISK MANAGEMENT

In his State of the Union address, the President reiterated his call for a bipartisan plan to create a strong safety net for farmers. That need is critical. We need policy tools that can provide needed support to farm incomes when natural disasters and market disasters strike, tools that farmers can rely on in a proactive approach to risk management.

The first step in building a stronger safety net is using $400 million from the 1999 emergency appropriation as a down payment on improving crop insurance. That $400 million will be used to reduce farmers' premiums by 30 percent this year, as an incentive to increase the use of buy-up coverage, and to help energize a broad-based crop insurance program that will be the anchor for the safety net.

In building on that base, we would like to work with Congress on some specific proposals, which include:

Increasing participation by making higher-level crop insurance coverage more affordable and effective for farmers; developing policies to cover multi-year as well as single-year losses; raising the floor for catastrophic coverage and the Noninsured

Crop Disaster Assistance program; expanding the range of crops that can be covered; authorizing a pilot revenue program for livestock as a first step to bringing the largest sector of American agriculture under the crop insurance umbrella; creating other new pilot options to see what works for farmers; working more creatively with private companies to develop risk management tools; and providing better information, education, and service to farmers.

While we believe crop insurance should be the centerpiece of the safety net, we need to look at a broad range of ways to help farmers manage risk. These ways should include allowing farmers to extend the due dates on market assistance loans to ease the pressure on cash flow. They should include incentives for establishing on-farm storage facilities to give farmers greater marketing flexibility.

In the next few months Secretary Glickman will hold three regional forums around the country; Deputy Secretary Rominger and I will hold others. We are inviting members of Congress to attend. We want to get input from all quarters, and to hear from farmers, ranchers, lenders, local officials—all who have a stake in agriculture—on how we can improve the safety net for producers. We want to hear directly from farmers and ranchers on what we need to do to make crop insurance a more attractive and viable vehicle in their risk management strategies.

Crop insurance has come a long way since the 1994 reforms were enacted. In 1998, the program provided nearly $28 billion in protection on more than 181 million acres through nearly 1.2 million policies. Hard-hit producers received $1.4 billion in indemnities. That performance stands in stark contrast to the situation just 5 years earlier, when only 83.7 million acres were insured through 700,000 policies providing $11.3 billion in liability.

Now, there are a number of new insurance programs with improved coverages, including five different types of revenue insurance protection, new crop programs, and dairy options. Last year, the Risk Management Agency (RMA) responded to the acute farm crisis gripping much of the Northern Plains with improved and expanded crop and revenue insurance for spring wheat and barley, corn and soybeans.

We intend to continue working on improving the crop insurance program. We will do everything possible to encourage program participation, to correct inequities in the structure of premium rates, yield guarantees, or other program provisions, to make the program user-friendly for companies and producers alike, and to facilitate new product development and other program innovations. We look forward to working with Congress on crop insurance reforms based on the principles of maximum participation, comprehensive coverage, use of market mechanisms, flexibility, and program delivery at the lowest possible cost to taxpayers and producers. Achieving these goals will provide a strong foundation for the reliable and effective safety net that producers need.

EXPORT PROGRAMS

Developments in overseas markets during the past year have certainly demonstrated that the health of the American farm economy is inextricably linked to the global economy. As markets in Asia, Latin America, Russia and elsewhere experienced financial turmoil and their imports of food and agricultural commodities were reduced, the impacts of those developments were felt throughout rural America. That is why the agricultural community worked so hard to ensure adequate funding for the International Monetary Fund, which is leading the international financial reform efforts.

We recognize that a healthy farm economy depends on strong export markets and USDA is using all of its available export tools to help American farmers and ranchers weather this economic crisis. Faced with the challenges posed by last year's market disruptions, we have expanded substantially the level of CCC export credit guarantees made available for export to markets in Asia, which otherwise would have been unable to obtain financing for their food and agricultural imports. As a result, sales registrations under the guarantee programs exceeded $4 billion in 1998, an increase of 40 percent above the previous year.

For fiscal 1999, we have announced the availability of $4.2 billion in export credit guarantees, compared with $3.9 billion announced at this time last year. This total does not include our anticipated $1 billion program for South Korea. We are continuing our negotiations with the South Korean government over the commodity mix to be included in the package.

In addition to these major undertakings, we also continue our export assistance efforts under other programs. For example, under the Dairy Export Incentive Program (DEIP), Secretary Glickman has authorized export bonuses up to the maximum volume and spending limits consistent with our World Trade Organization (WTO) obligations. From July through January, bonuses of nearly $80 million were

paid for exports of nearly 70,000 metric tons of U.S. nonfat dry milk, over 3,000 tons of whole milk powder, and 4,000 tons of cheese. Last May, Secretary Glickman reactivated the Export Enhancement Program (EEP) to announce a 20,210-ton allocation for frozen poultry to six Middle East countries to partly compensate U.S. poultry producers for markets lost in Europe. To date, 1,500 tons have been sold under this initiative. He also announced an EEP initiative for barley to Algeria, Cyprus, and Norway in response to the European Union's heavily subsidized sale of barley into the U.S. market. Before this initiative expired, USDA paid $1.2 million in bonuses for nearly 25,000 tons of U.S. barley exports. We continue to stress the importance of market development. In 1998, we allocated $90 million to 64 U.S. trade associations, state regional groups, and cooperatives for export promotion activities under the Market Access Program (MAP), and approved marketing plans for $33.5 million for 27 U.S. trade associations under the Foreign Market Development (FMD) program. In 1999, we have approved marketing plans of $33.5 million for 26 U.S. trade organizations under FMD. Just last month, we invited applications for our 1999 MAP and our fiscal 2000 FMD program. We are using a new means this year to reduce U.S. wheat surpluses while increasing our food aid to other nations—the President's Food Aid Initiative, announced in July. This initiative is being carried out under authority of the CCC Charter Act of 1933 to purchase surplus wheat from the domestic U.S. market. The wheat is subsequently being made available for donation overseas under the authority of Section 416(b) of the Agricultural Act of 1949.

By late October last year, we had fully allocated the 2.5 million metric tons of wheat and wheat products initially authorized. We doubled the size of the initiative in December, authorizing Section 416(b) donations totaling 5 million metric tons. Wheat donations under the Food Aid Initiative alone will now equal the total commodity tonnage that the United States will provide worldwide this year under all other food aid programs.

As of Jan. 30, 1999, allocations under the initiative totaled around 4.8 million tons of wheat and wheat products. Of the total, 3.3 million has been allocated for government-to-government donations, including Russia (1.5 million tons), Bangladesh (600,000 tons) and Pakistan (300,000 tons), with the remaining 900,000 tons going to 16 other countries. Another 1 million tons has been allocated for donations through the World Food Program, while 427,000 tons has been allocated for distribution by private voluntary organizations (PVO's).

Shipments have begun to some countries, and we continue to negotiate donation agreements with a number of recipient countries and PVO's. We expect that all 5 million tons will be shipped by the end of this calendar year.

We are also carrying out a major food aid effort in Russia. Along with the wheat that I mentioned earlier, our package for Russia includes 500,000 tons of corn, 300,000 tons of soybean meal, 208,000 tons of soybeans, 116,000 tons of rice, 120,000 tons of beef, 50,000 tons of pork, 50,000 tons of poultry, 39,000 tons of nonfat dry milk, and 15,000 tons of planting seeds. The U.S. and Russian governments have established an unprecedented monitoring program to ensure that aid reaches the targeted populations throughout Russia. USDA is devoting substantial resources to monitor the delivery and distribution of the food aid. Four additional USDA staff will be sent to Russia to aid in this effort. USDA also is requesting assistance from other U.S. government agencies to monitor the package and will, if necessary, consider sending additional staff.

TRADE NEGOTIATIONS

We must move forward with greater market reform in the next round of world trade talks, which begins late this year in Seattle. Although the Uruguay Round was a landmark agreement for agriculture—more was done to liberalize trade and bring agriculture into the GATT system than in all previous rounds combined—we have to recognize that agriculture still has a long way to go to complete its reform and be fully integrated into the world trading system.

Our goals for the upcoming WTO negotiations include: elimination of export subsidies; substantially cutting—and where possible eliminating—tariffs on farm products; tightening rules on domestic subsidies; reforming state trading enterprises; and tightening rules on technical barriers that unjustifiably restrict trade.

WTO accessions provide an excellent opportunity to address and resolve some trade problems. We will be working with China on its WTO accession.

In addition, we will continue to work to resolve the contentious bilateral trade issues that hinder our exports, such as the EU hormone ban, restrictive Canadian import policies for livestock and wheat, and unfair Chinese phytosanitary rules.

CONCLUSION

Mr. Chairman, that concludes my statement. I look forward to working with the Committee on the fiscal year 2000 budget so that together we can meet the needs of our nation's farmers and ranchers.

PREPARED STATEMENT OF PEARLIE S. REED, CHIEF, NATURAL RESOURCES CONSERVATION SERVICE

Mr. Chairman, thank you for the opportunity to appear before you today. For twenty-nine years I have served with the Soil Conservation Service and the Natural Resources Conservation Service. During the course of those years, I have had the opportunity to work with and meet many outstanding conservationists—people who care greatly for the land and for the farmers and ranchers that they serve. That is why I am here today. I want to represent the conservationists who go to work everyday to try and help our farms become more productive, to assist our communities be stronger and more sustainable, and to also protect and improve our land, water, and other valuable natural resources.

Our people in the field are what NRCS is all about. They are some of the most capable and dedicated employees you will find anywhere in the government. However, these employees need our assistance, if they are going to be successful at what they do. They need us to help them spend time out on farms and ranches with the farmers, rather than performing administrative tasks in the office. They need us to provide the technical and financial resources that they can use to help farmers; they need us to tell their story, so that folks here in Washington will understand our successes—but more importantly, what their needs are.

I want to begin with the topic of accountability. It is something that members of this Subcommittee have expressed very strongly to us. We got the message. As a result, during the course of fiscal year 1998 we put several new accountability measures in place. One aspect is the Total Cost and Accountability System (TCAS). It measures, on a daily basis, the number of hours that employees spend on various functions, including conservation planning, watershed work, or assistance in Farm Bill program implementation. A second aspect of our accountability system is the Performance and Results and Management System (PRMS). This system focuses on measuring the results of our work and capturing accomplishments. Although PRMS is just coming on-line, we believe it will be a useful tool in meeting the objectives of the Government Performance and Results Act (GPRA).

A third component is the Workload Analysis. At the state and field office levels, data were collected about the expertise of our employees in geographic areas of the country, how programs were utilized to achieve objectives, and what our future projected workload would be. The Workload Analysis aids NRCS strategic planning, in that we can set targets and match objectives to realistic resources and staffing. Initial results suggest that we need more help in the field to assist with program implementation and meet the needs of farmers. As Chief, I have taken many steps to minimize administrative tasks, and help conservationists spend time in the field. My "workload reduction team" has recommended and implemented many steps, such as eliminating unneeded forms and reports, that cost valuable staff time. For example, in Yolo County, California, commonly requested soil survey data is now available on the Internet and has reduced requests to the office; in New Mexico, many forms have been automated and streamlined, reducing staff workload; and in Texas, elimination of the Field Office Computing System (FOCS) has made more time available for field staff to meet with customers. We are pleased with the results of workload reduction, but regardless of the steps we take here in the leadership, we need sufficient resources to apply toward meeting the incoming workload.

We know the workload is great. For nearly 30 years, I have seen the people of NRCS eagerly and consistently go above and beyond the call of duty. We see every citizen who walks in an NRCS office as our customer. Some have criticized NRCS for this. I believe it is something to be proud of. NRCS staff are part of the communities they serve and the most impressive achievements of our agency, are where our field conservationist help people to help themselves. It is through the relationship that our field staff develop with individual farmers, or through the role they play in helping communities, that they have developed trust and a reputation for providing quality advice time and time again. Some call it "locally-led" or a "bottom-up" approach, but our work really comes down to "interactive assistance". NRCS staff interact with customers: we want to know what the farmer's objectives are; we gain an understanding for how the operation is run; and we work with them to apply conservation practices that will achieve their goals. We also strive to achieve national goals of clean water, erosion control, nutrient management, among many

others. We do all of this based upon sound science and utilization of the best technology available. It is an interactive process and it may take weeks, months or even years to put all of the pieces together and it is also very difficult to quantify.

Demands for NRCS' services continue to grow at an accelerating pace. In recent years, the need and demand for Conservation Technical Assistance (CTA) has increased as resource problems have been identified, including those associated with nonpoint source pollution, misapplication of fertilizers and pesticides, and land use changes. NRCS has responded by developing new technology and conservation standards to address emerging challenges such as nutrient management, wetland destruction, global climate change, the aging watershed infrastructure, and soil erosion. While this has increased public and local awareness of natural resource concerns, it has also broadened the agency's customer base to include a growing list of customers. We estimate that the operators of livestock operations will require over 350,000 nutrient management plans in the coming decade for the estimated 450,000 AFOs addressed by the Clean Water Action Plan. In addition, almost 11,000 small watershed dams constructed under the authority of Public Law 534, and Public Law 566 will reach the end of their design life in this coming decade. These watershed structures represent the safety, economic viability, and economic sustenance of thousands of communities. In defense terms, we often speak of "military readiness". What I would ask us all to do today, is think about the "readiness" of our conservation delivery system.

The people of NRCS have always given 100 percent of their abilities and will continue to do so. The 1985 Farm Bill asked them to concentrate more efforts on highly erodible lands, and they met that responsibility. The 1990 Farm Bill asked them to work harder for America's wetlands, and they also met that responsibility. The 1996 Farm Bill asked them to work harder for wildlife habitat, farmland protection, animal agriculture and a host of other activities. They are working hard to meet that responsibility, but they need our help.

I want to suggest, in closing, that the reason that so much is being asked of NRCS is that so much is being asked of our nation's farmers and ranchers. Everyday, they put their boots on and go out to bring us the lowest cost, safest, and most abundant food supply on this planet. At the same time, we ask them to be the caretakers of our water, guardians of our air, and the stewards of the soil. It is up to us to give them a hand.

PREPARED STATEMENT OF JAMES R. LYONS, UNDER SECRETARY FOR NATURAL RESOURCES AND ENVIRONMENT

Mr. Chairman, Members of the Committee. It is my pleasure to outline for you the fiscal year 2000 budget request for the Department of Agriculture's Natural Resources Conservation Service (NRCS). Over the past six years I have had the honor to appear before this Subcommittee during each appropriations cycle to present the budget for NRCS. In reviewing the budget requests for the agency in those years, it is quite startling to see how the agency has changed and emerged as a leader in Federal conservation activities. Through passage of the federal Agriculture Improvement and Reform Act of 1996 (1996 Farm Bill), and implementation of the Department of Agriculture Reorganization Act of 1994, NRCS has stepped up not only to advance the conservation mission of USDA, but also to become the central Federal agency for conservation on America's private lands.

Farmers, ranchers, and communities across the nation can turn to NRCS and receive assistance on a wide spectrum of conservation, encompassing nutrient and pesticide management, wetlands conservation, watershed planning, flood prevention, water quality improvement, development/maintenance of wildlife habitat, and, of course, soil conservation. To meet that demand, NRCS delivers a wide variety of financial and technical resources to its customers, through programs as diverse as the Wetlands Reserve Program, Wildlife Habitat Incentives Program, and the Farmland Protection Program.

But regardless of the programs that NRCS delivers and the responsibilities with which the agency has been entrusted, the core of NRCS has been and continues to be its people. It is the NRCS delivery system in the field that makes all of the work happen. It is the field conservationists who combine knowledge of the latest technology and science, with experience in farming and ranching operations to sensibly apply good conservation management practices. It is the field conservationists who have earned the trust of farmers and ranchers across the nation through that sound advice and assistance.

I want to take a moment to outline in more detail, how the NRCS field delivery system provides the conservation technical assistance necessary to meet the agency's mission.

NATURAL RESOURCES CONSERVATION SERVICE TECHNICAL ASSISTANCE

NRCS provides natural resources conservation assistance primarily on private lands. More than 70 percent of the land in the contiguous United States is privately owned, including virtually all of the Nation's agricultural lands. It is on the private lands where millions of individual decisions are made by farmers and ranchers, that the ultimate success of our natural resource efforts will be determined. NRCS is the only Federal agency whose major purpose is to provide conservation technical assistance to private landusers across the country. The agency's focus is on helping landowners and users achieve natural resource and environmental goals while maintaining productive and profitable operations and economically viable rural communities. NRCS has had significant success, and the field structure is designed to continue that success in the future. These are a few of its many assets:

People.—NRCS has a nationwide network of professional staff at the local level that provide conservation technical assistance to owners and users of privately-owned land. NRCS field staff areas of expertise cover a broad spectrum of natural resource issues. Over forty percent of the agency's science and technology occupations are engineers, over 25 percent are soil scientists, and nearly 10 percent are schooled in rangeland sciences. Other disciplines encompass biology, agronomy, cartography, physics, and forestry. NRCS field staff live and work in the areas that they serve, and have invaluable knowledge of the soil resources, watersheds, climate, and wildlife in the area. But even more importantly, our field staff know their customers. They interact with them everyday and understand the farming operations, agricultural trends, and resource constraints of the people they serve.

Technical skills.—NRCS natural resource specialists are trained to deliver technological support to groups and individuals quickly, efficiently, and consistently nationwide. Through a national framework, including science and technology consortiums as well as NRCS Institutes, field staff are trained to apply science-based assistance with a great degree of sensitivity to local conditions. NRCS field staff working in partnership with the local conservation districts are used as a primary source of help by local people—and often by people administering programs for other Federal, State, and local agencies.

Technical excellence.—NRCS specifications for soil and water conservation practices are considered invaluable throughout government and private industry. In addition, the agency is the leader in soil classification and soil mapping. NRCS soil surveys and GIS-based data are utilized daily not only by NRCS staff, but other Federal agencies, local governments, and academia. Soil surveys are used daily to make decisions as small as what type of plants to place in a backyard garden, to how best to engineer highways and bridges.

Natural resource planning experience.—NRCS has vast experience in broad-scale planning in watersheds and other areas and site-specific planning on farms and ranches to address natural resource concerns. Effective natural resource planning in the future will require this type of planning process to develop effective solutions that meet the needs for a sustainable land and its people. NRCS serves as a catalyst by providing coordination to bring local people together with skilled technical people to develop and implement meaningful solutions. These planning efforts are provided through the Watershed Survey and Planning Program, the Resource Conservation and Development (RC&D) Program, and Coordinated Resource planning provided through Conservation Operations.

Diversity.—I would like to underscore the contributions that NRCS is making toward ensuring equitable service and opportunity for all customers and employees of USDA. NRCS has had a good record of ensuring diversity and opportunity in the past, however, I believe we can do better. Throughout various program and technical assistance activities, NRCS will work hard to provide the necessary outreach and assistance to ensure that our customers have easy access to services. In response to the Civil Rights Action Team report, the Secretary has undertaken many steps to improve the Department's activities and policies in this area. I am confident that NRCS will continue to seek proactive ways to better serve minority and low-income customers. One of the hallmarks of the conservation assistance is that it is available to anyone, anywhere. That includes areas that are not typically designated as high workload areas based upon farm program participation, population, or other demographic factors. By offering basic and universal conservation assistance on a national basis, NRCS offers minority and limited resource farmers a needed helping

hand. A legacy of conservation on private lands must be built with the participation of everyone.

Partnerships and volunteerism.—Since its creation, NRCS has operated through voluntary cooperative arrangements with individuals, the private sector, and Federal, State, and local governments. The value of NRCS technical assistance is recognized by local and State partners; equally, we recognize the invaluable contribution of volunteers, who contribute immeasurably to conservation efforts. Americans have freely and generously given of their time to the volunteer arm of NRCS, known as the Earth Team. In fact, in fiscal year 1998 some 17,287 NRCS Earth Team volunteers donated 674,299 hours to conservation efforts. As calculated by the Points of Light Foundation, this equates to an additional $9,200,000 in direct assistance to private landowners for natural resource protection, an increase of nearly 11 percent from fiscal year 1997. The return on the investment for NRCS is enormous. We estimate that for every dollar spent on the Earth Team, we receive $48 dollars in service benefits.

Local people as decision-makers.—When NRCS provides conservation and program assistance, the agency works under mutual agreements with some 3,000 conservation districts that are established under state law. About 17,000 local conservation district supervisors provide the agency with invaluable guidance. The NRCS cooperative team structure is an established and practical example of how Federal programs can be managed with local guidance at the local level. It is crucial to remember that the agency's approach is a voluntary one. Our professionals provide options for problem-solving—developed in conjunction with customers, but it is the customers who make the final decisions.

Leverage.—State and local governments contribute substantially, with both people and dollars complementing NRCS technical assistance. Without NRCS technical assistance, which greatly enhances the value of State and local efforts, these funds almost certainly would not have been spent on natural resource protection. In a sense, this cooperation constitutes a two-way leveraging: State and local programs and NRCS benefit from each other's involvement.

We are asking a lot from our field delivery system. And as we look at how the agency has evolved to assist in so many areas of conservation, it has accomplished more despite decreasing numbers of employees nationwide. To a great degree, we have taken every step possible to ensure that reductions would not come at the expense of field services. As a result, the agency still maintains over 75 percent of its staff in the field. However, those staff are under increased demand for their time and expertise. Chief Pearlie Reed is working to minimize administrative functions, so that field staff can dedicate their time where it is needed most—on farms and ranches across the countryside. But as workload increases and our customers demand more services, we need to provide additional staff resources to help the agency meet that demand. Having said that, I will describe our programs and plans for fiscal year 2000.

The following table shows the major items in this year's budget request:

[In thousands of dollars]

	Fiscal year—		
	1998	1999	2000
Appropriation			
CONSERVATION OPERATIONS	633,231	641,243	680,679
WATERSHED SURVEYS AND PLANNING	11,190	10,368	11,732
WATERSHED AND FLOOD PREVENTION OPERATIONS	181,036	99,443	83,423
DEBT FOR NATURE	.....	.....	5,000
RESOURCE CONSERVATION & DEVELOPMENT	34,377	35,000	35,265
FARMLAND PROTECTION PROGRAM	.....	.....	50,000
CCC Funding			
WETLANDS RESERVE PROGRAM (WRP) [1]	193,597	127,870	207,065
WILDLIFE HABITAT INCENTIVES (WHIP)	30,000	20,000	10,000
ENVIRONMENTAL QUALITY INCENTIVES PROGRAM (EQIP)	200,000	174,000	300,000
FARMLAND PROTECTION PROGRAM (FPP)	18,000	.....	27,500

[1] Does not include technical assistance costs funded from unobligated WRP appropriation balances; fiscal year 1998—$18.7 million; fiscal year 1999—$4 million; fiscal year 2000—$2 million.

CONSERVATION OPERATIONS is the foundation for most of the agency's activitiesies. Conservation Operations represents a long-standing and historical partnership of interests all working in a concerted effort toward a sustainable and productive nation. The following programs and initiatives are funded through Conservation Operations:

CONSERVATION TECHNICAL ASSISTANCE is the cornerstone for most agency activities. The fiscal year 1998 appropriations were $541,361,000; and the fiscal year 1999 comparable appropriation is $547,905,000. The fiscal year 2000 budget request is $585,000,000 or a $37 million net increase.

The proposed funding levels represent support to the functions and activities that are vital to meeting the mission of conserving, improving, and sustaining our natural resources for the future. Conservationists on the ground are under increasing demand for their services, as they tackle new programmatic responsibilities while retaining a commitment to the community for providing basic assistance to landowners in need. It is our goal to ensure NRCS staff support to grassroots watershed partnerships and the development of conservation plans for communities. Throughout the nation, NRCS conservationists facilitate and enable local action. Technical assistance funding ensures the presence of these individuals and promotes voluntary conservation.

We have also responded to requests of this Subcommittee and others for additional data on our accomplishments and workload within Conservation Operations. I am pleased that NRCS has begun to implement accountability systems to capture the total cost of workload in various areas. Also, we are creating a sound system for measuring performance and quantifying the degree to which we are meeting our stated goals.

With respect to workload, one area of particular concern is the issue of water quality problems associated with animal feeding operations (AFO's). In September , 1998, as called for in the Administration's Clean Water Action Plan (CWAP), USDA and the Environmental Protection Agency (EPA) jointly released for public comment a draft AFO Strategy that establishes national performance expectations for all AFO owners and operators. The strategy presents a series of actions that USDA and EPA will take to minimize the water quality and public health impacts of the nearly 450,000 AFO's in the United States. Thousands of producers will likely request nutrient management assistance. In order to help them develop effective nutrient management plans that protect our Nation's water resource, the fiscal year 2000 budget proposes to increase the amount of conservation technical assistance available to AFO operations by $20 million.

Recognizing that NRCS can never fully meet this workload, the proposed funding level for Conservation Operations also represents a continued cooperative effort between NRCS and its conservation partners including Conservation Districts, Resource Conservation and Development Councils, and other non-profit and community action groups. The relationship between NRCS and its partners represents a catalyst that empowers local people to become involved in conservation activity. In addition, the funds that are appropriated by Congress are leveraged and matched by the hard work and resources of the thousands of partners and volunteers in virtually every aspect of NRCS operations. Additional support for the CWAP in the budget request includes $20 million for Competitive Partnership that will be used to strengthen the leadership of locally-based organizations such as conservation districts or watershed councils, to enable them to provide coordination of locally-initiated conservation efforts. Finally, a further increase of $3 million will be used by NRCS for additional monitoring to help target resources and document baseline conditions and performance.

Another area of increasing concern is the issue of Global Climate Change. As the Administration and Congress work toward international protocols concerning greenhouse gas emission, farmers and ranchers can play a key beneficial role. Preliminary research indicates that sound conservation practices, such as wetland protection, conservation tillage, conservation buffers, as well as planting biomass covers have the potential to dramatically reduce greenhouse gas levels. We want to learn more about this, and the proposed Conservation Technical Assistance increase includes $12 million for soil studies and inventories to provide accurate baseline soil carbon data and to assess the impacts of Federal programs on soil carbon stocks. Also, $3 million is proposed to fund demonstration and pilot projects to test various carbon sequestration and greenhouse gas mitigation strategies and monitoring mechanisms.

These increases are partially offset by a decrease of $31 million for a transfer of base funding to the proposed Support Services Bureau, which will centrally fund the administrative support services common to the county-based agencies. The fiscal year 2000 Budget requests $74 million for the Support Services Bureau's informa-

tion technology and Common Computing Environment functions. In fiscal year 1999, $31 million for similar activities was appropriated to NRCS. In addition, $16 million will be made available from CCC, and transfer authority is requested to merge the agencies' central administrative costs into this common account. Estimates of the amounts to be transferred from FSA, NRCS, and RD for administrative services are not yet available.

Some other activities that are encompassed by Conservation Technical Assistance Include the following:

Highly Erodible Land Conservation (HELC).—The 1996 Farm Bill provided amendments that have made HELC compliance requirements more farmer friendly and have provided USDA with additional options in assisting producers with compliance status, reduced the burden of complying with the HELC provisions and have provided USDA with additional tools to use in working with producers. However, all producers who receive USDA program benefits must fully apply a conservation plan or use an approved conservation system on highly erodible land. Therefore, NRCS continually assists producers in developing plans for land that they acquire and in making changes in their current plans so that their practices may reflect changes in cropping systems, weather conditions, new technology, and economic incentives. Our experience has shown that approximately 20 percent of producers will change their conservation systems each year.

Wetland determinations and certifications.—The 1996 Farm Bill changed Swampbuster to give farmers greater flexibility in complying with wetland conservation requirements by providing more options for mitigation and wetland conversions. NRCS determines areas subject to Swampbuster and responds to requests from farmers who plan activities that may adversely impact wetlands. NRCS certifies wetland determinations only upon request when clients propose a project to alter the hydrology within wetlands. Responding only on a request basis was provided for in the 1996 Farm Bill and ensures that requests from clients are serviced in a timely manner and that certifications are conducted where absolutely necessary. Certified determinations stay in effect as long as the land is used for agricultural purposes or until the owner or operator requests a review after natural events change the topography or hydrology of an area. Certified wetland determinations are conducted by NRCS on agricultural lands and non-agricultural lands for USDA program participants. Generally, these NRCS certified wetland determinations are also valid under Section 404 of the Clean Water Act. In fiscal year 1997 and fiscal year 1998, landowners requested about 40,000 certified wetland determinations annually and these requests are expected to increase.

Aside from wetland determinations, changes initiated by the 1996 Farm Bill have increased the activities of NRCS in wetland mitigation. NRCS provides assistance to landowners who wish to enhance functions of existing wetlands, restore former wetlands, and create new wetlands to replace wetland functions lost from planned conversions or alterations. These options, while creating increased opportunity and flexibility for landowners, require a great deal of work by NRCS field staff, who assess the functions of individual wetlands and provide the customer with technical assistance in every phase of the mitigation process. Other changes by the 1996 Farm Bill requires development of categorized minimal effect exemptions and also revises the concept of abandonment. When done under an approved conservation plan, landowners with farmed wetlands and farmed wetland pastures may allow an area to revert to wetland status and convert it back at a future date without violating Swampbuster. Thus far, interest and participation in these wetland activities has been widespread among landowners. While NRCS welcomes the opportunity to provide additional assistance to these landowners, these provisions have resulted in a marked workload increase for NRCS.

Grazing Land Conservation Initiative (GLCI).—This grassroots-driven initiative has helped NRCS better define the resource needs and benefits generated when grazing lands are improved. NRCS has been requested to continue technical assistance to livestock producers on private grazing lands. Grazing lands include rangelands, pasture, hayland, and grazed forestlands.

Natural Resources Inventory (NRI) analysis of range vegetation shows that over 15 percent of non-Federal rangelands are in poor condition; over 44 percent are in fair condition; 34 percent in good condition; and only 6 percent in excellent condition. The NRI indicates that 75 percent—nearly 299 million acres—of non-Federal rangelands need conservation treatment. Properly managed grazing land represents a renewable resource for producing food and fiber. Vegetative cover on well-managed grazing lands contributes to: (1) increased water quality and quantity; (2) improved wildlife habitat; (3) reduced soil erosion and sedimentation; and (4) improved riparian areas.

In fiscal year 1999, NRCS was able to continue support for a Grazing Land Conservation Coordinator position in each of the fifty states. This position helps us to provide multi-resource technical assistance to support grazing lands conservation and water quality improvement on rangelands and begin the process of rebuilding the agency's expertise in rangeland conservation, a capability demanded by our customers.

Urban Conservation.—Another area of attention has been the work of NRCS in urban and suburban conservation. Natural resources do not recognize the boundary between urban and rural areas and to ignore their interaction within a watershed would not do justice to either. The watershed approach to resource conservation has been widely acclaimed and highly successful. However, when we begin to examine and work to rehabilitate the health of a watershed we must include all contributing factors that may be present, including community and residential elements. The efforts of NRCS are aimed to improve water quality and protect our natural resources while maintaining and enhancing production. The demand for assistance with issues such as water quality and soil erosion prevention are matters that effect everyone, and workable solutions must include the participation of everyone. NRCS has had great success in utilizing the science and technology that it has gained in its 60 year history to all types of resources in many settings. Likewise, the expertise in soil and water quality that the agency has gained is well suited and easily applied to help communities realize their goals for ecosystem health. We will continue to work together as neighbors to achieve actual goals.

Snow survey and water supply forecasts provide western states and Alaska with vital information on summer water supplies. The fiscal year 1998 appropriation was $5,835,000, the fiscal year 1999 appropriation was $5,990,000; and the fiscal year 2000 request is $6,124,000. NRCS field staffs provide necessary leadership, standardization of procedures, and automation to a partnership of Federal, State, and local personnel to collect snow-pack data from more than 1,200 remote high mountain sites. After compiling and analyzing the data, NRCS is able to provide snowpack estimates and water yield on a monthly basis throughout the snow melting period. The knowledge gained through this effort supports critical decisions on billions of dollars of agricultural production, municipal water supply, hydroelectric and industrial water supply, flood control, and water flow requirements for fish and wildlife. This modest program contributes substantially to the economic and environmental well-being of a very large part of the country.

Soil Surveys provide the public with local information on the uses and capabilities of their soil resources. The fiscal year 1998 appropriation was $76,409,000; the fiscal year 1999 appropriation is $78,323,000; and the fiscal year 2000 request is $80,565,000. Soil surveys are based on scientific analysis and classification of soils and are used to determine land capabilities and conservation treatment needs. The published soil survey for a county or designated area includes maps and interpretations with explanatory information that is the foundation of resource policy, planning and decision-making for Federal, State, county, and local community programs. Homeowners and landowners also use soil survey information when making decisions. Soil surveys are conducted cooperatively with other Federal agencies, land grant universities, State agencies, and local units of government, many of whom contribute funds and staff.

Soils information has been gathered over many years and is primarily contained in published soil survey manuscripts and maps. There is a need for digital soils data for use in geographic information systems (GIS). NRCS has the leadership role for coordinating the development, maintenance, and distribution of a modernized digital soils data base. Geographically referenced digitized soil survey data, along with orthophotography will provide the accurate reference base needed for computer-assisted conservation, natural resource planning, and for geographic referenced data sharing. In addition, digitizing the soil surveys provides efficiency when updating and maintaining the soil survey data.

Plant Material Centers assemble and test plant propagation and the usefulness of plant species for biomass production, carbon sequestration, erosion reduction, wetland restoration, water quality improvement, stream bank and riparian area protection, coastal dune stabilization, and to meet other special conservation treatment needs. The Plant Materials Centers also focus on the important role of native species in ecosystem functions. The fiscal year 1998 appropriation was $8,825,000; the fiscal year 1999 appropriation is $9,025,000; and the fiscal year 2000 budget request is $9,238,000. Plant materials represent inexpensive, long-term conservation solutions to many environmental and natural resource problems and their maintenance costs are usually low. Many landowners and managers willingly use plant materials, if available, to meet their conservation needs.

The work at the 26 centers is carried out cooperatively with State and other Federal agencies, commercial businesses, and seed and nursery associations. Plant Materials Centers play an important research and development roles since most commercial nurseries will not develop new plant materials due to limited markets, but will grow and market the stock once a dependable plant has been developed. After species are proven, they are released to the private sector for commercial production.

Following are the other appropriated discretionary accounts in the NRCS Budget:

Watershed Surveys and Planning.—NRCS works with local sponsoring organizations to develop plans on watersheds dealing with water quality, flooding to develop plans on watersheds dealing with water quality, flooding, water and land management, and sedimentation problems. These plans then form the basis for installing needed works of improvement. The agency also works cooperatively with State and local governments to develop river basin surveys and floodplain management studies to help identify water and related land resource problems and evaluate sound solutions. For fiscal year 2000, this activity is proposed to be funded at $11.7 million.

WATERSHED AND FLOOD PREVENTION OPERATIONS is the first and only national program that helps local organizations plan and install watershed-based projects on private lands. It provides site-specific technical expertise and locally based watershed planning and financial assistance for plan implementation. The Watershed Program provides a process to solve local natural resource problems and avoid excessive regulation. fiscal year 1998 funding for Public Law 534 and Public Law 566 was $101,036,000; the fiscal year 1999 funding level is $99,443,000; and the fiscal year 2000 request is $83,423,000. The authorized purposes of watershed projects include watershed protection, flood prevention, water quality improvements, soil erosion reduction, irrigation water management, sedimentation control, fish and wildlife habitat enhancement, wetland creation and restoration, and public recreation. The program empowers local people as decision-makers, builds partnerships and requires local and State funding contributions and ownership.

The funding request for fiscal year 2000 also includes $1 million to educate the public about the condition of the aging infrastructure installed under our watershed programs. NRCS has assisted project sponsors to install over 15,000 individual measures since 1944. An integral part of many of these projects was structures for flood and water control, municipal and industrial water supply, and recreation. Since their installation, conditions surrounding the structures have changed due to an increase in population, residences built below the structures, upstream land use changes, and changed Federal and State dam safety regulations. By fiscal year 2000, approximately 2,000 of the aging structures could require significant restoration.

Debt for Nature.—The fiscal year 2000 budget includes $5 million as proposed legislation to help implement the Debt for Nature program. Debt for Nature provides technical and financial assistance to USDA borrowers with cash flow problems, who also have lands that require conservation treatment. In exchange for debt forgiveness on their lands, program participants agree to enroll environmentally sensitive lands into conservation easement. USDA's Civil Rights Action Team recommended that the program be implemented. The USDA farm loan program has a significant number of limited resource borrowers who have a high debt load and tight cash flow situation. The Debt for Nature program is a win-win, in that it offers direct financial assistance to borrowers, and also provides the public with protection of valuable natural resources. The program will work to mitigate the adverse economic implications of the ailing farm economy in many communities. The proposal will also directly facilitate the reduction of soil erosion, the implementation of the conservation buffer initiative, and the conservation of diminished and other important fish and wildlife habitat.

RESOURCE CONSERVATION AND DEVELOPMENT (RC&D) is a program initiated and directed at the local level by volunteers. The fiscal year 1998 appropriation was $34,377,000; the fiscal year 1999 appropriation is $35,000,000; and the fiscal year 1999 budget request is $35,265,000. This increase of $265,000 represent pay cost increases.

Each RC&D area encompasses multiple communities, various units of government, municipalities, and grassroots organizations. The RC&Ds represent a creative approach for helping citizens address multi-jurisdictional natural resource and community development issues. NRCS provides coordination to the program which serves as a catalyst for these civic oriented groups to share knowledge and resources, and it leverages public and private funds to solve common problems—including economic development—in a given area. Assistance is obtained from the private sector, corporations, foundations, and all levels of government. Historically,

every dollar of NRCS technical and financial assistance for this program and applied directly to local projects, has been matched by about $13 from other sources. By fostering local ownership and self sustenance for conservation and rural development projects, we believe that RC&D will contribute greatly to the legacy of locally-led action. The fiscal year 2000 request of $35,265,000 will allow NRCS to continue to support the 315 RC&D areas currently authorized.

COMMODITY CREDIT CORPORATION PROGRAMS

NRCS also administers, on behalf of the Commodity Credit Corporation (CCC), several cost-share programs, including those set forth in the 1996 Farm Bill and also provides technical assistance to individuals and groups participating in the Conservation Reserve Program, which is administered by the Farm Service Agency. The conservation programs provided by the 1996 Farm Bill, which NRCS administers on behalf of CCC, are the Environmental Quality Incentives Program (EQIP), the Farmland Protection Program (FPP), and Conservation Farm Option (CFO), and the Wetlands Reserve Program (WRP). In addition, NRCS administers the Wildlife Habitat Incentives Program (WHIP), which was funded by a transfer from CCC to NRCS. The 1996 Farm Bill also amended the Food Security Act of 1985, to the continued implementation of which NRCS administers on behalf of CCC.

The ENVIRONMENTAL QUALITY INCENTIVES PROGRAM (EQIP) provides in a single, voluntary program flexible technical, financial, and educational assistance to farmers and ranchers who face serious threats to soil, water, and related natural resources on agricultural land and other land, including grazing lands, wetlands, forest land, and wildlife habitat. Assistance is provided in a manner that maximizes environmental benefits per dollar expended, while assisting producers with issues such as local environmental laws or community identified environmental needs.

Funds of the CCC are used to fund the assistance provided under EQIP. For fiscal year 1999, $174 million was available to implement the EQIP. The program is primarily available in priority conservation areas throughout the Nation. The priority areas consist of watersheds, regions, or areas of special environmental sensitivity or having significant soil, water, or related natural resource concerns that have been recommended through a locally-led conservation process. For fiscal year 1998, nearly 75 percent of the EQIP financial assistance funding was provided within priority areas. Over 1,300 priority areas were approved by the State Conservationists and about 655 of these were funded. Funds are made available to the States based upon the quality of the priority area proposal, local initiatives, and the environmental needs of the affected areas.

The program has been very successful. We received nearly 55,000 applications in fiscal year 1998. After NRCS ranked the applications based on criteria developed at the local and state level, FSA county committees approved over 19,800 long-term contracts with farmers and ranchers. The EQIP financial assistance on these contracts will exceed $156 million.

The fiscal year 2000 proposal seeks an increase in EQIP funding to $300 million. Based on the fact that requests for assistance far exceed available funding, there is a need to continue to prioritize and focus our efforts so that we meet our Congressional mandate to maximize environmental benefits per dollar expended. We expect that in fiscal year 2000, continued interest in animal nutrient management and the release of the joint USDA/EPA AFO strategy will spur an increase in EQIP participation by owners and operators of animal feeding operations. The nutrient management focus of the program will help meet national objectives of water quality, while involving farmers and ranchers in voluntary and cooperative solutions.

The WILDLIFE HABITAT INCENTIVES PROGRAM (WHIP) provides for implementing wildlife habitat practices to develop upland wildlife habitat, wetland wildlife habitat, threatened and endangered species habitat and aquatic habitat. WHIP provides a significant opportunity to restore native habitat, help landowners understand how to best meet their own needs while supporting wildlife habitat development, and to develop new partnerships with State wildlife agencies, nongovernmental agencies and others.

WHIP is a solely voluntary program, whose projects encompass a wide array of wildlife practices. Projects performed under the program include advancing the following measures: upland wildlife habitat, wetland wildlife habitat, threatened and endangered species habitat, fishery habitat and other approved activities.

State NRCS offices have made an enormous effort to develop partnerships and outreach methods with government and private organizations to develop a program that targets specific state concerns. We estimate that approximately 1 million acres will be enrolled in the program in 1999, at a cost of $20 million. In order for WHIP to continue to be a successful national program, it needs to remain available for all

those interested in incorporating wildlife into the overall management of their farm or ranch operations. The fiscal year 2000 budget request includes legislation to authorize continued funding of WHIP at $10 million. $8.1 million would be for the implementation WHIP practices and $1.9 million for technical assistance, certification, and status reviews on enrolled acres. Funds for technical assistance are critical for the continued implementation of program activities.

The FARMLAND PROTECTION PROGRAM (FPP) protects prime or unique farmland, lands of State or local importance, and other productive soils from conversion to nonagricultural uses. It provides matching funds to leverage funds from States, Tribes, or local government entities that have farmland protection programs. The FPP establishes partnerships with State, Tribes, and local government entities to acquire conservation easements or other interests in land. It protects strategic farmland from urbanization. It ensures that the valuable farmlands are preserved for future generations and also helps maintain a healthy environment and sustainable rural economy. The program was originally funded in the 1996 Farm Bill at a level of $35 million. To date, those funds have been exhausted, and local interest in the program has been overwhelming. In the State of Union Address, the President referenced the issue of urban sprawl and the troubling trend of conversion of agricultural lands for development. The fiscal year 2000 budget proposes a total of $77.5 million for the Farmland Protection Program in two components: $50 million in new discretionary funding from the land and Water Conservation Fund to support the President's Lands Legacy Initiative and $27.5 million in CCC funding under proposed legislation.

WETLANDS RESERVE PROGRAM (WRP) is a voluntary incentive program to assist owners of eligible lands to restore and protect wetlands and necessary adjacent upland areas. WRP preserves, protects, and restores valuable wetlands mainly on marginal agricultural lands where historic wetlands functions and values have been either totally depleted or substantially diminished. Wetland restoration of such marginal lands provides landowners with a financial alternative to continued attempts to produce agricultural products on such high risk lands. Program delivery is designated to maximize wetland wildlife benefits, to provide for water quality and flood storage benefits, and to provide for general aesthetic and open space needs. Approximately 70 percent the WRP project sites are within areas that are frequently subjected to flooding and the flood storage being provided will lessen the severity of future flood events. The WRP is making a substantial contribution to the restoration of the nation's migratory bird habitats, especially for waterfowl.

Cumulative acreage enrollment through fiscal year 1999 is expected to reach 775,000 acres. For fiscal year 2000 we propose to enroll almost 200,000 acres and essentially reach the 975,000 acre legislated cap for the program. Technical assistance funding needed for the larger enrollment effort in fiscal year 2000 will be $18,300,000.

From inception of the program in 1992 through 1998, interest in WRP has been exceptional, providing approximately 665,447 acres enrolled in the program through the end of fiscal year 1998, and enabling the achievement of the long-standing goal to reach the presently authorized acreage cap of 975,000 acres by the end of fiscal year 2000. Historically, there have been more than five fold as many acres offered than the program could enroll. Beginning with the fiscal year 1998 sign-up, landowners are provided with the continuous opportunity to seek enrollment in the program. States periodically rank all unfunded offers and seek allocation of funding for the highest ranked offers. By following this process, the maximum opportunity for landowner participation is provided and the WRP is assured of having the best possible list of ranked offers available for funding during the year.

In response to the 1996 Farm Bill, the enrollment is separated into three components (i.e., permanent easements, 30-year easements, and cost-share agreements). Pursuant to the 1999 Appropriations Act, enrollment is now being balanced to respond to the level of landowner interest in each of these three components. The authorized level of enrollment for 1999 is 120,000 acres. Thus far approximately 22,000 acres have been enrolled. The level of landowner interest in the three components is presently 77 percent permanent easement, 18 percent 30-year easement, and 5 percent cost-share agreement. While we project that the backlog of unfunded acreage being offered in fiscal year 1999 will be 7 times greater than the actual acres enrolled in 1999.

Under the continuous sign-up process the backlog list for each of the program components will continue to be updated. Once the fiscal year 1999 enrollment process is completed, these lists will be available for immediate use in selection of the 2000 enrollment.

CONCLUSION

NRCS offers landowners a great deal of options and can provide programs and resources that are tailored to an individual customers needs. And the assistance is interactive. We expect to gain a full understanding of the needs and goals of our customers and provide planning and programs that a farmer and rancher can realistically implement. This is what has made NRCS an attractive vehicle for offering so many different kinds of assistance. It is also why when we look toward emerging issues such as nutrient management and greenhouse gasses, that NRCS is an obvious choice to lead the way. However, these policy and financial commitments become moot unless the Department of Agriculture and NRCS, its lead conservation agency, have sufficient resources to deliver the technical assistance that farmers and ranchers time and again say they need to take advantage of the conservation opportunities now confronting them. Our partners in State and local governments and the private sector, responding to widespread public support for environmental protection efforts, have increased their financial commitments to conservation on private land in recent years. At the same time, they look to the Federal government for a continuing commitment to technical assistance for private land and private landowners, not the diminishing commitment in real dollars that has been the trend over the past two decades. It is this technical assistance that, when coupled with the contributions of our many public and private-sector partners, will allow us to realize the full promise of the 1996 farm bill and to look beyond. Given the needed resources in this appropriation request, we can support the field conservationists of NRCS to make it happen.

That concludes my statement. I am looking forward to working with you in the months ahead to review the proposal and work together to maximize service to our customers and help them be good stewards of the land. I will take any questions that members of the committee might have.

TIMING OF DISASTER PAYMENTS

Senator COCHRAN. Thank you very much, Mr. Schumacher.

One concern that we have is that it has taken so long to get these payments that have been authorized and funded in this disaster assistance package to the farmers. We were hopeful that this could be handled with a little more dispatch than it has been.

You mentioned in your statement postponing the signup date until some time in April. It seems that, when we passed that emergency assistance, we were promising funds would be available, and you did, as you said, send out some of the money. Where people were already on the rolls and already on the list in the computers, those checks got sent out quickly. We appreciate that and commend you for that.

But the other part of the program has not really produced any money for farmers or any disaster assistance. It was called an emergency program and we are getting asked: where is the money and where is the assistance?

I know you had to design new software and you had other problems. And these offices have worked very hard. I agree with you here. The people out in the field are doing all that they can. But it seems that there is not enough emphasis on this program from the Washington level.

What can we expect in terms of getting the funds under this program into the hands of farmers in view of the very serious economic situation in which they find themselves this year?

Mr. SCHUMACHER. Thank you, again, for your comment.

If I may just take a minute or two on this, this is very, very important. A lot of farmers are interested in when they are going to get their checks, and what else they have to do to qualify for the different categories of disaster assistance. If you would bear with me for a minute or two, I would like to walk through it a bit.

When the bill was signed in November, as you said, the computers worked very well, and we were able to issue the first round of payments very quickly. There were no glitches, checks went out, and people were actually commenting and asking how we got those out so fast. It was terrific.

However, when we started the second phase of assistance, complications began to set in. First, we had a number of, shall we say, inquiries from both Senate and House members, asking for some changes. There was an interesting dialogue for a few weeks with members of Congress.

We did make a few adjustments. Some of them we could not make, but some we did make, and that delayed it for a few weeks.

Then we hit the California freeze. That hit us hard, and we looked at making some further program adjustments because of that. We have to work very hard on that.

So if we look at what is going well, we have $400 million insurance, buy-up for the buy-down, clear and that is moving reasonably well.

I think the dairy assistance program will work well. We have that moving quite quickly. We are helping dairy farmers and I think that will go fairly well.

I think the multi-year crop loss disaster assistance program is going reasonably well. We need to sort out a key issue of entities, and if you have further questions, I can ask Ken Ackerman to address that. But that, by and large, is going fairly smoothly once we have the entity issue sorted out. It was certainly raised by other Members of the Senate.

The Livestock Assistance Program has sort of overwhelmed us with the number of applications. We only have $200 million, which we will have to prorate. We extended the signup to March 25. Payment will go forward, as I said, in April.

The biggest challenge right now is the single-year crop loss disaster assistance program, Mr. Chairman. We had some computer compatibility problems, which should be resolved this week. The program has been extended to April 9. Once we have the computers fixed, we will get that done.

I think it is very important that we get our software in order because this will help farmers when we actually get down to the final paperwork. This is because if we get the computers set up right, which we think we can get done fairly quickly, producers will not have to reconstruct their 1998 records. This is very important. And they will not have to come into the offices with a reconstruction of their prior year records either. If we can take the time now to get it right, then we will get those payments out in late spring.

We have done a lot of work. We have more work to do, and we promise we will be getting that assistance out.

We have taken one additional measure. I am very pleased that Carolyn Cooksie is here; she is our Deputy Administrator for Farm Loan Programs, under Keith Kelly. With the supplemental coming down there is tremendous workload on farm credit by her group. What we are going to do is let farmers do some income assignments, using an estimate of what the farmers are likely to get in crop loss and livestock feed assistance payments. I think it will be

helpful for farmers to have those amounts reflected in their cash flow when they come in to see loan officers at the local level.

So we are trying to be flexible and timely. It is complicated. But I think, by and large, we are working it through and we will get those payments out fairly soon.

LIVESTOCK ASSISTANCE PROGRAM

Senator COCHRAN. With respect to the Livestock Assistance Program, is there any date that you can give us that we can pass on to our farmers and let them know when they may expect to actually receive payments?

Mr. SCHUMACHER. Parks, do you want to comment on that?

Mr. SHACKELFORD. Early April.

Mr. SCHUMACHER. In early April.

Senator COCHRAN. We know that you cannot make a final decision on how much money an individual farmer gets until the signup has been complete. Isn't that correct?

Mr. SCHUMACHER. Yes, we have to factor that.

Senator COCHRAN. Because it is all prorated.

Mr. SCHUMACHER. Right.

Senator COCHRAN. So can you estimate at this point, based on the applications you have received, how much money this is going to mean to individual farmers? Can you give us an estimate of that?

Mr. SCHUMACHER. Keith mentioned that it is 25 percent to 30 percent on the Livestock Assistance Program.

Senator COCHRAN. For the Livestock Assistance Program, yes?

Mr. SCHUMACHER. Yes. It's 25 percent to 30 percent. The factor will take it down because the demand has been so high.

Senator COCHRAN. Considering the demand and how high it has been, is the Department considering asking for any additional funds for this program?

Mr. SCHUMACHER. Our supplemental that we sent up does not include this. We want to get the available funds out as quickly as possible, and we have not formally considered an additional request for this within the Administration.

COTTON PROGRAM

Senator COCHRAN. Mr. Collins, you mentioned the export situation and a lot of the prices that are affected by that, the breakdown in some of these markets. In the cotton program, you talked about the Step 2 program and that you were out of money.

Is it not a fact that the Administration requested a cut in funding for this program last year and that you have requested no money for the program this year?

Mr. COLLINS. That is a fact, Mr. Chairman.

Senator COCHRAN. Why haven't you?

Mr. COLLINS. I think it was simply a question of budget priorities. It was a question of looking at the various needs that we had within our mandatory spending. We simply decided that the cotton Step 2 program was not among the top priority items.

That does not acknowledge that there is not an effect by not having a Step 2 program. I think we have seen one this year.

USE OF EXPORT PROGRAM AUTHORITIES

Senator COCHRAN. We hope that the Administration will be more aggressive also in these export enhancement programs. We noticed that the EEP Program and the Dairy Export Enhancement Program, and other programs may not be as aggressively utilized by the Department given the downturn in our sales in overseas markets as they should have been.

Tell us how the Department has utilized these existing authorities. Some of this does not depend upon funding that this Committee provides. You have CCC authority that you can use. But there does not seem to be any aggressive work going on in this area.

Am I wrong? If I am, tell me how I am wrong about that.

Mr. SCHUMACHER. You know, the Australian Prime Minister called me an "avaricious looter" for some of our aggressive use of our GSM. I was quite surprised at that, Mr. Chairman. I don't normally get those kinds of comments. Particularly, I think we have been very, very aggressive in terms of the utilization of our CCC authorities on food aid to Russia and to other countries associated with the President's food aid initiative announced last July.

On the Dairy Export Incentive Program, I think we are at the right level, and we have rolled up some unused balances from prior years to even more aggressively use the program. We have certainly heard from some of our competitors as they felt we went beyond our authorities. But we felt that that was the right thing to do and think that it has been very effective and the program has been fully utilized.

On the Export Enhancement Program itself, as you recall, when the EU tried to subsidize barley into this country, we took very, very aggressive steps and used our EEP authorities. But, overall on EEP, we have not used it in the last couple of years because we felt that the utilization of the other authorities of the CCC would give us a more targeted response, especially on wheat.

Senator COCHRAN. Senator Kohl.

DAIRY ASSISTANCE PROGRAM

Senator KOHL. Thank you, Senator Cochran.

With respect to the $200 million in assistance to dairy producers, do you have a target date for the distribution of that money?

Mr. SCHUMACHER. Yes. We would like to get that out in early April, if we can. It's sometime in April.

Senator KOHL. The money is to be distributed in early April?

Mr. SCHUMACHER. If we can make that target.

We have pretty well completed all of our analysis and a number of proposals have been made. We are examining that program at the highest levels in the USDA at the moment, and we hope to have an announcement fairly shortly, Senator.

We are going to keep the program as simple as possible. So dairy farmers will get their payments in the spring flush.

Senator KOHL. Can you give us some indication with respect to the general principles that you will use in your decisions as to how to distribute that money? I am talking about will it be on the basis of trying to help small family farmers? Or will it be on the basis

of number of units, like factory farms, things of that sort? Give us some indication of where you are.

Mr. SCHUMACHER. Well, the proposals we are putting forward are not quite formally at the Secretary's level at the moment, but they are very, very near to getting there. But, certainly, we would be tilting toward helping family operators.

Senator KOHL. OK.

I would like to ask you with respect to the ongoing efforts at USDA to reform U.S. dairy policy, to what extent does current dairy policy still serve to avoid disruptions of supplies of fluid milk to consumers? And, have not changes in technology and transportation vastly reduced or even eliminated those kinds of problems?

Mr. SCHUMACHER. Keith or Mike Dunn, would you respond?

DAIRY POLICY

Mr. COLLINS. I will respond.

I think that certainly the current dairy policy—and by that you are referring to Federal milk marketing orders, I believe, which have the purpose of ensuring adequate fluid supplies to fluid users. I think the question is are they still as relevant today as they were when they were conceived in the 1930's.

I think economists have looked at this question in a lot of detail and have come to the conclusion that there still is a purpose to be served in ensuring a stable, adequate, high quality supply of milk to fluid users. I think that is one of the reasons why Congress did not eliminate the Federal Milk Marketing Order Program in 1996.

Nevertheless, I think that the 1996 Farm Bill suggested that the whole program needed to be looked at. The changes in technology and transportation that you are talking about, the ability to truck milk 1,000 miles with almost no loss in temperature of the milk, and quality of the milk mean that we had to go back and take a very hard look at the incentives that are in the program to ship milk from one region to another.

That has been the whole purpose behind the work we have done in Federal milk marketing order reform.

So I think the answer is that there is probably a general consensus that many of the provisions of orders still have a usefulness, but that the levels at which they are set may not be appropriate.

Senator KOHL. All right. In connection with that, how can dairy policy be shaped in order to eliminate or reduce undue harm to any one region of the country? What is USDA doing to help establish a policy that can benefit all dairy producers?

Mr. COLLINS. This is the essence of Federal marketing order reform.

We did propose a rule last year. We took 4,000 or so comments on that rule. We are in the process of issuing a final rule.

I can only say that I can guarantee you, Senator Kohl, that the final rule will be issued within the next 4 to 5 weeks because the statutory deadline is April 4.

So we will have a final rule, and I hope you will see in that final rule that we have addressed some of your concerns, that we have tried to design a dairy policy that more reflects the technology change in the marketplace and that does impart a sense of equity

across the Nation. But it will be up to you to make that judgment when you see it.

IMPACT OF TRADE AGREEMENTS ON DAIRY PRICES

Senator KOHL. Thank you.

Secretary Schumacher, you mentioned in your statement the efforts you are making to promote dairy exports through the Dairy Export Incentive Program. In terms of trade, we need also to consider the effect of imports on dairy producers.

What effect are dairy imports having on domestic prices? And, in particular, what has been the impact of NAFTA, GATT, and the WTO on domestic prices?

Mr. SCHUMACHER. The dairy imports are under tight quotas. We have not seen much impact on dairy imports—some on the high value cheeses. But I notice that we are getting much more competitive on some of the specialty cheeses and high value cheeses in different parts of the country.

With respect to NAFTA, we have done very well in Canada and Mexico. Exports continue to rise, nearly $13 billion between our two NAFTA partners. It has been a real success. But on dairy and poultry in Canada, we have not done well under the existing NAFTA and Canadian Free Trade Authorities.

We lost the dairy case with Canada. Certainly in the next round we are going to take that up again because there is a wonderful market in Canada with their supply management system. Canada theoretically is supposed to be free trading under NAFTA. But on dairy and poultry, we do not really have as much access as we really need to have to that market.

We will be taking that up aggressively—and they are well aware of that—in the next round of the WTO starting in Seattle in November.

OPPORTUNITIES AND OBSTACLES TO DAIRY EXPORTS

Senator KOHL. In addition to the Dairy Export Incentive Program, what opportunities do we have to support dairy exports and what specific obstacles do you see?

Mr. SCHUMACHER. Chris, would you join us on that?

Chris is running the Dairy Export Incentive Program.

I think we have had some success, especially, for example, on some of the powders in Mexico where there is a strong demand. They are privatizing further down there. We have had a number of inquiries even yesterday for additional powder. So I think there is pretty good demand for that.

Our biggest problem, Senator, to be quite frank, is the European Union. Their inability to eliminate export subsidies on dairy is really hurting us very badly. That, again, is something we are going to be very aggressive on in the next round. We need a level playing field with those tremendous subsidies they have on the export side. It is killing us in the long term. There is no question about that.

Chris, did you want to amplify on that?

Mr. GOLDTHWAIT. I would make two points.

Senator COCHRAN. Would you identify yourself for the record, please?

Mr. GOLDTHWAIT. I'm Chris Goldthwait, the General Sales Manager at the Department.

I would add two points to what the Under Secretary has said. First of all, we are already competitive in world markets with respect to some specialty dairy products—for example, whey powder and ice cream.

I think the second important thing is that, as the Under Secretary said, our dairy industry is beginning to look forward to the aftermath of the next trade round, at which point we hope we will have eliminated the European export subsidies.

We foresee that we are going to be competitive in a much broader range of dairy products in the absence of the distortions caused by the EU export subsidies. And we are already positioning ourselves through the use of the DEIP Program for that situation where, for example, just in the past few months we have introduced a special use of the program for specialty cheeses where we think, once the cheeses are introduced to foreign buyers, they will demand a premium over the generic market cheeses.

Mr. SCHUMACHER. If I may, Senator, I just want to clarify one important issue.

In the original poultry and dairy situation we did not do well. But we did recently win a WTO case in Canada, and I am very pleased about that. I mean how can we export when they have a 300 percent tariff against us?

We did win that one.

Senator KOHL. Okay.

There are many small farm operations, as you know, that are finding it increasingly difficult to compete in an environment of large corporate interests. For a number of reasons, the small operator is finding it more and more difficult to balance rising production costs with shrinking leverage in the marketplace.

To what extent is the current downturn in prices especially harmful to small operators?

Mr. SCHUMACHER. I think this is one of the most difficult issues we are facing. The operators, for example, in Minnesota and Wisconsin—Mike, you may want to join us on this one—for them I think the average is going to be very difficult. It is buffeted, to some extent, by low feed prices and a drop in interest rates.

But certainly, as the dairy prices go down, it will probably be unduly hurtful to family operators with 50, 70, 80 cows.

Senator KOHL. Is this a cyclical thing or is there something more deep operating in the marketplace that makes these small operators more and more likely to go out of business permanently?

Mr. SCHUMACHER. I have been for many years working with small dairy farmers in different parts of the country. As we see some of the big dairy feedlot operations expanding in the Southwest and in the West, and in some cases in the Rocky Mountain Foothills, they have certain advantages of water, three times a day milking, and lower costs in the Southwest because of the better climate. It has made them a little bit more competitive on these large operations. There are also cheaper labor costs.

So it is going to be a difficult time, I think, with lower dairy prices in the next couple of years for smaller operators in the North-Central and the Northeastern part of the United States.

We are even hearing from the Southeast extensively. A number of commissioners are constantly calling me to assist on dairy as well.

Mike, do you want to add to this?

Mike has been our lead on dairy. Maybe he could make a comment. This is Michael Dunn.

Senator COCHRAN. Mr. Dunn, would you state for the record your title.

Mr. DUNN. I am Michael Dunn, Under Secretary for Marketing and Regulatory Programs.

Certainly, we are concerned about all small farmers. Senator Kohl, if you are addressing specifically dairy producers, last year the basic formula price averaged a little over $14. That was an outstanding year. In March, when the BFP did drop down to $10.88, we had some hearings on whether or not we should establish a base price, a floor price. Most folks indicated that that should be about $13.50.

So at $14 BFP last year, we had a very, very good year.

As Mr. Collins has indicated, unfortunately, we may not see that this coming year. So that will, I believe, force us to do a lot more innovative things than we have in the past.

Senator KOHL. What do you expect will be the price of feed this year on average?

Mr. COLLINS. As I indicated in my opening statement, I thought it might be very close to the 1997 level, which was a little over $12 per cwt. It was $12.05 in 1997, which was a year of great financial stress for dairy producers.

This past year, as Mr. Dunn said, it was $14.20.

All along over the last few months, I have been thinking it might be about midway between the two years. But if you have seen what has happened in milk markets over the last couple of weeks, notably a 1-day drop in the BFP futures of over 60 cents this week, I am now thinking it is probably going to be much closer to the $12.05 than to the $14.20—maybe between $12.00 and $12.50, probably.

Senator KOHL. Thank you.

Thank you, Mr. Chairman.

Senator COCHRAN. Senator Durbin.

AGRICULTURAL TRADE

Senator DURBIN. Thank you very much, Mr. Chairman.

I thank the witnesses for joining us today.

Could I ask some general questions on trade, Mr. Collins? Perhaps others could help?

We have been told that our trade deficit continues to rise in this country at alarming rates. Usually, we have had a positive trade surplus in the agricultural accounts. Is that still a fact?

Mr. COLLINS. It is still a fact, although this year will be the lowest in over 10 years.

Senator DURBIN. On the agriculture account?

Mr. COLLINS. On the agriculture account. It will be about an $11 billion surplus. A couple of years ago, it was as much as $27 billion or $28 billion.

Senator DURBIN. So are we continuing to import more food or are exports going down? Or both?

Mr. COLLINS. Both.

Senator DURBIN. Both at the time?

Mr. SCHUMACHER. I think exports, Senator, have gone down like $10 billion. Imports just chug along at about $1 billion extra. So it is a gradual rise in our imports and a sharp, relatively sharp, drop in our exports, although I think we are still well ahead of where we were on exports in the first 3 years of this decade.

EXPORT TACTICS

Senator DURBIN. Secretary Schumacher, you also mentioned that we have come into some controversy about tactics in terms of encouraging export products. Could you be more specific?

Mr. SCHUMACHER. Yes.

Tim Galvin, Chris Goldthwait, and the fine folks we have in the Foreign Agricultural Service have done an absolutely spectacular job in the overseas area.

For one, we have doubled the GSM program credits, as I mentioned in my testimony earlier, especially in Asia.

We have also had major increases in our food aid donations in terms not only of existing programs, but we have put 8 million tons additional into the pipeline. That is now moving forward. Most of that will be shipped this year.

In terms of meat volume—if we look back 10 or 12 years—the really major change that has occurred is the extraordinary performance of our poultry exports until the Russian problem hit. We now have a net value surplus on beef. And our pork continues to do very, very well on a volume basis.

So on volume, we are doing quite well on the red meats and certainly were doing superbly on the poultry until the Russian thing hit. But when it did hit, we then put 50,000 tons of poultry on donation, and then 200,000 tons or so on P.L. 480, Title I. We heard some criticism from some of our trading partners.

But I think it is legal. We are well within our WTO obligations, unlike the Europeans, who are bumping up against them.

So we continue to be very aggressive in the use of those programs and will be very active in the WTO, whether it is on cherries, or apples from the West, or other issues that we are dealing with—for example, the long-standing problem we have had on beef hormones. That is coming to a head on May 13 and we are working hard on that as well.

So we have been very aggressive and we certainly have been criticized by some of our trading partners for that. But so be it.

NAFTA TRADE INCREASES

Senator DURBIN. I note from testimony here that it appears that the bottom has dropped out of the Pacific Basin demand for U.S. exports. I think there is some indication that the NAFTA trade, though, has increased. Is that what your testimony has indicated?

Mr. SCHUMACHER. That is correct, Senator. We are doing actually quite well with our Mexican partners and are holding our own in Canada. But what is interesting is Japan. They continue to be our single largest trading partner but trade has dropped off $3 billion

or $4 billion, mostly in value, because of their recession. That has certainly had an impact since they are unwilling to open up some of their markets not only to ourselves but to their neighbors. That has exacerbated the recession in Malaysia, Thailand, and other big markets where trade has fallen off as well.

So the bulk of that drop has been in Asia. We are holding steady in South America. The whole Western Hemisphere is $18 billion and is holding pretty steady. We continue to do reasonably well in Europe with a two-way trade of about $18 billion.

In Russia, we were not selling a great deal, except for poultry. I think that is why the work of Tim and Chris on poultry will be helpful.

CROP INSURANCE

Senator DURBIN. If I could switch to another topic, I have to leave very briefly. I wanted to talk about the risk management aspect of this.

I have supported disaster assistance. There have been times when I have needed it in my home State and other States have needed it. I have tried to be sensitive to their needs.

We have said for a long time, though, that we are going to try to encourage producers to buy crop insurance, to provide for themselves, and that there would be some penalty attached to it if they did not. We have had a variety of different approaches in this area in the past, suggesting that if you did not buy the crop insurance, you would not be eligible for disaster assistance.

I listened to your testimony and it suggested that we are still having a very difficult time convincing producers to buy crop insurance. I don't know if that is a fair characterization of what you said.

Mr. SCHUMACHER. I think what we have tried to do is this. The Congress delinked the program payments from crop insurance so that it was not mandatory so there was some drop-off. But I think what we try to do now with this disaster is to roll forward the $400 million so that we make crop insurance more affordable this coming year, as I indicated, to buy down the buy-up coverage. I think that has been popular.

We are also widening very much the crop insurance, for example, our whole farm adjusted gross revenue in pilot programs. And, as indicated, we have 4, 5, or 6 major initiatives in our white paper, and we will be expanding on those in hearings coming up in the next 10 days.

Senator DURBIN. I want to take a closer look at that. A few years ago we got into it and discussed the fact that we were selling crop insurance in areas where God had instructed us not to.

We had had crop failures 70 percent of the time, but we still sold the insurance policy as if maybe next year it will come around. I would like to get an update on that, perhaps, and see how we are doing in that regard.

Thank you very much for your testimony.

Senator COCHRAN. Next is the distinguished Senator from North Dakota.

Senator DORGAN. Mr. Chairman, thank you very much.

Let me thank the representatives of the Department of Agriculture. We have put you through some difficult times with the disaster program that we developed last fall. We also thank the Chairman of the Subcommittee who was instrumental in the Senate in helping move that, and the Ranking Member as well.

What we have provided for you is a very substantial task. Your agency does a lot of good work under difficult circumstances, and I appreciate that.

Having said that, let me just tell you that, as I look through the budget here, I am reminded that the Department of Agriculture was initiated under President Abraham Lincoln with 12 employees. We have come a long way since Abe Lincoln created the Department of Agriculture. But, as I read your statement, Mr. Collins—and you are an economist, right?

Mr. COLLINS. Yes, sir.

Senator DORGAN. I taught economics for a couple of years. I always say that I was able to overcome that. But it is an interesting field. [Laughter.]

Your testimony was really very interesting to me. But my central thesis is I don't really think we need a Department of Agriculture at all—we can move all of the other functions elsewhere in government—unless the central goal is to maintain a network of family producers, and family farmers in our country.

If that is not the goal, in my judgment we should just abolish USDA and move some of these other things around to another agency.

But if our central goal is to maintain a network of family farm producers in our country, then the question, as I look through your statement and others, is how are we going to do that? The price of wheat in North Dakota this week is about $2.60 or $2.70 a bushel.

Price adjusted, those are Depression Era prices. That goes back to the Great Depression.

Your statement, Mr. Collins, indicates that that probably will not improve in the coming year. And if that is the case, I want to ask a series of questions.

Congress has said under the current farm program that we want farmers to operate in the free market and we are going to create a decreasing level of support in our farm program. So we are now in a sliding scale of downward support prices at a time when we have wheat prices equivalent, in price adjusted terms, to those of the Great Depression.

Last fall we did something to try to help people get into this spring. But the fact is it does not make anybody whole.

If we do nothing, are we not going to lose a massive quantity of family farmers? I mean, you did not have a lot of discussion in your presentation about family farming. Your discussion was about aggregate numbers with respect to income and so on.

NUMBER OF FARMERS

Are we not, under the current scheme of the farm program of declining price supports, at a time when we have seen a collapse of commodity prices and no expectations from you that they are going to improve? Are we not going to see a wholesale reduction in the number of farmers out in this country?

Mr. COLLINS. I think we will certainly see a decrease. Surprisingly, if you look at farm numbers, they have been quite stable over the last 5 years, at around 2.2 million farms. That is our revised estimate based on the census of agriculture. The census of agriculture has 1.9 million farms, but the annual survey that we do shows 2.2 million.

Within that category, though, there have been some substantial changes, particularly, as you characterize it, the small family farm in the middle, the one who says they are principally engaged in agriculture, the one who is trying to get most of their income from agriculture, but whose annual sales might be $50,000 to $200,000. Those are the ones who have been under tremendous stress and, in many cases, those are the ones who have gone out of business, or they become smaller, or they become larger.

There has been a lot of dynamic change in that area.

So yes, I would look out over the next couple of years and if this situation that we have now persists for any appreciable time, I would think we are going to put tremendous pressure on those farms.

Senator DORGAN. I think those numbers are completely at odds with what is going on in the country.

My home county has gone from 5,000 people to 3,000 people in a 20-year period, and in recent years it has accelerated. If you stand on a section line and look in any direction, you can name the farmers that are gone who were there 5 years ago, 3 years ago, or 10 years ago.

Mr. COLLINS. Sure.

Senator DORGAN. So the aggregate data is at odds with what you see out in the country, I think. Most of these farmers are leaving and what we have is a skeleton out there. These small towns are drying up as a result of it.

The reason I am asking the question is this. It seems to me that the real pile driver here on the budget question is what must Congress do to respond to a circumstance of Depression-level prices? Is the Freedom to Farm bill with decreasing price supports—at a pretty pathetic level at this point—going to do anything? Or is it just sort of waiting while we see a wholesale collapse of the family farm structure?

And if that is the situation, then do we not have a requirement, both from the Department of Agriculture to recommend, and the President to recommend, and the Congress to respond, for some new, significant initiative that says this country wants to have a network of family farmers in its future?

Mr. COLLINS. Maybe I could start that and Mr. Schumacher could chime in since you are fundamentally asking a policy question as well.

The answer to the first part of your question about how the Farm Bill will perform is this. Clearly, in 1996, we took away some of the counter-cyclical effects of the Farm Bill. There still is a very modest counter-cyclical cushion in there. That is the loan deficiency payment, which is kicking in. But, admittedly, it is a level that is at a fairly low rate relative to production expenses for many farmers.

Senator DORGAN. A couple of dollars a bushel below production levels.

Mr. COLLINS. For many farmers. I agree with that.

There is also the AMTA payment on top of that, which has been running at $5.5 billion, but, as you say, it will decline to $4 billion by the end of the period.

So there is some support being provided by government. I mean, we will spend in fiscal year 1999 $18 billion on farm price and income support programs. The last time we did that was in the 1980's.

So I would not characterize the current farm program as simply walking away.

On the other hand, farmers have seen their costs rise over time. The fact that there are not the counter-cyclical benefits of the earlier Farm Bill, combined with the world economic problems and the shrinking demand, there is no question that this Farm Bill is not going to offset that kind of income loss.

Then that becomes a policy question, how you want to deal with that.

In 1996, the policy choice was to move away from affecting market prices, to, in a sense, decouple the program to the extent that it could be decoupled.

If you are going to go that route, then the only choice for enhancing farm income is through larger direct payments to farmers.

If you are not going to go that route, then you have to make the choice: do you want somehow to have government affect supply and more directly intervene in market prices? Those have been the choices on the table for a long time.

Senator DORGAN. Mr. Chairman, I recognize that I asked a policy question, but the implication of a change of policy that I think is necessary has huge budget ramifications. That is the reason I did.

I look at the numbers bureau by bureau, and so on. All of that is just moving nickles and dimes around. If we are not in a circumstance where we have family farmers given the opportunity to survive during these tough times, then all of this, in my judgment, is basically for naught. I would just as soon consult Abe Lincoln and maybe get rid of USDA—that is not my choice, of course—and move the other things around.

I essentially want the central feature here to be a feature that says we want to maintain a network of family farmers, and the budget implications of doing that, from a policy standpoint, is what we ought to be discussing.

Senator COCHRAN. Thank you, Senator.

Senator Burns.

Senator BURNS. Thank you.

Senator Dorgan, we can do only one thing to eliminate the attrition of small farmers: pass a law that you cannot build a tractor any more than 65 horsepower on the drawboard. That will do it—pure and simple.

I thank you for coming today and appreciate it very much.

PRODUCTION AGRICULTURE

Senator BURNS. I do want to say that, as for the root of our problem, we are probably working on the wrong end of it when we start talking about the economic climate of American agriculture at the production level.

I think our good friend at Auburn University made a good point. Since 1984, we have only seen food prices go up about 3 percent, but we have seen increased profitability both in the banking, meat processing, grain companies, and transportation. The good times have rolled on. Also there has been increased profitability in our grocery stores. But we have seen farm income drop almost over 30 percent.

We can make it through any kind of economic decline in any of the commodities if those prices on the decline are reflected in the end product, because we consume everything we produce—but at a price. We have not seen that happen at this time, however, and no commodity is making any money at the production level.

Oil is $7 a barrel. As for mining, the environmentalists are trying to run that out of Montana. There is also timber, and certainly no product from the farm.

What I am saying is at the production level nobody is making any money.

However, on the other end of it, on the front end of the grocery store and where the consumers pay, they are doing fabulously well, as Wall Street would indicate.

So I think we are working on the wrong end of this thing.

Exports in pork, as you brought up, Mr. Schumacher, have a $15 live weight on hogs. We ought to be covering the world in hogs. There is nobody, not even the Taiwanese, who could produce hogs at that level.

I am just at odds as to where the answer lies.

I think this bodes hard times for the rest of the economy, but it has not come yet and I thought it would be here by now. So I was wrong about that. Of course, I have not been right on much, anyway.

But I am right on one thing, though. Everybody got worried about Y2K and I went up to the Montana Department of Livestock and filed for that brand, Y2K. [Laughter.]

That cost $50. The other day a guy called up and said he would like to have something to commemorate the turning of the century, but you own that brand. Would you take $500 for it.

Now I'll have to look at that. That might be a good trade. I don't know. [Laughter.]

I just want to say that my message here is that we are working on the wrong end of this thing. We are not getting any support from our processors, purveyors, and retailers—none.

I think that is our big problem. We are just not getting our share of that consumer dollar. I did not see pork chops go down in price at the grocery store. Did anybody go to Giant Food recently? Your pork chops cost the same, don't they? They cost the same.

Mr. COLLINS. No. The Consumer Price Index for pork chops for January was about 10 percent lower than for January 1998. So they are going down somewhere in this country.

Senator BURNS. But, I'll tell you, it's just like moving the Rock of Gibraltar.

Mr. COLLINS. It is hard, I admit.

Senator BURNS. Yes, it is hard to do.

But I think that is where the problem lies, and I don't think anybody has come up with any answers. I sure have not come up with any. But that is where we have to work on it. That is what the USDA has to do, start going to our companies and saying listen, folks, we have to get some dollars back to the farm, and that is where you come in.

You could become an advocate for production agriculture because you have the power to do it. You have the power to call up any CEO in this country and they will return your call. But we are not doing that. We are not doing that.

Those are the areas where we have to work.

I was in Minneapolis yesterday and talked to some pretty large sized, important folks there. I am going to continue to work with those folks and try to get ourselves out of this situation. I don't think the Government could do it.

I don't think this Federal Government can deal with the problem that we have with our friends to the North. I don't think the Government can do it.

I think producer to producer we can do it. We can do something about the rate of exchange, and we can help the Canadian farmer if we can raise his income level. This is because when the water comes into the bay, all boats go up.

We have to get them in a position to where they are making money, too. We have a great production and we are very proficient. We do everything. There is no part of the American economy that is more efficient than agriculture at the production level. I mean, we are good.

Senator COCHRAN. Excuse me. We have a vote on now.

Senator BURNS. Really? Then I will go vote now and will just shut up. [Laughter.]

But I want to make that point. You are sitting in a position where you can do something and you have to call those folks in. That is where it is at. We could eat our way out of anything.

If you pick up a farm paper in Missouri, it says to come and get your hogs: free hog, free Christmas pig. And nobody is doing too much about that.

I say that that is your role.

It is good to see you are better, Jim Baker. I was worried about you a little bit. I thought you were on the casualty list there for a little while.

Let's go vote.

Senator COCHRAN. The Committee will stand in temporary recess so that we can go to the floor for this vote. We will be back very shortly.

Thank you.

[A brief recess was taken.]

Senator COCHRAN. The Committee will please come to order.

CROP INSURANCE PROGRAM

Earlier this month, the Secretary of Agriculture in a speech he made announced some proposals to strengthen the Crop Insurance Program. My question is, is there a specific legislative vehicle that will be introduced at the Administration's request to authorize changes in the program? If so, what will the changes be? What are the costs estimated to be? Will there be any kind of additional funding request made of this Congress this year for crop insurance?

Mr. SCHUMACHER. Mr. Chairman, with your permission, I would like to ask Ken Ackerman, if he could, to join us at the table. Ken will be testifying extensively in the next few weeks and he could help us address that question. He is the man on the spot.

Senator COCHRAN. Thank you.

Mr. Ackerman, tell us what your official title is these days.

Mr. ACKERMAN. Thank you, Mr. Chairman.

My official title these days is Administrator of the Risk Management Agency.

Senator COCHRAN. Thank you.

Mr. ACKERMAN. I guess on your question, as Mr. Schumacher mentioned, I will be testifying in more detail on this over the next 2 weeks before the authorizing committees—before the Senate Agriculture Committee on March 17 and on the House side on March 10.

We will be putting more detailed proposals on the table. The Secretary proposed a white paper at the time the budget came out on February 1 that outlined our ideas for reforming crop insurance.

The process we would like to follow this year is to try to reach consensus within the farm community, with commodity groups, and with the House and Senate members on both sides of the aisle on the basic ideas to reform crop insurance, and then address the budget issues.

We recognize that it will be an expensive project. The Secretary has said it will cost at least $1 billion. We have been refining our budget estimates, and I hope to be able to testify on that in more detail over the next couple of weeks.

But we do recognize that we do have to address the budget issues in order to accomplish legislation this year.

Senator COCHRAN. One of the elements of a proposal that we have heard is that you are suggesting that $1 billion may be needed to subsidize premium costs to induce farmers to purchase revenue assurance policies. Is that going to be part of the proposal?

Mr. ACKERMAN. Yes, that would be part of the proposal. The number of $1 billion, or "at least $1 billion," would cover the entire package. As I said, we are refining what that overall number would be.

But, clearly, the biggest expense item in either our package or any of the other proposals that have been discussed would clearly be toward creating better incentives for farmers to buy up to higher levels of coverage.

One of the biggest problems we have had in crop insurance, in our experience last year as Mr. Schumacher mentioned, is too many farmers were either uninsured or underinsured. We found that those farmers who had catastrophic level coverage, for instance, tended to be very disappointed in that coverage in the event that they had real significant losses.

We feel that revenue insurance should be fully supported. Under crop insurance currently it does not get a full subsidy, as with MPCI, multi-peril crop insurance.

So yes, that is part of our package of proposals and, yes, that would have a significant budget impact.

Senator COCHRAN. One of the problems in the South is that rating inequities put Southern farmers at a disadvantage, and that is a serious problem in the minds of a lot of producers in our part of the country.

What can be done to deal with that in an effective way?

Mr. ACKERMAN. I guess there are two parts to the answer on that. The fact that farmers find crop insurance not accessible enough, not affordable enough, is a general problem nationwide. We think that has to be addressed by creating better incentives through subsidy—through better targeting the subsidy system.

But specifically on rates in the South, we recognize we have an issue with rates on cotton. Cotton planting patterns have changed a lot in the last few years, and a lot of the rate base on cotton goes back 10 or 20 years.

We are doing a study specifically on our cotton rates right now and we have made that an agency priority. We have brought in some outside advisors, some outside university people to look at our rates. We have had a number of meetings with the National Cotton Council to discuss the rating system, and we expect that we will be able to report our findings to you probably within the next 2 or 3 months.

Senator COCHRAN. Thank you very much. Your answers are very helpful.

Mr. ACKERMAN. Thank you.

CONSERVATION RESERVE PROGRAM

Senator COCHRAN. I have a series of questions now that deal with the Natural Resources Conservation Service. You may want to invite Mr. Reed to come forward to help answer these questions.

It is my understanding that limitations placed on the Commodity Credit Corporation technical assistance funds are severely hampering the ability of the Natural Resources Conservation Service staff to provide technical assistance to land owners. If the section 11 cap, as it is called, is not fixed, what will be the impact on NRCS support for the Conservation Reserve Program?

Mr. REED. Senator Cochran, our estimate right now is that, based on the current dollars that are available, we have enough money to do CRP-type work, provide technical assistance, up to about the 15th of May.

We estimate, based on what the Secretary plans to accept in the 18th signup, that we need approximately $28 million in order to provide the anticipated technical assistance that is needed.

NRCS STAFF YEAR REDUCTION

Senator COCHRAN. For the record, I think we should identify the Chief of the Natural Resources Conservation Service, who is Chief Pearlie Reed. We appreciate your being here today.

We understand also that the fiscal year 2000 budget request will result in a reduction of staff for the Natural Resources Conservation Service. What impact is this going to have on NRCS and its ability to carry out its functions as required by law?

Mr. REED. Well, based on basic soil and water conservation work that the policy makers in this country are expecting us to do and all of the additional things that the policy makers are putting on our plate, namely the massive animal waste workload, the emerging water quality issues, and global climate change initiatives, we are being asked to do too much.

The proposed 1,055 staff year reduction for the NRCS for fiscal year 2000 will be something that will, quite frankly, get us in a position where we cannot deliver on those priorities that have been established for us.

Senator COCHRAN. This may not be a question that you are supposed to answer, but I am curious to know how much funding would be necessary to add to the NRCS budget request to ensure that you have the staff to meet your responsibilities?

Mr. REED. Approximately $90 million over and above the fiscal year 1999 level for conservation technical assistance.

WATERSHED FACILITIES

Senator COCHRAN. We recognize the fine work you have done, that the agency has done, over the last 40 years in putting flood control structures and other watershed projects in place that benefit local communities and production agriculture. Tell us, if you can, what you are going to do about the problem of maintenance requirements and the deterioration of these watershed infrastructure facilities. We understand that this is a problem, that because some of these structures were constructed so long ago, they now are not doing the job that they were expected to do, and are creating, in some cases, public safety and health risks. We need to know about this and what can be done about it.

Mr. REED. Mr. Chairman, starting in the late forties up to about 1962, under P.L. 534 and 566 and the RC&D program, we built approximately 10,000 or so dams out in the countryside that were designed to last for 50 years.

Those dams have functioned as they were designed to function. Now they are filling up with sediment and they are to the point where there is a need out in the countryside for some major, major rehabilitation.

I should add that it is really not a maintenance problem, it is not an operations problem. It is a problem with the system having functioned based on the life expectancy that the dams were designed for.

Starting about 1962, we started to design these dams to last 100 years. So for those that were constructed since 1962, we have a little bit longer before we need to be concerned about their life expectancy.

But the major thing right now is that I am of the opinion, we are of the opinion in the NRCS that we have a potential major public health and safety situation out in the countryside: the roads, the bridges, and other parts of the infrastructure out there, namely water supplies, recreation facilities. Indeed, a lot of development has gone in the flood plain below some of these structures.

We are of the opinion that, if this issue is not addressed, it is just a matter of time before we have some major, major disasters—loss of life, loss of property, and all of the things that go along with that.

Our lawyers tell us that it is not the NRCS's or Federal Government's responsibility for these projects, that it is a local issue. My concern is that it is a major public health, public safety issue, and I think it is our responsibility to bring that to the attention of the policy makers in this country and let them decide how best to deal with it.

Senator COCHRAN. Is there any specific amount in the budget submission that is designed to deal with this problem, or to educate communities about the problem, or to do anything in regard to it?

Mr. REED. There is approximately $1 million for an education effort.

CONSERVATION PROGRAMS

Senator COCHRAN. Let me ask you about some of the other programs that the agency is involved with.

We know that, because of the economic problems in production agriculture, there are some programs that do provide some financial benefits to help farmers. I am curious to know your reaction to the benefits that are available and the sufficiency of these benefits. Conservation programs are some that have been very important to me personally, and we have been actively involved in trying to design the programs so that they are workable.

I would like your reaction to these conservation programs. I have in mind the Wetlands Reserve Program, the Wildlife Habitat Incentives Program, which we were able to get authorized a couple of years ago; and EQIP, which has become very well known. Describe to us what is being done in the administration of these programs to help farmers.

Mr. REED. Let me just tick off the programs. Of course, the biggest one is CRP. Then we have the Wetlands Reserve Program, the WRP Program. In the President's budget we are proposing that a $5 million amount be made available for Debt for Nature.

Senator COCHRAN. For what? I'm sorry?

Mr. REED. For Debt for Nature. Basically, that is a program that has been authorized but never funded that would provide technical assistance and financial assistance to farmers in such a way where maybe they could provide easements and things like that to offset certain kinds of debts.

Senator COCHRAN. OK. Thank you.

Mr. REED. I would like to offer to provide for you for the record some specific examples of situations out in the countryside where farmers have been able to keep their farms, of farmers who are in situations where they have been able to get out of severe economic stress because of the WRP program, because of the Wetlands Reserve Program. But I am not prepared to talk about those specifically today.

Senator COCHRAN. Okay. That would be helpful to have in the record and we would appreciate your submitting that for inclusion in the record.

[The information follows:]

CONSERVATION PROGRAM ASSISTANCE TO PRODUCERS DURING TIMES OF ECONOMIC STRESS

USDA Conservation Programs [1] provide financial, technical, and education assistance to aid farmers and ranchers attain their conservation goals, comply with environmental requirements, and achieve longer term resource sustainability. These programs mitigate not only the vagaries of weather but also the violent shifts in agricultural markets while providing long term productivity gains and reduced reliance on purchased inputs. Several examples are cited below that depict how conservation programs assist producers during times of economic stress and over the long term.

Mississippi, Iowa, and Maine—EQIP helps producers reduce costs and contributes to long term income while providing environmental benefits.

Regardless of the economic hardships being experienced by producers, there is an ever increasing number of local and State environmental laws and regulations that must be addressed. In Iowa. State legislation requires producers to stop using agricultural drainage wells for the disposal of agricultural land surface runoff. EQIP priority areas in Humboldt and Pocahontas Counties are being used to provide assistance for developing environmentally safe methods of runoff disposal and to comply with this legislation, while helping producers minimize costly outlays to meet this requirement. A similar State mandate in Mississippi requires the elimination of underground pits for the disposal of poultry carcasses. EQIP priority areas in East Central Mississippi and in the Upper Pearl River watershed are helping the small, family poultry farmers meet the new regulations.

A second way that EQIP assists farmers in economic stress is with the establishment of natural resource conserving practices that maintain or enhance the long-term economic viability on the farm. Farmers under economic stress commonly make investments that provide near term income even though investing in conservation of natural resources can enhance longer term sustainability and economic potential. For example. the Passamaquoddy Tribe in Maine is using EQIP for forest and wildlife habitat conservation and management purposes that will ultimately improve their forestland income. They are also establishing integrated crop and pest management techniques with EQIP assistance that reduce reliance on costly agrochemicals while maintaining yields on their blueberry lands.

The economic stresses stemming from adverse market conditions can often impact small, limited resource. and minority farmers more severely than larger operations with more capital. Limited resource farmers in Mississippi were found to have a higher percentage of their forest lands being inadequately managed or not reforested after harvesting because they had to invest their limited funds in farm operations with a quicker income return. EQIP has provided financial assistance to these limited resource producers for reforestation purposes that will primarily improve the local natural resources while helping longer-term economic returns.

WYOMING—flow WHIP provides supplemental income

In Wyoming, thirty landowners in one country entered into WHIP agreements for land surrounding two state wildlife management areas. The State's wildlife areas are rich in water and wetlands, yet lacked upland bird habitat and nesting cover, and thus limited overall wildlife benefits. The land enrolled in WHIP provides the missing habitat for pintails, mallards, pheasant, and sharptails as well as neotropical migratory birds. In addition, the participants can lease their land during

[1] USDA conservation programs cited here include the Environmental Quality Incentives Program (EQIP), Wildlife Habitat Incentives Program (WHIP), Wetlands Reserve Program (WRP), and Emergency Watershed Program (EWP).

hunting season as a source of additional income and enterprise diversification. This, in turn, benefits the local economy.

Senator COCHRAN. There is one parochial question on this subject that I wanted to bring up.

The legislature in our State authorized $5 million from the sale of bonds last year to be used for the rehabilitation of watershed infrastructures. The State can only use this money if some match is provided from the Federal Government. That is the provision of the statute that the legislature passed.

The agency has authorized a pilot project for the rehabilitation of an aging project. Would the agency consider Mississippi as a possibility for this pilot program?

Mr. REED. Absolutely. [Laughter.]

But let me tell you that in the fiscal year 1998 appropriations, you provided the authorization for us to do that and I think it was approximately $1 million. We have obligated those funds for this pilot project in the State of Oklahoma. So, as it has been explained to me by our lawyers, in order for us to proceed elsewhere with pilot projects, we would have to get the appropriate authorizations or appropriations to do so.

Senator COCHRAN. Okay. We will work on that. Maybe we need some new lawyers. [Laughter.]

HONEY LOANS

Let me ask you something, Mr. Secretary, about a revision that we put in the emergency appropriations title last year to the fiscal year 1999 appropriations bill that had to do with marketing loans for honey producers. It is not probably widely known, but Congress approved this program because honey producers, like many others involved in agriculture, faced seriously low prices. The Department has delayed implementing this program, and I am curious to know why.

Congressman Skeen, who is chairman of the Appropriations Subcommittee on the House side, and I learned that the Department also had assumed to not implement the program in the manner intended.

We wrote a letter recently to try to spell that out. We would like the delays to end, but we have not gotten a reply to our letter and no regulations implementing the program have been published.

We would like to have regulations promulgated so that the Department could implement the program. Can we expect action on that? Or is there any reason why the Department is just refusing to carry out the provision of section 1122 of the 1999 Agriculture Appropriations Act?

Mr. SCHUMACHER. Thank you. Again, with your permission, I would ask Mr. Parks Shackelford, who is running that program and is here today, to reply.

Mr. SHACKELFORD. I am the Associate Administrator for Programs at the Farm Service Agency.

Actually, we very strongly intend to implement the program. The difficulty was that, unlike some of the other no net cost programs, this legislative language required that it be run at no net cost and did not provide an exemption for administrative costs.

We have worked with the industry trying to determine a way that we can provide the loans at a reasonable cost to cover the administrative costs and still be workable to the industry.

I think our staff has come up with some creative ideas—for example, the fact that we will be getting interest payments and can offset some of the costs.

The regulation is in clearance. We hope it will be published very soon and that we will be able to get these loans out to the industry.

Senator COCHRAN. Thank you.

COTTON PROGRAM

Dr. Collins, we mentioned earlier in the hearing the Step 2 Certificate Program for cotton. It seems to have worked very well to promote cotton exports overseas and to ensure that domestic mills have access to domestic cotton at competitive prices.

Could I ask you a couple of questions about this? We observed, when we were talking about it earlier, that funds have been exhausted under existing authorities. What is the intention of the Department with respect to seeking additional funds?

Mr. COLLINS. I do not think the Department has any stated position on that at this time, Mr. Chairman.

Senator COCHRAN. What is your assessment of the value of these certificates to domestic cotton producers?

Mr. COLLINS. I want to be very careful how I answer that because I remember a year ago you asked me that and I got a flood of mail afterwards based on my response. [Laughter.]

I would say that there are a couple of things we could look at.

One is what has happened since the Step 2 Program terminated in mid-December. What has happened since then is that we have only made a net increase of about 100,000 bales in sales of cotton—that is the sales minus the cancellations we have had since then. That would be, by all historical standards, a very poor performance on export sales.

So I would have to say that the world has been looking for a Step 2 payment this year for us to be able to sell cotton. So this is a year in which the Step 2 Program would have made a big difference.

As we look out to 1999, however, I think the effect would be lessened. This is a year in which we had a very small crop in the United States but we had large supplies around the world. As a result, we had the unusual situation of low U.S. supplies and low prices. These do not usually come together.

As we look out to 1999, we may see a situation where we have large U.S. supplies but again low prices. With those large U.S. supplies, I think we would be in a better position to compete, and I think the effect of the Step 2 program probably would not be great.

However, there is an effect. I mean, I think it does increase domestic mill use and it does increase export sales. But it depends on the world conditions in each season as to how effective it would be.

CROP INSURANCE

Senator COCHRAN. During the last brief recess we had, the so-called President's Day Recess, I ran into a few of my friends who

are in the cotton business, cotton growers. They think that the Step 2 program is something that they really need, and they would like very much to have it extended.

For the first time, I understand we have a new crop insurance product called Crop Revenue Coverage, offered for sale in our State for rice producers. We have received a number of calls from producers about this product, and there is some concern that the availability has influenced planting decisions and may have affected the rice market.

This coverage, as I understand it, does not serve as a price guarantee for the quantity of rice a farmer produces. In other words, it is not similar to a put option. Is that correct?

What are your thoughts about the influence and the availability this product has had on planting decisions and market prices?

Mr. ACKERMAN. Senator, as for the product you are referring to, there are two related products. So it is important to distinguish.

There is a product called Crop Revenue Coverage which is a widely available product on a number of crops. But this is the first year it has been offered for rice. It is different than a put option.

What it does is give a farmer a guarantee on their revenue. In other words, it will cover you if prices move down, but only if your revenue, the price times yield, falls below a certain floor.

It will also give you a protection if the price moves upward.

This is different than a put option because a put option is based on the price standing alone. CRC, as an insurance based revenue product, is based on price times yield. This is a product that we reinsure, back, subsidize, and that we are very fully engaged in.

There is an additional product that is a private sector product offered by the same company, called CRC Plus. CRC Plus is what is called an add-on product which basically enhances the price guarantee. In this case, it does it, I believe, by 3 cents.

There were some concerns that, because of changes in the rice price since the time the prices for these tools were set several months ago, that may have influence on some planting decisions by farmers.

CRC Plus is a product that we do not reinsure. It is a purely private product. The only review function we have for it is to see whether it impacts the risk borne by the Government on the underlying product.

At this point, I can tell you the sponsoring company is reviewing the situation. They are considering a number of options. We have not seen any direct indication that CRC Plus is affecting rice prices.

Obviously, the availability of any insurance tool, if it is a good insurance tool, would be to give farmers more confidence to plant a crop. If it is having that kind of beneficial impact, that may not necessarily be a problem. But it is a new tool. Like many of the new revenue tools, we are learning by experience this year because we are dealing in a time of volatile prices and we have a new generation of crop insurance products on the market today that are price sensitive. We are learning a lot of lessons this year about how they operate when markets are volatile, particularly when market prices change after the initial prices are set on products.

We have had that happen before with traditional crop insurance products if we set a price election on a crop and then the market moves away from it. When you have a price sensitive product, that concern can be compounded.

We are tracking this very closely. We have been in very direct contact with the companies, simply to be on top of the situation. But CRC Plus is a purely private product.

Senator COCHRAN. Thank you.

MONITORING FOOD AID TO RUSSIA

Mr. Schumacher, in your statement which you submitted to the Committee you point out that the United States and Russia have established a monitoring program, which is new and unprecedented, to help ensure that food aid reaches the populations for which the aid is intended.

Could you describe this program and how it works? Or, is it working to get the food aid to the targeted populations?

Mr. SCHUMACHER. Yes. It has been really an unprecedented monitoring system that we put in place. The first shipments of seeds should arrive in St. Petersburg on March 12 and we'll be kicking in the monitoring as that starts. We've put enormous effort into ensuring that the agreements that we have signed with the Russian Government will be adhered to and we'll know where this product is going.

With your permission, I will ask Mr. Goldthwait to take a minute or two to go into the very important details to assure all of us that this is going to take place well.

Senator COCHRAN. All right.

Mr. GOLDTHWAIT. Senator Cochran, the monitoring and oversight program has actually three parts to it.

First of all, there is an element that the Russian Government itself is undertaking. They are setting up a special unit within the Ministry of Interior basically to do individual tracking of the shipments within Russia. That is what they are doing.

What we are doing has two components. It has what I call a real time reporting component where, instead of getting all of our reporting on the disposition of commodities after the fact, traditional in USDA food aid programs, we are actually going to be getting reporting on the discharge of the commodities within 48 hours after they reach the Russian ports and the movement of the commodities on an ongoing basis to, ultimately, their endpoint of disposition.

That is the second element.

The third element is an extensive spot checking effort, actual people on-site, going out and, first of all, talking to the people that are to receive the commodities before the commodities are going to be delivered, alerting local media as to what to expect. Then the people will actually be observing the discharge of commodities at the ports, visiting the railheads and storage locations as they are distributed internally, and, ultimately, going to the end delivery point and observing the commodities as they arrive in the designated regions.

The actual plan for the disposition of the commodities for all of the commodities is available on the FAS website.

FISCAL YEAR 2000 FSA STAFFING

Senator COCHRAN. Thank you.

Mr. Schumacher, the Administration's supplemental funding request, which was submitted last week, includes $42.7 million for Farm Service Agency salaries and expenses to accommodate the increased county office workload.

Does the fiscal year 2000 budget request accommodate the agency's workload requirements as well? Will it result in any staff reductions?

Mr. SCHUMACHER. Yes, the fiscal year 2000 budget includes a reduction of 752 in staffing.

Senator COCHRAN. That's 752 staff years?

Mr. SCHUMACHER. Yes, 752 FTE's, full-time equivalent staff-years. That's a reduction in the budget for the year 2000 for permanent employees.

Senator COCHRAN. What will be the practical consequences of that? Will farmers suffer because of that, the programs?

Mr. SCHUMACHER. We are going to be looking hard at additional forms of efficiency. We will be going through an administrative convergence to make sure that, as we move forward into some consolidation, we're putting people behind counters and not in administrative offices. However, sometimes we have county offices that are very thinly staffed, and we can do better if we combine two offices. We will work closely with Congress on these proposals.

So we are making some efficiencies there as well, sir.

ADDITIONAL COMMITTEE QUESTIONS

Senator COCHRAN. I have some additional questions and other members of the Committee may, as well, which I will submit. I request that you respond in writing in a timely fashion.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FARM OWNERSHIP LOANS

Question. The fiscal year 2000 President's budget request proposes an increase of $42,400,000 in budget authority for direct farm ownership loans resulting in an increase to provide 500 additional loans for minority farmers and to help reduce the backlog of unfunded loan applications. What is the current backlog that exists for direct farm ownership loans?

Answer. There are 1,214 direct farm ownership loan applications on hand as of March 2, 1999.

AGRICULTURAL CONSERVATION PROGRAM

Question. There has been a $33,300,000 carry over balance available for the Agricultural Conservation Program for several years now. Why hasn't this money been used for ACP cost-sharing agreements and when does the agency expect this money to be obligated?

Answer. The Federal Agriculture Improvement and Reform Act of 1996 repealed the ACP and incorporated its objectives into the Environmental Quality Incentives Program. The remaining funds are available only for valid prior years' obligation adjustments.

Question. When will all cost-sharing agreements be completed?

Answer. The last multi-year cost-share agreement was entered into during fiscal year 1996 for water quality incentive practices. Those practices are completed over

a 3- to 15-period. The last ACP long-term agreements were entered in fiscal year 1995 and are contracts for 3 to 10 years.

TREE ASSISTANCE PROGRAM

Question. The unobligated balance of $3,200,000 brought forward from prior years for the Tree Assistance Program is available for use in fiscal year 1999. Does the agency plan to use these funds in fiscal year 1999?

Answer. The unobligated balance of $3,200,000 brought forward from the prior years for the Tree Assistance Program will be used in fiscal year 1999. Any unobligated balance at the end of fiscal year 1999 will expire according to Public Law 105–277.

Question. If yes, then for what purposes?

Answer. This funding will be used to provide cost-share payments to orchard and vineyard growers who suffered losses due to fire blight infestation (a destructive disease caused by bacteria) that was caused by a natural disaster.

LOANS FOR IRRIGATION SYSTEMS

Question. The Committee conference report accompanying the fiscal year 1999 Agricultural Appropriations Act states that the conferees expect USDA to provide guaranteed loans for installing irrigation systems for farmers in areas declared a disaster due to droughts. Have any loans been provided for this purpose? If not, why?

Answer. Providing funds to install irrigation systems is an authorized purpose for guaranteed loans. FSA does not gather data on the use of loan funds for specific purposes, so we are not able to fully respond to this question.

LIVESTOCK PRICING

Question. Hog Prices have dropped as low as $7 per hundredweight in some parts of the country. Cattle prices reached around $80 per hundredweight at the first of the year, and have hovered in the $60–70 range in some parts of the country. Does USDA have any plans to provide any emergency relief to cattle farmers?

Answer. USDA recently authorized $20,000,000 of section 32 funds to support the beef industry. USDA is currently purchasing beef roasts and ground beef. In fiscal year 1999, USDA has purchased $66,000,000 worth of beef with Section 32 funds to fulfill entitlement needs for the 1998–99 School Lunch Program.

Question. What authority does USDA have to assist the livestock industry?

Answer. The Agricultural Marketing Service assists the livestock industry under Section 32 of the Act of 1935 (Public Law 320).

SUSPENSION OF LOANS FOR HOG PRODUCTION FACILITIES

Question. The Federal Register contained a notice on January 26, 1999, that temporarily suspends direct Rural Economic Development Loan and Business and Industry Guaranteed Loan financing for the construction of specialized facilities used for the production of hogs. How many loan applications will be affected by this suspension?

Answer. In addition to the suspension you mentioned, on January 8, 1999, FSA suspended direct and guaranteed loans for construction or expansion of specialized facilities used for the production of hogs. We do not know how many applications were affected by these temporary suspensions.

Question. Will these applications be considered for funding once the suspension is lifted or will all appropriations be obligated by that time?

Answer. When the suspensions are lifted, applications will be considered for funding. The suspensions are indefinite in duration so it is impossible to say what the availability of funds will be when they are lifted.

Question. What will be the determining factors to lift this suspension?

Answer. The suspensions will be lifted when the Secretary determines that resumption will not contribute to oversupply and continue to depress hog prices.

SMALL HOG OPERATIONS PAYMENT PROGRAM (SHOP)

Question. Many hog farmers claim that the $50,000,000 assistance that will be provided to them is too small to help medium and large hog producers. Was this assistance directed towards the smallest producers?

Answer. The Small Hog Operations Payment Program (SHOP) was directed towards small hog operations, which may or may not be an individual producer.

Question. How is a "small producer" defined by USDA?

Answer. A small hog operation is defined as any hog operation whose gross income for 1998 was $2,500,000 or less. The operation must also have marketed less than 1,000 hogs during the last 6 months of 1998 and must still be in business.

Question. Is USDA considering additional emergency assistance for small and medium-sized producers?

Answer. Approximately $50,000,000 of Section 32 funds were authorized for SHOP. The Section 32 provisions invoked permit direct payments to farmers to reestablish their purchasing power. If additional assistance is needed to help hog farmers reestablish their purchasing power, providing additional Section 32 program assistance would be considered.

DELIVERY OF EMERGENCY PROGRAMS

Question. Please give an update on the delivery of the following emergency programs: wool and mohair recourse loans, honey recourse loans, indemnity payments for cotton producers, and emergency assistance provided in Title IX, Section 1124.

Answer. There are no programs available for wool. The CFR regulations for honey and Mohair Recourse loan programs were filed on March 3, 1999. Notice LP-1673, instructing county offices to publicize the programs, accept applications and disburse loans was issued to State Offices on March 4, 1999. Application forms for both programs are available on the FSA electronic bulletin board system. The forms are also available to applicants with Internet access on the Price Support Division web site (www.fsa.usda.dafp.psd).

In terms of indemnity payments for cotton, USDA was to make a $5,000,000 payment to the State of Georgia to help fund an indemnity fund, which was to be established and managed by Georgia, to compensate cotton producers in Georgia for losses incurred in 1998 or 1999 as a result of bankruptcy of a warehouseman or other party. In order for USDA (CCC) to pay Georgia the $5,000,000, Georgia was required to contribute a matching $5,000,000. Georgia has until July 1, 1999 to establish the fund and until January 1, 2000 to make all the payments.

To do this, Georgia had to pass a law allowing it and to appropriate the funds. The Georgia legislature has passed the law and drawn up the paperwork to appropriate the funds, and the documents were still awaiting signature by the Governor. If the fund is not established by Georgia by July 1, USDA shall make available our $5,000,000 to provide partial compensation to cotton producers.

Funding for emergency assistance shown in the fiscal year 1999 Appropriations Act, Section 1124, was further broken down in Section 763. As required in Section 763, paragraph b, $27,000,000 was transferred to the Secretary of Commerce, $20,000,000 was transferred to the Economic Development Administration, and $7,000,000 was transferred to the National Oceanic Atmospheric Administration. An additional $5,000,000 was transferred to the Small Business Administration, in accordance with Section 763, paragraph c. We are also working with the State of Alaska to offer $18,000,000 in emergency aid to individuals with family incomes below the federal poverty level in connection with fishery failures.

FARM LOANS

Question. The Secretary of Agriculture announced that USDA will postpone certain loan payments for farms suffering severe financial distress from low prices. The loan deferment announcement included 1998 farm ownership and operating payments due January 1, 1999. These payments will instead be added at the end of the repayment period along with loan servicing authorities, including debt rescheduling and forgiveness, to assist farmers. What will be the cost of delaying these payments, if any?

Answer. We estimate that there will be no additional cost to the Government as the amount set aside continues to accrue interest at the note rate and will be due and payable when the loan matures.

Question. Besides the 1998 farm ownership and operating payments due January 1, 1999, what other loan payments will be postponed by this deferment?

Answer. All FSA Farm Loan Program loans may receive disaster set-aside. These include payments on Farm Ownership, Operating, Soil and Water, Emergency, Economic Emergency and Rural Housing loans for farm service buildings that were impacted by the 1998 disasters and low commodity prices. Non-program farm type loans may receive disaster set-aside if the borrowers also have any of the regular Farm Loan Program loans types listed above.

Question. The fiscal year 2000 President's budget request proposes an increase of $28,000,000 for emergency loans for a total of $53,000,000 in program level that will provide about 852 loans. Based on the fiscal year 1999 demand for emergency loans

and the supplemental request, is the fiscal year 2000 request for this program still appropriate?

Answer. It is not possible to predict the frequency and severity of natural disasters. Hopefully, normal weather patterns will be prevalent in fiscal year 2000, and the high demand for emergency loans experienced in fiscal year 1999 will not be repeated.

Question. In the fiscal year 1999 Appropriations Act, the limitation on the amount of both a farm ownership and an operating loan was raised to $700,000. How has this affected the type of loans that are being made? Are larger loans being made to fewer people?

Answer. Yes, larger loans are being made to fewer people. Thus far in fiscal year 1999, the average loan amount has increased. Farm ownership loans increased 12 percent (from $177,127 to $199,053) and operating loans increased 14 percent (from $123,879 to $141,287).

Question. To what extent has this change contributed to the increased demand/shortfall of fiscal year 1999 emergency funds for these loans?

Answer. For the past 8 years, the average loan size has been increasing 2 to 5 percent each year. We believe the increased loan size has contributed to exhausting our loan funds so early in the year.

Question. Many banks that lend to farmers are turning away those that are on the brink of losing everything, so there is an increasing demand for USDA farm credit loans. How is this affecting the demand for USDA's direct and guaranteed farm operating and ownership loans and the availability of funds?

Answer. Demand for both direct and guaranteed loans has increased significantly in fiscal year 1999 compared to fiscal year 1998 due to low commodity prices and numerous natural disasters. Due to this growth in demand for FSA farm loan assistance, there will be a shortage of funds in all FSA direct and guaranteed loan programs in fiscal year 1999. On February 26, the President requested supplemental funding to provide an additional $1,100,000,000 in financing to farmers and ranchers.

COTTON

Question. Funds for the Step 2 competitiveness provision for cotton were exhausted in December, 1998. USDA announced a special import quota under Step 3 on Thursday, February 25, 1999. In the absence of additional Step 2 funds do you expect domestic cotton consumption and exports to decline for the 1999/2000 marketing year?

Answer. USDA has not yet published the official 1999/2000 projections for cotton in the monthly World Agricultural Supply and Demand Estimates (WASDE) report. However, at USDA's recent Agricultural Outlook Conference, estimates placed 1999-crop domestic mill use for all kinds of cotton at between 10,000,000 and 10,500,000 bales, roughly the same as the level now expected in 1998/99. Exports of cotton for 1999/2000 were estimated at the conference to range from 5,000,000 to 6,000,000 bales. This would represent an increase of between 600,000 and 1,600,000 bales (about 25 percent) from the exports estimated for 1998/99. Ending stocks of cotton for 1999/2000 are projected to increase about 2,000,000 bales, to about 5,400,000 bales, an increase of nearly 60 percent from the carryover stock level from 1998/99.

Question. Will Step 3 import quotas continue to open on a weekly basis and if so, for how long?

Answer. Step 3 import quotas will continue to trigger as long as the Friday-Thursday average U.S. quotation for middling 1–3/32", delivered C.I.F. northern Europe, exceeds the northern Europe index by 3.00 cent per pound or more. The spread between the U.S. quote and the northern Europe index for the current crop is now about 15 cents. On Tuesday, March 15, the first indication of the forward-crop prices was published. Though there was some improvement noted in the competitive position of U.S. cotton, the spread still appears to be about 10 cents. Thus, the Step 3 quotas can reasonably be expected to continue triggering for many weeks.

Question. In the absence of additional Step 2 funds, does USDA have any authority which, if utilized, would make US cotton more competitive and which would serve to close import quotas?

Answer. Both Step 1 and Step 3 still are in effect. By its design, Step 3 is supposed to start and stop automatically with no action required of—or permitted to—USDA. It has started this year at a time when it was needed. The actual importation of cotton likely will stop when the cotton is no longer needed. We cannot stop the continual announcements of new, unneeded import quotas. Since the adjustment of the U.S. northern Europe quote will be zero in the absence of Step 2, only the

market can stop those superfluous announcements. Under Step 1, USDA has authority to reduce the marketing loan repayment price, also known as the "adjusted world price" or AWP, whenever the U.S. northern Europe quotation exceeds the northern Europe price, as long as the calculated AWP is less than 115 percent of the loan rate. (We use the "A" Index to represent the northern Europe price.) Factors to be considered in determining whether a Step 1 adjustment should be made are specified in the law. They are: (1) the U.S. share of world exports, (2) the current level of cotton export sales and cotton export shipments, and (3) other relevant data, as available. Under that last category, we at USDA have considered the volume of loan activity to be very important.

The theory behind the adjustment of the AWP under Step 1 is that the authority can be used when it becomes clear that cotton is being maintained in the loan program and is not flowing into the market. The competitive position of U.S. cotton is being hurt as a result of the impediment to flow. With larger loan deficiency payments or gains from the lower loan repayment price, farmers are believed likely to forgo loans or redeem loans. Cotton will become available to the market. Competitiveness will be served.

We have no experience that would tell us if this theory is valid. The few instances in which Step 1 was invoked in the 1991 crop year did not appear to affect loan activity. However, the provision had just recently been enacted, and it is possible that it was not used aggressively enough. It does increase budget exposure, and that always has been an important consideration. Between January 1994 and December 1997, Step 1 adjustments were not possible because the AWP was too high.

There are two schools of thought on the implementation of Step 1 adjustments: (1) Step 1 adjustments to the AWP should be used sparingly and intermittently to entice farmers to redeem loans or forgo loans as needed to relieve temporary constrictions in market flow; or (2) Step 1 should be incorporated into a larger pricing strategy designed to enhance U.S. competitiveness in world cotton trade.

Under the first approach, if heavy loan placements appear imminent, it is argued that a reduced AWP could help move cotton into the market instead of to the loan. These results are predicted because farmers will perceive either that they will earn a larger marketing loan gain if they redeem loan cotton or that they will earn a larger LDP by deciding not to place the cotton in the loan. Under this line of reasoning, the key ingredient for Step 1 to work properly is uncertainty. Farmers should never be sure whether USDA will again announce a Step 1 adjustment in the following week. Therefore, to take advantage of the increased benefit, they must move in the current week. One thing we have learned recently concerning this approach is that, once farmers become cognizant of the mere possibility that Step 1 might be invoked, they tend to hold their cotton off the market so they do not "miss" the extra benefit. This defeats the purpose of Step 1.

Under the second approach, Step 1 should be operated during a specific period to provide "carry-plus" so that U.S. cotton can be offered in world trade at more competitive prices. The AWP would float at some level under where it would regularly be. The loan deficiency payment rate or gain from marketing loan redemptions would be constant from week to week, while the AWP would fluctuate from week to week, as it does now. This approach would, in effect, move the pricing structure downward and should contribute to competitiveness. It would not encourage speculative holding, as the first approach appears to do. Under this approach, Step 1 could function in the same general manner as Step 2 had functioned before the funding went dry, i.e., as a means of reducing the U.S. price level in both domestic and international trade.

LOAN DEFICIENCY PAYMENTS

Question. There is a $750,000 per "person" limitation on cumulative loan deficiency payments (LDPs). During 1998, USDA took action which increased eligibility for LDPs (silage and high aflatoxin corn) and the amount of LDPs (adjustments to the county-posted price). As a result of these actions, does USDA expect some commodities pledged as collateral for CCC loans to be forfeited as producers hit the payment eligibility limits?

Answer. Department commodity analysts do not expect appreciable amounts of grain, soybeans or cotton to be forfeited from the 1998 crops. There may be individual producers whose operations are of such a size that they may reach the $75,000 limit on loan deficiency payments (LDPs) and marketing loan gains, but most will not.

Using LDP rates determined recently, over 2,000 acres of soybeans would be required to generate a payment of $75,000 at the national average yield. In the Mississippi Delta and the Southeast, with the poor yields of 1998, between 3,000 and

4,000 acres of soybeans would be required. At the height of the corn LDP about 6 weeks ago, to hit the $75,000 limit would have required over 3,000 acres of corn in the Delta and over 4,000 acres in the Southeast. In the case of cotton, about 1,000 acres would be required to generate loan deficiency payments of $75,000 in the Mississippi Delta or the Southeast.

Most farms have more than one of these commodities planted. The acreage required to reach the $75,000 limit is, therefore, something over 1,000 acres. Most producers have had a chance to organize their operations so that they have avoided large acreage on a single operation. Most have had a chance to avail themselves of the "three-entity" rule, effectively doubling the acreage required to hit the limit. The analysts do not expect the payment limit to affect many producers or cause the forfeiture of many bushels or bales.

Question. Does USDA expect to require some producers to repay LDPs, resulting from audits which identify overpayments?

Answer. Yes, some producers will be required to repay their LDP's if an overpayment occurred.

Question. Does USDA expect to advise some producers with commodities still under loan that they cannot redeem those commodities at the world price even though the commodities have been contracted for future delivery using USDA approved options contracts?

Answer. If a producer should reach the $75,000 limitation of LDP or marketing loan gains, no further marketing loan gains could be permitted that producer for 1998-crop commodities. In that case, the producer would be informed that 1998-crop loans could no longer be redeemed at reduced rates, such as the AWP, in the case of cotton.

Question. Under the cost reduction authority of current farm law, does USDA have authority to forgive interest and loan principal on commodities under loan?

Answer. We have determined that loans could be repaid at less than the original loan rate under the cost reduction option.

Question. If so, what conditions would warrant the use of that authority?

Answer. Under the provisions of Section 1009 of the Food Security Act of 1985, as amended, the redemption amount due on a commodity loan may be reduced if the reduction will cause a saving to the Federal Government of: (1) interest receipts that otherwise might be lost; (2) receipts of loan principal that would be lost if the collateral were forfeited in satisfaction of the loan; or (3) reduction or elimination of handling, storage, and carrying charges that otherwise might accrue to the Government because of a forfeiture.

Question. Is USDA contemplating the use of that authority for any commodity in the immediate future?

Answer. No, we are not anticipating using that for any commodity in the immediate future.

ACREAGE REPORTING

Question. What is the current status of acreage certification by the Farm Service Agency (FSA)?

Answer. Producers are required to certify acreage for the following benefits:

—Production Flexibility Contract Payments—fruits and vegetables

—Loans and LDPs—Acreage of the crop for which a loan or LDP is being requested

—CRP annual rental payments—CRP acreage according to CRP–1 appendix

—NAP—Crop acreage for which a NAP benefit may be requested

—Quota Tobacco and Peanuts—All quota tobacco, except burley, and peanuts

Question. If producers voluntarily report acreage, what action is taken by FSA?

Answer. County offices accept FSA–578's from all producers who wish to report their acreage for any FSA program purpose.

Question. Are there requests for FSA acreage data by other agencies or organizations?

Answer. The National Agricultural Statistics Service (NASS) uses the data to evaluate the accuracy of acreage surveys done annually. FSA acreage totals are used as a secondary source of State and national crop estimating programs. They also use the data when allocating State estimated in support of county estimates programs.

Private insurance companies, reinsured by Risk Management Agency (RMA), use and rely on FSA acreage to verify crop insurance acreage information reported by producers.

FSA also provides acreage and production information related to the tobacco and peanut programs to RMA electronically for use by private crop insurance companies.

This program allows producers to obtain crop insurance without providing production certification to companies.

Natural Resources Conservation Service uses FSA acreage information to develop producer crop rotation plans for compliance with the highly erodible land conservation provisions.

The Boll Weevil Eradication Program, administered by the Animal and Plant Health Inspection Service, has historically relied heavily on the FSA acreage information.

Question. Is USDA cooperating with NASA in the development and utilization of cropping and other data collected by satellites?

Answer. In April 1998, a Memorandum of Understanding (MOU) was signed by the Secretary of Agriculture and Administrator of NASA. The MOU provides a framework for cooperation and coordination to facilitate research, development, transfer, and utilization of satellite data in implementing precision agriculture techniques and managing resources. Following the signing of the MOU, USDA helped NASA identify research priorities in the areas of agriculture, forestry, and range resource management. NASA offered to fund research in these priority areas in a NASA Research Announcement which drew about 180 research proposals from the national remote sensing community. By March 1999, through a series of panels—co-chaired by USDA and NASA—those proposals, that demonstrated the most potential for developing improved remote sensing applications were selected for funding.

LIVESTOCK PRICE REPORTING

Question. Secretary Glickman has stated that there is a need for greater authority to require packers to report livestock and meat prices through a mandatory program. He also has indicated that he plans to take "specific steps" to collect additional price information under existing law. Does the Department have a legislative proposal to submit to Congress to grant USDA the authority to require livestock price reporting?

Answer. USDA has drafted proposed legislation to grant USDA the authority to require mandatory livestock price reporting. The proposed legislation currently is at OMB for clearance.

Question. What "specific steps" under existing law will the Department take to help determine if there is evidence of price manipulation or unfair pricing activity by packers? What are the existing authorities for these "specific steps"?

Answer. The Grain Inspection, Packers and Stockyards Administration (GIPSA) has broad authority to collect information from subject firms, conduct investigations, and interview parties to carry out its enforcement responsibilities under the Packers and Stockyards (P&S) Act. GIPSA will use transaction data collected under the mandatory reporting pilot investigation included in USDA's fiscal year 1999 appropriation to investigate pricing issues affecting the cattle and sheep industries. In the hog industry, GIPSA is conducting an investigation of hog procurement contracts and marketing agreements to assess their use and reasons for price differences among producers.

Question. It has been reported that a Federal investigation last year showed that the prices meatpackers report for hogs are lower than the actual transaction prices. I have also heard that Secretary Glickman is seeking a Justice Department probe into possible hog price fixing, and USDA is investigating price spreads between farms, packers, and retailers. When will the Department finish the investigation?

Answer. GIPSA's Western Cornbelt Hog Procurement Investigation, which was completed last year, showed that the quality of a "base hog" as reported in public market news reports was lower than the average quality of hogs purchased by packers. Thus, prices reported for a "base hog" were lower on average than actual transaction prices during the period of the investigation. Secretary Glickman has asked the Department of Justice and the Federal Trade Commission to examine the current record price spread in pork. USDA's investigation of price spreads was initiated as a result of Secretary Glickman's Pork Crisis Task Force. A time frame for completion of this investigation has not yet been set.

Question. How have the low prices that farmers are receiving for their hogs been affected by this "possible hog price fixing"?

Answer. USDA has not alleged that low prices for hogs resulted from "possible hog price fixing." A large supply of hogs was and continues to be the most important factor pressuring prices. Other factors likely played a role in the precipitous price drop seen at the end of 1998, and USDA is committed to determining whether practices in violation of the P&S Act played a role.

Question. What other activities have been undertaken by the Department to address this issue?

Answer. USDA has undertaken a number of activities to address the issues raised by the recent hog price crisis. In addition to an investigation of price spreads, GIPSA is conducting a comprehensive review of hog contract provisions and a review of recent hog slaughter plant closings.

MEAT LABELING

Question. A National Cattlemen's Association survey indicates 78 percent of consumers polled want to know where their grocery meat comes from. What is the Department's position on country-of-origin meat labeling?

Answer. Currently the Department does not have an official position on country-of-origin labeling for meat and meat products.

Question. How will this affect the cost of meat to consumers?

Answer. We are not sure of the effect of country-of-origin meat labeling on the cost of meat to consumers since we have not conducted any consumer cost analysis.

Question. What, if any, actions has the Department taken regarding this issue? If not any, does the Department have any plans to take action in the future?

Answer. As directed by the Omnibus Consolidated and Emergency Supplemental Appropriations Act for Fiscal Year 1999, USDA is conducting a study of the potential effects of mandatory country-of-origin labeling on imported beef and lamb muscle cuts. As part of this study, USDA will review the regulations and policies governing USDA grading of imported meat and the use of the U.S. grade stamp on meat imported into the U.S. We plan to submit the report to Congress in April, as directed.

DAIRY PRODUCTION DISASTER ASSISTANCE PROGRAM

Question. An additional $3,000,000 was appropriated in the fiscal year 1999 Appropriations Act for the dairy production indemnity program. Has this money been distributed to dairy farmers?

Answer. Yes, and approximately $750,000 of that remains undesignated.

Question. Geographically speaking, which States in the country benefitted from this additional assistance?

Answer. California received approximately $1,400,000, New York received $200,000, and Georgia and Florida received approximately $150,000 each.

Question. What was the average payment for a qualified dairy farmer?

Answer. The average payment was approximately $7,775 per dairy operation.

DAIRY MARKET ASSISTANCE

Question. The fiscal year 1999 Agriculture Appropriations Act provides $200,000,000 in disaster assistance for dairy producers. The law gives the Secretary of Agriculture the discretion to distribute this assistance in a manner that he sees fit. How is this assistance being allocated and distributed to dairy farmers given that dairy prices were at a high last year and are predicted to fall in 1999?

Answer. The Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act, 1999, provides that $200,000,000 shall be available to provide market loss assistance to dairy farmers in a manner determined by the Secretary. The record high milk prices of last fall have been replaced with below average prices. The Basic Formula Price (BFP), which is the price that the Federal Milk Marketing Order system sets for milk used in manufacturing and is the price mover for fluid milk, declined from $16.27 per cwt in January to $10.27 per cwt in February. The $6.00 decline from January to February is more than twice the previous record monthly drop of $2.52 per cwt in November 1996. The February BFP is over $2 below the past 5-year average BFP in February—$12.51 per cwt. However, the drop will not be fully reflected in milk checks until April due to the lag in fluid milk price changes. The sudden plummet in the BFP resulted in a sense of urgency to get immediate and direct help to dairy farmers in a timely fashion.

USDA will make payments under the Dairy Market Loss Assistance Program based on a dairy operation's first 26,000 cwt of milk produced and marketed in either 1997 or 1998, whichever is the highest. Targeted to family-sized operations, the amount of eligible production is about the annual production of a herd of 150 cows. The final payment rate per cwt will be calculated after signup ends, but USDA expects the rate to be between 18 and 20 cents per cwt and the maximum benefits to be about $5,000 per dairy operation.

Question. What criteria has the Department developed to determine which farmers are eligible to receive this assistance?

Answer. All dairy operations that produced and commercially marketed milk from cows in the United States from October 1998 to December 1998 are eligible.

Question. What is the time line for the delivery of this program assistance to eligible farmers?

Answer. Producers must apply at their local Farm Service Agency office between April 12 and May 21, 1999. Payments are expected to be made in mid-June.

GROCERY MERGERS

Question. Across the nation, we are seeing consolidation in all areas of business. The supermarket industry is no exception. What impact will the consolidation of this industry have on prices paid to farmers for their goods and the prices charged to consumers?

Answer. At the national level, the concentration of sales among chain and other grocery retailers has traditionally been relatively low, but has been increasing in the past few years. In 1997, over two hundred grocery store chains operated in the United States, along with several thousand independent grocers. The four largest chains, accounted for approximately 23 percent of all supermarket sales. At the local level, where competition for consumer dollars occurs, concentration of sales is generally considerably higher, but varies across local areas and has not increased significantly since 1990. The four largest supermarket operators accounted for 96 percent of sales in Miami but only 52 percent in New York, with other metropolitan areas falling between the two.

Consolidation can make firms in the supermarket industry more efficient and benefit both farmers and consumers. For example, larger firms may contract directly with farmers for fruits and vegetables. Improved efficiency and eliminating intermediaries can mean higher prices for producers and lower retail prices for consumers. Farmers have historically marketed very little of their production directly to retailers. Thus, the competition between retailers for farm level products has not been an important factor affecting farm prices. More critical to farm prices is the overall demand for agricultural goods and the competition among traditional first buyers of farm goods like grain elevators and meat packers.

Consolidation may be creating a food system that is slower to respond to market forces. Lower farm prices may not be passed through to consumers as quickly when supermarket chains are fewer and larger and face fewer competitors. When this happens, farm prices may stay low longer because retail price cuts are not being used to work off the supply-demand imbalance that caused farm prices to fall.

NATURAL RESOURCES CONSERVATION SERVICE STAFFING

Question. In the fiscal year 2000 President's budget request for the Natural Resources Conservation Service (NRCS) a staff level of 1,055 is decreased from the fiscal year 1999 level. Why is the number of staff being decreased when the proposal of several new Administrative initiatives are in the fiscal year 2000 budget request in the conservation area?

Answer. The NRCS budget increases are primarily for grants, easements, and other financial assistance directly for producers. However, the technical assistance required to support these initiatives and the acreage reduction from fiscal year 1999 for the Conservation Reserve Program result in 1,055 fewer staff years. Most of the reductions will take place in the field because past reorganizations have drastically reduced staff above the field level. This will result in a substantial reduction in the level of service provided to landowners and landusers in such areas as planning assistance, implementation of conservation practices, construction projects, resource inventories and reduced levels of implementation for some cost share programs.

Question. Is the agency's funding strained under the current workload and staff level? Why?

Answer. The fiscal year 2000 budget does not provide full funding for all the technical assistance needed to implement the proposed program activities, but all the staff years are counted as being funded in the 11,194 FTE ceiling shown in the budget. The fiscal year 2000 does not request any additional for the emergency watershed protection program. There is a $25,300,000 short fall to pay for the technical assistance necessary to implement Wetlands Reserve, Farmland Protection, and Conservation Reserve programs. The short fall exists because the cost to service these programs exceeds the CCC Section 11 cap on technical assistance.

COMMUNITY/FEDERAL INFORMATION PARTNERSHIPS

Question. The fiscal year 2000 budget request proposes an increase of $5,000,000 and 20 full-time employees (FTE) for the Community/Federal Information Partner-

ships (CFIP). $1,500,000 would be used to hire 10 additional FTEs. From where will the other 10 FTEs come and what work are they currently doing?

Answer. The explanatory notes mistakenly identified 20 FTEs for the Community/ Federal Information Partnerships. This initiative would only require the addition of 10 FTEs.

AIR QUALITY

Question. In the fiscal year 2000 budget request and agency programming, how does NRCS plan to work with American farmers who face air quality compliance problems?

Answer. Both the Environmental Quality Incentive Program (EQIP) and the Conservation Reserve Program (CRP) help American farmers who face air quality problems. EQIP enables NRCS to direct financial assistance to farmers with air quality problems. For example, in California there are four serious PM–10 non-attainment areas. In fiscal year 1998, NRCS' California State Office addressed air quality problems in the following ways: $15,000 for education grants to local Resource Conservation Districts and Air Quality Management Districts that helped publicize methods for controlling on-farm road dust; $300,000 for statewide concerns cost-shared at 75 percent with farmers for dust suppression on farm roads and chipping almond residues as an alternative to burning; and, within geographic priority areas, local work groups supported cost sharing on air quality mitigation practices. Similar levels of spending are planned for fiscal year 1999. The CRP has also mitigated air quality problems on thousands of acres across the nation (e.g., Washington).

Question. What funding is requested for this purpose, if any, and what amount of funding is needed to get the job done?

Answer. NRCS is not requesting specific funds for technical assistance in the current budget cycle to address air quality compliance. However, in response to the question regarding the funding needed to get the job done, NRCS estimates that about

$25,000,000 will be needed to begin addressing compliance issues through the Conservation Operations Program. These funds would be used to train existing field staff and to employ new staff to increase specialized technical assistance available to agency customers in defined air quality non-attainment areas.

Question. How is the agency working in cooperation with both the Environmental Protection Agency and USDA's Air Quality Task Force in representing the needs and interests of the American farmer on air quality issues?

Answer. Pearlie Reed, Chief, NRCS, chairs the Agricultural Air Quality Task Force (AAQTF). The AAQTF is comprised of representatives of agricultural production, agricultural industry, science, and health, including a representative of EPA's Office of Air Quality Planning and Standards. AAQTF recommendations regarding oversight, coordination, and science of agricultural air quality are transmitted to the Secretary of Agriculture and the Administrator of EPA. To date, the AAQTF developed a Memorandum of Understanding, signed by Secretary Glickman and Administrator Browner (NRCS A–3A75–8–30), to facilitate cooperation on agricultural air quality between USDA and EPA and has recommended priorities for air quality research. NRCS has also located a liaison with EPA's Office of Air Quality Planning and Standards in North Carolina. USDA staff from NRCS, FS, ARS, and CSREES and EPA staff from the Office and Air Quality Planning and Standards and the Office of Research and Development are meeting regularly on agricultural air quality issues.

GRAZING LANDS CONSERVATION INITIATIVE

Question. In fiscal year 1997, fiscal year 1998, and fiscal year 1999 $15,000,000 was earmarked for the continuation of the grazing lands conservation initiative. Please update the Committee on this initiative and include any money in the fiscal year 2000 President's budget request for this project.

Answer. NRCS continues to work successfully with the National GLCI Steering Committee and other partners to develop and coordinate NRCS' commitment to meeting the needs of local farmers and ranchers responsible for management of the nations grazing lands. The fiscal year 2000 President' budget does not specify additional appropriations to implement this initiative. NRCS continues to expand on past accomplishment which includes the availability of grazing land specialists in all states. The following is a report of NRCS fiscal year 1998 accomplishments due to increased emphasis and demand for technical assistance for the Nation's grazing lands. Fiscal year 1999 activities are ongoing and are not available at this time

ACCOMPLISHMENTS

Staffing

In 1998 hired 45 new employees and 421 employees allocated the majority of their time to providing technical assistance on GLCI activities.

Training

Over 16,000 individuals, including NRCS employees, and personnel from other agencies, and private grazing landowners and managers received training.

Technical Assistance

Technical assistance was provided on over 14,000,000 acres of grazing land. The conservation practice Prescribed Grazing was applied to over 11,500,000 acres.

Grazing Land Projects

There are 324 grazing land projects nationwide that demonstrates grazing land management and technologies.

Public Education and Awareness

NRCS conducted over 1,000 public awareness and education and awareness activities to over 202,000 individuals.

DEMONSTRATION PROJECTS LANGUAGE

Question. The appropriation language proposed in the fiscal year 2000 budget request deletes the prohibition on demonstration projects. This deletion will provide NRCS the ability to have demonstration project to educate and share conservation techniques with small farmers and financially limited landowners. Please explain the need for this change in law.

Answer. This change is proposed to allow NRCS the flexibility needed to efficiently and effectively implement its Civil Rights Outreach program. Demonstration projects are often the most effective way to work with groups of underserved farmer and ranchers. However, the current language in the Conservation Operations appropriation account prevents us from conducting demonstration projects, and our lawyers tell us authorities granted under other NRCS programs are inadequate to carry out this type of demonstration project.

CLEAN WATER ACTION PLAN

Question. As a part of the President's Clean Water Action Plan, all States have prioritized their watersheds according to the need for water quality and natural resource restoration or protection. This process is known as the Unified Watershed Assessment. Of the requested increase of $31,000,000 for conservation technical assistance (CTA), how much is allocated for the Clean Water Action Plan?

Answer. All of the requested increase in CTA funding is for implementation of Clean Water Action Plan initiatives (Animal Feeding Operation strategy—$8,000,000; locally-led conservation—$20,000,000; and watershed health monitoring—$3,000,000).

UNIFIED WATERSHED ASSESSMENT

Question. How much is being spent on the Unified Watershed Assessment process currently and how much is allocated for fiscal year 2000?

Answer. For fiscal year 1999, there was no funding specifically allocated to NRCS for the Unified Watershed Assessment (UWA) process. NRCS support for the UWAs in fiscal year 1999 came as a part of ongoing program efforts. The fiscal year 2000 budget request proposes a $3,000,000 increase for additional environmental monitoring and research work, a portion of which will provide data and information needed to establish base information and evaluate program outcomes for Federal resources used in UWA priority areas.

ANIMAL FEEDING OPERATIONS DRAFT STRATEGY

Question. Another component of this Clean Water Action Plan is the Animal Feeding Operations (AFO) draft strategy. The fiscal year 2000 budget request proposes an increase of $8,000,000 and 97 staff years to support this initiative. The Environmental Protection Agency estimates that there are 450,000 animal feeding operations and 6,600 concentrated animal feeding operations in this country. It believes that a large number of these will need to develop or revise their waste management plans. How much is currently being spent on this initiative and how many staff years are working on it?

Answer. NRCS will spend $53,500,000 ($37,000,000 Conservation Technical Assistance and $16,500,000 EQIP) in fiscal year 1999 to provide technical assistance through the locally-led planning and implementation process to help AFO owners and operators address water quality issues related to animal agriculture. The small watershed progra contributes technical assistance dollars also, however, data is not available to identify specific contributions. Starting with this year, NRCS is tracking through its accountability system how its staff time is used to address the needs of AFO owners and operators, by specific program and activity, for all employees.

Question. What kind of demand from farmers is there for this technical support through Conservation Operations since no cost-share assistance will be provided.

Answer. NRCS currently assists approximately 10,000 AFOs annually through a variety of programs (i.e., Conservation Operations, EQIP, and the small watersheds program) to prepare animal waste management plans, provide technical engineering and agronomic expertise, design and build structures, and implement land management practices. Regularly these farmers seek our technical assistance before they determine whether or not to apply for financial assistance from a variety of potential cost-share sources, including USDA and state and local agencies. Thus, initially they will receive planning assistance, for example, through the Conservation Operations program, but they may ultimately receive implementation assistance through a different or non-USDA financial assistance program. Our accountability system is not currently capturing the data we need to provide specific demand numbers; however, we anticipate that the pending issuance of the Unified National Strategy for AFOs will significantly increase the demand by AFO owners and operators for technical assistance.

Question. How does this demand compare to the demand for technical and cost-share assistance provided through the Environmental Quality Incentives Program (EQIP)? Is not this work not addressed through EQIP? Please explain.

Answer. The primary source of USDA financial assistance to AFO owners and operators is the Environmental Quality Incentive Program (EQIP), which has been funded at $200,000,000 in 1997 and 1998 and $174,000,000 in 1999. Approximately 45 percent of the funds in each of these years fund contracts with AFOs to develop and provide cost share incentives to help implement nutrient management plans. The requests for financial assistance funds for AFOs during each of those years was approximately three times the amount available. It is likely that the Unified AFO Strategy, as well as the increased attention to this issue by states, will further increase the demand for both technical and financial assistance from USDA. It should also be noted that EQIP is specifically designed to encourage the leveraging of other sources of technical, educational and financial assistance funds.

Question. The fiscal year 2000 Budget Justification Notes state that the $8,000,000 for AFO will be combined with approximately $1,000,000 in climate-related AFO pilot projects and $11,000,000 in redirected conservation technical assistance funds. This will bring the total to $20,000,000 for the AFO conservation technical assistance. What sort of climate change-related AFO pilot projects are planned? From what area of conservation technical assistance will the $11,000,000 be redirected?

Answer. The AFO pilot projects will demonstrate and test various greenhouse gas mitigation strategies and monitoring mechanisms, as well as a variety of financial assistance mechanisms under existing authorities. Examples of potential pilot projects include compost-based waste handling facilities, constructed Wetlands for waste management, rotational grazing systems, and improved feed/forage efficiency.

Conservation technical assistance funds are to be used to maintain and improve the soil, water, and related resources of the Nation's nonpublic lands by reducing excessive soil erosion; reducing agricultural nonpoint source pollution of water; improving irrigation efficiency; making more effective use of water; reducing upstream flood damages; improving range condition; and restoring, maintaining, and improving wetlands. Thus, the allocation of the $11,000,000 will be made with the requirement that the funds be used to address the needs of AFOs.

Question. The fiscal year 2000 budget request proposes an increase of $15,000,000 for activities supporting the Global Climate Change. What is currently being spent on these activities?

Answer. NRCS has funded its Global Climate Change research program at $1,200,000 in fiscal year 1998 and fiscal year 1999. Prior years were funded at $1,500,000. Funds were distributed and utilized as follows:

—50 percent to the National Soil Survey Center, Lincoln Nebraska ($600,000). Conservation and Wetlands Reserve Programs carbon sequestration effects, conducted jointly with ARS and University Cooperators, changes in soil climate (moisture and temperature) and associated rates of carbon sequestration, Soil Carbon map production, National soil carbon stock analysis

—40 percent to NRCS state offices for University cooperator research projects ($442,000). Most funds directed toward a long term 8-state (TX, LA, OR, IN, ND,MN,NH,UT) comprehensive wetlands study which includes rates of change in carbon stocks.
—10 percent to universities in response to RFP's on climate change and carbon sequestration ($162,000).

SOIL CARBON STUDIES

Question. Which agency conducted the soil carbon studies? What is NRCS' role in expanding this study?

Answer. Several agencies within USDA, including the ARS and the FS, are conducting soil carbon studies. NRCS is engaged in a multi-year effort related to Global Change. As a result, seven technical volumes have been published on soils and global change and five more are currently in process. Most of these publications were proceedings from scientific meetings organized jointly by the Natural Resources Conservation Service, the Agricultural Research Service, the Forest Service, the Environmental Protection Agency, the National Aeronautics and Space Administration and the Ohio State University. Titles include: Management of Carbon Sequestration in Soil, Soil Management and the Greenhouse Effect, and Soil Processes and the Carbon Cycle. One volume was a special synthesis report on The Potential for U.S. Cropland to Sequester Carbon and Mitigate the Greenhouse Effect. Similar reports on the potential for U.S. grazing lands and U.S. forestlands are currently in production.

The carbon cycle research projects undertaken by the NRCS are directed at terrestrial soil carbon interactions with atmospheric biochemical fluxes. This knowledge will enable circulation models to more accurately describe, at the regional scale, the impacts of agriculture and forestry on greenhouse gas levels, and to project adaptation capacity.

The NRCS cooperative soil survey data is the first building block essential to understanding the terrestrial carbon pool. To establish the scientific basis for a terrestrial carbon inventory, refinement of soil carbon data across soils, climate regimes, and under various management systems and land uses is required. The fiscal year 2000 Global Change budget initiative in NRCS begins to address this requirement. Specific components include the following:

NRCS will enhance the national soils data bases through five initiatives: Accelerate digitizing of county level soil surveys, and update the state level soil mapdatabase, which are the primary geospatial data layers linked to the national soils attribute database, Complete the National Soil Information System (NASIS) development effort to achieve on-line database access, Add "use-dependent" soil carbon data and soil pedon descriptions to the NASIS database, Develop on-line, a real-time georeferenced soil pedon database Develop the Ecological Site Information System (ESIS: a cooperative FS/BLM/NRCS effort) for range and forestland.

Evaluations, including field validation and calibration, of modeling, remote sensing, and statistical inventory approaches to field level, regional and national scale carbon stock assessments that are sensitive to the land management practices and agronomic systems that impact soil carbon levels.

—Directed field soil sampling and increased laboratory analysis capacity
—Development, testing and application of improved sampling, inventory and analysis protocols

This enhanced NASIS database, and associated databases, models, inventory and assessment products will be applicable to integrated environmental and agricultural sector policy impact analysis, as well as providing scientifically grounded tools for potential carbon crediting or trading programs. It will enable carbon cycle, land use, and socio-economic models and inventories to utilize soil carbon data that reflect actual biophysical and human induced variability in soil carbon stocks.

Focus of the first year's effort in these carbon studies (Global Change Research Program, $12,000,000) will be in major agricultural regions on major crops in common production systems, and expanding into about 25 percent of non-federal range and forest lands.

The initiative also has a component (Climate Change Technology Initiative, $3,000,000) that includes pilot projects for delivery of carbon enhancing/emission reducing conservation systems.

Incentives, planning tools, and technical assistance for conservation systems that comprehensively enhance soil carbon sequestration and reduce greenhouse gas emissions, while also achieving water quality, wildlife and other environmental benefits will be field tested and evaluated.

Pilots will be conducted on croplands, grazing lands, and animal feeding operations, using existing financial and technical assistance programs. Innovative management systems and field carbon prediction and planning tools being developed by ARS will be field applied and evaluated.

Example of systems and practices that build soil organic carbon, and reduce greenhouse emissions that will be piloted may include: Cropland, use of cover crops, field application of organic amendments, reduced tillage and residue management systems,nutrient management, establishment of landscape buffers; Animal production and grazing land establishment of grass based animal feeding systems, establishment of aerobic compostig operations alternative management systems for confined animal manure handling.

Attention will be paid to technology and delivery systems appropriate for limited resource, small scale, and underserved clients.

MEASUREMENTS OF SEQUESTRATION OF SOIL ORGANIC CARBON

Question. Once the measurement and incentive systems are developed and applied, sequestration of soil organic carbon will be measured and verified. Which agency will carry out the measurements of sequestration of soil organic carbon?

Answer. NRCS does not anticipate conducting extensive measurement of carbon sequestration. NRCS is cooperating with ARS and others to direct selected field carbon measurements to develop, validate and verify models that could be used at various scales to predict carbon sequestration. Models that are being developed to predict soil carbon sequestration are compatible with existing programs in use in the NRCS field offices to plan and predict the erosion control benefits of conservation systems. The intent is to create a seamless system, into which data need be entered only one time to predict erosion rates and carbon sequestration rates for farming system options selected by farmers. The information infrastructure is being designed to be available on the Internet, so that farmers or private sector consultants may utilize the available information and analytic tools independent of federal conservation programs. These tools may also be applied by NRCS in national and regional carbon stock inventories in addition to other natural resource condition assessments, such as erosion in the National Resources Inventory. Field measurement validation of models will be conducted by NRCS in cooperation with the Agricultural Research Service. Field level measurement for verification may be conducted by NRCS or others as appropriate, based on the type of program or private contractual agreement in place for carbon storage.

GLOBAL CLIMATE CHANGE

Question. Will any of this work address the study by the Pew Center on Global Climate Change that indicates global warming will change where crops are currently grown in the U.S.? (The study indicates crop acreage and livestock operation will shift northward.)

Answer. The NRCS budget request includes $200,000 which will be contributed to the Agricultural Sector and regional global climate change assessment reports that are being coordinated through the USDA Global Change Program Office and the USGCRP.

TRACKING GRAZING CONSERVATION ASSISTANCE PROGRAM FUNDS

Question. In the fiscal year 1999 Senate Report, the Committee directed the agency to establish a system to provide an accounting of funds used for the grazing conservation assistance program within conservation operations. What has the agency done to address this directive?

Answer: NRCS has established an accountability system that meets the directive. The National Performance and Results Measurement System (PRMS) captures data from all levels of NRCS. It provides easy and timely access to agency accomplishments. Time and Cost Accounting System (TCAS) is part of the accountability system to collect information on how employees spend their time. Specific to the GLCI earmark, PRMS and TCAS collectively will allow the agency to monitor and report progress in staffing, training, technical assistance, projects and outreach activities. Additionally the NRCS has also implemented a workload analysis system to address future GLCI workload requirements.

PLANT MATERIALS CENTERS FUNDING

Question. Please explain how the $1,000,000 for the plant materials centers in the fiscal year 1999 Senate Report has been used to continue development of warm season grasses for use in the Conservation Reserve Program and the Wildlife Habitat

Incentives Program. How has the agency encouraged the development and transfer of technology among all the Department's natural resources conservation programs?

Answer. The $1,000,000 was distributed among plant centers doing work with warm season grasses. Some of the species under study include: eastern gama grass, bluestems, switch-grass, dropseed, gramas, and Indiangrass. All of these species are natives that provide critical food and/or habitat (e.g., cover) for wildlife. Consequently, they represent a core group of plants that are available for use in the Wildlife Habitat Incentives Program. Many of the same species are also important components of the Conservation Reserve Program (CRP). In the Great Plains, for example, bluestems, Indian grass, and switch-grass are widely used to restore and stabilize highly erodible lands. In recent years, the Plant Materials Program has developed and released cultivars that are now in high demand for the CRP. Without these releases, it is doubtful that the CRP would be very functional.

Despite past success, however, there is an ongoing need to develop better materials and technical information on warm season grasses. The $1,000,000 has enabled this work to continue actively at 16 Plant Materials Centers. Centers that are involved include ones in Arizona, Arkansas, Florida, Georgia, Kansas, Louisiana, Mississippi, Missouri, Montana, New Mexico, New York, North Dakota, Texas (3 centers), and Washington. These centers have studies underway with warm season grasses to develop better selections and more advanced technology.

Technology development and transfer in the Plant Materials Program has advanced along a broad front. Cooperative work is underway with the National Park Service, Department of Defense, Department of Transportation, and Agricultural Research Service. The Plant Materials Program serves as a source of technology for application-oriented information. The Natural Resources Conservation Service encourages work of this sort. It is promoted as one way to avoid duplicative efforts among other natural resources conservation programs. Technology transfer is achieved through printed materials, oral presentations, and electronic transfer. Last year, for example, the Plant Materials Program had 310 written materials and 469 oral presentations. Written materials included technical notes, plant guides and fact sheets, symposium/poster materials, and progress reports. Oral presentations included training sessions, tours, and local/regional/national presentations. Electronic transfer was also accomplished via an Internet homepage. The address is: http://plant-materials.nrcs.usda.gov.

PRIORITY AREA PILOT PROJECTS UNDER EQIP

Question. Please explain the progress that the NRCS has made in addressing the Committee's directive in the fiscal year 1999 Senate Report regarding the priority area pilot programs under the guise of EQIP.

Answer. The fiscal year 1999 Senate Appropriations Report, the Committee "directs the agency to evaluate the applications for fiscal year 1999 and proceed to provide adequate funding for not less than two national priority area pilot projects." NRCS is in the process of establishing the two national priority areas called for in the Senate Report.

In the interim, to meet the Committee's direction, $5,650,000 was allocated in fiscal year 1999 to increase funding to two priority areas previously identified and approved by NRCS State Conservationist, and recognized by NRCS as having national significance. Of this amount, $1,300,000 was allocated to Mississippi for the Mississippi Delta region. The funds will be expended in several smaller priority areas approved in this region. The second area of national significance is the Colorado River Salinity Control effort. Colorado, Utah, and Wyoming were allocated a total of $4,350,000 for use in priority areas where salt reduction is occurring in cooperative efforts with other local, State, and Federal agencies and groups.

WETLANDS RESERVE PROGRAM EASEMENTS

Question. How has the agency addressed the acceptance of WRP bids and the goal that landowners be offered a choice among permanent and nonpermanent easements as well as cost-share agreements?

Answer. Landowners are offered the opportunity to sign up for one or more of the categories of WRP projects. The offers for each category are ranked with others of the same category and funds are allocated to fund the best offers from each of the three types. The amount of enrollment from each category is proportional to the level of landowner interest.

COOPERATIVE AGREEMENTS SUPPORTING WRP

Question. Please describe the existing cooperative agreements with private conservation organizations to support the implementation of the WRP.

Answer. Cooperative agreements are in effect with a number of private conservation entities. They include the California Waterfowl Association, Ducks Unlimited, Great Swamp Conservancy (New York), Iowa Natural Heritage Foundation, Mississippi Fish and Wildlife Foundation, National Fish and Wildlife Foundation, Pheasants Forever, and the Wisconsin Waterfowl Association. The type of services included in the various agreements include: site evaluation and planning assistance to landowners; engineering field topographic surveys and structure design; on-site restoration implementation assistance; nest structure conservation and placement; funding assistance to primarily limited resource landowners; and administrative assistance with realty title clearance and land survey issues. In the Lower Mississippi River Valley States of Arkansas, Louisiana, and Mississippi, the assistance is in the form of engineering field topographic surveys and structure design, on-site restoration implementation assistance, nest structure construction and placement and cost-share assistance to limited resource landowners.

TRANSFER OF WATERSHED ACCOUNTS TO CONSERVATION OPERATIONS

Question. What is the purpose of the new appropriations language proposed in the Administration's fiscal year 2000 budget request that transfers funding for Watershed Surveys and Planning to Conservation Operations?

Answer. Appropriating the funds to the water resources planning and construction accounts shows the total program costs of planning, technical assistance and construction during the fiscal year. Transferring these planning and technical assistance funds to the Conservation Operations account shows the costs for most of NRCS field activities in one appropriation account.

Question. What is the purpose of the new appropriations language proposed in the Administration's fiscal year 2000 budget request that transfers funding for technical assistance for Watershed and Flood Prevention Operation to Conservation Operations?

Answer. Appropriating the funds to the water resources planning and construction accounts shows the total program costs of planning, technical assistance and construction during the fiscal year. Transferring these planning and technical assistance funds to the Conservation Operations account shows the costs for most of NRCS field activities in one appropriation account.

FLOOD PREVENTION PROGRAM FUNDING

Question. The decrease of approximately $16,000,000 in the proposed fiscal year 2000 budget request for Watershed and Flood Prevention Operations is based on the possibility that no Public Law 534 projects will score high enough for environmental and economic benefits to be funded. Is this correct? What will this money be used for instead?

Answer. The decrease in the Watershed and Flood Prevention Operations of $16,000,000 is not directly related to the fact that in recent years, $15,000,000 of the total appropriation for watershed operations has been designated for Public Law 534. It has been NRCS' position that since all projects are funded by the same appropriations, both Public Law 534 and Public Law 566 projects should stand on their own merits in terms of economic and environmental defensibility. For this reason all projects in contention for funding are evaluated using the same criteria. To this point, Public Law 534 projects have competed well with those being considered.

If no Public Law 534 projects were found to be economically and environmentally defensible in the near term then all available funds would be used to fund Public Law 566 projects.

PUBLIC LAW 534 WATERSHED PROJECTS CRITERIA

Question. For Public Law 534 watershed projects, there are 23 unserviced applications and 24 projects in the planning process. Will these be assessed under this new criteria of environmental and economic benefits in order to be addressed? When does the agency plan to move forward on the unserviced applications and the others in the planning process?

Answer. The environmental and economic defensibility is considered for each project in contention for funding. In many ways these challenges are addressed in the planning process as a means of ensuring an appropriate investment of both federal and local dollars. The program statutes require that all projects must be economically defensible. It is doubtful that all necessary permits could be obtained unless it can be clearly demonstrated that a given project is also environmentally defensible. However, decisions for funding are not based solely on any one criteria. Consideration is given to other factors including existing threats to life and property

that would be addressed by the project, and the needs of economically depressed communities.

As to when the NRCS will move forward with unfunded authorized Public Law 534 projects and unfinished watershed plans is dependent on three key variables: sponsor commitment; the amount of Public Law 534 funding available to support the technical assistance necessary to complete the work; and, the amount of financial assistance available to complete the project.

Local sponsors are required to make commitments regarding landrights, liability, and securing the non-federal funds required in cost share projects. Sponsors are also required to obtain all necessary permits prior to implementation of their projects. Many of the authorized projects on which there has been no activity, and those with incomplete watershed plans have been placed in a hold status at the request of local sponsors. They simply have not wanted to accept the risk and uncertainties associated with readying their projects for funding in light of the drastic decline in appropriations for watershed operations.

RISK MANAGEMENT AGENCY

Question. In the fiscal year 2000 President's budget request an increase of $715,000 is proposed for civil rights activities for the Risk Management Agency (RMA). What activities is the Risk Management Agency currently doing in the civil rights area?

Answer. RMA has significantly increased outreach activities aimed at assuring that ALL farmers and ranchers can equally access all risk management tools and programs. We have designated a full time National Outreach Coordinator as well as regional coordinators in the Regional Service Offices to implement the National Outreach plan. To assure that we reach all small and limited resource and traditionally under served farmers and ranchers, we have entered into cooperative agreements with eleven (11) community based and other organizations, summarized below, to provide risk management education and technical program assistance. We are reviewing four outreach proposals for consideration in fiscal year 2000. The Office of Civil Rights and Community Outreach Staff recently mailed out approximately 400 letters to community groups and organizations requesting that they get the message out to their constituents on the Emergency Financial Assistance to Farmers announced by President Clinton.

In addition, RMA is currently working on the following initiatives relating to civil rights:

Data Collection.—RMA and the Office of General Counsel have developed data and reporting regulations and procedures for reinsured companies to begin collecting civil rights data in the fall of 1999. The data will be used to determine how effectively RMA programs are reaching underserved groups and identify areas where additional outreach is needed.

Civil Rights Compliance Reviews.—RMA is currently developing procedures, based on guidelines furnished by the Department, for conducting on-site civil rights/EEO evaluations and training for reinsured companies. The first of these training sessions is scheduled to begin on July 1, 1999.

Diversifying the Delivery System.—The Office of Civil Rights and Community Outreach is working with reinsured companies to recruit and hire minority Agents. We are providing the companies with a list of minority insurance agents who may be interested in selling crop insurance. We are also inviting the companies to recruit at National Conferences, e.g., Minorities in Agriculture and Natural Sciences (MANRRS) scheduled in April, and at the 1890 and 1994 Land Grant Colleges and Universities.

Cooperative Agreements.—RMA has cooperative agreements with the following organizations:

—Federation of Southern Cooperatives—Provides program technical assistance and training to small and limited resource farmers in 12 southern states, and is conducting a customer survey.

—Toppenish High School—Promote and encourage community efforts and government agency participation in developing the project to utilize the high school to educate local farmers and deliver outreach efforts. The Washington State FAC, including the Spokane RMA Regional Service Office will work with the project coordinator on this initiative.

—Intertribal Agriculture Council—This agreement is funded by RMA and other USDA agencies to support specific goals to inform Indian producers and tribal governments of programs and program technical assistance which may be available to them in the conservation of their natural and agricultural resources.

—Rural Coalition/Coalition Rural—The Coalition will sponsor an annual conference which will include representatives from approximately 90 community-based organizations (CBOs). These representatives will be trained on several USDA programs. They will provide USDA training to members of their respective CBOs through workshops and one-on-one consultations.
—Hmong American Community, Inc.—Provides risk management education, program training and information to Hmong and other Southeast Asin farmers in California.
—Bringing Rural America Venture Opportunities—RMA is partnering with Office of Small and Disadvantaged Business Utilization to create technology-based jobs on Indian lands and surrounding economically disadvantaged rural areas. Tribal entities (Indian Nations) will establish small start-up technology companies. Initial services provided will be software development for USDA.
—Lac du Flambeau (LDF) Band of the Lake Superior, Chippewa Indians, Lac Du Flambeau, WI—The LDF tribe will initiate an agricultural and resource management program to provide disadvantaged farmers and ranchers on the LDF Indian reservation with the technical assistance and infrastructure necessary to assure success. The LDF Band will provide assistance to the LDF Indian tribe by allowing them to begin providing food, jobs and income for their tribal members.
—University of California, Cooperative Extension—Will develop a directory and guide of Agricultural programs and services for small farmers in San Joaquin Valley.
—National Black Farmers Association, Inc.—Will provide training and technical assistance programs to disadvantaged farmers in 16 counties in Virginia.
—First American Curriculum Development Project—RJS & Associates will develop five major (both print and computer assisted instructional) curriculum units tailored to meet the needs of American Indian agribusinesses. RJS & Associates will work with the twenty-nine tribally controlled land grant colleges in the development of this curriculum. This project will also identify and develop potential employees (American Indians) for RMA and other USDA agencies to address under representation in the workforce.

Question. How much of your current resources are being spent on civil rights activities?

Answer. There was no separate funding provided for Civil Rights activities in RMA's fiscal year 1999 appropriation, but the Civil Rights staff has estimated $207,000 is needed for ongoing activities.

Question. How much will the survey which RMA plans to commission with North Carolina A&T State University cost? How was this 1890 Land Grant University chosen to do this survey?

Answer. We are currently estimating $25,000 for the survey. We have not made a commitment to North Carolina A&T at this time—other universities are also being considered. North Carolina A&T is being considered because it has the capacity to conduct surveys and provide professional analysis.

RISK MANAGEMENT EDUCATION

Question. An increase of $3,000,000 for Risk Management Education activities is also proposed in the President's fiscal year 2000 budget request. What amount of resources and on which activities is the RMA currently spending on education?

Answer. Since its beginning in fiscal year 1998, the Risk Management Education (RME) initiative has never received operating (A&O) funding. All expenditures for RME have come from the FCIC Fund. In the enacted 1998 Agricultural Research Title, Public Law 105–185, certain expenditures from the FCIC Fund (including those for RME) were capped at $3,500,000 per year as part of a measure to permanently fund the crop insurance program. For fiscal year 1999, $1,000,000 of the $3,500,000 FCIC cap has been allocated to RME activities.

The fiscal year 1999 RME budget is as follows:

Item	*Amount*
Direct Producer and Trainer Education (local workshops)	$550,000
Cooperative State Research, Education, and Extension Service (continued development of the Internet Library)	100,000
Publications	250,000
FFA Essay Contest	50,000
Curriculum Development	50,000
TOTAL	1,000,000

PUBLIC OUTREACH

Question. How much is RMA currently spending on public outreach activities?

Answer. We are spending an estimated $260,000, with an additional $330,000 possible for a nationwide mailing to approximately 1,000,000 producers should the proposed reform measures be approved.

INTERNATIONAL CROP INSURANCE

Question. Why is the RMA considering an expansion into an international crop insurance program and what purpose will this program serve?

Answer. RMA's international work assignments are in response to requests made by various nations and emerging economies through USDA's Foreign Agricultural Service (FAS) foreign agricultural posts. Inquiries are handled on a case by case basis depending upon the individual request. Generally, initial briefings are handled by FAS Agricultural Attaches and other FAS personnel traveling overseas on other business. When there is a need for further technical assistance, RMA receives a request from FAS and a one or two hour meeting is held during which various RMA program staff are asked to brief the international representatives regarding: (1) How the U.S. crop insurance program is designed; (2) What benefits US producers receive; (3) The program's delivery mechanism, i.e., the Standard Re-insurance Agreement (SRA) which RMA uses to contract for delivery services with private sector insurance providers, and (4) Answers regarding any specific questions which are asked.

Recent inquiries include: Japan has made two separate inquiries as to how the Dairy Options Pilot Program (DOPP) works; France requested information regarding revenue products, status of current legislative proposals, whether there is a possibility of new legislation which would restore price protection to US producers; Australia has inquired about potential legislative changes and inquired about Risk Management Education strategies; Rumania has requested USDA/RMA to provide training for four Rumanians on starting a crop insurance program utilizing a public-private partnership.

Since the beginning of 1998, delegations from the following countries, international producers' groups, or international re-insurers have made requests through FAS to the Risk Management Agency: Argentina, Austria, Australia, Brazil, Canadian Crop Insurance Research Directors, Czech Republic, European Corn Growers' Association, France, Germany Farmers' Union, Hungary, Israel, Italy, Japan, Mexico, New Zealand, Peru, Poland, Republic of South Africa, Rumania, Russia, Sweden, Taiwan, and the United Kingdom.

Interest has also been expressed by the World Bank for RMA availability for representatives to speak at tentative upcoming seminars and/or participate in other local conferences.

In addition, under the auspices of the U.S.-Republic of South Africa (RA) Bi-National Agreement (Bi-National) and in response to a specific request from the RA, the United States Agency for International Development (USAID) funded a grant to USDA/RMA which includes a section on creating crop insurance pilots for the RA. The general purpose of Bi-national is to foster stability for a new democracy with a newly enfranchised majority population and an emerging economy. Vice-President and Secretary Glickman participated in signing ceremonies for the Bi-National in South Africa in mid-February. With funding (approximately $300,000) from USAID, RMA will give assistance to RA so that crop insurance pilots and a subsequent education and training program can be created. Private insurance companies and their international re-insurers can be expected to participate in the project.

Development of an international perspective for agricultural production insurance can assist local U.S. producers in two ways:

—One: Level playing field issues for U.S. producers: WTO-GATT agreements (within the framework of the Annex II negotiations) call for the phase-out of direct subsidies to participating nations' agricultural producers by the year 2020; and the FAIR ACT of 1996 legislated the phase-out of U.S. producers' direct subsidies (with AMTA payments slated to end in 2002). As AMTA payments decline, U.S. farmers are being forced to compete in foreign markets with international producers who still receive large direct subsidies. RMA's assistance to foreign inquiries has a long range goal of assisting other nations reduce their producers' subsidies so that all farmers receive the same kinds of assistance, i.e., sell/compete on a "level playing field" under similar conditions.

—Two: Spreading the risk so that the cost of insurance can be cheaper for U.S. producers: Reinsurance companies, who are investing and taking risk on one side of the world, are seeking ways in which they can spread out or mitigate their own risk taking. Having global access to successful farming endeavors on

all parts of the globe, rather than in just one hemisphere, can help to mitigate the risks.

Question. What is the estimated cost of this program.

Answer. To date, RMA does not have a specific budget for international activities. Other than the USAID funds through the Bi-National Agreement, RMA expenditures have, for the most part, been revenue neutral because of FAS' participation in the program and the ability of FAS and RMA to work together. Other RMA costs are minimal, e.g., limited to the sharing of materials which are already developed for U.S. farmers. If RMA were to take a more pro-active approach to the creation of an international crop insurance program, either additional Congressional funding or a Memorandum of Understanding would be necessary.

CROP INSURANCE REFORM

Question. The current crop insurance program was intended to eliminate the need for ad hoc disaster assistance in appropriations bills. Why do you think your proposed reform package would eliminate the need for ad hoc disaster assistance?

Answer. By addressing the concerns that farmers have raised regarding the program, we would increase participation and coverage nationally so that when natural disasters strike, farmers would have an adequate safety net to see them through the financial hardships. The Administration's proposal addresses the problems most often expressed by producers as to why the crop insurance program does not work for them. The plan would raise the current level of protection associated with catastrophic risk protection to some level that is more meaningful than the current 50/55 (yield/price) coverage available. At the same time the proposal would increase the current subsidy level for buy-up coverage. Producers often complain that subsidies above the 65/100 coverage level are necessary to make effective coverage more affordable. The plan would also provide incentives for all coverage plans including the increasingly popular revenue plans. The Administration's proposal also seeks to address concerns raised by multi-year disasters and would authorize some form of umbrella coverage to assist farmers who have suffered repetitive crop losses due to natural disaster.

The Administration's proposal would also seek authorization to offer limited coverage for livestock which is currently restricted by statute and would continue to emphasize the role of risk management education to ensure that farmers are aware of available options, including market mechanisms, to protect them from financial losses.

KEY INITIATIVES

Question. The President's fiscal year 2000 budget request proposes an increase of $7,000,000 to inform producers about risk management tools and alternatives. Also this increase would be used to expand research and create programs to cover more crops and expand the range of programs offered to existing crops. What is the agency currently spending on these program initiatives and how will the success of these initiatives be measured?

Answer. In fiscal year 1999, it is estimated that $1,000,000 of the available $3,500,000 in the FCIC Fund will be used for Risk Management Education activities and programs. This is an important part of the crop insurance program in that it informs producers, through educational programs in local workshops, of risk management tools available to them, and also provides train-the-trainer sessions for educational partners, such as lenders and crop insurance agents. The remaining portion of the funds available, $2,500,000, will be used to maintain and improve current crop programs and to research new programs, to assure that farm producers have a cost-effective means of managing their risk through a strengthened safety net of risk management tools. A portion of this funding may also be used for the Public Outreach and Civil Rights activities. Civil Rights activities are estimated at $207,000, and Public Outreach activities are estimated at $590,000.

RMA uses several methods of measuring the effectiveness of the RME initiative. First, evaluations are administered at all workshops and training sessions. These are used by local program planners to get feedback from producers as to which elements of training meet their needs so that future training sessions can be more effective. Second, a professional evaluator has been contracted through the Cooperative State Research, Education and Extension Service to examine larger projects funded through the RME initiative. Third, a survey project funded by RMA and conducted by four Land Grant universities will identify producers' risk management awareness and skill levels over several diverse agricultural areas and among small and limited resource farmers. Follow up surveys in the future will show the extent

to which the RME initiative has been effective in raising producers' ability to manage risk.

RMA will contract to assess the value of the Public Affairs support for the risk management education initiative. Key elements of the contract will include market research, to determine what producers know about the crop insurance program; the development of an outreach plan to inform producers of knowledge that was lacking; developing and producing materials and information to reach targeted audiences; and a final evaluation of the venture to see if the goals were met. The type of evaluation conducted will depend heavily on the funds made available for the effort.

The success of the Civil Rights outreach initiatives will be measured through initial producer surveys, with a follow up survey with a year or two. Success will also be measured by the level of program participation of minority and small, limited resource producers, as well as the number of fee waivers granted to minorities and limited resource farmers in 1999 and 2000, as compared with 1998.

RMA will measure the success of its research and development of new crop programs by evaluating premium income, insured acreage, participation, and actuarial soundness of pilot programs relative to performance goals established for the pilot at program inception. RMA will measure the success of its expansion of existing crop programs and overall program effectiveness by evaluating the degree to which U.S. agricultural production is covered by RMA insurance products. Currently, RMA covers an estimated 62 percent of U.S. agricultural production as allowed by the Act. As new crop programs and plans of insurance are made available, RMA will look to cover an increasing share of the total U.S. agricultural production. In addition, evaluations are made to assess producer acceptance, the ability of products to provide a viable economic benefit in times of yield or revenue loss, and whether product design adversely affects product delivery. These evaluations assist RMA in determining whether products should be eliminated, modified, or expanded.

FUNDING FOR CROP INSURANCE IMPROVEMENTS

Question. The Budget makes no recommendations for offsets to pay for any changes to crop insurance statutes. I understand that several billion dollars will be necessary. How does the Department propose to pay for these improvements?

Answer. In its white paper, "Strengthening the Farm Safety Net," the Administration states its intentions to seek consensus among producers, the Congress, and other stakeholders as to the nature of the changes needed. Once that consensus is built, agreement will be needed on the difficult task of finding the best way to finance those improvements. RMA is ready to work with Congress to develop a package, finalize the package, and work through everyone's ideas in a responsible manner regarding this issue.

FOREIGN MARKET DEVELOPMENT COOPERATOR PROGRAM

Question. In past years, this Administration has proposed that the Foreign Agricultural Service (FAS) directly fund certain costs supported by the Commodity Credit Corporation (CCC) and that appropriations for the Foreign Market Development Cooperator Program be reduced to offset these and other proposed increases in the FAS appropriation. Now, the President's fiscal year 2000 budget proposes that the Cooperator Program be funded by the CCC rather than the FAS appropriation. Why has the Administration reversed its position, both as to the program costs which should be borne by the CCC and the level of funding for the Cooperator Program?

Answer. The budget proposes to continue funding for the Cooperator Program at $27,500,000, unchanged from estimated fiscal year 1999 level. However, the proposal to shift Cooperator Program funding from the discretionary category to the mandatory category of the budget would free up an equal amount of discretionary spending for other worthy purposes. This proposal is consistent with provisions of the CCC Charter Act which authorize the use of CCC funds for export promotion and market development activities. Program funding for other market development activities carried out by FAS is already provided through CCC and this change would consolidate the source of funding and financial management activities for these various programs. By providing a permanent authorization for CCC funding, the proposal would provide stability for future program activities and would thereby enhance long-term planning by program participants.

Question. The fiscal year 2000 request assumes savings in appropriations from proposed legislation to shift funding for the Foreign Market Development Cooperator Program from the direct appropriation of the Foreign Agricultural Service to the Commodity Credit Corporation. While the appropriations request for FAS is not reduced, the $27,500,000 in savings is nonetheless reflected in the total discretionary appropriations proposed by the President for this Subcommittee. If the legis-

lative proposal to shift funding for the Foreign Market Development Cooperator Program to the CCC is not enacted by the Congress, what reductions in appropriations does the Department propose to offset the $27,500,000 in fiscal year 2000 appropriations required to continue funding for this program?

Answer. The fiscal year 2000 budget was submitted on the basis of current law, which includes funding for the Cooperator Program in the FAS appropriation. Also included in the fiscal year 2000 budget is a legislative proposal to shift for the Cooperator Program to CCC. If this legislative proposal were adopted by Congress, the amount requested for FAS in fiscal year 2000 would be reduced accordingly.

Question. Please provide a table showing the total amount of funding available for the Foreign Market Development Cooperator Program in fiscal years 1997 through 1999, and the amount proposed for fiscal year 2000, showing for each fiscal year the amount of federal funding, non-federal funds, and any federal carryover balance.

Answer. I will be glad to provide that information for the record.

[The information follows:]

COOPERATOR PROGRAM FUNDING

[Fiscal years 1997–2000]

	1997	1998	1999 Estimate	2000 Estimate
FAS Funding	$27,500	$28,000	$27,500	$27,500
Non Federal Funds	47,200	43,900	44,000	44,000
Federal Carryover Balance	10,400	12,200	9,700	7,200

Question. Provide a breakdown of how FMD Cooperator Funds were allocated in each of fiscal years 1998 and 1999.

Answer. I will be glad to provide that information for the record.

[The information follows:]

COOPERATOR FUND ALLOCATIONS

	1998	1999
American Forest & Paper Association	$1,613,300	$2,251,499
American Peanut Council, Inc	522,978	420,168
American Seafood Institute	134,669	68,832

Cooperator Total	28,000,000	27,500,000

REVERSE TRADE MISSION PROGRAM

Question. The fiscal year 2000 request proposes an increase of $250,000 to create a reverse Trade Mission Program. Please explain why this new program is needed to focus on the export potential of high-value products and trade opportunities in the food service and hotel-restaurant-institution section and why this cannot be done through existing market development, promotion and outreach activities.

Answer. This proposal represents a low-cost/high-return investment activity that will expose foreign importers, retail-oriented business, and related trade officials to the diversity and quality of U.S. food products in addition to the superior U.S. food safety, production and marketing systems. This activity can be undertaken using existing market development authorities; however, there are no funds currently available that would allow this program to be implemented without necessitating a reduction in funding for other market development activities.

OVERSEAS CURRENCY FLUCTUATIONS FUND

Question. For fiscal year 1999, the conference committee did not approve the Administration's request recommended in the Senate bill to establish a $2,000,000 revolving fund to enable the Foreign Agricultural Service to manage overseas currency fluctuations. The conference committee did not take a position on the merits of this proposal but pointed out the Administration had not yet developed a plan for this activity as requested in the fiscal year 1998 conference agreement. I do not find this plan in the President's budget, as the conferees expected. In fact, after two years of advocating a mechanism to allow the Foreign Agricultural Service to handle overseas currency fluctuations, I find no such proposal in the President's fiscal year 2000 budget. Why?

Answer. Section 705 of the General Provisions submitted with the Department's fiscal year 2000 budget estimates includes proposed language to allow "up to $2,000,000 of the appropriation shall remain available until expended solely for the purpose of offsetting fluctuations in international currency exchange rates, subject to documentation by the Foreign Agricultural Service". This language will allow the establishment of an overseas buying power maintenance account to assist FAS manage unanticipated changes in the costs of overseas operations associated with exchange rate losses or gains and overseas inflation. This proposal is budget neutral and responds to conference report language which directs the Department to develop a plan for establishing an account to manage overseas currency fluctuations.

EXPORT MARKET EXPANSION

Question. Please describe how the Department has utilized existing authorities including, but not limited to, the Export Enhancement Program, the Food for Progress program, Public Law 480, and GSM credit programs to facilitate additional sales and donations to maintain and expand export markets.

Answer. The Department has sought to maximize the use of its available tools to maintain and expand U. S. agricultural exports during this period of world financial turbulence. For example under the Section 416(b) program, the Department is responding to financial and other crises around the world by donating over 5,000,000 metric tons of wheat and wheat products (flour and bulgur). Also under the Section 416(b) program, we are donating smaller quantities of corn and non-fat dry milk to needy countries. By comparison, the Section 416(b) program shipped almost no commodities in fiscal year 1998.

We also continue to facilitate exports under the Dairy Export Incentive Program. From July through January, bonuses of nearly $80,000,000 were awarded for exports of nearly 70,000 metric tons of U.S. nonfat dry milk, over 3,000 tons of whole milk powder and 4,000 tons of cheese.

The Export Enhancement Program has been used sparingly in recent years due to world supply and demand conditions. However, last May, the EEP was reactivated to announce an allocation of frozen poultry to six Middle East countries and an EEP initiative for barley was announced to Algeria, Cyprus and Norway.

Under the Food for Progress program, USDA programmed more commodities in fiscal year 1998 than it did in fiscal year 1997, getting very close to the 500,000 metric tons (MT) ceiling permitted under the program. USDA successfully programmed commodities to a wider range of countries and regions in fiscal year 1998. By region, commodities were programmed as follows: 50 percent to Eastern Europe and the Former Soviet Union, 30 percent to Africa, Asia and the Middle East, and 20 percent to Latin America. For fiscal year 1999, USDA expects to program close to that level again and has focused its efforts on programming a broader range of commodities, including planting seeds, canned salmon, green and yellow peas, and non-fat dry milk for Russia.

Under the Public Law 480 Title I program in fiscal year 1998, USDA signed agreements with 25 countries providing approximately 1,300,000 metric tons of commodities. For fiscal year 1999, USDA expects to maximize U.S. agricultural commodity shipments under Public Law 480 by focusing on non-wheat commodities, given the availability of the wheat under the President's Food Aid Initiative. For example, USDA expects to program 975,000 MT of commodities (excluding the special Russia program) in fiscal year 1999 including 20 percent as wheat. This compares to 1,300,000 metric tons of commodities programmed in fiscal year 1998 which included 77 percent of wheat. Shipments of feed grains, soybean meal, vegetable oil, and rice are expected to increase as a result.

Under the GSM export credit guarantee programs, USDA expanded the scope of the program in fiscal year 1998 in response to the world financial crisis. Approximately $4.000,000,000 in sales were registered in fiscal year 1998, compared to $2,900,000,000 in fiscal year 1997. The projected sales registrations of $4,700,000,000 in fiscal year 1999 are designed to support expansion and maintenance of U.S. agricultural exports.

In response to the Russian financial crisis, the Department is making broad use of Public Law 480 title I, Section 416(b), and the Food for Progress programs to ship approximately 3,100,000 metric tons. This is into a market that purchased only very limited quantities of U.S. grains in recent years.

PUBLIC LAW 480 PROGRAM

Question. The Public Law 480 title I Program not only provides food aid to targeted developing countries but is intended to promote future markets in these countries. At a time when market expansion is critical, why is the Administration proposing to reduce funding for the program?

Answer. A higher program level for Public Law 480 assistance might have been preferred, but the targets for discretionary spending which were established to help balance the budget make it extremely difficult to allocate additional funds to the program. We will be able to supplement Public Law 480 food assistance in 2000 with commodities to be made available under the Food for Progress Program.

Question. Please provide for the record the Public Law 480 funding allocations, by title, and by country and commodity, for each of fiscal years 1998 and 1999, to date.

Answer. I will provide for the record the Public Law 480 funding allocations, by title, and by country and commodity, for each of fiscal years 1998 and 1999, to date.

COCHRAN FELLOWSHIP PROGRAM

Question. The fiscal year 2000 budget proposes to maintain FAS funding for the Cochran Fellowship Program at a level of $3,500,000. Are available resources sufficient to extend fellowships to all countries which seek to participate in the program? If not, what additional funding would be required to meet these requests?

Answer. The success of the Cochran Fellowship Program to initiate and pursue short- and long-term trade objectives and to influence public- and private-sector decision makers has led to increased requests to initiate the program in countries around the world. For fiscal year 2000, we have had requests from our Agricultural Affairs Offices to start a Cochran Program in Oman, India, Sri Lanka, Cambodia, and Pakistan, and expect requests for several additional African, Middle Eastern, and Latin American countries. The most frequent requests for the Cochran Program are to provide training in areas related to WTO/CODEX agricultural issues, food safety, sanitary and phytosanitary (SPS) issues, genetically modified organisms (GMOs), and biotechnology. At present, the Cochran Fellowship Program is able to provide a fellowship to about twenty-five percent of its potential candidates.

Question. Please provide fiscal year 1998 and fiscal year 1999 program participant levels by country and region.

Answer. In fiscal year 1998, a total of 567 participants from 48 countries received training. This information is presented by country and by region.

[1] Did not participate in the program

We estimate we will be able to provide training for 760 participants in fiscal year 1999. In addition to the countries listed above, we are starting pilot Cochran Programs in Tanzania, Ghana, Nigeria, and Morocco.

Question. Please provide examples of the benefits of the 1998 Cochran Program to U.S. agriculture.

Answer. The Cochran Fellowship Program provides a cost effective tool in promoting U.S. agricultural exports, addressing policy issues such as are related to food safety, biotechnology, and other non-tariff barriers to trade; promoting mutually beneficial trade and business linkages, as well as fostering goodwill with the United States.

—A fiscal year 1997 Vietnamese participant has purchased about two containers of U.S. pistachios per month since his training in May 1997. The estimated value is about $300,000 per year. Several Vietnamese participants in a fiscal year 1998 Supermarket Management Program bought 18 containers of U.S. consumer ready products as a result of their training and attendance at the Food Marketing Institute/National Association of State Departments of Agriculture (FMI/NASDA) Food Expo in Chicago in May 1998.

—The Agricultural Trade Office in Shanghai, China reports that a fiscal year 1998 Produce Marketing team member purchased, for the first time, two containers of California table grapes after his training. Another team member increased his purchase of U.S. celery from 10 to 15 containers per week. Chinese seafood importers purchased 1,700 tons of yellow fin sole, three containers of squid, two containers of conch, and five containers of frozen scallops from the U.S. after their May, 1998, Cochran training. More U.S. seafood sales are expected in the future.

—U.S. Wheat Associates and the Cochran Program organized a Grain Marketing & Import Management training program for Armenia and Georgia in fiscal year 1998. U.S. Wheat writes: ". . . we felt we had phenomenal success in bringing this industry core to the U.S. commercial wheat market. Following, and as a direct result of that program, we saw several cargoes of U.S. wheat purchased commercially."

—The Agricultural Office in Beijing, China states: "We continue to see double digit growth in the U.S. export of high value products to China and we firmly believe that the Cochran Program is a major reason for this growth."

—The team leader of the fiscal year 1998 China Beef Grading program was promoted to Vice Chancellor at Nanjung Agricultural University. As a result of the program, China developed their first beef grading system. According to the Shanghai ATO ". . . our strengthened connections between the Vice Chancellor and USDA will help USDA and many of its cooperators for many years to come."

—A Thailand Cochran participant reports that he purchased large quantities of raw popcorn, raw almonds, prunes, and other fruits and nuts after his May, 1998 Cochran training in supermarket management. The FAS Agricultural Officer in Thailand states: "the ongoing economic crisis in Thailand may be forestalling additional sales that could be attributed to participation in the program, but the groundwork has been laid for such sales."

—Prior to her departure from the U.S., a Hungarian participant purchased eight containers (20 foot) of walnut meal, 8 containers of almonds, as well as 400 cases of Maraschino cherries.

During fiscal year 1998, 42 Cochran fellows from 14 countries participated in training programs directly related to providing information on the safety of the U.S. food and fiber system as well as providing direct contact with U.S. counterparts. In addition, 11 participants from 4 countries received training in biotechnology and Genetically Modified Organisms (GMO). As a result, these countries have a better understanding of the U.S. food safety and biotechnology systems. For example:

—The FAS Agricultural Office in Poland states that Cochran-trained veterinarians were able to help release two shipments of U.S. cheese which had been held up.

—The new Minister of Agriculture in Lithuania, Dr. Edvardas Makelis, is a 1996 graduate of the Cochran Fellowship Program. The Agricultural Affairs Office in Poland states that Minister Makelis . . . " warmly expressed his appreciation for his participation in USDA's Cochran Fellowship Program in 1996 and stated that he would like to expand opportunities for cooperation between the Ministry of Agriculture and USDA. The Minister offered to help resolve the problem of trade barriers in livestock genetics that has prohibited U.S. exporters to supply livestock semen and embryos to Lithuania."

—After his training, a lawyer of the Hungarian Ministry of Agriculture, one of the drafters of Hungary's new act on Genetically Modified Organisms helped to arrange a biotechnology seminar in Budapest and is a good contact (for USDA) to the Government of Hungary for the recently established Biotechnology Association.

—The Agricultural Office in Malaysia states that a Cochran biotechnology participant ". . . acquired beneficial information from the program which was put to use in her research work on plant genetic modification, and this has enabled her to participate actively in the Malaysian Modification Advisory Group."

—The Agricultural Office in Brazil states that the Cochran training in food regulations improved the understanding of Brazilian food regulators of the concept of consistency and transparency of information related to food inspection and trade under the WTO. It also improved the confidence of Brazilian food regulators of the U.S. food inspection system, and food certification for export.

—The Agricultural Attache in Bulgaria states: "One company involved in the Fiscal year 1998 High Value Products team has contacted the office and said it plans to import U.S. products. Two members of the fiscal year 1998 Meat Products Team are currently using U.S. meat and additives for meat processing because of the visit."

—The Agricultural Office in Austria states that a Czech company started to import U.S. cranberries as a result of their Cochran Program visit to the U.S. distributor. Fiscal year 1997 South African participants have purchased California wine ($12,000) and two containers of processed cheese ($62,000).

—A staff member of the Wisconsin Department of Agriculture states: "Thank you for allowing us to work with the Cochran Fellowship Program to bring cheese buyers from Mexico to Wisconsin. I have already been back to Mexico to meet with the buyers and I am very excited about the potential business for Wisconsin cheese companies. One Wisconsin cheese manufacturer was able to introduce their products into Mexican stores and predicts $200,000 of sales annually to the Mexican market."

—The New Jersey Department of Agriculture hosted a Russian seafood importer. They report that "our companies had the opportunity to gain a better understanding of how to conduct business in Russia."

—The FAS Agricultural Officer in Vietnam writes: "The Cochran Program has provided a key for unlocking some of the more non-transparent areas of the Government of Vietnam (GVN) import regime. This has been extremely helpful in the context of the Bilateral Trade Agreement (BTA) negotiations. This access has enabled us to advocate on behalf of U.S. companies in Vietnam and has led to increased sales of U.S. commodities. We also have been better able to explain the import regulations to USDA/FAS for dissemination to potential exporters."—South African Cochran alumni are helping formulate agricultural policy. For example, one participant is helping consolidate a draft of the South African national agricultural policy paper focusing on public/private sector partnerships; another is formulating agricultural credit policy at the national level; and others are involved at the provincial and local levels in policy areas such as rural electrification, market information systems, land tenure and regional trade.

MARKET ACCESS PROGRAM

Question. Please provide the Market Access Program allocations for fiscal year 1998, including the amount of the grant, and the recipient company, commodity, and targeted markets.

Answer. The information is provided for the record.

[The information follows:]

1998 MAP Budget Ceilings by Trade Organization, Brand Company, Product and Market

Trade Organization	Company_Name	market_code	Promoted_Product	Budget Ceiling

EXPORT SUBSIDY PROGRAMS

Question. Provide the total amount of bonus awards to U.S. exporters under the Export Enhancement Program and the Dairy Export Incentive Program for fiscal year 1998 and for fiscal year 1999 to date.

Answer. Bonus awards under the Export Enhancement Program for fiscal year 1998 totaled $2,067,500. As of March 16, 1999, fiscal year 1999 awards totaled $27,762. For fiscal year 1998, Dairy Export Incentive Program bonus awards totaled $110,159,692. As of March 16, 1999, fiscal year 1999 awards totaled $70,450,425.

Question. What are the maximum volume and spending limits for each of these export subsidy programs consistent with U.S. World Trade Organization obligations for each of fiscal years 1998, 1999 and 2000?

Answer. Quantity commitments are based on a July through June year, while expenditure commitments are based on an October-September year. For the years 1998, 1999 and 2000 maximum subsidies under the Uruguay Round Agreement are provided for the record.

[The information follows:]

CCC EXPORT CREDIT GUARANTEES

Question. Provide a listing of the activities supported under each of the four export credit guarantee activities in fiscal year 1998, and in fiscal year 1999 to date: Supplier Credit Guarantees, Facilities Guarantees, GSM–102, and GSM–103.

Answer. The attached report provides the requested information for the Supplier Credit, GSM–102 and GSM–103 programs. The Facilities Guarantees program availability is listed below; however, to date, no projects have been guaranteed under this program.

Fiscal Year 1998 Allocations Under the Facilities Guarantee Program

Caribbean Region.—$20,000,000. Includes: Jamaica and Trinidad and Tobago

Central America Region.—$30,000,000. Includes: Costa Rica, El Salvador, Guatemala, and Panama

Southeast Asia Region.—$40,000,000. Includes: Indonesia, Philippines, Malaysia and Thailand

Mexico.—$50,000,000

Peru.—$10,000,000

Russia.—$5,000,000

Fiscal Year 1999 Allocations Under the Facilities Guarantee Program

Baltic Region.—$10,000,000. Includes: Lithuania, Estonia and Latvia.

East Africa Region.—$10,000,000. Includes: Kenya, Uganda and Tanzania.

Southern Africa Region.—$30,000,000. Includes: Angola, Botswana, Burundi, Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Rwanda, Seychelles, South Africa, Swaziland, Democratic Republic of the Congo (formerly Zaire), Zambia and Zimbabwe.

Caribbean Region.—$20,000,000. Includes: Jamaica, Trinidad and Tobago.

Central America Region.—$30,000,000. Includes: Costa Rica, El Salvador, Guatemala and Panama.

Southeast Asia Region.—$50,000,000. Includes: Indonesia, Philippines, Malaysia and Thailand

Mexico.—$50,000,000

Turkey.—$10,000,000

QUESTIONS SUBMITTED BY SENATOR BOND

FOREIGN AGRICULTURAL SERVICE

Question. Do you expect USAID to comply in fiscal year 1999 with the requirement (7 USC 1724(b)(1)) that 75 percent of non-emergency donations be in the form of processed, fortified, or bagged commodities? If not, why not and what is USDA doing to assure future compliance? In fiscal year 1998, USAID barely reached 50 percent in supplying value-added commodities, yet other requirements, such as monetization far exceeded requirements (15 percent statutory minimum versus nearly 50 percent actual). What steps is USDA taking to restore the balance required by law?

Answer. Based upon the approved level of fiscal year 1999 title II non-emergency activities to date, it is expected that 63.6 percent of the commodities will either be fortified, processed, or bagged. Part of the decline in the use of these value-added commodities is the result of an increase in the demand for bulk commodities that are suitable for monetization (sale). In addition, there has also been a decline in the number of direct feeding programs under title II which have traditionally emphasized the use of value-added commodities. USAID has been monitoring the decline in the use of value-added commodities and has initiated discussions with the cooperating sponsors, domestic commodity producer groups, and Congressional staff to emphasize the importance of adhering to this mandate. In addition, USAID will issue new guidance in the Federal Register explaining the importance of using value-added commodities in title II activities, including both direct distribution and monetization. It is the goal of USAID over the next two years to significantly increase the percentage of value-added commodities used in title II non-emergency activities when compared to the percentage achieved in fiscal year 1998.

CCC SECTION 11 FUNDING CAP

Question. It is our understanding that the limitation placed on CCC technical assistance funds is undermining NRCS efforts to provide technical assistance. If the Section 11 cap is modified, would that help enable greater delivery success?

Answer. Modifying the Section 11 cap would enable NRCS to continue to provide technical assistance for those programs that are funded by the Commodity Credit Corporation. Without these funds, NRCS will not be able to provide all of the technical assistance that is proposed in the fiscal year 2000 budget.

STAFFING REDUCTION IMPACT ON MISSION

Question. What reduction in force at NRCS does the budget envision and how will that impact NRCS mission performance?

Answer. The NRCS budget indicates a reduction of approximately 1,055 FTE would be necessary to stay within the amount of technical assistance funding. This reduction would come through a combination of furloughs, early and optional retirements, buy-outs, and reductions-in-force. The primary impact of these FTE reductions will occur at the field level. The result will be substantial reductions in the level of service provided to landowners and landusers in such areas as planning assistance, implementation of conservation practices, construction projects, resource inventories and reduced levels of implementation for some cost share programs.

BENEFITS OF WATERSHED STRUCTURE

Question. Many in our state suspect that OMB has never met a structure that they liked and fail to see the multiple benefits of the watershed program.

Answer. The annual benefits of both structural and non-structural practices are easily defended. Though NRCS assists project sponsors in the consideration of a wide array of alternatives, including structural, non-structural, land treatment and floodplain easements, there are many situations in which the use of structural measures are the only solution to address the problem.

The benefits of the existing flood projection projects became abundantly apparent during recent flooding events in Texas. In the fall of 1998, a band of severe thunderstorms swept along the Interstate 35 corridor. The San Antonio region, extending northward through the New Braunfels and into the Austin area, was hit especially hard. The heaviest rainfall fell in Bexar, Hays, Comal, Guadalupe, and Caldwell Counties. Rainfall in these areas totaled between 18 and 31 inches, with rain falling at a rate of 2–3 inches per hour for prolonged periods. This was the most rainfall recorded since records have been kept, beginning in 1885.

In spite of these conditions, the loss of life and property damage was greatly reduced in those watersheds protected by Public Law 566 floodwater retarding structures. In the Upper San Marcos River Watershed alone, the floodwater protection structures resulted in an estimated $20 million in benefits. These include flooding depths, which were reduced by 6–8 feet in the City of San Marcos. Had these structures not been in place, the likelihood of loss of life and tremendous property loss would have been a certainty.

FOOD AND AGRICULTURE POLICY RESEARCH INSTITUTE

Question. Mr. Collins, what is your knowledge of the Food and Agriculture Policy Research Institute (FAPRI) in the context of our nation's interests in economic intelligence and informing the public of economics and policy of agriculture and food?

Answer. I am very familiar with the work of the university consortium, FAPRI. They have an excellent record of collecting and reporting on global agricultural information, projecting long term trends in agricultural markets and analyzing key policy options. FAPRI makes their analysis available through publications and briefings, including frequent briefings to USDA staff and others in Washington, D.C.

Question. If the work of this consortium and potentially others is so important, can you tell me how much money your department is putting or wants to put into the support of these centers?

Answer. USDA provided $800,000 to FAPRI, specifically the University of Missouri and Iowa State University in fiscal year 1999. No funds have been requested in USDA's budget for fiscal year 2000.

Question. Apparently OMB is not supportive of funding the centers. Nevertheless, would you and others in the Department like to see these policy research centers supported.

Answer. I would like to see FAPRI continue its work and maintain a strong base of financial support. However, it is the policy of USDA that funds now used to support centers such as FAPRI should be used for competitively awarded, peer reviewed grants that meet National goals.

Question. In 1996 and in 1998 laws were passed at Congress's initiative which provided authority for policy research centers to be supported. What can be done to adequately overcome the obstacles so that we can ensure that these benefits continue being provided.

Funding for FAPRI has continued, even though not requested by USDA.

At USDA, funding decisions are complicated by limits on available funds and priorities of needs, FAPRI has done an outstanding job of communicating its contributions to parts of its rural constituents, USDA and Congress. But FAPRI's contributions are less well known and understood in the broader research and education community in which is exists. I understand that FAPRI will be making an effort to broaden its communications among the research and education community's leadership and with other parts of USDA. The best way for FAPRI to maintain funding is to continue to usefully serve the needs of rural people by providing unique, relevant, competent, and timely information and analysis.

QUESTIONS SUBMITTED BY SENATOR BURNS

CROP INSURANCE

Question. Why was there no funding included for crop insurance reform in the USDA fiscal year 2000 budget?

Answer. We wish first to come to agreement on the needed changes, then identify the costs and work with Congress in a responsible manner to find the required funding.

FARM AND FOREIGN AGRICULTURAL SERVICES BUDGET

Question. President Clinton promised to bring trade in line with agriculture. Yet, the Farm and Foreign Agricultural Services budget was decreased by nearly $6.5 billion. Two of the main programs for export, the Export Enhancement Program and the Food for Peace program, were reduced by $56 million and $772 million respectively. With 70 percent of Montana's grain being sent for export we cannot afford to lose these important programs. How will the Administration restore this money? Why has the funding currently in the Export Enhancement Program not been distributed to producers? How will USDA restore lost export opportunities to producers?

Answer. Although the budget shows a reduction in the overall program level for USDA international activities in 2000, this is primarily due to the sizeable increase in food aid programming during 1999 which results from extraordinary circumstances this year. For 2000, the budget assumes food aid programming will return to a more traditional level. On the other hand, the 2000 budget provides a total program level of $6.5 billion for USDA international activities; this is considerably higher than the actual level for 1998 of $5.7 billion.

COMMODITY CREDIT CORPORATION PROGRAMS

Question. Several programs important to export enhancement were cut. The Commodity Credit Corporation Program was cut by $5.8 billion, the Dairy Export Incentive Program by $15 million and the Food for Progress program by $24 million. With today's global market situation, producers cannot afford to have the few opportunities they have for export reduced. How will USDA restore lost export opportunities to producers?

Answer. During the past year, USDA has responded vigorously and creatively to developments in world financial and commodity markets. As a result, the level of programming for many of our export activities has increased substantially. For example, in response to the financial crisis in Asia, USDA expanded the level of CCC export credit guarantees made available. As a result, sales registrations under the guarantee programs were 40 percent higher during 1998 compared to the previous year. The expanded level of guarantee programming is expected to continue in both 1999 and 2000.

This fiscal year, USDA has greatly expanded the level of foreign food assistance programming, and the overall level of U.S. foreign food assistance will total as much as 10 million metric tons this year. This increase results from the President's Food Aid Initiative under which 5 million metric tons of wheat and wheat products will be made available to countries requiring assistance in meeting their food import needs. It also reflects a major package of food assistance for Russia which will total more than 3.1 million metric tons, including 1.5 million metric tons of wheat to be made available under the President's Food Aid Initiative.

Question. The CCC provides an important service for private negotiations with other countries. Agricultural producers have an increasing need for avenues to market their products through private entities. The budget cut to CCC makes them more dependent on the federal government, rather than giving them opportunities

to expand marketing channels. How does the USDA intend to provide producer assistance for marketing, private or otherwise?

Answer. There are currently only two USDA programs that are categorized as export promotion programs—the Market Access Program funded at $90 million and the Foreign Market Development Cooperator Program funded at $27.5 million. However, FAS administers various other agricultural export assistance programs including the Emerging Markets Program, Section 108, and the Cochran Fellowships.

Last fall, the FAS began a new initiative—known as the Unified Export Strategy (UES)—to more effectively coordinate strategic planning and resource allocation processes across these various agricultural export assistance programs. The UES was developed to streamline the application process for these programs and facilitate better use of complementary marketing tools and resources. Through the submission of a single proposal, organizations may apply for assistance under the Market Access Program, the Foreign Market Development Cooperator Program, the Emerging Markets Program, Section 108 and make recommendations for trade policy initiatives, Cochran Fellowships, or Export Credit Guarantee programs.

In addition, the fiscal year 2000 budget proposes a new program, Quality Samples Program (QSP). The QSP would use CCC funds to assist U.S. commodity organizations in providing commodity samples to foreign importers in order to promote a better understanding and appreciation for the high quality of U.S. agricultural commodities.

TRADE BARRIERS

Question. Trade inequities continue to be a major problem, especially with Canada, the European Union and China. When will the Foreign Agricultural Service step in to reduce trade barriers and resolve international trade disputes?

Answer. Unfortunately, U.S. agricultural exports are subject to import duties and non-tariff trade restrictions in nearly every foreign market. Many of these restrictions are permitted under international trade rules, just like U.S. tariffs and import requirements. FAS has worked diligently over the years to identify and seek the removal of barriers which are not consistent with international trade rules or which are particularly restrictive for U.S. exports. There are many examples of FAS activities which have helped to remove or prevent the imposition of barriers to U.S. exports. These include the use of the WTO Committee on Agriculture to obtain the removal of WTO inconsistent trade barriers, bilateral talks to open the Japanese market for U.S. wood products through deregulation of its housing sector, removal of Chilean and Brazilian restrictions on U.S. wheat, new access to Taiwan's market as part of its WTO accession, and many other specific cases.

Some trade restrictions are more difficult to resolve than others. The inequities with Canada, the EU and China that you mention are the best examples.

FAS, in cooperation with other USDA agencies and the U.S. Trade Representative continue to work on these issues, and we have made some progress. For example, the December 1998 Record of Understanding with Canada begins to address many of Canada's barriers to U.S. exports and the Veterinary Equivalency Agreement with the European Union is an important step towards resolving many of our differences on food safety issues with Europe. We also have had a number of market access gains in China, getting them to allow access for U.S. grapes and a number of livestock products. On other issues where we have not yet been able to reach agreement, the United States has vigorously pursued our rights under international agreements. We will continue to work with our trading partners on these issues, and will be prepared to take the necessary action if acceptable resolutions cannot be reached.

NATURAL RESOURCES CONSERVATION SERVICE

Question. Why was funding for the GLCI (Grazing Lands Conservation Initiative) held level under the NRCS budget rather than be increased? This program is invaluable to ecosystem management. This program provides education and technical assistance to agricultural producers.

Answer. NRCS utilized congressional recommendations to maintain level funding for GLCI. NRCS did provide technical assistance staffing to assist in the voluntary application of conservation on grazing lands, including GLCI, that exceeded $33 million in fiscal year 1998.

Question. Funding should be increased from $15 million to at least $20 million. How will USDA implement an increase for GLCI?

Answer. Should GLCI be earmarked at $20 million NRCS will continue to implement a program to provide for additional staffing, training, technical assistance,

public awareness and project activities in an attempt to meet increasing workload demands.

EMERGENCY APPROPRIATIONS

Question. Congress appropriated approximately $6 billion to come to the aid of farmers and ranchers, as an emergency supplemental appropriation. Many producers have seen none of this money due to deadlines and extensions. When will USDA be held accountable for this funding and disperse it to the people who desperately need it?

Answer. While RMA is responsible for only $400 million of this assistance, these funds have already impacted farmers by providing them with the assurance of risk protection on their 1999 crop at a reduction of 30 percent or more in premium costs. Some farmers have applied the savings toward the purchase of higher levels of coverage, others can look forward toward more cash flow, which could enhance their ability to obtain credit. As for the rest of the emergency funding, it is our understanding that the requirements for prorating the funds available, as well as the need to help farmers make informed decisions among the choices in assistance for multi-year losses, have challenged USDA's field staff. Significant staff reductions over the last several years have also contributed to the difficulty in being timely in providing assistance. However, we are confident that USDA will eventually receive high marks for carrying out this responsibility in a fiscally sound and fair manner.

QUESTIONS SUBMITTED BY SENATOR BYRD

FARM SERVICE AGENCY

Question. Once again, my questions concerning the Farm Service Agency (FSA) are targeted toward the issue of staff reductions. While I understand, and supported, necessary FSA staff reductions that occurred nationwide as a result of the USDA Reorganization Act of 1994 and the 1996 Farm Bill, I am puzzled about reports that West Virginia is again being requested to reduce staff. I am particularly puzzled by the recent reduction proposal in light of the fact that West Virginia implemented the previous rounds of required reductions, and that I understood that the Congress provided funds last year to avoid further staff reductions in FSA during fiscal year 1999. Can you please explain this situation to me in detail?

Answer. Yes, Congress did provide $40,000,000 in emergency funding included in the 1999 appropriations act which has allowed FSA to maintain about the same staffing levels in 1999 as in 1998, rather than separate additional personnel during the current crisis in production agriculture. That $40,000,000 did not provide funding for additional personnel to deal with greatly increased agency workload, however. West Virginia did reduce permanent full-time (PFT) staffing from fiscal year 1994 through fiscal year 1998 by about 21 percent; however, this trend was nationwide with Midwestern and Northwestern States reducing PFT staffing by over 25 percent. The average nationwide decrease for PFT employees was just over 23 percent from 1994 through 1998. West Virginia has used and continues to effectively use shared management, office collocations and consolidations since the streamlining process began in 1994. After significant office consolidations in 1995, employment has been evaluated and adjusted over the last 3 years to maximize service within available funding. Of the 377 FSA county offices closed in some 37 states, 15 of these offices were in West Virginia. In fiscal year 1999 FSA began addressing the imbalance of the number of FSA employees relative to existing National workload. FSA established temporary ceiling goals for each State to work toward. This has allowed State Executive Directors to manage more efficiently and position themselves for realistic permanent staffing levels. We emphasize that no State is under any mandate to reduce the number of "on board" employees nor will any State lose any monies allocated to date.

Question. Can you please provide me with a report on your views of the FSA's role in West Virginia?

Answer. Actual workload in West Virginia for fiscal year 1998 indicates that present staffing is very closely aligned with current workload conditions in comparison to many other States where emergency and disaster programs have generated an extensive backlog of workload. FSA continually monitors workload in States to determine areas of increased workload and moves both human and monetary resources to those areas based on availability to provide the most effective and efficient service to its customers. State Directors are using a variety of management

tools to ensure service to producers by initiating employee details, overtime, directed reassignments, shared management and office collocation and consolidation.

NATURAL RESOURCES CONSERVATION SERVICE

Question. I have long supported the important work of the Natural Resources Conservation Service (NRCS) in West Virginia. The state NRCS staff, including Bill Hartman and Paul Dunn, have done a fine job in implementing watershed and conservation programs in West Virginia that have made a positive impact to the state's rural communities, and I commend them for their efforts. My questions pertain to several West Virginia NRCS projects. Please provide a status report on the Potomac Headwaters Land Treatment Watershed Project, complete with pertinent timetables and participation rates.

Answer. This land treatment watershed project is entering the third year of operation. During the first two years, 212 long term contracts were executed with landowners who agreed to install needed animal waste storage facilities and mortality composters, relocate or treat animal feeding operations to prevent pollution, and follow an agreed to nutrient management plan. Planned in these contracts are 216 storage structures, 94 composters, 75 feedlot improvements, 15 feedlot relocations, and 35,600 acres of nutrient management. As of this date 84 storage structures, 25 composters, 18 feedlot improvements, and 6 feedlot relocations have been completed. Funding for new contracts in fiscal year 1999 is $2,000,000, which will allow about 52 additional farmers to enter the program, bring the total participation rate up to 83 percent. With these new contracts included (264 total) the estimated cost is $10,000,000. Of this amount, $5,350,000 is Federal cost, $1,070,000 a state cost, and the remaining $4,280,000 a landowner expense. Upon completion the Potomac Headwaters Project will yield the following benefits:

Potomac Headwaters Benefits

Total acres benefited	1,787,850
Monetary agriculture benefits	$1,131,100
Public facilities benefited (no.)	59
Farms benefited (no.)	264
Disadvantaged benefited (no.)	8,718
Direct beneficiaries (no.)	72,654
Incidental recreation (no. water bodies)	26
Erosion (tons)	8,200
Lakes/reservoirs protected (acres)	2,969
Animal waste (average annual tons)	90,733
Chemical and nutrient management (acres)	35,600
Domestic water supply (no.)	60
Sponsor costs (as reported in plan)	$10,700,000
Sponsor operation. Maintenance, and replacement (as reported in plan)	$294,400
Tons commercial fertilizer displaced by available litter	90,720

The long-term contracts with the landowners are 10 years in duration. All conservation practices will be installed during the first five years of the contract. The remaining years are an operation and maintenance period to assure compliance with program requirements.

FLOOD CONTROL STRUCTURES IN WEST VIRGINIA

Question. Please provide a full list of all flood control projects in West Virginia that are currently under construction, the cost associated with that construction, and a timetable for the completion of each project.

Answer. The following is a list of flood control projects under construction in West Virginia, including the Federal construction cost and the timetable for completion:

—Cranberry Creek Channel Improvement Project, Raleigh County, WV
Federal Cost: $16,355,289
—Completion Date: May 1999—(completed except for landscaping, which will be completed May 1999)
—Little Whitestick Channel Improvement Project, Raleigh County, WV
Federal Cost: $4,019,016
Construction bids received on February 10, 1999
Completion Date: August 2001
—Upper Mud Recreation Facilities, Lincoln County, WV
Cost: $1,278,197.08
Completion Date: June 1999

WEST VIRGINIA FLOOD CONTROL PROJECTS WITH FEASIBILITY STUDIES

Question. Please provide a full list of flood control projects in West Virginia for which feasibility studies have been completed.

Answer. The following is a list of flood control and other projects West Virginia that have completed feasibility studies or are in some phase of the planning process:

Plan Completed:

Inwood Watershed, Berkeley County.—The NRCS provided technical assistance to the Eastern Panhandle Soil Conservation District and a watershed group to develop a Local Implementation Plan (LIP). The LIP addresses flooding in a rapidly developing area of Berkeley County. This plan was completed in December 1998.

Plans Underway:

Deckers Creek Watershed, Preston and Monongalia Counties.—Water quality is the primary purpose of this plan. Eleven treatment systems are proposed to address acid mine drainage in Deckers Creek and tributaries. Installation of systems over a ten-year period will raise pH and improve water quality in 23.7 miles of stream. NRCS has extensive water quality data to aid in design of effective systems. The plan is 90 percent complete. Dunloup Creek Watershed, Fayette County—The purposes of this project are flood protection, water supply, and recreation. The NRCS is preparing a local implementation plan to address these problems. A local watershed group is providing input to the effort. The plan is about 95 percent complete.

Fayette County Water Resources Study.—This study is cooperatively funded by the NRCS and the WVSCA. The planning effort will result in a comprehensive water resources plan addressing water supply, water quality, flooding, sewage, and recreation. A county-wide steering committee is providing local input. The plan is about 98 percent complete.

Hardy County Resources Study.—The Hardy County Commission has requested a county-wide natural resources study. The county is anticipating expansion of land and water resource needs with the planned construction of Corridor H and associated economic development. Kings Creek Watershed, Hancock County—This local implementation plan evaluates and compares flood damage reduction alternatives. Non-structural measures and limited channel improvement appear to be the most economically feasible alternatives, based on planning studies. The plan is about 95 percent complete.

Logan/Mingo Counties Resources Study.—Local officials and the Pigeon Creek Watershed Association have requested NRCS assistance in conducting a study of natural resources concerns and potential solutions. The county is experiencing accelerated development with the recent construction of Corridor G.

North Fork South Branch Potomac River Watershed, Grant and Pendleton Counties.—Local citizens have formed a watershed association to work with NRCS and other agencies to solve watershed problems. The catalyst for the formation of the watershed association was two severe floods in January and May 1996. The watershed association obtained the sponsorship of the Potomac Valley Soil Conservation District and the County Commissions and requested NRCS planning assistance. NRCS is preparing a Watershed Management Plan utilizing the CBA planning concept. The area of focus, as agreed to by the North Fork Watershed Association and numerous involved agencies, interest groups, and other stakeholders are water quality, flooding, streambank erosion, water supply, grazing lands, wetlands, and forest management. The planning process is about 40 percent complete.

Pleasant Valley Watershed, Marion County.—The NRCS is providing technical assistance to the Monongahela Soil Conservation District and a local watershed advisory group in developing a Local Implementation Plan that will address flooding. This plan is 15 percent complete.

Upper Tygart Valley Watershed, Randolph County.—The NRCS is providing assistance to project sponsors and the Upper Tygart Valley Watershed Partnership in developing a Watershed Plan and NEPA compliance document. Project purposes include water supply, water quality, flood protection, fish and wildlife, and conservation land treatment. This project is 10 percent complete.

Projects Underway: Public Law–566

Upper Mud River Watershed, Lincoln and Boone Counties.—The current cost of the project is $23,800,000, including $13,300,000 Federal cost and $10,500,000 non-Federal cost. One multi-purpose dam for flood prevention and recreation was completed in 1994. Remaining work consists of construction of recreation facilities. The fishing part of these facilities was completed in 1996. The remaining recreation facilities are under construction as a local contract ($2,556,000) and are scheduled for completion in February 1999.

Little Whitestick—Cranberry Creeks Watershed, Raleigh County.—The current Federal cost is $25,500,000. The 2.1 miles of channel improvement on Cranberry Channel was completed in 1998. The 1.5 miles of channel on Little Whitestick is presently being advertised for construction bids, and the work is expected to begin in late April. Local sponsorship is very strong. Landscaping work will be done during this spring for the Cranberry Channel.

Mill Creek Watershed, Jackson and Roane Counties.—Six structures are planned and five have been completed. The Federal cost is $25,000,000. The final dam (No. 6) will be evaluated for feasibility.

Upper Buffalo Creek Watershed, Marion County.—Estimated Federal cost is $30,100,000. The project has been modified by supplement dated April 1994 to seven dams and 1.9 miles of channel improvement. All seven dams have been completed. The channel improvement was completed in October 1997 at a total cost of $5,109,228, and landscaping was completed in April 1998. The subchannel will be extended a total of 1200 linear feet in three areas of Upper Buffalo Creek downstream of the completed channel work. Bidding and contracting for the work will take place in August 1999, with construction scheduled to start in September. Estimated cost of the additional subchannel is $56,000.

Elk Twomile Creek Watershed, Kanawha County.—The project consists of six single purpose flood prevention dams. Four have been completed. The feasibility of proceeding with the remaining sites is being evaluated.

Projects Underway: Public Law 534

Lost River Watershed, Hardy County.—The total estimated cost is $37,700,000 of which $34,000,000 is Federal cost. The project includes 4 single purpose structures and 1 multipurpose structure. Dam No. 4 (single purpose FP) was completed in 1996. Dam No. 27 (single purpose FP) was completed in December 1998. The three remaining dams remain viable and are scheduled for construction over the next 5 years pending Congressional appropriations. Local sponsorship is strong.

New Creek Watershed, Grant and Mineral Counties.—Nine of twelve dams planned for this watershed have been completed. New measures needed to replace protection provided by the remaining three dams and to address other natural resources problems are being evaluated.

North and South Mill Creek Watershed, Grant and Pendleton Counties.—The total estimated cost is $15,999,999 of which $12,800,000 is Federal cost. The project includes 5 single purpose structures and 1 multi-purpose structure. Three of the single purpose structures have been installed with $5,300,000 Federal obligations through fiscal year 1990. Dam No. 7 (multipurpose dam—FP & Recreation) was completed in December 1993 at a cost of $6,350,000. The recreation facilities were completed in 1996. The two remaining dams are not feasible and will be deleted from the project through preparation of a supplement.

Patterson Creek, Grant and Mineral Counties.—The estimated Federal cost is $25,600,0000. The project includes 33 single purpose flood prevention dams and one multi-purpose structure for flood prevention and water supply. Thirty of the single purpose dams have been completed along with the single multi-purpose dam. The feasibility of proceeding with the two remaining dams is presently being evaluated.

South Fork Watershed, Pendleton and Hardy Counties, West Virginia and Highland County, Virginia.—Twenty-three of 24 single purpose flood preventiondams have been completed. One dam (No. 20) on the Upper South Fork remains to be built. The local sponsors are presently not interested in building this structure.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

Question. Please provide a status report of the Environmental Quality Incentives Program in West Virginia.

Answer. The Environmental Quality Incentives Program in West Virginia has been very successful in the first 2 years of program implementation, as evidenced by the high demand being placed on the program by the State's farmers. The demand by farmers far exceeds available funds. In fiscal years fiscal year 1997 and 1998, there was a 6:1 and 4:1 ratio, respectively. It is expected to be similarly high in fiscal year 1999.

During fiscal year 1997 and 1998, $1,995,000 and $1,809,000, respectively, were allocated here. The NRCS State Conservationist, with the advice of the West Virginia State Technical Committee, including the Farm Service Agency (FSA), selected four priority areas where most of the funds would be used. These areas were over 250,000 acres in size with typically between 100,000 to 150,000 acres of agricultural land needing treatment. Ninety-five percent of funds were used to address livestock-related natural resource concerns.

In fiscal year 1997, approximately $1,600,000 of financial assistance were provided to 362 farmers for long-term contracts. These contracts provided assistance on: 5,856 acres of prescribed grazing; 6,848 acres of nutrient management; 4,080 acres of pesticide management; winter feeding areas and other conservation practices. In fiscal year 1998, approximately $1,400,000 were distributed to 265 farmers for contracts that will treat 18,233 acres.

Priority areas were revised in fiscal year 1999, based on watershed boundaries. There were a total of 24 priority areas identified throughout the State. The largest agricultural area to be treated in any priority area will be 50,000 acres, and 750 acres will be the smallest. This revised approach will allow NRCS to quickly and more thoroughly address the major natural resource concerns in a specific watershed. It is anticipated that an increase of environmental benefits will be attained with the watershed approach. Service center personnel have completed one-on-one visits with farmers and are determining contract costs for fiscal year 1999. Conservation plans and contracts will be developed and awarded within the next 2 months. Of the $1,584,000 allocated to the State, about $1,280,000 are available for financial assistance.

West Virginia's soil conservation districts have convened the local work groups for identification and prioritization of priority areas in fiscal year 2000. The local work groups consist of local farmers, conservation district supervisors, FSA county committeemen, and other local, State, and Federal agencies.

STATUS OF ALDERSON, WEST VIRGINIA PLANT MATERIALS CENTER

Question. Please provide a status report on construction of the Plant Materials Center in Alderson, West Virginia, and a flow chart illustrating the release and award of funds appropriated for the project.

Answer. The project is progressing well, and it should be completed by late fall of 1999. Sufficient funds were provided to the Plant Materials Center in the fiscal year 1999 budget to complete construction work.

Construction of the seed barn is complete, and the building is now being used as a temporary office. This building forms the hub for operations at the center. Work on the office is underway, and the building is now "under roof" with work proceeding on the interior. It is about 60 percent complete. The building should be completed by May and occupied by June. Specifications are due in April for the shop/storage building, and construction is expected to start on it in June. Construction on the final building, the greenhouse, is scheduled to begin in July.

In addition to construction activities, there is a parallel effort underway to bring field operations on-line. Weed control has been a problem in many fields, but active control measures are underway to eliminate it. Several of the fields have already been planted to grasses and/or herbaceous species. In the spring of 1999, the center will move part of the woody plant collection (50 clumps) from Quicksand, Kentucky to Alderson. In the fall, the remainder of the woody plants will be transferred.

With construction activities completed by fall and with field studies also in place, it is anticipated that a Plant Materials Center dedication can be held early in 2000.

Funds for the Plant Materials Center in fiscal year 1999 have been provided to: (1) conduct operations, and (2) complete construction for the project. A flow chart illustrating the release and award of funds for the project in fiscal year 1999 may be found in the table on the following page.

CAPITAL IMPROVEMENTS FLOW CHART, ALDERSON, WV PLANT MATERIALS CENTER

Description of Construction & Related Activity	Pre-Fiscal Year 1999 Funds	Fiscal Year 1999 Funds	Timeline Date

QUESTIONS SUBMITTED BY SENATOR KOHL

FARM SAFETY NET/EMERGENCY ASSISTANCE

Question. Please provide an overview, to the extent possible by State and commodity, of the levels of emergency assistance provided to producers as a result of the $5.9 billion made available in the Omnibus Appropriations Act for fiscal year 1999.

Answer. We are able to provide data only on market loss assistance payments as of March 2, 1999.

[The information follows.]

MARKET LOSS ASSISTANCE PAYMENTS, FISCAL YEAR 1999

[As of March 2, 1999]

	Corn	Sorghum	Barley	Oats	Wheat	Upland	Rice	Total
Alabama	3,055,087	527,052	2,792	15,994	2,832,130	13,243,767	35	19,676,857

TIMING AND EFFECT OF ASSISTANCE

Question. Please include any timetables available to indicate when producers may expect to receive assistance plus an analysis of the degree to which the assistance made available by the aforementioned Act will remedy shortfalls in farm income due to either production or market losses in 1999.

Answer. Within 10 working days of the omnibus bill's enactment, USDA began making income loss assistance payments. By November 21, 1998, USDA had paid 1.4 million farmers more than $2.8 billion.

On November 12, 1998, USDA announced the Livestock Assistance Program (LAP) and began taking applications on November 23, 1998. To accommodate the extremely high demand for LAP, USDA extended the signup for this program and now plans to close enrollment on March 25, 1999. USDA will issue payments shortly thereafter. We estimate that the $200 million Congress appropriated for livestock assistance will be heavily over-subscribed, and USDA, consequently, will be able to pay only a portion of the total request.

On March 15, 1999, the sales closing date for the 1999 crop insurance program, USDA will have disbursed the $400 million dedicated to lowering crop insurance premiums—the Administration's down payment on its commitment to strengthening the farm safety net by reforming and improving crop insurance.

USDA has implemented the honey and mohair loan programs included in the bill.

In the near future USDA's plans for the $200 million dairy assistance program will be announced.

USDA now expects to make CLDAP payments in June, following a 6-month signup program, the same length of time USDA ran the signup for the 1988 disaster assistance program, the last time USDA had to implement a major, new crop loss assistance program. While USDA was able to use the 1988 program as a template for subsequent programs, we could not do so for this year's program.

The additional resources sought by the Administration and approved by Congress have been instrumental in keeping thousands of farmers and ranchers in business during tough times. USDA is at your disposal to provide any additional information about implementation of these programs.

STATE OF THE FARM ECONOMY

Question. Please provide any information available about the state of health of the farm economy at present and the extent to which producers may not be able to continue viable farming or ranching operations this coming year even with the assistance provided in the fiscal year 1999 Act.

Answer. The farm economic outlook for 1999 is not favorable. In 1998, the farm economy took a sharp downturn when bad weather devastated many production regions from California to Florida, while grain and oilseed prices nosedived as a result of large global supplies, the deepening Asian financial crisis, and weak export demand. Livestock prices also dropped due to large supplies, and hog prices went into a free fall late in the year. Unfortunately, exports and commodity prices likely will be even lower in 1999, causing increased farm financial stress, particularly in grain and oilseed producing areas, such as the Corn Belt States, that up to now have weathered the economic downturn.

U.S. farm exports, for example, are expected to drop to $49 billion in fiscal year 1999—down $4.6 billion from fiscal year 1998 and nearly $11 billion from the peak in 1996. Net farm income is expected to drop to $44.6 billion for 1999, a 7-percent decline from 1998 and a 16-percent drop from 1996. Net income just for key field crops (wheat, corn, soybeans, upland cotton and rice) will be 17 percent below the average for the past 5 crop years for the 1998 crops, and for the 1999 crops, net income is projected to be 27 percent below the previous 5-year average. USDA's revised baseline projections for the next 10 years indicate that economic recovery will occur at a very gradual pace.

The nearly $6 billion in government assistance enacted last year is helping to maintain farm income and ease financial hardship for many producers. Direct government payments to producers reached nearly $13 billion in calendar year 1998 and will probably total at least $11 billion in 1999. Also, lower interest rates and fuel costs have helped reduce production costs, offsetting some of the decline in cash receipts for many producers.

However, aggregate measures of the health of the farm economy mask a marked erosion in market income in many regions and commodity sectors, and all signs now point to greater farm financial stress in 1999. Net cash income is currently projected to decline $3–4 billion. Land values began declining in a number of Midwestern States during the last half of 1998, after years of steady increases. The drop in income, coupled with declining asset values for many producers, means many will

have difficulty obtaining credit, and those who do will use it for variable cash expenses, not investment, and will find themselves squeezed trying to repay debt out of current income. For the many producers who struggled with cash flow in 1998 because of adverse weather and low prices, problems likely will worsen in 1999.

As a result of increased financial stress in farm country, demand for USDA farm loans in fiscal year 1999 has been extremely strong. Many farm families who have been financing their business operations through their own resources or with a minimum of commercial bank debt are now seeking farm loan assistance. Commercial lenders are utilizing Farm Service Agency loan guarantees to restructure the short-term indebtedness of their customers into more favorable long-term rates so that they can continue to provide financing. FSA is using all servicing authorities, including rescheduling and reamortizing, deferring installments, and debt writedowns to assist FSA borrowers.

However, funds are exhausted or will soon be exhausted for key credit programs: all emergency loan funds and non-targeted direct farm ownership loan funds have been obligated already; non-targeted interest-assisted guaranteed loans and direct farm ownership loans will be exhausted in March; funding for direct farm operating loans will last into April, and guaranteed operating loan funding will be gone by August. Credit is no substitute for income, but adequate credit is essential to maintaining any farm operation.

For many farmers and ranchers the key to weathering the farm crisis is duration: how long the period of low commodity prices will last. According to a 1998 Iowa State University study of 1,200 Iowa farmers, those in basically strong or stable financial condition can withstand a year of low prices, but if these conditions were to continue for several years, one-third of the farmers in the study would face restructuring or liquidation.

There are many uncertainties that could affect market demand and prices, and, hence, farmers' well-being over the next 1 to 2 years. Weather is always key; so is the world economy for a farm sector as export-dependent as American agriculture.

DAIRY POLICY REFORM

Question. Would you please provide your observations or suggestions relating to changes in USDA programs to help move toward a more rational and fair dairy policy through either regulatory action or legislation? In particular, would you address steps that might be taken to help find a policy of comity among all regions to eliminate the otherwise unavoidable conflict and turmoil that would result from regional compacts or other tools of geographic disparity?

Answer. On or before April 4th, the U.S. Department of Agriculture (USDA) will issue its final decision on consolidation and reform of Federal Milk Marketing Orders as mandated by the Federal Agriculture Improvement and Reform Act of 1996 (1996 Act), as amended. In the nearly 3 years since enactment of the 1996 Act, USDA has requested information from all segments of the dairy industry and received nearly 4,500 comments on Federal order reform and consolidation. In addition, USDA established agreements with dairy industry experts in the academic community to analyze specific issues, including the Class I price structure and replacement of the Basic Formula Price (BFP) for milk, and conducted several listening sessions around the country before and after release of USDA's proposed rule in January 1998. We believe this meticulous approach in informing the public and obtaining input from interested parties will yield a final decision that is in the best interests of all segments of the dairy industry and be fair to all areas of the country.

EMERGENCY PRECEDENTS

Question. USDA recently announced the granting of $50 million to hog producers to help offset the dramatic reduction in price. How does the Department intend to address similar requests from producers of other commodities (e.g. beef cattle, aquaculture, minor crops, etc.) now that a precedent appears to have been established?

Answer. Hog producers were hit with the lowest prices in 5 decades, and we made every effort to find a way to help producers. We would hope to be able to help other producers in similar circumstances and are working hard to shore up the safety net for all farmers and ranchers.

RISK MANAGEMENT REFORM

Question. It has been suggested that approximately $1 billion should be directed to reform crop insurance, including an expansion of revenue insurance. To what extent should the availability of any funds be used to expand new programs rather than improve existing programs? For example, during debate of the disaster assistance package last Fall, certain Senators complained that there should be no "crop

insurance requirements" tied to assistance eligibility due to the fact that existing programs in their state were not economically viable. Should our commitment to make sure that existing crop insurance programs work in all states be any less than to create new programs?

Answer. The Administration agrees that continual review of existing crop insurance programs is as essential as developing new insurance products and insuring new crops. Poorly designed or administered programs that fail to meet the producers' needs are counterproductive to the Administration's goal of strengthening the safety net for agriculture.

As you note, some Senators stated last Fall, that the current insurance program was not viewed as attractive for certain crops in their states. Reasons vary, but dissatisfaction with premium costs are a major factor. RMA develops premium rates from the experience in each county and state. In some cases, the experience is poor, resulting in high premium rates. Cotton is such a crop. RMA has undertaken an extensive review of its experience for cotton in the states east of Oklahoma and Texas. Participation in the cotton crop insurance program at buyup levels in these states ranges from essentially nothing to over 50 percent of planted acres. The intent of this review is to understand the causes of the poor experience that resulted in high rates in certain of these states. Once this review is completed, adjustments to premium rates for crop year 2000 can be considered. Similar reviews will be undertaken for other crops in other areas as resources permit. We are also initiating a pilot review of our methodology with the goal to publish new rates in a test area in 2000.

EFFECTS OF CLIMATE CHANGE

Question. To what extent is climate change having an impact of USDA policies? Recent weather events lead to a conclusion that adverse conditions are affecting agriculture more severely and more significantly than in earlier decades, resulting in more volatile markets, reduced farm income, and disruption of consumer expectations. How is USDA responding to these changes in terms of long-term policy and what recommendations would you make for Congressional action in this regard?

Answer. Temperature increases can have both positive and negative effects on crop and forest yields, with the difference depending on location and on the magnitude of the increase. And, agricultural and forestry systems are most sensitive to extreme climatic events such as floods, wind storms, and droughts, and to seasonal variability. Climate change could alter the frequency and magnitude of extreme events and change seasonal patterns. Increases in rainfall intensity pose a threat to agriculture and forestry and the environment because heavy rainfall is primarily responsible for soil erosion, leaching of agricultural chemicals, and runoff that carries livestock waste and nutrients into water bodies. Adjustment costs are likely to be higher with greater rates of change. While climate change is not expected to seriously threaten the U.S. ability to produce enough food to feed itself through the next century, regional production patterns are likely to be affected.

Strategies such as changing planting and harvest dates, rotating crops, selecting varieties for cultivation, changing irrigation practices, using fertilizers and pesticides, and choosing cultivation and forest management practices can lessen potential yield losses from climate change and improve yields in regions where climate change has beneficial effects.

We need to improve our understanding of how extreme events could affect agriculture and forestry and develop appropriate management systems for coping with these events. And, we need more research to explain and predict how agriculture and forestry will be affected by climate change. USDA investment in additional research on the adaptation of appropriate strategies is needed to gain a better understanding of the climatic factors that affect enterprise level adoption such as information flow, access to capital, and the role of global change public programs and policies.

We need Congressional support for our fiscal year 2000 research and climate change technology programs so we can conduct this vital research and demonstrate alternative management practices that not only address the climate challenge but provide significant co-benefits in the form of improved productive capacity of our soils, improved water quality, and habitat protection. We would also welcome your ideas on how USDA's programs can be augmented to include greenhouse gas abatement and carbon sequestration. And, we look forward to working with you to address the international challenge of reducing the atmospheric concentrations of greenhouse gases in the most cost-effective way.

FARM CREDIT

Question. Reduced farm income increases the difficulty of obtaining commercial credit. In many cases, commercial lenders are restricted by State and Federal banking requirements in a manner that will adversely affect farmers when cash flow, debt-to-assets ratios, or other financial conditions cannot be met. What role is USDA taking with the financial industry (including Federal and State regulators) to help farmers overcome banking regulatory burdens?

Answer. FSA is increasing interest in the guaranteed program by making the program more accessible and easier to understand for both lenders and loan applicants. A Preferred Lender Program (PLP) has been developed for lenders experienced with the FSA guaranteed loan programs. Under the PLP, FSA will approve the lender's system of credit management up front, and the lender will then be able to obtain a guarantee under a simplified process tailored to each lender's own policies. The application will consist of a one-page signed form supplemented by a lender narrative addressing certain credit criteria. Furthermore, the guarantee will be automatically approved if we do not take any action within 14 days.

Question. Does USDA intend to seek additional levels of direct farm credit for Farm Service Agency programs to help offset the growing difficulty of farmers to obtain operating capital from commercial lenders?

Answer. Improvements being made to the guaranteed program, along with the higher level of available guaranteed loan funds, will sufficiently supplement direct loan funds in fiscal year 2000 so that the credit needs of family farmers can be fulfilled.

Question. Does USDA intend to seek additional farm credit funding budget authority for fiscal year 1999?

Answer. A request for additional fiscal year 1999 FSA farm loan funding of $1.1 billion was submitted to Congress by President Clinton on February 26, 1999.

LOAN DEFICIENCY PAYMENT CALCULATIONS

Question. It has come to my attention that differences in points of delivery for certain commodities in Wisconsin and Minnesota are working to the detriment of Wisconsin farmers in the calculation of Loan Deficiency Payments (LDP's). In other States it has been determined that the existing system for LDP calculations based on posted county prices did not accurately reflect prices received by producers. Please review the situation in Wisconsin and report your findings and actions taken to ensure fair and equitable treatment for Wisconsin producers.

Answer. LDP's are calculated using county loan rates that are established once a year and Posted County Prices (PCP's) that may change daily. There is a common misconception that the PCP pricing system was designed to ensure that all producers of a commodity have the potential of earning the same marketing loan gain or LDP. In actuality, the primary objective of the PCP system is to determine a value as close as possible to the local cash market price in any given area. The PCP system was designed to provide producers with equitable, but not necessarily equal, value for their commodities.

The Kansas City Commodity Office (KCCO) conducts weekly surveys of 187 counties in major production areas throughout the nation to determine if PCP's accurately reflect local market prices. The most recent surveys for corn and soybeans were conducted on March 9 and included four counties in Wisconsin. In general, the results indicate that PCP's in Wisconsin accurately reflect local market conditions for these commodities.

If you have specific questions concerning the PCP for a specific commodity or region of Wisconsin, I encourage you to submit your comments to the Farm Service Agency for further review.

STUDY OF DAIRY PRICES AND THE WTO

Question. Section 151 of the Federal Agricultural Improvement Act of 1996 calls for a study and report regarding the United States' membership in the World Trade Organization and the potential impact of such membership on domestic dairy prices, federal dairy programs, and other related items. This report was to be provided to the House and Senate Agriculture Committees no later than July 1, 1997. Please provide information on the status of this report and, if complete, would you please provide a copy to this subcommittee?

Answer. The study referred to was assigned to the Economic Research Service (ERS). Unfortunately, the same staff that was working on this report was also needed to do economic analysis related to the reform of the Milk Marketing Order system. This slowed the progress on the study considerably. The analysis for the sec-

tion 151 study has been completed and the report is currently being cleared within USDA. We plan to have the report available within the next six months.

FSIS USER FEES AND FARM INCOME

Question. Please explain if you disagree that any FSIS user fees imposed on meat and poultry companies would not be passed on to producers. Do you believe the major meat and poultry companies act more competitively in their relationship with consumers than with producers? If so, please explain? If so, why is there so much concern expressed by the Department and elsewhere about concentration within the agricultural industry, especially in regard to the livestock sector and the effect of concentration on farm prices?

Answer. We estimate that the impact of the user fees on producers in the form of lower prices received would be minimal. We estimate that most of the fees will be passed on to consumers in the form of higher retail prices. We estimate that the cost will be passed onto consumers and consumer demand for meat and poultry is relatively inelastic, so this proposal would not have much impact on the market. The overall impact on retail prices is estimated to be less than one cent per pound of inspected and passed product.

EMERGENCY FORESTRY ASSISTANCE

Question. The fiscal year 1999 Appropriations Act included $10 million in emergency funding through the Forestry Incentives Program (FIP) related to forest fires in Florida and disasters in other states, including Wisconsin. What is the status of providing this assistance and what plans for distribution of benefits do you intend to use? Additionally, what timetable do you envision for delivery of this assistance? Since the identified need for Wisconsin is nearly $1.3 million for disasters in 1998, and since the $10 million provided nationally will not cover all identified needs, will the Department reflect these shortfalls in emergency funding when making any allocation to states based on an appropriation of FIP funding in fiscal year 2000?

Answer. On February 16, 1999, $9 million in Forestry Incentives Program (FIP) funds were allocated to 17 States to address reforestation needs caused by wildfires and other natural disasters in 1998. A $1 million reserve is being retained for future assistance, primarily tree planting needs, in Florida. USDA's Natural Resources Conservation Service (NRCS) and Forest Service, along with State foresters, carried out a thorough assessment of needs, which far exceed available funds. NRCS intends to closely monitor the use of these emergency funds. The Administration's fiscal year 2000 budget currently does not request funding for the FIP program in fiscal year 2000.

SANCTIONS

Question. Please provide an update on U.S. negotiations regarding the lifting of sanctions against countries such as Cuba and Iran in terms of the implications for agriculture. Please provide any information relating to the effect the lifting of such sanctions would have for U.S. producers.

Answer. With respect to Cuba, on January 5, 1999, the President announced an initiative to enhance U.S. support of the Cuban people and to promote a peaceful transition to democracy. As part of this initiative, the U.S. is implementing certain "new measures" including allowing exports of food and certain agricultural commodities to Cuba. Exports are limited to non-governmental entities in Cuba so that eligible recipients are effectively small "mom and pop" shops, private farmers and restaurants. While this represents an important first step, the immediate impact on the level of exports of agriculture products to Cuba is likely not to be great. USDA will continue to work with the Commerce Department in drafting the regulations that will govern these sales.

If sanctions on Cuba were lifted, the U.S. could reasonably expect to supply about half of Cuba's agricultural imports or about $350 million, if trade were resumed. According to some analysis, Cuba has the potential to become a $1 billion market for U.S. agricultural exports (only after substantial investments), making Cuba our second largest market in Latin America.

Regarding Iran, in December the Treasury Department received a request for approval of a license to broker a sale of approximately $500 million in agriculture exports to Iran. While a sale of this kind is currently prohibited under the terms of the comprehensive embargo against Iran, the request is being given serious consideration by the Administration. USDA is working to ensure that all points of view are represented in the decision-making process.

If sanctions on Iran were lifted, despite heavy competition from Australia, Canada and South America, it is not unreasonable to expect that U.S. agricultural exports

to Iran could reach $300 million per year in a relatively short period of time and perhaps twice as much within five years. Principle gains for U.S. exports would be in grains and oilseed products.

ASSISTANCE TO RUSSIA

Question. There have been recent claims that Russia has executed sales of wheat to Iraq. Although there appears to be no evidence that these sales involved the conveyance of commodities originating in the U.S. (notwithstanding the fungibility of commodities such as wheat) these allegations do raise serious questions about the role of U.S. assistance to Russia. Please provide information that outlines the steps the U.S. is taking to ensure that food assistance to Russia is actually being delivered to the populations intended.

Answer. In the agreements with the United States, the Government of the Russian Federation agreed to export restrictions on commodities and related products supplied as food aid. On January 29, 1999, the Government of the Russian Federation published an official decree formalizing this agreement. During recent meetings with senior USDA officials, Russian Government officials at the highest levels denied that Russia sold wheat to Iraq. If further claims surface, the Russian Government is committed to addressing the problem or face suspension of the food aid programs.

USDA is mounting an unprecedented real-time monitoring effort to ensure that the food assistance provided to Russia is delivered to the intended populations and to investigate any irregularities that arise, including Russian food exports. As part of the original food aid agreements, the Government of the Russian Federation was required to submit work plans that provide detailed information about the handling and distribution of food aid imports from the United States. These documents provide the foundation for the U.S. monitoring effort.

A working group has been established in Moscow to review the work plans, facilitate the operation of the programs and provide a forum to address monitoring issues. In addition to the U.S. Government, representatives of the key Russian ministries and commercial agents are included in monitoring activities.

Finally, four USDA monitors have been detailed to Moscow and one to Vladivostok to ensure, to the extent possible, that the agreements between the Governments of the United States and the Russian Federation are fulfilled. The team will be headed by the Agricultural Trade Officer at the U.S. Embassy. In addition, a "country team" approach has been adopted by the U.S. Embassy in Moscow so that all U.S. Government agencies represented in Russia can support the monitoring effort. The USDA monitors will coordinate with the Russian Ministry of the Interior in its independent monitoring effort.

An additional key part of the USDA monitoring plan is to provide widespread publicity about the arrival and distribution of food aid in the areas where it is destined. By building a grass roots network with local government officials, civic organizations and the press, USDA will be able to multiply its monitoring effort considerably.

PAKISTAN

Question. Last year, Congress took action relating to sanctions against Pakistan in order to help protect U.S. agricultural interests in that country. Now, we hear an opportunity exists to provide an additional 200,000 tons of wheat to Pakistan, but since that nation is in default on GSM loans, that sale (or any other) is in jeopardy. What is USDA doing to help protect markets such as this?

Answer. On March 5, the Government of Pakistan paid a portion of their arrears under the GSM–102 program and the program was reactivated. However, on March 8 Pakistan purchased 300,000 metric tons of Australian white wheat and U.S. exporters were unable to capture any business. Although GSM credit has been available for two of the last three tenders (including this one), Australia's surprisingly large freight advantage this year has put its wheat just under U.S. offers, on a landed basis. To assist in protecting our market in Pakistan, USDA has donated a total of 300,000 metric tons of wheat under the Section 416(b) program to Pakistan. The wheat will be shipped this spring. In addition, USDA is providing to Pakistan $15 million worth of additional wheat and $10 million worth of soybeans under the title I concessional sales program.

Question. To what extent is the Pakistan problem related to the general financial pressures in that part of the world?

Answer. The Asian financial crisis is a contributing factor to Pakistan's current financial woes, along with the economic sanctions imposed after the nuclear tests in May, and Pakistan's own difficulties (lawlessness, corruption) in mobilizing its

economy effectively. The extent to which financial problems in Asia have affected Pakistan's finances in general and its ability to buy U.S. wheat in particular is difficult to quantify.

For example, the value of cotton and textile exports, which constitute about two-thirds of Pakistan's $7.5 billion export earnings, is down about 15 percent this year compared to last (partly due to reduced exports to Far Eastern markets as a result of the economic downturn there and partly due to depressed prices in general as a result of the global economic situation). At the same time, worker remittances (a major source of foreign exchange) have virtually dried up since the Government of Pakistan's hard currency bank accounts were frozen last May following the nuclear tests.

Question. How many other trading partners, or potential trading partners, are in similar situations?

Answer. In addition to Pakistan, Russia is also in arrears on GSM payments, and, as a result, the GSM program in that country is currently not operative. The GSM program in Ecuador was also recently closed due to the major financial crisis there. Although GSM credit guarantees are currently not available in Russia and Ecuador, USDA has maintained a presence in both of these markets by providing extensive food aid in fiscal year 1999. As with Pakistan, we will continuously review the financial situation in Russia and Ecuador. Should there be an improvement in the financial situation in these countries, USDA will be prepared to reconsider the availability of GSM.

DAIRY EXPORT INCENTIVE PROGRAM

Question. The fiscal year 2000 budget reflects a decrease in this program. Please provide information relating to this program's use in fiscal year 1999 and reasons for the projected reduction in 2000.

Answer. The President's budget assumes that bonus awards under the Dairy Export Incentive Program will reach $99 million in 2000, which is just slightly below the level of $102 million projected for 1999. However, these numbers are only projections of program activity. The actual level of DEIP bonus awards in both 1999 and 2000 will be determined by market conditions and the Uruguay Round Agreement subsidy reduction commitments.

BANANA REGIME ISSUES

Question. A February 3rd article in the Journal of Commerce discusses the relationship of the current Banana Regime issue with the overall economies in the Caribbean Basin and suggests that a U.S. victory at the WTO may ultimately cause the U.S. more harm than good. Would you please comment on that statement and provide an overview of the implications of the Banana Regime issue on U.S. agricultural trade?

Answer. The issues in the EU Banana regime case ultimately test whether the EU will provide access to its market on a fair and non-discriminatory basis. While the Banana case does not present a situation in which U.S. agricultural products are being denied access, it does present a situation in which U.S. businesses that supply or service agriculture (U.S. farm equipment manufacturers, fertilizer producers, marketing firms, etc.) have suffered injury because of discriminatory practices. Maintaining the principles of fair access to the EU market is an important issue for U.S. agriculture in general.

The Banana case also tests whether the EU will comply with its obligations under the WTO or will ignore the Dispute Settlement Body (DSB) Panel rulings. If it ignores the DSB rulings, the benefits of the Uruguay Round will be put at risk for all members.

The United States, and U.S. agriculture in particular, has a strong interest in an effective WTO dispute settlement mechanism. Since the WTO was established in 1995, the United States has received favorable decisions in three agricultural cases and has three other cases pending where preliminary findings have supported our positions. In addition, the United States has resolved a number of agricultural issues through the WTO consultation mechanism without going to a panel.

BIOTERRORISM

Question. Please explain the steps USDA is taking, along with other federal agencies, regarding the threat of intentional contamination of our food supply as either part of an international terrorism threat or any other means.

Answer. USDA is actively involved in the Administration's overall policy initiatives to counter bioterrorism as required under Presidential Decision directives 39, 62, 63, and 67. These initiatives address prevention, consequence management plan-

ning and coordination. Currently, the Under Secretary for Food Safety co-chairs the USDA task force charged to develop the Department's Continuity of Operations Plan (COOP), which is expected to be completed and tested by October of this year.

USDA has organized an intra-departmental Food Emergency Rapid Response and Evaluation team to respond to food emergencies, which may include some bioterrorism emergencies. This team, headed by the Under Secretary for Food Safety at USDA, is a coordinating mechanism for strong ties with CDC, FDA, and the state and local public health departments working together on the Foodborne Outbreak Response Coordination Group. This group has developed a white paper describing foodborne outbreak response coordination.

APHIS has requested $1.2 million in the fiscal year 2000 President's Budget to develop a national emergency management system to meet the needs of emergency disease outbreaks and emerging animal health issues including microbiological residues, manure management, transmissible spongiform encephalopathies, and biological terrorism. Components of the system would include prevention activities such as surveillance and a national disease reporting system; preparedness activities such as training and the development of response plans; and response and-recovery activities. Of the $1.2 million, approximately $700,000 would be used to survey for significant animal health events including biological terrorism. APHIS would also conduct 4 training sessions for Agency and State employees and industry representatives regarding biological terrorism, decontamination procedures, and other animal health events. The remaining $500,000 would be used to complete a master plan for the new system and to develop a National Animal Disease Reporting System and Geographical Information System.

Question. To what extent does the President's Food Safety Initiative address this issue?

Answer. The President's Food Safety Initiative does not include any funds for bioterrorism activities. However, the Initiative's emphasis on strengthening the public health surveillance infrastructure for foodborne diseases would also be important for early detection and response to bioterrorist attacks on the food supply. For example, the Initiative funds the development of FoodNet active disease surveillance efforts and the PulseNet information system to enable Federal and State laboratories to rapidly identify and link outbreak cases. This system is proving to be an invaluable asset to the early detection of naturally caused foodborne outbreaks, and it would also be important in detection of an intentional contamination induced outbreak.

HACCP IMPLEMENTATION IN SMALL PLANTS

Question. Please provide information regarding the effect HACCP implementation is having on small firms. Since implementation of HACCP at the small firm level is very recent, have there been any unanticipated problems that should be considered by the Appropriations Committee that might not have been known at the time the fiscal year 2000 budget request was being developed?

Answer. Approximately 2,200 small establishments were required to implement Hazard Analysis and Critical Control Point (HACCP) systems by January of this year. At this time we have not encountered any serious problems. As of February 24 of this year, only 13 out of 2,211 small plants have had FSIS take enforcement action against them for failure to fully meet HACCP requirements. All of these plants have provided FSIS with corrective action plans and have been approved to continue operating. Eight other plants have voluntarily requested that inspection be suspended or withdrawn.

One of the vehicles FSIS uses to monitor HACCP implementation is the HACCP Hotline, which is managed by the agency's Technical Service Center at Omaha, NE. The HACCP Hotline has identified the following items as the principal concerns expressed by owners and operators of small plants.

[The information follows:]

Inclusion of critical control points for identified food hazards.

The use of control programs/good manufacturing practices in lieu of critical control points.

The process for completing the pre-shipment review for plants supplying products to hotels, restaurants, and institutions

PESTICIDE DATA PROGRAM

Question. Please provide information explaining the role of the Pesticide Date Program (PDP) within the context of food safety. Also, please provide information that directly links the PDP to the availability of pesticides for producers, especially for producers of minor crops.

Answer. During fiscal year 1998, EPA used PDP data for the re-registration of iprodione, thiodicarb and methomyll. During this process, EPA reassessed approximately 160 separate toleranes, of which, about 60 were tolerances for minor crop uses. In addition, EPA is using all available PDP data for the re-registration of organophosphate pesticides. For example, EPA is preparing preliminary risk assessments for azinphos methyl, methidathion, chlorphyrifos, malathion, diasinon, dihlorvos, acephate, dimethoate, disulfoton, ethion, fenamiphos, fonofos, ethdamidophos, oxydemeton methyl, parathion, parathion methyl, phorate, phosalone, phosphamidon, and tetrahlorvinphos usine PDP data. There are approximately 179 food uses covered by these data.

PDP provides data EPA needs to re-examine pesticide residues in food to determine whether a tolerance i.e., maximum allowable concentration) is "safe." The term "safe" refers to a toxicologically determined average daily intake to assure there is a reasonable certainty of no harm from dietary exposure to a pesticide. EPA gives consideration to the special susceptibilities and food consumption patterns of infants and children, and uses available and reliable data when making risk determinations. EPA uses PDP data to make "best" (refined) exposure estimates resulting from pesticide residues in foods. Furthermore, because PDP places emphasis on food items highly consumed by infants and children, EPA uses PDP data to address the special needs of this vulnerable population subgroup.

PDP also conducts studies (single serving-size portions) specifically designed to evaluate acute (short term) exposure to organophosphate and N-methylcarbamate pesticides. Data from these studies are critical for the re-registration of these chemicals needed to sustain minor crops. These data will be used in Monte-Carlo analyses, a newly developed technique which has the capability to use more realistic data.

In a related effort, EPA is testing statistical methods using PDP single-servicing size data generated for specific high consumption foods. These methods will be used to maximize use of PDP data on composite (more than one unit in a sample) in order to project acute dietary risk for other foods.

Approximately 88 percent of PDP data collected to date are for pesticide residues on minor crops. PDP data are extremely useful in retaining pesticide uses for minor crops. PDP data are being extensively used in the re-registration of organophosphate pesticides needed to sustain minor crops. EPA uses PDP data to replace previously used "worst case" residue values (e.g., toleranes or farm-date field trails to more accurately reflect residues in food near the time of consumption.

INVASIVE SPECIES

Question. Please provide information relating to potential cost to the national economy due to the existing and potential introduction of alien species for which USDA has regulatory jurisdiction. In what areas of the nation are these problems the most serious?

Answer. On February 3, 1999, the President announced an Executive Order to expand the effort to address the growing environmental and economic threat of invasive species. This order establishes an interagency Invasive Species Council with the Department's of Agriculture, Commerce, and Interior with the Secretaries as co-chairs. Experts estimate that invasive species already infest over 100 million acres of the United States and is growing at a rate of 3 million acres annually. The costs to the U.S. economy are about $123 billion annually.

Question. Is there any way to better protect areas into which these species may migrate in the immediate future?

Answer. The Council will develop a comprehensive plan to minimize the economic, ecological, and human health impacts of invasive species and determine further steps to prevent the introduction and spread of invasive species.

Question. From a budgetary perspective, keeping in mind the constrains on this subcommittee, what are the best strategies to control the threat from these pests?

Answer. The USDA budget includes an increase of $16 million for programs to combat invasive species by preventing entry, improving monitoring and detection, providing rapid assessment and eradication, increasing crosscutting research and technology, and developing partnerships directed at education and outreach.

Question. Please provide information relating to potential cost to the national economy due to the existing and potential introduction of alien species for which USDA has regulatory jurisdiction. In what areas of the nation are these problems the most serious? Is there any way to better protect areas into which these species may migrate in the immediate future? From a budgetary perspective, keeping in mind the constrains on this subcommittee, what are the best strategies to control the threat from these pests?

ORGANIC CERTIFICATION

Question. Please provide information regarding finalization of the Organic Certification program. In which areas of the nation do you believe this program will be the most important from both a producer and consumer perspective?

Answer. ASM is in the final stages of issuing another proposed rule for organizally-grown food. There were more than 275,000 comments on USDA's previous proposed organic standard. We are revising our proposed standards, and plan to issue another proposal later this year with another public comment. While some areas of the country produce more organic product than other, both producers and consumers nationwide will benefit from the universal standard that this program will ensure.

WETLANDS RESERVE PROGRAM

Question. Will the expected enrollments in the Wetlands Reserve Program (WRP) in fiscal year 2000 bring total enrollments to the fully authorized level? In the event the WRP enrollment authorization is met, does USDA intend to request additional authorization? If so when and to what levels?

Answer. The requested WRP acreage enrollment level for fiscal year 2000 will bring the total enrollment to the fully authorized level. USDA does intend to request additional authorization once the present acreage cap is reached. The request will be contained in the fiscal year 2001 budget. The exact level is still under consideration but will likely range from up to 200,000 to 250,000 acres per year for the period fiscal year 2001 through fiscal year 2006.

Question. Since many watershed structures are reaching their life expectancy, what does USDA plan to do to help avoid continuing deterioration of these structures beyond educational activities? To what extent does the current status of these structures present a threat to public safety? Please explain if you believe the level of activity needed to correct the problem of deteriorating infrastructure does not rise above the normal maintenance requirement, and thereby places the burden of repair solely on local watershed organizations.

Answer. The issue of the aging watershed infrastructure is a growing concern because of potential safety and health risks to the public. Between the 1940's and 1960's, local sponsors with the assistance of USDA, constructed over 10,000 flood control dams that were designed to last 50 years. Many of these dams and others of newer design are in a higher hazard classification due downstream development and will also require major construction.

It is our opinion that the sponsors of dams built under the Small Watershed Program are responsible for the operations, maintenance, rehabilitation as well as compliance with all state and federal laws involving dam safety and environmental permits. USDA presently has no statutory authority to provide financial assistance for rehabilitation. USDA is assessing ideas on how to assist in addressing the problem within current authorities.

USDA/NRCS is currently completing a "Rapid Assessment of Known Rehabilitation Needs" of dams built under the Small Watershed Program in the states of Arkansas, Alabama, Colorado, Georgia, Iowa, Illinois, Indiana, Kansas, Kentucky, Missouri, Mississippi, Nebraska, New Mexico, New York, Ohio, Oklahoma, Pennsylvania, Tennessee, Texas, Virginia, West Virginia and Wisconsin. While this assessment is strictly a compilation of known rehabilitation needs, it will provide stakeholders valuable information on future direction. Early findings of this assessment are being provided for the record.

RAPID ASSESSMENT OF KNOWN DAM REHABILITATION NEEDS

[Includes only dams built under PL–534, PL–566, Pilot Projects, and Resource Conservation and Development authorities of USDA]

State [1]	Number of Dams Needing Immediate Rehabilitation	Estimated Cost [2]
Alabama	71	$24,000,000
Arkansas	77	21,000,000
Colorado	49	28,000,000
Georgia	129	85,000,000
Illinois	36	11,000,000
Indiana	41	14,000,000

RAPID ASSESSMENT OF KNOWN DAM REHABILITATION NEEDS—Continued

[Includes only dams built under PL–534, PL–566, Pilot Projects, and Resource Conservation and Development authorities of USDA]

State [1]	Number of Dams Needing Immediate Rehabilitation	Estimated Cost [2]
Iowa	284	20,000,000
Kansas	97	19,000,000
Kentuky	105	20,000,000
Mississippi	84	31,000,000
Missouri	244	21,000,000
Nebraksa	294	4,000,000
New Mexico	17	23,000,000
New York	49	2,000,000
Ohio	46	7,000,000
Oklahoma	190	53,000,000
Pennsylvania	7	1,000,000
Tennessee	43	12,000,000
Texas	283	84,000,000
Virginia	16	10,000,000
West Virginia	24	54,000,000
Wisconsin	42	3,000,000
Totals for these states only	2,238	547,000,000

[1] These 22 states have 10,188 of project dams.
[2] Does not include Operations and Maintenance costs.
[3] Caution Preliminary Estimates: Subject to change upon detailed on-site assessment.

RESOURCE CONSERVATION AND DEVELOPMENT

Question. Do you believe Resource Conservation and Development (RC&D) districts should be expanded in number or should the areas be expanded geographically? Should the RC&D program contain a "graduation" requirement which would allow new districts to come into the program as others leave due to either completion of RC&D goals or inactivity?

Answer. At current funding levels, we do not believe Resource Conservation and Development (RC&D) Areas should be expanded either in number or geographically. Even at these levels, NRCS is finding it difficult to meet the basic support needs of the 315 authorized RC&D areas. There are 37 areas with applications currently requesting designation by the Secretary of Agriculture with an additional 20 councils being formed.

Expansion.—RC&D Areas are typically multi-county, many being made up of three or more counties. There may be locations where sufficient similarities in issues, action priorities and other interests exist such that designated areas could be expanded to incorporate all or portions of adjacent applicant areas. This would be contingent upon local Councils' willingness to adjust their boundaries, council membership, priorities, etc., to accommodate the additional counties. This will not work everywhere due to geographic distances or other similar limiting factors. NRCS State Conservationists will be requested to work with their State Associations and RC&D Councils to assess where expansion can work and make the necessary adjustments. We expect this will be viable in a few locations.

Graduation.—The RC&D program should only contain a "graduation" requirement for those RC&D Councils found to be inactive or performing below a minimum level. This would be a 'de-designation' of an RC&D area. USDA, in consultation with the National Association of RC&D Councils, Inc. has developed minimum performance criteria for RC&D Councils. The 315 existing designated area councils will be requested to assess their performance using this criteria this fiscal year and identify actions to improve where needed. Inactive or limited performance councils would be provided the opportunity to revise their area plan and strengthen results. USDA could then determine to withdraw assistance if insufficient progress occurs. We think this would be rare.

The concept of "Graduation" is inconsistent with the program objectives, and the needs of rural communities. Currently, there are not any agreed upon measures of

"self sufficiency" in the professional field of rural development, let alone measures that also include conservation of natural resources. This is not unique to USDA. It is an issue that is endemic to the whole discipline of economic development. USDA no longer provides RC&D financial assistance to councils as the number of designated areas has increased. In recent years, congressional appropriations for the program have declined in real dollars. Some councils, no longer receiving financial assistance due to budgetary constraints, characterize this as a form of graduation. Complete "Graduation" would sever the basic partnership of the USDA with Councils, providing a disincentive for councils.

In addition, local partners would be less likely to participate if they felt their much of their energy and resources had to go toward overhead and administrative costs rather than producing results for their communities. One of the key attributes of the RC&D Program is that participating organizations see their financial and "in kind" contributions put to work in local projects.

The idea of "graduation" does not recognize the need of poor rural areas to sustain the program over the long term. The strength of the program rests in the experienced local delivery network working in partnership with USDA to address local, regional, and national interests. USDA's technical assistance is viewed as the catalyst for providing access to information and technical expertise, leveraging other support, and providing continuity for the Council in addressing new issues facing their communities.

A letter has been sent to the Appropriations Committee in response to language in the fiscal year 1999 Agriculture Appropriations Bill. The letter will provide further information and discussion of actions USDA is undertaking to improve the efficiency and effectiveness of the RC&D Program.

RURAL HOUSING RENTAL ASSISTANCE

Question. The budget request for 2000 would reduce the amount available for Rental Assistance, in part by deferring a portion of the funds until October 1, 2000. What effect would this action have on current tenants of eligible housing facilities and on the USDA housing programs generally?

Answer. This proposal should have no effect on the tenants of our rental units. The rental assistance contracts cover a five-year period and requesting the funds over a two-year period will have no effect either on the owners of the projects or the tenants. Nor should this approach have any effect on the housing programs in general.

FORMULA RESEARCH FUNDING

Question. Formula Research Funding. For the first time in many years, Congress in fiscal year 1999 appropriated funding level increases for many of the Formula Funded Research Programs, such as the Hatch Act, Smith-Lever, and other programs important to states and rural areas. However, the fiscal year 2000 budget request, again, calls for a significant reduction in these accounts. Please explain the rationale for these reductions, the anticipated affect it will have on state and county based research and extension activities, and the extent to which USDA consulted with its state and local partners in this decision.

Answer. As you know, the Administration supports a balanced portfolio of funding for university-based agricultural research including formula programs, competitive grants, special grants and projects, and other programs such as Smith-Level 3(d).

Competitive grants are an important mechanism for achieving accountability to taxpayers. The Agricultural Research, Extension and Education Reform Act of 1998 sets specific standards for federally funded agricultural research activities, including activities resulting from formula funding programs. Section 101(a) requires that agricultural research, extension or education activities address priority concerns that are of national, multi-state or regional in significance. The legislation also requires the Secretary of Agriculture to set research priorities after consulting with persons who conduct or use agricultural, research, extension or education and that entities receiving formula funds also develop a procedure for receiving such input into program development. Competitive grant programs provide an opportunity for the Administration to meet that statutory obligation to taxpayers. Following extensive consultation with stakeholders including the National Research, Extension and Education Advisory Board, the land grant university system, and producer representatives, the Administration developed a list of national agricultural research priorities for fiscal year 2000, including food safety, methyl bromide alternatives, small farms, Food Quality Protection Act implementation and water quality. Through the competitive grants process, the Cooperative State Research, Education, and Extension (CSREES) can ensure that scarce federal resources are used to address these high

priority concerns. States and localities may still choose to invest the funds they receive through formula programs or other sources to address issues of immediate state and local concern as identified through their own stakeholder input process. Since they are free to use those funds, as well as the funds they receive from formula programs in the manner they choose, the impact of the proposed fiscal year 2000 budget will vary from state to state.

The Administration does not believe that redirecting funds to competitive grant programs is at the expense of our land grant partners. In fiscal year 1998, land grant colleges and universities received approximately 75 percent of the funds awarded under CSREES competitive grant programs. If past percentages hold true, the proposed $81 million increase in the National Research Initiative in fiscal year 2000 may result in $61 million in additional research to land grant colleges and universities more than offsetting the proposed decrease in formula funds and ensuring that federal research, extension and education programs meet national priorities. The Administration also believes focusing on competitive programs will allow USDA to leverage research dollars from other agencies such as NSF, Environment Protection Agency, and National Institutes of Health to agricultural problems, thereby increasing the funding opportunities for land grant partners. A broadly competitive grant program will also ensure that scientific expertise from outside the land grant system will be brought to bear on agricultural problems, thereby increasing the potential return to taxpayers. Through this approach to research funding, the Administration believes more resources can be devoted to agricultural problems and we can continue to provide our farmers, ranchers and consumers with world-class cutting edge research to meet the ever increasing array of production, processing and nutritional challenges that face them.

Question. Methyl Bromide. Please provide information regarding USDA activities in fiscal year 1999 and in the fiscal year 2000 budget relating to methyl bromide alternatives, including your expectations on finding an acceptable alternative in the near term, and please note any changes in program activities that may have resulted from last year's extension of production phase-out from 2000 until 2005.

Answer. In fiscal year 1999, the Agricultural Research Service (ARS) has nearly $14.4 million appropriated for research on methyl bromide alternatives. The funds currently are distributed among 20 ARS locations (see table below). About half of the funds are in the two states that are most impacted by the impending loss of methyl bromide—California ($4,373,900) and Florida ($3,029,400). The Honolulu, HI, and Weslaco, TX, locations, where research on methyl bromide alternatives for quarantine purposes is conducted, account for an additional 25 percent of the funding ($3,167,600). ARS sponsors field-scale validations of the most promising alternatives identified in experimental plots. Parallel programs are proceeding in Florida and California ($250,000 each annually) will emphasis on tomatoes in Florida and strawberries in California. Research teams that include ARS and university scientists, extension personnel, and grower representatives meet periodically to evaluate research results and plan future trials. To help transfer the technology to growers, many of the field-scale validations are done with active grower participation on commercial farms. Such alternatives are being tested at seven strawberry sites in California, scattered from just north of San Diego to Watsonville and with one site in the Central Valley, to test alternatives under a range of growing conditions. There are five sites devoted to perennials. In Florida, there are five sites each for tomatoes and strawberries. $50,000 of the Florida funds supports extension efforts to facilitate adoption of alternatives.

ARS Funding for Methyl Bromide Alternatives Research—Fiscal Year 1999

Location:	
Davis, CA	$226,000
Fresno, CA	3,485,400
Riverside, CA	126,600
Salinas, CA	535,900
Washington, DC	241,200
Gainesville, FL	213,000
Miami, FL	1,219,300
Orlando, FL	1,597,100
Byron, GA	83,900
Tifton, GA	462,200
Honolulu, HI	1,684,700
Manhattan, KS	70,800
Beltsville, MD	1,048,200
Stoneville, MS	182,200
Corvallis, OR	487,400

Charleston, SC	330,600
Weslaco, TX	1,482,900
Wenatchee, WA	209,200
Yakima, WA	258,000
Kearneysville, WV	435,000
Total	14,379,600

Current budget projections for fiscal year 2000 are similar to fiscal year 1999.

Other USDA agencies with methyl bromide alternatives research projects are the Forest Service (FS) and CSREES. In fiscal year 2000, an increase of $5 million is provided in the CSREES budget for a new integrated competitive grants program to support the discovery and implementation of pest management alternatives for commodities most affected by the methyl bromide phase-out. The new program will focus on short and intermediate-term solutions for commodities at risk. Special emphasis will be placed on activities targeting technology transfer of research into practical management alternatives. The Forest Service has reestablished nursery programs at Athens, Georgia, and St. Paul, Minnesota, with the goal of developing integrated pest management programs that will ensure high quality seedlings. In the post harvest area, the Forest Service, together with the Foreign Agricultural Service and the Animal and Plant Health Inspection Service, has been successful in negotiations to get U.S. heat-treated coniferous wood accepted into Europe and kiln-dried lumber into Korea in lieu of fumigation with methyl bromide. The Cooperative State Research, Education, and Extension Service, which administers the National Research Initiative Competitive Grants Program, has funded research on biological control of soil borne disease organisms. ERS is analyzing the economic tradeoffs associated with the methyl bromide phase-out, which will augment USDA's effort to prioritize an alternatives research program.

An acceptable alternative must allow growers to raise a profitable crop reliably from year to year. In the short term, it is clear that acceptable alternatives will have to come from among those already under development and testing. Because methyl bromide is effective over a wide range of soil types, climates, and crops, no single alternative is available to replace all the uses. The most likely short-time alternatives will be replacement fumigants that are already registered but they may have to be augmented with other pesticides such as herbicides. Other kinds of alternatives, such as resistant varieties, biological control, and cultural improvements, show promise; but there is not enough time to develop and adapt them to acceptable cropping systems before the phase-out. Even for replacement fumigants, results are mixed and not as consistent as methyl bromide—probably why the replacements have not been widely adopted as long as methyl bromide is available.

In summary, although there are likely to be short-term replacements for some uses of methyl bromide, in most cases, the alternative is likely to cost more and be less effective. Among the soil fumigation uses, some of the more severe impacts will occur to the production of strawberries in California and Florida, orchard crops and nurseries in California, and vegetable crops in Florida. Serious economic consequences and shifts in agriculture within states and among foreign countries are expected.

The strategy for finding alternatives is not expected to change because of the extension of the phase-out; there will just be more time to look for solutions. The strategy remains to identify and develop alternatives in laboratories and small plots, then test the most promising in larger plots under a variety of conditions, and finally to select the most effective and validate their effectiveness in commercial field-scale settings. The final stages are done with the cooperation of the agriculture industries and growers, many times on grower land.

Question. Also, please compare USDA activities in methyl bromide research to those of other federal departments or agencies in terms of total expenditures and interims of a percentage of the total agency budget.

Answer. Methyl bromide is primarily an agriculture chemical and as such the USDA has primary responsibility for finding alternatives for those uses. The Agricultural Research Service, the intramural research arm of the USDA, has the primary lead within the USDA. The Cooperative State Research, Education and Extension Service and the Forest Service have small research efforts on methyl bromide alternatives. The Economic Research Service conducts research on the impact of the methyl bromide phase-out. Research expenditures by agency are summarized in the following table.

Agency	Fiscal Year	Amount	Percent
ARS	1999	$14,379,600	1.83
ARS	2000	14,379,600	1.72
FS	1999	518,000	(1)
FS	2000	508,000	(1)
ERS	1999	200,000	(1)
ERS	2000	200,000	(1)
CSREES	1999	306,000	(1)
CSREES	2000	5,306,000	(1)

[1] Less than 1 percent.

The Environmental Protection Agency and the National Oceanic and Atmospheric Administration have methyl bromide research programs, although the focus of those programs relate to atmospheric ozone depletion and the role of methyl bromide in that phenomenon.

Question. To what extent is USDA working with other departments or agencies on methyl bromide research?

Answer. The USDA and EPA co-sponsor with Methyl Bromide Alternatives Outreach, the International Methyl Bromide Alternatives Research Conference each year where scientists, growers, exporters and other members of the impacted agricultural community discuss the latest methyl bromide alternatives technology. Also, the USDA is working closely with the EPA Office of Pesticide Programs to identify and resolve registration issues that impact the availability of potential chemical alternatives to farmers. EPA has agreed to give high priority to the registration of methyl bromide alternatives.

USDA AGENCY ADMINISTRATION

Question. Section 754 of the fiscal year 1999 Appropriations Act directed that any submission of unauthorized user fees in the fiscal year 2000 budget request before this subcommittee would have to include certain additional information if the revenue for those fees was necessary to meet the President's budget authority requirements. While the budget authority request for FSIS appears to include the full amount necessary for inspection and related activities in fiscal year 2000, the table found on page 379 of the Budget reflects a total discretionary requirement for this subcommittee that assumes the $504 million in proposed revenues from unauthorized user fees for FSIS activities. Please list by USDA agency and by amount any assumptions of revenues from unauthorized user fees used to achieve the discretionary spending total found on page 379 and, consistent with Section 754 please note the funding levels currently in the budget request recommended for reduction in the event the fees in question are not authorized prior to the convening of a committee of conference for the fiscal year 2000 appropriations bill.

Answer. For fiscal year 2000 the budget is presented on a current law basis and this is the amount that is shown on page 379 of the Budget which lists discretionary proposals by appropriations subcommittees. Last year the budget was presented on a net basis.

In addition, the President's statement when he signed the fiscal year 1999 appropriations bill said, "Section 754 of the Agriculture/Rural Development appropriations section constrains my ability to make a particular type of budget recommendation to the Congress. This provision would interfere with my constitutional duty under the Recommendation Clause, and I will treat it as advisory."

COUNTY AND STATE OFFICE STREAMLINING

Question. To what extent are total agency costs in office consolidations considered? For example, would USDA require relocation of a State office for one agency in order for all State agencies to be in a single location if the cost for the relocation exceeded the costs of current locations?

Answer. FSA with NRCS and RD will be establishing a working group comprised of representatives from management and the unions to develop a plan for implementing office consolidations where these are not already in place. The working group will be looking at every aspect of plans to achieve savings under current budget resources. It is possible that the benefits to producers and field offices of a common State office location could outweigh a somewhat higher cost.

EMPLOYEE REDUCTIONS AND OFFICE CLOSURES

Question. Since budget constraints are resulting in lower service levels in field offices due to increased workload and a reduced workforce, has USDA conducted an evaluation to determine when the continuation of a county office in a given location is of less importance to the customer than the maintenance of "service" in the area? At what point does the presence of a workforce in an area become more important than the existence of a field office regardless of whether that office can meet workload requirements?

Answer. The Agency is continually monitoring workload in States to determine areas of increased workload and moves both human and monetary resources to those areas based on availability to provide the most effective and efficient service to its customers. State Executive Directors have been charged to use all management tools available to ensure that producers are served as expeditiously as possible using details, directed reassignments of employees, shared management and office collocation and consolidation to get the work accomplished. When the cost of keeping a service center in operation exceeds the benefit of service provided at the counter, States consider closure and consolidation of operations to improve efficiency but only with Congressional concurrence.

FARM SERVICE AGENCY FEDERAL AND COUNTY EMPLOYMENT STATUS

Question. Please provide an update on activities relating to the conversion of Farm Service Agency (FSA) county personnel to Federal status.

Answer. No further discussion or action has been taken in converting FSA county employees to Federal status. Currently, the Secretary is on record as being in favor of this conversion. No Congressional action has been taken to enact this proposal. However, on October 21, 1998, the President signed Public Law 105–277, which contains a section to provide permanent FSA county office committee employees with Federal civil service status for only the purpose of applying for USDA civil service vacancies.

FARM SERVICE AGENCY SALARIES AND EXPENSES

Question. The fiscal year 2000 request for FSA Salaries and Expenses includes an $80 million increase, although that increase does not take into account the additional $40 million provided as emergency spending in fiscal year 1999 which reduces the actual increase to $40 million. To what extent has the FSA Salaries and Expenses account been supplemented by carryover balances in past years and how much will be available in fiscal year 2000?

Answer. FSA has both Federal offices and non-Federal county offices, and the ability to obligate administrative funds for carryover workload is authorized by a general provision in each year's appropriation act, which is only applicable to the non-Federal county offices. Funds obligated for carryover workload expenses are normally kept at a minimum. Funds made available to county committees in a fiscal year are based on actual and estimated workload and staff year requirements according to the FSA County Office Work Measurement and Funding Allocation System. Requirements are updated during the year to take into account changing conditions. Programs administered by county committees are highly volatile in nature and subject to rapid changes. Such changes include weather conditions, domestic market prices, export sales, legislative and policy changes. Many emergency programs end up being quickly administered at mid-fiscal year or late in the fiscal year. In a disaster situation the top priority is to furnish a check to a farmer or rancher as quickly as possible, so most county offices must end up delaying or completing the process of all necessary paperwork according to required procedures in order to comply with Agency procedures as well as satisfy general and specific audits by OIG and/or GAO.

Obligated carryover in fiscal year 1997 amounted to $63.8 million of which $50.8 million was designated for use in fiscal year 1998 and $13 million for use in fiscal year 1999. The ending obligated carryover for fiscal year 1998 was actually $32.1 million which includes the $13 million brought forward from fiscal year 1998 and programmed for fiscal year 1999. The $32.1 million is for carryover workload expenses to be completed in fiscal year 1999. There is currently no expected carryover estimate for fiscal year 2000, given 1999 funding enacted.

Question. To what extent will the $80 million increase described in the fiscal year 2000 budget request actually reflect an increase in funding available to maintain personnel?

Answer. The increase is actually $40.5 million. The 1999 funding level includes the additional $40 million provided by the emergency appropriations title of the

1999 Act. This funding identified as administrative support for the emergency programs allowed FSA to maintain fiscal year 1998 staffing levels into fiscal year 1999. An increase of approximately $40.5 million over the fiscal year 1999 enacted level is required to sustain critical program delivery, including pay costs at a reduced staffing level, offset by some decreased operating costs. After adjusting fiscal year 1999 for $32.1 million in obligated carryover funding, the actual net increase for fiscal year 2000 amounts to only $8.4 million. Therefore, the small increase in total availability actually requires a decrease in staffing because of pay and related costs.

Question. In what manner does the agency expect to reduce the staffing levels to those included in the budget documents by the end of fiscal year 2000?

Answer. Fiscal year 2000 Explanatory Notes reflect a decrease of 752 staff years in the Federal and non-Federal staffing level, from fiscal year 1999 staffing of 16,545 FTE's to fiscal year 2000 staffing of 15,793. FSA has no buyouts or RIF's planned for fiscal year 2000. The Agency hopes to achieve the 752 decrease in staff years through attrition.

Question. What effect will this have on the administration of programs and the level of service afforded customers?

Answer. Because workload, particularly for marketing assistance loans, loan deficiency payments and farm loans, is expected to increase in fiscal year 2000, the proposed reduction of 752 staff-years proposed will pose a formidable challenge to FSA. The Agency will strive for maximum efficiency in program delivery as it continues with its re-engineering efforts for program and administrative services. But ultimately, these reductions will negatively impact program delivery in terms of delays in delivering payments to farmers, and in implementing emergency and disaster programs across the nation, particularly in locations already minimally staffed as a result of previous agency downsizing.

CONSERVATION TECHNICAL ASSISTANCE

Question. To what extent will the restrictions on Commodity Credit Corporation (CCC) Section 11 reimbursements affect the administration of conservation programs in fiscal year 2000?

Answer. Section 161 of the 1996 farm bill amended Section 11 of the CCC Charter Act to limit the uses of CCC funds for reimbursable agreements and transfers and allotments of funds to State and Federal agencies. In fiscal year 2000, after adjusting the cap to remove the Emerging Markets Program from the base, the total expenditure of CCC funds for such uses may not exceed $36.2 million. The budget projects obligations under the revised cap for reimbursable agreements will total $36.2 million in fiscal year 2000, excluding funding for technical assistance for the Wetlands Reserve Program (WRP) and the Conservation Reserve Program (CRP). Technical assistance needs in fiscal year 2000 for the WRP are estimated to total $18.3 million, with $2.0 million provided from unobligated prior year appropriations and $9.8 million from funds available under the Section 11 cap, leaving a shortfall of $6.5 million. Technical assistance needs in fiscal year 2000 for the CRP are estimated to total $18.1 million.

Question. Does USDA plan any action, either administratively or through requests to Congress, to correct any serious problem posed by the Section 11 limitation?

Answer. No funds for CRP technical assistance in fiscal year 2000 are available from unobligated prior year appropriations, no CCC funding has been provided for, and we are therefore attempting to determine appropriate actions to resolve the funding shortfall.

FOOD GLEANING SAVINGS

Question. Food gleaning savings. As efforts at food gleaning become more successful, will there be any anticipated future savings for USDA feeding programs? If so, when might these be realized and to what levels might they reach?

Answer. It is highly unlikely that even a large-scale increase in food recovery and gleaning could significantly reduce the need for funding for other USDA nutrition assistance programs in the near future, particularly given that emergency feeding organizations throughout the country are now reporting that they are struggling to keep up with a dramatically rising demand for food from families at risk of hunger—particularly from working poor families who may not be eligible for food stamps.

A 1998 report by the Second Harvest Food Bank Network indicated that approximately 21 million Americans rely on emergency food through that network—and many food banks are currently reporting that the number of people they are serving is growing, even under the optimal economic conditions that now exist. If USDA obtains the $15 million in funds requested and reaches the ambitious goal of increas-

ing the amount of food recovered and gleaned each year by 33 percent, that would provide approximately 500 million additional pounds of food a year, which equals roughly three meals a day for 450,000 people. While this would be a significant number of people served, it would be less than 3 percent of the estimated 21 million people served by the current emergency feeding system. Thus, USDA anticipates that most of the additional food provided under such a scenario would help nonprofit feeding organizations meet their increasing need, rather than reducing the burden of Federal nutrition assistance programs.

ADVISORY COMMITTEES

Question. Please provide an update on the status of nominations to the USDA Agricultural Policy Advisory Committee (APAC). Wisconsin has a candidate that represents the small and medium-sized family dairies that are prevalent in the Midwest. What is the Department's status on completing those nominations?

Answer. The charters for the Agricultural Policy Advisory Committee for Trade expires April 3, 1999. To ensure continued operations of both the committees, it is the Department's intention to recharter all of the committees and make the membership appointments no later than the end of March, 1999.

QUESTIONS SUBMITTED BY SENATOR DURBIN

FOOD AID PROGRAMS

Question. Under Secretary Schumacher, you mentioned using the Food Aid Initiative to reduce U.S. wheat surpluses. Beyond what you have already done using pork in aid programs to Russia, are there other avenues the Department can explore to increase the use of pork and other commodities in foreign food aid programs? Possibly to Nicaragua or Honduras? Are there any plans for the near future? What tangible benefits would this type of aid have on U.S. pork producers?

Answer. The Department is always vigilant to the possibility of helping U.S. pork producers through our food aid programs, as evidenced by our donations of pork to Russia. In the case of Nicaragua, Honduras, and other Central American countries hit by Hurricane Mitch, we did closely examine the possibility of donating live hogs or pork to those countries. However, due to a combination of serious logistical problems with delivery of these kinds of products to Central America following the hurricane, and, for some of the countries, a lack of interest in receiving such products, no food aid donations of live hogs or pork have been made to those countries this year. Small donations of hogs or pork products such as the one that was considered but later rejected for Central America could not be expected to have any significant impact on U.S. hog or pork prices.

CONSERVATION RESERVE PROGRAM

Question. The Natural Resources Conservation Service is expected to provide an estimated $55–70 million in technical assistance for the Conservation Reserve Program, and $11.8 million for the Wetlands Reserve Program. Yet, the NRCS could see a shortfall of $50–60 million in fiscal year 1999 because of the Section 11 cap in the 1996 Farm Bill. Is the Department concerned about the shortfall in funding? What is the Department doing to alleviate the shortfall?

Answer. Yes, the Department is concerned about the shortfall in funding because of the impact this would have upon producers accepted in the general signup (signup 18), the continuous signup, and the Conservation Reserve Enhancement Program. The Department is working to resolve the issue.

QUESTIONS SUBMITTED BY SENATOR KYL

KARNAL BUNT

Question. As you know, the report accompanying last years appropriations bill directed APHIS to work with the Arizona wheat industry and Arizona regulatory agencies to develop a plan for de-regulation of Karnal bunt in Arizona. The plan was to be submitted to the Committee on Appropriations no later than November 15, 1998. I have been informed, however, that the plan is still in draft form and is not expected to be released until April of this year. This is unacceptable, especially in light of the fact that the 1998–99 growing season for wheat began at the end of November. Because of this delay, our growers are essentially operating in the dark; without a set protocol, growers risk planting wheat in a potentially regulated area.

Arizona wheat growers wish to operate with some certainty and comply with the rules and regulations set forth by APHIS, but this is a most difficult task when growers haven't even been informed as to what those rules will entail. Arizona growers need to know what regulatory actions will be taken by APHIS for Karnal bunt prior to the beginning of each growing season. Is APHIS willing to publish the planting rules for the 1999–2000 growing season by no later than December 1, 1999?

Answer. Yes, we are willing to publish the planting rules for the 1999–2000 growing season prior to December 1, 1999, and we will strive to meet that deadline.

Question. Pursuant to the fiscal year 1999 appropriations bill, did you meet with the representatives of the Arizona wheat industry and Arizona regulatory agencies to develop a plan for deregulation? Why or why not?

Answer. Yes, we have met on several occasions with representatives of the Arizona wheat industry and Arizona regulatory agencies to develop a de-regulation plan. We will meet with them again this spring. For the 1999 harvest season, we have published a proposal in the Federal Register in which we would greatly reduce the size of the existing regulated areas with 3 years of negative survey and allow the planting of wheat in plowdown, traceback, and bunted kernel fields. We intend for the final rules to be published in time to provide relief for the crop that will be harvested in May, June, and July.

Question. When will this joint plan be submitted to the Committee?

Answer. We published a proposed rule on our plan on March 9, 1999. It became effective upon signature on April 28, 1999, and was published as a final rule on May 4, 1999.

Question. I have also learned that the compensation package for the 1997–98 growing season was finally published on December 17, 1998, long after the wheat harvest had been completed last spring. I have also been informed that this package compensates growers at 60 cents per bushel and handlers at $1.80 per bushel. Why did it take USDA so long to publish this package?

Answer. We realize that compensation rules have been delayed each crop year, and we are trying to improve our timeliness. The delays have been in part because we have been attempting to issue a longer term compensation package. We were analyzing the benefits of developing a longer-term proposal concurrent to our 1997–98 package that would provide growers with the information they need well in advance of when they must make planting and contracting decisions. In July, we decided to table the longer-term proposal for future consideration and propose the 1997–98 package by itself. The 1997–98 proposal was published on December 17, 1998.

Question. Why are growers being compensated at only 60 cents per bushel when the actual loss per bushel is estimated at $2.00 per bushel?

Answer. Growers and handlers with wheat from the same regulated areas are given equivalent compensation rates. The difference in compensation rates reflects the fact that affected entities in areas under the first regulated crop season would not have known that their area was to become regulated for KB when they made planting and contracting decisions. Therefore, they would not have considered the risk of loss in value of their wheat due to KB. Conversely, growers and handlers in previously regulated areas knew they were in a regulated area when they made planting and contracting decisions for the 1997–98 crop season. With this knowledge, growers and handlers could have chosen to alter planting or contract decisions to avoid experiencing potential losses due to KB.

Question. The proposed compensation package states that growers and handlers could have chosen to alter planting or contract decisions to avoid experiencing potential losses due to Karnal bunt. In light of the fact that USDA failed to publish the planting rules for the 1998 crop in time for the growers to alter planting or contract decision, what is the justification behind this statement?

Answer. Growers and handlers were aware of the regulatory boundaries from the rules we published in fiscal year 1996 for the 1995–96 crop season. Therefore, they were aware of the risks they may encounter. In addition, our compensation package for the 1997–98 crop season did not increase the regulated area, so growers and handlers were not faced with any additional risk. As you know, the report accompanying last year's appropriations bill directed APHIS to "work with the Arizona wheat industry and Arizona regulatory agencies to develop a plan for de-regulation of karnal bunt in Arizona." The plan was to be submitted to the Committee on Appropriations no later than November 15, 1998. I have been informed, however, that the plan is still in draft form and is not expected to be released until April of this year. This is unacceptable, especially in light of the fact that the 1998–99 growing season for wheat began at the end of November. Because of this delay, our growers are essentially operating in the dark; without a set protocol, growers risk planting

wheat in a potentially regulated area. Arizona wheat growers wish to operate with some certainty and comply with the rules and regulations set forth by APHIS, but this is a most difficult task when growers haven't even been informed as to what those rules will entail.

SUBCOMMITTEE RECESS

Senator COCHRAN. This concludes today's hearing. I want to thank you all for appearing before us and providing us with answers to our questions and statements that will help us understand the budget request and the implications for the programs that are administered under these agencies.

Our next hearing will be on Tuesday, March 16, at 9:30 a.m. in this same room, 138 of the Dirksen Senate Office Building. At that time, we will hear from witnesses from the Departments of Agriculture and Health and Human Services on the topic of food safety.

Until then, this Subcommittee stands in recess.

[Whereupon, at 11:07 a.m., Tuesday, March 2, the Subcommittee was recessed, to reconvene at 9:30 a.m., Tuesday, March 16.]

AGRICULTURAL, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2000

TUESDAY, MARCH 16, 1999

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met, at 9:35 a.m., in room SD–138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.

Present: Senators Cochran, Kohl, Durbin, Harkin, and Dorgan.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

CENTERS FOR DISEASE CONTROL AND PREVENTION

STATEMENT OF JEFFREY P. KOPLAN, M.D., DIRECTOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order. This morning we continue to review the President's budget request for programs and activities that come under the jurisdiction of our subcommittee. This morning we are considering the budget request as it relates to food safety activities of the Department of Agriculture and the Department of Health and Human Services.

The witnesses this morning represent the agencies responsible for monitoring food preparation and processing to make sure that the United States and its citizens continue to have the safest food supply in the world.

One observation at the outset is that the so-called Food Safety Initiative has received funding over the past 2 fiscal years of $508 million. One issue that I hope we will consider is whether or not those funds are being well used, how they are being used and coordinated as a part of the Food Safety Initiative.

I hope the witnesses will discuss with us their efforts to reduce threats to the public health and to increase the safety of our nation's food supply through the implementation of inspection systems and the use of technologies and education to help promote food safety procedures and safe food handling.

We welcome this morning Dr. Catherine Woteki, Under Secretary for Food Safety at the Department of Agriculture; Dr. Jane Henney, Commissioner of the Food and Drug Administration; and Dr. Jeffrey Koplan, Director of the Department of Health and Human Services' Centers for Disease Control and Prevention.

Before proceeding to hear your comments, I will be happy to yield to my distinguished friend from Wisconsin, the ranking Democrat on our subcommittee, Senator Kohl.

STATEMENT OF SENATOR KOHL

Senator KOHL. Thank you, Senator Cochran.

Our hearing today looks at what is one of the most basic responsibilities of government, namely ensuring that the food we eat is safe. There is no single constituency for today's hearing for everyone eats and everyone expects a healthy and a safe food supply.

We will hear today from agencies, not all of which are directly funded through this subcommittee. Secretary Woteki, it is good to have you back, and I want to welcome Commissioner Henney and wish for you the best in your new role with the Food and Drug Administration. Dr. Koplan, I want to especially thank you for appearing today. Although the Centers for Disease Control and Prevention is funded through the Labor, Health and Human Services Subcommittee, your agency plays an important role, along with USDA and FDA, in the Food Safety Initiative.

As is often the case when governmental missions cross agency lines, there is the potential for overlap, duplication and inefficiencies. One suggested solution is to consolidate all food safety activities into a single agency. I find the idea of a single agency intriguing, but thoughtful consideration needs to be given to consolidating agency missions in order to avoid harm.

The President has proposed a substantial increase for the Food Safety Initiative in fiscal year 2000. Providing that full increase will not be easy, especially if the money available to this subcommittee continues to be reduced. That said, the fact that we are dedicating an entire hearing to this topic is evidence of our commitment to make certain that federal policy priorities and funding for food safety receives proper attention.

We hope today to gain a better understanding of the working relationships of the several different agencies at USDA and HHS tasked with protection of the food supply. Our end goal is to fund a Food Safety Initiative that, in the most efficient and effective manner possible, maintains the United States promise of providing not only the most abundant food supply in the world, but also the safest, for in fact we can afford no less.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator. We appreciate your remarks. I also ask that a statement from Senator Burns be inserted in the hearing record at this point.

[The statements follow:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you Mr. Chairman: I look forward to working with this committee and other members of Congress, as well as industry groups to improve food safety and ultimately improve consumer perception of the safety of agricultural products. American producers carry the distinction of producing and distributing the world's safest food supply. That they are not recognized as such by our own consumers is a situation that must be changed.

Interagency cooperation will be vital to the development of this goal. The National Academy of Sciences (NAS) has found that successful integrated operation of a food safety system requires that officials at all levels of government work together in

support of common goals of a science-based system. I believe this is mandatory, as well as complete cooperation of industry groups and agricultural producers.

Additionally, a strong science base is vital to the Food Safety Initiative proclaimed by the President. The well-being of consumers and American farmers and ranchers alike depends on it. It is of paramount importance that science is used as a basis for all reports of outbreaks. Countless unfounded reports have leaked into the press and hurt agricultural producers immensely.

E. coli, salmonella and listeria are buzz words for consumers. Although numbers of incidences are down, public perception of meat and meat products do not appear to have improved significantly. I urge the FSIS to work closely with consumer groups, agricultural producers and industry groups to reduce consumer distrust of meat products and eventually eliminate the threat of food-borne illness.

This session I have introduced a bill, S251, along with Senators Craig, Thomas and Enzi for country-of-origin labeling. Country-of-origin labeling will assure consumers of the safety of American agricultural products. Labeling will protect both the American producer and the American consumer. Currently, foreign meat that comes into the U.S. is rolled with the USDA grade stamp. This is grossly unfair to the producer and consumer alike.

The USDA stamp on foreign product is a detriment to the producer because foreign countries get the benefit of the grade stamp, without having to pay for it. America's producers need the protection of country of origin labeling to assure that the USDA label really means just that—-produced in the U.S. It is a detriment to the consumer because they deserve to know that they are buying American. They deserve to know that they are buying absolutely the safest food supply in the world, which is grown by American farmers and ranchers.

Furthermore, other countries already require labeling of meat and meat products. Argentina, Australia, Brazil, Canada and Mexico currently require country of origin labeling. The European Union plans to do the same by the year 2000. If we are to compete in an international market, the U.S. must require the country-of-origin label.

Again, American agriculture provides the American consumer with the safest, most reliable source of food and fiber in the world. Consumers have proven they want to know where their food comes from. With this in mind we then should be informing the American consumer that they really are purchasing American product.

I congratulate you on your timely address of the Y2K issue. I urge you to continue to raise awareness of the Y2K problem and the threat it may pose to our nation's food supply, as well as to plan to address any problems that may occur within the food safety industry. Y2K holds special interest to me and I am proud that the state of Montana is well ahead of the game in preparing for the potential disaster.

I am gravely concerned about the issue of imposing user fees for inspection of meat, egg and poultry programs. User fees, or a food safety tax, such as the one proposed, could hurt the 500,000 workers who depend on the economic well- being of the agriculture industry. It would lead to a loss of jobs and damage businesses, large and small, that depend on the economy of rural America. Agricultural producers are struggling to make ends meet. They cannot afford the effects new user fees will have on the already depressed market.

I am also concerned about the implementation of HACCP in the state of Montana. HACCP inspections for very small plants are scheduled for January 25, 2000. There are about 40 state inspected plants in Montana; all of them considered very small by the HACCP inspection standards. Most are already above federally inspected standards. Under the FSIS (HACCP) program, state inspected plants must meet standards greater than or equal to federal standards.

I am concerned that many of these plants may be put out of business if they are subjected to unreasonable regulations that are there only for the sake of regulations being in place. I am certainly not advocating unsafe practices or creating a potential for contamination. What I am advocating is the use of common sense and consideration of the livestock folks in Montana, when reviewing HACCP proposals submitted by producers subject to the HACCP program.

I would like to reiterate that we must all work together for an effective food safety program. Administrative agencies must learn to work more closely and effectively with industry groups, as well as producers and consumers, in order to provide effective food safety service.

I would also like to submit for the record questions from the Food Marketing Institute and Olson, Frank and Weeda, representatives for many food retail establishments

STATEMENT OF DR. KOPLAN

Senator COCHRAN. We have the witnesses' written statements, which we appreciate receiving. We will make them all a part of the record in full and urge you to make such summary comments or other remarks that you think are appropriate.

We want to start this morning with Dr. Jeffrey Koplan, who is the Director of the Centers for Disease Control and Prevention.

Dr. Koplan.

Dr. KOPLAN. Thank you, Senator Cochran. Thank you, Senator Kohl.

Good morning and thank you for the opportunity to speak with you.

CDC monitors the occurrence of human foodborne illness in the United States. We work with State and local health departments to conduct surveillance of cases of foodborne illness and to investigate disease outbreaks. We then use these data to identify the factors responsible for illness, so that immediate control measures can be taken and longer term prevention strategies can be developed in concert with our regulatory agencies.

There are different ways to measure whether these strategies have been successful. Others measure success via reductions in food contamination. CDC's role in measuring the success of interventions is to see whether they translate into reductions in the incidence of human cases of foodborne illness.

Although the United States has one of the safest food supplies in the world, we continue to face challenges to the safety of our foods. New foodborne pathogens are emerging. The eating habits of Americans have changed. An increasing proportion of our food is imported. New products and processing methods are being used, and mass production and distribution of foods have the potential to produce diffuse outbreaks. In addition, there are more people in groups at high risk for foodborne illnesses.

New challenges require new ways to do our job. Foodborne disease is a target area in CDC's recently released plan, "Preventing Emerging Infectious Diseases: A strategy for the 21st century." CDC has also been an active partner in the National Food Safety Initiative primarily to harness information and laboratory technology to propel our nation's foodborne disease surveillance system into the 21st century.

I will provide two examples of CDC's progress in this area. First is the foodborne diseases active surveillance network called FoodNet, which is a joint effort by CDC, FDA, USDA and State health departments, to capture a more accurate picture of trends in the occurrence of illness. FoodNet sites canvas laboratories and other data sources for illnesses caused by nine foodborne pathogens on an active, ongoing basis, using standardized data collection methods.

FoodNet gives high quality data never before available and allows determination that any differences across sites are real and not due to differing surveillance intensity or methodologies. Provisional 1998 data were released last week, and the results are encouraging.

The overall incidence of Salmonella infections decreased 14 percent between 1996 and 1998. The incidence of the specific Salmonella subtype associated with egg contamination declined by 44 percent.

For Camplobacter, the most common bacterial foodborne pathogen in the United States, there was an increase of incidence between 1996 and 1997, but now we have documented a 15 percent decline from 1997 to 1998.

The incidence of infection with the parasite Cyclospora decreased to virtually zero after the importation of raspberries from Guatemala was suspended.

Although there may be other explanations for these declines, the fact that they were seen across sites suggests that we may be seeing a beneficial impact of our prevention measures.

A second system to highlight is PulseNet, a network of molecular fingerprinting laboratories at State health departments, FDA, USDA and CDC, which enhances the ability of laboratory-based surveillance to rapidly identify clusters of related foodborne infections of certain pathogens. This system uses a methodology known as pulsed-field gel electrophoresis (PFGE), where each bacteria and its offspring have a unique pattern.

In 1998, CDC created a national computer database of these electrophoresis patterns. Participating labs submit their patterns to CDC over the Internet. The computer automatically scans previously submitted patterns searching for matches. If a match is found, a signal is given to the submitter to initiate an investigation to look for a common source. All of this happens in real time, allowing the early warning system that we all desire.

The impact of this system, PulseNet, has been enormous, both in identifying outbreaks that otherwise would have gone undetected and allowing us to better focus our investigations. For example, in late 1998, an increased number of cases of listeriosis was noticed.

Using PulseNet technology, CDC tested the strains from several States and determined that many had the same electrophoresis pattern.

Epidemiologic investigations found a strong association with hot dog consumption in patients with the outbreak strain, leading to the recalls which occurred just before Christmas. Some strains which were tested were different from the outbreak strain but similar to each other, indicating a separate outbreak. Investigations found that they were linked to a specific imported cheese.

Other small clusters of cases have been identified and are under investigation. If not for the ability to do subtyping, these outbreaks would never have been discovered and investigated, and prevention measures would never have been undertaken.

CDC plans to devote fiscal year 2000 food safety resources to continue to build the national network of labs capable of performing this PFGE technology and participating in the PulseNet system and to expand the number of different pathogens we can identify.

Other funds will go to expanding the FoodNet system and to support our web-based system called DPDx, which harnesses telemedicine technology to transmit images of parasites to CDC for proper diagnosis from state laboratories. In concert, CDC will continue to

use emerging infections resources to build State health department capacity to conduct appropriate epidemiologic investigations.

In conclusion, these activities represent a small sample of how CDC supports its State and local partners and other Federal agencies in monitoring, controlling and preventing foodborne illness. Foodborne diseases remain a challenge for public health.

To address this challenge will require continued investment in our public health infrastructure and strong partnership among State and local health departments and Federal agencies.

I have been away from government and from CDC for the last 5 years and have just returned. One of the things that has been most striking to me is the level of cooperation and the increased capabilities that we have in this particular area.

The level of interchange that my colleagues at USDA and the Food and Drug Administration and CDC have on a daily basis is much greater than what it was 5 years ago. It is really gratifying to see this level of cooperation and partnership.

PREPARED STATEMENT

Thank you for your attention, and I will be happy to answer any questions when you have them.

Senator COCHRAN. Thank you, Dr. Koplan.

[The statement follows:]

PREPARED STATEMENT OF JEFFREY P. KOPLAN

I am Dr. Jeffrey Koplan, Director of the Centers for Disease Control and Prevention (CDC). I am accompanied by Dr. Stephen Ostroff of the National Center for Infectious Diseases, which is the organizational component with lead responsibility for food safety issues at CDC. I would like to thank the Committee for the opportunity to be here today with my colleagues from the U.S. Department of Agriculture (USDA) and the Food and Drug Administration (FDA) to describe our Nation's food safety activities.

Today I will discuss CDC's role in the area of foodborne diseases and food safety, including how CDC has used resources obtained through the National Food Safety Initiative to strengthen the Nation's ability to detect and respond to emerging foodborne disease threats. I will also use examples from surveillance reports and from recent outbreak investigations to demonstrate how these resources are being applied to today's public health practice.

At its most fundamental level, CDC is the agency that keeps its finger on the pulse of the Nation's health. CDC is the cornerstone Federal agency for identifying and monitoring foodborne and other illness and for documenting the effectiveness of prevention and control efforts, including both voluntary and regulatory measures. Using this information, we then work to develop ways to improve disease control and prevention actions. CDC collaborates with partners ranging from State and local health departments, clinical medicine, academic centers, industry, other countries, and international organizations. In food safety, CDC works in very close coordination with the other agencies represented in today's hearing.

Foodborne and waterborne diseases is a target area in CDC's recently released plan, Preventing Emerging Infectious Diseases: A Strategy for the 21st Century. Public health priorities in the plan are organized under four broad, interdependent goals, each of which can be applied specifically to the prevention of foodborne illness: improving surveillance and response capacity, addressing applied research priorities, repairing the Nation's public health infrastructure and training programs, and strengthening prevention and control programs required to control emerging, reemerging, and drug-resistant infectious diseases. Copies of CDC's plan have been provided to the Subcommittee.

CDC'S ROLE IN FOODBORNE DISEASES AND FOOD SAFETY

CDC plays a critical and unique role as a monitoring, investigative, and advisory agency that is separate from regulatory agencies, but that works closely with them. CDC monitors the occurrence of human foodborne disease in the United States. This

includes not only traditional public health concerns, such as illness caused by pathogens such as Salmonella, but also newer foodborne threats such as E. coli O157:H7 and Cyclospora parasites. CDC works with State and local health departments to conduct ongoing surveillance of cases of foodborne illness and to investigate disease outbreaks, which often provide the first clue of new or different threats to the food supply. CDC uses both surveillance data and results of outbreak investigations to identify the factors responsible for illness so that immediate control measures can be taken and longer term prevention strategies can be developed. While other agencies measure success of interventions via reductions in food contamination, CDC's role in measuring the success of interventions is to see whether they translate into reductions in the incidence of human cases of foodborne illness. The ultimate test of all prevention efforts is whether they prevent human illness.

Once an outbreak is detected, the first response is usually from the State or local health department. Due to limited resources at State and local levels, not all outbreaks can be adequately investigated and reported. CDC will often be invited by the State health departments to participate in the investigation if an outbreak is very large or significant, is thought to involve an unusual pathogen or unexpected food vehicle, affects multiple states or countries, or when preliminary investigations do not reveal a source. When investigating an outbreak of a foodborne illness, public health officials must combine laboratory diagnostic techniques and epidemiologic investigative methods to determine the causative agent of the illness, the food vehicle responsible for transmission, and the environmental factors that contributed to the outbreak. If a food is identified as the source of illness, CDC collaborates with FDA or USDA on the investigation and control of the outbreak, based upon which agency regulates the suspected food.

In addition to our surveillance and response activities, CDC also conducts applied foodborne illness research. Some examples include developing laboratory diagnostic tests where none currently exist, such as detection of hepatitis A virus in food and detection of Norwalk-like viruses or Cyclospora in clinical specimens and foods; developing methods to subtype, or "fingerprint", bacteria, viruses, and parasites causing foodborne illness; conducting risk factor studies for foodborne illness in special populations, such as the immunocompromised; and performing cost-effectiveness studies of potential prevention measures such as routine use of hepatitis A vaccine in food workers.

The public health infrastructure is the underlying foundation that supports the planning, delivery, and evaluation of public health activities and practices. CDC's ongoing effort to rebuild the U.S. public health infrastructure that addresses infectious diseases is critical to improve the capacity of health departments, health care delivery organizations, and clinical and public health laboratories to detect and report cases of foodborne and other illness and to implement prevention and control strategies. Part of this effort includes enhancing capacity to respond to disease outbreaks and training public health professionals to be able to respond to emerging threats now and in the future.

CDC also engages in educational activities targeted to health care professionals and the public. Some examples include producing videos on laboratory methods to diagnose foodborne pathogens and materials on how to avoid foodborne illness among immunocompromised, high-risk persons. CDC actively participates with FDA, USDA, and other Federal agencies, industry, and consumer organizations in the Partnership for Food Safety Education, an ambitious public-private partnership created to reduce the incidence of foodborne illness by educating Americans about safe food-handling practices through many activities, including the national Fight BAC!TM Campaign. The purpose of the Fight BAC!TM Campaign is to help educate consumers about the problem of foodborne illness and motivate them to take basic sanitation and food-handling steps that will reduce the risk of foodborne illness.

THE CHALLENGES OF FOOD SAFETY

Although the United States has one of the safest food supplies in the world, the public health burden of foodborne diseases is still substantial, and we continue to face challenges to the safety of our foods. New foodborne pathogens are emerging, old foodborne pathogens are showing up in new foods, and antimicrobial resistance in foods is increasing. The eating habits of Americans have changed. We now consume more fresh produce and seafood and demand a constant supply throughout the year. Changing food habits can result in a changing pattern of foodborne illness. To meet the demand, an ever increasing proportion of our food is imported, especially from developing parts of the world. As a result, we are being exposed to pathogens not commonly found in the United States, as demonstrated by the Cyclospora outbreaks associated with raspberries imported from Guatemala. The array of new

products and processing methods, such as pre-packaged salad mixes, presents another challenge, as does mass production and distribution of foods, which has the potential to produce diffuse, nationwide illness outbreaks of unprecedented scale.

New challenges require new, creative ways to do our job more effectively and efficiently. The President's National Food Safety Initiative, launched in 1997, recognizes this need and is moving our food safety system forward. CDC has been an active partner in the development and implementation of the Food Safety Initiative. Our resources under this initiative have primarily been targeted to harnessing the information and laboratory technology revolution to propel our Nation's foodborne disease surveillance system into the 21st century.

FOODNET

I will provide two examples of CDC's progress in this area. First is the Foodborne Diseases Active Surveillance Network (FoodNet). The FoodNet system is a joint effort by CDC, FDA, USDA, and State health departments to capture a more accurate and complete picture of trends in the occurrence of illness caused by priority foodborne pathogens. It is built on the foundation of CDC's emerging infectious disease activities, which provides the basic infrastructure to conduct active disease surveillance. Before 1996, the Nation's foodborne disease surveillance system was based on passive reports of illness from clinicians and laboratories which were submitted to local health departments and then onward to the State health department and from the State to CDC. Such information lacks timeliness, is often incomplete, and is highly variable from one place to the next depending on the resources invested at the state and local level.

FoodNet is part of CDC's Emerging Infections Programs (EIP's). CDC funds EIP cooperative agreements with State and local health departments to conduct population-based surveillance and research that go beyond the routine functions of health departments. In these sites, the program, which usually involves a partnership between the State health department and an academic center, canvasses laboratories and other data sources for illnesses caused by seven different pathogens on an active, ongoing basis using standardized data collection methods, standard definitions, and standard techniques. Each case is reviewed and strains are collected and analyzed. Special case-control studies are conducted across FoodNet sites in order to identify the major risk factors for sporadic illness, and community surveys are conducted to help determine the overall burden of foodborne illness, which include mild illnesses which do not come to medical attention or patients who do not have diagnostic testing performed. Data are electronically submitted to CDC for collation with rapid turnaround. FoodNet gives high quality data never before available and also allows determination that any differences across sites are real and not due to differing surveillance intensity or methodology.

As a demonstration of how rapidly these data can be analyzed and disseminated, provisional 1998 data was released on March 11, 1999, in CDC's Morbidity and Mortality Weekly Report. The results are very encouraging. For the five original FoodNet sites which have been collecting data since 1996, the incidence of Salmonella infections declined 13 percent between 1996 and 1998. For Salmonella Enteritidis (SE), the Salmonella subtype associated with egg contamination which became a major problem in the 1980s, the decline was especially pronounced. Between 1996 and 1998, the incidence of SE in FoodNet sites declined by 44 percent. For Campylobacter, the most common bacterial foodborne pathogen in the United States, there was an increase in incidence between 1996 and 1997, but now we have documented a 15 percent decline from 1997 to 1998. The incidence of infection with the parasite Cyclospora decreased to virtually zero after the importation of raspberries from Guatemala was suspended. These provisional data use 1997 census estimates. When 1998 census estimates are available later this year, these 1998 rates will be recalculated and are likely to be slightly lower due to population increases. Although there may be other explanations for these impressive declines, the fact that they were seen across sites suggests they are not surveillance artifacts and may be an indication that prevention measures being implemented by USDA and FDA are working.

PULSENET

A second system to highlight is PulseNet, a system developed in partnership with State health departments and the Association of Public Health Laboratories. PulseNet is a network of molecular subtyping (fingerprinting) laboratories at State health departments, FDA, USDA, and CDC, which enhances the ability of laboratory-based surveillance to rapidly identify clusters of related foodborne infections of certain pathogens, sometimes scattered over large geographic areas. This system

uses a methodology known as Pulsed Field Gel Electrophoresis (PFGE) to digest bacterial DNA into fragments which can be run on gels to produce unique patterns. Like human fingerprints, each bacteria and its offspring have a unique PFGE pattern. If two bacteria are found with an indistinguishable pattern, it is likely that they have a common source, meaning they may be part of an outbreak of many similar cases. CDC has standardized PFGE methodology for E. coli O157:H7 and for Salmonella. Last fall CDC standardized PFGE methodology for Listeria, not long before there was a multi-state outbreak of listeriosis associated with contaminated hot dogs. Using funds from CDC's Epidemiology and Laboratory Capacity (ELC) cooperative agreements and from the Food Safety Initiative, state health laboratories have obtained PFGE equipment, and CDC has provided training and standardized methodology to them to test for foodborne pathogens. USDA and FDA laboratories also participate in the network to allow comparison between animal, food, and human isolates. By the end of 1999, 33 laboratories will be linked into this network. Eventually, CDC hopes to include all state laboratories.

To enhance the power of the PulseNet system, in 1998, CDC created a national computer database of PFGE patterns that is housed at CDC. Now states can submit PFGE patterns to the database over the Internet. The computer then automatically scans previously submitted patterns searching for matches. If a match is found, a signal is given to the submitter that duplicate patterns are present and where they came from, so that an investigation can begin to look for a common source. All of this happens in real time, allowing the early warning system for nascent outbreaks that we all desire.

The impact of PulseNet has been enormous, both in identifying outbreaks that would otherwise have gone unnoticed, and in allowing us to focus our investigations to determine the true source and extent of an outbreak. For example in late 1998, an increased number of cases of listeriosis were noticed. Using PulseNet technology, CDC tested the strains from several states and determined that many had the same PFGE pattern. Epidemiologic investigations found a strong association with hot dog consumption in patients with the outbreak strain, leading to recalls which occurred just before Christmas. Since then, CDC has continued to work with states to test all available Listeria isolates from patients since last summer, in order to determine how many cases and deaths occurred as part of the outbreak and to confirm that the outbreak is over. As of late February, a total of 97 outbreak-associated cases have been identified in 22 states with 14 fatalities and 6 still births.

Some of the strains which were tested were different from the outbreak strain. Among these a second cluster of strains with a common PFGE pattern was found. Investigation of these cases found they were linked to consumption of a specific imported cheese. Other small clusters of cases have been identified and are under investigation. If not for the ability to do the subtyping, these outbreaks never would have been discovered and investigated, and prevention measures would not have been undertaken.

Another PulseNet example involves Shigella, a bacterial pathogen that can be foodborne but most often is not. The Minnesota Department of Health, a FoodNet site, routinely fingerprints its Shigella isolates, and last summer they identified a cluster of strains with a similar pattern. Epidemiologic investigations found that illness was linked to eating chopped parsley in two different restaurants. By informing other states and searching databases for places with an increased number of cases, similar outbreaks were identified in five other states and Canada. The Shigella from these outbreaks also had the same PFGE fingerprint. All of the outbreaks were parsley associated. Working with FDA, the implicated parsley was traced to production fields in Mexico. Again, if not for routine utilization of PFGE, the links between the outbreaks would have been missed, the source would not have been identified, and the outbreak would have spread much further.

PFGE is a powerful tool. It allows us to detect widely dispersed outbreaks and small clusters that would have previously been missed. This illustrates a central tenet of epidemiology: better surveillance leads to better and more accurate disease detection, which in turn leads to more investigations. This causes increased burdens, not only on CDC and other Federal agencies, but also on state and local partners.

Therefore, as surveillance improves, more outbreaks, not fewer, will be detected. However, this should not be interpreted as a failure. Rather, it represents success, because only by finding and investigating the outbreaks can we define risks, develop and implement interventions, and over the long term target and ultimately eliminate the risk.

NATIONAL FOOD SAFETY INITIATIVE AT CDC IN FISCAL YEAR 2000

CDC is committed to continuing to build a sensitive, timely, and accurate public health infrastructure for the Nation. To this end, the President's request for CDC for fiscal year 2000 National Food Safety Initiative is $10,000,000 above the fiscal year 1999 appropriation of $19,476,000. CDC plans to devote these resources to continue to build the national network of labs capable of performing PFGE technology and participating in the PulseNet system. We will increase the number of pathogens monitored in the system in order to detect additional outbreaks. Other funds will go to expanding the FoodNet system and adding surveillance components for viral gastroenteritis. In the future, we hope to expand and incorporate subtyping methods for viral agents and to support the development of subtyping methods for Cyclospora and Cryptosporidium, parasitic agents for which subtyping is not sufficiently developed. And finally we will continue to support a system known as DPDx, which harnesses telemedicine technology to transmit images of parasites under the microscope to our experts at CDC for appropriate diagnosis. In concert, CDC will continue to use emerging infections resources to build State health department capacity to conduct appropriate epidemiologic investigations.

CONCLUSIONS

In conclusion, these activities represent a small sample of how CDC supports its state and local partners and other Federal agencies in monitoring, controlling, and preventing foodborne illness. Foodborne diseases remain a challenge for public health. To address this challenge will require continued investments in our public health infrastructure and strong partnerships among State and local health departments and Federal agencies.

Thank you for the opportunity to discuss the surveillance of foodborne disease. We will be happy to answer questions you or other members of the Subcommittee may have.

STATEMENT OF DR. JANE HENNEY, COMMISSIONER

Senator COCHRAN. Dr. Henney, we will now hear from you.

Dr. HENNEY. Good morning, Mr. Chairman, members of the committee. I appreciate the opportunity to address you today, and thank you for your interest in this very important area of food safety.

The Food and Drug Administration has been entrusted with ensuring the safety of the majority of the food supply since the passage of the first Food and Drug Act of 1906. Throughout the 20th century, we have fulfilled our obligation to protect the public from unsafe foods by relying on a strong scientific basis for our regulatory approach.

As our scientific knowledge has developed, so, too, have our regulations evolved to reflect the current state of knowledge. As we move toward the 21st century, we must remain dedicated to strengthening the science base throughout the agency. It is my strong conviction that through the development and application of sound scientific principles, we will solve the numerous public health threats posed by an ever-changing world.

This is particularly true in the area of food safety. While our food supply is, in general, safe, our citizens are more at risk from food today than they have been in many years.

First, the food we eat in this country has changed drastically from a diet of meat, potatoes and locally grown seasonal produce, to today when we are eating a much greater variety of food, such as seafood, fresh fruits and vegetables. And these foods are often transported over long distances, both domestically and internationally. And they are available to us throughout the year. The combination of the new sources and wide distribution of food poses new safety challenges for the public.

Second, we are eating more food prepared by others. We have gone from the past, when most meals were prepared in the home, to today, when 50 cents of every food dollar is spent on food prepared outside the home. This food includes ready-to-eat foods from restaurants and supermarkets.

There are also a large number of Americans who have their meals prepared and served in hospitals, nursing homes, day care and senior centers.

Third, there has been an increase in the number of people considered to be at-risk for foodborne illness. Today nearly 25 percent of people in the United States fall in this category: the elderly, children, pregnant women, the immuno-compromised.

Moreover, the size of the vulnerable population is growing, particularly with our senior population being the fastest-growing sector of our society.

Last and most important, more resistant old and more deadly new pathogens have emerged in our food supply. With respect to the latter, we are aware of five times the number of foodborne pathogens in 1999 than we were just 50 years ago, the most notorious of which is E. Coli O157:H7.

As a result of these changes, outbreaks of foodborne illness are now all too prevalent. They seem to occur every day, everywhere, in almost any food. And we are identifying more and more outbreaks associated with FDA-regulated products: apple juice, eggs, sprouts, raspberries, even toasted oat cereal, a product not generally regarded as high risk.

While the number of deaths and illnesses associated with food have been the source of great debate, virtually all experts believe that many foodborne illnesses are preventable. Therefore, we have a public health responsibility to do what we can to minimize them.

The Administration's Food Safety Initiative was first announced in January 1997 and further enhanced in October 1998 to provide special emphasis to help ensure the safety of imported and domestic fruits and vegetables. The goal set forth in this initiative could not be accomplished without additional resources. And your support through prior years' appropriations has been crucial to our success.

We have completed virtually all of the activities funded by the $24 million you provided in the first year of the initiative and are well along toward meeting our goals for this year's funding.

We are now asking you for $30 million for fiscal year 2000 that can make a real difference in building the infrastructure the Nation needs to effectively combat foodborne illness.

My written submission for the record contains details of those accomplishments and plans, Mr. Chairman. But let me give you just a few highlights today.

In the area of prevention, we have implemented state-of-the-art HACCP controls for seafood that will ensure its safe processing. We have developed agricultural and manufacturing guidance for fresh fruits and vegetables that gives farmers and processors the latest information on how to protect those foods from contamination.

And we have established a national anti-microbial resistance monitoring system that is intended to give us the ability to detect emerging pathogens that threaten human health.

Moreover, we are rapidly improving our ability to identify foodborne illness when it does occur, track it to its source and prevent further illness. For imported foods, we are increasing our surveillance at the border and helping foreign producers better understand how they can prevent contaminated food from being sent to us.

With the additional funding that we are requesting for next year, we will begin, for the first time in many, many years, to inspect high-risk food processors at least once a year. We will increase our collaborations with States who share with us the responsibility to inspect these firms.

We will utilize the new DNA technology that promises to revolutionize our ability to respond to foodborne illness. And we will launch a serious effort to improve the safety of food at the retail level.

In closing, let me just say that our food safety efforts to date have taught us many lessons. One of the most important is that FDA cannot solve this problem on its own. We must work together with other Federal agencies, such as CDC, USDA, EPA, as well as our important counterparts in the States to accomplish our goal of a truly coordinated and effective food safety net based in sound science.

In our efforts, we must remember our public health responsibility. As we continue to work with States and other Federal agencies, the standard for food safety in this country must remain a high one. The public demands it. The science is developing to allow it. And we must keep pace, or we will have failed to meet our public duty.

Although we cannot anticipate every food safety problem before it happens, we must make sure that we have a strong science-based food safety system in place that can minimize the harm to public health. Our budget request for fiscal year 2000 will give us the resources we need to meet the challenge we will face into the next century.

PREPARED STATEMENT

I thank you for your time, and I will be pleased to answer any questions you may have.

[The statement follows:]

PREPARED STATEMENT OF JANE HENNEY

Mr. Chairman, senators, ladies and gentlemen, I appeared before the Senate last year to ask you to consider me for a position in public service. Today I am honored to address you as the Commissioner of the Food and Drug Administration. I thank you and your colleagues who saw fit to entrust me with this office.

During that process, I promised the Senate that I would make food safety a high priority if I was confirmed as FDA Commissioner. It is my privilege today to begin to deliver on that promise by presenting the highlights of the Agency's food safety accomplishments for fiscal 1998, the plans for fiscal year 1999, and the expectations for food safety as reflected in the Administration's proposed budget for fiscal year 2000.

FOOD SAFETY PROBLEM

The Food and Drug Administration began as a science-based consumer protection agency nearly 100 years ago with a food safety issue. A chemist in the Bureau of Chemistry at the Department of Agriculture, Harvey Wiley, was concerned that chemical additives used as preservatives in a time when refrigeration was in its infancy were a danger to the public health. Called the "crusading chemist," his experiments on additives such as borax and formaldehyde found his original concerns to be valid and culminated in passage of the Pure Food and Drugs Act in 1906. Harvey Wiley, as you may know, was ultimately designated the first Commissioner of the Food and Drug Administration.

The food safety challenges that face FDA and other food safety agencies today may be different that those that Harvey Wiley confronted but they are no less challenging or compelling.

What people eat has changed. We are no longer a nation of meat and potato eaters only, but a people who are eating a greater variety of foods, particularly seafood and fresh fruit and vegetables. This is great for our nutrition but offers greater food safety challenges. When consumers are demanding these foods year round, safety issues surrounding transportation and refrigeration become an increasing problem. And as trade barriers break down, new challenges for ensuring the safety of the imported food arise.

Where people eat has changed. People are eating more of their meals away from home. In fact, fifty cents of every food dollar is spent on food prepared outside the home. This food is purchased not only from grocery stores and restaurants, but also

is consumed in institutional settings such as hospitals, nursing homes and day care centers. The result is that as more food workers become involved in preparing our meals, both the chances for disease-producing errors and the regulatory responsibility of assuring food safety increases.

Who's eating is also changing. Nearly a quarter of the population is at higher risk for foodborne illness. This includes pregnant women, children, the elderly, and the immunocompromised. The size of the vulnerable population is growing, with aging babyboomers and increased longevity.

All are important—different foods, more foods prepared outside the home, and increased vulnerable populations—but there's another important element in our changing world, the emergence of many new foodborne pathogens. We are aware of more than five times the number of foodborne pathogens in 1999 than we were in 1942. Many of these pathogens can be deadly, especially for people at highest risk.

As a result, outbreaks of foodborne illness are now all too prevalent. They happen frequently, in all regions of the country, and in every type of food. And we are identifying more and more outbreaks associated with FDA regulated products. Therefore, as the world of food changes, we must be sure that the food safety system changes along with it, identifying new solutions to today's problems.

THE PRESIDENT'S FOOD SAFETY INITIATIVE

Recognizing the increasing risks to the food safety system, on January 25, 1997, the President announced a Food Safety Initiative to reduce the incidence of foodborne illness to the greatest extent possible. Four months later, recommendations for the President were delivered in a report entitled "Food Safety: From Farm to Table." This report outlined the steps the federal government would take in the short and long term to achieve that goal. The Food Safety Initiative was enhanced by President Clinton on October 2, 1998 to provide special emphasis on ensuring the safety of imported and domestic fruits and vegetables. FDA has a central role in the Administration's efforts.

A Strong Science Base Is Critical

As critical as it was in Harvey Wiley's time, it is just as critical today to the food safety system that it be grounded in a strong scientific foundation. Equally important is that we have a strong, scientifically skilled workforce to conduct the President's Food Safety Initiative. We rely on and therefore must support the scientific work of those entrusted with carrying out FSI responsibilities at every step along the farm to table continuum. We must invest in enhancing and maintaining scientific excellence to ensure that we have the best possible data for decision-making at both the policy and implementation level.

A recent outbreak of Salmonella Agona in breakfast cereal illustrates the importance of a scientific basis to public health. In the spring of 1998, 20 states reported an increase in Salmonella Agona infections. There were 409 cases of illnesses reported. Over 102 people were hospitalized and one person died. Through molecular fingerprinting (DNA) technology we were able to link the bacteria from the food and from the patients. The bacteria was subsequently traced to one manufacturer who produced the cereal under a variety of labels. Ultimately 2 million pounds of Toasted Oat cereal was recalled.

Already, FDA has made the following scientific contributions under the FSI:

Prevention Programs

Developed a science-based hazard analysis critical control point (HACCP) regulatory program for seafood to prevent foodborne illness. This includes extensive training for our inspectors so they provide a knowledgeable oversight role.

Developed technology to eliminate or inactivate microbial contaminates by the use of high hydrostatic pressure techniques. This technique has been shown to inactivate a number of different pathogens in packages of fluid products while retaining the products' sensory characteristics, and provides an alternative pastuerizing technology in some situations for which thermal pasteurization and irradiation are less desirable.

Initiated research to prevent contamination of unpasteurized juice by assessing the effectiveness of different antimicrobial technologies in an actual cider mill.

Initiated research on safe sprout production at sprout production facilities constructed at the National Center for Food Safety and Technology (Moffett Center) in Chicago, operated in partnership with Illinois Institute of Technology. This research will evaluate the effectiveness of intervention strategies such as sanitizing agents to prevent contamination of sprouts with pathogens.

Surveillance and Outbreak Response

Developed a comprehensive, coordinated national foodborne illness outbreak response system in collaboration with CDC and USDA among federal, state and local agencies.

The National Antimicrobial Resistance Monitoring System (NARMS) has allowed us to increase our ability to detect emerging pathogens and identify relationships between animal and human foodborne isolates. NARMS isolates provide a pool of organisms to research for rapid tests for identification of foodborne pathogens for salmonella type.

Detection Methods

Developed through a collaboration between federal, state, and local agencies, an improved technique to detect directly and quantify harmful Escherichia coli within 30 minutes, compared to 24 to 48 hours using conventional techniques. This pathogen was responsible for outbreaks of food-related illness in young children after they drank unpasteurized apple juice.

Developed a rapid, sensitive and reliable method capable of detecting low levels of Norwalk viruses in contaminated shellfish.

I would endeavor to have a strong science base throughout the Food Safety Initiative.

Federal Partnerships

As you can see, many of these programs have joined FDA and its Federal partners in successful collaboration to protect the public health. Further examples include: development of an interagency Risk Assessment Consortium to coordinate priorities of risk-assessment research, such as the Listeria risk assessment currently underway that involves both USDA and FDA regulated products; the signing of a memorandum of understanding to create the Foodborne Outbreak Response Coordinating Group (FORC-G) to enhance coordination of resources and expertise during an outbreak and prepare for new and emerging threats to the food supply; collaboration between FDA and USDA with CDC on funding, protocol development, and priority setting for FoodNet; multiagency collaborations on the National Advisory Committee on Microbiological Criteria for Foods to achieve food safety advice of the highest scientific standards for all federal agencies involved in food safety; and the development of a Joint Institute for Food Safety Research (JIFSR) which allows for the joint funding and coordination of priority research projects.

Federal-State Partnerships

An integrated federal-state partnership makes sense as well from an effective use of resources perspective and provides the greatest level of public health protection. I strongly support such partnerships. For this approach to work, we need: strong federal standards; training and certification for all inspectors; shared databases; federal oversight of state activities; and effective enforcement and surveillance. The need for increased inspection coverage is sufficiently large that we will need an increased federal inspection force, and also need more qualified state and local counterparts.

Our work and cooperation with the States is central to our success in these endeavors. Currently, FDA is leading an effort to integrate federal, state and local food safety systems for FDA-regulated products. This work began in September 1998 in Kansas City with an FDA-hosted meeting of food safety and agriculture officials from all 50 states, Puerto Rico, and the District of Columbia, epidemiologists from state and local health departments, and colleagues from CDC and USDA. The focus of the meeting was to find a way for local, state, and federal food safety and public health agencies to share resources and work together to make the U.S. food supply safer than ever. Discussions centered around joint planning opportunities for increased inspections, linking data and communication systems, and improving government response to outbreaks.

Tasks of integrating the nation's food safety systems has now been divided into working groups of local, state and federal health officials. The reports from these working groups will be made available for public comment later this spring. We estimate that it will take 5–10 years to build this national system and it will require resources to enhance state and local capabilities.

FISCAL YEAR 1998 ACHIEVEMENTS

In fiscal year 1998, FDA received its first additional appropriation of $24 million under the initiative. The Agency used these funds to begin to set the foundation for creating a state-of-the-art science-based food safety system.

This system focuses on combating foodborne illness on two major strategic fronts. The first is the development of prevention strategies, programs that will keep bacteria out of the food, throughout the food chain, from farm to table. These prevention programs are supported by education and verification—by educating producers, processors, food preparers, and consumers in how to use prevention techniques correctly, and by verifying, through inspections at business establishments, that the prevention techniques are, indeed, being applied properly. The second front is the early detection and containment of foodborne hazards during an outbreak. In addition to limiting the extent of the outbreak, we must seek the cause and provide a "feedback loop" of information that helps strengthen our prevention programs.

Virtually all the goals promised for the first year in the May 1997 Farm-to-Table Report were achieved. I would like to highlight some of them for you.

Prevention, Education, and Verification

Prevention is the key to reducing foodborne illness. A major focus of our prevention strategy for food safety was the implementation of a HACCP (Hazard Analysis Critical Control Points) program for seafood. HACCP is a science-based system in which a food producer identifies the hazards associated with its particular product, and then puts appropriate controls in place to prevent, reduce, or eliminate the hazard. Through a combination of FDA inspection and state contracts, all domestic seafood processors and importers were inspected to verify implementation of HACCP by the end of calendar year 1998.

We have expanded our prevention strategies by proposing HACCP regulations for juice. We also are working with small juice and cider producers to further our juice safety goals. And, together with USDA, we have launched a multi-pronged initiative to prevent illness caused by Salmonella contamination of raw eggs.

We have worked on prevention strategies involving produce as well. FDA and USDA held a series of public meetings with the agricultural community and conducted site visits to growing and packing areas to elicit detailed information on common problems involved in the production of safe produce. These meetings were held as background for the development of a guidance document for growers, packers and shippers of fresh fruits and vegetables, which provides information on agricultural and management practices that may enhance the safety of fresh produce. We were very pleased with the way the final guidance was accepted by industry. In fact, the final guidance won the endorsement of United Fresh Fruits and Vegetable Association, a large national trade organization.

In recent months, we approved the use of chlorine dioxide as an antimicrobial agent for use in produce processing, and published a policy under which we will expedite the review of food additives that would make predictable contributions to preventing or reducing pathogen contamination of foods.

Food safety education campaigns, soundly based in science, can reach large numbers of commercial and home food preparers with information on safe food handling practices that can prevent food contamination and reduce pathogen growth. Food safety education is another part of FDA's strategy to protect consumers from foodborne hazards. These activities, often sponsored in conjunction with other federal agencies, states and professional associations, provide a cost-effective means to preventing processing, preparation, handling and storage practices that could cause food to become contaminated with dangerous levels of microorganisms or other substances that could cause illnesses.

Education activities in fiscal year 1998 included work in conjunction with USDA and CDC with the Partnership for Food Safety Education's "FIGHT BAC!" campaign. Extensive educational efforts were undertaken through the media and through community-based education programs for food handlers both in retail settings and in the home. FDA field offices across the country also launched educational efforts to help average citizens prevent food-related illnesses.

An education program was also started for health professionals. FDA and CDC signed an agreement with the American Medical Association to develop a program to educate physicians and their patients on foodborne disease.

EARLY DETECTION AND CONTAINMENT OF HAZARDS

Responding to emerging pathogens in the food supply quickly and effectively is essential to preventing widespread illness. FDA scientists in the Center for Veterinary Medicine and the National Center for Toxicological Research are adapting for use in the United States an assay for detecting bovine DNA in feed to protect us against occurrence of imported "Mad Cow" disease in the United States.

We are convinced that this focus on detection and containment has had a significant, beneficial public health impact. For example, information gathered through field investigations supported by the Administration's Food Safety Initiative linked

Guatemalan raspberries to cyclosporiasis; outbreaks in 1996 and 1997 caused about 2,500 cases of cyclosporiasis in this country. This past year, no Guatemalan raspberries were imported to the U.S., and no cases of cyclosporiasis were linked to raspberries. In contrast, Canada imported Guatemalan raspberries last summer and continued to suffer raspberry- associated outbreaks of Cyclospora infections. We estimate that our preventive actions avoided 1,200–1,500 Cyclospora infections for the American public and saved $2.8 to $3.5 million in health- care costs. We are continuing to work with Guatemala to permit future importation of raspberries without importing foodborne hazards.

I would also like to raise with you a food safety issue that is likely to have major public health implications: antibiotic resistance. We know that antimicrobial resistance (the resistance of disease-causing bacteria to drug treatment) can develop in some organisms when food animals are treated with certain drugs. We also know that this resistant pathogen can be transferred on food and infect humans. This drug resistant infection may cause disease in people consuming the animal derived food product and result in infections that are resistant to treatment potentially increasing the costs and risks associated with the infection. Increasing antibiotic resistance and loss of the effectiveness of antimicrobials is an emerging public health threat world-wide. We are taking several actions to combat this threat. FDA and USDA have established a nationwide surveillance system to identify and track developing antimicrobial drug resistance in food-producing animals. FDA is also collaborating with CDC and USDA to study resistance by tracking the emergence of resistant pathogens and developing scientifically sound mitigation and intervention strategies to prevent the development of resistance. FDA also plans to conduct research into the mechanisms of resistance, their dissemination and the risk factors associated with resistant human infections. We must continue to develop our scientific understanding of antibiotic resistance and take action to ensure that effective drugs remain available to treat infections in humans and animals.

I have only touched on the many FDA accomplishments for fiscal year 1998. A more complete listing is available in a First Year Report, FDA's Accomplishments on the President's Food Safety Initiative, which I will submit for the record.

FISCAL YEAR 1999 PLANS

Added funds for fiscal year 1999 allow FDA to focus on imports as well as on domestic and international education and outreach on the good agricultural practices guidance. In fiscal year 1999 we will also give further emphasis to seafood HACCP and antibiotic resistance monitoring.

Imports

On the premise that the safety of imported foods can be better enhanced where the foods are produced rather than at the U.S. border, FDA has undertaken not only to strengthen our border surveillance activities, but also to design new programs to prevent contamination in countries that export to the U.S. We are assessing foreign controls over food products exported to the U.S. and are providing technical assistance to foreign countries. We also will conduct foreign inspections of food establishments that produce food products at high risk for microbial contamination and conventional surveillance of imported food products at our borders will be increased. When foodborne illness outbreaks associated with imported foods occur, we will conduct follow up investigations in the exporting countries. I will submit for the record a more detailed plan of our fiscal year 1999 food safety import plan.

Last year, as you are aware, the Administration put forward a bill that would have expanded FDA's authority over imported foods (S.1707/H.R.3052). That bill raised many questions and concerns in Congress and as you know, ultimately did not succeed. The President recently reaffirmed his commitment to providing FDA with enhanced authority over imported foods. I want to assure you that the Agency heard and understands the questions and concerns, and I want to work with you to find the right solution to provide FDA with the tools necessary to improve the safety of imported foods.

Good Agricultural Practices Guidance

FDA will work with USDA to provide information and education on the Good Agricultural Practices guidance developed in 1998. Fresh fruit and vegetable growers may use this guidance to reduce the risk that their products will become contaminated with pathogens. Technical assistance and education programs are now under development for the domestic and international produce industry to improve the safety of fresh produce available to U.S. consumers.

Seafood HACCP

FDA continues to implement seafood HACCP during fiscal year 1999 by conducting the second year of annual inspections of domestic seafood processors. The first year's inspections focused on providing processors with clear feedback on the status of their new HACCP systems. They were designed to be educational as long as a critical public health hazard was not found. In the last year, FDA found a range of problems with HACCP implementation that needed to be addressed by seafood facilities. Our goal is to see that HACCP is being more fully implemented in a larger proportion of the industry by the end of calendar year 1999. I will submit for the record our plan for strengthening the safety of seafood in this, our second year, of seafood HACCP implementation.

Antimicrobial Resistance

In order to assure detection of emerging resistance trends in pathogenic bacteria, we are planning to expand our program to increase the information in the National Antimicrobial Resistance Monitoring System. The collection and analysis of this data will improve our ability to detect changes in antimicrobial resistance patterns and identify trends at the local level. The identification of trends helps us target our research. For example, we are now looking at how the use of multiple drugs and multiple exposure to the drugs affect the development of antimicrobial resistance. We are also looking at how drugs are administered to determine if the route of administration affects the development of antimicrobial resistance.

FISCAL YEAR 2000 BUDGET REQUEST

As a result of funding provided in fiscal year 1998 and fiscal year 1999, a solid, science-based infrastructure is being developed to improve food safety and reduce the risk of foodborne illness, for both domestic and imported foods.

The President's fiscal year 2000 budget request for FSI includes a $30 million increase for FDA that further builds this science base and expands capabilities in surveillance and containment of foodborne outbreaks. The additional resources will be targeted to develop further a nationally integrated food safety system, and provide greater emphasis on the control of foodborne hazards in the post-harvest phase of the farm-to-table continuum.

Expand Inspections

In fiscal year 2000 we will focus on increasing our domestic inspection coverage. Inspection and compliance efforts will be expanded during fiscal year 2000 with additional emphasis on the frequency of inspection of domestic firms producing food that is at high risk of microbiological contamination or high risk of causing severe disease. There are a total of 6250 such firms. Inspection of these firms will increase to a schedule of once per year by 2001. By "high risk" we mean, in addition to seafood: infant formula, certain ready-to-eat foods that are not processed or only minimally processed—e.g., by heating, freezing, washing—before consumption; heat and serve products; and low-acid canned foods and acidified foods. fiscal year 2000 resources would be applied both to increasing Federal FDA inspections as well as increasing inspections by our state and local partners according to federal standards. We also will more than double the number of foreign inspections we conduct for these same types of products.

Enhance Surveillance and Investigation to Improve Outbreak Response

Funding in fiscal year 1998 and fiscal year 1999 expanded public health surveillance efforts, resulting in improved outbreak detection. Since it is anticipated that there will be an increase in the number of outbreaks detected, FDA must continue expansion of foodborne outbreak response and traceback activities. To that end, we need a rapid response capability directed to foodborne outbreaks. We need to increase the links between CDC surveillance and epidemiology and FDA response team, as well as between FDA laboratories and CDC's PulseNet pathogen subtyping system. This rapid response team will enable early containment of hazards, and will provide a feedback tool on new causes of outbreaks to promote development of new preventive controls.

Food Safety at the Retail Level

An additional focus for fiscal year 2000 will be on strengthening Federal and State partnerships regarding retail food safety. I mentioned at the beginning of my statement that American consumers are increasingly eating food prepared outside their homes. That factor in itself may not seem significant. CDC data, however, clearly demonstrate the substantial occurrence of foodborne disease outbreaks in retail settings. FDA will work with its state partners to lower that risk. Reducing out-

breaks associated with food service operations is a significant challenge. To appreciate the magnitude of the problem, I should point out that there are approximately 750,000 restaurants and 37,000 institutional food service operations in the U.S.

FDA will work with states and the food industry to develop and implement food production and preventive control systems. In particular, FDA will encourage the states to adopt the 1999 Food Code, a model code developed by FDA in collaboration with state officials. FDA will provide training to state and local officials as well as education to the private sector regarding safe food handling practices.

Accelerate Food Safety Research

Research will be conducted to expand methods development and prevention technology research during fiscal year 2000. FDA will collaborate with other agencies and the private sector to translate preventive technologies and techniques into appropriate versions for use by small industry and consumers. FDA, along with CDC and USDA, will expand mechanisms to transfer technologies to States, small and large industry, foreign governments, consumers, and others.

The National Center for Food Safety and Technology (Moffett Center) and the Joint Institute for Food Safety and Applied Nutrition (JIFSAN) are key components of FDA's efforts to achieve established food safety objectives. These partnerships with academia and industry allow for more efficient use of public and private research resources and enhance the quality of food safety and public health policy. The additional resources requested for fiscal year 2000 will permit FDA to expand risk assessment efforts at JIFSAN and the Moffett Center to fill the critical gaps in exposure assessment of foodborne hazards. This expanded risk assessment research effort will enhance FDA's ability to characterize more rapidly and accurately the nature and size of the risk to human health associated with foodborne hazards, as well as the effects of intervention. More rapid and accurate risk assessment techniques are critical to providing consumers greater protection against potential hazards posed by foodborne pathogens. This research compliments efforts underway at CFSAN, CVM, and the National Center for Toxicological Research (NCTR).

Antimicrobial Resistance

In fiscal year 2000, we will continue to improve and expand our National Antimicrobial Resistance Monitoring System including expanding the geographical scope and supporting international efforts to develop a global resistance database. We will conduct epidemiology studies to evaluate management, production and drug use practices in food animals to determine how such practices influence the development of antimicrobial resistance. We will get additional information from collaborative efforts with other government agencies, academic institutions, and producer groups in order to develop education material related to proper drug use. We will work with State and local authorities to develop effective educational program.

CONCLUSION

Mr. Chairman, all of us testifying today—FDA, the U.S. Department of Agriculture and the Centers for Disease Control and Prevention—as well as other federal agencies, state and local government officials, and agriculture, industry and consumer representatives, have key roles to play in the effort to reduce the incidence of foodborne illness. This effort has been a highlight of the President's Food Safety Initiative. All the partnering agencies' and organizations' programs need a base in science and a focus on public health. We also need open communication between federal, state, and local governments, the industry, and consumers. Working together, we can ensure the safety of the nation's food supply.

SUBMITTED QUESTIONS

Senator COCHRAN. Thank you, Dr. Henney.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

Question. What is the incidence of foodborne illness in the United States? Has it increased over the last 10 years? Over the last five years? Over the last year?

USDA answer. Estimates of the magnitude of foodborne illness in the United States have been imprecise. To quantify, better understand, and more precisely monitor foodborne illness, since 1996 the Foodborne Diseases Active Surveillance Network (FoodNet) has collected data to monitor nine foodborne diseases in selected

U.S. sites. The overall incidence of the foodborne illnesses under surveillance from 1996 to 1998 declined, particularly for salmonelllosis and campylobacteriosis, and the data continued to demonstrate regional and seasonal differences in the reported incidence of diseases. Over this 3-year period, the largest decrease in bacterial pathogen-specific rates occurred in cases of infection caused by Salmonella (14.5 per 100,000 population in 1996 to 12.4 per 100,000 population in 1998, a 14 per cent decline).

Each year, millions of persons experience foodborne illness, though only a fraction seeks medical care and an even smaller number submit laboratory specimens. FoodNet provides a precise measure of the laboratory-diagnosed cases of specific foodborne illnesses and performs additional surveys and studies to interpret trends over time. The 1998 Food Net data indicate a decline in several of the major bacterial and parasitic causes of foodborne illness. These declines might in part reflect annual fluctuations in the incidence of foodborne illnesses and temporal variations in diagnostic practices. The trends also may reflect implementation of disease prevention efforts. The declines in salmonellosis and campylobacteriosis may reflect changes in meat and poultry processing plants in the United States mandated by the Pathogen reduction and Hazard Analysis and Critical control Points (HACCP) final rule. The decline from 1996 to 1998 in the incidence of salmonellosis parallels the reported decline in the percentage of meat and poultry products tested at large, federally inspected processing plants that were positive for Salmonella.

FDA answer. Estimates of foodborne illness are wide-ranging, and the true magnitude of foodborne illness remains illusive. In 1994, the Council for Agricultural Science and Technology (CAST) estimated the incidence of symptomatic illness at 6.5 million cases annually, with about 9,000 related deaths. CDC has undertaken a broad-based, multi-disciplinary effort to update estimates of foodborne illness using the best available information. CDC anticipates that the revised estimates will be available for public review within the next few months. Substantial future efforts will be required to further improve estimates of the burden of illness caused by certain bacterial, parasitic, and viral foodborne pathogens.

Question. What percent of foodborne illness is attributed to the processing of foods versus consumer food handling?

FDA answer. CDC and FDA do not know of reliable data to determine the percent of foodborne illness attributed to the processing of foods versus consumer handling of food. However, the current data indicate that we need to do more to prevent foodborne disease, both by making food safer and by improving commercial and home food preparation practices. To reduce the frequency of foodborne diseases, improvements need to be made throughout the food supply—reduce the prevalence of pathogens on farms, decrease the contamination of foods during processing, and improve food handling practices in restaurants and homes.Most food-borne illness have traditionally been attributed to food prepared in the home, although, most outbreaks have been reported from food prepared at the retail level. This apparent inconsistency is the result of bias in traditional foodborne illness surveillance program. The Foodborne Diseases Active Surveillance Network, FoodNet, established under the Food Safety Initiative, was developed in part to provide a more accurate estimate of where, contamination and other food preparation errors that lead to food-borne illnesses are occurring.

Question. With the use of HACCP, USDA officials have noted a sharp decline in Salmonella contamination of meat and poultry. However, more than a third of ground turkey is still tainted. Why?

USDA answer. The prevalence of Salmonella in the FSIS nationwide raw ground turkey microbiological survey—conducted during January through March 1995 and September through November 1995—was 49.9 percent. The Post-HACCP implementation, January 26, 1998—January 25, 1999, Salmonella prevalence for raw ground turkey produced in large plants was 36.4 percent. Thus, there has been a decline in Salmonella contamination on raw ground turkey since the implementation of HACCP. Ground meat and poultry products tend to have a higher Salmonella prevalence than carcasses, because they are prepared from numerous carcasses.

Question. There have been increasing numbers of recalls in the United States involving cooked, ready-to-eat products and Listeria. What are the concerns about this and what is being done about this problem?

USDA answer. FSIS has undertaken an aggressive strategy to decrease the risks from Listeria on ready-to-eat products. This strategy includes: developing guidance to industry on "best practices" that can help to reduce the potential of product contamination; targeting consumer education for high-risk groups; initiating a study to address developing policy guidance on industry responsibility to address Listeria under HACCP in ready-to-eat product at retail; and, conducting a quantitative risk assessment for Listeria that will determine the foods that pose the greatest risk to

consumers and specific subpopulations at increased risk of contracting listeriosis. We have also improved the sensitivity of test methods to better detect contaminated product.

FDA answer. The public health concern is that processed meats and ready-to-eat products continue to contain Listeria, and as a result are a persistent source of infection and death among susceptible persons. CDC is developing new molecular subtyping systems for Listeria monocytogenes, conducting foodborne disease surveillance, and studying listeriosis in several states to help measure the impact of prevention activities and recognize trends in disease occurrence. Early detection and reporting of outbreaks of listeriosis to local and state health departments can help identify sources of infection and prevent more cases of the disease. Thus, CDC assists State health departments in investigating outbreaks. CDC is working to educate consumers, especially those in high risk groups, about listeriosis risk associated with certain foods. In addition, CDC is working with regulatory agencies on prevention strategies, such as post-packaging pasteurization of high risk foods.

FDA has contributed to efforts to decrease response time to outbreaks of listeriosis and other harmful pathogens. Specifically, FDA has helped fund the CDC, surveillance for listeriosis for many years. Since 1995, FDA, CDC, and the U.S. Department of Agriculture, or USDA, have been working with cooperating state and local health departments on active surveillance for foodborne illness, including listeriosis, through the Foodborne Diseases Active Surveillance Network, which is commonly referred to as FoodNet. Additional funding through the Food Safety Initiative has increased FoodNet effort, by including more active sites and additional pathogens, and has allowed more case control studies for outbreaks of listeriosis to be included. Such studies are important in determining which are the most at-risk individuals, actual incidence, foods implicated, and numbers of Listeria monocytogenes organisms in implicated foods.

FDA and CDC cooperate with USDA and public health laboratories in PulseNet, the National Molecular Subtyping Network for Foodborne Disease Surveillance, to perform "fingerprint" comparisons on bacteria that may be foodborne. Such analyses help identify molecular subtypes of bacteria and identify common food source outbreaks. PulseNet is now operational for E. coli O157: H7. Salmonella serotype Typhimurium was added in 1998. PulseNet techniques are used for some outbreaks and clusters of listeriosis. The next proposed organism for 50 state harmonization is Listeria monocytogenes.

In May 1997, the President announced the comprehensive Food Safety Initiative to improve the safety of the nation's food Supply. Prominently included in this initiative are measures to improve surveillance and outbreak response. Following the announcement, The Foodborne Outbreak Response Coordinating Group, also known as FORC-G, was formed, bringing together FDA with other federal, state, and local agencies to develop a comprehensive, coordinated, national foodborne illness outbreak response system. Early detection and reporting of outbreaks of listeriosis to local and state health departments can help identify sources or infection and prevent more cases of the disease.

In the summer of 1998, FDA began developing a charge to a task force to perform a risk assessment of the public health impact of foodborne Listeria monocytogenes. The risk assessment formally began in 1999. The objectives of the risk assessment are to identify low vs. high risk foods, the characteristics high risk food have in common, and the role of shelf life; the numbers of Listeria monocytogenes organisms consumed, both routinely and when illness results; and knowledge of dose-response relationship, especially in the at-risk populations. The goal is to provide as complete a description as possible of current knowledge of the sources and quantity of Listeria monocytogenes consumed and of the health consequences to the populations that consume these microorganisms. Information from the risk assessment should help to both decrease response time and help to educate consumers, industry, and health professionals.

FDA has also contributed to the prevention of future outbreaks. Listeriamonocytogenes education has been directed especially to the most at-risk populations such as pregnant women and people with AIDS, and distributed through brochures placed in physicians' offices and by FDA Public Affairs Specialists and through educational videos on foodborne illness prevention, including Listeria monocytogenes and listeriosis. The target population also includes food service managers and workers and nursing home medical directors and administrators. The general public has been targeted through periodic news releases from FDA's press office; articles published in the FDA Consumer in 1987, 1988, and 1991 and through the FDA web site, with additional links to related web sites including the USDA Food Safety and Inspection Service and the CDC. "Research on Listeria

monocytogenes" was published in the FDA Drug Bulletin I 1987 and distributed to over one million health professionals.

The Foodborne Pathogenic Microorganisms and Natural Toxins Handbook, also known as the "Bad Bug Book", has been publicly available since 1994 through the CFSAN web site. This handbook contains information on Listeria monocytogenes and listeriosis that is supplemented with up-to-date information through links to current research articles and surveillance reports. The "Bad Bug Book" is one of the most popular sites at the CFSAN web site, and is consulted by consumers, industry, and other government agencies, both here and abroad.

The most recently available data on cases of listeriosis reported to CDC, included in the Healthy People Review, 1998–1999 National Center for Health Statistics, show a reduction and leveling off in the numbers of cases of listeriosis. This includes sporadic and outbreak cases. Reduction achievements between 1989 and 1993 were attributed to industry, regulatory and educational efforts.

I will be happy to provide a chart with this data for the record.

[The information follows:]

Cases of Listeriosis reported to CDC

1Year	*Cases per 1 million U.S. Population*
1987	7.0
1990	7.7
1991	6.1
1992	4.5
1993	4.4
1994	4.2
1996	[1]5.0
1997	[1]5.0

[1] FoodNet data based on Active Surveillance at selected sites

Question. In late February of this year, the press reported that USDA and FDA agreed to share information about inspections, recalls, and outbreaks of foodborne diseases. Was this report accurate, that the agencies had not been sharing such information before this time? If true, why?

USDA answer. The press reports on the recently agreed upon memorandum of understanding (MOU) between FSIS and FDA may not have been completely accurate. The MOU deals mainly with sharing information about inspections and findings at dual jurisdiction establishments. FSIS historically has shared, and continues to share, data about recalls and outbreaks of foodborne illness with FDA. Neither FDA nor FSIS will disclose to each other confidential or trade secret information.

FDA answer. No, the press report was not accurate. The two agencies have been sharing information for some time now. On August 8, 1979, FDA and USDA entered into a Memorandum of Understand, or MOU, that formalized the exchange of information on inspections. In June of 1981, this MOU was amended in order to take into consideration the provisions of the Infant Formula Act. In 1983, a revised MOU outlined several expanded areas of cooperation and sharing of inspection information.

In February of this year, the agencies reevaluated the previous MOU, updated that agreement, and entered into a newly signed agreement on coordination of inspectional efforts. The new agreement will facilitate the exchange of information at the field level about food establishments and operations that are subject to the jurisdiction of both agencies. Field offices will notify their counterparts of food safety recalls, instances of product contamination and mislabeling, and conditions at facilities that could result in unsafe or unwholesome food.

In a May 1997 Report to the President entitled "Food Safety From Farm to Table-A National Food-Safety Initiative," the agencies primarily responsible for food safety, made several recommendations to improve public health protection from foodborne illness, including increasing cooperation among agencies, and more specifically, of ensuring that FDA and USDA/FSIS use the resources and experience of as efficiently as possible to avoid duplication of efforts. The President accepted the report and directed the Agencies to implement the report's recommendations to improve the efficiency and effectiveness of the food safety system in this country.

Question. Do organic foods pose any greater risk than other foods?

USDA answer. We are not aware of any scientific evidence comparing the relative health risks of organic foods versus non-organic foods that would indicate that organic foods pose a greater health risk to the consumer.

FDA answer. FDA has no data to suggest that foods identified as organic pose a greater or lesser risk than foods that are conventionally grown or manufactured. To a large degree, potential microbial food safety hazards, and their control, apply

to both organic and non-organic food operations. In the production of fresh fruits and vegetables, for example, all growers need to ensure agricultural water quality is adequate and take appropriate steps such as run-off controls to maintain water quality. Most factors, such as available water source, are more likely to be dictated by regional or other factors than by whether a grower is organic. Likewise, sanitary facilities need to be clean and easily accessible. Workers in the field and packinghouse need to be aware of and follow appropriate sanitary and hygienic practices. Some practices, such as the use of manure as a fertilizer, have been identified as practices that need to be closely monitored to reduce the risk of microbial contamination. To the extent that organic and non-organic producers employ such practices, appropriate Good Agricultural or GAPs and Good Manufacturing Practices or GMPs should be followed to limit the potential for contamination.

Question. Is the expansion of FoodNet complete?

USDA answer. No, several states plan to add counties to the catchment area in fiscal year 2000. A ninth site may be considered in the future to enhance geographic representation. In 1998, the FoodNet catchment area included 20.5 million persons, based on 1997 estimates, which represents 7.7 percent of the U.S. population. In 1999, the catchment area will include approximately 30 million persons based on 1997 estimates, with Georgia initiating statewide surveillance and New York adding counties to its catchment area.

FDA answer. CDC does not anticipate adding additional states as FoodNet sites at this time. However, CDC does intend to enhance surveillance and expand the number of pathogens actively tracked in FoodNet sites, with the purpose of expanding knowledge of foodborne illness through precise monitoring of the burden of foodborne illness over time. The population currently participating in FoodNet is sufficiently large to address many food safety questions and to provide data that can be generalized to the nation as a whole.

Question. What is your goal for expansion of PulseNet?

FDA answer. PulseNet, CDC's national molecular subtyping network for foodborne disease surveillance, has demonstrated the utility of real-time routine fingerprinting of pathogenic bacteria by state health departments. The broad goal of PulseNet is to be a national early warning system to identify and track nationwide trends of foodborne illness. In fiscal year 1999 and 2000, CDC will expand the national network of laboratories performing molecular subtyping and increase the number of pathogens monitored though standard, molecular subtyping methods.

State (and city) public health laboratories participating in PulseNet have been able to facilitate outbreak investigations by helping to better interpret epidemiologic data on outbreaks, identify clusters of disease that would not have been otherwise identified, and link cases in distant locations with outbreaks occurring in a specific region the country. This will allow earlier detection of outbreaks of contaminated foods that are nationally distributed.

For PulseNet to be fully successful, the state public health laboratories must have adequate resources and capability to perform routine subtyping of foodborne pathogenic bacteria in a timely fashion, complete analysis of the data without delay, provide the subtyping data and interpretations to state epidemiologists, and send the DNA patterns to CDC (or upload the patterns to the PulseNet server located at CDC) so that the patterns could be compared with the national database and shared with other PulseNet laboratories. Presently 33 states participate in PulseNet; additional states will be added over time.

FDA working through the CDC will expand its access to PulseNet and increase outbreak response and associated traceback activities. FDA will begin initial development of electronic communication and data sharing systems for use in Federal-State monitoring and traceback activities. Working with CDC, FDA will also expand and increase the overall capacity of the National Antimicrobial Resistance Monitoring System or NARMS and the number of states covered to assure a higher probability of detecting emerging resistant pathogens capable of animal to human transmission and to minimize the occurrence of foodborne outbreaks including those from outside of the United States.

As of December 1998, FDA's Center for Food Safety and Applied Nutrition or CFSAN, USDA, 25 State Health Departments and two County Health Departments were connected to a central server at the CDC. All E. coli O157:H7 isolated at these sites are being reported to CDC for comparisons; other pathogens analyzed on a case-by-case basis include Listeriamonocytogenes and various Salmonella and Shigella species.

In fiscal year 1999, two FDA regional FDA field laboratories will be equipped and trained to participate in PulseNet. FDA's Center for Veterinary Medicine or CVM may also participate, initially using CFSAN as a gateway, on pathogens of mutual interest such as Salmonella Typhimurium DT104. This strain is multi-drug resist-

ant and is rapidly becoming one of the most prevalent Salmonella species encountered. A parallel effort conducted through field labs will subject all Salmonella isolated from food to antibiotic resistance screening. Those exhibiting multi-resistance will be submitted for PulseNet analyses.

The other three FDA field labs identified as mega-centers will be equipped and trained for PulseNet as resources become available. This will minimize the time between the isolation of a pathogen from a food sample and the reporting of its DNA fingerprint to the PulseNet system.

Once the system is refined, other foodborne pathogens of public health significance will be included for 100 percent reporting. By analyzing pathogens from outbreaks and apparently sporadic cases, the system will detect those diffuse clusters that currently often get erroneously classified as sporadic cases. Identifying the foods involved in these many-mini diffuse outbreaks will help better focus surveillance activities of the FDA field operations. In the future, the network will be linked to a similar network in the European Union so as to share outbreak data and spot emerging pathogens that may have pandemic potential.

Question. The National Academy of Sciences indicated in its report that "Surveillance efforts currently in place (such as FoodNet) have been designed to provide data representative of national trends with regard to seven indicator foodborne pathogens yet are not designed to identify trends within smaller geographic areas of communities." To what extent is this true?

USDA answer. Yes, as indicated in the National Academy of Sciences' report, surveillance efforts currently in place, such as FoodNet, have been designed to provide data representative of national trends, yet are not designed to identify trends within smaller geographic areas of communities. However, it is important to note that FoodNet data are used by each of the FoodNet sites to determine the most important foodborne illness prevention programs that should be undertaken by that site.

FDA answer. FoodNet—the Foodborne Diseases Active Surveillance Network—consists of active surveillance for foodborne diseases and related epidemiologic studies designed to help public health officials better understand the epidemiology of foodborne diseases in the United States. FoodNet is designed to provide accurate and precise national estimates and interpretation of the burden of foodborne diseases over time. FoodNet provides a network for responding to new and emerging foodborne diseases of national importance, monitoring the burden of foodborne disease, and identifying the source of specific foodborne diseases. Specifically, the goals of FoodNet are to describe the epidemiology of new and emerging bacterial, parasitic and viral foodborne pathogens; to estimate the frequency and severity of foodborne diseases that occur in the United States each year; and to determine how much foodborne illness results from eating specific foods, such as meat, poultry, and eggs.

Through other "passive" disease surveillance systems, the states and localities are able to detect outbreaks in geographic areas of the communities.

Question. Testimony was presented to the Committee that "Food Safety Initiative" includes funding for any program or activity mentioned in the May 1997 report to the President entitled "Food Safety from Farm to Table: A National Food Safety Initiative". Provide a list of the "Food Safety Initiative" expenditures. List each by federal agency, appropriations account, and activity and show the fiscal year 1997, 1998, 1999, and 2000 budget request levels.

USDA answer. For the record, the following table presents by federal agency, appropriations account and activity funds budgeted for the "Food Safety Initiative", which focuses on the reduction of microbial pathogens in the Food Supply, in fiscal years 1997, 1998, 1999, and 2000.

Question. Provide a list by federal agency, appropriations account, and activity of the food safety related expenditures not counted as part of the "Food Safety Initiative" for each of fiscal years 1997, 1998, 1999, and requested for fiscal year 2000.

USDA answer. For the record, the following table presents the remaining balance of the Food Safety and Inspection Service's budgetary resources from fiscal year 1997 to 2000 after subtracting resources devoted to the President's Food Safety Initiative. All of the remaining funding for the Food Safety and Inspection Service (FSIS) is for food safety related activity. The President's Council on Food Safety will be developing a comprehensive strategic plan identifying all Food Safety activities for 5 core Food Safety hazards: microbial hazards, chemical contaminants, regulated/pre-market approved substances, physical hazards, and water used in food production and processing.

[The information follows:]

Research, Education, and Economics

All ARS food safety related expenditures are included in the "Food Safety Initiative". The funding provided for the Food Safety Initiative was $49,647,300 in fiscal year 1997; $54,949,400 in fiscal year 1998; $69,867,600 in fiscal year 1999; and $81,587,600 is requested for fiscal year 2000. The Appropriations Accounts for fiscal years 1997 to 1999 were 1271400, 1281400, and 1291400. The fiscal year 2000 Appropriations Account will be 1201400.

CSREES Hatch Act, Evans-Allen Program, Animal Health and Disease Research, and Special Research Grant funds support the food safety research activities in addition to funding for the "Food Safety Initiative". The total estimated funding provided for Food Safety research was $5,961,000 in fiscal year 1997; $5,962,000 in fiscal year 1998; $6,123,000 in fiscal year 1999; and $3,748,000 is requested in fiscal year 2000. The CSREES Appropriation accounts for fiscal years 1997 through 1999 were 1271500, 1281500, 1291500 for these research activities. The fiscal year 2000 Appropriations account will be 1201500.

A table showing the funding by activity for food safety related expenditures not counted as part of the Food Safety Initiative follows.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

[Food safety]

Program	Fiscal year 1997	1998	1999	2000 Budget
Hatch	1,726	1,726	1,846	1,571

Question. What is the status of USDA's plans to expand the number of products that would be considered adulterants if they contain E. coli O157:H7?

USDA answer. FSIS is evaluating the comments submitted on the January 19, 1999, Federal Register Notice (64 FR 2803), as well as the statements presented at the March 8, 1999, public meeting. In addition, a risk assessment for Escherichia coli O157:H7 in beef and ground beef, announced in an August 18, 1998, Federal Register Notice (63 FR 44232), is expected to be completed by September 1999. Furthermore, an industry coalition has stated that it will submit a protocol for a carcass testing study in early April 1999. FSIS does not expect to begin to act on the January 19 policy statement until it has had sufficient opportunity to assess the comments received.

Question. FSIS has been testing beef for E. coli O157:H7 since 1996. Out of 26,088 samples, only 25 positives have been found, none of which were connected to an outbreak or illness.

(A) What are the current expenditures for this testing program?

USDA answer. The Food Safety and Inspection Service (FSIS) spends approximately $10.4 million per year on testing meat and poultry products for 9 pathogens, including E. coli O157:H7, Salmonella, Campylobacter, and Listeria.

(B) If, in nearly three years of testing, none of the positive results have been associated with an outbreak or illness, what is the justification for continuing this program?

USDA answer. The testing program for E. coli O157:H7 began after the tragic outbreak of foodborne illness associated with this pathogen in the State of Washington. USDA estimates that over 10,000 illnesses per year result from consuming foods contaminated with E. coli O157:H7.

As the Washington outbreak demonstrated, those most susceptible to this pathogen include children, the elderly, and the immune compromised. Testing programs like that for E. coli O157:H7 assist FSIS in controlling deadly pathogens by identifying contaminated product in time to remove it from the market before it can cause foodborne illness. The justification for continuing this program is that the agency believes this testing program is reducing the risk of illnesses/outbreaks caused by E. coli O157:H7 in raw ground beef. The FSIS program of random sampling at federal, State, and import establishments and at the retail level, as well as the implications of a positive finding, encourage the meat industry to use good manufacturing practices, good sanitation procedures, antimicrobial interventions, microbial testing, and other measures to eliminate this serious pathogen from the nation's meat supply.

Question. Although this year the President's budget recognizes that enabling legislation must be enacted into law, it again assumes savings in appropriations from its proposal to implement user fees to pay the cost of meat and poultry inspection. Why does the Administration believe that meat inspection is a benefit to industry, rather than a public health service which is provided for the benefit of the public?

USDA answer. Both the public and industry benefit from our inspection services. However, industry is the direct beneficiary of Federal inspection, which enables businesses to engage in commerce and earn profits. Industry also directly benefits from the consumer's confidence in inspected meat, poultry, and egg products. The consuming public benefits from the public health protections that Federal inspection provides.

Question. I understand that a relationship has been found between bacteria in food supplies where close, crowded conditions for animals exist. Is this true? What is being done about this ?

USDA answer. No relationship has been found between bacteria in food supplies where close crowded conditions for animals exist. FSIS has sponsored a pair of recent studies of dairy animals reared in close quarters, most of which are "cull cows". Bacterial samples were collected from cattle at the farms, through transport (under crowded conditions), and from the carcasses. There was no correlation between results from live cattle and finished carcasses. Similar work done with poultry indicates the same is true for these intensively reared animals.

Question. HACCP in large plants was implemented a year ago. What improvements have been made with respect to the incidence of Salmonella, E coli, and other food-borne pathogens?

USDA answer. Preliminary findings show that this science-based, prevention-oriented system has contributed to reducing the prevalence of Salmonella in some raw meat and poultry. As the following chart illustrates, based on the one-year of data collection in the approximately 200 large plants that implemented HACCP in January 1998 and produced product subject to the Salmonella testing requirement, the prevalence of Salmonella has significantly fallen.

In ground beef, for example, 7.5 percent of the national baseline samples tested positive for Salmonella prior to January 1998; only 4.8 percent tested positive after HACCP implementation; a decline of 36 percent. Of broiler carcasses, 20.0 percent tested positive for Salmonella before HACCP implementation, compared to 10.9 percent after implementation, a decline of over 45 percent. On swine carcasses, 8.7 percent of the samples tested positive prior to HACCP versus 6.5 percent after HACCP implementation, a decrease of more than 25 percent. And, 49.9 percent of ground turkey tested positive prior to HACCP versus 36.4 percent after HACCP implementation, a 27 percent decrease.

The data also indicates that 88 percent of HACCP plants for which there are adequate data meet or exceed our Salmonella performance standards. Plants that do not meet the standards are required to take immediate corrective measures, and also undergo targeted testing.

[The information follows:]

TABLE 1.—PREVALENCE OF SALMONELLA IN MEAT AND POULTRY PRODUCTS: POST-HACCP IMPLEMENTATION RESULTS FROM LARGE PLANTS JANUARY 26, 1998, THROUGH JANUARY 25, 1999 [1]

Class of Product	Pre-HACCP Baseline Studies [2]	Post-HACCP implementation
Broilers	[3] 20	[3] 10.9 (n=5697)
Swine	[3] 8.7	[3] 6.5 (n=1532)
Ground Beef	[3] 7.5	[3] 4.8 (n=1184)

Ground Beef	25	10	90 (9)
Ground Turkey	17	11	91 (10)
Total	199	114	88 (100)

[1] Reflects testing results from products with 10 or more completed sample sets.

Question. What challenges has FSIS had to overcome in implementing the HACCP program?

USDA answer. For the record, here are a few examples of challenges.

The establishment and delivery of a cost effective HACCP Technical Training Program for field inspection and compliance personnel was a major challenge. Inspection personnel are located in over 2,500 different, often geographically remote, locations across the United States. The majority of our workforce is tied to the production schedules of the meat and poultry industries. Plant operating schedules had to be taken into account and replacement inspectors brought into plants where assigned personnel were being training during plant operating hours.

After decades of performing inspection from a command and control perspective, gaining the acceptance of the field workforce of the new regulatory approach—established by the Pathogen Reduction and HACCP rule—proved to be a challenge.

Some members of the meat and poultry industry had the view that the PR/HACCCP rule provided increased authority to in-plant inspection personnel and were apprehensive that inspection personnel would use it in an adverse way.

Question. When HACCP was implemented a year ago, there was concern about layering the new HACCP system over the old, outdated organoleptic system. Even USDA expressed concern and committed to conducting an internal regulatory review to take these old rules off the books. Can you give the committee the status of that review? How many of those old rules have been removed from the books? And, what is your time line for completing this regulatory review?

USDA answer. On December 29, 1995, FSIS published an advance notice of proposed rulemaking (ANPR) in the Federal Register describing the FSIS regulatory review agenda (60 FR 67469). Several command-and-control type regulations were identified as being appropriate for conversion to performance standard-based regulations, while other regulations were identified as being obsolete in the HACCP regulatory environment. Of the regulations identified as candidates for revision or removal prior to HACCP implementation, FSIS issued one final rule prior to the January 1998 HACCP implementation for large establishments; "Eliminating of Prior Approval Requirements for Establishment Drawings and Specifications, Equipment, and Certain Partial Quality Control Programs," published on August 25, 1997 (62 FR 45016).

FSIS and FDA jointly published an advance notice of proposed rulemaking on "Transportation and Storage Requirements for Potentially Hazardous Foods" in the Federal Register on November 22, 1996 (61 FR 59372). The comments have been evaluated and a performance standard-based proposed rule is being developed. The first in a series of process performance standards for ready-to-eat products—"Performance Standards for the Production of Certain Meat and Poultry Product"—was published as a final rule in the Federal Register on January 6, 1999 (64 FR 732). Meanwhile, several proposed rules published in the Federal Register and are now in the process of being finalized, including the following: "Sanitation Requirements for Official Meat and Poultry Establishments," publishing on August 25, 1997 (62 FR 45045); "Rules of Practice," publishing on January 12, 1998 (63 FR 1797); and "Meat Produced by Advanced Meat/Bone Separation Machinery and Recovery Systems," published on April 13, 1998 (63 FR 17959).

FSIS has a number of dockets under development for replacing other prescriptive requirements with performance standards, including water retention in poultry, chilling requirements for slaughtered poultry, and processing/handling temperature requirements for livestock and poultry. In addition, a proposed rule for the elimination of most of the remaining partial quality control requirements is expected to be published this spring. FSIS expects that final action on many current regulatory reform efforts will be completed prior to the beginning of 2001.

Question. With respect to the Administration's commitment to food safety research and your request for funding for fiscal year 2000, can you tell the committee what, if any, efforts are planned to eliminate E. coli O157:H7 in beef, and Listeriamonocytogenes in ready-to-eat meat and poultry products other than enforcing a zero tolerance standard for these pathogens and overseeing product recalls?

USDA answer. We are continuing to work with ARS concerning research that could lead to procedures to control or eliminate E. coli O157:H7 in beef. ARS research is providing valuable information into the etiology of this organism. It is too early to predict if it will be possible to eliminate this organism as a potential contaminant of the cattle slaughtering process.

The industry procedures used to process ready-to-eat products will kill Listeria monocytogenes. However, product can become recontaminated during packaging and distribution if cooked products are not distributed in the containers in which they were cooked.

Since this is a hazard that is likely to occur, the industry is studying procedures to control the hazard. For example, one producer has started distributing hot dogs in the plastic casing in which they where cooked. Another possibility is packaging in special clean rooms where precautions such as airlocks, special air filters, and limited access are used.

ARS carries out research programs to help eliminate E. coli O157:H7 from beef including pathogen identification, pre and postharvest ecology, and pathogenesis. The preharvest ARS research programs to control E. coli O157:H7 and related organisms in cattle seek to understand the carrier state of E. coli O157:H7 in calves; to describe the epidemiology and occurrence of this pathogen in the production environment of food producing animals, and to discern the relationship of preslaughter feeding and production factors, including transportation to post slaughter contamination. Research on control of E. coli and other pathogens in animal manure is being initiated which will further help achieve pathogen control. ARS postharvest research improves slaughter and dressing procedures to minimize contamination on carcasses; develops predictive models for the growth of the pathogen on meat products; and develops more rapid and user friendly detection methods using biotechnology approaches. This research can provide the means to greatly lower the incidence of toxigenic E. coli, but because of environmental occurrence, including wild animals, insects and water supplies, it is unlikely that all toxigenic E. coli can be eliminated from food-producing animals.

ARS has research programs directed to the development of intervention strategies for Listeria that may be incorporated into HACCP programs to eliminate the patho-

gen. A rapid gene based assay has been developed that can readily identify and differentiate Listeria species in various ready-to-eat foods, allowing for molecular fingerprinting and trace-back. A program has been initiated, specifically aimed at developing technology to surface pasteurize food products, including hot dogs, which economically reduces microbial contamination without significant loss of product quality. A major research program continues in an effort to determine the effect of various food components, and parameters (pH, water activity, salt, process and storage temperature) on the inactivation, survival and growth of Listeria in ready to eat products. L. monocytogenes is a highly unusual and difficult pathogen to eliminate in that it possesses the ability to adapt and grow under conditions of high salt, high osmolarity, and low temperature, all at the same time. Research is specifically aimed at understanding, at cellular and molecular level, how this adaptation and growth occurs. Research is also aimed at identifying new generally recognized as safe (GRAS) compounds that can be incorporated into foods as a antimicrobial agents to protect against Listeria and other pathogens.

Question. Does FSIS have any data or other scientific evidence to support the provision of additional oversight or inspection resources to "in-distribution" facilities ?

USDA answer. Since the publication of the proposed Pathogen Reduction/HACCP regulation on February 3, 1995, FSIS has indicated its concern about the possibility that food safety hazards can be introduced into meat and poultry products at virtually any point in the farm-to-table continuum, but agency resources were heavily concentrated in official slaughtering and processing establishments. Commenters supported the more equitable distribution of agency resources. In the preamble to the final rule, FSIS stated, "A large number of commenters requested that HACCP be required throughout all phases of food production from the farm to the consumer." The final PR/HACCP regulations did not include transport temperature requirements which would have directed agency resources toward in-distribution locations, but this was more a matter of technical feasibility, and not a reflection on lack of public interest. The agency has retained its interest in this area and has been continuing its work: jointly with FDA, it published an ANPR and held a public meeting. The agency expects that these efforts will culminate in regulatory proposals setting one or more performance standards for the handling of meat and poultry products during transport and storage.

FSIS knows that there are segments of the public which are very concerned about the inequities which have arisen under the current system of exemptions. FSIS also believes that consumers are concerned that the protections provided by regulatory requirements that apply, for instance, to grinding hamburger in official establishments, are not provided by similar regulatory requirements applicable to the same operations when they are conducted by retail stores.

FSIS is proposing the conversion of 638 inspection personnel to Consumer Safety Office rs positions in fiscal year 2000.

Question. How many traditional inspection personnel will be available after this conversion? Is this sufficient to meet slaughter and processing facility needs?

USDA answer. For fiscal year 2000, FSIS plans to stabilize the workforce at approximately 7,500 employees who will be involved in direct inspection activities. This resource level is adequate to meet the needs of the regulated industry. The workforce includes food inspectors, veterinarians, consumer safety officers, and consumer safety inspectors. The introduction of the Consumer Safety Officer classification series will enhance the level of resources committed to direct inspection activities at regulated establishments. This series is part of the Agency's strategy to improve the skills and qualifications of its workforce involved in direct inspection activities in regulated establishments as well as to take full advantage of these skills to meet its goal of reducing foodborne illness and to provide appropriate regulatory oversight within its statutory authorities along the farm-to-table continuum.

Question. How will the role of an inspector differ from the role of a Consumer Safety Officer?

USDA answer. The roles of inspectors, veterinarians, and consumer safety officers do not differ. Each functions as the FSIS regulatory agent in an establishment under Federal inspection. Each occupation brings a different set of qualifications and knowledge to bear on making regulatory determinations. The individual assignments and work methodologies carried out by various FSIS employees will differ based on the need to draw upon different types of scientific knowledge to make appropriate regulatory determinations about the compliance of industry operations with USDA regulatory requirements.

Current work methods for food inspectors are "cookbook" in nature and generally prescribed through central assignment scheduling systems. Work methods for Consumer Safety Officers will require the exercise and application of scientific knowledge in making regulatory determinations about the adequacy of industry HACCP

systems, other process control systems, and pathogen testing systems. FSIS expects to introduce Consumer Safety Officers into the inplant workforce in assignments where there is the greatest opportunity to apply scientific, professional knowledge in making regulatory determinations about industry compliance. This will likely be in locations with a sizeable number of plants having a wide diversity of HACCP process categories and products, and sophisticated food production technologies and pathogen testing systems.

Question. Will current inspectors require additional training to perform their duties as Consumer Safety Officers?

USDA answer. Yes, additional training will be required. In order to qualify for Consumer Safety Officer (CSO) positions, inspectors must have obtained an educational background to meet the scientific and technical requirements of the position. Although current inspectors who are eligible for the CSO series have the appropriate educational background, they will have to be trained to operate within a new work methodology and with considerably more latitude for making scientific judgments than they have in their current inspection positions. The CSO position brings additional scientific expertise and decision-making to the plant level to assess and verify if plant control systems are adequately controlling for food safety hazards.

Question. If so, what funding is required for this additional training? Does the budget request include this funding?

USDA answer. FSIS plans to use a great deal of the $3.5 million in available funds to train 638 newly converted or hired CSO's and their supervisors in new work methods. These funds, which are included in the total FSIS budget request, will be available for CSO training because only a few hundred inspection personnel will require training to prepare for implementation of HACCP in the very small plants. The Agency is currently in the process of assessing the projected cost of CSO training for fiscal year 2000.

Question. What merits a pay raise for these personnel for performing a job integral with the HACCP inspection system for which they are already being compensated?

USDA answer. Consumer Safety Officers will be expected and required to apply scientific and professional knowledge in making regulatory determinations about industry compliance. The work methodologies and job requirements for positions filled by Consumer Safety Officers will require the exercise and application of scientific knowledge in an evaluative capacity to verify the adequacy of HACCP systems. The salary differential compensates individuals for the required application of professional judgment in rendering regulatory determinations about industry operations that is not currently expected or required of food inspectors.

Question. What additional costs will be associated with these new Consumer Safety Officers (ie. travel, vehicle costs)?

USDA answer. We anticipate that the travel and operating expenses of Consumer Safety Officers will be similar to those expenses incurred by processing food inspectors, which are higher than those for slaughter inspectors.

Question. Why not put these inspectors where there is a need rather than where you may be duplicating the efforts of the Food and Drug Administration and local health inspectors?

USDA answer. The presence of Consumer Safety Officers (CSO's) within the FSIS workforce and assigned to Federally inspected plants does not duplicate the efforts of FDA or State and local authorities. CSO's will be assigned to Federally inspected establishments where they will be applying scientific, professional judgment in making determinations about industry compliance with HACCP and other regulatory requirements. FSIS has determined that there is a need for inspection program personnel who possess a different set of skills and knowledge, having both an academic background and experience in making regulatory decisions. With a flexible, more highly educated work force, FSIS will be able to assign personnel to any type of industry operation within FSIS' jurisdiction. The future workforce will include a variety of scientific disciplines, among which is the professional level position of CSO now under development.

In the long-term, FSIS envisions using the CSO series to employ much of the regulatory workforce of the future. Increasing the number of inspection personnel in this series will better enable the Agency to meet its goal of reducing foodborne illness and provide the appropriate regulatory oversight within its statutory authorities along the food safety continuum. In order to effect conversion to this series, there will be a transition process in which two additional occupational series will be used. Line slaughter work in plants that are not part of the HACCP-based in-

spection models project [1] will continue to be classified in the Food Inspector, GS–1863 series. HACCP work now being performed will be classified in the Consumer Safety Inspector (CSI), GS–1862 series. This is a more appropriate classification series to describe this work and it is a series that other Federal agencies have used as a companion series to the CSO, GS–696 series, thereby facilitating the transition for the long-term. CSI's will perform technician level work that involves making judgments using a limited range of principles and an extensive body of facts accumulated from long-term or in-depth experience in a limited range of work. CSO's will make judgments by selecting and using principles and facts from a body of knowledge commonly inherent in one or more professional occupations. CSO's will be employed in HACCP plants primarily in fiscal year 2000 due to the highly complex nature of the work in that environment.

The presence of food safety hazards after product leaves Federally inspected establishments has prompted the Agency to pilot test the use of a small number of FSIS resources in the in-distribution sector in accordance with the farm-to-table strategy. Under this pilot test FSIS will redeploy some inspectors currently assigned within plants to verify the safety and wholesomeness of meat and poultry products as they move to consumers. This project focuses on developing new inspection models that will permit FSIS to deploy inspection resources more effectively within plants and between in-plant and in-distribution sites, consistent with farm-to-table food safety goals and FSIS current statutory obligations in the in-plant and in-distribution sectors. The CSI series will be used in the in-distribution pilot of the HACCP-based Inspection Models Project. After gaining experience through the Models Project, FSIS expects to employ the CSO series in in-distribution.

FSIS is aware that State and local authorities have primary responsibility for food safety regulation and oversight at retail levels and are active in other areas as well. Rather, through the limited in-distribution pilot and the broader initiatives to create a seamless food safety system, FSIS plans to work in partnership with State and local food safety agencies. The pilot is expected—and in fact designed—to raise questions about coordination with State and local agencies, and these will be addressed as the pilot proceeds.

Question. Do you have any data to show that grocery stores need more inspection than imported foods?

USDA answer. FSIS is not proposing more inspection for grocery stores but better control on the integrity of meat and poultry product as it moves through transportation, distribution and marketing channels to consumers.

For example, in response to the proposed Pathogen Reduction/HACCP regulation, FSIS received many comments supporting the more equitable distribution of meat and poultry inspection resources throughout the farm-to-table continuum. The proposed rule included temperature controls for meat and poultry products during transportation and storage; FSIS did not finalize this feature of the proposal, but stated: "FSIS has concluded that its food safety objectives may be achieved more effectively by regulatory means other than those proposed . . . . FSIS agrees with those commenters who stated that keeping raw products cooled after they leave the establishment, during transportation, storage, distribution, and sale to consumers is essential if growth of pathogenic microorganisms on raw products is to be prevented. This is consistent with FSIS's farm-to-table strategy."

FSIS intends to develop performance standards for products being shipped into commerce. These standards would be applicable to all persons who handle such product before the product reaches the consumer (61 FR 38856–57, July 25,1996). In addition to a handling performance standard for the farm-to-table continuum, FSIS believes that there is benefit to be gained by conducting certain retail sampling of meat and poultry products just before they reach the consumer. Product leaving inspected establishments goes through an often lengthy distribution process that involves many transporters, storers and other handlers. So, at some future time, FSIS may determine that a greater portion of its sampling and subsequent analytic work may need to be directed at meat and poultry products in the final stages of distribution. With respect to imported products, FSIS believes that its current system for control of imported meat and poultry products provides an appropriate level of control and is an efficient use of current resources.

---

[1] Under the slaughter models component of the HACCP-based Inspection Models Project, FSIS is exploring alternative ways in which slaughter inspection might be accomplished in establishments that have already implemented HACCP systems and that exclusively slaughter certain market classes of animals. These market classes are young poultry, steers and heifers, and market hogs. In all cases, these are young, healthy animals that do not exhibit the same disease and public health concerns that may be present in older animals.

Question. What will the Consumer Safety Officer's role be in the farm-to-table food safety initiative, especially in food retail and the farm?

USDA answer. To carry out the farm to table food safety strategy FSIS needs to have a flexible, more highly educated workforce that can be assigned at any time, and to any industry operation, to perform inspection and determine regulatory compliance. FSIS has assessed the current deployment of the inspection workforce and determined that changes are needed to optimize inspection coverage while maintaining our continuous presence in plants. Through this assessment FSIS identified the need to establish a new Consumer Safety Officer position. The position of Consumer Safety Officer, currently under development, will be at a professional level in terms of educational requirements and responsibilities. FSIS has focused on introducing the Consumer Safety Officer occupation to conduct a broad range of regulatory activities, including:

—participating in special projects such as nationwide initiatives requiring application of professional qualifications, e.g., implementation of a significant new procedure;

—serving as a member of a team with other professionals in conducting assessments in plants with sensitive compliance issues where previous industry and/or FSIS personnel have been unsuccessful in identifying causes and developing effective corrective actions;

—visiting Custom Exempt establishments, evaluating them for compliance with applicable regulations;

—visiting warehouses in order to verify that they are keeping food safe; and

—fact-finding visits to State-inspected plants to obtain information for FSIS personnel responsible for assuring the "equal to" status of such plants.

To transition the workforce to the CSO position, FSIS plans to establish the Consumer Safety Inspector (CSI) position. FSIS plans to use CSI's for positions to be established in both the in-plant and in-distribution pilot test that are part of the HACCP-based Inspection Models Project. Consumer Safety Inspectors will be working at both in-plant and in-distribution sites.

Under the farm to table strategy FSIS will be using Consumer Safety Inspectors to carry out its regulatory responsibilities in verifying the safety and wholesomeness of meat and poultry products as they move from the plant to the consumer. Under the FSIS's pilot project for Consumer Safety Inspectors, the inspector will carry out the following in-distribution activities:

—Conduct scheduled as well as unscheduled reviews of a wide range of diverse commercial operations.

—Observe meat and poultry products in commerce and control those that are believed to be adulterated, misbranded, or otherwise in violation of the laws and regulations.

—Conduct recall effectiveness checks.

—Conduct sampling to verify compliance with FSIS requirements.

—Conduct follow-up inquiries on consumer complaints.

The following are examples of verification activities that consumer safety inspectors might perform at various commercial locations:

—At a warehouse, the consumer safety inspector would check inspected meat and poultry products to ensure that labeling meets all Federal requirements and that the products are not being held under conditions that may cause them to become adulterated. For example, the inspector would check to ensure that the products are not being contaminated by a leaky ceiling.

—At a rendering operation, the consumer safety inspector would ensure that product labeling meets Federal requirements for transporting and handling condemned and inedible products.

—At a retail location, the consumer safety inspector would ensure that any meat or poultry product that has been recalled is no longer being offered for sale and would ensure that retail operations are complying with retail exemptions from inspection.

—Ultimately, FSIS intends that CSO's will cover the full range of regulatory activities described for both the CSI and the CSO positions. The transition from Food Inspector to CSI to CSO is intended to accomplish the transformation of the inspection workforce in the most effective manner.

Question. What is the role of the Joint Institute for Food Safety Research? What authority does this body have to prioritize the research efforts of member agencies? Does this institute have its own staff? If so, how much and from what agency and what account does the Institute receive its funding?

USDA answer. The role of the Joint Institute for Food Safety Research, as defined in the Presidential directive of July 3, 1998, is "to develop a strategic plan for conducting food safety research activities consistent with the President's National Food

Safety Initiative and efficiently coordinate all Federal food safety research, including with the private sector and academia".

By agreement between the U.S. Department of Agriculture (USDA) and the Department of Health and Human Services (DHHS), the Institute would serve as a coordinating body to ensure that research needs of the regulatory agencies, the affected industries, and the general public are met in a coordinated and most cost effective manner.

The Institute, as described in an October 1, 1998 report to the President, and responded to in a public hearing on December 1, 1998, would have an Executive Director and a small staff. The Executive Director would report to an Executive Research Committee which in turn reports to the President's Council on Food Safety. An advisory committee consisting of 16 stakeholder members will report to the Executive Director. At the present time, the amount of the funding for support of the small Institute staff and operations has not been determined. It is proposed that staff and funding will be provided from the Food Safety Research Agencies of USDA and DHHS.

FDA answer. In 1998, the President instructed the Department of Health and Human Services and the Department of Agriculture to establish the Joint Institute for Food Safety Research or JIFSR to serve as a mechanism for coordinating the federal research related to food safety. The goals of the JIFSR are to optimize the current food safety research investment and infrastructure through coordination of planning, budget development, and prioritization, provide enhanced scientific support to food safety regulatory agencies in their efforts to protect public health, enhance communication among all Federal agencies with food safety research responsibility, and encourage the development of public and private partnerships with industry and academia to efficiently develop and transfer new food safety information and technologies.

JIFSR will be funded jointly through the two Departments. At this time, the details of the funding arrangements and the amounts, as well as the staffing, have not been worked out by the group tasked with developing a plan to fund and staff JIFSR.

Multi-agency task forces will be the foundation upon which the JIFSR will operate. Working through those entities, the Federal food safety research agencies will work with food safety and public health agencies to identify and prioritize research needs, minimize unplanned research redundancies, foster opportunities for multidisciplinary research programs, facilitate the transfer of research accomplishments, and promote strategic planning for future food safety research needs and initiatives. The establishment of the JIFSR will institutionalize and enhance the already considerable coordination among the Federal agencies.

The JIFSR will be a virtual office, with a purposefully limited full-time staff. The majority of the work of that staff will be to support the multi-agency task forces formed for limited durations to address specific assignments and needs. While the details of the staffing requirements will not be finalized until May 1999, it is anticipated that the full-time staff of the JIFSR will be limited to five to six individuals drawn from the member agencies. The exception is the Director of the JIFSR. This individual will be an internationally recognized food safety researcher recruited for this position. The specific mechanisms for funding the JIFSR are still being finalized, but will be based on an equitable sharing among the agencies conducting research.

Question. Please distinguish between the pesticide residue data programs operated by the Food and Drug Administration and USDA. Please also outline funding requirements as proposed in the President's budget for each of these programs.

USDA answer. USDA's Pesticide Data Program (PDP) and the Food and Drug Administration's (FDA) Regulatory Monitoring Program have different missions. PDP is a statistically-reliable program that provides pesticide residue data to evaluate population-based actual exposures. The data are used by the Environmental Protection Agency (EPA) to conduct realistic dietary risk assessments as required by the Food Quality Protection Act of 1996. PDP is used to support the export of U.S. commodities in the expanding global environment. FDA's Regulatory Monitoring Program is oriented towards enforcement of tolerances (maximum allowable pesticide residues in or on food crops) and is not statistically representative of the overall residue situation for a given crop, pesticide or region.

One program cannot accomplish both missions because of differences in sampling rationales and testing requirements. Sampling for enforcement programs over-represent suspected violators, and require rapid turn around time for sample analysis. Risk assessment programs take into account the general population and can take longer to analyze samples to verify extremely low-level results.

The following is a comparative analysis of both programs:

Sampling:

FDA generally uses targeted, non-random sampling of products oriented primarily towards the enforcement of tolerances. Under these conditions, sampling bias may be incurred because sample weighting is done to include factors such as commodity or place of origin with a history of violations. In addition, the total number of samples of a given commodity analyzed for a particular pesticide each year is often not sufficient to draw conclusions about pesticide residues in the whole volume of that commodity in commerce.

PDP uses statistically-reliable, unbiased random sampling procedures to provide objective comprehensive residue data to produce national estimates of pesticide residues. State population figures are used to assign the number of samples collected per month. This number is constant for each commodity if the commodity is available in the marketplace. In general, at least 600 samples of a commodity are obtained each year.

Sampling Locations:

FDA's monitoring program collects samples of domestic products close to the point of production and imported products are collected at the point of entry into U.S. commerce.

PDP collects samples as close to the consumer as possible at locations such as terminal markets and chain store distribution centers. Domestic and imported samples are collected based on availability in the marketplace. Probability of site selection is based on annual product volumes.

Commodities:

FDA's monitoring program covers a wide range of commodities and collects approximately equal numbers of domestic and imported products. Commodities tested by FDA include fruit and vegetables, grain and grain products, milk and dairy products, fish and shellfish, various nuts and spices, and miscellaneous processed products.

PDP focuses on high consumption items with emphasis on foods highly consumed by infants and children. Products collected by PDP include fresh and processed fruits and vegetables, selected grains, and milk.

Laboratory Methodology:

FDA primarily uses traditional, multi-residue methods with some single, selective methods capable of detecting residues at or below tolerance levels. No verification of residues is required unless a tolerance violation is suspected.

PDP uses refined multi-residue methods capable of detecting residue levels much lower than tolerances. These methods require additional steps to allow for detection of residues at trace levels, and verification of positive results is required. All data are supported by rigorous quality assurance and quality control procedures. PDP also conducts an extensive proficiency check sample program to determine consistency of results among the participating State and federal laboratories.

FDA answer. FDA's pesticide program entails regulatory monitoring designed to enforce the pesticide tolerances established by EPA. Domestic samples are collected as close as possible to the point of production in the distribution system; import samples are collected at the point of entry into U.S. commerce. FDA's pesticide program places considerable emphasis on imported products, where experience has shown more violations occur. In general, a very low violation rate has occurred over the years in both domestic and imported commodities. Although processed products are also included in sampling, the emphasis is on raw, agricultural products. Raw products are analyzed in the unwashed, whole, unpeeled, and raw state. This type of sampling provides FDA with a broad view of the entire food supply. In addition to monitoring pesticide levels in the food supply, work under the pesticide program includes research to develop analytical methods, enforcement activities, and cooperative efforts with foreign countries to decrease violation rates.

FDA also conducts its annual market basket survey, the Total Diet Study, or TDS, to estimate intakes in representative diets of 14 different age or sex groups. Because the study has been under way for over 30 years, trends can be discerned, such as the decrease in dietary levels of DDT and other banned pesticide residues. It also helps to identify potential public health issues that warrant changes in agricultural practices. FDA has also collected and analyzed a number of baby foods in addition to those already covered in the TDS. This TDS adjunct survey includes 23 different food items in each market basket survey.

USDA's Pesticide Data Program, or PDP, collects data on pesticide residues in foods. The data are used by EPA for its dietary risk assessment process and pesticide registration process. It includes a limited number of commodities each year

and monitors fewer pesticide residues at much lower levels than those included in the FDA's regulatory program. The samples are collected as close to the point of consumption as possible. Most samples tested are domestic. For example, approximately 86 percent of samples tested in 1997 were domestic.

The FQPA legislation authorizes an appropriation of $12 million for increased FDA monitoring of pesticide residues in foods for the period fiscal year 1997 through fiscal year 1999. However, no additional funds have been appropriated. FDA currently utilizes about 117 FTE at a cost of $8.6 million.

Question. This Administration and some of my colleagues have advocated giving the Federal Government mandatory recall authority. What powers does the Federal government now have to recall food products?

USDA answer. FSIS does not have mandatory recall authority. The recall system coordinated by FSIS is voluntary on the part of the recalling firm. The voluntary nature of the recall gives the recalling firm some discretion as to the exact timing of the recall which could compromise the effectiveness of the recall action. FSIS may detain or seize adulterated or misbranded product that is in commerce with the cooperation of the U.S. attorney's office and the Federal Courts. If a firm refuses to recall adulterated or misbranded product after asked to do so by FSIS, the Agency may act unilaterally to protect the public health by withdrawing inspection, which would shut down the firm's operation.

FDA answer. The only food for which the Agency has explicit statutory recall authority is infant formula. Under this authority, FDA can request an infant formula recall only in situations that pose a hazard to health.

FDA does not have explicit statutory authority to order the recall of other food products. However, the Agency promulgated regulations for voluntary recalls in June 1978. Among other things, these regulations provide criteria for the health hazard evaluation, the recall classification, the need for public warning, and the effectiveness of the recall. At the present time, when a firm is not willing to voluntarily recall a hazardous product, FDA's alternative is to issue a press release and pursue a court injunction to require the firm to recall and to stop the violative practice.

FDA has no statutory recall authority for veterinary or animal drugs or feeds. However, we can and do request that firms conduct recalls of products that are in violation of the FD&C Act. We also have the authority to take enforcement action, or seizure, if no recall action is taken.

It is my understanding that DNA testing has been increasingly used to link outbreaks in foodborne pathogens.

Question. The Detroit Free Press reports that USDA chose not to actively publicize its most serious recalls 39 percent of the time. How does FSIS decide which food recalls are to be publicized?

USDA answer. FSIS does provide public notification of all recalls by posting a recall notification report (RNR) on its website for all recalls it coordinates. The report provides specific information regarding the recalled products such as, recalling firm, reason for recall, identifying product codes, company contacts, geographic distribution, quantity recalled, and classification. The main purpose of the RNR is to alert State and local public health officials and other responsible parties working in the public health area about product that may be hazardous to health.

FSIS does not issue press releases in all cases. The purpose of Agency recall press releases is to quickly alert the public about product that may present a serious health hazard that they may have in their possession and can identify. Through this tool, the public is alerted to the potential problem and advised to return the product to the point of purchase.

In general, FSIS issues press releases for all Class I Recalls dealing with products that may be in the hands of the consuming public. A Class I Recall may involve only product that is packaged and marketed for food service. In these cases, FSIS would not normally issue press releases since the product is not in the public's possession, nor is it readily identifiable by the public. In fact, issuing press releases in many of these cases may be counter-productive by causing confusion among consumers. FSIS does conduct recall effectiveness checks to verify that the recalling firms, and any subsequent distributors, contact any potential holders of the recalled product with instructions to immediately stop serving it and to dispose of it appropriately. FSIS is currently considering whether it should modify its policy on when it will issue a press release.

Question. An increase of $1 million is requested for FSIS civil rights training and programs. Please explain in more detail how this funding would be spent.

USDA answer. Of the $1 million requested, $500 thousand is for conducting civil rights training that is mandated by USDA for all employees in the areas of disability awareness, sexual harassment, and complaint processing procedures. Train-

ing the inspection workforce, which is dispersed across the nation, necessarily involves travel costs and overtime pay for other inspectors to cover trainees' inspection assignments. These costs exceed the direct cost of training and require additional resources to ensure that mandated training is delivered.

The remaining $500 thousand will be used by FSIS to improve its own civil rights program delivery by addressing the unique environment and needs of the FSIS workforce. FSIS, using this additional funding, plans to fully implement the Alternative Dispute Resolution (ADR) Program, which will provide a process for solving problems at an informal level rather than letting them escalate to the stage where a costly investigation is required. These funds will also be used for improving the civil rights program through training for FSIS managers that is geared to the inspection work setting and its inherent stresses.

Question. Statistics show that the percentage of Salmonella present in broilers, swine, ground beef, and ground turkey is lower since the implementation of HACCP. What does FSIS attribute to this success?

USDA answer. As FSIS has consistently maintained, these are limited data, and care should be taken in interpreting these statistics. The completed sample sets are from the large establishments, and although they produce the significant majority of product, they are fewer in number than either the small or very small category of establishments and their experience may not be typical of the set of all establishments. Furthermore, the data analyzed to date reflect accomplishments during the first year of HACCP implementation and therefore, may not be representative of long run performance.

Nevertheless, FSIS believes these data indicate that the regulatory approach embodied in the PR/HACCP final rule is effective. FSIS believes that HACCP provides incentives for establishments to take frontline responsibility for the production of safe and wholesome meat and poultry products. Establishments which take that responsibility seriously and implement HACCP successfully appear to have the capacity to significantly improve the microbial characteristics of the raw products they produce.

Question. Twenty-six State inspection programs for meat and poultry are overseen and supported by FSIS. These cooperative programs permit States to inspect product for distribution within their own boundaries. Should a State elect to not participate in this program, does FSIS fully fund the inspection for that State? If yes, what is the cost to FSIS for each State not in the program?

USDA answer. FSIS fully funds the cost of mandatory federal inspection in States that do not operate cooperative programs. For the record, the following table displays the estimated cost by State of the federal inspection program for fiscal years 1998 through 2000 under the FSIS appropriation, excluding federal matching funds to those States operating cooperative inspection programs.

[The information follows:]

COST OF THE FEDERAL INSPECTION PROGRAM BY STATE

[Dollars in thousands]

	Fiscal year 1998	Fiscal year 1999	Fiscal year 2000
ALABAMA [1]	$21,661	$22,808	$24,167

[1] Identifies those 26 States with a State Meat and Poultry Inspection Program.

Question. What motivates a State to participate in the cooperative program?

USDA answer. States have the potential to provide the optimum response to the unique needs of their local small or very small packers while also responding responsibly to the public health needs of their citizens. State programs may have the potential to provide the most responsive "user friendly" technical guidance as well as regulatory control to very small packers. These local small businesses often lack the technical know-how of larger packers which have experts on staff to address such issues. The cooperative program is a means to support small business in addition to protecting consumers. States may also have pride in maintaining their own programs. When these factors fit in place, sufficient support may exist to fund such a program.

Question. The production of animals on the farm is a quality control issue that is being addressed by the Animal Production Food Safety Staff in FSIS. Please ex-

plain what this staff is doing to encourage the implementation of this quality control program.

USDA answer. The Animal Production Food Safety Staff (APFSS) works with farm and consumer groups, the agri-business industry, state authorities and other USDA agencies to promote the voluntary adoption of producer practices that will result in safer animals. APFSS helps ensure that research is being conducted to identify practices which reduce or prevent human pathogens and residues in or on animals and eggs submitted for processing. The APPSS staff also conducts risk management outreach activities by focusing on the practical application of hazard prevention practices from farm to slaughter.

The Animal Production Food Safety Staff is FSIS's liaison with the animal production community. At the state and local levels, the Animal Production Food Safety Staff works with the 50 State Departments of Agriculture and State Public Health Departments; academia; practicing veterinarians; professional and industry associations and consumer groups. The objective is to reach the one million food animal producers, the thousands of livestock markets, and satellite industries to educate them on the impact of in-plant HACCP systems on animal production practices and the importance of quality assurance practices. The quality assurance standards adopted by industry will provide HACCP plants with information necessary to assess the risks presented by animals submitted to slaughterhouses.

To encourage the adoption of HACCP-compatible quality assurance practices, the Animal Production Food Safety Staff provides funds to State animal and public health agencies to develop animal production food safety local partnerships. Currently 11 states have food safety partnership groups addressing how they can best educate producers on quality assurance practices and HACCP concepts. These states are Colorado, Louisiana, Michigan, Nebraska, New York, Ohio, Oregon, South Dakota, Texas, Vermont, and Wisconsin. The Animal Production Food Safety Staff also is overseeing demonstration projects evaluating pathogen risk reduction practices for non-fed beef (culled dairy beef), pork, lamb and broiler commodities and is working closely with Tuskegee University (Alabama) to determine the educational needs of small and disadvantaged producers.

Question. Are plants that are operating under HACCP advocating changes in the marketing of animals? If yes, which livestock industries are being targeted by these plants?

USDA answer. According to the Final Rule, meat and poultry plants must consider hazards reasonably likely to occur before, during and after entry into official establishments. With regard to plants that are operating under HACCP, some are requiring producers to be educated on certain quality assurance practices. Some producers of branded products also inspect their suppliers for appropriate records for animal drug use and other certified practices assuring the quality of their animals. While FSIS does not have specific knowledge of plant purchasing activities, we are aware that large pork processing facilities are requiring that their suppliers be certified on the Pork Quality Assurance Program, Level III, an educational program in the production of safe /quality animals. At this stage in the development of HACCP, however, this is an exception. In a related matter, we are aware that some plants are having producers sign letters of guarantee regarding the residue safety of the animals supplied.

Question. What role does FSIS play in the National Antimicrobial Resistance Monitoring System (NARMS)? How much does the fiscal year 2000 budget request contain for this?

USDA answer. FSIS believes that slaughter origin Salmonella isolates are critical to assessing the extent of human exposure to antibiotic resistant bacteria in foods of animal origin. Under HACCP, FSIS conducts Salmonella testing of raw products in order to monitor plant compliance with pathogen reduction standards. These results are reported as positive or negative for Salmonella. Other Agency activities, such as participation in PulseNet make additional use of Salmonella isolates. These additional uses require that the Salmonella isolates be serotyped. FSIS pays for a percentage of its total Salmonella isolates to be serotyped at the USDA, Animal and Plant Health Inspection Service, National Veterinary Services Laboratory (NVSL), in Ames, Iowa. For fiscal year 2000, the Agency estimates $100,000 will be required for this and related testing at NVSL.

To support NARMS, FSIS forwards these serotyped Salmonella isolates from each of our field laboratories to the USDA-ARS research laboratory in Athens, Georgia, that conducts the antimicrobial resistance testing for the veterinary portion of the NARMS program. Beginning in fiscal year 1999, FSIS began a baseline sampling program for Campylobacter in broilers. The FDA's Center for Veterinary Medicine requested, and FSIS agreed, to forward those isolates to the same USDA-ARS research laboratory in Athens, Georgia. Agency databases contain the most complete

information about the establishment and product source of these serotyped isolates. Accordingly, the Agency provides NARMS with technical support in order to correctly interpret the slaughter origin Salmonella and Campylobacter data.

Question. In January, the inspector's union met with Congressional staff and argued that the old system needed to be maintained in its entirety in conjunction with HACCP. This is at complete odds with the commitments the Secretary of Agriculture, and FSIS have made to Congress. How are you working with the union to resolve this dispute, and do you anticipate the union's position will slow FSIS' timetable or force a policy change?

USDA answer. In the early 1990's, FSIS' thinking about HACCP and its relationship to the existing inspection system was quite different than it is today. FSIS believed that HACCP could be implemented as a supplement, not a replacement, to the existing inspection system. HACCP was viewed as a mandatory industry process control system intended as an enhancement to the current inspection system. In fact, the Agency signed a memorandum of understanding with the union that confirmed the thinking of that time.

[The information follows:]

MEMORANDUM OF UNDERSTANDING

In an effort to improve relations and communications with respect to the HACCP initiative, the National Joint Council (NJC) and Food Safety and Insection Service management are committed to the following:

(1) HACCP is viewed as a mandator industry process control system, not as a system of inspection.

(2) The implementation of HACCP is intended to be an enhancement to the current inspection system and not a substitute for inspection.

(3) FSIS plans to make HACCP mandatory so that the industry can improve food safety, not to reduce the number of inspectors.

(4) FSIS will support any unit employee when their action causes a reduction in plant production due to HACCP non-compliance if the action is in accordance with established regulations, directives and guidance.

(5) To the extent that disagreements arise between the parties concerning any aspect of the HACCP initiative, the undersigned will first use internal mechanisms to address their concerns. If those mechanisms fail, then the parties are free to use alternative methods.

(6) The parties recognize that circumstances, both those that currently exist and those unforeseen, may impact on the commitments made above. The parties, therefore, recognize the importance of maintaining continued communication concerning HACCP so that changes in circumstances can be dealt with in the spirit of a good faith labor management relationship.

Subsequent development of the HACCP regulatory framework and the public process through which the Pathogen Reduction and HACCP (PR/HACCP) final rule was developed led to a different conclusion. That is, that the HACCP system must be implemented in a way that would focus industry efforts on production of safe products and that would focus FSIS regulatory efforts on verifying the effectiveness of the industry's HACCP system. Through the public process, it became clear that the implementation of HACCP needed to do more than supplement the existing inspection system. It must also result in no layering of additional regulatory requirements on top of existing regulations. FSIS' regulatory reform efforts over the past few years since promulgation of the PR/HACCP final rule have focused on eliminating such layering.

The next steps in that process are to determine whether the existing inspection system can be further modernized based on the existence of industry HACCP systems. In particular, this means determining whether traditional slaughter inspection procedures for certain market classes of animals can be modernized by industry assumption of principal responsibility for food safety concerns at slaughter. The HACCP-based inspection models project is focused in part on this question.

The Agency has engaged in an open, public process for the development of alternative methods of conducting regulatory activities in certain types of slaughter plants. Federal register notices have been issued periodically to share Agency thinking and three public meetings have been held to date. A new design for inspection work has been developed and was the subject of extensive negotiations with the union January 5–14 and February 23–25, 1999. The parties were assisted by a mediator from the Federal Mediation and Conciliation Service at the latter session. Following mediation the parties jointly submitted the outstanding issues to the Federal Service Impasses Panel for resolution.

The existence of litigation has not affected FSIS' resolve to seek alternative inspection methods that work more effectively in the HACCP-based production environments of regulated plants. While litigation is pending, the Agency is continuing work on developing new inspection systems. As progress is made, consultations and negotiations with the union are conducted. It is anticipated that the continuing dialogue between the Agency and the union throughout all appropriate venues will facilitate resolution of differences and permit the introduction of new food safety strategies in a timely manner.

Question. FSIS has initiated HACCP pilot programs in several meat and poultry plants to see if new inspection strategies could help in the fight against foodborne pathogens. We understand the inspector's union is suing the agency over the pilots and that the pilot program thus cannot move forward. Has FSIS' commitment to the pilots wavered, and how does FSIS propose to resolve the problem so we can begin taking advantage of these new food safety strategies?

USDA answer. No, the Agency's commitment to the pilots has not wavered and it anticipates resolution of the outstanding issues with the inspectors' union through the Federal Service Impasses Panel. Dialogue between the FSIS and the union continues throughout all appropriate channels, which will facilitate the resolution of differences and permit the timely introduction of new food safety strategies.

Question. Regardless of this impasse, many pilot plants still are seeking to implement new technologies in fighting pathogens. We understand FSIS is requiring testing protocols before these new technologies can be implemented. This flies in the face of FSIS' commitment last year to Congress to fast-track technological innovations that reduce pathogens. Why does FSIS need to approve protocols for the pilot plants when it already has conducted baseline microbial testing and can determine by the results of subsequent pathogen testing whether the new technology is yielding beneficial results?

USDA answer. Before implementation of the Pathogen Reduction; HACCP final rule (PR/HACCP), FSIS approval of protocols for in-plant trials of new technologies was required. Under PR/HACCP, FSIS approval is no longer required and a plant generally is free to innovate and experiment without FSIS prior approval. If requested, FSIS will provide technical advice and conduct a review of protocols for in-plant trials of new technologies.

Under the PR/HACCP final rule, the Food Safety and Inspection Service's strategy to improve food safety encourages the use of innovative technologies to reduce or eliminate pathogens from food. In fact, this strategy calls for FSIS to establish food safety standards that provide incentives for the food manufacturing and allied industries to develop and implement innovations that lead to improved food safety. The design of an experiment to test an innovation in-plant is the plant's decisions. If a plant decides to conduct an in-plant trial, it must accept responsibility for its workers, its products, and for providing the information necessary for FSIS to examine the impact on inspection procedures and inspector safety. The plant also is responsible for ensuring that it conducts the in-plant trial in accordance with any applicable regulatory requirements (e.g., OSHA, FDA, EPA, requirements). The Agency's role under PR/HACCP is to provide regulatory oversight, not approval, of the in-plant trial or the innovation. The main purpose of such oversight is to verify that the trial or introduction of a new technology will not interfere with FSIS inspection personnel's ability to verify that the food is safe or compromise the safety of FSIS inspection personnel. This is accomplished through the review and clearance of protocols for in-plant trials when there is reasonable expectation that inspection procedures will be affected or the safety of FSIS inspection personnel is in question.

The only other circumstance in which FSIS has required testing of a new technology is if implementation of the technology will require a change in FSIS' regulations, for example, use of trisodium phosphate for on-line reprocessing has required testing. This testing is necessary to provide a basis for a change in FSIS' regulations, which do not permit on-line reprocessing of poultry.

Question. You recently told the House Agriculture Appropriations Subcommittee that some meat and poultry plants are resisting the effort to remove unnecessary layers of the old inspection system. Could you please provide the committee with more complete detail about the types of plants that are resisting de-layering and a list of specific regulations that plants have told the agency they want to retain?

USDA answer. A number of establishments have strongly opposed FSIS regulatory reform efforts regarding certain regulations. The elimination of prior approval for proprietary substances and nonfood compounds included within the proposed rule on "Sanitation Requirements for Official Meat and Poultry Establishments" (62 FR 45045); the conversion of the historically prescriptive thermal processing (canning) requirements into performance standards (9 CFR 318.300 and 381.300); and the elimination of prior approval for equipment included within the final rule on

"Eliminating of Prior Approval Requirements for Establishment Drawings and Specifications, Equipment, and Certain Partial Quality Control Programs" (62 FR 45016) are among those reforms opposed by certain segments of the industry.

Question. We have heard concerns about FSIS conducting inspections in warehouses and at the retail level. Obviously, no one wants to see duplication of state and local efforts, but you seem to feel FSIS has an appropriate role to play in such inspections. Please describe for us the role you envision for federal inspectors and the ways you think it could enhance the safety of the food supply?

USDA answer. The In-Distribution portion of the HACCP-Based Inspection Models Project is designed to redeploy some inspectors currently assigned within plants to verify the safety and wholesomeness of meat and poultry products as they move to consumers. FSIS envisions one fully integrated program that will permit movement of personnel between in-plant and in-distribution sites, consistent with farm-to-table food safety goals. Thus, the in-plant and in-distribution models are being developed concurrently and are both essential components of the HACCP-Based Inspection Models Project.

FSIS' goal is to reduce the risk of foodborne illness associated with the consumption of meat and poultry products to the extent possible. To achieve this goal, FSIS is carrying out a farm-to-table strategy that recognizes the need to take steps at each segment of the farm-to-table chain to improve food safety. The need to adopt a farm-to-table strategy was articulated in the Agency's February 3, 1995, proposed rule on Pathogen Reduction and Hazard Analysis and Critical Control Point (HACCP) Systems. In that document, FSIS stated that as a major element of its food safety regulatory strategy:

> "FSIS must approach its food safety mission broadly, and address potential hazards that arise throughout the food production and delivery system, including before animals enter FSIS-inspected facilities and after meat and poultry products leave those establishments."

A significant problem with the current inspection system is that it does not fully permit FSIS to allocate resources according to public health risk. Thus, where gaps in public health protection are identified, the Agency may not be able to respond. For example, there are indications that risks to consumers associated with inspected products often stem from hazards associated with the handling of products during transportation, storage, or retail sale (commonly referred to as "in-distribution."). It is important that FSIS have the ability to focus its resources as appropriate to address the risks identified. This flexibility will enhance the overall safety of the food supply by addressing hazards that occur after product leaves the plant on the way to consumers.

Question. It is my understanding that DNA testing has been increasingly used to link outbreaks in foodborne pathogens.

(1) Can DNA fingerprinting alone definitively link a food product to a human illness"?

USDA answer. FSIS uses pulsed-field gel electrophoresis (PFGE) for "genetic fingerprinting" of E. coli O157:H7, Salmonella spp. and Listeria monocytogenes. This technique is highly discriminative and reliable compared to other molecular subtyping methods used for foodborne pathogens. FSIS laboratories employ methodology that has been approved and standardized by the Centers for Disease Control and Prevention (CDC). The CDC standardized methodology is used not only by FSIS laboratories, but CDC and participating State public health department laboratories as well.

FSIS actively shares PFGE data with CDC and participates in PulseNet, a network of federal and State health department laboratories dedicated to the early detection of incipient outbreaks. This collective effort has already proven invaluable for protecting the public health. Laboratory intercommunication of PFGE data played a vital role in implicating ground beef produced by Hudson Foods for a cluster of foodborne illness cases in Colorado and other states in the summer of 1997.

(2) Is the Department willing to share pathogenic isolets with the food processing industry?

Answer. It is FSIS policy not to share evidentiary cultures. Cultures that are potentially associated with samples pending regulatory and/or legal action are considered evidentiary.

FDA answer. No. DNA "fingerprinting" has greatly facilitated rapid recognition of foodborne disease outbreaks and identification of the sources of outbreak by permitting comparison of bacteria isolated from humans and from suspected food using standardized equipment and methods. However, DNA "fingerprinting" results must be considered along with epidemiologic investigation data in making links between

a food source and human illness. In the absence of epidemiologic data, DNA "fingerprinting" alone cannot definitively link a food product to human illness.

Bacteria are "fingerprinted" by their unique DNA composition through a method known as pulsed-field gel electrophoresis (PFGE). DNA is extracted from the bacteria and treated with an enzyme that cuts the DNA at specific places called restriction sites. The location of these restriction sites is unique to each strain of bacteria. The resulting pieces of DNA are then separated in an electrical field, resulting in a "DNA fingerprint" resembling a bar code.

FDA answer. Yes. Once an outbreak investigation is completed and a final report has been issued, CDC shares outbreak-associated isolates with the company whose product was involved or with an appropriate industry trade association. CDC requires the company or the trade association to submit an official written request for the isolate(s) and certify that it has access to laboratory resources for appropriate handling of pathogenic bacteria under recommended biosafety guidelines. FDA shares resistant strains with whomever requests them.

Question. It is my understanding that there have been several errors made by FSIS in relation to its testing program and recalls. For example, there was a recall that may have actually been a mistake since the laboratory in Florida could not "find" the E. coli O157:H7 after the laboratory said it was in the meat; in another case, FSIS issued a press release listing the wrong products, telling consumers to return to their grocery stores products that were not even contaminated. What are your plans for addressing these problems?

USDA answer. In the Florida case mentioned, FSIS requested the firm voluntarily recall about 359,000 pounds of its ground beef based on the following factors: 1) official notice from the Florida State Department of Agriculture and Consumer Services that an intact sample of ground beef produced at an FSIS inspected plant confirmed positive for Escherichia coli O157:H7; 2) the Agency's review of the laboratory methods used by the State; and 3) the fact that E. coli O157:H7 is a dangerous pathogen.

The Florida food laboratory made subcultures from the original culture and sent them to the Florida health laboratory and the FSIS Special Projects and Outbreaks Laboratory. In the course of examining the isolates, the FSIS lab did not detect E. coli O157:H7 in the subcultures, which are samples of the samples. However, failure by other labs to reconfirm original results does not invalidate the original confirmed results. Based upon our review of the Florida Laboratories method, there is no reason to doubt the accuracy and reliability of the original testing procedures that confirmed the pathogen in a product sample.

Although not common, it is possible to "lose" E. coli O157:H7 during the transfer from original culture to subculture. One possible explanation is that the original culture contained other organisms that outgrew (out-competed) E. coli O157:H7. Because the original culture is not available to retest, it is impossible to determine that this occurred. However, even if faulty transfer had occurred, this finding would not invalidate the original confirmation.

To address the concerns raised by your question, FSIS has instituted a policy of not formally requesting recalls by firms based solely on laboratory results from other than FSIS laboratories.

In cases when third party laboratories report positive pathogen findings to us, FSIS makes a diligent effort to collect samples of the same "lots" of product tested by the reporting laboratory and acts on the results of its official samples. In the question you raise about a press release that may have listed products incorrectly, the Agency is not aware of the specific case referred to. FSIS relies on product and coding information provided by the recalling establishments. As you are aware, FSIS is also engaged in a public process of reviewing its general recall policies and practices. The Agency is currently evaluating comments on its proposals from all stakeholders. When the analysis is completed, policy decisions will be considered by the Department.

Question. As you are well aware, the General Accounting Office, the National Academy of Sciences, and others have concluded that the nation's food safety system is "bureaucratically fragmented", being implemented by over 12 agencies and overseen by 28 different congressional committees, and should be reorganized under a single food safety authority. Do you agree?

USDA answer. Recently, the President's Council on Food Safety reviewed and responded to the National Academy of Sciences Report (NAS). Although the NAS report indicates that many of the NAS committee members believe that a single, unified agency headed by a single administrator is the most viable structure for implementing the "single" voice concept, the Council response recognizes that there may be many other models that would be workable.

The Council agreed with the goal of the NAS recommendation—that there should be a fully integrated food safety system in the U.S. The food safety agencies are

committed to this goal, and the President's Council is confident that its comprehensive strategic plan will be a major step toward creating a seamless food safety system. To ensure that the strategic plan achieves this goal, the Council will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning and resource allocation.

While the Council recognized that certain models of reorganization may improve coordination and allow for better allocation of resources, any reorganization of food safety activities must consider the non-food-safety-related responsibilities of each agency and how these relate to the food safety responsibilities. Reorganization must not be done at the expense of these other responsibilities and activities. The Council is concerned that if not done carefully, separating food safety from non-food safety activities in each agency could act to weaken consumer and environmental protection overall.

FDA answer. We are aware of the numerous reports over the years that have recommended a single food agency or recommended that all food safety activities are located together or in one or another existing agency. The NAS report recommended a new statute that would establish a unified framework for food safety programs with a single official with control over all federal food safety resources. The report went on to acknowledge that there may be several organizational approaches to achieving the goal of a single voice for federal food safety activities, with a single agency being only one possibility. The President's Council on Food Safety, of which DHHS is a co-chair, responded to the NAS report, by voicing the commitment of the food safety agencies to achieving a fully integrated food safety system in the U.S. In formulating a strategic plan to achieve this goal, the Council will evaluate various models of reorganization that may improve coordination of food safety activities to be more effective and efficient. The Council, echoing concerns expressed in the NAS report, pointed out that reorganizations must avoid interfering with the public health framework established to identify and respond to infectious and non-infectious public health threats whether they are foodborne or not, since many of the major foodborne pathogens also produce non-foodborne disease. FDA is committed to working within the structure of the Council on Food Safety to develop a more coordinated, effective and efficient U.S. food safety system.

Question. Dr. Woteki, you indicate in your prepared statement that the Administration has been actively engaged in organizational and program changes to improve coordination and eliminate conflicts, enhance coordination of responses to public health issues and emergencies, and coordinate research planning and prioritization.

What conflicts and areas for improved coordination have been identified? What organizational and program changes have been made by the Administration to address these?

USDA answer. Much has been said about the need for organizational and structural change in the intergovernmental system as well as the need for more coordination within an improved food safety system. The Administration has been actively engaged in organizational and program changes to eliminate conflicts, enhance coordination of responses to public health issues and emergencies, and coordinate research planning and prioritization.

In 1994, the Congress and Administration cooperated in enacting a major reorganization of food safety within USDA, creating the new mission area and Office of the Under Secretary for Food Safety, which oversees the Food Safety and Inspection Service (FSIS) and the U.S. Manager of Codex Alimentarius. Under that legislation, a mission area dedicated to public health was created within USDA, and the legislation mandated that this office be occupied by an individual with a proven background in public health and safety.

The Food Safety and Inspection Service (FSIS), the USDA regulatory agency under the Under Secretary for Food Safety that is responsible for the safety of meat, poultry, and egg products, also underwent a major reorganization. Among its most significant features were the establishment of a more efficient field organizational structure and the establishment of a new Office of Public Health and Science to provide scientific focus, leadership, and expertise to address the most important public health risks related to meat, poultry, and egg products.

Research is also a key component of the President's Food Safety Initiative. There have been a number of actions taken by the Administration and the Department in the past few years that have provided an expanded role for coordinating research in the U.S. food safety system.

The 1994 reorganization of USDA centralized research activities in the newly created mission area and the Office of the Under Secretary for Research, Education and Economics (REE). Food safety research is largely funded through two USDA agencies—the Agricultural Research Service (ARS) and the Cooperative State Re-

search, Education and Extension Service (CSREES). Together in fiscal year 1998 these agencies conducted and funded in excess of $56 million in food safety research. The centralized research focus enables the Department to better leverage existing funds.

The REE research activities, both intramural and extramural, are intended to meet the need of the regulatory agencies to achieve improved food safety via HACCP implementation and other initiatives. To that end, ARS, the intramural research arm of USDA, and FSIS have yearly food safety and research budget and planning sessions. These sessions provide one mechanism to ensure that proposed research initiatives address the specific priorities of FSIS. In addition, FSIS consults closely with other USDA agencies to ensure that its critical research and information needs are being met.

CSREES supports food safety research via several funding mechanisms that include formula funds, National Research Initiative competitive grants, special research grants awarded by a competitive process and special site-specific grants that are appropriated by Congress. The priorities for competitive grants are based on stakeholder input, including government agencies in support of their public health mission.

The Administration has also been actively engaged in other coordinated research planning and prioritization. In 1998, an Interagency Working Group (IWG) on Food Safety Research was created. The IWG, co-chaired by USDA and the Department of Health and Human Services (HHS), is charged with developing a government-wide coordinated strategy for food safety research, including the identification of information gaps and priorities for future research. The IWG provides a forum for coordination, collaboration, and communication in setting and reviewing the Federal research agenda.

In July 1998, the President directed the Secretary of Agriculture and Secretary of Health and Human Services to develop a Joint Institute on Food Safety Research (JIFSR). The JIFSR concept provides a mechanism for coordinated planning of food safety research among the various parts of government and the private sector, as well as fostering effective translation of research results into practice. The JIFSR, operationally located in REE at USDA, expects to optimize food safety research investments, channel Federal resources to research that is needed to minimize the impact of current and emerging food safety problems, and avoid research redundancies. The JIFSR is currently being developed jointly by USDA, HHS, and Office of Science and Technology Policy. The program is expected to be fully developed by late 1999. FSIS and FDA are in the process of implementing a Memorandum of Understanding (MOU) to facilitate appropriate sharing of information among senior agency field personnel regarding safe food production in these plants. FSIS has a trained inspection force in every Federally inspected meat and poultry slaughter and processing plant in the United States. In some cases, products are being processed in the same plants that fall under the jurisdiction of FDA because they are food products that do not contain meat or poultry.

USDA is also working more closely with its counterparts at the Federal, State, and local level to encourage national uniformity in food safety standards through support and endorsement of the Food Code. Because world trade in agricultural commodities continues to grow, USDA is working through the Codex Alimentarius Commission to encourage international uniformity in food safety standards. Responsibility for oversight of the U.S. manager of Codex is in the Office of Food Safety.

There are several other areas that are contributing to enhanced coordination of public health issues and emergencies that are worthy of note including voluntary quality control programs, surveillance, outbreak response, and education.

Voluntary Quality Control Programs.

The Animal Production Food Safety Staff in FSIS is an excellent example of developing partnership with states to encourage the voluntary implementation of quality control programs at the animal production level. The education of small producers is of particular concern as we move forward with HACCP implementation in small plants.

Surveillance

In July 1995, USDA began a collaborative project with HHS, through its Centers for Disease Control and Prevention (CDC) and Food and Drug Administration (FDA), to collect more precise information on the incidence of foodborne disease in the United States. The FoodNet Surveillance Network has been expanded under the President's Food Safety Initiative, and it is providing valuable information on trends in foodborne illness and on the association between cases of illness and the types of foods consumed.

USDA also conducts farm-level surveillance through the Animal and Plant Health Inspection Service (APHIS). APHIS has a field force of veterinarians who work cooperatively at the state and local level to ensure the health of poultry and livestock populations. APHIS' National Animal Health Monitoring System has conducted nine science-based studies addressing information gaps in the areas of animal health, welfare, and production; product wholesomeness; and the environment in the cattle, swine, and layer industries.

The National Antibiotic Resistance Monitoring System was established in 1996 as an interagency cooperative activity to monitor emerging resistance in foodborne pathogens, beginning with Salmonella. The effort is coordinated and directed through HHS by the Food and Drug Administration's Center for Veterinary Medicine (CVM) and includes CDC and three USDA agencies, ARS, APHIS, and FSIS. Both APHIS and FSIS play an integral role in system design and the acquisition of isolates.

Outbreak Response

In 1998, the Foodborne Outbreak Response Coordinating Group (FORC G), a partnership of Federal and State agencies, was established to better respond to foodborne illness outbreaks. The role of this interagency group, co-chaired by the Under Secretary for Food Safety and the Assistant Secretary for Health, is to coordinate and develop procedures for managing outbreaks, share information on potential sources of outbreaks and pathogens, and coordinate interdepartmental action on those issues when necessary.

Within USDA, the Secretary asked the Under Secretary for Food Safety to form and chair an internal Food Emergency Rapid Response and Evaluation Team (FERRET), designed to enable USDA to be prepared to respond to such emergencies as outbreaks involving foods purchased by USDA feeding programs, and formulate plans across mission areas to diminish those possibilities in the future.

PulseNet, the national database of molecular fingerprints of pathogens, developed through partnerships involving CDC, FSIS, FDA, and State governments, allows a comparison of strains of bacteria to determine whether or not there is a single source for outbreaks or sporadic cases.

Education

Improving research, inspection, and surveillance alone will not ensure safe food. Education and training for all those involved in producing, processing, and distributing food are essential to the goal of providing the public with safe food products.

The President's Food Safety Initiative has spurred new consumer education programs within USDA as well as expanded cooperative ventures with public and private partners, including other Federal agencies. One example is the "Fight BAC!" campaign sponsored by the Partnership for Food Safety Education, a public-private partnership, with participation of both USDA and HHS. In addition, USDA is working through organizations such as the Association of Food and Drug Officials (AFDO) to provide education to those who handle food at the retail level and is carrying out extensive HACCP education for its own and State employees involved in inspection.

USDA is also working with industry to develop science-based food safety assurance programs for fresh-cut fruit and vegetable processing facilities. USDA is basing its safe food handling education on science. Epidemiology information from FoodNet and other sources is helping to identify types of foods associated with illness, behaviors that can contribute to disease, and populations who are more vulnerable. In addition, USDA is increasingly using risk assessments and research data to develop accurate and high-priority consumer messages. An example is an ARS/FSIS study on the premature browning of ground beef, which led to a nationwide education campaign to promote the use of food thermometers when cooking hamburger.

CSREES administers a food safety education program, called the National Food Safety and Quality Initiative, in partnership with land-grant institutions across the United States. This program supports food safety education initiatives at all land-grant institutions as well as specific education initiatives that reach animal and food handlers along the entire farm-to-table chain. In addition, science-based programs in HACCP training for the meat and poultry industry are funded by CSREES through Fund for Rural America grants and special research grants. The scope and focus of these educational programs are developed in consultation with stakeholders, including other Federal agencies involved in food safety education.

Question. When will the Administration's report on the proposal to consolidate the rules and agencies dealing with food safety be complete?

USDA answer. The President's Council on Food Safety has completed its review of the National Academy of Sciences report "Ensuring Safe Food from Production

to Consumption." The Council submitted a response to the President in March and the report is provided for the record.

[The information follows:]

PRESIDENT'S COUNCIL ON FOOD SAFETY ASSESSMENT OF THE NAS REPORT: ENSURING SAFE FOOD FROM PRODUCTION TO CONSUMPTION

Executive Summary

At the request of Congress, the National Academy of Sciences (NAS) conducted a study of the current food safety system to: (1) determine the scientific basis of an effective food safety system; (2) assess the effectiveness of the current system; (3) identify scientific and organizational needs and gaps at the federal level; and (4) provide recommendations on scientific and organizational changes needed to ensure an effective food safety system. To conduct this study, the NAS established a committee and obtained input from federal agencies and other stakeholders of the federal food safety system. The NAS issued its report on August 20, 1998.

On August 25, 1998, through Executive Order 13100, the President established the Council on Food Safety and charged it to develop a comprehensive strategic plan for federal food safety activities and to make recommendations to the President on how to implement the plan. Also on August 25, 1998, the President directed the Council to provide him with an assessment of the NAS report in 180 days. Specifically, the President directed:

> ". . . the Council to review and respond to this report as one of its first orders of business. After providing opportunity for public comment, including public meetings, the Council shall report back to me within 180 days with its views on the NAS's recommendations. In developing its report, the Council should take into account the comprehensive strategic federal food safety plan that it will be developing."

In response to the President's directive, the Council established a task force consisting of representatives from the following departments and agencies: Departments of Agriculture (USDA), Health and Human Services (HHS), and Commerce (DOC), Environmental Protection Agency (EPA), Office of Science and Technology Policy (OSTP), and Office of Management and Budget (OMB). The task force benefited from valuable input obtained at four public meetings (Arlington, VA; Sacramento, CA; Chicago, IL; and Dallas, TX) and from public comment dockets maintained by EPA, USDA/Food Safety and Inspection Service (FSIS), and the HHS/Food and Drug Administration (FDA).

In general, the Council finds the NAS report a constructive contribution to efforts to improve the effectiveness of the federal food safety system through strengthening science and risk assessment, strategic planning, and better federal integration with state and local governments. In particular, the NAS places appropriate weight throughout its report on applying science to the management of government food safety efforts. Science must be advanced within the context of these competing interests. The NAS report recommends that priorities of the nation's food safety system should be based on risk. The Council agrees with the report's thesis that a food safety system that includes regulation, research and development, education, inspection and enforcement, and surveillance should be based on science and should use various risk analyses including quantitative and qualitative risk assessments and risk management principles to achieve such a system.

The Council recognizes that a food safety system comprised of multiple agencies with differing missions and statutory authority may increase the potential for uneven adoption and inconsistent application of science-based regulatory philosophies. While different applications may provide useful information to policy makers relative to the effectiveness of various approaches, the Council's strategic plan (including its assessment of existing statutes and structures) will result in more consistent regulatory measures and philosophies. The Council is committed to identifying further improvements that would result in a seamless, science-based food safety system.

RECOMMENDATION I—BASE THE FOOD SAFETY SYSTEM ON SCIENCE

The NAS report recognizes that the United States has enjoyed notable successes in improving food safety and that with increasing knowledge, many rational, science-based regulatory philosophies have been adopted. The report suggests, however, that adoption of these regulatory philosophies has been uneven given the fragmentation of food safety activities, and the differing missions of the various agencies responsible for specific components of food safety. The greatest strides in ensuring future food safety from production to consumption, the NAS argued, can be made

through a scientific, risk-based system that ensures surveillance, regulatory, research, and educational resources are allocated to maximize effectiveness.

Council Assessment

The Council strongly endorses this recommendation. Many federal food safety programs are already, or are being modified to be, science-based. The Council recognizes that scientifically robust programs will result in better identification of public health needs, and determination of the most effective means of reducing public health risk, including the most cost-effective opportunities for improvement, and improved priority setting.

The scientific information generated through surveillance, research, and risk assessment efforts will result in improved food safety only if there is a commensurate strong effort to translate that scientific information into practical, usable information at the working level, e.g., through guidance or education. This means there must be education for all those involved in producing, manufacturing, transporting, and preparing food as well as for those persons involved in government food safety regulatory activities.

The Council's goal is to ensure that science-and risk-based decision making are central to the Administration's on-going efforts and its strategic plan. Considerable improvements have been made over the past several years. The strong scientific underpinnings of the President's Food Safety Initiative, enactment of the Food Quality Protection Act (FQPA), restructuring of food safety agencies within USDA, and many individual agency activities such as implementation of Hazard Analysis and Critical Control Points (HACCP) programs for meat, poultry, and seafood, have strengthened the overall science base of the food safety system.

The Council believes that the necessary elements of a science-based program—surveillance, outbreak response, risk assessment, research, regulation, inspection, and education—are largely in place, and that improvements planned for the next 5–10 years will enhance food safety significantly. The Council will consider in its strategic plan the following elements of a science-based food safety system:

Surveillance.—Food safety agencies will continue to develop more effective ways to achieve surveillance goals and to monitor the safety of the food supply. Although FoodNet (foodborne disease surveillance system), PulseNet (foodborne pathogen DNA fingerprinting system), and the National Antibiotic Resistance Monitoring System (NARMS) provide information never before available in the United States on foodborne illnesses and the occurrence of antibiotic resistant pathogens, enhanced quantitative data on the entire range of infectious and non-infectious foodborne hazards will require additional efforts.

Risk Assessment.—Risk assessment is a valuable tool for setting priorities, allocating resources, and making regulatory decisions and must be continually improved. For example, EPA will continue to refine its risk assessment methods to determine acceptable levels of pesticides residues. Under FQPA, this approach has been strengthened to further protect all consumers, especially children, from the risks of pesticides in their diet. As currently is done for chemical hazards, the federal government needs to create and use a national microbial risk assessment capability as a means of identifying hazards and quantifying risk and assist in creating similar capacities internationally.

Research.—Through the Joint Institute for Food Safety Research, a research infrastructure has been established to improve and coordinate food safety research activities across the federal government. The Institute will continue a critical review of the federally supported food safety research that was begun through the National

Science and Technology Council.—Future goals in the area of research include: coordination of research planning; budget development and prioritization; scientific support of food safety guidance, policy, and regulation; enhanced communication and links among federal agencies; and enhanced communication and links with industry and academic partners through use of public-private partnerships and technology transfer mechanisms.

Education.—Food safety agencies will expand science-based education and training programs for producers, processors, distributors, food service and public health workers, health care providers, food scientists, and consumers as well as those involved in regulatory activities. It is essential to include in these programs new scientific information on foodborne hazards and their control and effective food safety management strategies.

Inspection/Preventive Controls.—FSIS and FDA will further improve and evaluate the effectiveness of inspections of domestically and internationally produced food and will continue to develop and implement science-based preventive controls such as HACCP systems and the Good Agricultural Practices. Where necessary, regulatory requirements will be established, such as additional performance standards

for pathogen reduction that can be developed as more monitoring and surveillance data become available.

Consistency of Science-Based Standards.—FSIS, FDA, and EPA will work toward clear food safety standards nationally and internationally. The Conference for Food Protection brings together all 50 states for purposes of regulating retail establishments, and the model Food Code is gaining wider adoption among the states. Internationally, the Codex Alimentarius Commission (CAC) is the primary mechanism through which these activities will take place. U.S. food safety agencies should also become more active in providing technical assistance to developing countries.

Private Sector Incentives.—The federal and state regulatory agencies will work with the private sector to develop new technologies to further food safety and to encourage commercial scale-up applicable in large and small companies, and industry adoption. Research efforts with industry, consumer, academic, and government participation could develop and validate new technologies.

Evaluation.—Evaluating the effectiveness of science based regulatory programs continues to be critical. For example, Salmonella data from the first year of HACCP implementation in poultry facilities show a trend toward fewer contaminated products. Also, by providing important information on trends in the incidence of infections with foodborne pathogens, FoodNet assists in the evaluation of the effect of preventive controls. The effect of preventive controls implemented by the processed food industry on the reduction of the number of cases of listeriosis was readily apparent in the Centers for Disease Control and Prevention (HHS/CDC)-conducted surveillance effort that was a forerunner of FoodNet.

A general challenge for the food safety agencies is that while they must be guided primarily by science, the agencies must also consider other factors such as technical limitations, statutory mandates, policy considerations, budget constraints, practicality, and consumer and societal preferences.

Scientific Challenges

The Council faces a number of challenges in improving the scientific base of the food safety system. The following are a few examples of challenges that must be met to strengthen the scientific underpinnings of federal food safety efforts:

—New data are required to address the occurrence of emerging pathogens, changes in domestic food habits, a global food supply, and changes in demographics. Specific data needs are difficult to predict and obtain in a timely way. An example is the impact of E. coli O157:H7, which was unknown as a foodborne pathogen 20 years ago, but has been responsible for major outbreaks of foodborne illness in recent years.

—Gaps exist in our knowledge of microbial pathogens and in our ability to measure their impact on human health. For example, there are gaps in knowledge about the pathogens associated with fresh fruits and vegetables and the routes of contamination.

—Assessment of the total impact on health of multiple chemicals from multiple sources presents a major scientific challenge. Implementation of the new FQPA standards for pesticide residues requires EPA to assess aggregate risk from food, water, and residential exposure to a single pesticide as well as cumulative risk from multiple pesticides.

—Gaps exist in our knowledge of effective interventions, prevention, and alternatives that minimize contamination of food. For example, the existing limited body of knowledge about microbial contamination limits the ability to develop on-farm preventive controls and systems of testing. Similarly, with the advent of FQPA, more research is also needed to develop safer pesticide alternatives or crop production techniques in order to promote transition from older pest control techniques that may pose risks to newer, safer ones.

—Insufficient data exist on the entire range of infectious and non-infectious foodborne hazards. Even with the improvements made through FoodNet and PulseNet, enhancement of quantitative data on the entire range of infectious and non-infectious foodborne hazards will strengthen monitoring and surveillance programs for prevention, early identification, and prediction of emerging food safety problems.

RECENT CHANGES THAT STRENGTHEN THE FEDERAL FOOD SAFETY SYSTEM
SCIENTIFIC BASE

USDA 1994 reorganization (separated public health from marketing functions)
HACCP implementation (12/97 seafood and 1/98 meat and poultry)
FQPA enactment and implementation
FoodNet/PulseNet established
FDA Fresh Produce Guidelines released
Joint Institute for Food Safety Research created
Research funding increased
Food Safety Research Database initiated
Annual Food Safety Research Conference held
Interagency Risk Assessment Consortium established

Congress should change federal statutes so that inspection, enforcement, and research efforts can be based on scientifically supportable assessments of risks to public health.

The NAS report identifies a need for a "national food law that is clear, rational, and comprehensive, as well as scientifically based on risk" as a major component of a model food safety system. The report concludes it is necessary to revise the current statutes on food safety to create a comprehensive national food law under which:

—Inspection, enforcement, and research efforts can be based on a scientifically supportable assessment of risks to public health. This means eliminating the continuous inspection system for meat and poultry and replacing it with a science-based approach that is capable of detecting hazards of concern.
—There is a single set of flexible science-based regulations for all foods that allows resources to be assigned based on risk, that permits coordination of federal and state resources, and that makes it possible to address all risks from farm to table.
—All imported foods come only from countries with food safety standards equivalent to U.S. standards.

The NAS report states that the laws, particularly what the report characterizes as the requirement that there be continuous inspection of meat and poultry production through sight, smell, and touch (Aorganoleptic@) inspection, create inefficiencies, do not allow resource use to reflect the risks involved, and inhibit the use of scientific decision-making in activities related to food safety, including the monitoring of imported food.

Council Assessment

The report's recommendation that federal statutes provide agencies with authority to make decisions based on scientific assessments of risks to the public health is sound. Decisions based on public health risk assessments allow agencies to make effective use of science to set food safety priorities, allocate resources to higher risk areas, and instill consumer confidence that high-risk hazards are being addressed.

Since the federal food safety regulatory agencies operate under very different legislative authorities, the Council will conduct a full assessment of these statutes and evaluate the degree of regulatory flexibility that already exists. The Council has decided that this legislative review will be undertaken as part of the strategic planning process. The purpose of the review will be to: 1) examine the similarities and differences in federal food safety statutes; 2) identify the "best" statutory approaches for reducing foodborne illness; and 3) assess both gaps and statutory barriers to implementation of the plan. The need for statutory changes could then be determined, and, if necessary, legislative principles developed which would form the basis for discussions with stakeholders and Congress. For example, given the recent overhaul of pesticide legislation, the Council believes that further statutory changes may not be needed for pesticides at this time.

In some cases, the NAS report misinterprets existing statutory requirements. For example, the report concludes that the statutes require the current method of organoleptic inspection of all carcasses. Even though the current law requires continuous inspection, it does not specify how this inspection mandate is to be carried out. The statutes do require appropriate inspection of animals prior to slaughter and inspection post-slaughter at all official slaughter and processing facilities. Among other significant food safety purposes, this continuous inspection requirement ensures use of the best sanitary dressing processes, prevention of fecal contamination,

and prevention of meat from diseased animals from entering the food supply. Under the statutory flexibility that already exists, USDA has begun to develop and test a more risk-based inspection system, including adopting regulations requiring that HACCP be implemented in all slaughter and processing plants. In addition, USDA is studying how best to effect further improvements in the inspection of meat and poultry.

The food safety agencies have achieved and can continue to accomplish significant science-based improvements in their food safety programs under current authorities. However, new authorities that would improve the federal food safety system have been proposed by the President and are waiting action by Congress. Further analysis of the statutes may result in additional proposed statutory modifications.

Current Legislative Challenges

As part of its review of food safety statutes, the Council will focus on areas where regulatory jurisdiction is split between agencies and where resources could be more effectively shared between agencies. The Administration will work with Congress to pass:

—the Food Safety Enforcement Enhancement Act, forwarded by the Clinton Administration and introduced during the last Congress to increase the enforcement capabilities of FSIS; and

—legislation that gives FDA increased authority to effectively assure the safety of food imports.

RECENT ADVANCES IN APPLYING SCIENTIFIC ASSESSMENTS OF PUBLIC HEALTH RISKS TO FOOD SAFETY

HACCP implemented for meat, poultry, and seafood
FQPA tolerance reassessment based on aggregate exposure, cumulative risk, and vulnerable subpopulations.
Single, risk-based pesticide standard for raw and processed food established
Tolerance reassessment focusing on the riskiest pesticides first
Priority registration given to "safer" pesticides
Risk Assessment Consortium established
FoodNet/PulseNet established Good Agricultural Practices guidance for fresh produce established Unpasteurized juice warning labels required

Congress and the Administration should require development of a comprehensive national food safety plan. Funds appropriated for food safety programs (including research and education programs) should be allocated in accordance with science-based assessments of risk and potential benefit.

This recommendation contains two parts. The first part recommends that Congress and the Administration require preparation of a comprehensive, national food safety plan. The NAS report lists several essential features of such a plan, including a unified food safety mission; integrated federal, state and local activities; adequate support for research and surveillance; and increased efforts to ensure the safety of imported foods. The second part of the recommendation stresses that resources should be allocated on the basis of science-based assessments of risk and potential benefits.

Council Assessment

The Council agrees that a comprehensive national food safety strategic plan should be developed and the development of such a plan is underway. In fact, the President's Food Safety Initiative was an initial step toward a national food safety plan. The 1997 Farm to Table report was a means of leveraging federal food safety resources through coordinated planning and cooperative work to meet common needs such as development of surveillance data, response to outbreaks, research into preventive interventions, development of risk assessment techniques particularly for microbial risk assessments, and consumer education. This initial plan also took some steps toward extending food safety planning to the state and local level.

Strategic Planning

Picking up where the Farm to Table report left off, the Council will continue and expand the strategic planning process. One of the Council's primary purposes is to develop a comprehensive strategic plan for federal food safety activities that contains specific recommendations on needed changes, including goals with measurable outcomes. The plan's principal goal is to enhance the safety of the nation's food sup-

ply and protect public health through a seamless science-and risk-based food safety system. The plan will set priorities, improve coordination and efficiency, identify gaps in the current system and mechanisms to fill those gaps, continue to enhance and strengthen prevention strategies, and develop performance measures to show progress.

Preparation of the food safety strategic plan will be a public process, and will consider both short-and long-term issues including new and emerging threats and the special needs of vulnerable populations such as children and the elderly. Once the plan is sufficiently complete, the Council will advise agencies of priorities for investing in food safety and ensure that federal agencies annually submit coordinated food safety budgets to OMB to sustain and strengthen existing capacities. In short, the President's Council on Food Safety will develop a national food safety plan and make budget recommendations to agencies and OMB to accomplish what the NAS report recommends.

The Council has defined the scope of future federal level food safety strategic planning and a process for interagency planning and public participation. An interagency task force anticipates having a draft plan ready for public review and discussion in January 2000. Even while developing this plan, the task force intends to continue its consultations with stakeholders. The following is the draft vision statement for the Council's strategic plan:

—Consumers can be confident that food is safe, healthy, and affordable. We work within a seamless food safety system that uses farm-to-table preventive strategies and integrated research, surveillance, inspection, and enforcement. We are vigilant to new and emergent threats and consider the needs of vulnerable subpopulations. We use science-and risk-based approaches along with public/private partnerships. Food is safe because everyone understands and accepts their responsibilities.

The President's Council on Food Safety held four public meetings in the Fall of 1998 in Arlington, VA; Sacramento, CA; Chicago, IL; and Dallas, TX to solicit comments on this draft vision for food safety and to identify a strategic planning process, goals and critical steps as well as potential barriers to achieving that vision.

The Council's strategic planning task force is analyzing the transcripts of the 1998 public meetings and the input received through the notice and comment process to determine the major themes, issues, and subject areas. The task force will also consider the conclusions and recommendations of the NAS report, input from the federal, state, and local government integrated National Food Safety System Project, and input from the agencies involved.

The planning process will build upon common ground and provide the forum to tackle some of the difficult public health, resource, and management questions facing the federal food safety agencies and our state, tribal and local government partners. The plan will identify areas for enhanced coordination and efficiencies, determine whether legislative changes would be beneficial, and clarify federal, state, tribal, and local government roles and responsibilities in the national food safety system (see discussion under recommendation IIIb).

The strategic planning process will consider thoroughly the results of the legislative review outlined under the Council's assessment of NAS recommendation IIa. Examples of possible legislative proposals from such a review include:

—developing legislative proposals to eliminate current duplication of efforts by FDA and FSIS by reevaluating each agency's role in areas such as the regulation of eggs and egg products, game meats, food additives, animal drugs and biologics, and food products produced in plants under the jurisdiction of both agencies;

—modifying statutes to facilitate greater leveraging of agency resources;

—developing a legislative proposal giving FSIS explicit authority to enter into cooperative agreements for food safety risk assessment; and

—developing legislation that provides Performance Based Organization (PBO) authority for voluntary seafood inspection.

Allocation of Resources

The NAS report recommendation goes a step further than a national plan by urging that resources be allocated according to science-based assessments of risk and potential benefits. As stipulated in Executive Order 13100, the Council will ensure that agencies develop a coordinated food safety budget submission consistent with the strategic plan. The Council will develop guidance for food safety agencies to consider during the preparation of their individual budgets. The Council has created a budget task force that will:

—work with the strategic planning task force and review the draft and final strategic plans and Council budget guidance on priority areas for investment to

identify budget data and other information that will be necessary to plan and coordinate agency budget submissions to OMB;
—design a uniform format for presenting food safety initiative budget components in the OMB budget process for use in both individual agencies and the unified budget submissions;
—develop necessary guidance to facilitate submission of a unified food safety initiative budget and any other food safety issues deemed appropriate by the Council;
—establish a timetable for developing coordinated food safety budget requests and for submitting information to the Council that accommodates the various agencies' budget planning processes; and
—consider the issue of whether to amend OMB Circular No. A–11 (OMB guidance to agencies on budget structure and reporting elements) to include food safety as a budget cross-cut.

Comparative Risk Assessment

An important part to both risk-based planning and resource allocation will be the development of a comprehensive comparative risk assessment of the food supply. The Council has requested the Interagency Food Safety Risk Assessment Consortium, which consists of HHS and USDA agencies and EPA, to consider how to develop a comparative risk analysis for food safety strategic planning. The Council will direct the Consortium to seek and consider public input in its analysis.

The Council believes that various steps may need to be taken to evaluate risks including: a ranking of foodborne pathogen risks based on surveillance and economic data; consideration of a broader range of food safety hazards including not only microbial risks, but also pesticides and chemicals; and finally, selection of highly ranked hazards, an evaluation of control measures, and an evaluation of net benefits. The Council must avoid applying risk assessment in a manner that is too strict, rigorous, or inflexible. Instead, the comparative risk assessment must be used to prioritize the known greatest risks at the current time, with the understanding that scientific risk estimates can, and will likely, change frequently over time.

Challenges in Planning

The Council faces the following challenges in developing a comprehensive food safety strategic plan and allocating resources based on risk:
—Developing and successfully implementing a national plan will require strong cooperation, coordination, and communication, since each federal, state, and local agency has unique mandates, authorities, history, culture, and operating procedures.
—The diversity of stakeholders in food safety is enormous. It will be difficult, but imperative, that all stakeholders are represented in the Council's planning process.

PROGRESS IN STRATEGIC PLANNING

President's 1997 Farm to Table Food Safety Initiative
President's Fresh Produce and Imported Food Safety Initiative
Establishment of the Joint Institute for Food Safety Research
Establishment of the President's Council
Input from the National Academy of Sciences, Council of Agricultural Science and Technology, and other organizations
National Integrated Food Safety System project meetings
Development of a draft vision statement
Input from multiple public meetings and public comments

To implement a science-based system, Congress should establish by statute a unified and central framework for managing federal food safety programs, one that is headed by a single official and which has the responsibility and control of resources for all federal food safety activities, including outbreak management, standard-setting, inspection, monitoring, surveillance, risk assessment, enforcement, research, and education.

The NAS report finds that the existing regulatory structure for food safety in the United States is not well equipped to meet current challenges. Specifically, it points out that the system is facing tremendous pressures with regard to:
—emerging pathogens and ability to detect them;

—maintaining adequate inspection and monitoring of the increasing volume of imported foods, especially fruits and vegetables;
—maintaining adequate inspection of commercial food services and the increasing number of larger food processing plants; and
—the growing number of people at high risk for foodborne illnesses.

The report cites the strengths of the current food safety system, including the advent of FoodNet and PulseNet, HACCP implementation, and the Partnership for Food Safety Education. It also identifies deficiencies, which it attributes partly to "the fragmented nature of the system." The report attributes the fragmentation largely to a lack of adequate integration among the various federal agencies involved in the implementation of the primary statutes that regulate food safety, and observes that this lack of adequate integration occurs also with state and local activities. The report notes that several federal agencies are involved in key food safety functions and references more than 50 memoranda of agreement between various agencies related to food safety.

The NAS report attributes the lack of adequate integration among federal, state and local food safety authorities in part to the absence of "focused leadership" that has the responsibility, the authority and the resources to address key food safety problems. The report presents several examples of possible organizational structures to create a single federal voice for food safety. These include:

—a Food Safety Council with representatives from the agencies with a central chair appointed by the President, reporting to Congress and having control of resources;
—designating one current agency as the lead agency and having the head of that agency be the responsible individual;
—a single agency reporting to one current cabinet-level secretary; and
—an independent single agency at cabinet level.

Although the report indicates that many of the NAS committee's members believe that a single, unified agency headed by a single administrator is the most viable structure for implementing the "single voice" concept, the report recognizes that there may be many other models that would be workable.

Council Assessment

The Council agrees with the goal of the NAS recommendation—that there should be a fully integrated food safety system in the U.S. The food safety agencies are committed to this goal, and the Council is confident that its comprehensive strategic plan will be a major step toward creating a seamless food safety system. To ensure that the strategic plan achieves this goal, the Council will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning, and resource allocation.

The Council's strategic plan will bring agreement on the vision, goals, and actions needed to enhance the safety of the nation's food supply and protect public health by reducing the annual incidence of acute and chronic foodborne illness. It will also clarify the roles and responsibilities of each food safety agency as well as their interactions with state, tribal, and local government partners.

While the Council recognizes that certain models of reorganization may improve coordination and allow for a better allocation of resources, any reorganization of food safety activities must consider the non-food-safety-related responsibilities of each agency and how these relate to the food safety responsibilities. Reorganization must not be done at the expense of these other responsibilities and activities. The Council is concerned that, if not done carefully, separating food safety from non-food safety activities in each agency could act to weaken consumer and environmental protection overall.

The Council also recognizes that expertise and knowledge, particularly expertise in state-of-the-art science and technology, provides a resource to food safety activities. For example, analytical methods for detection and quantification of adulterants in foods may be adapted to detection of chemical contaminants that threaten public health. Expertise in non-food safety regulatory science and legal procedures are critical when warnings are required on food labels to assure safety. In addition, reorganizations must avoid interfering with the public health framework established to identify and respond to infectious and non-infectious public health threats whether they are foodborne or not, since many of the major foodborne pathogens also produce non-foodborne disease. Thus, in its strategic planning the Council will be cognizant of the interplay between the food safety and non-food safety activities of each agency and how they affect each other.

The Council believes that there are programs that can benefit from immediate reorganization. For example, during the last two years, FDA and NOAA have been developing a proposal to transfer the NOAA Seafood Inspection Program to FDA as

a Performance Based Organization (PBO) in order to operate the voluntary Seafood Inspection Program on a more business-like basis. The PBO would be formed under the umbrella of FDA and would include all seafood inspection activities now carried out by NOAA. The fiscal year 2000 budget proposes to transfer the existing Seafood Inspection Program from NOAA to FDA. This action will fully consolidate federal seafood inspection activities within one agency thereby increasing the efficiency and effectiveness of seafood oversight. It will also enhance the overall safety and wholesomeness of seafood products. Funds are provided in the President's fiscal year 2000 budget to cover the costs of transition, including training and education activities.

Factors to Consider in Organizational Restructuring

The Council assessment of structural and organizational options must take into consideration factors such as:

—There are numerous instances in the existing food safety system where the division of regulatory responsibility is not optimal. For example, within the same plant, FSIS and

—FDA inspectors are often responsible for different foods. FDA and FSIS also share regulatory responsibility of eggs and egg products. Examples such as these create stakeholder confusion and inefficient allocation of resources. Any reorganization must consider areas where there is significant jurisdictional overlap.

Many food safety issues would be difficult to resolve by a reorganization. For example, some issues like bovine spongiform encephalopathy are both animal health issues and human health issues. Foodborne disease problems may also be waterborne disease problems. Other programs, particularly research and education programs for food safety often do not operate as separate activities within the agencies, but rather draw significant strength from one another. While some projects are entirely focused on food safety, the food safety research portfolio includes many other projects in such areas as animal health and animal genetics. Reorganization must also accommodate successful partnerships such as the Partnership for Food Safety Education.

RECENT STEPS TAKEN TO CREATE A UNIFIED FEDERAL FOOD SAFETY SYSTEM

1997 President's Food Safety Initiative implemented
Interagency Risk Assessment Consortium created
President's Fresh Produce plan implemented
Federal/State Outbreak Response task force established
Joint Institute for Food Safety Research created
President's Council on Food Safety established
Restructuring of seafood inspection proposed
Partnership for Food Safety Education created

Congress should provide the agency responsible for food safety at the federal level with the tools necessary to integrate and unify the efforts of authorities at the state and local levels to enhance food safety.

The NAS report recommends that federal, state, and local governments function as an integrated enterprise, along with their partners in the private sector. The report identified five statutory tools required to integrate federal, state, and local food safety activities into an effective national system:

—authority to mandate adherence to minimal federal standards for products or processes;

—continued authority to deputize state and local officials to serve as enforcers of federal law;

—funding to support, in whole or in part, activities of state and local officials that are judged necessary or appropriate to enhance the safety of food;

—authority given to the Federal official responsible for food safety to direct action by other agencies with assessment and monitoring capabilities; and

—authority to convene working groups, create partnerships, and direct other forms and means of collaboration to achieve integrated protection of the food supply.

This recommendation acknowledges the "equally critical roles" of state, tribal, and local government entities with those of the federal government in ensuring food safety, and suggests that changes in federal authorizing and appropriating legislation may be necessary to achieve better integration of federal, state, tribal, and local activities. The report points out that the work of the states and localities in support

of the federal food safety mission deserves "improved formal recognition and appropriate financial support."

Council Assessment

The Council agrees that the roles of state, tribal, and local governments in the food safety system are critical and that their efforts deserve the formal recognition that partnership in a national food safety system conveys. Thus, the Council supports steps taken toward the development of a more fully integrated national food safety system. While more needs to be done to optimize and develop new partnerships, the federal food safety agencies have already established extensive interactions with state and local regulatory agencies. In fact, a critical factor for the Council to consider is the manner in which existing federal/state or local activities are integrated and coordinated. The Council believes that its strategic planning process provides a fresh opportunity for their non-federal partners to participate as primary and equal partners in the development of the future food safety system.

Some overlap occurs among federal, state, and local food safety efforts. Neither federal food safety agencies nor state and local agencies have sufficient resources to carry out a comprehensive food safety program, but all these agencies have expertise and resources that, when combined in an integrated program, would significantly enhance the impact of food safety programs.

The Council also agrees that the five statutory tools identified by the NAS are critical for ensuring good coordination between the federal government and state, tribal, and local agencies. Fortunately, the federal food safety regulatory agencies (FDA, FSIS, and EPA) already have most of the statutory tools recommended by NAS.

The Council recognizes and agrees with the report's conclusion that the lack of integration among federal, state, and local authorities often complicates the administration of regulatory programs. We need to utilize available mechanisms to leverage resources and expertise from government, industry, academia, and consumers to expand the nation's food safety capabilities beyond what any one group can accomplish. Increased awareness and knowledge of food safety in each segment of the food safety community should reduce the need for regulation of industry and decrease the incidence of contamination at every point in the food safety system in order to protect public health.

Integrated National Food Safety System (NFSS) Project

HHS, USDA, and EPA are working with state and local officials on an integrated National Food Safety System (NFSS) Project to identify appropriate roles and to develop mutually supporting common goals for all levels of government in the U.S. food safety system. This work is considered integral to the Council's strategic plan and coordinated budget recommendations and will be the basis for improved integration with state, tribal and local governments.

Under the leadership of the FDA, the Project is proceeding under existing federal, state, and local laws although all levels of government recognize that changes in some of the federal and state laws will be necessary to achieve an integrated system. The Project began with a meeting of state and local officials from public health and agriculture agencies and state laboratories representing all 50 states, Puerto Rico, and the District of Columbia, FDA, CDC, and FSIS in Kansas City in September 1998. In December 1998, six work groups and an 18 member Coordinating Committee composed of federal, state and local officials met in Baltimore, Maryland to begin to develop plans for implementing recommendations and overcoming the obstacles identified at the Kansas City meeting. Subsequent meetings will be held throughout 1999 to continue the planning process. The group estimates that a fully integrated federal/state/local food safety system will take up to 10 years to build. The Association of Food and Drug Officials, which is an organization of state and local public health officials and regulators, strongly endorses the concept of a NFSS.

The NFSS Project builds on existing systems of federal/state cooperation such as the FSIS long-term "equal to" meat and poultry system currently operating in 26 states with shared state and federal funding and EPA's delegation to states of various regulatory programs.

Challenges to Developing a National Food Safety System

The Council recognizes that the existing systems for federal, state, and local government regulation of food and pesticides have different histories and important distinguishing characteristics. The Council believes it is important to respect the nature and strengths of the existing systems and that integration must proceed in a coordinated fashion. There are numerous challenges to building an integrated food safety system:

—*Establishment of a clear framework for integration*.—Such a framework would include the following: strong federal food safety standards, consistent training and competency of inspectors and other state/local officials, data sharing/exchange, federal oversight of state activities, and appropriate and effective enforcement. There needs to be public assurance that state and local activities are integrated with, and an extension of, the federal responsibility in order to assure consistency, accountability, and above all, enhanced consumer protection.

—*Responsiveness to stakeholder concerns*.—Development of an integrated system needs to be responsive to stakeholder concerns to have credibility and obtain public support. For example, consumers are concerned that the economic interests of industry within states may be a source of conflict if those states have an expanded food safety role that includes activities thought to be primarily a federal responsibility. Moreover, industry is concerned that food safety regulation will be inconsistent among the states if systems are integrated without adequate preparation of the state agencies to step into an expanded food safety role.

—*Infrastructure and support*.—There is a potential need for legislative change at the federal or state/local level to achieve uniformity and consistency in enforcement authorities and to permit the sharing of inspection and other resources.

EXAMPLES OF FEDERAL/STATE/LOCAL COOPERATION

Milk Sanitation Program—Pasteurized Milk Ordinance
Retail Food Safety Program—Food Code
Integrated National Food Safety System Project
Interstate Shellfish Sanitation Program
States conduct 5,000 inspections of FDA-regulated plants
FSIS oversee and supports 26 state "equal to" meat and poultry inspection programs
FDA maintains more than 100 state partnerships
Conference for Food Protection
FoodNet/Emerging Infections Program
PulseNet
Epidemiology and Laboratory Cooperative Agreements
Appropriate delegation of pesticide responsibility to states
Partial funding of states for implementation of some pesticide programs and for most pesticide compliance programs
State FIFRA Issues Research and Evaluation Group
State and local government involvement in Foodborne Outbreak Response Coordination Group (FORC-G)
States conduct inspections in 250 FSIS regulated plants
FSIS supports animal production food safety outreach projects involving 11 states
FSIS supports animal production food safety workshops
HACCP based enhancement of state labs, computer capabilities, and state training
Partnership for Food Safety Education "Fight BAC!" campaign

FDA answer. The Council on Food Safety has developed a process for developing a 5-year strategic plan that includes steps necessary to achieve a fully integrated U.S. food safety system. As part of this process, the Council will assess structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning, and resource allocation. The timeline associated with this process calls for the strategic plan to be presented to the public for comment in January 2000 and the final plan to be presented to the Council for approval in July 2000.

Question. While irradiation isn't a "magic-bullet", it is one extra step we can take to assure the safety of food products. What is being done to dispel consumer misconceptions about irradiation? Is this being done as part of the food safety education effort? If not, why?

USDA answer. Where food irradiation is concerned, dispelling misconceptions is a key component of consumer education. FSIS has been doing this for quite some time through the usual communications channels: Consumer publications (for example, Ten Most Commonly Asked Questions About Food Irradiation, September 1992) The Meat and Poultry Hotline (1–800–535–4555) FSIS Web site (http://

www.fsis.usda.gov/OA/topics/irrmenu.htm) Backgrounders (for example, Poultry Irradiation and Preventing Foodborne Illness, May 1992/Slightly Revised September 1992, or USDA Issues Meat and Poultry Irradiation Proposal, February 1999)

When the proposed rule on red meat irradiation was published in the Federal Register on February 24, 1999 (64 FR 9089) both the proposal and a "Review of Risk Analysis Issues" document were made available to the public through the FSIS Constituent Update. The FSIS Constituent Update is a mechanism for faxing FSIS information to more than 300 consumer, industry, and allied organizations. Informational documents were also made widely available to the public through the FSIS Web site. These included a review of risk analysis issues that addressed particular consumer concerns: food safety, environmental impact, worker safety, and transportation safety.

Answer. The FDA has been particularly active in its efforts to educate the public about the irradiation process. For example, last spring Dr. Michael Friedman, as lead Deputy Commissioner, was featured in the major television spots on the recent approval of meat irradiation. Dr. Friedman stressed the strong scientific basis for FDA's conclusion that irradiation of meat is safe. In addition, FDA staff handled a variety of print and broadcast interviews where they explained that irradiation has been shown to be safe and to significantly reduce bacterial contamination. They also made numerous presentations on this technology to scientific organizations and consumer groups. We value the importance of informing consumers. Nevertheless, we believe it is critical that consumer education efforts remain balanced and objective so irradiation and other antimicrobial interventions are placed in the proper context in the overall effort to ensure food safety.

Over the years, FDA experts on food irradiation have been made available to many requests for interviews from the press and broadcast media. These experts have also spoken at several professional meetings of food safety scientists and educators. FDA's Office of Public Affairs prepared a series of consumer oriented articles for its FDA Consumer magazine and is in the process of preparing a consumer education brochure on this issue. These efforts date back prior to the current food safety education effort and continue.

Question. To what extent is irradiation used now, both here and abroad?

USDA answer. FSIS estimated in the proposed rule on red meat irradiation that a low volume (i.e., one percent) of the U. S. poultry is irradiated (64 FR 9099). FSIS attributed this low volume of irradiated poultry, in part, to command-and-control pre-HACCP regulations governing the irradiation process. The FSIS red meat irradiation proposal included several substantive proposed changes to the poultry irradiation regulations that would make the poultry irradiation regulations more consistent with those proposed for red meat irradiation, as well as with HACCP regulations.

Regarding the extent to which irradiation is used abroad, more than 35 countries allow food, including meat and poultry, to be irradiated. As of 1994, the year in which the Joint FAO/IAEA report by the International Consultative Group on Food Irradiation was issued, seven countries had specific clearances for meat, 15 countries had clearances for poultry, and six countries had clearances for both meat and poultry. No data are available regarding the volume of meat and/or poultry irradiated.

FDA answer. The use of irradiation to process food has been relatively minor, both in the U.S. and abroad. At present, irradiation facilities can handle only a small proportion of food and most of the irradiation capacity has been used to sterilize medical supplies. We are aware of the use of irradiation to sanitize some spices although a larger fraction has been treated with fumigants such as ethylene oxide. We are also aware of one facility that has irradiated poultry and fruits and another that has irradiated fruits from Hawaii to prevent introduction of insect pests on the mainland.

Question. To what extent does irradiation kill pathogens? What about viruses?

USDA answer. Irradiation, at the absorbed dose level approved by FDA and proposed by FSIS, is highly effective in reducing the level of most pathogens associated with meat and poultry. As an example, if the minimum absorbed dose for fresh (not frozen) meat was 2.0 kGy throughout all parts of the meat or poultry, the decimal log reduction (each log reduction is equivalent to a 90 percent reduction in the total population) would be as follows: Campylobacter jejuni = 10 log10 per gram of product; Escherichia coli O157:H7 and Trichinella spiralis = 6.7 log10 per gram of product; Listeria monocytogenes and Toxoplasma gondii = 5 log10 per gram of product; and Salmonella spp.—4 log10 per gram of product. All of the reductions in the previous example would represent the potential for significant reductions in the number of foodborne outbreaks associated with meat and poultry. Irradiation, at the ab-

sorbed dose level approved by FDA and proposed by FSIS, would not be effective in reducing the level of viruses.

FDA answer. Pathogens are not all equally sensitive to irradiation and the amount of radiation needed to kill a significant fraction can depend on whether the food contains free liquids such as water. For example, pathogens such of the vibrio species are very sensitive while spore forming bacteria such as Clostridum botulinum can be very resistant. Other pathogens, such as Salmonella, Campylobacter, Listeria, or certain pathogenic strains of E. coli, have intermediate resistances. Larger doses are needed when the food is dry or frozen. Irradiation is very effective at killing all of these pathogens other than Clostridum botulinum under the conditions of approval for meats and poultry. As a general rule, viruses in food are not very sensitive to radiation and are controlled better by heat processing.

FDA answer. Irradiation of a food, as with other processing methods, can have an effect on texture, taste, or quality. The magnitude of the effect can be controlled, to some degree, by controlling the conditions of irradiation. For example, an effect will become larger as the radiation dose is increased. Irradiation of a solid versus dry or deep-frozen product has less of an effect than one that contains liquids. Oxygen in the atmosphere can promote rancidity in a fatty food. Effects in meats with strong flavors may be less detectable than in more bland products. Optimizing irradiation conditions would require balancing costs and the degree of bacterial control against unintended effects to obtain a product that consumers would want.

We would expect food processors to control the conditions of irradiation so that any irradiated meat sold would be acceptable to the average consumer. This does not necessarily mean that there would be no effect on texture, taste, or flavor. However, we would not expect food manufacturers to market a product unless consumers found it to be of good quality and taste.

Question. I understand that irradiation will not alter the texture, taste, or quality of meat if used properly. Is this true?

Answer. Irradiation, at the absorbed dose level approved by FDA and proposed by FSIS, will not noticeably alter the texture, taste, odor, appearance, or keeping quality of fresh or frozen meat or poultry.

Question. Will the use of irradiation affect the cost of food products to the consumer?

Answer. FSIS estimated in the proposed rule on red meat irradiation that the low end cost of irradiating ground beef would be 2.0 cents per pound and the high end cost would be 6.0 cents per pound, depending upon the volume of product irradiated (64 FR 9100).

Question. I understand that irradiation will not affect the nutritional value of meat products any more than cooking does. Is this true?

USDA answer. Irradiation, at the absorbed dose level approved by FDA and proposed by FSIS, will not reduce the level of sensitive nutrients (e.g., thiamin) below the level expected to be reduced by cooking. This point has been made in all educational materials produced by FSIS on irradiation. It is also discussed in FSIS' proposed regulation, which says in part:

"Central to the FSIS food safety strategy are efforts to reduce the level of microbiological pathogens in raw meat and poultry products. Irradiation has been shown to be a highly effective method for reducing the levels of microbiological pathogens in raw meat food products. Further, FDA has concluded that irradiation of meat food products, under the conditions requested by Isomedix, Inc. and granted by FDA, would not present toxicological or microbiological hazards and would not adversely affect the nutritional adequacy of these products. FSIS, therefore, sees compelling reasons to propose regulations providing for the irradiation of meat food products and has rejected the option of disallowing irradiation." (Federal Register, Vol. 64, No. 36, p. 9097)

FDA nswer. Both irradiation and cooking can decrease the levels of some nutrients and irradiation followed by cooking can have a greater effect, just as heat processing canned or cooked hams followed by cooking will increase nutrient loss. The important thing is that people get their nutrients from a variety of sources in sufficient amounts to allow for some losses. FDA has concluded that consuming irradiated meat will not have a significant effect on the nutritional status of consumers.

Question. Will the use of irradiation affect the cost of food products to the consumer?

FDA answer. Because the use of irradiation has been relatively minor, limited information is available on how the marketplace will address the issue.

Question. There has been a controversy over the labeling of irradiated products. Could you give us a status report on where we are on the labeling of irradiated food products?

USDA answer. For packages of irradiated product (i.e., all the meat or poultry contained in the package is irradiated), FSIS has proposed the same labeling requirements as those specified by FDA. Regarding secondary products (i.e., products in which irradiated meat or poultry comprise one or more ingredients in the formulation), FSIS has proposed that the ingredient statement should list the irradiated ingredient in the order of its level of predominance in the formulation. Presently, FDA does not have a similar requirement for the secondary product labeling of irradiated ingredients. FDA did issue an advance notice of proposed rulemaking on February 17, 1999 (64 FR 7834) concerning possible revisions to the labeling requirements for irradiated foods. Meanwhile, FSIS and FDA expect to meet and discuss the secondary product labeling issue. Both FSIS and FDA recognize the benefits of a consistent labeling policy for irradiated food.

FDA answer. When FDA issued its rule on irradiated foods in 1986, it concluded that there was no safety reason for requiring special labeling but that consumers should be informed when a food has been irradiated. Because a food that has been irradiated will not appear to have been processed, FDA required that the label indicate processing, except where an irradiated ingredient was added to a food which obviously had been processed. FDA required placement of a symbol, the radura, along with the words "Treated by irradiation" or "Treated with radiation" to educate people on what the radura symbolized. FDA encouraged manufacturers to add truthful phrases to the statement so consumers would understand why the food was irradiated.

In 1997, FDAMA mandated that the disclosure statement could not be required to be more prominent than the ingredient statement. On August 17, 1998, FDA amended its requirement for the labeling of irradiated food to clarify the interpretation of prominence consistent with FDAMA.

On February 17, 1999, FDA issued a notice requesting comment on the labeling of irradiated food. FDA cited the directive to solicit comment on this issue from the FDAMA Conferees Report, provided background information on labeling requirements, and posed a series of directed questions intended to address how consumers interpret the label and what information should be provided. At this time, FDA is receiving comments. The comment period is open until May 18, 1999.

CODEX ALIMENTARIUS ACTIVITIES

Question. What is the current (fiscal year 1999) budget for our Codex activities? What is the fiscal year 2000 request? Is this funding sufficient to protect our trade policy needs, and how is it administered in the budget?

USDA answer. USDA considers the Codex Alimentarius function to be very important for maintaining a science-based approach to standard setting for foods which are in international commerce. Recently the positioning of the U.S. Codex Office within USDA and FSIS has been elevated to the Office of the Administrator, and he and the Under Secretary are working with the U.S. Codex Manager to insure the staff works efficiently across USDA and the U.S. Government. An expanded Codex Steering Committee chaired by the Under Secretary for Food Safety includes membership from across the U.S. Government, including State, U.S. Trade Representative, Commerce, as well as AMS and FAS within USDA and all the food standard setting agencies—FSIS, FDA and EPA.

FSIS plans to spend about $782,000 in fiscal year 1999 on Codex Alimentarius activities. This amount is expected to increase in fiscal year 2000 by the amount needed to cover mandatory pay raises. Additional Codex costs are decentralized throughout USDA and other government agencies to support Codex delegate participation and provide for meetings, and for policy setting discussions.

FDA answer. FDA does not have a defined budget for Codex activities. The U.S. Codex Office, which has oversight over U.S. Codex activities, resides in USDA within the Office of the Administrator of the Food Safety and Inspection Service. Most of the activities of Codex, however, are decentralized throughout several government agencies, including FDA, USDA agencies, EPA, National Marine Fisheries Service in the Department of Commerce, and trade agencies. FDA has, since the beginnings of the Codex Alimentarius Commission in 1962, devoted considerable resources to ensuring that Codex international food standards reflect the level of safety and quality expected by the U.S. consumer. Currently FDA provides the U.S. Delegate or the Alternate Delegate to 14 of 16 Codex Committees and has established a Codex Management Group within FDA to better assist the U.S. Codex Office in coordinating the broad array of FDA-related Codex activities.

Codex activities are part of the Animal Drugs and Feed's Program's overall International travel budget. There is no separate line item in the budget for Codex activities. In fiscal year 1999 the Animal Drugs and Feeds Program spent approximately

$3,000 on Codex activities. For fiscal year 2000 the anticipated expense is $5,000. The international travel budget is spread throughout the Program's budget.

Question. Dr. Woteki, you are aware that the Food Industry Codex Coalition strongly believes that adequate and dedicated line-item funding to support the activities of the U.S. Codex Office in the amount of $3.15 million is required for fiscal year 2000 to expand export opportunities for U.S. products and advance international food policy based on sound science. In fact, as Chair of the U.S. Codex Steering Committee, I understand that you have indicated to the Coalition that the Committee agrees with this need and is committed to working on securing this funding in the fiscal year 2001 budget cycle.

USDA answer. The Steering Committee is in agreement that the level of resource commitment described in the Coalition's proposal is desirable. However, it has not concluded that a line item for the U.S. Codex Office is the appropriate mechanism for assuring an appropriate level of activity in support of U.S. positions in Codex.

Question. Why do you not share the Coalition's concern that U.S. trade and food safety interests require these additional resources now and this additional funding should not be postponed until fiscal year 2001?

USDA answer. As you may know, the Administration was approached with the Coalition's proposal very late in the fiscal year 2000 budget development cycle. While the Codex Policy Steering Committee is in agreement that the proposed funding level is desirable, the Codex Policy Steering Committee decided to delay consideration of a line item for the U.S. Codex Office until fiscal year 2001. This would permit the Departments and Agencies to assess what their current spending is on Codex activities, how that might be offset by this new line item, and what would actually constitute an increased effort, if any.

Question. What is the relationship between the Codex Alimentarius and the agreements of the World Trade Organization, specifically to the science base of the Sanitary and Phytosanitary Standards?

USDA answer. The rules that govern international trade are those that were agreed during the Uruguay Round of Trade Negotiations and apply to the members of the World Trade Organization (WTO). With respect to food safety matters, those rules are set out in the Agreement on the Application of Sanitary and Phytosanitary Measures—The SPS Agreement. The overall objective of the SPS Agreement is to permit countries to take legitimate measures to protect the life and health of their consumers, but keeping them from using those measures in a way that unjustifiably restricts trade. The primary goal of the SPS Agreement is to limit the use of any measures that may restrict trade to those that are justified to provide the necessary level of health protection. It recognizes the right of Member States to protect their consumers at a level they consider necessary, subject to certain principles, such as consistency and transparency. Codex decisions are given new standing under SPS, as they are regarded as setting food safety standards as a baseline under SPS.

The standards, guidelines, and other recommendations of the Codex Alimentarius Commission are considered by the WTO to reflect international consensus regarding the requirements for protecting human health from foodborne risks. A Member State's food safety measures are considered justified and in accordance with the provisions of the SPS Agreement if they are based on Codex standards and related texts. While the adoption and application of Codex standards are not mandatory, failure to apply the Codex standards creates the potential for dispute if a Member State applies standards that are more restrictive of trade than necessary to achieve required levels of protection. Additionally, by the terms of the SPS Agreement, WTO members are committed to considering Codex standards as a basis for their national laws and regulations, and to participate in the development of those international standards.

FDA answer. The WTO Agreement on the Application of Sanitary and Phytosanitary Measures, the SPS Agreement, makes specific reference to the Codex Alimentarius Commission as an international standard setting organization whose standards WTO Members should use as a basis for national SPS measures. The SPS Agreement also obligates Members to participate actively in Codex, within the limits of their resources. With regard to the science basis for standards, the SPS Agreement requires that Members base their national measures both on scientific evidence and on international standards, specifying that Members can maintain more stringent SPS measures, if there is scientific justification, under the terms of the Agreement. Under the Agreement, national SPS measures that conform with Codex standards are presumed to be in accord with the SPS Agreement.

Question. Is the current budget sufficient to permit US trade agency representation at critical Codex meetings (Departments of State and Commerce and the United States Trade Representative) in order to proactively influence decisions key to US trade interests?

USDA answer. Currently, trade agency representation at Codex meetings is encouraged. In fiscal year 1998, the U.S. sent delegations to 13 foreign hosted meetings of Codex subsidiary committees. There was a total of 14 trade agency representatives on the United States' delegations to 10 of those meetings. Trade agencies' representatives were not members of delegations to the Cocoa and Cocoa Products, Mineral Water, and Nutrition and Foods for Special Dietary Use Committees.

FDA answer. FDA cannot respond on behalf of the U.S. trade agencies, but the Agency can address its roles, responsibilities, and related resource commitments with respect to Codex. While FDA does not have a specific line item in its appropriation, a significant amount of the Agency's resources is devoted to Codex activities. FDA expends funds to support a portion of the time of 39 individuals directly involved in 14 of the 16 Codex Committees. As the quantity of food products flowing in and out of this country is increasing at an ever rapid pace, the Agency must use a greater percentage of base resources each year to provide technical support for these U.S. trade agencies, and also represent U.S. interests at critical Codex meetings. FDA is involved in these activities in order to ensure the safety of imported products and accomplish our mission as stated in the Food and Drug Administration Modernization Act of 1997 Plan for Statutory Compliance, to ". . . participate through appropriate processes with representatives of other countries to reduce the burden of regulation, harmonize regulatory requirements, and achieve appropriate reciprocal arrangements."

Question. Would increased funding for Codex enhance our trade policy and US exports? What additional activities could be undertaken with increased funding?

USDA answer. Putting additional funds into a line item for Codex may not result in any additional activity. Agencies and departments already make decisions to fund activities that support our positions in Codex from their program funds. Spending from a line item account would likely offset that spending. While it would create an ease of administration with respect to some activities, such as paying for U.S. hosted meetings of Codex Committees, it would limit the flexibility agencies and departments now have to address changing priorities.

FDA answer. Yes, increased funding for Codex activities would enhance our trade policy and U.S. exports. With the World Trade Organization or WTO and the Sanitary and Phytosanitary System or SPS Agreement, the U.S. trade agencies will be more dependent on the agencies responsible for setting standards for both human and animal food. Increased funding would greatly enhance the U.S. efforts to ensure both public health and fair trade. In the future, it will be much more difficult to determine whether new standards are protective of public health or are just disguised trade barriers.

As one example, Codex, with the assistance of the Joint Expert Committee on Food Additives or JECFA, developed and adopted maximum residue levels for several hormones used to enhance growth in beef. Since Codex serves as the reference international organization for food safety standards under the World Trade Organization SPS Agreement, these Codex standards were accepted by a WTO panel in the dispute between the EU and the U.S. over the use of hormones in beef production. This case involved more than $200 million in beef exports to the EU and was subsequently won by the U.S. FDA personnel participated in both the Codex and JECFA deliberations. This example illustrates the value of Codex in enhancing our trade policy and U.S. food exports.

Presently, the Codex mandate is to protect the health of consumers while ensuring fair trade practices. FDA continues to focus on protecting public health, but as the demand for FDA's involvement in ensuring fair trade practices grows, comparable resources are needed. If FDA receives additional funds, the Agency can expand upon those existing activities that simultaneously ensure the safety of human and animal food, and enhance our exports and U.S. trade policy. FDA is involved in three major areas related to Codex and or U.S. trade. These are ensuring that Codex standards meet a high standard of public health and safety consistent with our level of protection, technical assistance to U.S. trade agencies and bilateral negotiations in matters of equivalency or assessment. FDA needs resources, both budget and FTE, that will support coordinated efforts with U.S. trade agencies to determine the impact of Codex activities on trade long before disputes are taken to the WTO. FDA is involved in these activities in order to ensure the safety of imported products and accomplish a key component our mission as stated in the Food and Drug Administration Modernization Act of 1997 Plan for Statutory Compliance.

Question. We are currently making a substantial investment in food safety research. For fiscal year 1999, the Administration indicates that a total of $108 million will be invested in food safety initiative research, including $70 million by the Agricultural Research Service, $28 million by the Food and Drug Administration, and $15 million by the Cooperative State Research, Education and Extension Serv-

ice. How is the food safety research funded by different agencies and through these various programs being coordinated to address research priorities and needs, to prevent duplication of effort?

USDA answer. These three agencies have had a collective history of consulting about research priorities, the specific needs that should be reflected in Requests for Proposals for extramural programs, and the research focus for internal programs. This interaction has been accelerated by the work of the Interagency Working Group, chaired by USDA Deputy Undersecretary Eileen Kennedy and DHHS Science Advisor William Raub. This group has been involved in compiling an extensive inventory of existing research in food safety using data from fiscal years 1997 and 1998. From this base, the agency scientists have analyzed the current portfolio and compared it to the expressed research needs stated by regulatory agencies, industry spokespersons, consumer representatives and other interested parties in a series of stakeholder listening sessions. This analysis has provided greater assurance that our research portfolios do reflect the stated needs of our stakeholders. These kinds of inputs have also created an impetus for shifting research funds from a focus almost entirely on meat, poultry, eggs, and dairy, to the inclusion of a larger segment of research on fresh fruits and vegetables as it was evident that this was an emerging problem area. By virtue of these analyses, we have been able to confirm that duplication of research efforts was not a serious issue.

FDA answer. The food safety agencies have worked to coordinate activities in every area of the initiative since the implementation of the Food Safety Initiative in May, 1997. In fiscal year 1998 and fiscal year 1999, FDA worked directly with USDA in establishing areas of responsibility for Food Safety Initiative research. In fiscal year 1999, FDA sent a letter to the USDA research agencies concerning the expenditure of $5 million by USDA in consultation with FDA and listing FDA's regulatory research needs that would potentially be more optimally performed by USDA. Most of the FDA research needs focus primarily on pre-harvest research areas that the intramural and extramural programs of the USDA research agencies have unique expertise and facilities, or for which FDA knows that there is USDA research already underway.

President Clinton signed an Executive Order in fiscal year 1998 that established the Joint Institute for Food Safety Research and formalized the interagency research planning process. Likewise, Executive Order 13100 was signed on August 24, 1998, establishing the Food Safety Council and formalizing an interagency food safety budget planning and overall strategic planning. The President's Council on Food Safety has the responsibility for the development a comprehensive strategic plan for federal food safety activities to the Council. The Council will develop a comprehensive plan to improve the safety of the nation's food supply by establishing a seamless, science-based food safety system. The plan will address the steps necessary to achieve this improved system, focusing on key public health, resource, and management issues and including measurable outcome goals.

The Animal Drugs and Feeds Program initiated a detailed planning session designed to focus on food safety issues related to our regulatory mission, specifically, the impact of animal feed and antibiotics used in food producing animals on human health through the transmission of food-borne pathogens and/or the development and dissemination of antibiotic resistance. As an integral part of the planning efforts, scientists from FDA and other federal agencies such as USDA/ARS, and USDA/FSIS were actively involved with the development of our research plans, in large measure to avoid duplication of effort. In addition, the Animal Drugs and Feeds Program scientists participated in the planning activities of these same agencies. This process has continued to keep the other agencies apprised of our ongoing activities as well as their activities, explore areas for collaborative research efforts, and be able to respond to changing research needs and priorities.

Question. How are research results being shared and utilized by the various agencies involved in food safety? (USDA's REE)

USDA answer. Research results are being shared and utilized among the various agencies involved in food safety research. The staff members of the REE agencies are in frequent contact with one another regarding research agendas in their respective program areas. They participate with each other in workshop and committee meetings, and they serve together on many governmental and professional committees and in joint budget initiatives. The Under Secretary of REE has worked with members of the various agency staffs to prepare an Inventory of Food Safety Research which will serve as the basis for interagency program planning. The ARS has established formal liaison with both the FSIS and the FDA who have the responsibility to coordinate the research needs of these agencies with the available ARS research capabilities. Yearly workshops are held to review results and plan and coordinate research to meet new needs of these regulatory agencies. In addition there

is oversight of all food safety activities by the newly formed Food Safety Council. Reporting to the Council will be the new Joint Institute for Food Safety Research which will be a coordinating body among the food safety research agencies in both USDA and DHHS.

CSREES has a strong interaction with all other agencies involved in the food safety agenda of the Federal government as well as strong linkages with the land-grant and other universities. Examples of the latter are the fact that we regularly receive input on adequacy of Requests for Proposals from merit review panels following their review and critique of a set of submitted proposals. These faculty come from the potential recipient universities and usually have close contact with many other stake holders. To ensure formal involvement, most of the invited speakers at the First Annual Food Safety Conference held on November 12–13, 1998, and sponsored by CSREES and ARS, were from the research community in the land-grant system. This conference was focused on establishing research needs and included substantive dialogue between industry, consumer, and other stakeholders on the one hand, and interested research scientists on the other.

The substance of the Requests for Proposals for both the National Research Initiative and the Special Research Grants program was discussed with all other Federal agencies, including FDA, prior to the final version being submitted for administrative review and publication. CSREES has taken up the responsibility of providing a major portion of the educational effort needed to ensure a smooth transition to the FDA Guidance Document, "Minimizing Microbial Contamination of Fresh Fruits and Vegetables".

CSREES provided funding for the domestic conference which was focused on development of the educational program and framework for the domestic grower of fresh fruits and vegetables. CSREES scientists have participated with scientists from other Federal agencies in the Interagency Working Group which has just completed an analysis of the current (1998) food safety research portfolio. This analysis will provide a beginning point for the new Joint Institute for Food Safety Research as it begins to coordinate and oversee the Federal research effort on food safety.

Other interagency efforts currently in place include a mycotoxin committee linking FDA and USDA scientists in an effort to establish some mutual goals and objectives. CSREES scientists are also participating in a USDA task force on antibiotic resistance and CSREES program scientists are having discussions with FDA-Center for Veterinary Medicine on specific responses to the increasing concern about antibiotic resistance and the research needs which this issue has surfaced.

FDA answer. The results of food safety research efforts are shared among Federal food safety agencies, industry, and the public through multiple means. Within the scientific community, communication among researchers has always been the cornerstone upon which scientific advances have been built. Scientists have developed numerous formal and informal venues for the exchange of knowledge such as scientific publications, meeting of professional societies and internet bulletin boards. In addition, food safety researchers and the agencies to which they belong make a concerted effort to research segments of the country's population that can benefit from the scientific advances. For example, during the past year the FDA hosted two technical workshops for the manufacturers of orange juice to allow scientists to share the latest advances in methods for preventing unpasteurized orange juice from being contaminated with foodborne pathogenic bacteria. Similar workshops have been held with the sprouted seed industry and are planned for apple cider industry. There is also a concerted effort on the part of the food safety research community to inform the public of scientific advances. For example, FDA scientists working on research in support of the National Food Safety Initiative have been posting plain language reports of their research projects on the FDA's Center for Food Safety and Applied Nutrition internet web site. One of the goals of the newly established Joint Institute for Food Safety Research is to further enhance the communicate of food safety research advances to all interested parties.

The Animal Drugs and Feeds Program initiated a detailed planning session designed to focus on food safety issues related to our regulatory mission, specifically, the impact of animal feed and antibiotics used in food producing animals on human health through the transmission of foodborne pathogens and/or the development and dissemination of antibiotic resistance. As an integral part of the planning efforts, scientists from FDA and other federal agencies such as USDA/ARS, and USDA/FSIS were actively involved with the development of our research plans, in large measure to avoid duplication of effort. In addition, the Animal Drugs and Feeds Program scientists participated in the planning activities of these same agencies. This process has continued to keep the other agencies apprised of our ongoing activities as well as their activities, explore areas for collaborative research efforts, and be able to responsive to changing research needs and priorities.

CDC surveillance information is communicated to FDA and USDA on a regular basis. Also, through laboratory networks such as PulseNet, diagnostic information is shared very quickly electronically. For example, laboratories participating in PulseNet have a direct link with a central computer and electronic database of DNA "fingerprints" maintained at CDC. Laboratories are able to submit patterns to the national database online and obtain epidemiologic information associated with patterns in the database, If patterns submitted by laboratories in different locations during a defined time period are found to match, the CDC computer alerts PulseNet participants of a possible multistage outbreak so that a timely investigation can be done. If a bacterial strain is isolated from a suspected food, the strains from humans and suspected food can be compared quickly. Thus, matching patterns can indicate possible nationwide outbreaks and lead to public health actions such as epidemiologic investigations, product recalls, and ultimately to regulatory and other changes to prevent widespread outbreaks.

Such efforts have stimulated additional interagency collaboration to develop new, and evaluate existing, systems for sharing important information.

Question. Please distinguish the role of the various agencies in food safety research.

USDA answer. The Agricultural Research Service (ARS), as the intramural research agency of the U. S. Department of Agriculture, is considered to be the first response agency for the primary USDA regulatory agency, the Food Safety and Inspection Service. The ARS provides much of the expertise for development of detection systems required for regulatory oversight plus information about intervention methods, especially in meat and poultry. This agency is also well suited to undertake long term investigations that require a long period of sustained funding to accomplish the stated goal, a process not well suited to smaller, investigator initiated projects from the public sector.

The Cooperative State Research, Education, and Extension Service provides funding to extramural research organizations, universities, and institutes in both public and private settings. It benefits from investigator initiated proposals which bring forward new concepts and ideas for control of food safety hazards. Because these extramural programs can draw on a vast array of expertise in the university system, proposals may cover a very wide spectrum. In the National Research Initiative, the focus is on basic or fundamental research which can then provide information of use in more applied research efforts within our Food Safety Special Grants program or as a basis for extension educational programs.

The Economic Research Service (ERS) determines estimates of the costs of food borne illnesses and evaluates economic consequences for consumers of policies and programs which reduce food borne disease incidence and their associated medical costs and productivity losses. With respect to risk assessments, ERS evaluates the costs and benefits of alternative pathogen control strategies.

To summarize, it does appear that each agency has a specific mission or role to fulfill and the research programs of the various agencies are complementary and not duplicative. In addition, ARS scientists are often located in close proximity to the Department's partners in the academic community, providing further opportunity for collaboration and communication between researchers.

FDA answer. Considering the highly complex nature of food safety concerns and the wide array of factors that can impact the safety of the U.S. food supply, it is not surprising that there are a number of agencies that contribute to the Federal food safety research effort. The primary agencies within the Department of Health and Human Services that directly conduct food safety research are the FDA and the CDC. In addition, the NIH supports fundamental research that provides scientific advances that contribute to the general advancement of public health research. Within the USDA the primary research agencies are the ARS which is the intramural research agency for USDA, and the Cooperative State Research Education, and Extension Service or CSREES which is the extramural research agency. In addition to these agencies these are a number of other agencies, such as DOD, EPA, and NMFS, that have smaller, focused food safety research programs.

The specific areas and aspects of food safety research undertaken by the individual agencies largely reflect the mission of the agency. For example, the FDA CFSAN research program is in direct support of the Agency's need to have scientifically based inspection systems and food safety policies. Thus, the research program has focused on the development of effective detection methods, the evaluation of post-harvest intervention and prevention technologies, and the advancement of risk assessment techniques. Conversely, a substantial portion of the ARS food safety research has focused on the development of pre-harvest methods for preventing the introduction of human pathogens at the agricultural production level. Such a diverse research portfolio has the potential for unplanned redundancy of efforts. To avoid

this, there has always been a high degree of coordination among food safety research agencies and their scientists. This is being enhanced further by the establishment of the Joint Institute for Food Safety Research which will provide a formal mechanism for coordination of food safety research planning.

CDC plays a critical and unique role as a monitoring, investigative, and advisory agency, and works closely with Federal food safety regulatory agencies. CDC is the cornerstone Federal agency for identifying and monitoring foodborne and other human illness; for detecting, investigating, and responding to outbreaks of foodborne illness; and for documenting the effectiveness of prevention and control efforts.

In addition to surveillance and response, CDC conducts applied research. Examples include developing laboratory diagnostic techniques; developing methods to subtype, or "fingerprint" pathogens causing foodborne illness; conducting risk factor studies for foodborne illness in special populations, such as the immunocompromised; and performing cost-effectiveness studies of potential prevention measures.

FDA's role in food safety research is based on the need to maintain safety and efficacy of food animal drugs, food additives, packaging materials, and diagnostic kits. The research is used to define science-based policies and regulatory frameworks. The FDA Animal Drugs and Feeds Program has focused on those FSI activities, as specified in the document "Food Safety from Farm to Table," which relate to the Animal Drugs and Feeds regulatory mandate. The research developed from FSI research areas will aid the Animal Drugs and Feeds Program and Agency in formulating policy and regulations related to antibiotic use in food-producing animals and the potential impact on human health.

Question. What research is currently being carried out by each agency for fiscal year 1999? What is planned for fiscal year 2000? Please provide a description of each research project, the level of funds for the project, and indicate who is carrying out the research.

USDA answer. Food Safety activities are carried out by CSREES, NASS, ERS, and ARS. The Cooperative State Research, Education, and Extension Service (CSREES) has not yet made any awards under its competitive grants program in the National Research Initiative or in the Food Safety Special Research Grants program for fiscal year 1999. The Requests for Proposals have been issued and the focus of these Requests are as follows. In the regular National Research Initiative Food Safety program ($4.5 million), proposals have been requested that focus on control and prevention strategies, sources of microbial contamination, improved sampling and detection systems for bacteria, an understanding of the mechanisms of antibiotic resistance, risk assessment and hazard evaluation, studies on consumer behavior and adoption of safe food habits by consumers, and mechanisms of microbial pathogenesis in humans. The National Research Initiative Supplemental grant program ($5 million) will focus on epidemiologic investigations of food borne pathogens within all segments of the farm to table continuum and in all types of food products, including meat, poultry, dairy, and fresh fruits and vegetables. The goal of this supplemental program is to have a major focus on the production segment of the food chain and provide information needed to develop best management practices or conduct meaningful risk assessment studies on specific pathogens.

The Special Grants Program in Food Safety ($5 million) will continue to have some focus on fresh fruits and vegetables with more of an emphasis on applied studies on the production segment of the industry. Other specific issues include development of risk assessment models for specific segments of the food chain with a special emphasis on ready-to-eat foods, and establishing the scientific basis and models for establishing and validating critical control points in the food chain. This Request for Proposals is expected to be released on about April 1, 1999.

For the fiscal year 2000, CSREES has requested $10.1 million increase in food safety research to strengthen efforts in risk assessment research, and in the epidemiology of food borne pathogens and development of improved control and prevention methods including implementation of Good Production Practices by producers and growers.

The National Agricultural Statistics Service (NASS) has requested for fiscal year 2000 $2.5 million to conduct a survey of fruit and vegetable growers, as well as packing houses, to establish a baseline for good agricultural practices as they relate to microbial food safety issues. The survey would consist of core questions covering water and manure management, facility sanitation, worker sanitation and hygiene, and transportation practices. In fiscal year 1999, NASS will conduct a pilot study in California and New York to provide information for the final design of materials and plans for the requested nationwide baseline survey effort in fiscal year 2000. These two pilot States were chosen based on distinct differences in crops grown, growing conditions, and agricultural practices.

Total Economic Research Service (ERS) funding for food safety research in fiscal year 1999 is $938,000. ERS is continuing research on the costs associated with illnesses associated with microbial pathogens in food. Starting with the estimated number of illnesses, and examining the nature and severity of the illness, ERS analysts have calculated the medical costs, based on the typical treatment for each type of illness. This year we have completed a project to re-estimate the medical costs of disease caused by one specific pathogen, Salmonella. We conducted a joint research project with staff of the Centers for Disease Control and Prevention, using data from the FoodNet Surveillance System, to re-evaluate the number of cases of Salmonellosis, and to re-estimate the medical costs and productivity losses using new data sources. Preliminary findings are that the total costs of illnesses associated with Salmonella in food are lower than previously thought. Final results will be released when the FoodNet estimates on the number of Salmonellosis cases are cleared by CDC. ERS has also completed a study evaluating the alternative economic methods for placing premature death from foodborne illness in an economic perspective. These methods allow us to estimate the costs to society from premature death. ERS is planning a major conference for fiscal year 2000 to provide guidance to decision makers on the best methodologies for placing an economic value on premature death.

For fiscal year 2000, ERS has requested $1,391,000, which includes an increase to support economic analysis in risk assessment. In fiscal year 1999, ERS has worked with the Risk Assessment Consortium (established under the President's Food Safety Initiative), to begin ranking foodborne health risks on the basis of their economic cost to society. We intend that these funds will be awarded under a competitive grants process, where one or more research programs will be funded over three years to apply state-of-the-art economic analysis to estimate the benefits of making the U.S. food supply safer, and to expand our risk assessment activities to include analysis of the economic burden placed on society by additional sources of foodborne health risk.

In fiscal year 1999, Agricultural Research Service (ARS) is providing $69,867,600 for food safety research specifically in the areas of detection and prevention/control of food borne hazards; antimicrobial/antibiotic resistance; risk assessment; and food handling, distribution and storage. In fiscal year 2000, ARS is requesting an increase of $11.7 million to support additional food safety research, for a total of $81,589,600.

In fiscal year 1999, ARS undertook 40 projects ($14.2 million) in detection of food borne pathogens; 70 projects ($37.9 million) in prevention and control of pathogens; 7 projects ($2.2 million) in antimicrobial/antibiotic resistance; 9 projects ($4.9 million) in risk assessment; and 18 projects ($10.6 million) in food handling, distribution and storage.

In fiscal year 2000, ARS plans to undertake additional research in the following areas: detection of food borne pathogens ($700,000); prevention and control of pathogens ($4,750,000); antimicrobial/antibiotic resistance ($3,420,000); risk assessment ($2,400,000); and food handling, distribution and storage ($450,000).

A listing of the fiscal year 1999 ARS projects is provided for the record.

[The information follows:]

ARS PROJECTS

[Fiscal year 1999]

Research title	Funds	Location
DETECTION OF FOOD BORNE PATHOGENS		
Food Safety Pathogen Reduction	110,000	Headquarters
Agricultural vs Natural Habitats as Sources of Cryptosporidium Parvum	42,100	Beltsville, MD
Epidemiology and Control of Toxoplasma, Trichinella and Related Parasites	353,400	Beltsville, MD
Prevention and Therapy for Protozoan Parasites	245,700	Beltsville, MD
New Technologies to Improve and Assess Meat Quality and Safety	344,700	Beltsville, MD
Develop Detection Methods for Cryptosporidium	296,400	Beltsville, MD
Methods of Analysis for Residues in Meat and Agric. Products	310,300	Beltsville, MD
New Handling Systems and Pathogen Decontamination Technology for Fruits	59,300	Beltsville, MD

ARS PROJECTS—Continued

[Fiscal year 1999]

Research title	Funds	Location
New Handling Systems and Pathogen Decontamination Technology for Fruits	59,300	Beltsville, MD
Detection of Pathogenic Bacteria by Biosensors	1,141,000	Wyndmoor, PA
Advanced Technologies for the Analysis of Contaminants in Foods	1,093,600	Wyndmoor, PA
Rapid Pathogen Diagnostic and Detection Methods	541,900	Wyndmoor, PA/ Purdue University
Stress Adaptation and Virulence Expression of Pathogens in Food	328,300	Wyndmoor, PA
Food Safety Engineering Univ. Of Purdue: Biosensor Technology	988,000	Wyndmoor, PA
ARS Microbial Germplasm Collection for Agricultural and Industrial Uses	378,800	Peoria, IL
Supercritical Fluid Techniques for Food Safety and Nutrient Analysis	434,100	Peoria, IL
Detection, Identification, and Surveillance of Mycotoxins in Cereals	826,100	Peoria, IL
Prevention of Loss from Colibacillosis/E. coli O157:H7 in Cattle and Swine	284,300	Ames, IA
Prevention in Livestock of Potential Human Foodborne Pathogens	487,000	Ames, IA
Treatment/Handling of Animal Manure to Prevent Pathogen Transmission	148,200	Riverside, CA
Control of Pathogens on Surfaces of Poultry and of Fruits and Vegetables	478,100	Albany, CA
Adhesion of Human Pathogens to Surfaces of Poultry, Fruits and Vegetables	538,500	Albany, CA
Removal of Aflatoxin Contamination from Human Foods in Real-Time by Imaging Techniques	215,000	Albany, CA
Treatment of Animal Manure to Prevent Pathogen Transmission	148,200	Albany, CA
Pinus and Gutierrezia Species: Toxicoses and Abortion in Livestock	53,700	Logan, UT
Astragalus and Oxytropis Poisoning in Livestock	63,600	Logan, UT
Livestock Poisoning by Pyrrolizidine Alkaloids and Other Hepatotoxic and Teratogenic Plants	43,800	Logan, UT
Poisoning of Livestock by Larkspur (Delphinium) Species	53,700	Logan, UT
On-Line Verification and Intervention Procedures for HACCP in Slaughter/Processing Systems	436,500	Clay Center, NE
Control of Salmonella and E. coli O157:H7 in Livestock/Preharvest	783,400	Clay Center, NE
Prevent the Occurrence of Toxins in Water/Protect Food and Environment	296,400	Fargo, ND
Methodology Development for Rapid Analysis of Drug and Pesticide Residues in Food Animal Products	797,000	College Station, TX
Mississippi Center for Food Safety and Postharvest Technology	358,700	Mississippi ST,
MS Determine Isoflavonoid Induction in Legumes and Their Phytoestrogenic Effects in Animal Systems	206,200	New Orleans, LA
Post-Mortem Muscle/Meat Changes That Affect Product Safety and Quality	414,100	Athens, GA
Reduction of Fusarium Mycotoxins in Agricultural Commodities	166,500	Athens, GA
Rapid Pathogen Diagnostic and Detection Methods	245,500	Athens, GA
Reduction of Biofilms Related to Bacterial Contamination and Pathogen Load During Poultry Processing.	297,600	Athens, GA
Prevent Pathogen Transmission in Animal Manure	74,100	Athens, GA

ARS PROJECTS—Continued

[Fiscal year 1999]

Research title	Funds	Location
Treatment of Poultry Manure to Prevent Pathogen Transmission	74,100	Athens, GA
TOTAL	14,217,200	
PREVENTION AND CONTROL OF PATHOGENS		
Preharvest Control of Aflatoxin	861,200	Headquarters
Food Safety Pathogen Reduction	105,700	Headquarters
Assessment of Agricultural vs Natural Habitats as Sources of C. Parvum	168,500	Beltsville, MD
Epidemiology and Control of Toxoplasma, Trichinella and Related Parasites	342,700	Beltsville, MD
Strategies to Control Swine Parasites Affecting Food Safety	766,600	Beltsville, MD
Prevention and Therapy for Protozoan Parasites	245,600	Beltsville, MD
Animal Waste Handling Systems to Prevent Pathogen Transmission	592,800	Beltsville, MD
Fate and Environmental Impact of Agricultural Nutrients in Sustainable Production Systems	350,800	Beltsville, MD
The Effect of Plant Genetics and Zinc on Cadmium Concentration and Bioavailability in Crops	218,200	Beltsville, MD
Composting, Stabilization, and Safe Use of Manure and Mineral By-Products from Rural/Urban Areas	790,800	Beltsville, MD
Integrated Soil-Nutrient-Crop-Microbial-Pest-Waste Management Strategies for Sustainable Agriculture	240,600	Beltsville, MD
Development of Techniques for Inspection of Poultry Carcasses	1,001,800	Beltsville, MD
New Handling Systems and Pathogen Decontamination Technology for Fruits	177,800	Beltsville, MD
New Handling Systems and Pathogen Decontamination Technology for Fruits	177,800	Beltsville, MD
Quality Maintenance and Food Safety of Fresh and Fresh Fruits/Vegetables	545,200	Beltsville, MD
Agricultural Approaches to Human Health Through Understanding Soil-Plant-Human/Animal Food Systems	166,500	Ithaca, NY
Improving the Nutritional Quality and Stress Tolerance of Food Crop Species	149,700	Ithaca, NY
Interventions to Improve the Microbiological Safety and Quality of Fruits and Vegetables	776,000	Wyndmoor, PA
Pathogen Contamination in Food Producing Swine	296,400	West Lafayette, IN
Molecular Approach to Understand/Control Fusarium Infection and Mycotoxin Contamination of Crops	852,800	Peoria, IL
Strategies for Developing Maize Kernels Resistant to Invasion by Fusarium	222,700	Peoria, IL
Control of Fusarium Mycotoxins and Diseases in Corn and Small Grains	984,000	Peoria, IL
Integrated Control of Aspergillus Flavus and Aflatoxin in the Midwest Corn Belt	1,201,100	Peoria, IL
Control and Prevention of Cryptosporidium Parvum Infection	415,700	Ames, IA
Rumen Microbes and Their Interactions with Secondary Plant Metabolites	475,800	Ames, IA
Prevention of Losses from Colibacillosis and E. coli O157:H7 in Cattle/Swine	710,800	Ames, IA
Epidemiology and Control of Salmonella	657,200	Ames, IA
Prevent Zoonotic Pathogen Transmission in Swine	592,800	Ames, IA

ARS PROJECTS—Continued

[Fiscal year 1999]

Research title	Funds	Location
Prevent Pathogen Contamination in Food Producing Animals, Swine	296,400	Ames, IA
Treatment/Handling of Animal Manure to Prevent Pathogen Transmission	444,600	Riverside, CA
Practical Application of Molecular Genetics for Improved Potato Cultivars	327,700	Albany, CA
Reduction of Aflatoxin in Tree Nuts and Figs Through Control of Major Insect Vectors	946,900	Albany, CA
Control and Prevention of Aflatoxin Formation in Tree Nuts	750,100	Albany, CA
Control of Pathogens on Surfaces of Poultry and of Fruits/Vegetables	697,200	Albany, CA
Adhesion of Human Pathogens to Surfaces of Poultry Fruits/Vegetables	517,000	Albany, CA
Treatment of Animal Manure to Prevent Pathogen Transmission	444,600	Albany, CA

Astragalus and Oxytropis Poisoning in Livestock	572,100	Logan, UT
Livestock Poisoning by Pyrrolizidine Alkaloids and Other Hepatotoxic and Teratogenic Plants	394,200	Logan, UT
Poisoning of Livestock by Larkspur (Delphinium) Species	483,100	Logan, UT
Control of Salmonella and E. coli O157:H7 in Livestock During Preharvest	1,081,900	Clay Center, NE
Determine the Correlation Between Production and Transportation Practices in Cattle	296,400	Clay Center, NE
Cytokine-Mediated Modulation of the Innate Immune Response to Prevent Salmonellosis in Poultry	539,500	College Station, TX
Development of Microbial CEC Methods to Reduce Pathogens in Swine	1,249,900	College Station, TX
Prevention and Control of Salmonella and Other Enteropathogens in Poultry During Growout	1,189,400	College Station, TX
Prevent Pathogen Contamination in Food Producing Animals, Cattle	281,600	Lubbock, TX
Disease Related Problems of Poultry Production and Processing	293,800	Fayetteville, AR
Enhancing Biotic Pest Resistance in Corn Germplasm	669,100	Mississippi ST, MS
Aflatoxin Control Through Targeting Gene Cluster Governing Aflatoxin Synthesis in Corn and Cottonseed	1,019,900	New Orleans, LA
Modification of Fungal Community Structure to Improve Food Safety	488,600	New Orleans,
LA Aflatoxin Control Through Addition of Enhancement of Antifungal Genes in Corn and Cotton	1,324,200	New Orleans, LA
Development of Improved Peanut Germplasm with Resistance to Disease and Nematode Pests	267,700	Tifton, GA
Genetic Improvement of Corn and Sorghum for Resistance to Insects and Aflatoxin	151,700	Tifton, GA
Plant Resistance and Germplasm Enhancement for Managing Insect Pests of Southern Crops	145,000	Tifton, GA
Biochemical, Physical, Microbiological Management for Prevention of Mycotoxin in Peanuts	745,600	Dawson, GA
Pathogenesis, Detection, and Control of S. Enteritidis and Other Salmonellae in Chickens	1,025,400	Athens, GA
Stimulation of Mucosal Immunity in Chickens to Protect Against Enteric and Respiratory Pathogens	371,200	Athens, GA
Engineering Innovations and Micro Developments to Reduce Contamination of Poultry and Equipment	537,500	Athens, GA

ARS PROJECTS—Continued

[Fiscal year 1999]

Research title	Funds	Location
Control of Campylobacter Jejuni in Poultry	1,117,400	Athens, GA
Control of Salmonella During Poultry Production	844,400	Athens, GA
Reduction of Fusarium Mycotoxins as Concerns in Agricultural Commodities	666,000	Athens, GA
Control and Prevention of Mycotoxin Formation by the Corn Endophyte Fusarium Moniliforme	1,032,300	Athens, GA
Epidemiology and Ecology of S. Enteritidis in Commercial Poultry Flocks	327,400	Athens, GA
Food Safety-Pathogen Reduction in Poultry	237,000	Athens, GA
Prevent Pathogen Transmission in Animal Manure	222,300	Athens, GA
Treatment of Poultry Manure to Prevent Pathogen Transmission	222,300	Athens, GA
On-Line Detection Technology: PPQRU RRRC/Institute Technology Development	439,100	Athens, GA/Inst. Of Tech. Dev.
Food Safety, Waste Minimization, and Value Enhancement of Fermented and Lightly Processed Vegetables	491,800	Raleigh, NC
National Agricultural Library: Food Safety Data Base	219,600	Beltsville, MD
TOTAL	37,942,600	
ANTIMICROBIAL/ANTIBIOTIC RESISTANCE		
Assurance of Microbiological Safety of Thermally Processed Foods	159,900	Wyndmoor, PA
Stress Adaptation and Virulence Expression of Bacterial Pathogens in Food Environments	506,100	Wyndmoor, PA
Improve Safety and Shelf-Life of Meat and Poultry with Ionizing Radiation	156,700	Wyndmoor, PA
Epidemiology and Control of Salmonella	295,300	Ames, IA
Development of Microbial CEC Methods to Reduce Pathogens in Swine	588,200	College Station, TX
Pathogen Reduction in Poultry	218,800	Athens, GA
Antibiotic Resistance Research	296,400	Athens, GA
Total	2,221,400	
RISK ASSESSMENT		
Epemiology and Control of Toxoplasma, Trichinella in Domestic Animals	374,800	Beltsville, MD
New Technologies to Improve and Assess Meat Quality and Safety	344,700	Beltsville, MD
Minimally Degradative Pasteurization Processes for Liquid or Solid Foods	302,900	Wyndmoor, PA
Assurance of Microbiological Safety of Thermally Processed Foods	399,900	Wyndmoor, PA
Risk Modeling to Improve the Microbiological Safety of Poultry Products	120,700	Wyndmoor, PA
Microbial Modeling Components for Use in Risk Assessments	1,209,600	Wyndmoor, PA
Improve Safety and Shelf-Life of Meat and Poultry by Irradiation	156,700	Wyndmoor, PA
Disposition of Beta-Agonists in Farm Animals	915,300	Fargo, ND
Dioxins and Other Environmental Contaminants in Foods	1,084,400	Fargo, ND

Stress Adaptation and Virulence Expression of Pathogens in Food	533,400	Wyndmoor, PA
Improve Safety and Shelf-Life of Meat/Poultry with Ionizing Radiation	1,253,800	Wyndmoor, PA
Quantitative Determination of Pathogen Reduction During Animal Slaughter and Food Processing	966,700	Wyndmoor, PA
Control of Pathogens on Surfaces of Poultry and Fruits and Vegetables	816,700	Albany, CA
Adhesion of Human Pathogens to Surfaces of Poultry and Fruits/Vegetables	1,098,600	Albany, CA
Adv. Technologies for Reduction of Microorganisms and Particulate Matter in Food Processing	541,300	Albany, CA
Removal of Aflatoxin Contamination from Human Foods in Real Time by Imaging Techniques	215,000	Albany, CA
Control of Pathogenic and Spoilage Bacteria on Red Meat	844,400	Clay Center, NE
Develop On-Line Verification and Intervention Procedures for HACCP in Slaughter/Processing Systems	436,500	Clay Center, NE
Engineering Innovations and Micro Developments to Reduce Contamination of Poultry and Equipment	537,500	Athens, GA
Reduction of Biofilms Related to Bacterial Contamination and Pathogen Load During Poultry Processing.	604,200	Athens, GA
Total	10,577,400	
Total Food Safety	69,867,600	

FDA answer. The applied research CDC conducts is directed toward developing and enhancing surveillance of foodborne illness, and is supported under the surveillance line of the Food Safety Initiative budget. For example, CDC's FSI resources are directed toward increasing CDC's capacity to identify new foodborne hazards and characterize the risk posed by those hazards, increasing the speed with which the presence of hazards in foods can be determined and controlled, and increasing the accuracy and timeliness of public health data that justify food safety control programs and evaluate their effectiveness.

FDA would be happy to provide this information for the record.

[The information follows:]

FOOD SAFETY RESEARCH

The 1999 Food Safety Initiative builds on science-based gains in research during 1998. The initiative places increased emphasis on ensuring the safety of domestic and imported fresh produce and imported foods, and develops scientific information and tools to control a greater range of food safety hazards. The 2000 President's Food Safety Initiative builds on the foundation established in 1998 and 1999 for research and risk assessment activities. The following information provides greater detail on research projects for fiscal year 1999 and 2000:

Planned Activities Funded by Fiscal Year 1999 Funds

FDA's FSI base resources and $25 million appropriation in fiscal year 1999 will support the following activities and accomplishments in the area of research and risk assessment:

—research toward pathogen growth and control in areas critical to reduce microbial risk in produce;

—improved detection methods (rapid tests) to identify a broader range of pathogens on food products (fresh fruits and vegetables), throughout food production, manufacturing and distribution systems;

—develop prevention/intervention strategies, with research on the development of alternative food production, processing, and handling systems that eliminate or pathogen contamination; and risk assessments of Listeria, Vibrio Parahaemolyticus, and methyl mercury.

Planned Activities Funded by Proposed Fiscal Year 2000 Funds

FDA's fiscal year 1999 FSI base resources and the proposed $3 million increase requested in fiscal year 2000 for research are expected to support the following activities:

—extramural contracts to further expand methods development and prevention technology research. These contracts will be supported with other Federal agencies; upgrade scientific equipment;

—expand data collection on contaminated foods associated with foodborne outbreaks and characteristics of people who did not become ill after exposure to the same foods;

—expand development of appropriate animal models for determining whether threshold or non-threshold models for infectivity are more appropriate for describing low dose infectivity rates for infectious and toxicoinfectious microorganisms;

—expand development of modeling techniques for assessing human exposure to a variety of foodborne contaminants especially emerging pathogens.

The following table provides a list of research projects planned by FDA in fiscal year 2000

Research Projects/Project Title	*Estimated Project Cost* [1]
Sampling for Pathogens on Produce	$1,500,000
Molecular Characterization of Maverick Strains of Enterohemorrhagic E. coli	400,000
Effects of Environmental Conditions, Phytochemicals, Modified Atmosphere Packaging and other Parameters for the Growth and Survival of Foodborne Pathogens on Produce, Particularly Sprouted Seeds	1,200,000
Molecular Mechanisms for Pathogen Emergence	1,250,000
Identification and Characterization of Virulence Determinants for Salmonella enteritidis and Vibrio vulnificus	400,000
Cyclospora Detection and Viability Assessment	450,000
Characterization of Pathogenic Aquatic Eucaryotes and their Toxins	1,500,000
Control of Viral and Bacterial Human Pathogens in Seafood	650,000
Assessment of Technologies for Pathogen Reduction or Elimination	1,750,000
Study of Mycotoxins	1,650,000
Virulence Assessment and Molecular Pathogenesis of Salmonella Typhimurium DT 104 and Shigella	450,000
Minimizing Biogenic Amine Formation in Seafood and Other Commodities	540,000

[1] The following estimated costs for each project are based on base resources (fiscal years 1997, 1998 and 1999) plus requested increases in fiscal year 2000.

ANIMAL DRUGS AND FEEDS PROGRAM/RESEARCH

Research Project	Organization Carrying Out Research	Fiscal Year 1999 Funding
Detection procedures for pathogens in meat, eggs, animal feed and the environment.	University of Tennessee Center for Veterinary Medicine.	$400,000
Pathogen reduction in animal feeds	Washington State University Center for Veterinary Medicine.	300,000
Pathogen reduction research on food producing animals and the environment.	University of Wisconsin, University of Georgia, ARS/USDA, Center for Veterinary Medicine.	800,000
Determine impact of antibiotic use in feed on bacterial resistance development and pathogen transmission in food producing animals and the environment.	Center for Veterinary Medicine	300,000
Evaluate effects of various drug doses and routes of administration on bacterial antibiotic resistance development and dissemination.	New England Medical Center William Beaumont Hospital Center for Veterinary Medicine.	700,000

FDA food safety research being conducted in fiscal year 1999 with NCTE for the Animal Drug and feeds Program ($85,000 from the Surveillance FSI program to NCTE) includes assessing microbial products intended for food animals that are designed to reduce colonization by Salmonella, evaluation of antimicrobial drug resistance in these products, development of rapid screening tests for antimicrobial drug resistance determinants and food borne pathogens, and identification of bovine mitochondrial DNA contaminants in animal feed.

ANIMAL DRUGS AND FEEDS PROGRAM/RESEARCH

Research Project	Organization Carrying Out Research [1]	Fiscal Year 1999 Funding
Detection procedures for pathogens in meat, eggs, animal feed and the environment.	University of Tennessee Center for Veterinary Medicine.	$800,000
Pathogen reduction in animal feeds	Washington State University Center for Veterinary Medicine.	300,000
Pathogen reduction research on food producing animals and the environment.	Center for Veterinary Medicine	800,000
Determine impact of antibiotic use in feed on bacterial resistance development and pathogen transmission in food producing animals and the environment.	Center for Veterinary Medicine	300,000
Evaluate effects of various drug doses and routes of administration on bacterial antibiotic resistance development and dissemination.	New England Medical Center, William Beaumont Hospital, Center for Veterinary Medicine.	1,000,000
Characterization of bacterial multiple antimicrobial resistance mechanisms in animals and the environment.	Center for Veterinary Medicine	500,000

[1] In fiscal year 2000 a request for proposals will be advertised and additional cooperative agreements will be funded in addition to the ones mentioned.

Question. The Administration indicates that $20 million will be invested in fiscal year 1999 through the Food Safety Initiative on education. Would you please describe the various education activities planned or being undertaken by each of the five USDA agencies, the Food and Drug Administration, and the CDC?

USDA answer. A food safety video for use in senior citizens' centers will be produced and distributed in cooperation with FDA. Other activities planned for 1999 and 2000 include work with the Partnership for Food Safety Education's "Fight

BAC! " campaign; observance of National Food Safety Education Month; curriculum development, aimed at bringing the farm-to-table Initiative into classrooms nationwide; and publications distribution. Participating agencies have also formed the National Food Safety Information Network to bring together the government's primary mechanisms for providing food safety information to the public. The National Food Safety Information Network consists of the following media: FDA's Food Information Line, USDA's Meat and Poultry Hotline, USDA/FDA Foodborne Illness Education Information Center at the National Agricultural Library; www.FoodSafety.gov, the Gateway to Government Food Safety Information on the World Wide Web; FoodSafe, an electronic dissemination system; and EdNet, an electronic newsletter for food safety educators.

In the area of pre-harvest food safety education, FSIS is working to establish animal production food safety partnerships with State agriculture agencies. FSIS is also working with the Department of Education to develop internet-based educational programs for agricultural extension agents and vocational agriculture teachers. Using data collected from a national producer educational survey—conducted in 1998–1999 by Tuskegee University, Texas A&M and the Research Triangle Institute—FSIS plans to issue grants to "1890 Institutions" to conduct educational outreach targeting small and limited producers in the southeastern United States.

The Cooperative State Research, Education, and Extension Service is providing education and outreach to growers and producers of domestic and imported fresh fruits and vegetables. This effort supports the President's Food Safety Initiative and the Initiative to Ensure the Safety of the Imported and Domestic Fresh Fruits and Vegetables. Increased funding in fiscal year 1999 has provided needed resources to support collaborative efforts with the Food and Drug Administration, the Centers for Disease Control and Prevention, and the Foreign Agricultural Service to provide education and outreach to both national and international growers and producers. An example is the "Fight BAC!" campaign developed by the Partnership for Food Safety Education in conjunction with the President's Food Safety Initiative to simplify and provide useful public education and information about safe handling of all foods. The Partnership consists of numerous associations, councils, and institutes, with liaison from four Federal agencies, including USDA, and an international affiliation with Canada. These efforts are focused on building a strong, viable, integrated food safety program across the federal government.

In fiscal year 1999, the Cooperative State Research, Education, and Extension Service has $7,365,000 for competitive projects in food safety education. We anticipate funding 70–80 food safety extension education projects which may range from $50,000 to $500,000. Proposals have been solicited which focus on training for food handlers, consumer food safety education, use of good agricultural practices to increase food safety, and development of a national food safety database.

FDA answer. CDC is happy to provide the information for the record. CDC conducts educational activities primarily for health care professionals and the public. Examples include materials on how high-risk populations can avoid foodborne illness and training videos on laboratory methods to diagnose foodborne pathogens. In addition, CDC actively participates with FDA, USDA, industry, and consumer organizations in the Partnership for Food Safety Education, a public-private partnership created to reduce the incidence of foodborne illness by educating Americans about safe food-handling practices through many activities, including the national Fight BACTM Campaign. The purpose of the Fight BACTM Campaign is to help educate the public about foodborne illness and motivate the consumers to take basic sanitation and food-handling steps to reduce the risk of foodborne illness. With National Food Safety Initiative resources in fiscal year 1999, CDC also is working with FDA and USDA to reach school-age children through school-based efforts.

FDA would be happy to provide the information for the record.

[The information follows:]

FOOD AND DRUG ADMINISTRATION EDUCATION ACTIVITIES

FDA will invest a total of $2.47 million in fiscal year 1999 on education, and consumer research that will serve as the basis for consumer education material. This amount represents a $400,000 increase over fiscal year 1998.

Education

The Agency will use the funding to continue to support and broaden partnerships and alliances with other food safety organizations that allow the Agency to leverage resources while spreading food safety messages to a greater number of people. The focus this year is to expand consumer education to change unsafe food handling

practices of individuals at high risk for foodborne disease and the non-English speaking populations.

Another FDA priority in fiscal year 1999 is the development of school-based food safety programs to establish lifelong safe food handling practices in young people. To achieve this goal, an agreement has been signed with the National Science Teachers Association to develop a supplemental food safety curriculum for use in secondary schools. This program will also provide food safety training to over half of these students who will at some time during their teenage years work in a food service establishment.

A recent FDA-USDA consumer survey showed that only 1 percent of consumers viewed eggs as a risky food, a decrease of 10 percent since 1993. A public education campaign through the media as well as through community health associations and food service operations will be launched later this year concerning the safe handling of eggs.

Funding during fiscal year 1999 will support the Food Information Center at FDA that provides food safety information to consumers through its hot line, fast fax, web page and E-mail dissemination system. The Food Information Center is part of jointly supported FDA-USDA system of information distribution.

Research

In order to target consumer education materials where it is most needed, research in kitchens is currently underway to identify unsafe food handling behaviors that consumers are actually practicing (as opposed to reported as being practiced).

FDA will also conduct consumer research on special groups, such as Spanish speaking populations, to determine the best way to communicate key food safety principles in order to achieve behavioral changes.

Data available to FDA indicates that retail food service operations (including fast food restaurants, vending operations, institutional feeding operations such as schools, hospitals, and nursing homes) are the source of a substantial number of food-borne illnesses. Market research will also be conducted to identify barriers to safe food preparation practices by the retail food service industry. This type of research activity will produce a knowledge base for educators and will guide the design of more effective training programs and materials targeted for development next fiscal year. This program will address the impact of the high turnover in food service workers and target small businesses, and new entrepreneurs.

Question. I know that the Food Safety and Inspection Service has food safety hotline. Is this the only government hotline, or does each agency have its own?

FDA answer. The Food Safety and Inspection Service hotline deals with meat and poultry. FDA's Center for Food Safety and Applied Nutrition has a toll free Food Information Line, 1–800–332–4010, to cover other foods and dietary supplement questions. The FDA and USDA information lines will soon be integrated so that calls will routinely be handled by the most appropriate agency and the agencies can more easily handle hot issues and crises.

Additionally, other Federal Government toll-free food-related information lines include Department of Commerce's National Marine Fisheries Service at 1–800–422–2750, Environmental Protection Agency's Safe Drinking Water Hotline at 1–800–827–2794, and EPA's National Pesticide Telecommunications Network at 1–800–858–7378. The administration has established a government food safety web site (http://www.foodsafety.gov/) designed to help the public find government food safety information more readily on the web. The site provides links to food safety-related web sites from federal, state and local government agencies, including CDC.

Question. What audiences are you currently targeting through your food safety education efforts?

USDA answer. FSIS is working to reach those at greatest risk for foodborne illness, in addition to the general public. Specific target audiences include: Home food handlers; Cooks and food handlers in retail settings and congregate feeding sites; School foodservice providers; Children; Expectant mothers; Child care providers; The elderly and Immune-compromised individuals. In the area of pre-harvest food safety education, FSIS is targeting its outreach efforts towards the one million food animal producers and the thousands of livestock markets and satellite industries.

In fiscal year 1999, the Food Safety and Quality National Education Initiative of the Cooperative State Research, Education, and Extension Service has significantly expanded the Department of Agriculture's education and outreach efforts to consumers, educators, health professionals, farmers, veterinarians, producers, processors, food service workers, sanitarians, food inspectors, retailers, distributors, transporters, and other food handlers. Growers and producers of domestic and imported fresh fruits and vegetables are also targeted.

The Food and Nutrition Service has provided food safety information to school food service professionals and child care providers to assist them in preparing and serving meals to children, and to work with children to teach them safe food handling.

FDA answer. The Food Safety Initiative's educational efforts will target individuals at high risk, such as children, women, elderly, individuals with comprised immune system, for foodborne disease, non-English speaking populations, and consumers of eggs. Another FDA effort in fiscal year 1999 is the development of school-based food safety programs targeted at young people, so that these messages may establish lifelong safe food handling practices.

Current target audiences are school children, general public and public health professionals, including physicians, nurses, nutritionists, food protection specialists, laboratorians and epidemiologists. CDC is working with FDA and USDA to reach children through school-based efforts.

Question. Dr. Henney, you indicate that through a combination of FDA inspection and state contracts, all domestic seafood processors and importers were inspected to verify implementation of HACCP by the end of calendar year 1998. Were these seafood processors and importers in compliance with HACCP implementation requirements?

FDA answer. Processors were inspected to determine whether they have HACCP systems in place, while importers were inspected to determine whether they were taking steps to verify that their foreign suppliers were processing in accordance with United States, such as HACCP requirements.

Initially, approximately 30 percent of processors and 20 percent of importers were in compliance, that is, they had HACCP systems that were essentially complete and needed little or no additional work. FDA defined compliance in terms of the presence or absence of significant technical HACCP problems, not whether a processor was producing food that was dangerous to eat, or in imminent danger of doing so. Minor technical HACCP problems were not regarded as out of compliance.

FDA has learned from HACCP pilots and the experience of other nations in implementing their own HACCP systems, that the early stages of HACCP implementation involves considerable trial and error, both for the industry and the regulator. Consequently, FDA's primary objective during the first round of inspections was to provide consistent, accurate feedback to firms on the status of their HACCP systems. The percentage of firms that achieved essentially error free HACCP programs by their first inspections was a secondary consideration. No regulatory action was contemplated for technical HACCP problems in the absence of an imminent public health problem.

Question. Dr. Henney, you indicate that FDA found a range of problems with HACCP implementation that needed to be addressed by seafood facilities. What problems did you identify and how are working with the seafood industry to address these problems?

FDA answer. The results of the first round of inspections reflect a range of issues, most of which were anticipated. Collectively, the most prevalent deficiencies involved lack of adequate sanitation monitoring and failure to have a HACCP plan. While many firms practice good sanitation, this is an area that has been a long-standing problem with the seafood industry generally. With regard to HACCP plans, some firms were simply being recalcitrant, while others held a good faith belief that, in their case, a plan was not needed. Plans are needed only when there are food safety hazards that are reasonably likely to occur with the product.

Where processors had HACCP plans, the problems were, in many cases, those that could reasonably be attributed to trial and error. Although not minor, those kinds of problems are often readily correctable. In other cases, a processor might disagree with FDA over the adequacy of its HACCP plan. In most cases FDA would categorize the processor as noncompliant, but would also provide the processor with the opportunity to demonstrate the adequacy of its HACCP system. Where adequacy can be demonstrated, the compliance status of the firm will be changed.

We are doing a number of things in the second year to continue to move the industry down the road toward full compliance. First, we are working with a consortium of Federal agencies, the Association of Food and Drug Officials, academia, and industry trade associations, collectively known as the Seafood HACCP Alliance, to develop a low cost training course for processors to help them overcome specific types of implementation problems. During part of the course, trained instructors will walk students through problem solving exercises that are tailored to their specific needs. The Alliance has already developed a basic training course in seafood HACCP that has been taken by over 10,000 individuals. FDA is now contributing $30,000 from FSI funds toward the development of this follow-on effort, and we expect it to be ready by mid-April. Second, in addition to the course, our district offices

are planning implementation workshops tailored to their local industries. Our Los Angeles district office recently conducted a highly successful workshop, and we wish to replicate that effort around the country.

Third, we are upgrading our guidance materials, including our principal guidance document to industry, the Fish and Fishery Products Hazards and Controls Guide. This document essentially describes everything we know about seafood hazards and controls. It is a one-of-a-kind document that has earned some international recognition. It has been translated into other languages and some countries have incorporated it, at least informally, into their own regulatory programs.

To help achieve international compliance with HACCP from those who export fish and fishery products to the United States, we are beginning a program of foreign inspections, primarily targeted toward developing countries with large volumes of seafood exports to the U.S.

We are also continuing to pursue equivalence agreements with more advanced seafood trading partners. Over 30 countries have requested that we determine whether their regulatory systems for seafood safety are equivalent to ours.

We are also upgrading the education we provide to our own inspectors. We will give them the same follow-on training course that is being prepared for industry. In addition, we are developing a certification program for seafood inspectors, consisting of courses, exams, and on-the-job audits. This program will help ensure uniform, national proficiency and will reward inspectors who increase their knowledge and inspectional skills.

Question. What is FDA doing in fiscal year 1999 to ensure full compliance with its seafood HACCP rules and regulations?

FDA answer. It is worth noting that FDA's compliance target for fiscal year 1999 is 50 percent, with full compliance not being anticipated for several years. A longstanding, key strategy for this program has been gradual and steady progress. In the Agency's view, a gradual approach provides the best long term chance for success, and is affordable given that there is no public health emergency with seafood that requires urgent action.

Seafood includes over 300 edible species from a variety of habitats. Most are still wild caught. While no potential hazard causes a large number of illnesses in the U.S., there are a wide variety of hazards, including some unique to seafood, that can cause illness. Seafood safety is a matter of some complexity.

Thus, it is essential that seafood processors know the potential hazards that could affect their products and take science-based preventive measures to ensure that these hazards are controlled. Before seafood HACCP, there was no requirement that seafood processors understand hazards and controls as a condition of selling food to the U.S. public. The FDA seafood HACCP program establishes such a condition for the first time. In this respect, the education of the industry in science-based hazards and controls is a key to success. Ultimately, each processor should be able to evaluate its own circumstances and develop and tailor a HACCP system to those circumstances.

Question. I understand FDA funding for Seafood HACCP was $8 million for each fiscal years 1998 and 1999. Is that correct? Last year, FDA indicated that a $3.4 million increase was requested for Seafood HACCP. Why is funding for Seafood HACCP being continued at the fiscal year 1998 level of $8 million for fiscal year 1999? What level of funding is requested for Seafood HACCP for fiscal year 2000? Please compare that level to the funding and staffing levels for Seafood HACCP in each of fiscal years 1998 and 1999?

FDA answer. Yes, FDA's funding for the field implementation of Seafood HACCP is $8 million for both fiscal years 1998 and 1999. The Agency plans to expend an estimated $3.4 million for activities that compliment and support Seafood HACCP in fiscal year 1999, but will not be directly expended on Seafood HACCP inspections by FDA's field office.

We are happy to provide for the record a table which outlines FDA's use of resources for Seafood HACCP.

[The information follows:]

FDA'S SEAFOOD HACCP RESOURCES—FISCAL YEARS 1998 THROUGH 2000

Activity	Fiscal year 1998		Fiscal year 1999 Increase		Fiscal year 1999 Total		Fiscal year 2000 Requestion Increase	
	Dollars	FTE	Dollars	FTE	Dollars	FTE	Dollars	FTE
HACCP Training, Implementation & Expansion	.....	.....	2.1	20	2.1	20	.5	1.0

FDA'S SEAFOOD HACCP RESOURCES—FISCAL YEARS 1998 THROUGH 2000—Continued

Activity	Fiscal year 1998		Fiscal year 1999 Increase		Fiscal year 1999 Total		Fiscal year 2000 Request Increase	
	Dollars	FTE	Dollars	FTE	Dollars	FTE	Dollars	FTE
Seafood HACCP Training	1.3	1.3	.....	.....	1.3	1.3	.....	.....
Seafood HACCP Field Inspections	8.0	8.0	.....	.....	8.0	8.0	.....	.....

Question. The President's budget for fiscal year 2000 proposes that the Seafood Inspection Program be transferred from the Department of Commerce to the Food and Drug Administration. How will the transfer of this program to FDA improve the safety of seafood?

FDA answer. Transfer of the Seafood Inspection Program from the Department of Commerce to FDA will improve the safety of seafood in several ways. Establishing a Performance Based Organization or PBO at FDA will establish FDA as the sole seafood agency with one federal HACCP standard, thereby promoting efficiency, effectiveness, and consistency of seafood regulation. This centralization will help both domestically and internationally. In addition, the PBO will provide additional trained inspectors to implement its HACCP regulations, resulting in increased frequency of inspection. Consumers will benefit by improved food safety from an increased federal regulatory presence and a single HACCP standard established by FDA.

Question. Why are you requesting that this transfer be made through the appropriations bill rather than submitting a legislative proposal to the appropriate authorizing committees of jurisdiction?

FDA answer. While the Administration has requested appropriations to transfer the program as is, without establishing it as a Performance Based Organization or PBO, the longer term solution is authorizing legislation that would establish the Seafood Inspection Program as a PBO with the Department of Health and Human Services. FDA and the Department of Health and Human Services is currently working with the Department of Commerce and other parts of the Administration to finalize a draft proposal that would accomplish such a PBO. We are eager to work with Congress to achieve this goal.

Question. The budget indicates that a legislative proposal will be transmitted to make the Seafood Inspection Program a Performance-Based Organization. Would you please explain that proposal.

FDA answer. FDA and the Department of Health and Human Services are currently working with the Department of Commerce and other parts of the Administration to finalize a draft proposal that would transfer the Seafood Inspection Program of the National Marine Fisheries Service in the Department of Commerce to FDA in the form of a Performance Based Organization or PBO. A PBO is a quasi-public organization that is located in a federal agency but operated like a business in that it is to be financially self-sustaining. Although the federal agency oversees the PBO, the PBO is given a great deal of autonomy to run day-to-day operations, particularly in the areas of personnel and procurement, in order to response to customer's needs and marketing conditions.

In this case, the seafood inspection PBO would continue to perform the voluntary, fee-for-service inspection, grading, certification, and training services for the seafood industry and other customers currently performed by the Seafood Inspection Program in the Department of Commerce. In addition, FDA would be able to utilize these trained inspectors to perform regulatory HACCP inspections under one Federal HACCP standard.

Question. Dr. Henney you indicate that FDA has undertaken not only to strengthen border surveillance activities but to design new programs to prevent contamination in countries that export to the United States, including an assessment of foreign control over exports to the United States and providing technical assistance to foreign countries. Would you please be more specific as to the new programs implemented by FDA to increase the safety of imported food?

FDA answer. The FDA is employing a number of strategies to better utilize existing import resources and target efforts. One strategy is to increase activity in developing Mutual Recognition Agreements or MRAs, as well as informal agreements with other countries. These agreements recognize regulatory expertise in the exporting country and allow foreign governments to provide a degree of assistance in controlling export of food products to the United States.

A second strategy is to conduct audits of Foreign Food Systems to assess the prospect of developing future equivalency agreements. As a part of these audits, country's infrastructure, laws, regulations, inspectional force, and regulatory follow up are evaluated. Assessments were completed for Honduras, Trinidad and Tobago in fiscal year 1998. We have tentative plans to conduct assessments for Costa Rica and Nicaragua in March 1999, and we have tentatively scheduled reviews of the infrastructure, laws and regulations related to food safety for both Canada and Mexico in fiscal year 1999.

As a third strategy, FDA is conducting several types of inspections in Country of Origin. Primary countries in which Seafood Inspections in Country of Origin are being conducted include Ecuador, Taiwan, Phillippines, Viet Nam, and Indonesia. Low Acid Canned Food Inspections in Country of Origin are being conducted in the following primary countries; Ecuador, Brazil, Canada, Malaysia, Philippines, Indonesia, and India. The Agency is also conducting compliance inspections for land foods in Country of Origin in Canada, Mexico, Italy, Portugal and France. Primary commodities inspected include cheese, ready-to-eat, heat and serve snack foods, and candy including chocolate candy.

Yet another strategy involves supporting proposed authority to more effectively prevent entry of products that come from countries whose food regulatory agencies are unable to effectively regulate their own industry, as well as prevent export of products that are violative under U.S. law. FDA also supports proposed new authority to cause mandatory destruction of refused merchandise. Finally, FDA seeks greater interactions with other Federal Agencies, including U.S. Customs, to screen, collect and analyze samples, and report these results to the FDA for appropriate follow-up.

The Agency is developing an assessment program of the regulatory structure and capabilities of foreign food regulatory agencies for possible future equivalency determinations, and has developed industry guidance Guide to Minimize Microbial Food Safety Hazards for Fresh Fruits and Vegetables.

The Agency has worked with foreign governments and industry of countries identified as being the source of large U. S. outbreaks over the last several years, trying to identify and eradicate problems. This included inspections of suspect processors and growers.

Question. Please describe FDA's current surveillance of imported food products at our borders. How is this surveillance capability being enhanced in fiscal year 1999? What funding and staffing is being devoted to this effort, as compared to fiscal year 1998? What level of funding is requested for fiscal year 2000?

FDA answer. FDA has allocated additional resources to increase its inspectional staff, with a significant number of new employees being devoted to the Agency's import activities. These import activities include increased examinations of imported seafood, fresh produce, and other public health hazards related to foods. The main emphasis of the 1999 increase in import surveillance is in our sampling programs, which include risk-based assignments and directives from FDA's Center for Food Safety and Applied Nutrition or CFSAN. These programs, assignments, and directives are being implemented through the enhancements to the FDA Operational and Administrative System for Import Support, or OASIS, which will allow more selective screening of products offered for entry. Through the OASIS system, FDA's districts will be able to target consignees, importers, ports and other data fields for coverage where as before, the system was unable to distinguish many of the data elements for selectivity screening. This will also enable FDA to test for specialized information such as seafood HACCP compliance status of importing firms.

One such program assignment is the Agency's Imported Produce Sampling Assignment for the examination of various fresh fruits and vegetables for microbiological contamination, such as E. coli O157H7, Shigella, Cyclospora, etc. This broad-based surveillance and enforcement approach is the Agency's response to potential microbiological hazards that may be associated with the U.S. fresh produce supplies.

Under the FDA Imported Seafood Program, importer HACCP inspections are being conducted to determine compliance with the requirements of Title 21 CFR 123.12, which requires seafood importers to assure their foreign seafood suppliers are operating in compliance with Seafood HACCP regulations.

FDA also developed and provided specialized import training for field employees to assure more uniform and consistent approaches throughout FDA's field offices. This training covers many of the basic import requirements, including the Federal Food, Drug and Cosmetic Act and FDA regulations, Center programs, proper sampling and examination techniques, documentation of violations of the laws enforced by FDA, and so forth.

In fiscal year 1999 FDA worked to make sure that all feed and feed ingredients were identified as components to be examined at import entry into the U.S. to ensure compliance with the regulation prohibiting the use of certain mammalian protein from use in ruminant feed. This regulation is to prevent the development and amplification of Bovine Spongiform Encephalopathy or BSE in the U.S. In addition, in fiscal year 1999 the Animal Drugs and Feeds Program will train the FDA import personnel to educate importers on the applicability of the BSE regulation to certain imported products.

Question. How has FDA placed special emphasis on ensuring the safety of imported and domestic fruits and vegetables?

FDA answer. FDA developed, in consultation with USDA and industry, guidance on good agriculture practices. In October 1998, FDA produced the "Guide to Minimize Microbial Food Safety Hazards for Fresh Fruits and Vegetables" and referred to as GAP's. This guide is intended to provide guidance in addressing microbial food safety hazards and good agricultural and management practices common to the growing, harvesting, washing, sorting, packing and transporting of most fruits and vegetable sold to consumers in an unprocessed or minimally raw form.

In fiscal year 1997 and 1998, FDA conducted multiple surveys of domestically produced fresh fruits and vegetables including sprouts, fresh unpasteurized apple juice and cider, and prepared cut vegetable salads. On February 23, 1999, FDA initiated a sample collection and analysis assignment for 1,000 samples of imported fresh produce. The Agency will test for pathogens and collect data on the extent of microbial contamination in fresh produce.

The Agency has developed and published industry and Investigational guidance "Guide to Minimize Microbial Food Safety Hazards for Fresh Fruits and Vegetables" and "Guide to Traceback of Fresh Fruits and Vegetables Implicated in Epidemiological Investigations", respectively. The Traceback Guide assists the field investigator in identifying specific shipments of fruits and vegetables that could be involved in epidemiological outbreaks. Training has been provided to FDA's field offices. In April 1999, FDA and USDA are sponsoring a national training conference for domestic and imported producers on the implementation of the "Guide to Minimize Microbial Food Safety Hazards for Fresh Fruits and Vegetables."

Question. How many foreign inspections of food establishments were conducted in fiscal year 1998? In which countries?

USDA answer. FSIS oversees imports of meat and poultry products from 37 countries to the United States. For the record, the following table presents the number of foreign meat and poultry slaughter/processing establishments audited by country in fiscal year 1998.

[The information follows]

Number of Foreign Establishments Audited by FSIS in Fiscal Year 1998

COUNTRY	*AUDITS*
Australia	18
Austria	9
Belgium	18
Brazil	16
Costa Rica	5
Czech Republic	2
Denmark	26
Finland	7
France	13
Germany	12
Great Britain	6
Guatemala	1
Honduras	5
Hong Kong	1
Hungary	9
Iceland	2
Ireland	9
Israel	15
Italy	25
Japan	3
Mexico	22
Netherlands	19
Nicaragua	3
Northern Ireland	1
Poland	37
Romania	7

COUNTRY	*AUDITS*
Spain	12
Sweden	16
Switzerland	12
Uruguay	17
Total Countries Visited:	30

Question. Were the foreign inspections being targeted only on those food establishments that produce food products at high risk for microbial contamination? Which foods are these?

USDA answer. FSIS did not target audits at establishments that produce meat and poultry products at high risk for microbial contamination. Audits are based on random selections of establishments that are certified by the foreign inspection systems to export to the U.S. When products are found to have microbial violations at U.S. ports of entry, the establishments of origin are targeted to be included in the list of establishments to be visited during the audits.

Question. What increases in foreign inspections of food establishments are planned for fiscal year 1999 and requested for fiscal year 2000?

USDA answer. FSIS's goal is to visit each country annually to conduct on-site audits of selected plants. As part of the audit of a country's food safety system, a random selection of establishments within each country is selected for review by FSIS personnel.

Question. Please indicate funding and staffing levels for foreign inspections for each of fiscal years 1998 and 1999, and requested for fiscal year 2000.

USDA answer. The FSIS budget for foreign inspections, including personnel, travel and operating costs, is approximately $800,000 and 8 staff years in fiscal year 1998. Both the funding and staffing are expected to remain at that level in fiscal year 1999 and fiscal year 2000.

Question. How many foreign inspections of food establishments were conducted in fiscal year 1998? In which countries? Were the foreign inspections being targeted only on those food establishments that produce food products at high risk for microbial contamination? Which foods are these? What increases in foreign inspections of food establishments are planned for fiscal year 1999 and requested for fiscal year 2000? Please indicate funding and staffing levels for foreign inspections for each of fiscal years 1998 and 1999, and requested for fiscal year 2000?

FDA answer. Twenty six foreign inspections of food establishments were conducted in fiscal year 1998. We inspected firms in China, Italy and Thailand. The inspections covered low acid canned foods. In addition, we also conducted assessments of Guatemala's raspberry growing industry. We anticipate completing 100 inspections in fiscal year 1999.

Only foreign food establishments producing products at high risk for microbial contamination are targeted for inspection, such as seafood, fresh fruits and vegetables, and Low Acid Canned Foods.

Question. The National Academy of Sciences' report indicates that "Although FDA recommended minimum food-handling standards in a Food Code issued in 1993, the Code has not been adopted in its entirety by most state and local authorities." What is being done to encourage states to adopt the Food Code?

USDA answer. USDA is working closely with HHS to promote adoption of the Food Code. Last year, Secretaries Glickman and Shalala sent letters to all the Governors, to constituents, and to employees of USDA and HHS encouraging the adoption and use of the food code. Virtually every USDA meeting with or speech directed at state audiences includes a reference to the Code and its value as a standard for regulation of food safety at retail. Promotion of the adoption of the Food Code was one of the themes at the recent, USDA-hosted Federal-State Food Safety Conference attended by state Health and Agriculture Commissioners, Secretaries Glickman and Shalala, and other officials. USDA personnel have also discussed the code with the agriculture committee of the National Council of State Legislators (NCSL).

We are continuing to work with the food industry as well as representatives of state and local government, through the Conference for Food Protection and in other forums, to encourage industry leaders and trade groups to endorse the Food Code and promote its adoption in all jurisdictions. Major trade associations like the Food Marketing Institute and the National Restaurant Association, government groups like the National Association of State Departments of Agriculture, professional groups like the Association of Food and Drug Officials and the National Environmental Health Association, and many others have had input into and have endorsed the Food Code.

This broad base of support has been instrumental in encouraging grass-root support for universal adoption of the Food Code.

FDA monitors the progress of initiatives in the various jurisdictions, and HHS and USDA have tendered a standing offer to provide technical advice and expert testimony upon request to support State administrative and legislative initiatives to adopt the Food Code. FDA's most recent report shows 15 state level agencies and 17 other jurisdictions (federal agencies, tribal and local government agencies) have now adopted the Code, and that another 23 states, Puerto Rico, the District of Columbia, and several additional local government agencies are in the process of adopting it.

[The information follows:]

FDA recently published the 1999 Food Code on February 22, 1999. There are at least six distinct efforts under our Public Health Service Act mandate to advise and assist states.

On June 4, 1998, Secretaries Shalala and Glickman wrote to the governors encouraging state adoption and implementation of the Food Code.

At the Conference for Food Protection meetings in 1994, 1996 and 1998, recommendations for modifying the Food Code have been debated, passed and sent to FDA. Many of these changes have made newer Food Code editions more acceptable to all parties. Strong opposition by the regulated industry is now rare.

We continue to emphasize promotion of the adoption of uniform standards by the states in our yearly Compliance Programs. Each fiscal year, about 8 person years are allocated to our Field Food Specialists to perform this activity.

When a state requests assistance during its adoption process, we have provided technical and administrative help from Headquarters. For example, FDA has attended public hearings in both Florida and Minnesota to answer questions and support state regulators.

FDA lists Food Code adoptions on its website to encourage participation.

FDA has drafted a set of proposed standards for food regulatory agencies. The first standard in this document is Regulatory Foundation—satisfied by adoption of the Food Code as the uniform set of rules for regulating retail establishments.

Question. Would you please tell us more about the importance of the Antimicrobial Resistance Monitoring Network to food safety and what your plans are to expand the network in fiscal year 1999 and 2000?

USDA answer. The National Antimicrobial Resistance Monitoring System (NARMS) has recently been renamed to NARMS—Enteric Bacteria (NARMS-EB) to more accurately reflect its scope. A public health surveillance system, NARMS-EB is a systematic, data collection and reporting activity. To most efficiently use federal resources, the veterinary and human components of NARMS-EB are structured to collect comparable data. NARMS-EB provides information on the temporal and geographic trends in antibiotic resistant foodborne pathogens. Critical analysis and timely reporting of the NARMS-EB data will enable researchers, public health practitioners, and clinicians to assess the extent of antibiotic resistance in the monitored foodborne pathogens so that reasoned action can be taken to prolong the useful life of antibiotics, maximize the therapeutic effect of antibiotics in animals and man, and minimize human exposure to these potentially harmful agents. The NARMS-EB data and isolates facilitate critical research on antibiotic resistance and virulence mechanisms.

As the lead agencies in the NARMS-EB, FDA and CDC have primary responsibility for decisions on expanding NARMS-EB. Beginning in fiscal year 1999, FSIS began a baseline sampling program for Campylobacter in broilers. FDA-CVM requested, and FSIS agreed, to forward those isolates to the USDA-ARS research laboratory in Athens, Georgia, that conducts the antimicrobial resistance testing for the veterinary portion of the NARMS-EB program. Because FSIS generates the majority of the domestic Salmonella isolates from meat, poultry, and egg products, FSIS is working towards designing its program to ensure that those serotyped Salmonella isolates of FSIS origin that are sent to NARMS-EB are most representative of the overall domestic meat, poultry, and egg products supply.

FDA answer. The National Antimicrobial Resistance Monitoring System or NARMS monitors the emergence and spread of resistance in enteric bacteria and helps to ensure the continued safety and effectiveness of veterinary antimicrobials. Under NARMS thousands of bacterial isolates are tested for resistance to antimicrobials. NARMS will provide an early warning to identifying resistance trends among bacteria. All data from NARMS are made public for review by scientists or the public. NARMS monitors changes in susceptibilities to 17 antimicrobial drugs of zoonotic enteric pathogens from human and animal clinical specimens, from healthy farm animals, and from carcasses of food-producing animals at slaughter.

NARMS objectives are to prolong the lifespan of approved drugs, identify areas for more detailed investigation, guide research in the area of antimicrobial resist-

ance, provide timely information to practitioners, and provide descriptive data on the extent and temporal trends of antimicrobial susceptibility in enteric organisms from human and animal populations.

Benefits gained from NARMS are multiple. NARMS contributed to food safety when CDC provided information to public health departments on the presence, in specific areas of the country, of Salmonella typhimurium DT104, a multi-drug resistant pathogen identified by NARMS. Food animal producers use the NARMS report to identify problems associated with drug resistance in some food animal populations. Researchers use NARMS as a source of well characterized isolates from food animals to develop rapid assays to identify human pathogens in food. One example is, the Salmonella typhimurium DT104 rapid assay announced by Secretary Dan Glickman.

In fiscal year 1999 and fiscal year 2000 we will expand the geographical scope of the NARMS database by supporting the inclusion of international resistance information through the World Health Organization.

Future benefits from isolates tested in NARMS are an increased ability to detect outbreaks of foodborne disease earlier and recall adulterated products preventing exposure of larger proportions of the population, improved ability to identify the source of resistant human foodborne pathogens, improved characterization of the magnitude and type of resistance in food animal populations and improved capability to determine the magnitude of resistance transfer in foodborne pathogens.

Question. What are the concerns about the effect of antibiotics on resistance of microbes that infect people?

USDA answer. In general, when humans become infected with a bacterial strain that is resistant to one or more antibiotics, therapeutic options are diminished, implementation of appropriate treatment may be delayed, illness severity may increase, and overall treatment cost may increase. FSIS, under the Pathogen Reduction and HACCP rule, has implemented a prevention based food production system that, in part, sets product specific limits on the prevalence of Salmonella in raw meat and poultry products. Recently reported test results from the first full year of HACCP indicate that Salmonella prevalence on broilers, ground beef, hogs, and ground turkey were lower after HACCP implementation. Continued monitoring of both the Salmonella prevalence in raw products and, through NARMS-EB, the antimicrobial resistance profiles of Salmonella and Campylobacter isolates will better enable us to characterize the public health impact of antimicrobial resistant foodborne pathogens.

FDA answer. Development of resistance in foodborne pathogens is a medical and public health concern. Drugs may lose all or some of their effectiveness in treating patients with bacterial infections. If resistant foodborne pathogens develop because of antimicrobial drug use in food animals, food products may be contaminated at slaughter and the resistant bacteria transmitted to humans. Even if the bacteria are not pathogenic to the animal they can be pathogenic to humans. For example, Salmonella, Campylobacter, and E. coli O157 can exist in the intestinal flora of various food-producing animals without causing illness. However, all three bacteria can cause severe foodborne illness in humans. If the bacteria that cause illness in humans is resistant to a drug used for treatment, medical therapy may be effected.

There are several concerns. When the microbes that affect people become resistant to the antibiotics used to treat the infections, treatment becomes more difficult, less likely to be successful, and more expensive. That means longer illnesses, higher medical costs, and ultimately, more deaths. Also, when the microbes become resistant, they can spread more easily and cause more illness in humans or animals that are already taking antibiotics for other reasons. This means that someone taking an antibiotic to treat one infection, may become ill with a second infection caused by a resistant organism. Finally, the genes that make the bacteria resistant are often mobile, so that different kinds of bacteria can swap the genes back and forth, and collect them in clusters of genes. This means that resistance that appears in one bacteria can subsequently spread to other bacteria, and can become linked to other resistance genes. Then the use of one antibiotic can select for all of the resistances that are linked together. For these reasons, the use of antibiotics in humans and in animals needs to be prudent and justified, because each use is also selecting for more resistance in the future.

Question. I understand FDA has begun a major revision of its guidelines for approving use of new antibiotics for animals and for monitoring the effects of old ones. What revisions will you propose and will these have a significant impact on the availability and uses of antimicrobials?

FDA answer. FDA has determined that the current regulatory structure for the approval of antimicrobial new animal drugs is inadequate for evaluating the antimicrobial resistance impact on human health. FDA is therefore undertaking an ex-

tensive process to evaluate issues related to the use of all antimicrobial drugs in food-producing animals and develop policies that protect the public health, including products already on the market. Our goal in this process is to protect public health by ensuring that significant human antimicrobial therapies are not compromised due to the use of antimicrobials in food animals, yet provide for future approvals and safe use of antimicrobials in animals.

FDA's proposed regulatory framework is based on scientific evaluation of the hazards to public health from the use of antimicrobials in food animals. The proposed framework takes into consideration two factors that would be used in evaluating human health concerns associated with food-animal use of antimicrobials. These factors are the importance of the drug or class of drugs for human medicine, and the potential exposure of humans to resistant pathogens or resistant elements originating from animals treated with antimicrobials, and the impact this exposure would have on the availability and effectiveness of drugs to treat human disease. FDA would then place the drug or related drug in one of three major tiers according to the drug's importance. Each tier would have different requirements for approval. The requirements for approval may include both pre-approval screening and post-approval monitoring conducted on farms.

FDA now believes it is necessary to evaluate the human impact of microbial effects associated with uses of all classes of antimcirobial new animal drugs intended for use in food-producing animals. FDA will evaluate the safety of antimicrobial products according to two factors. One is resistance, that is the quantity of resistant bacteria formed in an animal's intestinal tract (enteric) following exposure to the drug. The second is the pathogen load which is the changes in the number of animal enteric bacteria that cause human illness.

To address concerns, the framework document proposes that sponsors of antimicrobial products need to evaluate microbial safety, including assessment of pathogen load and antimicrobial resistance; assess pre-approval data showing that the level of resistance transfer from proposed uses of drugs, if any, will be safe for consumers of food products derived from treated animals; and establish acceptable thresholds prior to approval to ensure that approved uses do not result in resistance development in animals or transfer to humans above established levels.

Question. I understand that some consumer, health, and environmental groups are seeking a federal ban on feeding of antibiotics to livestock given developing evidence of immunity in strains of bacteria that infect humans. Do you advocate an outright ban? What is FDA's authority to remove drugs that may be found to cause human pathogens to build resistance to the antimicrobials?

FDA answer. FDA is engaged in discussions to resolve questions about appropriate uses of antibiotics, and the Agency is very concerned about the ever-expanding antibiotic resistance in organisms that cause illness in humans. Our draft framework document entitled A Proposed Framework for Evaluating and Assuring the Human Safety of the Microbial Effects of Antimicrobial New Animal Drugs Intended for Use in Food-Producing Animals sets out a conceptual risk-based process for evaluating the microbial safety of antimicrobial drugs intended for use in food-producing animals. This document has been released to the public and has been the subject of a great deal of appropriate public debate.

FDA has the authority under Section 512 of the Federal Food, Drug, and Cosmetic Act to withdraw approval of applications of new animal drug products, including antimicrobials, when certain conditions are met such as the drug is shown to be unsafe under its approved conditions of use. Sponsors of applications for such products must be given an opportunity for a hearing on the proposed withdrawal. Section 512 also gives FDA the authority to suspend an approval if the Secretary finds the drug poses an imminent hazard to the health of man or animals. In such cases, sponsors must be given an opportunity for an expedited hearing on the suspension. That section also gives FDA the authority to revoke an approval through a notice-and-comment process.

If FDA suspends or withdraws an approval, any product covered by the suspension or withdrawal that is subsequently offered for sale is considered adulterated and subject to seizure or other remedies.

FOOD SAFETY RESEARCH BY THE AGRICULTURAL RESEARCH SERVICE

Question. The Agricultural Research Service (ARS) is requesting an increase of $7.3 million for on-farm food safety research. What percent of ARS research is on-farm and post-harvest? What are the current funding levels for each?

USDA answer. In fiscal year 1999, the Agricultural Research Service devotes 59 percent of its food safety funding to on-farm research and 41 percent to post-harvest

research. The current funding levels are $41,078,200 for on-farm research and $28,789,400 for post-harvest research.

Question. Antibiotic use in animals is suggested as a contributing cause to pathogens in food producing animals and human infection. Please explain this problem; the research that has been done in this area and your proposals to confront this issue. (ARS)

USDA answer. The emergence of resistance to antibiotics has compromised control of some bacterial pathogens both in humans and in food producing animals. The problem starts with the inherent variation in all bacterial populations; when bacterial pathogens are exposed to antibiotics, or other control technologies, such as, heat, cold, low pH, high salt, or disinfectants, a few individual bacterial cells survive. But since these bacteria now have less competition, the resistant bacteria are able to grow and reproduce faster. Thus after a period of time if the selection pressure continues, the resistant bacteria outnumber the original susceptible population. A confounding factor is that the genes coding for this resistance may be transferred between different bacteria, and thus a bacteria population could become resistant even though they have not previously encountered the drug. Additionally pathogens can acquire resistance to multiple antibiotics.

It is possible that pathogens that have become resistant through antibiotic use in animals may be transmitted to humans; and if humans subsequently need to be treated with an antibiotic for this or other pathogens, a different antibiotic would be necessary. The frequency of the occurrence of this transmission is not known.

Research has helped to delineate the occurrence of antibiotic resistance in both human and animal isolates, and to elucidate the genetic basis of many of the types of antibiotic resistance. The latter information will help to associate specific types of resistance in humans and in animals. Research has not helped to answer the question of whether low level growth promoting uses of antibiotics in animals contribute to the incidence of antibiotic resistance in human pathogens; nor do we have data on the true incidence of resistance in humans, animals, and environmental reservoirs.

To help solve these problems and prolong the useful life of antibiotics, ARS is initiating research programs to develop rapid tests for the presence of antibiotic resistance, to determine how both pathogens and nonpathogens acquire and transfer antibiotic resistance and at what levels of antibiotic exposure, define any alterations in virulence which may be linked to the presence of resistance, and to determine sources and interaction of antibiotic resistant pathogens in the environment, that is, their population genetics. This information will help form the basis for risk assessments of the use of specific antibiotic in both humans and animals.

FDA answer. Just as there are many human infections where the human use of antibiotics can lead to resistance, so are there also infections in animals were the growing tide of resistance is making veterinary therapeutic drug choices more limited and difficult. Foodborne infections represent a crossover point, where the problems of resistance in the animal sector affect humans. In addition, resistance can develop in non-pathogenic bacteria in animals from exposure to antimicrobial drugs. Public health risks also occur from the transfer of resistance genes from animal commensals to human pathogens in the animal, on food or in the human gut.

Antibiotic use in animals leads to resistance in the bacteria that inhabit the animals, including foodborne bacteria such as Salmonella and Campylobacter. When those bacteria contaminate the foods we eat, we can become ill. When the bacteria is resistant to antibiotics that are used to treat human infection, serious infections become harder to treat. It takes the laboratory some time to determine the resistance pattern, so the first treatment is based on past experience of what will work. For example, the drug of choice for the treatment of severe salmonellosis is a fluoroquinolone. If the Salmonella is already resistant to fluoroquinolones, then treatment may fail, and there is a delay in finding a treatment that will work.

Through surveillance, CDC is documenting rising resistance in Salmonella and Campylobacter, which is making the choice of antibiotics more problematic. CDC investigates illnesses to determine the sources, and for some resistant Salmonella, CDC has traced the sources back to farms where antibiotics were being used imprudently, or where there were ill animals. CDC and FDA use this information to guide the development of specific prevention strategies.

The principle strategies for controlling the rising tide of resistance are: To make sure that antibiotic use is prudent and rational; to use different antibiotics in humans and animals as much as possible; and to promote better prevention so that infections do not happen in the first place. Non-essential uses of antibiotics need to be limited or stopped, so that their effectiveness can be preserved to treat sick humans and animals. CDC has been working closely with the FDA Center for Veterinary Medicine, and with EPA (which regulates the use of antibiotics on fruit trees

and in boat paint) to promote the concepts of prudent use. The FDA has proposed a new framework for regulating the uses of antibiotics in animal production that incorporates public health concerns about resistance. CDC believes that the combination of prudent use and prevention will actually lead to better animal and human health, as the usefulness of available antibiotics will be extended.

If resistant foodborne pathogens develop in response to antimicrobial drug use in food animals, food products may be contaminated at slaughter and the resistant bacteria transmitted to humans. In addition, when antimicrobial drugs are administered to food-producing animals they promote the emergence of resistance in bacteria that may not be pathogenic to the animal but can be pathogenic to humans.

FDA has determined that the current regulatory structure for the approval of antimicrobial new animal drugs is inadequate for evaluating the human health impact of antimicrobial resistance. FDA is therefore undertaking an extensive process to evaluate issues related to the use of all antimicrobial drugs in food-producing animals and develop policies that protect the public health, including products already on the market.

We would be happy to provide for the record the paper entitled The Issue of Antimicrobial Use in Food Animals. This paper describes the research that has been done in this area.

[The information follows:]

THE ISSUE OF ANTIMICROBIAL USE IN FOOD ANIMALS

The issue of antimicrobial use in food animals has been controversial for more than three decades. The Food and Drug Administration (FDA) first called for several restrictions on antimicrobial use in feed in 1977. That proposal has generated several studies and reports. Definitive answers about the safety of antimicrobial use in animals remain scientifically challenging, but we are continuing to uncover more truths and, more important, have begun updating FDA's process for determining whether antimicrobial products can be used in food animals.

In the United States, FDA is the primary Federal agency responsible for ensuring the safety of the food supply. While the Center for Food Safety and Applied Nutrition regulates the vast majority of human food, FDA's Center for Veterinary Medicine (CVM) ensures that animal drug products are effective and safe for animals and consumers of edible products from treated animals.

CVM, which is part of FDA, is responsible for establishing the safety assessments for the use of antimicrobial drugs in food from animals, and the U.S. Department of Agriculture (USDA) is primarily responsible for testing the meat supply for microbiological contamination and animal drug residues in the food from animals.

Although the use of antimicrobial products in food-producing animals raises various efficacy and safety concerns, in recent years these concerns have focused on human food safety because foods of animal origin are often identified as the vehicles of foodborne disease in humans. As a result of treatment of the animal with antibiotics, these microbes may also be resistant to antibiotics used to treat humans.

The source for some of the pathogens found on food may be the colon of the slaughtered animal. Feces that contain harmful bacteria can contaminate the meat at slaughter. An estimated 1 percent of beef carcasses and possibly 20 percent of poultry carcasses are contaminated with Salmonella.

Treatment of food-producing animals with antimicrobials may alter pathogen load and/or the resistance pattern of bacteria associated with the animal. Thus, to ensure the human food safety of edible animal products from animals treated with antibiotics, CVM considers these criteria for non-therapeutic uses:

—The safety of the chemical residues, including the drug and its metabolites.

—The microbiological safety, including changes in bacterial pathogen load and resistance pattern that occur as a result of drug use.

The use of antibiotics to treat disease in food-producing animals started in the mid-1940s.

The scientific debate over the possible public health risks posed by such use started more than 30 years ago, when researchers first reported that the addition of streptomycin to chicken feed increased the rate of growth of the chickens. The introduction of affordable antibiotics in feed for cattle, pigs, and chickens started in the early 1950s. It launched a new era in livestock management and meat production.

RESEARCH AND ACTIONS

Soon after livestock producers began using antimicrobials in food-producing animals, scientists began studying the possible effects of long-term use of antibiotics. Here's a review of the studies and reports to date.

1960 Netherthrope Committee

It was formed in the UK to consider possible human health implications from the use of subtherapeutic antibiotics in livestock and concluded that there was no evidence of a human health hazard associated with the use.

1969 Swann Committee

Also formed in the U.K., the committee reported no Howard to humans or animals from the use of antibiotics in poultry or swine. However, it linked an outbreak of salmonellosis in humans to the therapeutic use of antibiotics in sick calves. The committee recommended:

—Antibiotics used in animals should be divided into "feed" or "therapeutic" classes.

—The "feed" antibiotics class should not include drugs used therapeutically in humans or animals.

—"Therapeutic" antibiotics should be available only by prescription.

1970 FDA Task Force

The task force report, "The Use of Antibiotics in Animal Feeds," concluded:

—The use of subtherapeutic amounts of antimicrobials favored the selection and development of resistant bacteria.

—Animals receiving antimicrobial treatment may serve as a reservoir of antibiotic resistant pathogens that can produce human disease.

—The prevalence of multi-resistant bacteria in animals has increased due to the use of antimicrobials.

—Resistant bacteria are present in meat and meat products.

—There has been an increase in the prevalence of antimicrobial resistant bacteria in man.

Based on the report's recommendations, CVM began requiring microbiological safety studies for non-therapeutic uses. The focus of these studies was to preserve efficacy and safety of antibiotics for animal uses, and the safety evaluation included an evaluation of human health concerns.

1977 CVM Proposal

In 1977, CVM proposed to withdraw the subtherapeutic uses of penicillin and the tetracyclines from animal feeds when used alone or in combination. These two drugs were chosen because of their importance in human medicine.

The proposals were criticized at the time because of a lack of epidemiological evidence to show that the drug-resistant bacteria of animal origin are commonly transmitted to humans and cause serious illness. Critics argued that, while antibiotics used in animals select for resistant bacteria, the transfer of these bacteria from animals to humans is rare. Also, the critics said, no evidence showed that "any transferred organisms actually survive or cause disease in humans. The critics argued instead that the increased antibiotic resistance of bacteria found in humans was a result of the use of antibiotics in human medicine.

1980 NAS Study

As a result of the 1977 proposal, several studies were started. In 1978, FDA began to work with the National Academy of Sciences (NAS) to study the issue. In 1979, the

Congress required FDA to spend $1.5 million of its appropriations for a study of the antibiotics issue, to be conducted by NAS. The NAS study was finished in 1980. It concluded that existing data had neither proved nor disproved the potential hazards to human health from subtherapeutic antimicrobials use in animal feeds.

1984 NRDC Petition

In 1984, the Natural Resources Defense Council, Inc., (NRDC) petitioned the Department.

Health and Human Services (HHS) to suspend immediately approval of the subtherapeutic use of penicillin and tetracyclines in food animals by invoking the imminent hazard provision of the Food, Drug, and Cosmetic Act, 21 U.S.C. Sec. 360b(E)(1). That provision authorizes the Secretary of HHS to suspend approval of an application for the use of a new animal drug if an imminent hazard exists to the health of man or to the animals for which the drug is intended. NRDC based its case on several studies, two by Holmberg, et al., at the CDC in Atlanta, GA and one published by Thomas O'Brien, et al., in the New England Journal of Medicine. However, in November 1985, HHS denied the petition on the basis that an "imminent hazard" had not been demonstrated. This decision was based on an analysis of the NRDC's evidence as well as scientific evidence, information, and opinions

coming out of the January 1985 public hearing and other relevant data collected and analyzed by FDA.

1984 King County Study

In 1981, the House Appropriations Committee provided money in FDA's budget for a definitive epidemiological study of the antibiotics in animal feeds issue. The Committee stated that FDA should hold in abeyance any implementation of the proposed withdrawal pending completion of the studies and reevaluation of FDA's concerns. FDA contracted with the Communicable Disease Control Section of the Seattle-King County Department of Public Health to review the possibility of the movement of bacteria from chickens to humans. The study focused on poultry workers, slaughterhouse workers, and consumers. The report, "Surveillance of the Flow of Salmonella and Campylobacter in a Community," found that Campylobacter jejuni was more common than Salmonella on poultry. Also, it found that C. jejuni "does appear to flow from chickens to man via consumption of poultry products." The report stated that the "isolates from human cases and those from retail poultry had similar antibiotic susceptibility patterns, including prevalence of 29.7 percent and 32.8 percent, respectively, for tetracycline resistance, which was found to be plasmid-mediated."

1987 FDA Report

In its report, "Antibiotics in Animal Feeds: An Assessment of Scientific Data Concerning Their Safety," FDA concluded that the therapeutic use of antibiotics would not significantly contribute to the frequency of resistant organisms because of the pattern of use of these products. Therapeutic use is typically for a select number of animals and for a short duration, situations that are not likely to lead to antibiotic resistance, the report said.

1988 IOM Review

In 1988, the Institute of Medicine (IOM) again reviewed all the information about the antibiotic resistance issue available. An expert Committee was convened to determine the human health risks associated with the practice of feeding subtherapeutic levels of penicillin and tetracyclines to animals for growth promotion, feed efficiency, and disease prevention. In the report, "Human Health Risks with the Subtherapeutic Use of Penicillin or Tetracyclines in Animal Feed," the Committee developed a risk-analysis model, using data only on Salmonella infections that resulted in human death. The Committee found a considerable amount of indirect evidence implicating both subtherapeutic and therapeutic use of antimicrobials as a potential human health hazard, but did not find data demonstrating that use of subtherapeutic penicillin or tetracycline directly caused a human to die from salmonellosis. The Committee strongly recommended further study of the issue.

1995 AMS Report

The American Society of Microbiology (ASM), which includes members who specialize in medical and animal microbiology, issued a report in 1995 that cited grave concerns about both human and animal antibiotic use and the rise in antimicrobial resistance. The report advocated a significant increase in resistance monitoring in the U.S., more education about the use and risks of antimicrobials, and more basic research designed to develop new antimicrobials and vaccines and disease prevention measures. The report criticized overuse of antibacterials in human medicine, but also pointed out the large use in food production, which was partly attributed to the consolidation of farms to facilities with large numbers of confined animals. The report made it clear that the antibiotic resistance problem is global. The ASM report was a precursor to involvement by the United Nation's World Health Organization (WHO).

1997 WHO Meeting

In October 1997, WHO convened a meeting of experts in Berlin, Germany, to review the question of whether the use of antimicrobials in animals leads to antimicrobial resistance in humans. The experts sought to define potential medical problems that could arise from antimicrobial use in livestock and to recommend actions that the WHO should take. The group of experts recommended against using antimicrobials for growth promotion if those antimicrobials are also used in human medicine or can induce cross-resistance to antimicrobials used for human medical therapy. The group also recommended that research be conducted on non-antimicrobial growth-promoters and urged that the risk to human health from use of antimicrobials in food animals be accurately assessed. The group called for enhanced monitoring of resistance among isolates of enteric bacteria from food animals

and food of animal origin. In addition, the group recommended managing risk at the producer level through the prudent use of antimicrobials.

1998 WHO Meeting

In June 1998, the WHO held another meeting, this time in Geneva, Switzerland, to specifically address the use of quinolones in food-producing animals. The participants agreed that the use of antimicrobials will cause resistance to develop and that there is a potential human health hazard from resistant Salmonella, E. colt, and Campylobacter organisms transferred to humans through the food supply. However, the experts also agreed that antimicrobial drugs, including quinolones in certain instances, are needed to treat sick animals, and urged more research on the possible human health effects from the use of these drugs in animals.

1998 CSPI Report

In May 1998, the Center for Science in the Public Interest (CSPI), in a coalition that included 15 other health and consumer groups, produced a comprehensive report on the antibiotic resistance problem. The focus of the report was on human antimicrobial use; however CSPI made several recommendations regarding the use of antimicrobials in veterinary medicine. The report recommended that FDA ban all subtherapeutic uses of antimicrobial agents that are used in human medicine or might select for cross resistance to antimicrobials used in human medicine. The organization also expressed concerns about new human antimicrobials that may be at risk due to use of the same class of drugs in agriculture, at either subtherapeutic or therapeutic levels. Development of resistance to certain classes of drugs that are considered vital in human medical therapy, such as the fluoroquinolones, would cause particular concerto For this reason, CSPI recommended that FDA repeal approval of fluoroquinolones in poultry and allow additional approvals of fluoroquinolones only if the drug sponsor can show that those uses would not reduce the drug's effectiveness for human medical therapy.

1998 NRC Report

In July 1998, the National Research Council (NRC) produced a report reviewing antimicrobial resistance issues in broad terms. The NRC recommended establishing a national databases to support scientific process and policy development for approval and use of antibiotics in food animals. The NRC also recommended that FDA use interdisciplinary panels of experts so that ". . . further development and use of antibiotics in both human and animal medicine have oversight by an interdisciplinary panel of experts composed of representatives of the veterinary and animal health industry, the human medicine community, consumer advocacy groups, the animal production industry, and the regulatory agencies."

1998 EU Action

The European Union (KU) recently took action to minimize the agricultural use of antimicrobial drugs. In December 1998, health ministers for the EU voted to ban four antibiotics that are widely used at subtherapeutic levels to promote animal growth. The ban on using bacitracin zinc, spiramycin, tylosin, and virginiamycin in animal feed becomes effective for the fifteen member states of the EU on July 1, 1999.

CURRENT ISSUES

For several years, CVM has approved new antimicrobials for use in animals for therapeutic purposes as prescription-only products. This prescription-only policy is based on CVM's desire to assure the proper use of antimicrobials though precise diagnosis and correct treatment of disease to minimize animal suffering and to avoid drug residues in food. Antimicrobial products for use in animals have to meet FDA's standards for safety, efficacy, and quality to be approved in the United States.

When antimicrobial products are intended for use in food-producing animals, safety considerations include the evaluation of data to ensure that residues in food derived from treated animals are safe for human consumption. In the past, microbiological safety studies were required only for antimicrobials to be used in feed for more than 14 days. These studies examined resistance patterns and pathogen load.

In the 1990s, several scientists raised concerns about the therapeutic use of fluoroquinolone antibiotics in food-producing animals. The scientists said the use could lead to enteric disease in humans associated with fluoroquinolone-resistant zoonotic pathogens. At least part of this concern was prompted by the fact that the search for new antimicrobial drugs and other novel agents to combat bacterial pathogens had decreased in recent years, leaving fluoroquinolones as the last family of therapeutic agents available to treat some multiply resistant organisms. Adding

to that concern were reports of a temporal association between the approval of fluoroquinolone for therapeutic use in poultry and the emergence of a fluoroquinolone-resistant Campylobacter spp. from humans.

To further investigate the public health concerns regarding the potential impact of fluoroquinolone use in food-producing animals and to determine whether the 1987 FDA report (which concluded that therapeutic antimicrobials used for short duration were safe) was still valid, FDA held a Joint Advisory Committee meeting in 1994 that included the CVM Advisory Committee and the Center for Drug Evaluation and Research's Anti-infective Drugs Advisory Committee. The joint committee recommended that fluoroquinolones be approved, but that the use of the drugs should be limited to prescription only, that no extra-label use should be allowed, and that resistance should be monitored after the product was approved.

CVM created a Fluoroquinolone Working Group to address the points raised by the joint committee. The Working Group offered seven recommendations, all of which were accepted by CVM, and subsequently the use of fluoroquinolones was approved for poultry. As suggested in the recommendations, the sponsors agreed to provide baseline susceptibility information and to conduct continuing monitoring of target animal pathogens through the post-approval monitoring program.

More recently, scientists have detected a new multi-resistant pathogen, Salmonella typhimurium DT104. The organism carries chromosomally integrated resistance to

Ampicillin, Chloramphenicol, Streptomycin, Sulphonamides, and Tetracycline. This chromosomally integrated resistance is unique and raises concerns about the establishment of a reservoir of multi-drug resistant organisms that are zoonotic enteric pathogens that may become endemic in food-animal microbial populations. In addition to the chromosomally borne pen/a-resistance, the organism seems to be losing its susceptibility to quinolone and trimethoprim antibiotics and has been recently shown to carry additional florfenicol and spectinomycin resistance.

A report from the UK suggests that infections caused by DT104 may be associated with greater morbidity and mortality than other infections by Salmonella. An association has been noted between loss of susceptibility to fluoroquinolones among DT104 isolates and the approval and use of a fluoroquinolone for veterinary therapeutic use in the UK. This organism has also been identified in livestock and poultry in the U.S. Human disease caused by DT104 in the U.S. has been associated with unpasteurized dairy products and direct contact with livestock.

DT104 is currently epidemic in human and animal populations in Great Britain and has been isolated from most countries in Europe. The organism more recently has been found in the U.S. and appears to be increasingly prevalent in both domestic and wild animals. The most notable outbreak of DT104 was on a dairy farm in Vermont.

The DT104 findings caused FDA to aggressively move ahead with plans to change the regulatory framework for approving antimicrobial products. The discovery of DT104 was a turning point for FDA, and led to the development of a proposed regulatory course for the Agency.

Reports from the scientific and public health communities, both domestically and internationally, have identified concerns about the relationship between the approval of fluoroquinolones for therapeutic use in food-producing animals and the development of fluoroquinolone resistance in Campylobacter. The approval of these drugs in food-producing animals in the Netherlands, the UK, and Spain temporally preceded increases in resistance in Campylobacter isolates from humans. Despite several restrictions placed on the use of the two approved poultry fluoroquinolone products in the U.S., ciprofloxacin-resistant Campylobacter were recently isolated from 20 percent of domestic retail chicken products sampled. Molecular subtyping revealed an association between resistant C. jejuni strains from chicken products and C. jejuni strains from domestically acquired human cases of campylobacteriosis.

Framework Document

FDA's concept of the best regulatory approach for antimicrobial approvals is explained in what is called the "Framework Document," ("A Proposed Framework for Evaluating and Assuring the Human Safety of the Microbial Effects of Antimicrobial New Animal Drugs Intended for Use in Food-Producing Animals"), which is available on the CVM Home Page at http://www.fda Pov/cvm/fda/infores/vmac/antiml8 him or http://www.fda.Pov/cvm/fda/infores/vmac/antim18.pdf.

The document was released to the public December 9, 1998, and the comment period was scheduled to last until April 6, 1999.

The proposed framework takes into consideration two factors that would be used in evaluating human health concerns associated with food-animal use of antimicrobials:

—The importance of the drug or class of drugs for human medicine, and
—The potential exposure that humans would face to resistant pathogens or resistant elements originating from animals treated with an antimicrobial, and the impact this exposure would have on the availability and effectiveness for human medicine of drugs to which the resistance has developed.

Depending on the importance of the drug (or a related drug) to human health, FDA would place it in one of three major Tiers. Each Tier would have different requirements for approval. The requirements for approval may include both pre-approval screening and post-approval monitoring conducted on farms.

FDA's implementation of the framework will require the development of guidance documents and perhaps new or amended rules. All such guidance or rules would be developed with public input, and FDA will consider any needed change as a high priority.

Under the framework document, antimicrobial drugs would be placed in Class I, the level with the greatest approval requirements, if:

—They are needed to treat a serious or life-threatening disease for which there is no satisfactory alternative therapy, and
—They are important for the treatment of foodborne diseases.

Drugs that can select for cross-resistance to Class I human agents would also be listed in Class I, unless the sponsor could demonstrate that animal use did not result in the induction of resistant pathogens or the transfer of resistant elements to human pathogens.

Drugs would be placed in Class II if:

—They are of high importance or are the drugs of choice to treat a serious or life-threatening disease, but a satisfactory alternative therapy exists.
—They are members of a class of drugs that have a unique mechanism of action or nature of resistance-induction, that rarely produce resistance in human pathogens, and that hold potential for long-term therapy in human medicine.

FDA would put products into Class III if they do not meet any of the requirements of the other two classes.

NARMS

CVM now believes that the safety assessment of antimicrobials must include evaluation of resistance concerns with the conduct of pre-approval studies and post-approval monitoring programs, which are aided by the National Antimicrobial Resistance Monitoring System (NARMS).

The program was proposed by CVM as a post-marketing activity to monitor the emergence and spread of resistance in enteric bacteria and to help ensure the continued safety and effectiveness of veterinary antimicrobials. In 1996, the FDA, CDC, and the USDA created NARMS to prospectively monitor changes in antimicrobial susceptibilities of zoonotic enteric pathogens from human and animal clinical specimens, from healthy farm animals, and from carcasses of food-producing animals at slaughter. Non-typhoia Salmonella was selected as the sentinel organism; the NARMS has been expanded each year since its inception. At the present time, NARMS is monitoring susceptibilities of Salmonella and E cold isolates to 17 antimicrobics and Campylobacter isolates to 8 antimicrobics (azithromycin, chloramphenicol, ciprofloxacin, clindamycin, erythromycin, gentamycin, nalidixic acid, and tetracycline).

Veterinary testing is conducted at USDA's Agricultural Research Service Russell Research Center. Human isolate testing is conducted at CDC's National Center for Infectious Diseases Foodborne Disease Laboratory. Seventeen State and local health departments (CA, CO, CT, FL, GA, KS, Los Angeles County, MA, MD, MN, NJ, New York City, NY, OR, TN, WA, and WV) submit human clinical isolates of non-typhoid Salmonella and E. coli. Eight health departments are submitting human clinical Campylobacter isolates, and in addition MN, GA, MD, and OR are submitting Campylobacter isolates from poultry retail samples. A pilot study involving MN, GA, MD, and OR to monitor the resistance of human and poultry Enterococcus isolates to 27 antimicrobials was begun in 1998.

The goals and objectives of the monitoring program are to provide descriptive data on the extent and temporal trends of antimicrobial susceptibility in Salmonella and other enteric organisms from the human and animal populations; provide timely information to veterinarians physicians; prolong the life span of approved drugs by promoting the prudent use of antimicrobics; identify areas for more detailed investigation; and guide research on antibiotic resistance. Annual reports summarizing the data are available on the Internet (http://www.fda.gov/cvm/fda/mappos/narms/html and www.cdc.gov/ncidod/dbmd/narms).

The NARMS was substantially expanded during 1998. Veterinary diagnostic lab sentinel sites were enrolled as well as additional sites to gather human isolates, and

the number of Salmonella isolates collected from slaughter plants was increased. Beginning January 1, 1999, the State and local health departments began to submit human S. typhi and Shigella isolates.

Also in 1998, follow-on epidemiology research and investigations augmented the program. On-farm poultry studies were begun in five states, which are designed to elaborate management, production, and drug use practices that influence the development of resistant zoonotic pathogens. Collaborative molecular genetic studies have begun at FDA's National Center for Toxicological Research in Arkansas to identify regions of fluoroquinolone resistance in zoonotic enteric organisms. This information will be applied to enteric and environmental bacteria to provide improved monitoring for resistance emergence and transfer. Case-control follow-up investigations of human cases of salmonellosis and campylobacteriosis with losses in susceptibility to quinolones were begun in 1998. Also in 1998, two projects on prudent drug use activities were initiated in California and Michigan.

PRUDENT USE

CVM believes it is critical that prudent use of antimicrobials be emphasized in order to minimize the development of antimicrobial resistance and to ensure the continued efficacy and availability of antimicrobial products for use in food-producing animals. To promote this concept, CVM and CDC facilitated a meeting on "Prudent Use" held in May 1998 in Rockville, Maryland.

The objective of the meeting was to develop a plan to promote the Prudent Use of therapeutic antimicrobials in veterinary medicine. At the meeting, several groups agreed to develop programs about Prudent Use, and the effort was led by the American Veterinary Medical Association (AVMA), which has developed its Prudent Use program of "Judicious Use."

The Executive Board of AVMA has agreed to principles concerning Judicious Use developed by a special AVMA Steering Committee. CVM and CDC provided experts to advise the Steering Committee. CVM strongly supports the effort to develop Judicious Use principles for veterinary practitioners, and will financially support efforts to publicize the guidelines.

Key elements of Prudent Use that CVM believes should be addressed:

—Development of Prudent Use principles.

—Therapeutically based antimicrobial-use guidelines.

—Recommendations on appropriate measures to reduce disease transmission.

—Educational programs for prescribers and users of these drugs.

CVM defines Prudent Use of therapeutic antimicrobial agents as. . .

". . . use that maximizes therapeutic effect while minimizing the development of resistance."

At the May 1998 meeting and in other contacts, CVM has and will continue to solicit advice from the human medical community in the development of Prudent Use principles because their expertise about what has worked and not worked in human medicine will be useful. The development of the Prudent Use principles won't be static. Instead, the process will likely demand continued attention. In fact, CVM will probably engage food animal producers on this issue at some time in the future.

Question. The ARS budget request includes an increase of $2.4 million to develop risk assessment predictive models. What modeling has been done to date in this area and how has it been implemented? (ARS)

USDA answer. Risk assessments for pathogens have primarily been carried out in the postharvest arena to predict the frequency and the numbers of pathogens that might be present in specific food products such as eggs or ground beef. These numbers are then related to the frequency that sufficient pathogens might be present in a food to result in human illness. ARS has worked closely with the FSIS in the development of such a model for Salmonella enteritidis in eggs which was the basis of rulemaking by this USDA regulatory agency. It is now time to initiate the development of predictive microbiological models in preharvest animal production, and to help evaluate the effects of various production practices, interventions, and transportation systems on the risk of contamination of food producing animals as they are presented for slaughter.

Question. What is the time frame for developing the models you propose in the fiscal year 2000 budget? When would they be implemented? Who would utilize the technology?

You are requesting an additional $4,420,000 for post-harvest (slaughter and processing) research. This area has been ARS' major focus of pathogen contamination. Please summarize the progress made to date as a result of pathogen control strategies for Campylobacter, E. coliO157:H7, Listeria, and Salmonella.

USDA answer. Acquisition of the research information needed to develop truly useful predictive models is a significant research activity that will take several years. Quantitative microbiological data must be developed, rather than just the incidence or quantitative data of the past; quantitative data is expensive and time consuming to obtain.

The underlying research will require several years to develop the first data for the models. The first models will be available as soon as this phase is completed.

These models would be utilized/implemented by producers to help them make informed decisions on which interventions will yield the best food safety results within their available resources and production situations.

The progress made to date on postharvest research for the pathogens, Campylobacter, E. coli O157:H7, Listeria and Salmonella are as follows:

Progress in the area of detection methods:

—Monoclonal antibodies (MAbs) that bind specifically to Campylobacter jejuni and Campylobacter coli have been developed, and patented. These antibodies will be used in an immunologically based method (ELISA) to improve the current specific detection methods for Campylobacter.

—A laser assisted method (MALDI) has been developed for the rapid detection of Campylobacter. The methods advantage is that only a single bacterial colony is needed for analysis. The MALDI technique also has the potential to be widely used for confirmatory analysis of other pathogenic bacteria.

—A nucleic acid based (PCR) method was developed which simultaneously detects enterotoxigenic and Shiga toxin-producing E. coli (O157:H7) strains from calves. The method is being used by diagnostic laboratories to rapidly identify, differentiate and characterize pathogenic E. coli. This change will be useful to producers and veterinarians for the rapid diagnosis of all the diseases caused by E. coli in calves.

—An ELISA based test (immuno-precipitation pregnancy test design) called Meridian was developed. The test uses monoclonal antibodies to specifically detect all E. Coli O157 strains, not just O157:H7. Meridian has found widespread use by food companies since it has a much lower incidence of false negatives than other comparable tests.

—In cooperation with IGEN of Gaithersburg, MD, ARS has developed an immunomagnetic electro-chemiluminescent (IM-EC) method for the detection of E. coli O157:H7. The test is rapid, sensitive to low numbers of bacteria, inexpensive, and user-friendly. The technology is currently under evaluation by the FSIS.

—Optimized methods to identify, differentiate, and characterize pathogenic E. coli isolates from bovine sources were developed. Anti-O157 Mabs in an ELISA format accurately detected serum antibodies to E. coli 0111, in cattle and other livestock. Serum detection of antibodies to E. coli O157:H7 will allow accurate detection of all animals exposed to this pathogen at any time during animal growth.

—Research by ARS determined that automated nucleic acid based ribotyping of Salmonella was a better discriminator between isolates than serotyping. Ribotyping however, is not a replacement for serotyping. It was recommended that for epidemiological investigations, both techniques should be used simultaneously.

Progress in the area of pathogen reduction:

—In order to determine the effectiveness of a pathogen reduction method bacteria need to be modified to allow their identification and discrimination from background microflora. ARS has developed a genetic technique that allows the construction of (model) pathogens that bioluminesce under UV light due to production of a green fluorescent protein (GFP). Various model strains of E. coli O157:H7 and Salmonella were constructed having the same growth and attachment characteristics as the wild type strain. This research technology will aid in understanding the basis of microbial attachment and detachment to animal carcasses in real-time. The technology also offers a more rapid means to evaluate antimicrobial carcass treatments that do not rely on sampling, culturing and back-extrapolation of the resulting plate counts to large surface areas.

—ARS concluded research on washing and sanitizing hog hauling trailers and holding pens. The results have led to procedures to significantly reduce Salmonella, Campylobacter and E. coli contamination on animals entering slaughter plants.

—A surface pasteurization technique was developed to reduce microbial contamination (almonella, Campylobacter and Listeria) on the surface of solid foods without loss of quality. A prototype design to briefly steam fresh whole broiler

carcasses, so that surface organisms are killed but with no appreciable cooking of the meat, was built, tested and patented.

—Feed withdrawal in broilers prior to slaughter is used to induce molt and to stimulate egg laying in aged flocks, however, withdrawal increased infection rates in their crops by Salmonella and Campylobacter. Research showed that methods such as adding lactose to drinking water had the ability to restore resistance, and reduce infection rates.

—Various conventional and experimental wash formulations were evaluated to determine their efficacy in decontaminating apples of human pathogens (almonella, E. coli O157:H7, Listeria). Solutions containing 5 percent hydrogen peroxide, alone or in combination with acidic detergents achieved a 3–4 log pathogen reduction. These studies demonstrated that current conventional methods of washing apples are largely ineffective. Development of efficacious cleaning methods for fruit are crucial for the production of unpasteurized juices.

—Low dose gamma irradiation was found to be efficacious for destroying the human bacterial pathogens E. coli O157:H7, Listeria and Salmonella on seed used for the growth of sprouts. Irradiation is a useful technology that significantly reduces pathogens in certain food commodities, while increasing shelf life and maintaining freshness, all major consumer demands.

Progress in the area of pathogen control through intervention strategies:

—The discovery that electropolishing surfaces significantly reduces attachment of pathogens such as Campylobacter and subsequent biofilm formation. This finding will aid equipment manufacturers in developing methods and selecting materials to be used in processing foods.

—It was discovered that some naturally occurring food additives blocked the attachment of E. coli to bovine fascia and connective tissues. Inhibition of E. coli O157:H attachment to intact meat tissues by use of these substances will offer processors an additional means to help to prevent E. coli O157:H7 contamination of meats.

—Controlled atmospheric storage of fresh produce does not appear to offer a viable method for controlling Listeria monocytogenes. Therefore, the fresh cut industry should consider alternate methods for controlling this pathogen.

—ARS in collaboration with FSIS conducted a nationwide evaluation of color of cooked beef patties relative to potential food safety risk for E. coli O157:H7. The study provided solid evidence that cooked beef patty color is not a good indicator of internal patty temperature. The results were a major factor in the development of the new FSIS consumer message that "consumers should not eat ground beef patties that are pink or red in the middle unless a food thermometer has been used to verify cooked temperature."

Progress in the area of antimicrobial resistance:

—The acid tolerance of E. coli O157:H7 contributes to its ability to cause disease by increasing both its ability to persist in food, and its infectivity. ARS developed a technique to induce maximum acid tolerance in these microorganisms, and identified that the sensitivity to acid inactivation is dependent on acidulant identity, prior exposure to an acid environment, and strain identity.

Progress in the area of risk assessment:

—Bioluminescent strains of Salmonella were used as a tool for modeling behavior of Salmonella in raw and cooked poultry products. The data were incorporated into version 2.0 of the Salmonella—Risk Assessment Modeling Program for Poultry (-RAMPP). A new simulation model, the Food Animal Risk Model for Poultry Pathogens (FARM-PP) was also developed which predicts the severity of outcomes from consumption of poultry products contaminated with Salmonella and/or Campylobacter.

Question. Please identify and discuss food safety research that is specifically carried out to meet FSIS concerns. What other Federal agencies benefit directly from ARS food safety research? How are these needs expressed?

USDA answer. ARS carries out both preharvest and postharvest food safety research to meet the needs of the FSIS, particularly for the implementation of HACCP. In many cases this research also meets the needs of other ARS stakeholders such as animal producers and slaughter and packing houses, and food processors. Both the regulatory agencies and producers use the results of the latest research to help assure the production and delivery of safe food. Preharvest food safety research develops information and technologies to control E. coli 1057:H7 in cattle, Salmonella sp. in poultry, swine and cattle, Campylobacter sp. in poultry and swine, and Cryptosporidia infections in cattle. In particular this research develops methodology to detect pathogens, and it develops interventions such as vaccines and competitive exclusion bacterial cultures for use by producers to prevent zoonotic pathogens. Other preharvest research is directed at determining the major factors

in the genesis and dissemination of antibacterial resistance, and at developing strategies to help prolong the useful life of antibiotics.

In the postharvest arena ARS develops improved methodologies to detect pathogens, including E. coli, Salmonella, Campylobacter and Listeria with needed accuracy and reliability using reproducible sampling methods that meet agency cost constraints. Other projects develop imaging systems that will detect lesions and help assure that only wholesome birds are passed for human food. Interventions or hurdle technologies are developed for slaughter and processing establishments, including the very small plants; these technologies include acid rinses, the use of steam and hot water, and chlorine replacements. Biofilms are studied as they are formed on processing equipment, and methods to disrupt this natural biological protection of pathogens are developed. Steam pasteurization and irradiation are developed as final effective hurdles to prevent the occurrence of most pathogens on food products of animal origin. Information on both survival and kill times for the important pathogens in various food systems under different environmental conditions are obtained to aid in FSIS decision making, in the development of HACCP programs and most importantly for risk assessment.

Particular attention is being paid to Listeria, the pathogen recently recognized as responsible for a large number of food poisoning and deaths, and for which both FSIS and the food industry need answers. A rapid gene-based assay has been developed that can readily identify and differentiate Listeria species in various ready-to-eat foods, allowing for molecular fingerprinting and trace-back. A program has been initiated to develop technology to surface pasteurize food products, including hot dogs, which economically reduces microbial contamination without significant loss of product quality; and ARS is also defining the parameters required for irradiation of meats and meat products. ARS is determining the effect of various food components, and parameters (pH, water activity, salt, process and storage temperature) on the inactivation, survival and growth of Listeria in ready to eat products, and identifying new generally recognized as safe (GRAS) compounds that can be incorporated into foods as a antimicrobial agents to protect against Listeria and other pathogens. The FDA and CDC also directly benefit from ARS food safety research.

The FDA's needs are expressed to ARS through continual dialogue between the agencies via meetings between the Chief Scientist at CFSAN/FDA and his staff, and ARS Food Safety National Program Leaders. In order to ensure there is no duplication of efforts, there is a routine comparison of research agendas from each of the agencies and delineation of activities, and interaction between agencies on projects or issues of national importance when required.

Question. Please identify and briefly describe the food safety research ARS performs at its various laboratories.

USDA answer. ARS conducts research at the following laboratories:

Location	Fiscal Year 1999	Food Safety Initiative Rsch
Fayetteville, AR	$293,800	Prevention
Albany, CA	7,734,800	Detection, Prevention, Handling & Distribution
Riverside, CA	592,800	Detection, Prevention
Athens, GA	9,971,100	Detection, Prevention, Antibiotic Resistance, Handling & Distribution
Dawson, GA	745,600	Detection
Tifton, GA	564,500	Prevention
Ames, IA	4,215,400	Detection, Prevention, Antibiotic Resistance
Peoria, IL	4,899,600	Detection, Prevention
West Lafayette, IN	296,400	Prevention
New Orleans, LA	3,039,000	Detection, Prevention
Beltsville, MD	8,168,400	Detection, Prevention, Risk Assessment, Handling & Distribution
Beltsville, MD (NAL)	219,600	Prevention
Mississippi State, MS	669,100	Prevention
Raleigh, NC	491,800	Prevention
Fargo, ND	2,296,100	Detection, Risk Assessment
Clay Center, NE	3,879,100	Detection, Prevention, Handling & Distribution
Ithaca, NY	316,200	Prevention
Wyndmoor, PA	13,245,900	Detection, Prevention, Antimicrobial Resistance, Risk Assessment, Handling/Distribution
College Station, TX	4,722,600	Detection, Prevention, Antibiotic Resistance
Lubbock, TX	281,600	Prevention

Location	Fiscal Year 1999	Food Safety Initiative Rsch
Logan, UT	2,147,300	Detection, Prevention
Headquarters	1,076,900	Detection, Prevention
Total	69,867,600	

Question. Please identify the food safety research funding in REE agencies by each account. Provide for the record the funding appropriated from fiscal years 1990 to 1999. Also include the increase requested in the President's 2000 budget.

USDA answer. The National Agricultural Statistics Service (NASS) did not have any expenditures related to food safety research in fiscal years 1990 to 1999 and has not provided funding to institutions for food safety related research projects. For the fiscal year 2000 President's budget, NASS has one initiative for $2.5 million to conduct a fruits and vegetables food safety survey. Under this initiative, NASS would conduct a statistical survey of fruit and vegetable growers, as well as packing houses, to establish a baseline for good agricultural practices as they relate to microbial food safety issues.

The food safety research funding for Economic Research Service (ERS) for fiscal year 1990 through fiscal year 1999 and the request for fiscal year 2000 are as follows:

Fiscal Year	
1990	$325,000
1991	550,000
1992	550,000
1993	550,000
1994	500,000
1995	485,000
1996	485,000
1997	485,000
1998	485,000
1999	938,000
2000	1,391,000

In fiscal year 1997 and fiscal year 1998, ERS Food Safety funds were dedicated to ERS staff costs and the research was done internally. In fiscal year 1999 and fiscal year 2000, we plan to spend the initiative increases on extramural research programs to measure the benefits of food safety and to support economic analysis in risk assessment and surveillance. The recipient institutions have not been determined at this time. The food safety research funding for ARS for fiscal year 1990 through 1999 and the request for fiscal year 2000 are as follows:

Fiscal Year	
1990	$27,517,000
1991	33,087,900
1992	35,989,000
1993	35,989,000
1994	37,587,400
1995	43,840,300
1996	44,313,100
1997	49,647,300
1998	54,949,400
1999	69,867,600
2000	81,588,000

Based on Food Safety Initiative Codes, in fiscal year 1999, ARS undertook 40 projects ($14.2 million) in detection of food borne pathogens; 70 projects ($37.9 million) in prevention and control; 7 projects ($2.2 million) in antimicrobal/antibiotic resistance; 9 projects ($4.9 million) in risk assessment; and 18 projects ($10.6 million) in food handling distribution and storage. The increase requested for ARS in the President's fiscal year 2000 budget is $11,720,000 to be directed towards: Preharvest: manure handling and distribution-pathogen reduction ($2,500,000); risk assessment ($2,400,000); antibiotic resistance ($1,800,000); fungal toxins ($300,000); zoonotic disease risk ($300,000) and Postharvest: pathogen control during slaughter and processing ($700,000); pathogen control in fruits and vegetables ($2,100,000); antimicrobial resistance ($1,620,000). The food safety research funding for CSREES, including formula funds, all special research grants, and the NRI, for fiscal year 1990 through fiscal year 1999 and the request for fiscal year 2000 are as follows:

Fiscal Year	
1990	$5,790
1991	9,827
1992	12,002
1993	11,610
1994	14,117
1995	12,450
1996	11,644
1997	12,195
1998	14,727
1999	30,888
2000	39,536

Food Safety programs previously in the research and extension activities are now reflected in the integrated activities for fiscal year 2000.

Question. Please list the institutions receiving food safety funding from REE agencies' appropriations in each of fiscal years 1997 to 1999, a description of each food safety research project funded in each fiscal year, and the progress which has been made to date through the research funded.

USDA answer. Most ARS expenditures for food safety research are for in-house programs. The extramural institutions who have received funding (pass through dollars) from ARS during fiscal years 1997–1999 are as follows: Mississippi Center for Food Safety and Postharvest Technology, Mississippi State University (MCFSPT); Agricultural and Home Economics Experiment Station, New Mexico State University (AHEES), Food Safety Engineering Center, Purdue University (FSEC); Institute for Technology Development, Stennis Space Center, Mississippi (ITD); and grants to various Land Grant, State Universities and research groups, including Iowa State University, University of Arizona, Texas A & M, Purdue University, University of S.W. Louisiana, North Carolina State University, Mississippi State University, University of California, University of California-Davis, University of Illinois, Georgia Coastal Plain Experiment Station, and the Arizona Cotton and Protection Council. These programs are managed via the National Program Staff (NPS).

The extramural funding allocations for years 1997—1999 are as follows:

Center	Fiscal Year 1997	Fiscal Year 1998	Fiscal Year 1999
MCFSPT (Est.)	$314,335	$312,712	$312,712
AHEES	118,000	114,000	114,000
FSEC			878,049
ITD			219,000
Via NPS	560,087	553,341	784,468

Description of these extramural food safety research projects are as follows:

Mississippi Center for Food Safety and Postharvest Technology.—Project title/objectives: Detection and Treatment of Listeria and Other Bacteria in Channel Catfish. The major thrust of the project is to assess and help ensure the safety of channel catfish for sale throughout the United States. The research achievements of this project were: the development of an immunologically (ELISA)—medicated nucleic acid based method for the rapid detection of Listeria monocytogenes in foods; understanding the types of biofilms formed and the presence of various pathogens at the different processing stations; development of methods to detect the presence of antibiotics in channel catfish; and the identification of various pathogenicity vectors in Listeria. Processing and packaging technologies/treatments are being developed to reduce/eliminate microbial contamination to ensure product safety with extension of shelf life. Information from this research has been transferred to producers and processors, where it has been put into operation. Guidelines have been incorporated into HACCP program adopted for use by this industry.

Agricultural and Home Economics Experiment Station.—Project title/objective: Locoweed Ecology and Toxicology. The research in this project was aimed at determination of the cytokinetics (absorption, distribution, and excretion and clearance) of plants toxins from the tissue or products of animals that consume poisonous plants. The studies delineated the withdrawal time to ensure that animal products would be free from plant toxins. This information can be used for management strategies in many states. The research also improved animal productivity, and enhanced the utilization of pastures and rangelands where poisonous plants are found.

Food Safety Engineering Center.—Project title: Rapid Pathogen Diagnostic and Detection Methods: This is a new project initiated in fiscal year 1999. The goal is the development and use of biosensor technology in food safety.

Institute for Technology Development.—Project title: Online Detection Technology. This project initiated in fiscal year 1999 will develop real time on-line detection technology for rapid identification of surface contamination in poultry.

National Program Staff.—Project title: Aflatoxin Research: Funds are distributed to numerous Land Grant and State Universities and the objectives of this project are varied. Some funding for projects is specifically made available on a competitive basis (intent of Congress). The aim of the program is the reduction of aflatoxins which are metabolities of the fungi Aspergillus flavus and A. parasiticus for agricultural products, for example, cottonseed, corn, peanuts and tree nuts. Aflatoxins is considered one of the most serious food safety problems, and chronic problems with aflatoxin contamination occur in the southern United States. Two areas of research and development have resulted from these studies: the development of novel genetic engineering and or marker-based breeding methods to enhance general antifungal resistance in crops; and the isolation and formulation of special fungi for use in biocontrol. The biocontrol fungi are strains of A. flavus-group fungi that do not produce aflatoxin, but have the capacity to occupy the same ecological niche in the field and out compete harmful toxin-producing fungi. The research has led to the well grounded optimism that solutions to this serious problem will be available by the beginning of the next century.

The following list represents the projects in food safety funded by CSREES in the named program area within 1997 and 1998. The CSREES has not yet made any awards under the Food Safety Special Research Grants program and the National Research Initiative program in fiscal year 1999.

NATIONAL RESEARCH INITIATIVE AWARDS FISCAL YEAR 1997

The Role of Acid Resistance in Escherichia coli O157:H7 Colonization and Disease, University of South Alabama, $227,000. Enterohemorrhagic E. coli (EHEC) cause a variety of dangerous gastrointestinal infections. EHEC Stereotype O157:H7 has recently emerged as an important foodborne pathogen that threatens many aspects of the food industry. A crucial feature of O157:H7 pathogenesis is its ability to withstand stomach acidity. Our laboratory has identified three systems of acid resistance present in all E. coli and a fourth system dedicated to O157:H7. Each system will protect cells to pH < 2.5 for several hours. The University of South Alabama hypothesize that these acid resistance systems are induced during growth within livestock intestines and will persist over long periods of cold storage. One or more of these systems must contribute to the low infectious dose of O157:H7 by protecting E. coli from gastric acidity and intestinal weak acids. The University of Alabama's long terms goals are to develop new strategies that will diminish the infectious character of this pathogens through an understanding of the molecular basis of acid resistance in E. coli with emphasis on the superior acid resistance of O157:H7.

Quantitative Viability Assays for Cryptosporidium parvum and Giardia lamblia, University of California-Davis, $44,000. Cryptosporidium parvum and Giardia lamblia are common waterborne agents whose potential for transmission via foods is increasingly being recognized. The objectives of this study are to develop quantitative viability assays for C. parvum and G. lamblia based on cell culture or in vitro culture and ELISA, and to evaluate the methods in trials of killing the protozoan oocysts or cysts by various means pertinent to food safety. Oocysts or cysts, respectively, will be inoculated into foods at risk of protozoan contamination (e.g., apple juice, shellfish, etc.); foods will be suspended in diluent as necessary, and the oocysts or cysts will be recovered by immunomagnetic capture. The oocysts or cysts will be treated to induce excystation, diluted serially, and inoculated into ELISA plate wells. Amplification of viable infectious agents will take place in the plate wells, during approximately 24 h at 37. C. 0ocysts of C. parvum will be amplified in plate wells that contain monolayers of BSC–1 cells; whereas G. Iamblia cysts will probably be amplified in artificial medium in the wells. Homologous antibody will be added and labeled indirectly with horseradish peroxidase. The wells will be washed, a color reaction carried out, and results determined in a standard ELISA plate reader. Control inocula will include oocysts or cysts that have been inactivated by ultraviolet, formaldehyde, freezing, or heat. The tests will then be applied in inactivation trials with viable oocysts or cysts in foods of interest or in water that might be used in food processing.

Molecular Stress Physiology of Listeria monocytogene, Illinois State University, $113,000. The bacterium Listeria monocytogenes is the causative agent of the foodborne disease listeriosis. The fatality rate of listeriosis is high and it is believed to be the leading cause of death from foodborne infections in the United States. Although Listeria can grow at the body temperature of an infected person, it has the unusual ability to also grow at refrigeration temperatures. Refrigeration can then

in effect increase the Listeria content of a food. Illinois State University is interested in the underlying mechanisms involved that permit the bacterium to grow at low temperatures. Illinois State University will attempt to identify novel genes and proteins involved in growth at low temperatures. A fatty acid known as anteiso branched chain fatty acid appears to play a critical role in growth at low temperatures. Illinois State University will investigate the role of this fatty acid in maintaining membrane lipid fluidity at refrigeration temperatures. During food processing, bacteria can become injured and undetectable by conventional culturing methods, but not be dead. Illinois State University suspect that injured bacteria contain denatured proteins that must be degraded before the bacteria can grow, and will investigate this hypothesis. It is hoped that these studies will provide the scientific basis that will lead to novel methods of control of Listeria and improved methods of detection of the organism.

Detoxification of Fumonisin by a Simple Fructose Reaction in Corn for Food, $110,000. The toxin, fumonisin B1, is found in corn everywhere. A suspected cancer-causing agent in humans, fumonisin B1 requires its amine group, a simple nitrogen-containing portion of the molecule for its toxic action. Reacting this amine with simple sugars, such as fructose, is likely to block fumionisin toxicity, as the Iowa State University has previously demonstrated in a one-month model of liver cancer development in rats. Iowa State University's objectives are 1) to determine the toxicity of fructose-FB1 products in: a) a study of short-term toxic effects in pigs and b) a field-test feeding rats a fumonisin contaminated corn food that we have attempted to detoxify; and 2) to determine the processing conditions for the reactions of fructose and glucose with fumonisin to occur in corn-based foods. Objective 1) will be accomplished by feeding studies in pigs (for 2 weeks) and rats (for 4 months), comparing toxicity of pure fumonisin B1 with a fumonisin B1-fructose product and with corn contaminated with fumonisin and corn reacted to detoxify the fumonisin. Toxicity will be assessed by blood chemical changes and microscopic examination of tissues from the test animals. Objective 2) will determine the feasibility of performing this detoxification reaction in human foods, characterizing FB-reducing sugar reactions and the nature of the detoxification product(s), using a variety of chemical analytical techniques. These studies may provide a practical approach to the problem of natural toxins, increasing the safety of the food supply by detoxifying a natural toxin that occurs in corn everywhere.

Salmonella enteritidis Heterophil Resistance, Iowa State University, $164,000. Egg-transmitted human salmonellosis is the most widespread food safety problem in the developed world. Over the past two decades, the number of Salmonella infections has increased dramatically in the United States, mostly due to Salmonella enteritidis var.enteritidis (SE) infections of eggs and egg products. The difficulty in controlling SE is primarily due to the low, but significant incidence of infected eggs. Iowa State University has isolated two less virulent SE mutants which are only briefly shed by infected birds, are effective in protecting birds against virulent challenge, and prevent egg transmission of virulent SE. Iowa State University propose to utilize these mutants to study the molecular basis of SE virulence and to identify genes involved in immune cell resistance so that safer vaccines can be developed. The following specific aims will be addressed: 1) Iowa State University will complete the assessment of the SE mutants in chickens in order to assess their pattern of colonization of infected tissues and affinity for egg laying tissues; 2) The genes involved in immune cell resistance will be identified by screening complemented strains in cell cultures; 3) Mutations will be constructed in these genes in the wild type strain in order to confirm their role in immune cell resistance; and 4) The mutants will be assessed for virulence and egg transmissibility in chickens. For unknown reasons, immune cell resistance is directly linked to lowered virulence in SE. These studies will shed light on the possible mechanisms involved and add to our understanding of Salmonella pathogenesis.

Extracellular Sporulation Signals of Clostridium perfringens, University of Massachusetts, $148,000. Clostridium perfringens has established itself as a leading cause of human foodborne illness in the U.S. This organism produces heat resistant spores. An enterotoxin is produced by some strains during sporulation and therefore the sequence of events leading to spore formation are especially important. Yet virtually nothing is know about the early events of this process. The University of Massachusetts has identified a sporulation factor (C. perfringens sporulation fact [CPSF]) produced by both enterotoxin-positive and enterotoxin-negative strains which stimulate the onset of sporulation and enterotoxin formation by this organism. The product(s) may be part of a signal transduction system. The signal transduction system in bacteria monitors the bacteria's environment and reacts to changes by chemical signals to the interior of cell. The University of Massachusetts

will develop conditions to optimize the levels of this product then attempt to isolate and characterize it.

Raw protein foods are commonly contaminated with both enterotoxin-positive and enterotoxin-negative strains and the ability of enterotoxin-negative strains to stimulate sporulation and enterotoxin formation of co-cultured enterotoxin-positive strains will be determined in laboratory media and in a model food system. Such an ability by enterotoxin-negative strains could contribute to periodically-reported C. perfringens outbreaks having short incubation periods and may also identify a role for enterotoxin-negative strains in promoting sporulation and enterotoxin formation in the human intestine following ingestion of temperature-abused foods containing high levels of vegetative cells of both toxin types.

Enhanced Green Fluorescent Protein Expression in Escherichia coli to Study Adherence to Meat, University of Massachusetts, $92,000. The United States Department of Agriculture, Food Safety Inspection Service (USDA/FSIS) recently enacted a regulation that requires that all meat and poultry processing plants develop a hazard analysis critical control points (HACCP) program. The aim of this regulation is to reduce the presence of infectious bacteria on the surface of meats, ground beef, and poultry products. There has been much research focusing upon methods for meat disinfection, even though there is little known about how bacterial stick to meat surfaces. This proposal will develop a microscopic experimental system that will investigate bacterial adhesion to meat surfaces. Knowledge of the interaction between bacteria and meat surfaces will lead to improved methods of detection and meat decontamination. This project will create E. coli strains that express enhanced fluorescent green protein (EGFP) and use these constructs to study bacterial adhesion and growth on meat surfaces by laser scanning confocal microscopy (LSCM). Both non-pathogenic E. coliand pathogenic strains will be constructed. This model system will allow experiments to be designed to determine the specificity of the adhesion and for analysis of the distribution of bacteria to meat structures. The scientific significance of this study is the novel system for investigation into the specific nature and parameters involved in bacterial adhesion to meat at a cellular level. The practical applications of this study will be the generation of basic knowledge that can be applied to evaluation of differential binding of pathogens (and indicator organisms) and the application of this knowledge to the wash steps during meat processing.

Detection and Analysis of taphylococcus aureus Enterotoxin A in Food 7 Johns Hopkins University, $133,000. The goal of this project is to increase food safety by developing the next generation of detection and analysis methodology for bacterial toxins in food, using taphylococcus aureus enterotoxin A (SEA) as a model. The proposal aims to develop two technologies: a cell culture based assay of SEA activity and biosensor methodology for immediate automated detection of SEA in food. The two different approaches will complement each other since they address two sides of the same problem. Biosensor detection allows rapid detection of the toxin in food, while the cell culture methodology supplies the information on biological activity of the toxin. These two methods are expected to overcome the limitations of current immunological and animal-based tests for toxins in food. The cell culture based activity assay will be developed by exploiting the toxin's ability to stimulate division of lymphocytes. Biosensor technology represents a new approach to food safety analysis—real-time analysis. Biosensors can translate biological measurements into electronic signals enabling immediate analysis and automation. A novel methodology applying biosensor technology to food testing is proposed here. The aim of this project is to develop new testing methodologies which will aid food production and food regulation, and may increase food safety and quality.

Intimin: Candidate for an Escherichia coli O157:H7 Anti-Transmission Vaccine, Uniformed Services University of the Health Sciences, $232,456. Enterohemorrhagic Escherichia coli (EHEC) O157:H7 is the most common infectious cause of bloody diarrhea in the U.S., and an occasional consequence of this infection, the hemolytic uremic syndrome, is the primary cause of acute kidney failure in U.S. children. Most U.S. cases of EHEC O157:H7 disease have occurred after ingestion of under cooked, contaminated hamburger. Cattle are reported to be asymptomatically and sporadically infected with this organism. EHEC have been shown to adhere to the intestinal epithelium of neonatal calves via a bacterial surface protein called intimin. The long-term goal of our project is to develop an inexpensive vaccine to prevent cattle from becoming infected with EHEC and, thus, prevent transmission from cattle to humans. To achieve this objective, the Uniformed Services University of the Health Sciences will i) evaluate whether intimin is required for EHEC O157:H7 colonization of older calves; ii) assess whether oral administration of anti-intimin antibodies interferes with intestinal colonization and lesion formation caused by EHEC O157:H7 in piglets, a surrogate for calves; iii) test whether pregnant pigs adminis-

tered intimin by a non-oral route elicit anti-intimin antibody responses in serum, colostrum, and milk and whether suckling piglets born of these immunized sows are protected from infection with E. coli O157:H7; iv) compare the antibody responses of mice to intimin and a set of intimin fragments administered by different routes and identify the smallest fragment that elicits antibodies capable of blocking EHEC adherence to epithelial cells; and v) develop a plant that expresses intimin or a fragment thereof as a potential edible vaccine for cattle.

Survival and Virulence of Enterohemorrhagic Escherichia coli (EHEC) as Affected by pH and Water Activity, University of Maryland, $87,000. Enterohemorrhagic Escherichia coli (EHEC) have caused a series of foodborne outbreaks of bloody diarrhea as well as serious complications, including hemolytic uremic syndrome (HUS). While research efforts have been focused on E. coli O157:H7, it is becoming more evident that other serotypes of EHEC can also be associated with human diseases. An increasing number of non-O157 EHEC have been isolated from humans suffering from HUS and diarrhea. A variety of foods have been implicated in E. coli O157:H7 outbreaks, particularly foods of bovine origin. Certain foods such as apple cider and dry-cured salami that were considered safe and ready to eat, and are generally not heated before consumption have been identified as transmitting vehicle in E. coli O157:H7 outbreaks. Unlike O157:H7, most of non-O157 EHEC serotypes have been isolated from sporadic cases, hence, the significance of food as vehicle for transmitting non-O157 EHEC is not clear. It has been shown that bacterial regulatory responses to environmental conditions are tied to virulence gene expression and that stressful signal in a hostile environment (e.g. acidic and/or dry conditions) can be utilized to induce/enhance virulence gene expression by pathogenic microorganisms. Foodborne pathogens having been exposed to such conditions may become more virulent. We propose to study: 1) Survival of EHEC strains (mainly non-O157:H7) as affected by pH and water activity; and 2) Virulence of EHEC strains as affected by pH and water activity.

Symposia on Microbial Food Borne Hazards—Basic Research/Industry/Regulatory Concerns, DHHS Food and Drug Administration; $6,000. The Food Microbiology Research Conference (FMRC) focuses on the presentation of basic/applied research by scientists within academia, government, and industry. The activities of the FMRC are governed by a set of bylaws, which were adapted as part of the process of gaining tax exempt status (private/nonprofit), thereby providing formal structure to the conference's financial management. FMRC meets every two years in the Chicago area, participation is by invitation, and the program format (panel discussion; individual seminars; symposia) is designed by an Executive Committee. The goal of the Conference is to advance knowledge and understanding in the area of food microbiology. FMRC meeting represent one of the few regularly held gatherings exclusively devoted to food microbiology. Industry/regulatory concerns are incorporated into the program for timely and relevant research topics. The XVI FMRC was held on 9–12 November 1997 at the Ramada Inn, O'Hare, Chicago. Confirmed symposia include: Molecular Approaches for Food Safety Assurance; Resistance-Control-Host Response to Bacterial Pathogens; Developments in Bacterial Inactivation and Reduced Consumer Risk; Roundtable panel on Zero Tolerance/Risk; and General Topics. Invited speakers and chosen symposia topics are designed to promote research/industry/regulatory interaction, thereby furthering the overall goal of enhancing food safety.

Recombinant Antibodies to Natural Toxicants, Michigan State University, $116,000. There has been increased use by government agencies and the food industry of rapid antibody-based immunoassay in a first-tier screen for harmful toxins and microbial pathogens in foods. The antibodies used in these assays have been developed in animals such as rabbits or in tissue culture systems. Using recombinant DNA technology, it is now possible to engineer specific antibody reagents for improved food safety screening. The immediate advantages of recombinant antibodies are threefold. First, these antibodies can be genetically manipulated to improve sensitivity and greatly reduce assay time. Antibodies can also be designed that have specificity for groups or broad classes of toxicants or harmful microbes. Second, this approach will diminish the use of animals and animal products (e.g. fetal calf serum) for antibody production. Third, since recombinant antibodies will be produced in bacteria, the cost of the basic reagent will be as much as 10-fold less than that for animal or tissue culture systems. Thus, recombinant antibodies could be immediately useful in enhancing existing and new assays for toxins and microbes in foods. This proposal seeks to genetically engineer novel antibodies to an important group of natural toxins known as the Fusarium mycotoxins which commonly contaminate wheat, corn, rice and barley. Specifically, antibodies to fumonisin, vomitoxin and zearalenone will be prepared in bacteria and then these antibodies will be applied to testing for these harmful toxicants in food. From the perspective

of food safety, the general approaches developed in this research will be amenable to improved detection of natural toxicants, chemical contaminants as well as bacterial pathogens and their toxins. Over the long term, cloned antibody sequences may find novel uses such as (1) immunization of food producing animals prevent toxic residues or pathogens in meats and poultry, (2) development of low cost procedures for removing toxicants from milk and dairy foods, and (3) expression in plants to neutralize toxicity.

Adhesins for Colonization of Chickens and Their Use in Preventive of Salmonellosis, Washington State University, $156,000. The incidence of infection resulting from food borne pathogens continue to increase worldwide despite extensive research and changes at the production and processing levels. A 1996 CDC study indicated that Salmonella accounted for the majority of the bacterial foodborne disease outbreaks from 1988 to 1992. Washington State University's long-term objective is to reduce or eliminate Salmonella colonization of poultry, which would in turn result in a reduction in the shedding of Salmonella in feces, its transmission to eggs, and the cross-contamination which occurs during processing. An understanding of the mechanism of Salmonella adherence to chicken cells could be particularly valuable when developing strategies to eliminate Salmonella contamination of poultry. Washington State University's preliminary data support the hypothesis that the Salmonella bacterium expresses gene(s) encoding an "adhesin" protein in response to high iron concentrations, and this adhesin is involved in binding the bacterial pathogen to a host cell. The goals of this proposal are (1) to identify the gene(s) encoding the iron-induced adhesin from Salmonella typhimurium, (2) to evaluate the role of the iron-induced adhesin in the adherence of the Salmonella to avian cells and (3) to determine if the iron-induced adhesin is made by other Salmonella species which colonize chickens. Washington State University will identify mutants unable to synthesize this adhesin and these will be evaluated using tissue culture and animal models. Ultimately, this information will be used to design methods to eliminate Salmonella in poultry either by contributing to the development of a live oral vaccine, or by identifying possible changes in the slaughtering procedure to reduce Salmonella cross-contamination.

Incidence and Fate of Moniliformin in Corn and Heat Processed Corn Products, University of Nebraska, $97,000. Moniliformin is a highly toxic substance produced by Fusarium proliferatum and Fusarium sublutinans, molds commonly found on corn. Moniliformin has also been found in corn from different parts of the world, though the incidence and levels in corn and corn-based food products in the U.S. are not well documented. Considering the toxicity of moniliformin and the potential risk of chronic long-term consumption of it in corn-based foods, it is very important to know the extent of contamination and heat stability of moniliformin in corn and corn-based foods. The overall objective is to determine the incidence and levels of moniliformin in U.S. corn and corn-based foods, and the effects of heat, as applied in basic thermal processing of corn, on the stability of moniliformin. Specific objectives are to determine 1) the incidence and amounts of moniliformin in U.S. corn and corn-based foods; 2) the effect of heat on the stability of pure moniliformin in water at different temperatures, pH levels and heating times; and 3) the effect of selected thermal processes, including extrusion, alkaline processing (tortilla process) and baking on the stability of moniliformin in corn. To accomplish the objectives, corn and corn-based foods will be obtained from commercial food channels throughout the U.S. and analyzed for the presence and amounts of moniliformin. Heat stability of moniliformin in both water and corn substrates will also be studied. After heating in water or by the selected process, the presence and amount of moniliformin remaining will be determined by high performance liquid chromatography (HPLC).

Modeling the Interactions of Pathogenic and Biocontrol Bacteria for Applications in Foods, USDA Agricultural Research Service, $86,000. The objective of this research is to develop a safe method for preventing the growth of pathogenic bacteria in minimally processed, refrigerated foods. A biocontrol strategy will be used which involves bacterial competition to accomplish this task. Lactic acid bacteria which are commonly used in various food fermentations (dairy, meat, vegetables) will be added as biocontrol agents to prevent the growth of pathogenic bacteria in minimally processed foods. If a food protected by this type of biocontrol strategy should spoil due to improper refrigeration or other reasons, the lactic acid bacterium should grow and competitively prevent the growth of potentially harmful bacteria. Although the food may not taste good because of the acid produced, the product would not be unsafe. The Agricultural Research Service has developed a mathematical model that predicts the outcome of the competitive growth of bacteria. The model may be useful in determining which lactic acid bacteria should be chosen as biocontrol agents, and how the growth of selected lactic acid bacteria will affect the growth of pathogenic

or disease-causing bacteria. The Agricultural Research Service's research will involve growing both biocontrol and pathogenic bacteria, singly and in mixed culture, in vegetable broth and minimally processed vegetable products. Using the model to help interpret the data from these experiments, the Agricultural Research Service hope to gain insights into which factors such as growth rates, production of inhibitory compounds, or sensitivity of the cells to these inhibitors are most important to the predominance of one bacterial culture over another. While the Agricultural Research Service will primarily investigate biocontrol applications for refrigerated vegetable products, it is hoped that the principles learned in these studies can be applied to biocontrol applications for a variety of foods.

Salmonella in Modern Swine Production Systems. Risk Factors for Fecal Shedding by Finished Pigs, North Carolina State University, $241,000. Control of foodborne disease is best achieved through appropriate actions in all sectors of the farm to table continuum. Salmonellosis is a major foodborne disease worldwide and Salmonella is the foodborne pathogen of greatest importance in modem swine production. Systems for producing swine have changed radically in recent years, in association with increases in average herd size. Knowledge of the epidemiology of Salmonella infections in modem swine production systems is minimal, but is necessary to identify appropriate measures to reduce the risk of foodborne disease to people and ensure access to international markets. Specific objectives of this project are to determine 1) risk factors for Salmonella prevalence in finishing pigs raised on slotted concrete floors in barns managed all-in/all-out, within multiple-site production systems; and 2) the relative importance of Salmonella infection in nurseries or the finishing environment as determinants of Salmonella infection in finishing hogs. Prevalence and serotypes of Salmonella will be determined by fecal cultures in finishing pigs, raised at specialist finishing sites. The sites chosen will be typical of modem systems that are predominantly and increasingly used for pork production in the USA. Feed and environmental samples will also be cultured. Data on management and environmental factors will be collected and examined for associations with Salmonella prevalence. The information obtained will be relevant to a large and increasing segment of the national swine industry, and will aid in defining the most efficient options for reducing Salmonella in the pork supply.

Experimental Campylobacter Vaccine, University of Pennsylvania, $138,000. Campylobacter jejuni is a major cause of gastrointestinal infection in man and is the most common cause of sporadic diarrheal illness in the U.S. Campylobacter infection is primarily a foodborne disease with poultry being the single most important vehicle for transmitting the disease. A number of immunological approaches to reducing or eliminating Campylobacter from poultry are currently being investigated including the use of vaccines. The mechanism by which Campylobacter colonizes the chick GI tract is not completely understood but flagella are important colonization factors. The University of Pennsylvania expressed the full length Campylobacter flagellin gene, flaA, in an avirulent Salmonella typhimurium vaccine vector and tested several vaccine constructs in 4 day old chicks for immunogenicity and protection. During the past funding period, the University of Pennsylvania showed that these vaccines were highly immunogenic and induced anti-flagellin antibodies using a two-dose regimen. When animals were challenged 3 weeks after vaccination with the homologous strain of C. jejuni, vaccines conferred >95 percent homologous protection against cecal colonication. In the next funding period, the University of Pennsylvania will extend these studies to 1) assess the ability of these vaccines to confer cross-protection with different flaA types of C. jejuni, 2) determine the minimal amount of time needed post-immunization to confer protective immunity, 3) determine the minimal C. jejuni challenge dose in which complete protection occurs, 4) determine whether the bivalent vaccine confers protection against Salmonella infection and 5) determine the smallest flagellin fragment that can elicit protective immunity. An immunogenic, broadly cross-reactive vaccine, should be useful in improving the safety of poultry for human consumption.

Food Pathogen Biosensors for Rapid Safety Measurements of Meat, University of Rhode Island; Food Optic and Biosensor Research Group, Kingston, RI, $96,205. Classical procedures for the detection of microbial pathogens in meats are slow and labor intensive. Rapid methods currently available are either complex, require potentially hazardous and expensive materials, or utilize a pre-enrichment step of 18–24 hours to grow up enough cells for detection. This project will establish that biosensors; employing immobilized antibodies specific for meat pathogens can be successfully utilized for biomonitoring of contamination in food products. One approach will utilize fiber optics to analyze the optical excitation and emission properties of immobilized antibodies and attached pathogens on the surfaces of gold coated silicon. The second biosensor will continue to explore the potential of the Quartz Crystal Microbalance with reusable piezoelectric quartz crystals containing attached

antibodies. The maximum response of these biosensors for determination of microbial cell concentrations of pathogens in meat products will be established. Consumer demand for fresh and less processed food, such as meat, makes the need to ensure microbial safety of products very clear. This project provides the opportunity for a multidisciplinary effort to create specific biosensors for rapid and early detection of pathogen contamination in meat. These devices have the potential for specifically selecting food pathogens from among the total microbial load within minutes and measuring the concentration as real-time analysis on site. The capability for miniaturization and portability emphasizes the possibilities that this new technology will provide the tools for effective monitoring programs. The ability for rapid early detection of pathogens will enhance the safety and quality of U.S. meat products.

Salmonella typhimurium Genes Required for Systemic Infection of Cattle, Texas A&M University, $90,000. Salmonellosis is the most frequent food-borne illness in the U.S. and is usually contracted by consumption of meat and dairy products from infected livestock. Little is known about genes allowing Salmonella typhimurium to cause systemic infection in cattle, an important meat source in the U.S. Since systemic infection can lead to a chronic carrier state, information about the mechanisms used by S.typhimurium to establish systemic infection is relevant to development of strategies to eliminate this pathogen from cattle. The goals of this project are the identification and characterization of bacterial genes which enable S. typhimurium to cause systemic infection in cattle. The role that these genes play during infection will be examined by determining the ability of attenuated bacterial mutants to spread to different organs in cattle. Finally, by determining whether the same set of virulence genes identified in cattle is also required for infection of the mouse, the university will determine whether any of the genes identified in this study are host-specific adaptations to causing disease in cattle. The results of this research will help to develop strategies for reducing the number of carrier animals from cattle herds as well as for the detection of Salmonella in meat and dairy products, thereby increasing food safety.

Fumonisins: Immunology, Genetics and Enzymology, University of Wisconsin, $129,897. Fumonisins (Fms) are a group of mycotoxins produced primarily by the fungus Fusarium moniliforme, FmB1, the major mycotoxin in this group is a weak carcinogen and induces apoptosis both in animals and plants. It also is responsible for leukoencephalomalacia in horses and for swine edema syndrome/swine mystery disease. Because of the widespread occurrence of this group of mycotoxins in corn and related foods and their carcinogenicity and potent cancer promoting activity, this group of mycotoxins is potentially hazardous to human and animal health. Using mutant cultures and a combination of immunochemical and chemical methods, the University plan to identify the major steps, intermediates and enzymes involved in the biosynthesis of Fm. The methodology developed in the proposed work could be used for further studies of the conditions conducive to the formation of Fms in the field and during storage. Different tools and mutants developed from the present study will be shared with other scientists for related studies. This study is a critical step in the development of methods to control Fm formation.

NATIONAL RESEARCH INITIATIVE AWARDS FISCAL YEAR 1998

Rapid Detection of Brevetoxin and Ciguatoxin Using Recombinant Na + Channels, University of South Alabama College of Medicine, $90,000. Contamination of shellfish by a marine toxin known as brevetoxin periodically threatens the health and safety of seafood consumers. Brevetoxin poisoning typically causes neurological and gastrointestinal disturbances that last 3 to 4 days but fatalities have been reported in severe cases. There are not any known antedotes for poisoning and, consequently, toxin levels must be rigorously monitored to prevent ingestion of tainted seafoods. This proposal will develop rapid and sensitive methods to test for brevetoxin and ensure seafood product safety.

Role of Putative Pathogenicity Island in Campylobacter jejuni Virulence, University of Arizona, $190,000. Incidence of campylobacteriosis in man has risen dramatically in the past 10 years and passed salmonellosis as the number one disease acquired by consuming contaminated food products. It is estimated that Campylobacter jejuni causes 3 million cases per year with a cost due to treatment and loss of productivity greater than one billion dollars. Clearly, understanding mechanisms by which this major pathogen causes disease is invaluable. Nevertheless, few factors associated with C. jejuni virulence have been identified. Progress in this important research area has been hampered by the lack of genetic tools to examine or identify virulence factors. To date, roughly ninety C. jejuni genes have been characterized, and only six of which are related to virulence. Recently, the University has isolated an iron uptake system encoded within a putative pathogenicity

island from virulent C. jejuni. Genes within this island may be influential in defining the pathogenicity of the agent that will lead to control measures for decreasing the incidence of campylobacteriosis. The long range goal of the proposed research is to evaluate genes contained within a putative pathogenicity island in C. jejuni for their role in virulence. Sequence analysis reveals an area that encodes two disparate physiologic functions, an iron uptake system, and a cell wall biosynthetic pathway suggesting that maintenance of this unique island may not be due to environmental iron limitations alone. The island may encode other functions and comprise not only an iron uptake island, but a pathogenicity island. Consistent with these observations we hypothesize that this locus comprises a pathogenicity island which contributes to C. jejuni virulence.

Strategies to Eliminate and Prevent Microbial Contamination of Food Products, University of Arkansas for Medical Science; College of Pharmacy; Food Safety Group, Little Rock, AR, $70,000. While the American food supply is considered among the safest in the world, recent estimates suggest that as many as 9,000 deaths and 6.5 to 33 million illnesses in the United States each year are food-related, and with medical costs and productivity losses ranging between $1.8 billion and $4.8 billion annually. The need to develop strategies to eliminate and prevent microbial contamination of food products is highlighted by factors such as emerging foodborne pathogens and pathogenic strains, new and more frequent outbreaks of foodborne disease, and the increased susceptibility to foodborne infections of population groups with lowered immunity. Previous research in our laboratory indicated that cetylpyridinium chloride (CPC), a chemical safely used for over 30 years in oral hygiene products, was able to reduce Salmonella and other bacterial contamination from poultry tissues. CPC was also effective in preventing bacterial attachment, and has potential to reduce the risk of cross-contamination. The ultimate goal of the research in this proposal is to develop effective methods to control, eliminate and prevent microbial contamination of food products. The specific aims of this project are: 1) to determine the effectiveness of CPC for decontamination of fresh fruits and vegetables; and 2) to assess the organ.

Bacteria for Competitive Exclusion of Salmonella enteric Species in Chickens, University of Delaware, $185,000. The community of bacteria inhabiting the intestinal tract can prevent or impede the establishment of undesirable bacteria such as Salmonella enterica subspecies. Newly hatched chicks lack an intestinal bacterial community. Exposure to intestinal bacteria from adult chickens potentially heightens the resistance of young birds to infection with Salmonella. Such bacterial preparations can therefore contribute to increased microbial food safety of poultry products by reducing the number of chickens in a flock that carry Salmonella into the processing plant. The optimal composition of an effective bacterial preparation is currently not known. The goal of the proposed research is to identify and isolate bacteria from the intestinal tract of chickens and to eventually test their effectiveness in reducing colonization of young chicks with Salmonella. The research will focus on the bacteria that are associated with the inner surface of one of the chickens intestinal organs, the cecum. Since a considerable fraction of intestinal bacteria has been refractory to isolation in pure culture, the bacteria will initially be identified without culturing using genetic means. Identification will be achieved by sequencing of 16S rRNA genes amplified from total DNA extracted from the cecal bacterial community. Denaturing gradient gel electrophoresis of amplified DNA and in-situ hybridization with specific probes will provide information on the diversity, location and prevalence of bacteria within the ceca. Once the identity of the cecal bacteria is known, culture conditions for their isolation can be designed and their value in prevention of Salmonella carriage in chickens can be assessed.

Fluorescence-Based Chemical Sensor for Saxitoxin, University of Miami, $95,000. Saxitoxin is the primary constituent of the so-called paralytic shellfish poisons (PSPs). Currently, contamination of shellfish beds by PSPs is monitored by mouse bioassay. Recently, the University of Miami has discovered a molecular receptor that "signals" the presence of saxitoxin in solution by emitting light (technically known as enhanced fluorescence emission). This type of phenomenon is of considerable interest to the chemical community in general, but regarding saxitoxin, it could be the key to developing a photochemical sensor that would complement mouse bioassay. The first stage of this development, funded by this project, is to study the details of the "recognition" and emission phenomenon between saxitoxin and its receptor, both in solution and at a surface (the air-water interface). The University of Miami will begin by examining the fluorescence emissions quantitatively, then modifying the receptor to optimize its binding and signaling properties. The University will modify the receptor to make it amenable to incorporation into a monolayer that, when spread over the surface of water, can be studied in a similar fashion.

Studying the phenomenon in a monolayer is a prerequisite to development of a sensor using fiber optics.

Defining Genomic Sequences Specific to Virulent Vibrio vulnificus Strains to Assess Risk, University of Florida, $90,000. Vibrio vulnificus is the leading cause of reported human death in the U.S. caused by the consumption of seafoods. Since its discovery, V. vulnificus has had a significant impact on public health policy, food regulations, and industry practices. Currently, there is no practical test to determine if seafood products contain hazardous strains of V. vulnificus. The University propose to solve this problem by defining DNA sequences specific to virulent strains, and then developing simple DNA probe test(s) that can be used by industry and public health organizations to assess risk. The University will use two techniques to identify segments of DNA that are unique to virulent strains, 1) by "subtracting" DNA of non-virulent strains from virulent strains, thereby identifying virulent specific DNA sequences, and 2) by allowing the mouse model to directly select for strains that have acquired DNA sequences from virulent V. vulnificus strains that are randomly cloned into non-virulent strains. These approaches will produce virulence-specific gene probe(s) that can be widely used to assess V. vulnificus hazards in seafood products. The University anticipate that this information will be integrated in ongoing CDC-FDA-State efforts to determine the epidemiology of V. vulnificus infections and to develop effective interventions to reduce risk of V. vulnificus disease.

Regulation of Lipopolysaccharide Micro Heterogeneity, USDA Agricultural Research Service; Southeast Poultry Research Laboratory, Athens, GA, $125,000. Bacteria that contaminate food are genetically capable of altering their growth properties and cell surface properties in order to infect susceptible people or animals. One foodborne bacterium that is especially capable of contaminating the contents of eggs is Salmonella enterica serovar Enteritidis (SE). It has been shown that certain strains of SE enter an accelerated phase of growth when environmental conditions provide appropriate signals to the bacterial cell. During enhanced growth, many of the cell surface features of SE alter drastically which contribute collectively to an enhanced ability of the bacteria to grow to high numbers in organs, as measured by increased recovery from the organs of chicks, mice, and eggs. The most prominent molecule composing the outer membrane of SE is lipopolysaccharide (LPS). Previous research indicated that changes in LPS structure can be used to detect strains that are more capable of attaining full virulence. Current research to be conducted under this grant is directed towards understanding the genetic changes that result in strain variation, as measured by the ability of strains to generate particular LPS structures while maintaining accelerated growth. This work is important because it will lead to a better understanding of environmental conditions that favor outgrowth of new strains of SE. Since certain LPS structures alter the production of proteins on the cell surface, this research should also contribute to a more complete understanding of the immunological properties of virulent SE and to the development of improved vaccines.

Mechanism for Inactivation of Microorganisms by High Oxidation Potential Water, University of Georgia, $120,000. Reported cases of outbreak of food-related illnesses as well as severity of infection and cost of treatment are on the increase. An estimated 6.5 to 33 million people are infested annually in the U.S., out of which 9,000 die. The high oxidation potential (HOP) water has been reported by scientists in Japan to have strong bactericidal effect on most pathogenic bacteria. A major advantage of HOP water is that no chemical except water (with very dilute NaC1) is used. Therefore it has less adverse impact on the environment. Also, the treated food is not exposed to heat treatment and will experience minimal change in quality. The overall objective of this project is to study the fundamental principles involved in the inactivation of food microorganisms with HOP water. HOP water with different properties will be used to treat five strains each of three pathogenic bacteria (Bacillus cereus, Listeria monocytogenes and Escherichia coli O157:H7). The HOP water with the most effective combination of properties will then be used to evaluate the effect of different organic materials in food systems on its antimicrobial effect. Bacteria inactivation on food surfaces with HOP water will be evaluated using inoculated food samples. The application of this technology will ensure food safety at reduced cost, high food quality and reduced danger from foodborne illness.

Screening Corn for Resistance to Aspergillus flavus and Aflatoxin Accumulation, Southern Illinois University, $100,000. Two traits in corn genotypes will be used to identify potential resistance sources: 1) sporulation by Aspergillus flavus on intact or endosperm-wounded kernels, and 2) accumulation of norsolorinic acid (NOR) in kernels inoculated with A. parasiticus isolate SKI. NOR is an orange-pigmented intermediate in the aflatoxin biosynthesis pathway. Genotypes that exhibit minimal sporulation and accumulation of orange pigment will be tested for aflatoxin resist-

ance in controlled laboratory inoculations. Genotypes from this pool that prove to be resistant will be evaluated for resistance in field trials. Those that show resistance will be examined for mechanism of resistance. Surface wax will be removed from intact kernels of these resistant genotypes, as well as standard susceptibles, and weighed. Resistant genotypes with large amounts of wax will demonstrate that wax acts as a physical barrier to infection by A. flavus. Wax removed from kernels will be bioassayed for antifungal activity against A. flavus. Resistant genotypes with antifungal properties will demonstrate that wax acts as a physiological barrier to infection by A. flavus. Protein profiles determine whether proteins unique to, or in greater concentration in, resistant genotypes are involved in resistance to A. flavus.

Listeria monocytogenes: Ozone Inactivation, University of Illinois, $95,000. The objectives of this study are to examine the effects of ozone (03) on the pathogen Listeria monocytogenes. Ozone is one of the most powerful oxidizing agents (52 percent stronger than chlorine) and is effective against a broad spectrum of microorganisms, including viruses, bacteria, yeast and molds. Ozone has recently been recommended for approval as Generally Recognized As Safe (GRAS) in food production. Little or no research has been performed on the influence that ozone has on the destruction of L. monocytogenes. This proposal will determine important parameters of ozone-induced injury and death of L. monocytogenes. The optimal conditions of ozone exposure for listerial death will be determined. Initial variables will include time, temperature and ozone concentration. Injury and death will be determined using a dual plating procedure, and by the release of subcellular components. The thermodynamics of ozone inactivation will be determined. Any differences in the phase of growth on the susceptibility of L. monocytogenes to ozone will be examined. Recovery of ozone-injured listerial cells will be studied, as will be the site(s) of ozone damage. The influence of ozone in reducing listerial counts in a food product (cabbage) will also be determined. The influence of ozone on the enzymes catalase and superoxide dismutase in L. monocytogenes will be examined immediately following exposure and during recovery.

Persistence of Salmonella typhimutium in Swine, University of Illinois, $240,000. . typhimurium is one of the major causes of salmonellosis in humans. Pigs persistently infected with S, typhimurium are one of the major reservoir of this pathogen. Generally, pigs persistently infected with . typhimurium are asymptomatic. One means to reduce the risk of foodborne infections caused by . typhimurium is to prevent pigs from becoming persistently infected. This project is designed to understand the mechanisms promoting persistent infections. The initiation of infection requires the attachment of S. typhimurium to the lining of the small intestine. There are two types of cells in the small intestine that are targets for attachment: 1) epithelial cells call enterocytes and 2) epithelial cells call M-cells. The University's current hypothesis, which is based on our previous experiments using mutant . typhimurium that do not attach to enterocytes, is a attachment to enterocytes which is important for the development of persistent infections while attachment to M-cells results in disease. The goals of this study are to confirm that our non-adhesive mutants indeed do not attach to enterocytes in pigs but retain the ability to attach to M-cells. Furthermore, the University have found that a novel mechanism allows . typhimurium to sense its location in the intestine and turn on a set of genes that promote its ability to colonize enterocytes and this results in persistent infections. The University plans to create additional mutants that no longer can control these genes and determine whether the mutants have lost the ability to cause persistent infections.

Analysis of the Osmotic Regulation of Thermotolerance in Salmonella and E. coli O157:H7, Purdue University, $185,000. The addition of moderate or high concentrations of salts or sugars can enhance the high temperature tolerance of food pathogenic bacteria such as Salmonella and E. coli O157:H7. This enhanced thermotolerance is manifested both as increased growth rate at non-lethal high temperatures and increased survival at otherwise lethal high temperatures. These observations indicate that the addition of salts or sugars to food products as preservatives or flavor components can compromise the efficacy of high temperature treatment for the inactivation of contaminant organisms. The University found that betaine, which is found at high levels in edible plants such as spinach and cereal grains, block the ability of salt additives to increase the thermotolerance of bacteria. Part of the research project will be to carry out a comprehensive characterization of all available structural relatives of betaine for their ability to counteract the induction of increased thetmotolerance by salt additives in food pathogenic bacteria. This procedure may uncover new food additives that might be used to increase the efficacy of thermal inactivation in food contaminating bacteria. A second component of the project will be to discover genes which are involved in the induction of increased heat tolerance by salt. The understanding of the mechanistic connection between

high salinity and increased thermotolerance has the potential application that it might lead to the design of new antimicrobial compound that could lead to decreased survival of food pathogens during thermal processing.

Molecular Biology of Aflatoxin Biosynthesis in Aspergillus flavus, Purdue University, $160,000. Aflatoxins produced by the fungus Aspergillus flavus, are toxic and carcinogenic compounds contaminating a variety of food products. In addition to the significant health risks associated with aflatoxins, there is also an economic burden. Millions of dollars are spent each year to test potentially affected food, including corn, peanuts, figs, tree nuts and milk. Aflatoxins are products of fungal secondary metabolism. The genes involved in the biosynthesis of aflatoxin are grouped together in a single cluster. The cluster contains at least 18 genes that code for the pathway enzymes and for regulation of aflatoxin biosynthesis. This research project will investigate an unusual mutation in A. flavus. Strain 649 has a DNA deletion at the afl–1 locus that includes the entire cluster of aflatoxin biosynthesis genes. Diploids formed by crosses between strain 649 and aflatoxin-producing strains do not produce aflatoxin. The goal of the research is to determine the mechanism responsible for this suppression of aflatoxin biosynthesis. The specific objectives are to isolate and characterize the DNA at the deletion break-junction region in strain 649, and to determine the involvement of the regulatory gene aflR in repression of aflatoxin biosynthesis. This research will impact agriculture by furthering our understanding about the regulation of aflatoxin biosynthesis and contribute information leading to development of new strategies for eliminating aflatoxin contamination.

Modeling Food Fluctuating Microbial Populations and Their Aperiodic Outbursts, University of Massachusetts, $90,000. The total number of microorganisms, or of specific types, which are encountered in raw beef or dairy products for example tend to fluctuate. Usually such daily or hourly fluctuations are within a specified range and hence raise little or no safety concern. Only occasionally, and in some cases without an apparent cause the numbers encountered are unusually high and may be considered a safety problem. The University of Massachusetts plans to analyze the fluctuations pattern, and by mathematical models and statistical methods, to estimate the probability of the occurrence of such an outburst. In other words, the University of Massachusetts propose to convert the apparently random sequence of counts into a set of probabilities of encountering outbreaks of a magnitude of safety concern. These calculated probabilities can then be used as indication of an impending microbial outbreak, and as a tool to assess quantitatively the efficacy of preventive methods in reducing the risk.

Genomic Analysis of Escherichia coli O157:H7 Populations from Cattle and Humans, University of Nebraska, $150,000. Genetic fingerprinting of E. coli O157:H7 strains from cattle herds indicates that certain strains can be repeatedly isolated from a given herd over time (persistent population) despite the fact that other genetically distinct E. coliO157:H7 strains may be introduced into the herd but are unable to displace the persistent population. These results suggest that persistent strains are better able to survive and/or propagate in these environments. Are there particular herd management practices that have selected for these persistent populations and are these strains genetically distinct from those isolated from infected humans? The University of Massachusetts has developed a powerful technique, termed high-resolution genotyping (HRGT), that permits identification of even minor genetic differences between different E. coli O157:H7 strains. This procedure will be used to develop a database for rigorous assessment of the genetic relatedness of persistent and non-persistent and non-persistent isolates will be examined in further detail (full genome coverage) by HRGT to identify genetic differences that may be related to persistence. The genes that are marked by these differences will then be examined to begin assessing how their function may contribute to persistence and whether particular herd management practices may have played a role in selecting for alterations in these genes. Ultimately these results may provide a rational basis for understanding the impact of herd management practices on the population structure of this organism.

Antimicrobial Use and Emerging Resistance of Salmonella typhimurium in Dairy Cattle, Cornell University, $120,000. Antibiotic-resistant Salmonella infections in human are an increasing public health problem. The use of antibiotics in food producing animals for disease prevention or treatment and to enhance growth potentially selects for resistant Salmonella strains which may be transmitted to humans. Livestock investigations are needed to identify practices associated with the emergence of Salmonella resistant to antibiotics currently important in human medicine.

This project will investigate the effect of antibiotic treatment of clinical salmonellosis in dairy cattle on the occurrence of antibiotic-resistant Salmonella typhimurium, a major animal and human pathogen. This will be done by identifying

dairy herds with Salmonella typhimurium-infected cattle based on diagnostic laboratory culture results, obtaining antibiotic treatment information from farm records and collecting fecal samples from cattle on the farm for Salmonella isolation and determination or resistance patterns. The association between cattle from the same herd will be analyzed. The characteristics of study farms will be typical of large segment of the U.S. dairy industry.

The study results will provide valuable information on the emergence of antibiotic-resistant Salmonella typhimurium and specific drug-use practices which are associated with resistance. This will allow implementation of changes on farms designed to reduce the development of antibiotic-resistant bacteria and thereby decrease foodborne or direct transmission of resistant strains from dairy cattle to people. The project will also contribute data needed for policy decisions by regulatory agencies related to antibiotic use in food producing animals.

Identification of Human Enteric Viruses in Foods and Fooborne Disease Outbreaks, North Carolina State University, $140, 000. Enteric viruses are significant human pathogens, recently ranked fifth and sixth amongst identified causes of foodborne disease in the U.S. While these agents are responsible for diseases such as gastroenteritis and hepatitis, the true scope and significance of foodborne viral infection is drastically underestimated due to inadequacies in reporting and detection methods. The introduction of molecular biological techniques offers sensitive and specific alternatives for the detection of these previously non-detectable viral agents. The purpose of this research is to refine molecular methods to detect human enteric viruses from foods and to further develop approaches for the investigation of outbreaks of foodborne viral disease. The specific objectives are as follows: (1) Refine methods to extract human enteric viruses from foods, (2) Improve sensitivity, specificity, and speed of virus detection and confirmation, (3) Develop methods specifically for the detection and identification of small-round structured viruses of epidemiological significance to humans, and (4) Develop a comprehensive approach to the investigation of outbreaks of foodborne viral disease by linking detection and identification in clinical (fecal) and food specimens. The successful completion of this project will provide rapid and economical methods for the detection of viral contamination of foods and the investigation of foodborne viral disease outbreaks. These benefits will ultimately improve the safety of food products, protect public health, and minimize financial losses due to viral contamination of foods.

Stress-Induced Resistance to High Pressure in Listeria monocytogenes and Escherichia coli O157:H7, Ohio State University, $90,000. High pressure processing is a novel, non-thermal technique for inactivating pathogens in food by the application of extremely high pressures. Application of pressures in the range of 5000–9000 atmospheres for 1–5 minutes, at room temperature, can significantly reduce the microbial population in food and dramatically extend its shelf life. Since heat is not used in the process, negligible flavor and nutrient changes occur as a result of the high pressure treatment.

During the past two decades, new food-transmitted diseases emerged such as those caused by the enterohemorrhagic E. coli and the meningitis-causing Listeria. Such pathogenic bacteria are more likely to survive during food processing if they were exposed to conditions that make them resistant to preservation methods. For example, bacteria that are normally sensitive to heat may become heat-resistant when they are stressed during production, harvesting or even mild processing of food. Therefore, adaptation of bacteria to various stresses may compromise the safety of food.

This challenge to the food industry needs urgent attention when new processing technologies (such high pressure processing) are introduced. This project will identify the potential causes for increased resistance of pathogens to pressure. Additionally, the study will assess, in quantitative terms, the relationship between stress that foodborne pathogens may encounter and resulting stress-induced resistance to high-pressure processing. The outcome of this project will help food manufacturers develop strategies to overcome and eliminate stress-adaptation in foodborne pathogens.

The Molecular Epidemiology of Clostridium perfringens Type A Food Poisoning, University of Pittsburgh School of Medicine, $160,000. Clostridium perfringens type A food poisoning currently ranks as the second most common foodborne disease in the U.S. The diarrhetic and cramping symptoms of this illness are caused by C perftingens enterotoxin (CPE). Recent studies have shown that the CPE gene encoding this enterotoxin can be located on either chromosomal or extrachromosomal DNA. However, only C. perfringens isolates carrying an extrachromosomal CPE can cause non-foodborne intestinal disease. This project will evaluate four possible explanations for the strong association between chromosomal CPE isolates and food poisoning: i) isolates carrying a chromosomal CPE are predominant in the food poi-

soning environment, ii) chromosomal CPE isolates are more resistant to food-associated stresses (e.g. cooking) than are isolates carrying an extrachromosomal CPE, iii) the chromosomal CPE is more stable to food-related stress than the extrachromosomal CPE, and iv) food-related stress induces migration of the extrachromosomal CPE onto the chromosome. These studies should improve the safety of the American food supply by distinguishing whether only chromosomal CPE isolates are able to cause food poisoning, or if isolates carrying an extrachromosomal CPE can be converted, by food-related stress, into chromosomal CPE isolates. This information will improve the safety of the American Food supply in two ways: 1) it will become possible to specifically detect the presence of C. perfiringens food poisoning isolates in foods before these foods are consumed, and 2) it will elucidate how/when C.perftingens food poisoning isolates enter foods, which will allow the development of strategies to interfere with the introduction of C. perftingens food poisoning isolates into foods.

Inactivation of Foodborne Pathogens Exposed to a Uniform Glow Discharge Plasma, University of Tennessee, $71,442. Increased emphasis on food safety has intensified research efforts to develop and evaluate new and innovative means of inhibiting, destroying, and controlling pathogenic microorganisms in foods. The overall objective of this research is to evaluate the efficacy of a One Atmosphere Uniform Glow Discharge Plasma (OAUGDP) for its ability to destroy foodborne pathogens. The OAUGDP is a newly-invented form of electron discharge which generates a uniform glow discharge plasma (plasma—the fourth state of matter) in atmospheres of various gases such as helium, carbon dioxide, and most importantly air. The sterilization properties of the OAUGDP include ozone and other oxidative species, ultraviolet photons, photons in the visible part of the spectrum, charged particles, and neutral particles. Specific objectives of our proposed work are 1) to determine the susceptibility of ten foodborne pathogenic microorganisms to inactivation upon exposure to the OAUGDP, and 2) to determine the effect of culture age, pH, and growth temperature on the susceptibility of these foodborne pathogens to inactivation. The University of Tennessee's previous studies have shown that the OAUGDP is an effective means of destroying various microorganisms. Furthermore, the University's results indicate that treatment of culture media with the OAUGDP for the times required to kill bacteria does not result in the development of by-products toxic to microbial growth. The OAUGDP unit has the potential to be adapted as an in-line process suitable for application as a mechanism of pasteurizing foods and controlling foodborne pathogens.

Sporulation Control of Enterotoxin Synthesis in Clostridium perfringens, University of Tennessee, $130,000. Clostridium perfringens is a common source of food poisoning in humans, and it is responsible for 10 percent of the outbreaks in the U.S. Most large outbreaks of C. perfringens food poisoning are associated with commercial food services, such as restaurants and institutions, but many infections occur in the home as well. The symptoms of the disease (diarrhea, nausea and vomiting) are due to the production of a potent enterotoxin protein (CPE) in the intestinal tract by sporulating bacteria. The ability of C. perfiringens to produce a heat resistant spore not only leads directly to the production of the enterotoxin, but also leads to increased outbreaks of the disease. Often foods are prepared at high enough temperatures to kill vegetative cells, but not spores. If the food is not refrigerated, the spores germinate and the cells grow rapidly. When the contaminated food is eaten, the cells sporulate in the small intestine, releasing the enterotoxin. The University is interested in determining how the sporulation process regulates cpe gene expression at the transcriptional level. To study this, the University will take two experimental approaches: (1) Purify RNA polymerase enzymes that transcribe cpe gene promoters, and (2) Determine in which cell compartment of the developing spore transcription factors needed for cpe gene expression are made. Together, these studies will contribute to our knowledge of how heat resistant spores and enterotoxin are produced by the cell. This information can then be used to develop better food handling procedures to reduce the incidence of this very common disease.

Novel Antimicrobial Systems for Control of Foodborne Pathogens, University of Wisconsin, $90,000. The microbiological safety of imported and domestic fruits, vegetables, and certain other foods has become a major priority of the USDA, FDA, and HHS. Recent studies from our laboratory have demonstrated that certain food-approved flavorants markedly sensitize foodborne pathogens including Escherichia coli O157:H7, Listeria monocytogenes and Staphylococcus aureus to various classes of food-grade antimicrobials and to certain antibodies. In particular, in the presence of low concentrations (<100 ppm) of the flavorants nerolidol and farnesol, microorganisms are inhibited by markedly lower doses of certain antimicrobial agents and antibiotics. These compounds are derived from natural plant sources. The University's results indicate that these and related compounds could be used to increase

the efficacy of other food-grade antimicrobial agents. In the present study, sensitization by terpenoids and inactivation of foodborne pathogens will be investigated. Gram-negative and gram-positive bacterial pathogens will be exposed to potential sensitizing agents, and then evaluated for extent and kinetics of inactivation by sanitizers, food-grade antimicrobials and antibiotics. Killing will be assayed by traditional plating, and by flow cytometry. Organisms to be tested include strains of E. coli O157:H7, Salmonella serovars Listeria monocytogenes and Clostridium botulinum. The successful completion of this proposal will provide novel elimination and sanitation technologies to reduce the risk of foodborne disease from foods and food contact surfaces and will enhance the public and media image regarding the microbiological safety of raw and minimally processed foods.

DNA-Binding Proteins CspE and Dps Protect DNA at Low pH in Escherichia coli O157:H7, University of Wisconsin, $115,000. An important characteristic of Escherichia coli O157:H7 is the ability of 10 to 100 O157:H7/gram of raw ground beef to survive processing, storage, cooking, and host-defense systems and cause illness. It is hypothesized that acid tolerance is a contributing factor to the low-infectious dose noted for this human pathogen. Sustained acid tolerance in serotype O157:H7 strains is primarily regulated by the stationary-phase sigma factor o38, encoded by rpoS. The University has identified a rpoS-regulated Protein (CspE) that is present in acid tolerant strains of serotype O157:H7 strains and absent, or present at reduced quantities, in acid-sensitive strains. This protein has been previously identified as a cold-shock protein with no known function. Analysis of protein and DNA sequences finds a high proportion of basic amino acids, indicating that CspE is a DNA-bind protein Dps is another previously described rpoS-regulated protein with DNA-binding properties that result in DNA protection against oxidative stress. Because DNA is sensitive to low pH and survival is dependent upon its protection, the goal of this project is to define the contributions of CspE and Dps to DNA protection in low pH environments (i.e. foods and synthetic gastric fluid). Results from this study will provide industry and public health agencies with the much needed data to further refine strategies for control, identify areas of risk, and add to the scientific knowledge on the survival of E. coli O157:H7.

SPECIAL FOOD SAFETY RESEARCH GRANTS FISCAL YEAR 1998

Awards made after competitive peer review process

Nonthermal Processing Alternatives to Ensure the Safety of Apple Cider Cornell University, $86,345. This project will evaluate ultraviolet light, dimethyl carbonate and sulfur dioxide as alternatives to pasteurization of apple cider to reduce or eliminate E. coli O157:H7. These treatments would be cost-effective for small producers and yield a product acceptable to consumers.

Location of S. stanley in Alfalfa Seeds and Sprout; Relation to Treatment Efficacy, Rutgers University, $174,387. This proposal addresses spatial location and survival of almonella stanley in alfalfa seeds and sprouts, and defines new strategies using chlorine to kill . stanley during germination and sprout growth. The contamination of sprouts with seedborne pathogens is an important food safety issue.

Development of Washing Procedures to Reduce the Microbial Numbers on Fresh Produce, North Dakota State University Agricultural Experiment Station, $47,543. The objective of this proposal is to develop simple washing procedures using household ingredients such as vinegar, baking soda, and bleach, usable by consumers to reduce microbial contamination on fresh produce, with an emphasis on E. coli.

Inactivation of Microorganisms in Fruits and Vegetables by Ozone and Chlorine Dioxide Gas, Purdue Research Foundation, $208,873. The objective of this project is to improve the safety of minimally processed and refrigerated fruits and vegetables by combining modified atmosphere packaging with the gaseous disinfectants ozone and chlorine dioxide. The sensory quality of the treated produce will be examined to ensure that it will still be acceptable to consumers.

Reducing Edible Sprout Microbial Contamination Using Foam Seed Mat Technology, Ag Innovations LLC, State College, PA; $112,085. This project will investigate growing edible sprouts in hydrophilic (“water-loving”) foam as a method of reducing or eliminating seedborne bacterial pathogens. The researchers believe that the foam can soak up free water that may support the growth of pathogens. In addition, they will attempt to increase the usefulness of the foam by impregnating it with antimicrobial compounds.

Detection of Food Borne Pathogens on Fruits and Vegetables by PCR, University of Delaware, $75,997. This project will assess the usefulness of a commercially available PCR test kit for almonella, E. coli O157:H7 and Listeria monocytogenes in detecting these pathogens on fresh and minimally processed fruits and vegetables. The

investigator plans to develop guidelines or modifications to allow this kit to be used for rapid identification of these pathogens.

New Approaches for Removal of Food Borne Pathogens from Surfaces of Raw, Fresh Produce, University of Arkansas, $153,309. This project will study the effectiveness for different audiences of treatments to remove food borne pathogens from the surfaces of fruits and vegetables. For food service providers and consumers, they will investigate the use of GRAS (generally recognized as safe) household chemicals such as acidified table salt or cooking oil. Research on chelators or edible films in combination with bacteriocins, (antimicrobial proteins) will be directed towards the needs of food processors.

Alternative Processing Techniques for Fresh Juices, University of Tennessee Agricultural Experiment Station, $206,589. This proposal addresses methods to reduce or eliminate the pathogens E coli O157:H7, almonella and Cryptosporidium parvum in apple cider and orange, grape and cranberry juices, by treatments involving UV light and ozone, alone or in combination.

Capacitive Dielectric Heating as a Food Safety Intervention Method for Sprouted Seeds, Oregon State University Agricultural Experiment Station, $171,008. This project will study capacitive dielectric heating as a method to destroy pathogens on or in alfalfa and radish seeds used for sprouting. Capacitive dielectric heating is a technique in which an electric current passed through a mixture of materials with different physical properties, in this case seeds embedded in a gel, can be used to selectively heat the seeds. Much of the proposal is concerned with developing the appropriate treatment conditions to generate sufficient heat to kill pathogens in or on the seeds without affecting seed viability or melting the edible gel in which the seed will be embedded. This research addresses a serious food safety problem, contamination of sprouts with seedborne pathogens, for which there is currently no satisfactory intervention.

Mechanical and Antimicrobial Treatments to Remove Pathogens from Produce, University of Florida, $184,195. This project's objectives are to define how pathogenic bacteria and viruses attach to surfaces of produce, determine the pathogens' survival rates on produce surfaces, and assess the usefulness of selected mechanical and antimicrobial treatments that are practical for industry and consumers to decontaminate ready-to-eat produce. The organisms to be studied are almonella, E. coli O157:H7, and rotavirus SA–11. It is particularly valuable that the researchers have chosen to include a rotavirus in their study, as these viruses are among the major causes of acute gastroenteritis worldwide, yet their ecology is not well understood.

Development of Pathogen Reduction Treatments for Fresh Produce, Auburn University, $251,573. This project will investigate the use of antimicrobial compounds applied in cooling, washing or transportation water, low-dose ionizing radiation, or combinations of the two, to reduce or eliminate microbial pathogens from the surface of fresh fruits and vegetables. Both the antimicrobial compounds and low-dose ionizing radiation have been shown in principle to have antimicrobial activity in foods. The study will analyze the usefulness of these compounds against specific pathogens E. coli O157:H7, Listeria monocytogenes, Salmonella and Giardia lamblia, on fresh fruits and vegetables to develop treatment recommendations, and will assess the effects of the treatments on the quality of the produce.

Liposome Biosensing Devices for Rapid Screening of Food Toxins and Pathogens, Cornell University, $184,449. This project will modify liposome biosensor technology for rapid detection of E. coli in foods. This technology employs encapsulated antibodies or DNA probes in single use "dipstick" devices that can be used in the field.

SPECIAL SITE SPECIFIC FOOD SAFETY RESEARCH GRANTS FISCAL YEAR 1998

Alliance for Food Protection, Nebraska, Georgia, $300,000. This is a collaborative alliance between the University of Georgia Center for Food Safety and Quality Enhancement and the University of Nebraska Department of Food Science and Technology. fiscal year 1998 funds supported research at the University of Nebraska on the detection, identification and characterization of food allergens, the effects of processing on peanut allergens, and investigation of the efficacy of using various types of thermal processes to reduce or destroy the toxicity and mutagenicity of certain Fusarium metabolites in corn and corn products. Research at the University of Georgia was directed toward determining the foodborne significance of Helicobacter pylori, determining the effect of antimicrobials to eliminate Arcobacter from pork, determining the survival of E. coli O157:H7 at reduced water activity, and using extrusion cooking to destroy peanut allergens. The University of Nebraska developed assays for detection of peanut, milk, egg, and almond residues in processed foods; produced high-quality antibodies for these assays; identified a soy-

bean allergen and two sunflower seed allergens; discovered clues as to the reason why Brazil nuts cause severe allergic reactions; discovered that certain types of Fusarium fungi do not produce mutagenic substances; developed a simple liquid chromatographic procedure for determination of moniliformin toxin; found that the corn flake manufacturing process can reduce levels of fungal toxins such as aflatoxin and fumonisins; and also found that low levels of carcinogenic aflatoxins in corn grits might be reduced to less than regulatory actions levels by the corn flake manufacturing process. The University of Georgia has developed methods to culture Helicobacter pylori, and detect the pathogen in foods, the effect of antibiotics on the fate of E. coli O157:H7 in reduced water activity conditions, and found that extrusion cooking can greatly reduce allergens in peanuts.

Center for Innovative Food Technology, Ohio, $281,000. Funds from the fiscal year 1998 grants supported research projects on using neural network/fuzzy logic tools to develop a model of a growing and processing cycle for canning tomatoes, using electrostatic coating for snack foods and baked goods, combining several non-thermal processing techniques to sterilize low acid liquid foods, using Near Infrared reflectance systems to measure protein and ash content in wheat flour, using membrane separation systems to produce extended shelf life milk products, and developing a protocol for testing the microbial load of ingredients in meat processing facilities.

The original goal of the research was to develop innovative processing techniques to increase food safety and quality or reduce processing costs. The neural network project has developed a model for predicting the harvesting time that will optimize product quality and economic return to the grower, processor, and consumer. The coating project has demonstrated the shelf life, sanitation, and product cost advantages available through the use of this technology. The filtration project will allow fluid milk processors to lower their costs and increase water quality by removing high Biological Oxygen Demand materials from municipal treatment systems. The sterilization project will lower processing costs by increasing the shelf life of liquid products. The extended shelf life project has resulted in the marketing of single serving, long shelf life milk products, and the Near Infrared project will allow flour millers to develop improved process control systems.

Food Irradiation, Iowa, $200,000. Since the Linear Accelerator Facility was placed in operation in March 1993, studies on the effect of irradiation on shelf-life extension, safety and quality of ground beef, beef steaks, ham, pork chops from loins, chicken breasts, and turkey have been conducted. Studies combing irradiation with high hydrostatic pressure and cooking, using whole chicken breasts, turkey and ham, have been conducted to determine the combination of these treatments that will yield a shelf-stable product while maintaining high eating quality. Several studies were conducted to determine whether consumers can detect a difference between irradiated and non-irradiated ground beef patties. Experiments were also conducted to investigate consumer acceptance of pork products irradiated to prevent trichinosis. Test markets of irradiated chicken breasts were conducted to determine consumers' willingness to pay for irradiated products. Research on the effect of packaging materials on quality of irradiated meat is in progress.

With the recent FDA clearance of irradiation of red meat, research needs leading to commercialization of this technology have been enhanced. Additionally, researchers from eight other research institutes have used the irradiation facility for research projects. The effectiveness of irradiation, using an electron beam accelerator, in destroying known pathogenic bacteria in pork and beef has been determined. Mathematical models have been developed to predict the growth of bacteria in low-dose irradiated ground pork. Demonstration of irradiation technology has been presented to some commercial firms, and plans are being developed for some large scale test markets.

Food Processing Center, Nebraska, $42,000. The University of Nebraska Food Processing Center has been conducting short-term, highly applied research projects to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Projects were selected based on the estimated economic impact of the technical assistance or the criticality of the technical assistance to the future of the firm or venture. Priorities were placed on projects relating to the safety of the food product or process and to the fulfillment of regulatory mandates such as nutrition labeling, use of approved and effective ingredients, and adherence to regulations imposed by foreign governments. In addition, several research projects were conducted to improve or assess the quality, extend the shelf-life, or assess or improve the processing efficiency of specialty food products which impacted several processors or used alternative agricultural products.

The goal of the research, as stated previously, is to assist small and mid-sized food processing companies and entrepreneurs to develop or improve processes and products and to develop new food processing enterprises. Technological evaluations were conducted for 120 individuals or companies interested in developing new food processing businesses. These evaluations included formulations, processes, processing equipment, packaging, shelf-life, sensory, nutritional attributes, microbiological quality, regulatory considerations, and other factors. Additionally, microbiological analysis, shelf-life assessments, sanitation audits, and nutritional analyses were conducted for numerous Nebraska food companies.

Food Quality, Alaska. This is a new grant in fiscal year 1999 ($350,000). Research will be aimed at establishing the Salmon Quality Implementation Project. The project has two parts. The first part is the evaluation, design, and implementation of a voluntary quality seal that can be attached to salmon that meet the existing standards for premium and number one grade. The second part is a series of workshops and training sessions on salmon quality handling and maintenance for workers at all levels of the industry from harvesting to retail.

The original goal of this research was to ensure a consistent and predictable level of handling and quality for Alaska seafood. In doing so, the project will help Alaska seafood processors strengthen or maintain their place in domestic and international markets. Because this is a new grant, no progress has yet been reported.

Institute for Food Science and Engineering, Arkansas, $950,000. As the flagship center for the Institute of Food Science and Engineering, the Center for Food Processing and Engineering has as its objectives to facilitate and encourage value-added research and improve the processing of agricultural products. The Center requires researchers to obtain matching funds from industry to support their research. Research projects have been funded by 39 different companies from 17 states and 4 countries. The next request for proposals to the Institute will be issued in February 1999. The Center for Food Safety and Quality, with a mission to conduct research on the safety and quality of foods relative to microbiological and chemical hazards, was activated on January 1, 1997. Center researchers are presently receiving funding through the Food Safety Consortium. The Institute has also received funding from the United Nations Food and Agriculture Organization to establish a Center of Excellence for Food Quality and Safety.

The original goal of this research is to establish an Institute of Food Science and Engineering at the University of Arkansas-Fayetteville. The Institute for Food Science and Engineering and the Center for Food Processing and Engineering are operating. Research projects at the Center include: postharvest management practices for rice, such as studies of physicochernical properties, bacterial load of rice products, and milling systems, and development of methods to improve the texture and dill flavor of pickles, and the color of acidified pickled vegetables, with estimated impact to the pickle industry of one half million dollars annually. Researchers have developed 12 mechanized systems for total vineyard mechanization which maintain or improve juice and wine quality. Research on physicochernical properties of potatoes and bitterness in carrots and have had estimated economic impacts of several million dollars. Research on elecrochemical flow-through systems for chicken processing water and near infrared/mid-infrared imaging for large scale fruit processing have important applications in industry. Institute staff, including the Descriptive Sensory Panel, have assisted both national food processing companies and small commercial kitchens in process development, with an impact of up to 2 million annually on the Arkansas vegetable processing industry. The Institute's Center of Excellence presents workshops in the United States as well as planning train the trainer courses in Mexico and Central America to improve the safety of imported fresh fruit and vegetables. To date, 70 publications, two IMPACT reports and a quarterly newsletter have served to keep the industry and fellow scientists informed of research and technology transfer activities.

Midwest Advanced Food Manufacturing Alliance, Nebraska, $423,000. The purpose of the Midwest Advanced Food Manufacturing Alliance is to expedite the development of new manufacturing and processing technologies for food and related products derived from United States produced crops and livestock. The Alliance involves research scientists in food science and technology, food engineering, nutrition, microbiology, computer science, and other relevant areas from 12 leading Midwestern universities and private sector researchers from numerous U.S. food processing companies. Specific research projects are awarded on a competitive basis to university scientists with matching funds from non-federal sources for research involving the processing, packaging, storage, and transportation of food products. Projects selected for funding are merit reviewed by non-participating university scientists, industry scientists and scientists from professional organizations. Close cooperation between corporate and university researchers assure that the latest scientific advances are

applied to the most relevant problems and that solutions are efficiently transferred and used by the private sector.

Eleven projects were funded from fiscal year 1997 funds with anticipated completion and final reports due by May 31, 1999. Nine projects were funded from fiscal year 1998 funds with anticipated completion and final reports due by May 31, 2000.

Milk Safety, Pennsylvania, $268,000. The overall goal of the milk safety program is to provide insight into factors that help ensure an adequate and safe milk supply. Toward that end, the research has focused on factors that affect milk production, processing, manufacturing, and consumption. Special attention has been given to ways of preventing and/or treating pathogens that enter the milk supply. Projects are selected for funding each year based on competitive, peer reviews by scientists outside the recipient institution. The research is aimed at minimizing or eliminating future foodborne disease outbreaks from milk and dairy products. Researchers demonstrated that when subjected to a sublethal heat shock prior to pasteurization, Luterta monocytogenes becomes much more heat-resistant than previously thought, likely requiring the design of new pasteurization guidelines to ensure the safety of dairy products. They also developed a simple, fast, sensitive, specific and inexpensive method for the detection of Listeria monocytogenes in dairy products that will allow dairy processors to rapidly and easily screen for the presence of this pathogen in their products and in the processing environment. A computer model of Listeria monocytogenes growth in dairy foods under dynamic refrigeration conditions and during extended storage is under development to provide producers and processors a technology for further enhancing the safety of fluid milk and related products. Researchers have identified potential approaches for enhancing natural defense mechanisms of tile bovine mammary gland through vaccination and immunoregulation. Discoveries of factors influencing growth of taphylococcus aureus could be used to prevent or contain growth of this pathogen in foods. Researchers have identified and sequenced a gene from this bacterium that is essential for growth under stressful conditions. Consumer research has identified characteristics of consumers most likely to have a high general concern about milk and dairy product safety and nutrition.

Preservation and Processing Research, Oklahoma, $226,000. Research has focused on the effects of preharvest and postharvest factors on the market quality of fresh and minimally processed horticultural products, including marigolds, pecans, watermelons, and peaches. Researchers are developing harvester prototypes for marigold flowers and drying and threshing systems for marigold petal drying and separation. A fruit orienting mechanism is being developed for incorporation into an on-line grading system. An integrated harvesting and postharvest handling system is being developed for fresh market and processing market horticultural products. Research continues on methods to determine textural properties of pecans, determine optimum operating parameters for super critical carbon dioxide and other alternative partial oil extraction, and develop and optimize modified atmosphere packaging techniques for pecan shelf life extension.

A systems approach to develop complementary cropping, harvesting, handling and processing operations has resulted in development of improved handling systems for cucurbit and tree fruit crops. Nondestructive processing systems for partial oil reduction of tree nuts have been developed to extend shelf life and lower the calorie content for the raw or processed product. Funding has been secured for construction of a commercial nut extraction facility in Oklahoma, pending successful pilot testing which is underway. Technologies and procedures previously developed for cucurbit and tree fruit systems are being applied to development of okra, pepper, sage, basil, tree nut sweet corn, and marigold cropping, handling, and light processing systems, with a targeted completion date of year 2001. Research from this project provided the basis for commercial high relative humidity storage of peaches and to attract companies to the state to construct new value added food processing facilities.

Seafood Harvesting, Processing, and Marketing, Mississippi, $305,000. Research related to seafood safety, quality and by-product utilization is being performed. For fiscal year 1999, fruits will support research on 1) microbial population changes during retail display of shrimp, 2) development of an impedance-based method to rapidly detect microorganisms on shrimp, 3) determine physical, chemical, microbiological, and sensory differences between pond and tank aquaculture tilapia, and 4) evaluate processes for utilization of uncooked shrimp processing by-products for production of flavor extracts.

The original goals of the research were to improve the quality and safety of catfish and improve the utilization of catfish byproducts and underutilized marine species. Due to successes of the original project, subsequent efforts are focusing on additional uses of seafood and aquaculture foods by improving processing strategies and providing alternative products from waste materials. The project has expanded to include crab, shrimp, oysters, freshwater prawns, hybrid striped bass, tilapia, and

crawfish. FDA has passed rulings affecting the potential viability of Mississippi seafood and aquaculture harvesters and processors. Emphasis is being placed on addressing possible adverse consequences resulting from these changes.

Alternative Salmon Products, Alaska, $400,000. Research was aimed at developing a commercial pin-bone removal machine to reduce production costs of salmon fillets and open markets for salmon fillet shatter packs. The research goal is the development of market-desired salmon products using wild-caught salmon. In 1998, researchers addressed the problem of deboning wild-caught fish so that they can be marketed frozen rather than canned, and compete effectively with pen-reared salmon. Researchers designed, built and tested three prototype pinbone removal machines making sequential improvements in design.

Question. FDA recently provided the Committee a table showing the funding and staffing levels for Food Safety Initiative activities, by Center and field-related activities, funded from the increased funding provided to FDA for food safety in each of fiscal years 1998 and 1999 and proposed for fiscal year 1999. Please provide a copy of this table for the record.

FDA answer. We are happy to provide a copy of this table for the record.

NOTE: This five page report is designed to display, in detail, the FDA Food Safety Initiative plan from FY 1998 through FY 2000. The report is segregated into the five programmatic parts of the Food Safety initiative (Surveillance, Coordination, Inspections, Education, Research and Risk Assessment) and by program (Foods, Animal Drugs and Feeds, and the National Center for Toxicological Research). Summaries of each program are included at the top of each programmatic section and a grand total is found at the end of the report.

Question. The FDA Food Safety Initiative funding includes $109,335,000 million in funding for food safety activities funded for fiscal year 1997 and carried over as the Food Safety Initiative base for each of fiscal years 1998, 1999, and 2000. This base includes $100,476,000 for Foods", $100,000 for Animal Drugs, and $8,759,000 for Other Activities. For each of fiscal years 1998, 1999, and proposed for fiscal year 2000, please indicate the food safety activities being supported (both FTE and funding level) from the base amounts listed above for the Food Safety Initiative.

Answer. The food safety activities being supported from the base amounts for the Food Safety Initiative are listed in the following table.

[The information follows:]

Question. Please list the increases requested in the President's fiscal year 2000 budget for the Food Safety Initiative in order of priority.

USDA answer. The goal of the President's Food Safety Initiative is to further reduce the incidence of foodborne illness to the greatest extent feasible. USDA, FDA, CDC, and EPA have worked to build consensus and to identify opportunities to better utilize their resources and expertise, and to strengthen partnerships with private organizations. As directed by the President, the agencies have identified ways to strengthen the systems of coordination, surveillance, inspections, research, risk assessment, and education. The fiscal year 2000 budget therefore represents an integrated package that must be viewed as a unified, critical initiative.

FDA answer. The Food and Drug Administration is requesting an increase of $30.0 million in fiscal year 2000. Surveillance, coordination, inspections, education,

research and risk assessment are the interrelated building blocks of a strong science-based food safety system. By meeting objectives identified in these six areas, FDA will be able to better identify, track, and control food-related illness, or prevent, to the extent possible, future illnesses. Because surveillance, coordination, inspections, education, research, and risk assessment are the interrelated building blocks of a strong science-based food safety system, it is difficult to prioritize the categories. Advances in research and risk assessment, in addition to surveillance, must be successful before education programs and inspections based on science-based solutions can be derived and implemented since research and risk assessments and surveillance activities will provide the basis for these science-based solutions. Activities within each FSI category provide or rely on data or activities from other categories. For example, Food safety research provides critically needed information to develop the means to identify and characterize more rapidly and accurately foodborne hazards; to develop food safety policy and set standards for safe food handling; to provide science-based tools for regulatory enforcement, including inspections based on preventative strategies such as HACCP; and to develop effective interventions that can be used, as appropriate, to prevent hazards at each step from production to consumption.

Scientists and other food safety experts have concluded that the most effective and efficient mechanism to ensure that food processors identify and control hazards that could threaten the food supply is the application of preventive controls—HACCP principles. These science-based technologies, standards, and strategies of the Food Safety Initiative are developed through several means, including the surveillance data collected to recognize trends and target prevention strategies that form the basis of inspections that are used to evaluate the effectiveness and efficiency of the industry's preventive controls; the conduct of research and risk assessments to determine the hazards which are used to identify critical control points for industry application of HACCP systems; and the conduct of research and risk assessments to verify that critical control points in HACCP systems are working, as well as, to target the data gaps that hamper preventive control systems from working. The Food Safety Initiative and implementation of HACCP systems, along with education programs, which will provide a more efficient and effective system for monitoring the nation's food supply to ensure safety and ultimately result in the reduction of foodborne illness.

Question. If the caps on discretionary appropriations are enforced, as we expect, funding for nondiscretionary appropriations will be less than the fiscal year 1999 levels. Is increased funding for the Food Safety Initiative a priority if it must come at the expense of reducing funding for ongoing programs? What reductions in funding for existing programs would you recommend in addition to those requested in the President's fiscal year 2000 budget to offset necessary increases in funding for the Food Safety Initiative?

USDA answer. The President's fiscal year 2000 budget includes proposals for financing discretionary programs within the statutory discretionary caps. Changes in authorizing legislation are proposed that would reduce mandatory spending, establish user fees or raise revenues where the savings would be designated as offsets to the discretionary caps and provide for increases in priorities such as the President's Food Safety initiative.

FDA answer. Without knowing the exact impact of such reductions, I would be unable to speculate at this time on any reductions that might result from caps on discretionary appropriations. I would note that the President's budget request for fiscal year 2000 includes increases for all of FDA's major programs, recognizing the limits of FDA's ability to protect the public health in all of our program areas. I would also note that all of our program areas have taken effective cuts, including staffing reductions, in recent years as we have had to absorb pay raises and other inflationary costs. Therefore, I don't believe we could reduce other program areas to provide funding for the Food Safety Initiative without jeopardizing the effectiveness of our other programs.

While improving the safety of the food supply is of the utmost importance, and is a high priority of this Administration, our other programs to promote and protect the public health in the areas of foods, drugs, biologics, and medical devices are also of vital importance.

QUESTIONS SUBMITTED BY SENATOR GORTON

Question. USDA has requested more than $24 million for food safety research in the fiscal year 2000 budget. These research dollars are allocated by either eliminating or decreasing Agriculture Research Service and Cooperative State Research, Education and Extension Service programs consistently funded by Congress. What

additional food safety research will be conducted by USDA that is not already being performed by the Centers for Disease Control, the National Institutes of Health, and the Food and Drug Administration? I am concerned that production agriculture research is being eliminated at USDA for the sake of food safety research that may already be ongoing at other federal agencies.

USDA answer. Food safety research conducted by USDA agencies (ARS, CSREES, and ERS) is complementary to that conducted by DHHS agencies (CDC, NIH, and FDA). USDA agencies address agricultural production-related issues of food safety and the early processing segments of the food chain. Increasingly, this research is important to farmers and ranchers to insure the quality and safety of their production. USDA research, in addition to being targeted to the technology needs of farmers and the food processing industry, provides science based technologies and risk assessments to enable FSIS to carry out its inspection and regulatory policies for meat, poultry, and eggs. Within DHHS, FDA research is focused on issues related to its regulatory responsibility for the safety of marketed domestic and imported foods other than meat and poultry products. The CDC and NIH focus their research activities on the surveillance and epidemiology of food borne illness outbreaks and fundamental work on the pathogenesis of enteric diseases in humans, respectively. The additional food safety research funding requested by USDA in fiscal year 2000 will not address activities already performed by CDC, NIH, and FDA, but instead will focus on improved pathogen detection and prevention technologies for meat, poultry, and horticultural crop production and processing, as well as understanding antimicrobial and antibiotic drug resistance of microbial pathogens that can infect both food producing animals and humans.

Question. Your testimony suggests that Americans have a greater chance of encountering food borne illnesses due to increased consumer food choices and additional access to prepared foods. Recognizing the changes each agency has to make in order to address this new scenario, would you consider our food source less safe today than ten years ago? Five years go? Could you (USDA, FDA, or CDC) provide statistics or figures relating to how many illnesses and deaths a year can be attributed to food borne illnesses? Do the statistics suggest that the problem is being addressed?

USDA answer: The statistics from FoodNet show that during 1998, 9,787 laboratory-confirmed cases of 9 diseases under surveillance were identified: 4,031 of camplyobacteriosis, 2,849 of salmonellosis, 1,483 of shigellosis, 565 of cryptosporidiosis, 508 of E. coli O157:H7 infections, 186 of yersiniosis, 106 of listeriosis, 50 of vibrio infections, and 9 of cyclosporiasis. Although these data don't reflect all foodborne illnesses that occur, we suggest that they are representative of the nationwide pattern of foodborne illnesses.

CDC collects epidemiological data relating to the incidence and type of food borne illness that occur within the United States. ARS provides research information relating to risk factor analysis that are used by CDC in determining the risk of sustaining a food borne illness from a specific food type. For example, ARS released the Salmonella Risk Assessment Modeling Program for Poultry (S-RAMP), and the Food Animal Risk Model for Poultry Pathogens (FARM-PP) which predicts the severity of outcomes from consumption of poultry products with Salmonella and Campylobacter.

ARS does not collect human epidemiological statistical data relating to illnesses or deaths attributed to food borne illnesses.

FDA answer. Estimates of foodborne illness and death are imprecise and widely diverse. The Council for Agricultural Science and Technology (CAST) estimates that 9,000 deaths and 6.5 to 33 million illnesses in the United States each year are food related. CDC is in the process of analyzing and updating estimates of foodborne illness and death. Statistics suggest that, despite advances to produce safe food and protect consumers, foodborne illness remain a significant public health problem. FDA will carefully review the analysis and will provide additional data when possible.

It also is important to recognize that, as surveillance and laboratory methods improve, we may see an increase in foodborne illness. Better surveillance leads to better and more accurate disease detection, which in turn leads to more investigations. As surveillance improves, more outbreaks, not fewer, will be detected. By finding and investigating such outbreaks, CDC can define risks, develop and implement interventions, and over the long term target and ultimately eliminate the risk.

In order to determine whether our food source is safer today than it was five or ten years ago, we need to compare the incidence of death and illness from foodborne pathogens over that particular time period. However, estimates of foodborne illness

and death are imprecise and widely diverse. The number of deaths and illnesses attributed to foodborne disease are estimates—calculated from the number of individual cases that come to the attention of CDC and other public health agencies—from clinicians, laboratory analyses and surveys. Only 1 to 10 percent of actual cases of foodborne illness are reported. Therefore, multiplication factors are obtained from small studies to allow estimates of the total illness. These values all have an uncertainty range about them, and the final estimate will be the most likely value with an accompanying range of possible values. The widely quoted estimates of 6.5 million to 33 million annual cases and 9,000 deaths come from the 1994 Council for Agricultural Science and Technology or CAST report on Foodborne Pathogens.

The recently developed FoodNet system is designed to be more comprehensive in collecting the incidence of illnesses and to determine the various factors more accurately. As additional FoodNet information is collected, the estimates of illness should become more accurate and the ranges should be reduced. We would be happy to provide information for the record on the rate of detection of selected pathogens.

[The information follows:]

RATE [1] OF SELECTED PATHOGENS DETECTED BY THE FOODBORNE DISEASES ACTIVE SURVEILLANCE NETWORK (FOODNET) [2] ILLNESS RATES OF FOODBORNE PATHOGENS FROM THE 1996–1998 FOODNET SYSTEM

Isolate	1996	1997	1998
Campylobacter	23.5	25.2	21.7
Cryptosporidium	([3])	2.7	2.5
Cyclospora	([3])	0.3	0
E.coli O157:H7	2.7	2.3	2.8
Listeria	0.5	0.5	0.5
Salmonella	14.5	13.6	12.4
Shigella	8.9	7.5	8.5
Vibrio	0.1	0.3	0.3
Yersinia	1.0	0.9	1.0
Total	[4] 51.2	[4] 50.3	47.2

[1] In 1996, active surveillance was initiated for laboratory-confirmed cases of Campylobacter, Shiga toxin-producing E.coli O157, Listeria, Salmonella, Shigella, Vibrio, and Yersinia infections in Minnesota and Oregon and in selected counties in California, Connecticut, and Georgia. In 1997, surveillance for laboratory-confirmed cases of Cryptosporidium and Cyclospora infections was initiated in Minnesota and Oregon and in selected counties in California and Connecticut. Data presented in this table are from these original FoodNet sites only.

[2] Values are illnesses per 100,000 population.

[3] Not reported.

[4] Excludes Crytosporidum and Cyclospora.

NOTE: This table is based upon information provided in CDC's March 12, 1999 Morbidity and Mortality Weekly Report (MMWR).

Although the development of baseline data from FoodNet is still in its early stages, the figures from the CDC report of March 12 may indicate that the Food Safety Initiative efforts are having an affect in some areas. Comparing data from the five original FoodNet sites, overall incidence of laboratory-confirmed infections caused by the pathogens under surveillance declined from 1996 to 1998.

Although the U.S. systems for reporting foodborne disease are globally pre-eminent, they only capture a fraction of the cases that occur. This limitation reflects the fact that for sporadic cases of foodborne disease, only a small percentage of these medical events are reported. Even with outbreaks involving multiple victims, only about 40 percent are investigated sufficiently to identify the causative agent. One goal of the Food Safety Initiative has been to improve this reporting system, while simultaneously initiating programs to prevent foodborne disease. It is also important to recognize that, as surveillance and laboratory methods improve, we may see an increase in foodborne illness. Better surveillance leads to better and more accurate disease detection, which in turn leads to more investigations. As surveillance improves, more outbreaks, not fewer, will be detected. By finding and investigating such outbreaks, FDA, CDC, and USDA can define risks, develop and implement interventions, and over the long term target and ultimately eliminate the risk.

Question. Where do you believe the biggest food safety threat lies—in domestic produced crops, imported commodities, consumer preparation, or a mix? Where would the emphasis of the U.S. tax dollar be best spent?

FDA answer. Risk and benefits cost analyses have been done or are being done for some food safety risks such as E. coli O157:H7 in ground beef and Salmonella in eggs. Much more needs to be done for other food safety risks. Unfortunately, risk assessment is far less developed for foodborne pathogens than for chemical hazards. Even chemical hazards, for which risk assessment methods have been the most thoroughly developed, data gaps force continued use of assumptions about exposure, hazard potency, and characteristics of the populations at risk.

The President's Council on Food Safety has requested that the Interagency Food Safety Risk Assessment Consortium consider how to develop a comparative risk analysis for food safety strategic planning. Various steps may need to be taken to evaluate risks including a ranking of foodborne pathogen risks based on surveillance and economic data; consideration of a broader range of food safety hazards including not only microbial risks, but also pesticides and chemicals; and finally, selection of highly ranked hazards, an evaluation of control measures, and an evaluations of net benefits.

Risk assessment provides a strong foundation upon which efficient allocation of scarce food safety resources can be made. It plays a central role in the development of any science-based system of preventive controls. Risk assessment also provides essential information for estimating and analyzing the costs and benefits of policy alternatives. We are continuing to emphasize the development, testing, and validation of microbial risk assessments and foodborne illness evaluation methods. Improving risk assessment will allow us, in the future, to target the prevention of foodborne disease by informing surveillance plans, prevention strategies for process control systems and for food inspections based on HACCP principles, and research programs to fill critical food safety information gaps. By incorporating the results of risk assessments with economic analyses, we will enhance our understanding of the economic consequences of specific food safety policies and make better-informed choices among alternative and policy options.

Question. Pending at FDA is a proposed rule to require the imposition of mandatory HACCP on juice processors. Recognizing that 98 percent of all juices are pasteurized, what is FDA's rationale for the imposition of HACCP on juice processors that use a guaranteed pathogen kill step?

FDA answer. While pasteurization effectively controls pathogens in juice, there are other hazards associated with juice that are not heat-treatable. Hazard Analysis and Critical Control Point or HACCP is a preventive strategy for food safety that addresses microbiological, physical and chemical hazards. Because of the variety of hazards associated with juice, FDA tentatively concluded that HACCP and safety performance criteria offer the most effective way to control the significant microbial hazards, along with other potential hazards, that may affect public health. The Agency's decision was based on a recommendation by the National Advisory Committee on Microbiological Criteria for Foods that HACCP with a performance standard could form the general framework needed to ensure the safety of juices. The HACCP proposal for juice includes a 5-log performance standard for pathogen control that producers must meet in order to have a valid HACCP plan.

FDA proposed on April 24, 1998, that HACCP be mandatory for the juice industry and is currently involved in rule making on this matter. HACCP also considers chemical and physical hazards in addition to the microbiological hazards. The proposal gives excellent examples of instances in which non-microbiological hazards occurred in juice products. These examples were tin, poisonous plant parts, lead, patulin, unapproved use of food and color additives, improper sanitation procedures or faulty equipment, glass, plastic and a more recent 1999 recall with undeclared sulfites in grape juice.

Question. Where do you believe the biggest food safety threat lies—in domestic produced crops, imported commodities, consumer preparation, or a mix? Where would the emphasis of the U.S. tax dollar be best spent?

FDA answer. FDA believes that the biggest threat to food safety lies within a mix of factors. As a result of this mix of factors, U.S. dollars are best spent on a mix of the six FSI categories—surveillance, coordination, inspections and compliance, risk assessment, research and education. Each of the categories are intertwined and serve a unique function in addressing the threats to domestic crops, imported commodities, consumer preparation, and other sources such as retail establishments, including food restaurants, vending operations, and institutional feeding operations such as schools, hospitals and nursing homes.

Surveillance and investigation are powerful tools to detect new foodborne disease challenges, to determine what specific food sources are implicated in foodborne illness, and to learn how best to keep foods from becoming contaminated. Enhancing the capacity of states to monitor foodborne disease and to investigate and control outbreaks will lead to better general control measures and fewer illnesses.

Federal and state inspection programs are an important component of the nation's food safety inspection system that cover domestic and imported products. The move toward HACCP will pose a challenge to the states to implement. Federal agencies can help the state systems meet that challenge. If HACCP is to be an effective program for ensuring that food processors have modern, state-of-the-art procedures in effect, FDA must improve its inspection capabilities, so that the highest—risk food plants are inspected at least once per year.

Risk assessment is far less developed for foodborne pathogens than for chemical contaminants. Intensive commitment is necessary to develop critically needed methods of analyzing the available data and addressing its uncertainty; methods that account for variability, specifically of living microbial pathogens, are essential.

Food safety research is critically needed to develop the means to identify and characterize more rapidly and accurately foodborne hazards, to provide the tools for regulatory enforcement, and to develop effective interventions that can be used as appropriate to prevent hazards at each step from production to consumption.

An integral part of the overall food safety initiative is providing food safety education to a variety of audiences: consumers, that is the general public and specific groups at risk for foodborne illness; public health professionals and physicians; retail, food-service, and institutional food preparers; veterinarians, animal and other food producers; and food transportation workers. The challenge is to create educational messages that address the risks relevant to each audience throughout the food chain.

QUESTIONS SUBMITTED BY SENATOR MCCONNELL

Question. In 1998 FSIS and FAS estimated implementation and enforcement of new country of origin labeling requirements for imported meat would cost USDA $60 million. There are no funding requests for implementation of such a program in USDA's fiscal year 2000 budget. Should Congress pass imported meat country of origin labeling legislation, how will USDA pay for the costs associated with the establishment and enforcement of such a program?

USDA answer. The cost estimates to which you refer were preliminary, and based on the fact that the greatest impact would appear to be at the retail level, since most labels on fresh meat cuts are applied at retail and FSIS has limited presence at the retail level. Should this legislation be enacted, we would have to examine what resources would be necessary for implementation.

The country of origin labeling report currently being developed will propose various monitoring and enforcement regimes. Briefly, those options include: (1) enforcement by USDA at retail; (2) limited enforcement at wholesale establishments, which are already regulated by USDA; (3) enforcement at retail by States or other Federal agencies involved in marketing; (4) monitoring and referral through private, third-party certifiers; or (5) enforcement through a whistleblower or competitor complaint system. Depending on the regulatory regime Congress chooses, other Federal or State agencies or third parties may be able to perform these tasks at a lesser cost.

Question. What offsets would have to be made in other program areas?

USDA answer. The broad issue of country of origin labeling is primarily a marketing issue, not a food safety issue. FSIS must apply its resources to ensure the safety of meat, poultry, and egg products.

Question. If the price of meat rises as a result of country of origin labeling mandates, how will this impact individuals who rely on government assistance for their family food purchases?

USDA answer. From preliminary information, it would be expected that, if the price of meat increases as a result of mandatory country of origin labeling, all consumers of meat products would experience a corresponding price increase, at least in the short term, including those who rely on government assistance programs. According to data from USDA's Economic Research Service (ERS), the amount of imported fresh muscle cuts of beef consumed in the U.S. is very small compared to consumption of the same domestically produced product. The volume of imported beef muscle cuts represents about one percent of domestic beef production.

Question. Will country of origin labeling for imported meat result in higher cattle or sheep prices or higher profits for products?

USDA answer. Information from USDA's the Economic Research Service (ERS) and the Foreign Agricultural Service (FAS) that a country of origin labeling requirement would probably increase some costs to packers, processors, and retailers. These would include the cost of preserving the identity of domestic and imported products, the direct costs of new or revised labels, and possible shifted costs if firms cease using imported products as a result of a new labeling regime. Domestic prod-

ucts would have to be labeled, too. It is reasonable to expect that those costs would be passed along to consumers to some extent. The profits realized by the sale of those products would depend on the increased cost of processing and distribution in relation to the costs incurred as a result of new requirements, and the degree to which product manufacturers believe they can pass along those costs to consumers and still remain competitive in the marketplace.

Question. Is the United States a net exporter or net importer of meat products? What has been the trend over the past several years?

USDA answer. The United States is a net exporter of all meat products, including all red meat and poultry meat. In 1998, U.S. meat exports were 4.2 million tons valued at $6.4 billion and imports were 1.3 million tons valued at nearly $2.8 billion. The U.S. meat trade surplus in 1998 was about 3 million tons valued at $3.6 billion.

Poultry meat exports account for most of the surplus as the United States is the world's largest poultry meat exporter but imports only minimal amounts. The United States is a significant importer of beef and pork. In 1998, U.S. net exports of beef and pork, including variety meat, were 317,000 tons and $1.3 billion. In comparison, the U.S. poultry meat trade surplus was 2.5 million tons and $2.1 billion.

The meat trade surplus has grown significantly since 1994. In value terms, the meat surplus was $2.6 billion in 1994, peaking at $4.7 billion in 1996. The recent decline in the value of the meat trade surplus is due to lower meat prices during the past 2 years and a sharp drop in Russian imports of poultry meat at the end of 1998. The trade balance in volume terms had been steadily increasing until the onset of the Russian ruble crisis. The balance in volume terms was slightly lower in 1998.

Question. Which countries represent the largest markets for U.S. meat exports?

USDA answer. The leading markets for U.S. meat exports are Japan, Russia, Mexico, Canada, Hong Kong, Korea, and Taiwan. In volume terms, Russia is the leading U.S. meat export market because of the large quantities of poultry meat exported there—more than 715,000 tons in 1998 and 981,000 tons in 1997. However, in terms of value, Japan is the leading U. S. market by a large margin. U.S. meat exports to Japan were $2.4 billion in 1998, accounting for 37 percent of the total value of U.S. meat exports. Mexico at $860 million was the second leading market for the United States, followed by Russia at $708 million and Canada at $681 million. Russia and Hong Kong are primarily markets for U.S. poultry meat, while Japan, Canada, and Mexico are leading destinations for both poultry and red meat. The United States exports red meat to Korea and Taiwan.

Question. Would the establishment of a new meat labeling regime in the United States be viewed as a non-tariff barrier by our trading partners?

USDA answer. FSIS requires that all meat imported into the United States bear the name of the country of origin, which remains with the product to the retail level—unless it is further processed under U.S. inspection. Meat and poultry products can only be imported into the United States from countries and plants approved by and recognized as imposing inspection requirements "at least equal to" those of the U.S. To this end, labeling is approved prior to entry. The proposed legislation would set a new precedent regarding the rules of origin and product labeling which could invite mirror action by U.S. trading partners. Mandatory country of origin requirements could change the way both domestic and foreign meat retailers and others involved in production and distribution do business, thereby affecting their costs and consumer choices. Article IX of the GATT 1994 allows countries to require marks of origin on imported products, so long as the marking requirement does not seriously damage the imported products, materially reduce their value, or unreasonably increase their cost. However, if the new labeling requirement does not qualify under GATT-permitted marking rules, i.e. if the label requires the word "imported" rather than the specific country name, it might be challenged as violating national treatment and constituting a prohibited restriction. In addition, if the effect on imports is severe enough, a protesting country could bring a WTO non-violation nullification or impairment challenge against the new labeling requirement.

Question. Would the establishment of such a labeling requirement affect U.S. exports?

USDA answer. The effect on U.S. exports would depend upon the types of labeling requirements established by foreign countries.

Question. Has the United States challenged labeling or other non-tariff barriers proposed in other countries?

USDA answer. The United States continues to oppose mandatory labeling of foods obtained through biotechnology—European Union (EU) biotechnology labeling. It has also criticized other foreign nations, i.e. Korea and EU, for attempting to adopt similar country of origin requirements for meat products, and has challenged Korea,

the Kingdom of Saudi Arabia and the other Gulf Cooperation Council countries—Kuwait, Qatar, Bahrain, Oman, UAE—for imposing mandatory government set shelf-life labeling requirements which impede U.S. food imports. In each case, the new labeling requirements were inappropriate remedies unrelated to either the safety or quality attributes of imported food products being marketed.

Question. You recently told the House Agriculture Appropriations Subcommittee that some meat and poultry plants are resisting the effort to remove unnecessary layers of the old inspection system. Could you please provide the Senate Agriculture Appropriations Subcommittee with more complete detail about the types of plants that are resisting de-layering and a list of specific regulations that plants have told the agency they do not want removed?

USDA answer. A number of establishments have strongly opposed FSIS regulatory reform efforts regarding certain regulations. The elimination of prior approval for proprietary substances and nonfood compounds included within the proposed rule on "Sanitation Requirements for Official Meat and Poultry Establishments" (62 FR 45045); the conversion of the historically prescriptive thermal processing (canning) requirements into performance standards (9 CFR 318.300 and 381.300); and the elimination of prior approval for equipment included within the final rule on "Eliminating of Prior Approval Requirements for Establishment Drawings and Specifications, Equipment, and Certain Partial Quality Control Programs" (62 FR 45016) are among those reforms opposed by various segments of the industry.

Question. Is imported meat, or meat derived from imported cattle, less safe than meat of domestic origin?

USDA answer. FSIS has measures to ensure that imported meat is safe through its stringent equivalence requirements including reinspection activities at ports of entry. Approximately 9,000,000 pounds of product are rejected each year due to reinspection. In 1998 9,923,000 pounds were refused.

Question. Would country of origin labeling enhance food safety?

USDA answer. There are no data that support a link to food safety.

Question. FSIS has been testing ground beef for E. coli O157:H7 since 1996. Out of 26,088 samples, they have found only 25 positives. How much is it costing USDA to look for something they only find 0.096 percent of the time, or less than once in every one-thousand samples tested.

USDA answer. The Food Safety and Inspection Service (FSIS) spends approximately $10.4 million per year on testing meat and poultry products for 9 potentially deadly pathogens, including E. coli O157:H7, Salmonella, Campylobacter, and Listeria.

Question. None of these samples were connected to an outbreak or illness—so what is the val ue of this testing?

USDA answer. The testing program for E. coli O157:H7 began after the tragic outbreak of foodborne illness associated with this pathogen in the State of Washington. USDA estimates that over 10,000 illnesses per year result from consuming foods contaminated with E. coli O157:H7.

As the Washington outbreak demonstrated, the most susceptible to this pathogen include children, the elderly, and the immune compromised. Testing programs like that for E. coli O157:H7 assist FSIS in controlling deadly pathogens by identifying contaminated product in time to remove it from the market before it can cause foodborne illness. The justification for continuing this program is that the agency believes this testing program is reducing the risk of illnesses/outbreaks caused by E. coli O157:H7 in raw ground beef. The FSIS program of random sampling at federal, State, and import establishments and at the retail level, as well as the implications of a positive finding, encourage the meat industry to use good manufacturing practices, good sanitation procedures, antimicrobial interventions, microbial testing, and other measures to eliminate this serious pathogen from the nation's meat supply.

Question. Most of the 26,088 samples were collected from grocery stores. How can testing at grocery stores for E. coli O157:H7 or any pathogen contribute to the protection of the public's health if the consumer has already eaten the food by the time you get the test results back? Shouldn't the testing be done before the food reaches stores?

USDA answer. The FSIS Raw Ground Beef Products Testing Program collects approximately 60 percent of the samples from retail stores and approximately 40 percent of the samples directly from processing plants. Many retail stores further process ground beef from a federal plant, and the testing program is targeted to detect contamination problems at this level. Further, FSIS conducts a variety of separate testing—monitoring—programs for foodborne pathogens in ready-to-eat products, and all of these monitoring samples are collected at the processing plant level. Detection and removal of pathogen-contaminated foods at any point of distribution will

serve to protect the public from foodborne illness, if an effective recall can be accomplished. Again, knowledge of food contamination problems promotes corrective actions on the part of producers, and serves to prevent future foodborne health hazards.

Question. I understand that FSIS has announced a plan to test moving its food inspectors out of the Federal slaughter and processing plants and move them into retail such as into grocery stores. Grocery stores are already under inspection by FDA and the state and local public health departments. This doesn't seem very efficient or productive given that other areas are in greater need of food safety inspection. For example, Senator Susan Collins and the Government Accounting Office have identified a real need for increased inspection of imported foods at the ports of entry. Why not put these inspectors where there is a need rather than where you will just be duplicating effort? Do you have any data to show that grocery stores need more inspect ion than imported foods?

USDA answer. Reassigning FSIS inspectors to FDA for port-of-entry inspection is not a viable option for these reasons. Under HACCP implementation, FSIS does not contemplate any change in the continuous inspection requirements of the statutes or in the overall number of inspection personnel. FSIS anticipates full productive use of its inspection resources in pursuing food safety work for meat, poultry, and egg products.

The implementation of HACCP involves overseeing industry implementation and compliance with the regulatory requirements outlined in the Pathogen Reduction and HACCP final rule that was promulgated in July 1996. The HACCP provisions of that rule have different effective dates based on the size of establishments, e.g., large, small, and very small. The last phase of implementation does not occur until January 2000 when very small plants are required to implement HACCP systems.

During fiscal year 1999, FSIS redeployed approximately 100 employees from large HACCP plants to cover critical vacancies in small HACCP plants. This redeployment of inspection personnel was done to assure that adequate resources were available to oversee successful implementation of HACCP in small plants. We do not anticipate any further need to redeploy inspection personnel prior to implementation of HACCP in very small plants in January 2000.

Under the slaughter models component of the HACCP-based Inspection Models Project, FSIS is exploring alternative ways in which slaughter inspection might be accomplished in establishments that have already implemented HACCP systems and that exclusively slaughter certain market classes of animals. These market classes are young poultry, steers and heifers, and market hogs. In all cases, these are young, healthy animals that do not exhibit the same disease and public health concerns that may be present in older animals. The alternative slaughter inspection models under consideration meet current statutory requirements for continuous inspection, but may require fewer inspection personnel within the slaughter department of some establishments.

FSIS has food safety and other statutory obligations that are sufficient to fully occupy the inspection resources that may become available through this project. It is necessary as part of the verification of industry HACCP systems to assure that product bearing the Federal marks of inspection continues to move through transportation, distribution, and marketing channels in a manner that does not cause such product to become adulterated or misbranded. The second component of the HACCP-based Inspection Models project, the in-distribution model, addresses this issue by using a limited number of inspection resources to expand existing oversight of Federal product in-distribution channels.

For the record, FSIS and the National Joint Council of Food Inspection Locals have reached an impasse in negotiations necessary to begin the pilot tests for both the slaughter models and the in-distribution models. The parties have jointly requested assistance from the Federal Service Impasses Panel to resolve the impasse. Until such resolution occurs, the pilot tests will not be started and it would be premature to determine the number of resources that may be available for other FSIS food safety and economic adulteration concerns.

QUESTIONS SUBMITTED TO DR. CATHERINE E. WOTEKI, UNDER SECRETARY FOR FOOD SAFETY

QUESTIONS SUBMITTED BY SENATOR BURNS

CODEX ALIMENTARIUS STANDARDS

Question. Codex Alimentarius is a program to encourage fair international trade in food and promote the health and economic interests of consumers. What effects do you expect Codex Alimentarius to have on international uniformity in food safety standards in the long-term?

USDA answer. Codex standards have value as reference points. The food safety measures embodied in the standards, guidelines and codes of practice that constitute the Codex Alimentarius, if developed in accordance with principles that hold bases in sound science as the predominant value, will have unquestioned value to nations as bases for their own development of mandatory food safety measures. Nations could then act under the premise that the measure is scientifically linked to a specified public health concern. The value of Codex Alimentarius in the long term will be dependent on how true it remains to the principles of sound science. Codex standards are recognized as international standards for purposes of the Sanitary/Phyto-Sanitary (SPS) agreement and impact decisions of the World Trade Organization (WTO).

Question. You stated that REE has conducted $64 million in food safety research, under ARS and CSREES. What were the primary findings and what do you intend to do with the results of this research?

USDA answer. In fiscal year 1998 the USDA (ARS/CSREES/ERS) undertook $61.4 million in food safety research related to pathogens and chemical residues. A brief summary of ARS accomplishments during this fiscal year follows:

ACCOMPLISHMENTS IN THE AREA OF DETECTION METHODS

A. Human Pathogens

—Monoclonal antibodies (MAbs) that bind specifically to Campylobacter jejuni and Campylobacter coli have been developed, and patented. These antibodies will be used in an immunologically based method (ELISA) to improve the current specific detection methods for Campylobacter.

—A laser assisted method (MALDI) has been developed for the rapid detection of Campylobacter. The methods advantage is that only a single bacterial colony is needed for analysis. The MALDI technique also has the potential to be widely used for confirmatory analysis of other pathogenic bacteria.

—A nucleic acid based (PCR) method was developed which simultaneously detects enterotoxigenic and Shiga toxin-producing E. coli (O157:H7) strains from calves. The method is being used by diagnostic laboratories to rapidly identify, differentiate and characterize pathogenic E. coli. will be useful for to producers and veterinarians for the rapid diagnosis of all the diseases caused by E. coli in calves.

—An ELISA based test (immuno-precipitation pregnancy test design) called Meridian was developed. The test uses monoclonal antibodies to specifically detect all E. coli O157 strains, not just O157:H7. Meridian has found widespread use by food companies since it has a much lower incidence of false negatives than other comparable tests.

—In cooperation with IGEN of Gaithersburg, MD, ARS has developed an immunomagnetic electro-chemiluminescent (IM-EC) method for the detection of E. coli O157:H7. The test is rapid, sensitive to low numbers of bacteria, inexpensive, and user-friendly. The technology is currently under evaluation by the FSIS.

—Optimized methods to identify, differentiate, and characterize pathogenic E. coli isolates from bovine sources were developed. Anti-O157 MAbs in an ELISA format accurately detected serum antibodies to E. coli O157, as well as to the important non-O157 EHEC serotypes, E. coli O26 and E. coli O111, in cattle and other livestock. Serum detection of antibodies to E. coli O157:H7 will allow accurate detection of all animals exposed to this pathogen at any time during animal growth.

—A laser based detector that illuminates fecal contamination on meat was developed and patented. The instrument could be used to immediately alert meat packers to contamination, allowing carcasses to be promptly decontaminated.

—Research by ARS determined that automated nucleic acid based ribotyping of Salmonella was a better discriminator between isolates than serotyping. Ribotyping however, is not a replacement for serotyping. It was recommended

that for epidemiological investigations, both techniques should be used simultaneously.

B. Chemical Contaminants

—A method of analysis for multiple diverse pesticides was developed for fatty samples using chromatography/ion trap mass spectrometric detection. The method enables extraction of meat tissue as well as fat, expands the range of pesticides that can be analyzed. The method uses no chlorinated solvents, and provides a single step quantitation and confirmation analysis. This method will increase the capabilities of regulatory and other laboratories to analyze pesticide residues in food, and will provide more accurate data for risk assessment purposes.

—A monoclonal antibody capable of detecting the antibiotic Hygromycin B was formatted into a rapid ELISA assay, and a patent was issued and the antibodies licensed to a private kit manufacturing company. The method will allow the detection of drug residues in poultry by regulatory agencies.

—Supercritical fluid extraction and microdialysis methodologies have been developed to isolate and detect prohibited drug and other chemical residues in eggs. The methods have been transferred to the FDA and the FSIS for their evaluation, and use, as dictated by their regulatory programs.

—Valid and reliable laboratory methods for assaying iron were established as an indicator of soft bone constituents in trim beef derived form advanced meat recovery systems (AMRS). Studies indicated that iron content of AMR trim beef could be determined by either dry ash or wet ash (nitric/sulfuric) procedures, although the dry ash method was selected for routine analysis. The procedure will be implemented by the FSIS.

—An instrument for monitoring chlorine dioxide during disinfection of food processing water was developed. The membrane sensor can determine chlorine dioxide in the presence of chlorine and/or other oxidants and provide instantaneous analytical results. The instrument can be used to assure both adequate residual levels and to minimize unnecessary water overuse.

Progress in the area of pathogen reduction:

—In order to determine the effectiveness of a pathogen reduction method bacteria need to be modified to allow their identification and discrimination from background microflora. ARS has developed a genetic technique that allows the construction of (model) pathogens that bioluminesce under UV light due to production of a green fluorescent protein (GFP). Various model strains of E. coli O157:H7 and Salmonella were constructed having the same growth and attachment characteristics as the wild type strain. This research technology will aid in understanding the basis of microbial attachment and detachment to animal carcasses in real-time. The technology also offers a more rapid means to evaluate antimicrobial carcass treatments that do not rely on sampling, culturing and back-extrapolation of the resulting plate counts to large surface areas.

—ARS concluded research on washing and sanitizing hog hauling trailers and holding pens. The results have led to procedures to significantly reduce Salmonella, Campylobacter and E. coli contamination on animals entering slaughter plants.

—A surface pasteurization technique was developed to reduce microbial contamination (Salmonella, Campylobacter and Listeria) on the surface of solid foods without loss of quality. A prototype design to briefly steam fresh whole broiler carcasses, so that surface organisms are killed but with no appreciable cooking of the meat, was built, tested and patented.

—Various conventional and experimental wash formulations were evaluated to determine their efficacy in decontaminating apples of human pathogens (Salmonella, E. coli O157:H7, Listeria). Solutions containing 5 percent hydrogen peroxide, alone or in combination with acidic detergents achieved a 3–4 log pathogen reduction. These studies demonstrated that current conventional methods of washing apples are largely ineffective. Development of efficacious cleaning methods for fruit are crucial for the production of unpasteurized juices.

—Low dose gamma irradiation was found to be efficacious for destroying the human bacterial pathogens E. coli O157:H7, Listeria and Salmonella on seed used for the growth of sprouts. Irradiation is a useful technology that significantly reduces pathogens in certain food commodities, while increasing shelf life and maintaining freshness, all major consumer demands.

Progress in the area of pathogen control through intervention strategies:

—A competitive exclusion culture (CEC) to control Salmonella on commercial broiler farms was developed. The FDA approved this CEC under the trade

name PREEMPTTM for use in commercially produced broiler chickens. This was the first CEC to receive FDA approval for use in commercial poultry flocks, and is a major milestone in an integrated program to prevent Salmonella contamination in food products from poultry.

—Feed withdrawal in broilers prior to slaughter is used to induce molt and to stimulate egg laying in aged flocks, however, withdrawal increased infection rates in their crops by Salmonella and Campylobacter. Research showed that methods such as adding lactose to drinking water had the ability to restore resistance, and reduce infection rates.

—Electrostatic ionization of the air in an area housing S. enteritidis-infected adult birds was found to reduce the number of S. enteritidis in the air environment. Airborne transmission of Salmonella has gained considerable recognition as an important mechanism of spread of this pathogen within poultry houses.

—A porcine lymphokine (IL–12) that activates a protective responses in neonatal pigs has been isolated from the splenic T cells of S. enteritidis—immune pigs. Oral administration of the lymphokine will protect weaned pigs from S. choleraesuis organ invasion, cecal colonization, and will enhance growth performance and neutrophil function. Enhancing the host immune response to bacterial and parasitic infection will decrease the dependence on antibiotic administration.

—Cattle fed large amounts of grain (> 45 percent of DM), accumulate volatile fatty acids in the colons resulting in a decline in gut pH. This causes a significant increase in total E. coli numbers and acid resistance. However, cattle fed hay appeared to have decreased total E. coli numbers, and decreased acid-resistance. Although additional studies are required, it is possible that feeding hay to cattle prior to slaughter may significantly reduce post harvest contamination by pathogenic E. coli.

—It was discovered that some naturally occurring food additives blocked the attachment of E. coli to bovine fascia and connective tissues. Inhibition of E. coli O157:H7 attachment to intact meat tissues by use of these substances will offer an processors additional means to help to prevent E. coli O157:H7 contamination of meats.

—ARS in collaboration with FSIS conducted a nationwide evaluation of color of cooked beef patties relative to potential food safety risk for E. coli O157:H7. The study provided solid evidence that cooked beef patty color is not a good indicator of internal patty temperature. The results were a major factor in the development of the new FSIS consumer message that "consumers should not eat ground beef patties that are pink or red in the middle unless a food thermometer has been used to verify cooked temperature."

—The discovery that electropolishing surfaces significantly reduces attachment of pathogens such as Campylobacter and subsequent biofilm formation. This finding will aid equipment manufacturers in developing methods and selecting materials to be used in processing foods.

—Controlled atmospheric storage of fresh produce does not appear to offer a viable method for controlling Listeria monocytogenes. Therefore the fresh cut industry should consider alternate methods for controlling this pathogen.

—Low dose gamma irradiation was found to be efficacious for the control of parasitic pathogens, such as, the coccidia Cyclosporidium and Cryptosporidium, on soft fruits such as berries, while increasing shelf life and maintaining freshness, all major consumer demands.

Progress in the area of antimicrobial/antibiotic resistance:

—The acid tolerance of E. coli O157:H7 contributes to its ability to cause disease by increasing both its ability to persist in food, and its infectivity. ARS developed a technique to induce maximum acid tolerance in these microorganisms, and identified that the sensitivity to acid inactivation is dependent on acidulant identity, prior exposure to an acid environment, and strain identity.

—Over 5,000 clinical, non-clinical and slaughter Salmonella isolates were analyzed under the National Antimicrobial Susceptibility Monitoring System. This monitoring program in collaboration with the FDA and CDC provides critical information to prolong the useful life of antibiotics for both human and animal use, and its success has allowed expansion of the program to include testing of Campylobacter and E. coli.

Progress in the area of risk assessment:

—Bioluminescent strains of Salmonella were used as a tool for modeling behavior of Salmonella in raw and cooked poultry products. The data were incorporated into version 2.0 of the Salmonella—Risk Assessment Modeling Program for

Poultry (S-RAMPP). A new simulation model, the Food Animal Risk Model for Poultry Pathogens (FARM-PP) was also developed which predicts the severity of outcomes from consumption of poultry products contaminated with Salmonella and/or Campylobacter.

The results of this research will be shared and utilized among the various governmental agencies involved in food safety research. The staff members of the various agencies are in frequent contact with one another regarding research agenda in their respective programs. They also participate with each other in workshops, and committee meetings. The results will also be shared with Universities scientists at professional meetings, producers and processors at national, state and regional meetings, as well as through manuscripts published in refereed, trade or government publications.

Because CSREES provides funding via extramural grants to various universities, research institutes and laboratories, it is difficult to provide a complete accomplishment for specific grants which were awarded in 1998 for periods of 2–3 years. Therefore, we have provided some outcomes which are directly related to food safety research grants made by CSREES within the past 2–3 years. We would anticipate even greater accomplishments with the current portfolio of research projects now in progress as a result of the increased funding in 1998.

National Research Initiative

The Food Safety program of the National Research Initiative has several significant results from research funded in prior fiscal years. These results can be grouped in five areas: bacteriocins, basic microbial physiology, prevention of microbial colonization, biosensor development and production system epidemiology. In the following examples, more than one university usually has been involved in the research which has culminated in the outcomes cited. Where feasible, specific states have been mentioned in the text.

Bacteriocins.—Bacteriocins are proteins produced by lactic acid bacteria (the kind responsible for producing cheeses and yogurt) that have the property of inhibiting the growth of other, possibly pathogenic, bacteria. Investigators have been able to extract and purify these proteins from several kinds of lactic acid bacteria. One of these bacteriocins, called nisin, has been adapted as a coating for machine parts in processing plants and has been demonstrated to retard the growth of pathogenic bacteria in this setting.

Microbial Physiology.—Genetic and physiologic studies on microbial contaminants increase our understanding of their disease producing capabilities. Listeria monocytogenes is a bacteria that can normally grow at refrigeration temperatures. Investigators have found mutants of these bacteria that are cold-sensitive and produce so called "cold-shock" proteins. These cold-shock proteins are being studied to see if they inhibit the growth of normal L. monocytogenes and if they can be produced in quantities sufficient to be useful as antibacterial washes. Several studies on Escherichia coli O157:H7 have demonstrated that some of its pathogenic potential results from tolerating acid levels present in some foods that would normally inhibit the growth of bacteria. Further work on this has been funded.

Prevention of Microbial Colonization.—If pathogenic microbes cannot attach themselves to tissue surfaces, their ability to produce disease is severely reduced. Two ways that have been investigated are competitive exclusion and immunization. The principle of competitive exclusion is to block the tissue receptors to which the microbes would normally attach. Investigators have demonstrated that the inclusion of a yeast, Saccharomyces cerevisiae, in the drinking water in poultry raising facilities will keep pathogenic Salmonella enteritidis from colonizing the chicken gastrointestinal tract. Research has also been funded to test a vaccine against E. coli O157:H7 in cattle. Preliminary results have demonstrated a level of serum antibody sufficient to keep the bacteria from binding in calves.

Biosensor Development.—Fusarium moniliforme is a fungus that infects corn and corn-products resulting in the production of a mycotoxin, fumonisin, which is both poisonous and carcinogenic. Investigators report that they have developed an ELISA assay for fumonisin that detects in the 10–100 ppm range with an accuracy of 65 percent. This is ten times more sensitive than the standard test. Another research group developed a PCR-ELISA for E. coli O157:H7 that was 100 times more sensitive than the current test and also suitable for large-scale screening tests. Another ELISA was developed to detect Staphylococcus aureus toxin in foods. The test can be run in four minutes in a processing plant environment. Development of a piezoelectric sensor for Salmonella species has been successfully tested and is being combined with other multi-probe biosensors on a commercial line.

Production System Epidemiology.—A survey for Salmonella bacteria was conducted on 18 swine finishing farms in North Carolina. The field study revealed that

all the farms had Salmonella of varying species and serotypes present in both the adult and nursery swine. The most important finding was, however, that current cleaning and disinfection procedures are insufficient to kill all of the Salmonella bacteria present in one group of pigs from infecting the next group of pigs placed in the "clean" facility. This was confirmed on 5 of the 18 finishing farms.

SPECIAL RESEARCH GRANTS

Epidemiology of Escherichia coli (E. coli) in beef cattle—Kansas State University

This research is now entering its fourth year. Shedding of E. coli has been monitored on a frequent basis for more than 24 months in both small and large cow-calf operations. Percent of cattle shedding bacteria varies among times of the year and has appeared to be associated with certain management practices. Shedding is especially high during the calving period when cattle are brought together in closer proximity. Management systems to reduce the frequency of shedding are now being evaluated. It appears that contaminated water sources are a major source of exposure for the cattle.

Fresh Fruits and Vegetables—several universities

The Food Safety Research Grants program funded 12 projects directed at food safety problems involving fresh fruits and vegetables in the fiscal year 1998 funding cycle. These projects were directed at detection systems, methods for pathogen reduction on fresh produce, and non-thermal treatments for juices. A variety of institutions received these grants representing all sectors of the U. S. (Indiana, Delaware, North Dakota, New Jersey, New York (Cornell), Tennessee, Arkansas, Florida, Oregon, and Alabama).

Outcomes from this research are being used as the basis for development of educational programs which are delivered to a variety of constituents including consumers, food handlers, producers, production advisors, veterinarians, and others.

ERS accomplishments related to food safety include:

Costs associated with campylobacter.—As detailed in an article in Food Review, ERS research showed that the estimated annual costs of Campylobacter-associated Guillan-Barre Syndrome (GBS) are $0.2–$1.8 billion. When these costs are added to the previously ERS-estimated costs of campylobacteriosis ($1.3–$6.2 billion), total annual costs from Campylobacter are $1.5–$8.0 billion (1995 dollars). Assuming 55–70 percent of costs are attributable to food borne sources, costs of campylobacteriosis from food sources ($0.7–$4.3 billion) and costs of associated GBS ($0.1–$1.3 billion) combined equal total annual costs of $0.8–$5.6 billion from food borne Campylobacter. Reducing Campylobacter in food could prevent up to $5.6 billion in costs annually.

Distributional consequences of food borne illness.—The economic impact of the costs of food borne disease on the U.S. economy was reported in an article, "A Distributional Analysis of the Costs of Food borne Illness: Who Ultimately Pays," Journal of Agricultural and Applied Economics. Previous estimates of the costs of seven food borne pathogens were disaggregated by type and distributed across the population. Initial income losses resulting from premature death cause a decrease in economic activity. Medical costs, in contrast, result in economic growth, though this does not outweigh the total costs of a premature death. This accounting of how costs and illnesses are diffused through the economy provides useful information for policy makers.

Methods for valuing food safety risk reductions.—Food borne diseases caused by microbial pathogens impose an economic burden on society by causing premature death and productivity losses when people made sick are unable to return to work. An article, "Measuring the Consumer Benefits of Food Safety Risk Reduction," Journal of Agricultural and Applied Economics explored three valuation methodologies that place a monetary value on food safety risk reduction, and presented a case study for each. These techniques include contingent valuation models (where consumers are asked in surveys their willingness to pay for food-safety risk reductions), experimental auctions (where people actually exchange money for products with varying levels of food-safety risk), and the cost-of-illness approach (which values health risks on the basis of medical costs and productivity losses assigned to food borne illness).

ARS research has also been valuable to FSIS in areas over which FSIS has no jurisdiction. For instance, research that ARS completed for food animal production and transport is currently aiding the industry in meeting pathogen reduction guidelines. Indeed, both the results of ARS research plus advice received from ARS scientists aided FSIS in making the HACCP rule an effective and practical instrument.

Question. The President's goal is to "develop a comprehensive food safety strategy and coordinate food safety budgets that will result in further improvements in the safety of the food supply and will ensure the most effective use of Federal resources". Can you outline, the specific steps that have been taken to ensure this happens and how you plan to implement them?

USDA answer. On August 25, 1998, through Executive Order 13100, the President established the Council on Food Safety. The Council is co-chaired by the Secretaries of Agriculture and of Health and Human Services and the Assistant to the President for Science and Technology/Director of the Office of Science and Technology policy. The President charged the Council to develop a comprehensive strategic plan for federal food safety activities and to make recommendations to the President on how to implement the plan. In addition, the Council will advise Federal agencies in setting priority areas for investment in food safety and developing a coordinated budget for the Administration. Finally, the Council will oversee the research efforts of the Joint Institute for Food Safety Research. The development of a strategic plan is already underway. In fact, the President's Food Safety Initiative was an initial step towards a national food safety plan. The plan's principal goal is to enhance the safety of the nations food supply and protect the public health through a seamless science-and risk-based food safety system. The plan will set priorities, improve coordination and efficiency, and identify gaps in the current system and mechanisms to fill those gaps, continue to strengthen and enhance prevention strategies, and develop performance measures to show progress.

The implementation process will certainly pose some significant challenges because of the diversity of stakeholders in food safety. There will be a need to have a high degree of cooperation, coordination, and communication, since each Federal, state and local agency has unique mandates, authorities, history, culture, and operating procedures. The Council plans to use an open process in developing the plan—a process that will be responsive to all stakeholder concerns—in order to have credibility and obtain public support.

Question. The National Academy of Sciences (NAS) has found that successful integrated operation of a food safety system requires that officials at all levels of government work together in support of common goals of a science-based system. How do you intend to facilitate interagency cooperation?

USDA answer. Federal food safety agencies and State and local agencies have expertise and resources that, when combined in an integrated program, significantly enhance the impact of food safety programs. While more needs to be done to optimize and develop new partnerships, the Federal food safety agencies have already established extensive interactions with state and local regulatory agencies. We believe that the strategic planning process under the direction of the President's Council will provide new opportunities for officials at all levels of government to participate as primary and equal partners in the development of the future food safety system.

Question. On October 5, 1998 USDA's Recall Policy Working Group issued a report making several recommendations for improvements in the operation of food recalls. What is the status of USDA's implementation of the Recall Policy Working Group's recommendations?

USDA answer. The Agency provided an opportunity for public comment on the working group's report. It has evaluated the comments that it received and is now in the process of preparing a set of recommendations for the Secretary. The Agency will take appropriate action based on the Secretary's decision.

QUESTIONS SUBMITTED TO THOMAS J. BILLY, ADMINISTRATOR, FOOD SAFETY AND INSPECTION SERVICE

Question. E. coli outbreaks continue to be a problem in the agricultural sector. Although numbers of incidences are down, public perception of beef and beef products do not appear to have improved significantly. How does the FSIS intend to work further with industry and consumer groups to reduce illness and improve consumer perception?

USDA answer. The Agency's Meat and Poultry Hotline and consumer education program have long provided answers to questions and basic consumer information about E. coli and safe practices for preparing foods. In fiscal year 1998, the Agency partnered with the Agricultural Research Service to study the color of ground beef—as it relates to reaching a safe internal temperature of 160 degrees. As a result of the study's findings, the Agency published new consumer information about safely preparing hamburgers using a thermometer instead of using color as an indicator of doneness.

The Agency has also began work with the thermometer industry and retail establishments to encourage them to make thermometers easily available to consumers and make their packaging carry correct and consistent information about safe temperatures.

Question. Listeria monocytogenes is estimated to have affected 1100 people. How will FSIS continue to address the listeriosis issue and reduce the rate of illnesses?

USDA answer. FSIS has undertaken an aggressive strategy to decrease the risks from Listeria on ready-to-eat products. Included in this strategy is: developing guidance to industry on "best practices" that can help to reduce the potential of product contamination; targeting consumer education for high-risk groups; initiating a study to address shelf-life and Listeria risks; and, conducting a quantitative risk assessment for Listeria that will determine the foods that pose the greatest risk to consumers and specific subpopulations at increased risk of contracting listeriosis.

Question. I congratulate you on your timely address of the Y2K issue. I urge you to continue to raise awareness of the Y2K problem and the threat it may pose to our nation's food supply, as well as to plan to address any problems that may occur within the food safety industry. When will you have Y2K revisions completed?

USDA answer. The Food Safety and Inspection Service (FSIS) is continuing to raise awareness of the Year 2000 (Y2K) problem through its outreach efforts to the public and industry. The Agency is participating in USDA's Food Supply Working Group (FSWG) and operates its own Year 2000 Homepage, which is linked to that of the FSWG.

FSIS has recently issued a letter to managers of Federally-inspected meat, poultry and egg establishments, updating them on Agency progress in achieving Y2K compliance and alerting them to the needs to ensure that their own systems will not experience Y2K problems.

The Agency has completed Y2K revisions and testing for its mission critical systems. We plan to complete Y2K work on our remaining non-mission critical systems, telecommunications and vulnerable systems and processes by September 30, 1999.

Question. What are the specific implications of having AMS assume part of the certification responsibility in the exporting industry?

USDA answer. As long as the export service remains voluntary and fee-based, there is no implication of having AMS assume a part of the certification. Although AMS is not a regulatory agency, its mission is to foster and assist in the development of new or expanded domestic and foreign markets. AMS partially accomplishes this through voluntary, user-funded grading, certification, and inspection of agricultural commodities, some of which are exported. It is the policy of AMS to immediately notify APHIS, FDA, or FSIS regarding any hazards observed during the performance of our services.

Question. User fees, or a food safety tax, such as the one proposed, could hurt the 500,000 workers who depend on the economic well-being of the agriculture industry. It would lead to a loss of jobs and damage businesses, large and small, that depend on the economy of rural America. Agricultural producers are struggling to make ends meet. They cannot afford the effects new user fees will have on the already depressed market. What other means will FSIS employ to gain funding that user fees would provide?

USDA answer. If the proposed user fee funding structure is not approved by the Congress, FSIS will pursue obtaining appropriated funds to continue its mission of ensuring the safety of meat, poultry, and egg products that are supplied to the general public.

Question. I understand you have been in discussions with the FDA about the possibility of a cooperative effort between the agencies where resources freed-up by the implementation of HACCP in meat and poultry facilities would be utilized at ports of entry for inspecting imported foods. What is the status of those discussions?

USDA answer. Reassigning FSIS inspectors to FDA for port-of-entry inspection is not a viable option for these reasons. Under HACCP implementation, FSIS does not contemplate any change in the continuous inspection requirements of the statutes or in the overall number of inspection personnel. FSIS anticipates full productive use of its inspection resources in pursuing food safety work for meat, poultry, and egg products.

The implementation of HACCP involves overseeing industry implementation and compliance with the regulatory requirements outlined in the Pathogen Reduction and HACCP final rule that was promulgated in July 1996. The HACCP provisions of that rule have different effective dates based on the size of establishments, e.g., large, small, and very small. The last phase of implementation does not occur until January 2000 when very small plants are required to implement HACCP systems.

During fiscal year 1999, FSIS redeployed approximately 100 employees from large HACCP plants to cover critical vacancies in small HACCP plants. This redeploy-

ment of inspection personnel was done to assure that adequate resources were available to oversee successful implementation of HACCP in small plants. We do not anticipate any further need to redeploy inspection personnel prior to implementation of HACCP in very small plants in January 2000.

Under the slaughter models component of the HACCP-based Inspection Models Project, FSIS is exploring alternative ways in which slaughter inspection might be accomplished in establishments that have already implemented HACCP systems and that exclusively slaughter certain market classes of animals. These market classes are young poultry, steers and heifers, and market hogs. In all cases, these are young, healthy animals that do not exhibit the same disease and public health concerns that may be present in older animals. The alternative slaughter inspection models under consideration meet current statutory requirements for continuous inspection, but may require fewer inspection personnel within the slaughter department of some establishments.

FSIS has food safety and other statutory obligations that are sufficient to fully occupy the inspection resources that may become available through this project. It is necessary as part of the verification of industry HACCP systems to assure that product bearing the Federal marks of inspection continues to move through transportation, distribution, and marketing channels in a manner that does not cause such product to become adulterated or misbranded. The second component of the HACCP-based Inspection Models project, the in-distribution model, addresses this issue by using a limited number of inspection resources to expand existing oversight of Federal product in-distribution channels.

For the record, FSIS and the National Joint Council of Food Inspection Locals have reached an impasse in negotiations necessary to begin the pilot tests for both the slaughter models and the in-distribution models. The parties have jointly requested assistance from the Federal Service Impasses Panel to resolve the impasse. Until such resolution occurs, the pilot tests will not be started and it would be premature to determine the number of resources that may be available for other FSIS food safety and economic adulteration concerns.

Question. HACCP inspections for very small plants are scheduled for January 25, 2000. "There are about 40 state inspected plants in Montana; most already above federally inspected standards. Some of the state inspected plants in fact are larger than the approximately three federally inspected plants. Under the FSIS program, state inspected plants must meet standards greater than or equal to federal standards. Will the FSIS use discretion and common sense in examination of these plants?

USDA answer. FSIS has been very proactive is supporting the transition to HACCP for small and very small State and federal plants. Examples of FSIS assistance include:

—FSIS provided training and training materials to State program trainers who are presenting the training to State inspectors.

—FSIS has put on "HACCP demonstration projects" and public meetings for industry groups including state and federal plants.

—FSIS provided training materials for use by States in working with industry in HACCP training.

—FSIS has a National HACCP Coordinator—for HACCP in small and very small plants—who is accessible to State inspection programs and plants.

—A State HACCP network is in place that is a cooperative undertaking. Each State has a primary contact, often the State inspection program director and a coordinator, often a technical person from a university.

—The National HACCP Coordinator—for HACCP in small and very small plants—holds periodic nationwide conference calls with the State HACCP contacts to address any and all HACCP issues.

—FSIS prepared a letter that was sent to all federal very small plants regarding a recommended HACCP preparation time-table and assistance for HACCP implementation. The same information is being provided to all State programs for their use.

The FSIS Technical Service Center (TSC) is responsible for in-plant reviews for foreign plants, federal plants and State plants. The procedure used to review or "examine" State HACCP plants is consistent with the process used for foreign and federal plants and has been in place since January of 1999. Furthermore, in-plant reviews are performed using a team concept. The team is made up of the FSIS, TSC reviewer, the director of the State program, or his/her designee, the relevant State supervisor and the inspector-in-charge. The State program has the option to take the lead during the review. The findings are reviewed prior to leaving a plant and, to date, consensus has consistently been reached.

QUESTIONS SUBMITTED BY SENATOR CONRAD BURNS

Question. It is extremely important to have all state laboratories included in a system such as PulseNet, which is a program to enhance the ability of laboratory-based surveillance to rapidly identify clusters of related foodborne infections. How will CDC gain participation in all states in order to increase awareness and decrease foodborne illnesses?

FDA/CDC answer. CDC agrees that it is important to include all States in the PulseNet system in view of PulseNet's vital role in surveillance and investigation of foodborne illness outbreaks. States area critical element in the Nation's public health system, and are eager to participate in PulseNet and other systems to improve capacity to protect public health. Prior to PulseNet, most public health laboratories recognized the value of DNA fingerprinting, but few had ability to do such fingerprinting. Those that did have the capability did not use standardized techniques. PulseNet participants use a standardized protocol and have the capability to exchange information quickly.

Through its Emerging Infections Programs and Epidemiology and Laboratory Capacity cooperative agreements, CDC provides funds to public health laboratories for PulseNet training and technology transfer. Additional states are participating in PulseNet each year.

Question. A strong science base, as you mentioned, is vital to the Food Safety Initiative. Unfounded reports hurt agricultural producers immensely and must be stopped. How does the FDA plan to work with industry groups to ensure that science is used as a basis for a ll reports of outbreaks?

FDA/CDC answer. In fiscal year 1998, the foundation was set for creating a state-of-the art science-based food safety system. The system focuses on early detection and containment of foodborne hazards, and prevention, education and verification. As part of the Food Safety Initiative or FSI, FDA has met with representatives of producers, wholesale/distributors and retail agricultural commodities to solicit their input and support to develop more effective and timely tracebacks of agricultural commodities implicated in foodborne outbreaks.

The level of science being applied to foodborne disease through FSI resources is rapidly identifying clusters of related cases and contaminated foods that would have been missed just a few years ago. To develop a comprehensive, coordinated national foodborne illness outbreak response system among federal, state and local agencies, DHHS, USDA, and EPA signed, in May 1998, a memorandum of understanding to create the Foodborne Outbreak Response Coordinating Group, or FORC-G. This group's objective is to enhance coordination and communication among federal, state and local agencies, guide efficient use of resources and expertise during an outbreak, and prepare for new and emerging threats to the U.S. food supply. In addition to federal officials, other members of FORC-G include the Association of Food and Drug Officials, Association of Public Health Laboratory Directors, Council of State and Territorial Epidemiologists, and the National Association of State Departments of Agriculture.

In June 1998, FDA participated in a workshop at the annual meeting of the Association of Food and Drug Officials, or AFDO, on the need to improve outbreak coordination and investigations. Participants agreed that improved coordination of communication between the epidemiologists who investigate systematic and emerging food safety system failures and food regulatory officials who control the preventive and corrective facets as well as the food product and production environment of the food regulatory system is critically needed.

In September 1998, FDA hosted an important meeting of food safety officials from all 50 states, the District of Columbia and other localities, Puerto Rico, USDA and CDC to better integrate appropriate food safety functions at the local, state and federal levels. Integration efforts are focusing on inspection, analytical methodology, laboratory utilization, and response to disease outbreaks. The goals of this integration effort are better use of laboratory resources and investigative expertise and faster response to and control of foodborne illness outbreaks. FDA will seek input from industry and consumers on their recommendations for a science-based national food safety system.

In those instances where agricultural commodities are thought to be the vehicle, FDA and CDC will work with the state and local investigators to assure that on-site causes for the outbreak are carefully considered and illuminated before issuing reports or statements that the agricultural commodity was contaminated in distribution or at its source.

Additionally, we are equally concerned that the information released to the public on an outbreak be as consistent, accurate, validated, and timely as possible. While it is sometimes impossible to have all the information verified at the moment a pub-

lic health regulatory intervention must be communicated, it is a goal we always strive to achieve. FDA will work with appropriate local, state and federal agencies, and affected industries drawing on the available scientific expertise to make sound decisions. Some reports which question the safety of food originate from sources other than FDA. In these instances, the FDA Press Office and the Center for Food Safety and Applied Nutrition/Center for Veterinary Medicine/Office of Regulatory Affairs organizations work together to communicate the scientifically accurate information to the public. In addition, the Center for Veterinary Medicine, or CVM, issues CVM updates and also places this information on the CVM's internet home page.

Question. FDA has consistently failed to meet deadlines on reviews. While the statutory deadline on approval of generic drugs is 6 months, the FDA continues to drag its feet and take up to 32 months for approval. It is vitally important to both drug companies and consumers to have these drugs approved and on the market. Many consumers cannot afford the high cost of brand name prescriptions, while drug companies lose enormous profits waiting on FDA approval. How will the FDA find a way to complete reviews on time?

FDA/CDC answer. As background regarding Abbreviated New Animal Drug Applications or ANDAs, either an approval or disapproval is considered by FDA to be a final action. The agency makes every attempt to meet this requirement; however, for a number of reasons it is not always possible to do so. After receiving a disapproval action, manufacturers frequently resubmit applications that address the deficiencies indicated in the disapproval action.

Neither the Center nor the Office of Generic Drugs has conducted a study on the budgetary needs to review the majority of applications within 180 days given the current review environment. However, it believes the needs are substantial and would have to include the needs of other Agency components that play a supporting but critical role in the generic drug review process.

At this time, the Center believes that the key to addressing current review backlog and improving action times is increasing the number of chemistry, microbiology, and labeling reviewers as well as support staff within OGD.

Question. Dr. Henney, I understand that Bill Schultz has left to go over to the Justice Department. What are your plans for his position and the Office of Policy?

FDA/CDC answer. Mr. William K. Hubbard, Associate Commissioner for Policy Coordination, has assumed the responsibilities of Mr. Schulz's position. The Office of Policy will be included with all other components of the Office of the Commissioner in the organizational review that I committed to in my confirmation hearing in September 1998. This study is underway, and I expect to make decisions on the future structure of the Office of the Commissioner in the near future.

Question. The Food and Drug Administration Modernization Act (FDAMA) directed FDA to publish for pubic comment a proposed amendment to current regulation relating to the labeling of foods treated with ionizing radiation. The Conferees further directed that final regulations could be issued not more than 12 months after the date of enactment of FDAMA, which was November 21, 1997. FDA just recently published an Announced Notice of Proposed Rulemaking on the labeling of irradiated foods, an action that was clearly overdue. Why has it taken FDA so long to follow Congress' intent?

FDA/CDC answer. FDAMA imposed on FDA several foods-related tasks both in the statutory language of FDAMA and its accompanying Conferees' report. FDA was able to complete virtually all of its statutorily mandated tasks within the time frames specified in FDAMA. FDA was also able to complete some of the tasks discussed in the Conferees' report within the specified time frames. FDA will continue to work diligently to accomplish all tasks in a timely manner.

Congress addressed three specific tasks regarding food irradiation; timely decision by FDA on the petition to permit irradiation of meat; limitations on FDA's authority regarding disclosure statements; and a public comment process on the amendment of the irradiation labeling regulations. FDA's actions for each of these tasks is addressed below. As indicated, first priority was placed on the two irradiation tasks required by the statutory language of FDAMA.

First, Congress mandated FDA to reach a timely decision on the petition to permit irradiation of meat. FDA issued its final decision on December 3, 1997, approximately two weeks after the enactment of FDAMA, which was well within the 60 days specified in the Act.

Second, Congress established limits on the prominence of a radiation disclosure statement. To conform FDA regulations with the statutory language of FDAMA, on August 17, 1998, FDA issued a final rule that amended its regulations to ensure that the disclosure statement would not be presumed to be required to be more prominent than the ingredient statement.

Last, the Conferees Report directed FDA to use the public comment process to provide an opportunity for the public to comment on whether the regulations should be amended further to revise the proposed nomenclature for the labeling of irradiated foods. The conferees gave general guidance, such as labeling should not be perceived as a warning or give rise to inappropriate consumer anxiety, but gave no specific instructions regarding how these objectives should be accomplished. On February 17, 1999, FDA published an advanced notice of proposed rulemaking soliciting comment on the appropriate labeling for irradiated foods. The comment period is open until May 18, 1999. FDA has not addressed the directive to consider whether the regulation should be revised since the comment period on the notice has not yet closed.

Question. Under the Food, Drug and Cosmetic Act, irradiation is regulated as a food additive. Is this a necessary requirement in light of what we know today about this food processing technology?

FDA/CDC answer. The legislative history for the Food Additives Amendment makes it clear that it is the equipment used to irradiate food, not the process of irradiation itself, that is regulated as a food additive. The various reports explicitly cite radioactive isotopes, particle accelerators and X-ray machines as the additives whose use is regulated. This was done to ensure that the safety of the process be established before it was used on food in commerce. At that time, the effects of radiation on food were not at all well understood.

Food irradiation involves exposing a food to a source of ionizing radiation. It does not involve adding radioactive isotopes to food nor does it make food radioactive when the process is properly conducted under the limitations in FDA's regulations. The other important safety issues—chemical change, nutrient losses, and differential effects on different microorganisms—are important in all food processes. FDA has not evaluated in depth all possible applications of food irradiation. However, from what FDA has evaluated, nothing has been discovered that would distinguish irradiation from other processes.

FDA recognizes that some expert bodies throughout the world have concluded that irradiation processing does not raise concerns different from other processing. Others have emphasized the need for close monitoring consistent with the caution in adopting any new technology. No expert body anywhere has concluded that irradiation is unsafe, but not all have endorsed it either.

Certainly, as with the adoption of all new technologies, caution is needed to avoid making preventable mistakes. FDA can work to ensure safe application either through the current premarket approval route or by general oversight.

Question. Dr. Henney, every year FDA comes before this Subcommittee with a presentation that generally includes a discussion of the agency's successes over the past year in reducing the time it takes the agency to review applications for foods, drugs, and medical devices. In order to help Subcommittee members more accurately compare the agency's performance in this regard from year to year, please provide answers to the following questions:

In FDA's reports and statements to Congress over the last five years, has there been any change in the method (e.g., mean vs. median) FDA uses to measure the time it takes to review: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications? If yes for any type of petition or application, please explain.

FDA/CDC answer. Over the past five years, methods of measurement for most programs have changed only slightly. For the new drug and abbreviated drug applications, no changes have occurred. FDA has added a measurement of median times to the 510(k), premarket approval applications, new animal drug applications and abbreviated new animal drug applications. For those applications, averages are still measured and reported, but the Agency believes that the median can give a better representation of Agency performance in those cases in which outliers skew the mean. The median is a particularly valuable piece of data in program areas with a small number of applications.

The Foods Program has altered its definition of the term first action in recent years. Historically, for food additive petitions, the Program has considered a first action to be when it notifies an applicant that a substantive deficiency has been noted, even if reviews of other parts of the application have not been completed. Thus there could have been multiple first action responses to a sponsor as reviews of additional parts of the application were completed. However, the Foods Program is now establishing performance goals for the timely review of a complete package, and is measuring timeliness of review of food additives from the date of receipt of a fileable petition to a complete first action as defined in the Foods Program per-

formance goals. This measure started with the applications received in fiscal year 1998.

In the Animal Drugs and Feeds Program, measures of performance are evolving to reflect the improved drug review process. The Program has significantly improved its review process by reviewing data submitted to the investigational new animal drug file prior to the filing of the new animal drug application. This allows the Agency to evaluate and comment on data as they are collected, as opposed to the earlier process of waiting until the sponsor developed and collected the entirety of the data at considerable expense before the FDA made an approval or deficient decision. In the old process, there was no chance to recognize and resolve an early critical deficiency, such one involving the effective dose, before other required work was done, such as other dose-dependent studies or developing and validating manufacturing processes. This new process has allowed the Agency and sponsors to interact more effectively so that sponsors can make necessary modifications to the drug development plan, based on the FDA evaluation of initial data submissions.

The Agency currently working with its stakeholders to develop new measures or metrics that will satisfy both Agency and stakeholders' needs. These measures may replace traditional metrics that no longer are as valid in measuring the improved drug review process. This cooperative effort to develop more meaningful measures is being conducted in the spirit of the FDA Modernization Act. The new measures will also allow the Animal Drugs and Feeds Program to better fulfill its responsibilities under GPRA, because they are being developed to more appropriately measure outcome-based performance.

Question. How does FDA currently define the term "filing" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. For the Foods Program, regulations concerning the acceptance or nonacceptance of food additive petitions (filing) are laid out in the Code of Federal Regulations (21CFR 171.1). Filing of food additive petitions in the Animal Drugs and Feeds Program is defined in 571.1(I)(1). For both programs, upon receipt of an application, the information is examined to see if the petition requirements from the stature have been addressed. The petitioner is informed of the filing decision within 15 working days. If the petition is accepted for filing, the date of the notification letter to the sponsor becomes the date of filing, and a notice of the filing acceptance is published in the Federal Register.

For new drug applications or abbreviated new drug application, the agency will determine if the application may be filed within 60 days of receipt. The filing of a new drug application, or NDA, or abbreviated new drug application, or ANDA means that FDA has made a threshold determination that the application is sufficiently complete to permit a substantive review.

There is no definition of filing for 510(k)s. They are not filed, rather they are received by the agency and reviewed. For premarket approval applications, under 21 CFR 814.42, the filing of an application means that FDA has made a determination that the application is sufficiently complete to permit a substantive review.

In virtually all cases of new animal drug applications and abbreviated new animal drug applications, the filing as defined in 514.110 [a] is denoted by the date the application is initially received by the Document Control Unit of the Center. The only exception is for rare instances in which a sponsor withdraws an application before the Program's initial evaluation is complete, or the application is so deficient on its face that the Program retroactively refuses to file the application. In these cases, the filing date is that on which the application is resubmitted or reactivated.

Question. In FDA's report and statements to Congress over the last five fiscal years has there been any change to FDA's definition for the term "filing" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s premarket approval applications; new animal drug applications; and abbreviated new animal drug applications? If yes for any type of petition or application. Please explain.

FDA/CDC answer. There has been no change in the agency's definition of the term filing for food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s or premarket approval applications in the past five fiscal years. The minor change in new animal drug applications and abbreviated new animal drug applications is in which a sponsor withdraws an application before the Program's initial evaluation is complete, or the application is so deficient on its face that the Program refuses to file the application. In those cases, the filing date is adjusted to the date on which the application is resubmitted/reactivated. This filing date adjustment was not used prior to 1997 and is rarely employed. This change in the definition of filing for this small number of applications makes the filing-to-

approval-time measure equivalent to the first-substantive-review-to-approval measure.

Question. How does FDA currently define the term "review cycle" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. The review cycle has not been a metric the Agency has used to measure performance for food additive petitions, new animal drug applications or abbreviated new animal drug applications, so there is no definition of the term for those areas.

A review cycle for a new drug application and an abbreviated new drug application begins when an application is filed by FDA and ends when the agency issues an action letter. Generally, these letters communicate to the sponsor that their application is approved or not approved. If not approved, the sponsor is provided with the reasons why and has an opportunity to submit information needed to address these deficiencies. When this information is received a new cycle begins.

For 510(k)s, section 510(k) of the Federal Food, Drug and Cosmetic Act establishes a 90-day benchmark for the review of a premarket notification. In addition, 21 CFR 807.81(a) and 21 CFR 807.87(l) reference the 90-day benchmark for 510(k)s. If a final decision on the notification cannot be made on the basis of information supplied, it is placed on hold and a new 90-day review period (cycle) begins when the requested information is received. For premarket approval applications, section 515(d)(1)(A) of the Federal Food, Drug and Cosmetic Act establishes a 180-day benchmark for Agency action on a PMA. In addition, 21 CFR 814.37(c)(1) and 21 CFR 814.40 reference a 180-day review period, or cycle, for a PMA. A new 180-day review period, or cycle, begins when a major amendment containing significant new or updated data, detailed new analyses, or information previously omitted is received.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been any change to FDA's definition for the term "review cycle" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications? If yes for any type of petition or application, please explain.

FDA/CDC answer. FDA has not changed the definition for the term review cycle over the last five fiscal years in any Program where review cycle is measured.

Question. How does FDA currently define the term "approval" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. The definitions of approval vary, often due to requirements of the statute. For food additive petitions under review by the Foods or Veterinary Medicine Programs, current law states that a food additive may be marketed only when a regulation for the food additive exists, specifying the conditions for safe use of the additive. Approval of a food additive petition occurs when a regulation authorizing the use of the additive is published in the Federal Register.

For new drug applications and abbreviated new drug applications, a firm gains permission to market a product when an approval letter is issued.

For 510(k)s, the term approval is not relevant. Under 21 CFR § 807.97, the 510(k) is a clearance and not an approval. A device for which premarket notification is submitted is found substantially equivalent to a legally marketed predicate device and a letter is sent to the applicant informing them of FDA's determination. The letter gives the applicant clearance to market the device.

In the case of premarket approval applications, Section FD&C § 515(d)(1)(A)(I) states that FDA will issue an order approving a PMA if none of the grounds for denying approval apply specified in section 515(d)(2) and 21 CFR 814.44(d)(1). FDA issues an order approving the application if there is reasonable assurance that the device is safe and effective for the intended use for the target population.

For new animal drug applications and abbreviated new animal drug applications, approval is the status an application acquires when the drug product has been deemed safe and effective and the sponsor of the application is informed by letter and Federal Register notice that the application has met all of the requirements for approval under the FD&C Act.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been any change to FDA's definition of the term "approval" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbre-

viated new animal drug applications? If yes for and type of petition or application, please explain.

FDA/CDC answer. The use of the term approval has been consistently applied by FDA for food additive petitions, new drug applications, abbreviated new drug applications, 510(k)s and premarket approval applications in the last five fiscal years. However, a provision was established in the Food and Drug Modernization Act, or FDAMA, for the premarket notification of food additives that fit the definition of food contact substances, e.g., food packaging materials. If certain funding provisions of the Act are fulfilled, and the Premarket Notification Program for Food Contact Substances becomes operational, eligible substances may be lawfully marketed 120 days after submitting a notification, absent an objection by the Agency.

For new animal drug applications and abbreviated new animal drug applications, there has been a change in the date some applications are considered approved. For an application to be considered approved, both the sponsor and the public have to be notified. The sponsor is notified in a letter of the Agency decision to approve, while the public is notified by publication of the information in the Federal Register. Because of recent changes in legislation, the Animal Drug Availability Act of 1996, some animal feed drugs are now considered approved as of the date of the letter to the sponsor and sponsors are not required to wait for Federal Register publication to market the drug.

Question. How does FDA currently define the term "mean" concerning the review of: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. FDA defines the mean as the sum of all values in a group of data, divided by the number of values. This definition is used across all program areas.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been any change to FDA's definition for the term "mean" concerning the review of: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications and abbreviated new animal drug applications? If yes for any type of petition or application, please explain.

FDA/CDC answer. There has been no change in the agency's definition of the term mean in the last five fiscal years.

Question. How does FDA currently define the term "median" concerning the review of: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. FDA defines the median as the point in an ordered group of data at which half of the data falls above and half below. The median is the exact midpoint of the collected information. If the number of values is even, the median is the average of the two middle values.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been a change to FDA's definition for the term "median" concerning the review of: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications? If yes for any type of petition or application, please explain.

FDA/CDC answer. There has been no change to FDA's definition for the term median in the last five fiscal years.

Question. How does FDA currently define the term "average" concerning the review of: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. FDA defines the term average as the sum of all values in a group of data, divided by the number of values. The terms mean and average are used interchangeably.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been any change to FDA's definition for the term "average" concerning the review of: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; abbreviated new animal drug applications? If yes for any type of petition or application, please explain.

FDA/CDC answer. No, there has been no change in the agency's definition of the term average in the last five fiscal years.

Question. How does FDA currently define the term "receipt" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; pre-

market approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. Across the Agency, there are only minor, technical variations in how the receipt of a petition or applications is defined. For food additive petitions, receipt is defined as the day the petition is logged in to the Office of Premarket Approval and an acknowledgment letter is forwarded to the petitioner on the day of arrival or the following business day.

Receipt of a New Drug Application is considered to be when it is received by the agency and when it is accompanied by any required user fee payment, 5-day grace period, where applicable.

Receipt of an abbreviated new drug application or ANDA is defined as when a sponsor or applicant physically submits an ANDA to the Office of Generic Drugs. Receipt is independent of the filing status of an ANDA.

For 510(k) and premarket applications, FDA defines the term receipt as the date that a submission is received and date stamped in FDA's Document Mail Center. Similarly, the receipt of an animal drug application or abbreviated new animal drug application is considered to be when an application is received at the Document Control Unit of the Center for Veterinary Medicine and date stamped. Since processing of new submissions ceases for the day at 2:00 p.m., submissions received after 2:00 p.m. are stamped with the receipt date of the next business day.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been any change to FDA's definition for the term "receipt" for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications? If yes for any type of petition or application, please explain.

FDA/CDC answer. No, there has been no change to FDA's definition for the term "receipt" in reports and statements to Congress over the last five fiscal years.

Question. How does FDA currently define the term "overdue" concerning the review of food additive petitions?

FDA/CDC answer. In previous years, overdue petitions have been defined and reported as those pending before the agency for more than 180 days after filing without any action taken on them by the Agency. However, approval of a food additive requires complete review of a petition, preparation and review of an order that specifies the regulation and lays out the basis for Agency's decision, and publication of the document in the Federal Register. Most commentators and stakeholders in the food additive petition review process have agreed that 180 days is an impractical timeframe to complete each of the steps in the process. Accordingly, the agency has begun using 360 days after filing in its GPRA performance goals as the time period after which a petition would be considered overdue.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been any change to FDA's definition for the term "overdue" concerning the review of food additive petitions? If yes, please explain.

FDA/CDC answer. In previous years, overdue petitions have been defined and reported as those pending before the agency for more than 180 days after filing.

Nevertheless, because approval of a food additive requires not only complete review of a petition, but also preparation and review of an order that specifies the regulation and lays out the agency's basis for its decision, and publication of the document in the Federal Register, most commentators and stakeholders on this process agree that 180 days is impractical. The agency has begun using 360 days in its GPRA performance goals for time to first action. In any future reporting, overdues calculated in terms of GPRA goals will be clearly defined and delineated.

Question. How does FDA currently define the term "completed" concerning the review of new animal drug applications and abbreviated new animal drug applications?

FDA/CDC answer. A submission involving a New Animal Drug Application (NADA) or Abbreviated New Animal Drug Application (ANADA) is completed when the Animal Drugs and Feeds Program has finished the review of the information contained, or referenced, in the submission and informed the sponsor by letter of its findings. A favorable letter regarding the final submission to an NADA or ANADA will reflect approval of the application.

Depending on the information and data submitted, the application may be judged to be either approved or deficient. If the application is approved, then notification of the approval is sent by letter and subsequently published in the Federal Register and the drug may be marketed consistent with the conditions of approval. If deficiencies are found in the application i.e., the information submitted is inadequate to show the drug to be safe and effective, then the sponsor is notified of the deficiencies and can address these deficiencies and reactivate the application with that

information. The Animal Drugs and Feeds Program will then review the reactivated application.

Question. In FDA's reports and statements to Congress over the last five fiscal years, has there been any change to FDA's definition for the term "completed" concerning the review of new animal drug applications and abbreviated new animal drug applications? If yes, please explain.

FDA/CDC answer. The definition of completed has not changed in the last five years.

Question. How does FDA currently define the term "processed original" when describing new animal drug applications?

FDA/CDC answer. The phrase processed original as used in the budget report is synonymous with the phrase original applications or simply originals in the context of original applications received, completed, or approved.

Question. When and why did FDA start using the term "processed original" in agency reports and statements to Congress when describing new animal applications?

FDA/CDC answer. In fiscal year 1999 the Animal Drugs and Feeds program revised the format for reporting program activity data in the Justification of Estimates for Appropriations Committees—President's Budget. Prior, to fiscal year 1999, data was not reported in a consistent manner. For example, we reported medicated Feed Applications Processed, New Animal Drug Application Submissions Received and Completed and Original New Animal Drug Applications Approved. In fiscal year 1999 we began reporting program workload and output as Received, Completed and Approved. Processed original is redundant and provides no meaning, therefore we will omit it in future documents.

Question. How does FDA currently define the phrase "FDA days-approval" concerning the review of premarket approval applications and premarket approval application supplements?

FDA/CDC answer. FDA does not currently use the phrase FDA days-approval. FDA reports several measures for PMAs that include average review time and average elapsed time to approval. FDA also reports three components of time-FDA, non-FDA and total time. The FDA portion is the number of days FDA took to review the application in the last review cycle that led to a final approval decision.

Question. When and why did FDA start using the phrase "FDA days-approval" concerning the review of premarket approval applications and premarket approval application supplements?

FDA/CDC answer. FDA has not used the phrase FDA days-approval concerning the review of premarket approval applications and premarket approval application supplements.

Question. How does FDA currently define the phrase "FDA days-clearance" concerning the review of 510(k)s?

FDA/CDC answer. FDA does not currently use the phrase FDA-days clearance concerning the review of 510(k)s. FDA reports several measures for 510(k)s that include average review time, and median review time. The review time for a 510(k) is the number of days FDA was reviewing the 510(k) from the day of receipt of the submission until the date of issuance of the substantially equivalent letter.

Question. When and why did FDA start using the phrase "FDA days-clearance" concerning the review of 510(k)s?

FDA/CDC answer. FDA has not used the phrase FDA days-clearance concerning the review of 510(k)s.

Question. How does FDA currently define the phrase "review and act on" concerning the review of abbreviated new drug applications?

FDA/CDC answer. The phrase review and act on is defined by FDA as the examination of the chemistry data submitted in an ANDA and the communication with the sponsor or applicant that the ANDA is approved or disapproved. ANDA's that are disapproved are sent deficiencies in the form of not approvable or other types of letters.

Question. When and why did FDA start using the phrase "review and act on" concerning the review of abbreviated new drug applications?

FDA/CDC answer. The phrase "review and act on" originated with the implementation of PDUFA. The industry and Congress requested an affirmative statement to communicate the result of a review to the sponsor. The term and act on was added to review to meet this industry request. The phrase is meant to communicate both meeting the required time frame of the review as well as the result. Act on is defined as the issuance of a complete action letter after filing of an application. FDA issues three types of action letters: Approval letters, Approvable letters, and Not Approvable letters. The action letter, if it is not an approval, must set forth in detail the specific deficiencies, and, where appropriate, the actions necessary to place the

application in a condition for approval. For the past few years FDA has used the phrase review and act on with non-PDUFA abbreviated new drug applications to communicate similar information to their sponsors.

Question. Dr. Henney, this Committee has made it clear that we expect your agency to meet its statutory deadlines for review of all applications and petitions. However, we are also aware that resources are limited. For each type of application listed below, could you please provide the Committee with your best estimates of how much money and the number of FTEs the agency would need to meet 100 percent of its statutory deadlines for: food additive petitions; new drug applications; abbreviated new drug applications; 510(k)s; premarket approval applications; new animal drug applications; and abbreviated new animal drug applications?

FDA/CDC answer. Preparing the FDAMA implementation plan made it quite apparent to us that FDA is responsible for managing a rather complex triad of statutory expectations regarding the performance of review processes. First, and perhaps foremost, the agency's FDAMA mission statement directs us to the intended outcome of a successful review process—promotion of the public health by ensuring the timely marketing of new regulated products. In addition to this results-oriented goal, the statutory requirements for the FDAMA plan specify two enabling objectives. The first is to maximize the availability and clarity of information about the application review processes, and the second is to establish mechanisms for meeting the review time periods specified in the Act. The fiscal year 2000 budget request reflects our closely integrated approach to these three statutory requirements. Because of their confluence, it is not appropriate to develop separate cost estimates for the individual objectives.

We are fortunate to have an extremely robust template for this triad of statutory expectations. Beginning with the design of the initial Prescription Drug User Fee Act in 1992, and as it was updated the FDA Modernization Act, FDA's drug and biologic review processes have been striving to ensure that safe and effective new products are actually available to the publicnot just reviewed—as quickly as possible. This results-oriented societal goal has effectively made FDA and sponsors of new products collaborators during the entire development process, as well as during the final review steps, to ensure that the maximum possible number of safe and effective products are commercialized as quickly as possible.

The PDUFA results have given us a deeper understanding of the relationship between results measures, new product availability, and process measures, review timeliness. Measuring from the year before PDUFA in 1992, approval times for new drugs have been reduced by a year, clinical development times are two years quicker and the success rate, the percentage of applications approved, are up from less than 60 percent to 85 percent now. Yet, review time, the statutory time interval, has only decreased by about 2 months from the median interval of 12.5 months in 1992. This apparent paradox can be explained by the benefits realized by sponsors from a more transparent process affording more effective pre-submission collaboration with FDA that results in quicker preparation of higher quality submissions that can be approved by FDA on the first try. In the reauthorization of PDUFA through 2002, the pharmaceutical industry focused its willingness to pay additional fees on further expanded FDA collaboration within the development process. Their projections for 2002 predict an overall drug development time that is a year faster, but only a small fraction of that time savings is expected from quicker review times. The industry's acceptance of review timeframes that are longer than statutory goals acknowledges the amount of work that must be done within the review process, and the desirability of resolving problems within the first review cycle rather than churn through multiple review cycles, even if each might be within the statutory timeframe.

This collaborative approach that has effectively demonstrated its ability to ensure more timely access to the greatest number of safe and effective new products is evident in the fiscal year 2000 budget request for other FDA review processes. The President's specific funding requests for additional review capabilities in the device review process and the food additive process invite the sponsors of these submissions to collaborate with the agency, with both their energy and user fee funding, to achieve the jointly desired goal of more timely consumer access to new products. Looking forward, I believe the eventual level of funding for these FDA review processes will increase proportionally with the degree of industry confidence in the collaborative paradigm demonstrated by the success of PDUFA. This is necessarily an incremental process where initial commitments of industry collaboration and fee funding prove their worth in terms of quicker and more certain new product development cycles. Eventually, I believe full implementation of this new collaborative review paradigm will effectively achieve most of the regulatory review timeframes in the course of satisfying the broader FDAMA goals. However, I will not be surprised

if this step-wise proof by experience in the various FDA product areas will suggest that some of the present statutory review timeframes are not the optimal intervals for realization of the broader FDAMA objectives.

QUESTIONS SUBMITTED BY SENATOR KOHL

Question. Any initiative such as the Food Safety Initiative, that crosses agency and departmental lines requires high levels of agency coordination and cooperation. What steps are being taken to ensure that all food safety activities are properly coordinated? Is there any one agency or person responsible for taking the lead on food safety activities? What steps are needed to improve communication and cooperation among the agencies?

USDA answer. On August 25, 1998, the President, by Executive Order 13100, established the President's Council on Food Safety. The purpose of the Council is to protect the health of the American people by preventing foodborne illness through improving the safety of the food supply by means of sciencebased regulation and well-coordinated investigation, inspection, enforcement, research, and educational programs. The Secretaries of Agriculture and of Health and Human Services and the Assistant to the President for Science and Technology/Director of the Office of Science and Technology Policy serve as co-chairs of the Council.

The Council is charged with:

—the development and periodic update of a comprehensive strategic plan for food safety activities;

—making recommendations to the President on how to implement the comprehensive strategy and enhance coordination among Federal agencies, State, local and tribal governments, and the private sector;

—advising federal agencies in setting priority areas for investment in food safety and developing a coordinated food safety budget for the administration; and

—overseeing research efforts of the Joint Institute for Food Safety Research.

In recent years, we have made tremendous progress in strengthening ties among food safety agencies at all levels of government, industry, academia, and the public sharing a common public health mission and fulfilling that mission more effectively by continuing to build partnerships in so many food safety areas. The development of the comprehensive strategic plan for food safety and the development of coordinated food safety budgets under the guidance of the President's Council will be major steps in improving coordination and cooperation among agencies.

FDA answer. Since the implementation of the Food Safety Initiative, with release of the "Farm-to-Table" plan in May, 1997, the food safety agencies have worked to coordinate activities in every area of the initiative. The Partnership for Food Safety Education was formed by the agencies, industry, states, and consumer groups, to mount a coordinated approach to changing consumers' food practices. Representatives of federal and state agencies joined to form the Foodborne Outbreak Response Coordinating Group, or FORCG, as a means of improving the response to foodborne outbreaks whether they are multi-state outbreaks or occur at the state or local level, and improving consumer safe food practices. Interagency working groups were also formed to set up the Risk Assessment Consortium and to coordinate research planning.

FDA, in a coordinated effort with CDC, USDA, and EPA, developed a joint research plan. The plan provides a broad, uniform, and complementary approach to research that is intended to fill critical gaps in our scientific understanding of foodborne illness. To further assure that there is a mutual understanding of the issues surrounding foodborne illness. FDA and USDA participate on the National Advisory Committee for Microbiological Criteria for Foods, or NAMCF. This committee discusses scientific issues and research program needs for pathogens that may wind up in or on foods. FDA and USDA have also cooperated in joint food safety training programs such as the recent training on the application of Good Agricultural Practices. In order to assure that consumers and others keep abreast of food safety initiatives, the participating agencies have sponsored and will continue to sponsor a series of food safety education conferences.

On July 3, 1998, President Clinton directed the Department of Health and Human Services, DHHS, and the Department of Agriculture, USDA, to report back within 90 days with a plan to create a Joint Institute for Food Safety Research. The Institute is to coordinate planning and priority setting for food safety research among the two Departments, other government agencies, and the private sector and foster effective translation of research results into practice along the farm-to-table continuum. Enhanced and more efficient national investment in food safety research will do much to lower incidence of foodborne illness in the United States.

DHHS and USDA will have joint leadership of the Institute and will use existing resources to support it. This acknowledgment of the critical need to expand and coordinate food safety research also emphasizes the companion needs to expand and strengthen public-private partnerships and to augment collaboration among state, local, and other Federal agencies, thereby providing effective scientific information required to help achieve public health goals.

Likewise, Executive Order 13100 establishing the Food Safety Council has formalized interagency food safety budget planning and overall strategic planning. These processes are augmented by the numerous interagency working groups formed to coordinate food safety activities.

Question. Is there any one agency or person responsible for taking the lead on food safety activities?

FDA answer. No, no one person or agency has the lead or the responsibility on food safety activities. All the food safety agencies—FDA, CDC, USDA, and EPA—are working together, in a coordinated effort to achieve the goals of the Food Safety Initiative. The President's Food Safety Council released its response to the National Academy of Sciences, or NAS, report "Ensuring Safe Food from Production to Consumption" on March 15, 1999. One of the recommendations within the NAS report called for Congress to "establish by statute a unified and central framework for managing federal food safety programs, one that is headed by a single official and which has the responsibility and control of resources for all federal food safety activities . . ." The Council strongly agrees with the goal of a unified framework for the food safety programs, while noting that there may be many organizational approaches to achieving a "single voice" for federal food safety activities. The Council will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning and resources allocation.

Question. What steps are needed to improve communication and cooperation among the agencies?

FDA answer. In the interests of solidifying interagency coordination and communication, numerous interagency committees have been formed with representatives ranging from the working level to the agency's senior decision makers. We believe that the strategic planning process, conducted by the Food Safety Council, will further solidify lines of communication between the agencies as they work together to develop the national food safety plan described in the Council response to the National Academy of Science's report Ensuring Safe Food.

Question. I have been provided by the Food and Drug Administration a map of the United States which shows Food-Borne Disease Outbreaks from the period of January to July, 1998. I understand this map is based on information provided by the Centers for Disease Control and Prevention. This map indicates that some states with relatively low populations, such as Wisconsin and Kansas, have a large number of outbreaks compared to states with relatively high populations, such as Texas, Florida, and New York. What is the actual definition of a "Food-Borne Disease Outbreak"?

USDA answer. The definition of a foodborne disease outbreak is the occurrence of two or more cases of a similar illness resulting from the ingestion of a common food.

Question. Is the period shown on this map (January to July, 1998) representative of incidents of outbreaks generally?

USDA answer. The period shown on the map—January to July 1998—is not representative of outbreaks, generally. Rather, it is probably more representative of the reporting of outbreaks to the CDC. Thus, the number of outbreaks in some States may be higher because they are more likely to report their outbreaks than other States.

Question. I have been provided by the Food and Drug Administration a map of the United States which shows Foodborne Disease Outbreaks from the period of January to July, 1998. I understand this map is based on information provided by the Centers for Disease Control and Prevention. This map indicates that some states with relatively low populations, such as Wisconsin and Kansas, have a large number of outbreaks compared to states with relatively high populations, such as Texas, Florida, and New York.

What is the actual definition of a "Foodborne Disease Outbreak"?

FDA answer. An outbreak is defined as an occurrence of 2 or more cases of a similar illness resulting from the ingestion of a common food. (MMWR V45, #SS–5, 10/25/96)

FDA answer. The map illustrates outbreaks during that period of time; it is not generalizable to other time periods.

Question. To the extent outbreaks were a problem in Wisconsin during the period shown on this map, what is FDA or any other agency doing to help control this problem?

USDA answer. FSIS staff is available to help investigate plants that may be associated with foodborne illness in Wisconsin at the request of the Wisconsin state epidemiologist. This is usually done in collaboration with the local health department and CDC. FSIS assisted Wisconsin in this fashion once during 1998.

FDA answer. In general, CDC supports strengthening states' ability to detect and investigate outbreaks of foodborne illness through enhanced surveillance capacity.

Wisconsin is sophisticated in laboratory methods and epidemiology, with the aid of Epidemiology and Laboratory Capacity (ELC) cooperative agreements and as a member of PulseNet. The result of epidemiologic sophistication is better surveillance, which leads to better and more accurate disease detection. It is important to note that the outbreaks in Wisconsin illustrated by the map are the result of techniques that have allowed for detection of widely dispersed outbreaks and small clusters that would have previously been missed. FDA or USDA will investigate those outbreaks that involve regulated products under their corresponding jurisdictions. A renewed Memorandum of Understanding, or MOU, between the two agencies was signed in February 1999 that will facilitate enhanced exchange of information at the field level about food establishments and operations that are subject to the jurisdiction of both agencies. Most foodborne outbreaks involve mishandling at the point of preparation and/or two products that would have traveled in intrastate commerce. In such cases, the state public health agencies would respond at the state or local levels, as appropriate. States that show an apparent disproportionately large number of outbreaks, most likely indicate more active surveillance investigation and reporting by the State and public health agencies. In general, FDA and CDC support strengthening states' ability to detect and investigate outbreaks of foodborne illness through enhanced surveillance capacity. Specifically, Wisconsin's state public health agencies are sophisticated in laboratory methods and epidemiology, with the aid of Epidemiology and Laboratory Capacity, or ELC, cooperative agreements and as a member of Pulsenet. The result of epidemiologic sophistication is better surveillance, which leads to better and more accurate disease detection. It is important to note that the outbreaks in Wisconsin illustrated by the map are the result of techniques that have allowed for detection of widely dispersed outbreaks and small clusters that previously would have been missed.

Question. Last year, USDA began implementation of the Hazard Analysis Critical Control Point (HACCP) program for large meat and poultry processing plants both in the United States and foreign countries who export to the U.S. Earlier this month, similar programs were implemented for small firms both here and abroad. Although the inspection programs in foreign countries do not have to be identical to those in the U.S., they must be equivalent. What changes have occurred in the safety of meat and poultry products from foreign nations since the implementation of HACCP? How has implementation of HACCP in foreign plants compared to implementation in U.S. plants?

USDA answer. For the record, the following chart summarizes the status of eligible foreign countries with regard to the implementation of HACCP Sanitation Standard Operating Procedures (SSOPs) and generic E. coli testing. FSIS is in the process of its review of the implementation of HACCP and Salmonella testing in eligible foreign countries.

[The information follows:]

STATUS OF PR/HACCP EQUIVALENCE DETERMINATIONS

COUNTRY	1998 Import Volume	SSOP and E. coli Testing			
		"Identical" SSOP & E. coli Testing?	Alternate Sanitary Measures?	Were Measures Equivalent?	Was data/info. received and NO equivalence determination made?
Argentina	73,718,507	Yes	No		No
Australia	706,370,059	Yes	Yes	No [1]	No
Austria	7,291	Yes	No		No
Belgium	10,479,587	Yes	No		No
Brazil	69,991,833	Yes	No		No
Canada	1,413,660,410	Yes	No		No
Costa Rica	19,750,003	Yes	No		No
Croatia	2,013,764	Yes	No		No
Czech Republic		SSOP—yes E. coli—see→.	No		Yes, more E. coli testing information needed.
Denmark	114,653,909	Yes	Yes	Yes [3]	No

STATUS OF PR/HACCP EQUIVALENCE DETERMINATIONS—Continued

COUNTRY	1998 Import Volume	SSOP and E. coli Testing			
		"Identical" SSOP & E. coli Testing?	Alternate Sanitary Measures?	Were Measures Equivalent?	Was data/info. received and NO equivalence determination made?
Dominican Republic	122,064	Yes	No		No
Finland	550,321	Yes	No		No

United Kingdom	8,645,008	Yes	No		No
Uruguay	3,006,695,218	Yes	No		No

[1] Australia provided a scientific document comparing their E. coli testing program (two sampling sites) with a three-site sampling technique. After a thorough review of the research, in which the rump site was not sampled in the two-site technique and positive results of less that 1 CFU/cm^2 were omitted, FSIS determined the two techniques as not equivalent. Australia agreed to perform E. coli testing as identical to FSIS method.

[2] None.

[3] Denmark has recently submitted information in support of an NMKL method of analysis for generic E. coli. Based upon a review of the information and on an agreement between Denmark and the AOAC International, FSIS has determined the analytical method to be equivalent

[4] The Netherlands submitted scientific data in support of their testing program for Enterobacteriaceae as an alternative to E. coli testing. Their original submission included fewer sample sites, less frequent sampling, a smaller sample collection area, non-random sampling, and sampling prior to chilling. Based on the information provided, FSIS determined that the Netherlands could use Enterobacteriaceae and sample prior to the chiller (using statistical process control techniques). The other alternative sanitary measures were determined as not equivalent. The Netherlands recently submitted a research protocol to provide data in support of a 5cm^2 sample collection area for their Enterobacteriaceae testing program. FSIS has not received the data and has, therefore, not made an alternative equivalence determination on this issue.)

[5] New Zealand submitted scientific data in support of a smaller sampling area (5cm^2 vs 100cm^2) for E. coli testing. Additional information was submitted regarding alternative sampling frequencies, sampling tool, and sampling sites (outside hind leg instead of rump). Based on the data provided, FSIS determined that the smaller sampling area was not equivalent to the FSIS sampling area. Based on the additional information provided, FSIS determined that the outside hind leg site was equivalent to the rump if the anus is bagged prior to dropping, the site is no more than 5 cm from the FSIS rump site, and the NZ site is expanded to 100 cm^2 in the direction of the anus. It was also determined that the alternative sampling tool (swab) and the sampling frequency (5 bovine per week) were equivalent; based on generally recognized and accepted methods of sample collection and a history indicating a relatively low volume of slaughter production in New Zealand's export establishments, respectively.)

(NOTE: Information has been received from each of the countries listed and each is under review for an equivalence determination for HACCP plans and Salmonella testing. However, more information is required from each country before a provisional determination can be made. As was the case when considering the equivalence of a country's SSOP and E. coli testing programs, once a provisional determination is made, an on-site audit will be scheduled. Before, during, and after the determination process, audits are scheduled and performed on an on-going basis. Each audit provides information and feedback to FSIS covering inspection operations and equivalence issues, as necessary. Before a final equivalence determination is made, another on-site audit is completed and the findings and subsequent documents are thoroughly reviewed.)

Source: FSIS.

Question. Earlier this year, USDA began implementation of HACCP for small plants. There had been concern that the regulatory changes called for by HACCP might be economically difficult for small operations with limited capital. Wisconsin ranks 8th in the nation in the number of small plants that came under HACCP in January. Please describe how implementation of HACCP for these small plants is proceeding.

USDA answer. HACCP implementation for small plants has been very successful. As of February 24 of this year, only 13 out of 2,211 small plants have had FSIS take enforcement action against them for failure to fully meet HACCP requirements. All of these plants have provided FSIS with corrective action plans and have

been approved to continue operating. Eight other plants have voluntarily requested that inspection be suspended or withdrawn.

FSIS uses a tracking system on the number of calls made by the industry to the HACCP Hotline, which is managed by the agency's Technical Service Center at Omaha, NE, to monitor HACCP implementation. Because of the preparation by the industry and the Agency, there have not been more calls received from the approximately 2,200 small plants that implemented HACCP on January 25, 1999, than received from the 300 large plants that implemented during January 1998.

Question. How does the FDA program for import inspection compare to that of USDA? Are your standards similar and do your results show similar success?

FDA answer. We assume that your question refers to the FDA and USDA foreign inspection programs whereby the Agencies inspect foreign producers of products offered for entry into the U.S. The import program is commonly used to describe the review and testing of products offered for entry into the US at our borders.

Until fiscal year 1999, when additional resources were allocated to FDA under the President's Food Safety Initiative, or FSI, the Agency's inspection of foreign producers was limited primarily to manufacturers of low acid canned foods and acidified foods. FDA conducted an average of only 40 inspections a year of foreign producers. Unlike the USDA, FDA does not have statutory authority to require inspection of a foreign facility offering product for entry into the U.S. FDA must request permission from the foreign facility to conduct an inspection. USDA on the other hand routinely inspects all foreign facilities that wish to import products regulated by USDA into the U.S. The USDA has veterinarians and a foreign inspection cadre stationed overseas, FDA has none.

The USDA and FDA programs are not similar. Under its new HACCP regulations, USDA-regulated products offered for entry into the U.S. must be produced under an equivalent system to that of American products and then must be inspected upon entry. The FDA HACCP program currently covers only seafood products. FDA is in the process of determining equivalency in several countries, however, the primary focus of the program currently resides with importers. FDA requires that importers must have a HACCP verification plan for products they wish to bring into the US. Since FDA does not have staff located in foreign countries, nor resources to perform equivalency assessments in all countries offering product for entry to the U.S., it is not possible to compare the success rate of the FDA and USDA programs.

Importers of seafood must also demonstrate through affirmative steps that their foreign suppliers have implemented an effective HACCP plan. To insure that importers are meeting these new requirements, FDA has begun conducting inspections of importers of seafood in this country. We will also be conducting inspections of seafood processors in other countries who export to the U.S. to ensure that they are meeting U.S. requirements including the new HACCP regulation.

The seafood HACCP regulation relieves the importer from these obligations if there is an active agreement between FDA and the country that covers the fish or fishery product and documents the equivalency or compliance of the inspection system of the foreign country with U.S. system. We have started equivalence determinations with some of our trading partners including Canada, Australia, New Zealand, Norway, Iceland and Japan. None of these determinations has been completed.

FDA has increased the number of foreign inspections from 40 to 100 in fiscal year 1999, and an additional 150 foreign inspections has been recommended for fiscal year 2000.

The Agency also provided resources to FDA's Office of Regulatory Affair's Import Operations to ensure that regulated animal products (animal feeds and veterinary drug products) are examined.

Earlier this year, USDA began implementation of HACCP for small plants. There had been concern that the regulatory changes call for by HACCP might be economically difficult for small operations with limited capital. Wisconsin ranks 8th in the nation in the number of small plants that came under HACCP in January.

Question. Please describe the implementation of FDA's HACCP program as it applies to both large and small operations.

FDA answer. We would be happy to provide that information for the record.

[The information follows:]

In developing its seafood HACCP program, FDA did not distinguish between large and small operations; rather, FDA attempted to tailor both the requirements and the implementation of the program so that they would be feasible regardless of the size of the processing operation. FDA adopted this strategy after soliciting comment on the treatment of small businesses through the notice of proposed rulemaking for the program. The comments generally recommended against differentiating between large and small processors. Further, the preamble to FDA's final regulations requested that any processor that was having financial or similar difficulties imple-

menting HACCP should notify FDA so that the agency could consider adjusting the time frame available for implementation or making other changes to accommodate problems of this nature. FDA received no such requests.

A major philosophical underpinning for FDA's program is that it should be within reach of all commercial food processors to understand the food safety hazards that could affect their products so as to take reasonable, cost-effective measures to keep those hazards from occurring. In keeping with that philosophy, FDA took small businesses into account in the following ways:

—The program requirements were crafted to allow processors as much flexibility as possible to tailor their HACCP systems to their circumstances.

—All processors were given two years to implement their HACCP systems.

—The heart of each HACCP system is monitoring "critical control points" where a breakdown could cause a safety hazard to occur, and then recording the results of that monitoring. FDA encouraged processors to keep record keeping simple and inexpensive and provided advice and guidance on how to avoid unnecessary cost and complexity.

—FDA worked with the Seafood HACCP Alliance, a consortium of Federal agencies, the Association of Food and Drug Officials, academia, and industry trade associations, to develop an extremely low cost basic seafood HACCP training course for industry that has been taught around the country, especially in locations with many seafood processors.

—FDA developed a guidance package for processors that contains the agency's best advice on how to establish and operate a HACCP system in virtually any processing situation. The intended beneficiaries of this guidance were primarily small processors that lack the in-house expertise that larger processors possess. The guidance package contains a fill-in-the-blank HACCP plan that a processor could develop with information provided in the guidance package.

Question. Please outline specific problems you are hearing from these plants.

USDA answer. For the record, the HACCP Hotline has identified the following items as the principal concerns expressed by owners and operators of small plants.

[The information follows:]

1. Inclusion of critical control points for identified food hazards.

2. The use of control programs/good manufacturing practices in lieu of critical control points.

3. The process for completing the pre-shipment review for plants supplying products to hotels, restaurants, and institutions.

Question. Please describe the role you are playing in the administration's overall policy to counter bio-terrorism as it relates to the food supply.

USDA answer. The Food Safety and Inspection service (FSIS) and the Office of the Under secretary for Food Safety are actively involved in the administration's overall policy initiatives to counter bio-terrorism as required under Presidential decision Directives 39, 62, 63 and 67. Currently, the Under Secretary co-chairs the USDA task force charged to develop and test the Department's Continuity of Operations Plan (COOP). FSIS is a member of the taks force and has completed the first draft of it COOP.

USDA has organized an intra-departmental Food Emergency Rapid Response & Evaluation Team to respond to food emergencies, which may include some bioterrorism emergencies. This team, headed by the Under Secretary for Food Safety at USDA, is a coordinating mechanism for developing prompt departmental responses to food safety emergencies. FSIS also developed strong ties with CDC, FDA, and the state and local public health departments through working together on the Foodborne Outbreak Response Coordination Group. This group has developed a white paper describing foodborne outbreak response coordination.

FDA answer. CDC is the lead agency for efforts to upgrade national public health capability to detect, investigate, and control outbreaks of human illness related to bioterrorist attacks, whether or not the food supply is implicated. The focus of FDA and USDA is the food supply itself.

CDC's role is to build national capacity to detect and determine causes of human illness; strengthen state and local public health surveillance; improve diagnostic methods; enhance public health training, and transfer laboratory and other technology. These activities build upon the framework of CDC's Emerging Infections Plan and action to date to strengthen state and local emergency response capability.

FDA has formed an intra agency working group to coordinate bioterrorism activities and is moving to address the special technical and personnel safety issues associated with biological agents. These activities are being coordinated with the Food Safety Initiative. The Agency has maintained its capabilities to respond to incidents of food tampering, including bioterrorism. FDA is continuing cooperation in research and development with other Federal agencies as a member of the Bioterrorism

Technical Support Working Group. Current research efforts are directed toward the development of improved methods to detect bio-terrorism agents in foods. Some of these methods involve the transfer of technologies developed by the Department of Defense for biological weapons to detection of these agents in foods.

In the last two years, representatives of government and non-government personnel have participated in several meetings to consider bioterrorism issues, e.g., attack, threat, or hoax and the risk to animal agriculture, including the safety of feedstuffs and food from food-producing animals. Discussions at these meetings conclude that agriculture and food should be considered as a critical sector in the national strategy of defense against acts of bioterrorism.

FDA is participating in meetings with officials from the US Department of Agriculture's Agriculture Research Service and non-governmental organizations to address the need for relevant information on bioterrorism, such as effective lines of communication among anti-bioterrorism units of federal and state governments, to facilitate timely reporting of events, diagnoses, and to identify research needs, e.g. analytical methods to detect agents of bioterrorism in feeds. FDA's fiscal year 2000 request for funding for programs to combat bioterrorism does not include money for the Animal Drugs and Feeds Program.

Question. The implementation of HACCP was intended, in time, to replace the old Organoleptic system of inspection for meat and poultry process. What steps have been taken to remove requirements of the old system? What is the timetable to replace the old system with new procedures? To what extent will the organoleptic system be eliminated?

USDA answer. FSIS would not agree that the purpose of HACCP was to replace organoleptic inspection techniques, although FSIS certainly did expect that HACCP systems would enable inspected establishments to focus on a full range of food safety hazards including those which are not identified by organoleptic techniques, e.g., microbiological pathogens.

Certain undesirable features of meat and poultry products are readily identified using organoleptic techniques, including sight. For example, FSIS maintains zero tolerance standards for fecal contamination on carcasses for both livestock and poultry, and expects that organoleptic techniques will remain viable and efficient for identifying these defects. FSIS expects to propose an organoleptic performance standard for the presence of ingesta on poultry carcasses by the end of 1999. Organoleptic techniques may be extended to address other defects.

At the same time, FSIS is actively considering alternatives to organoleptic techniques which may themselves be a source of product contamination. Recently, FSIS published a Notice regarding its intention to change the procedures for inspecting lamb carcasses because those procedures relied extensively, and unnecessarily, on palpation that was causing cross-contamination—"Notice of Change of Inspection Procedures; Adoption of Selective Carcass Palpation Procedures for Lambs" (63 FR 63282). Other inspection procedures may need to be reviewed in the same light.

QUESTIONS SUBMITTED BY SENATOR HARKIN

Question. To Dr. Woteki, re: recall authority: Since we've seen emergence of many pathogens in the last 20 years, our food safety system must be responsive to the "unknown," the illness for which we haven't yet identified a cause. If we're successful in giving you mandatory recall authority, please explain your thinking about whether you could require recall based upon a positive test, or more broadly such as when people are getting sick from a specific food, even if we don't know why.

USDA answer. If there existed a strong epidemiological link between consumption of a particular food and illnesses, that is we knew the vehicle of the illness but not the specific agent, we would, as we have in the past, request that the producing firm voluntarily recall the product even without mandatory recall authority. However, if the firm chose not to recall, we would face significant problems in any action that we brought to detain or seize the product in order to prevent further consumption and illnesses. If we were to lose such a case, we may be confronted with significantly less willingness on the part of establishments to cooperate with Agency recall requirements. Mandatory recall authority would specify the circumstances and evidence needed for the Agency to order a product recall. Mandatory recall authority would provide us with an important tool of public health protection. It would also provide the regulated industry with a full understanding of the qualifying factors under which the Agency would move to order a recall.

Question. Follow-up: Should mandatory recall authority explicitly state that the Agency cannot be held accountable for decisions made based upon existing evidence, even if future evidence may provide different information?

USDA answer. The Agency never has taken lightly nor ever will take lightly, a decision to ask a firm to recall products. However, FSIS must be able to act, even without perfect evidence, to protect the public health. Mandatory recall authority and its supporting regulations should spell out to the extent possible the circumstances and qualifying factors under which the Agency would order a recall. If a given set of facts met the test set forth in the law and regulations, the Agency would be sure to act. The Agency would be held accountable for having acted within the scope of its mandate and regulations. If some future evidence comes to light on a given case, the Agency would evaluate the information and again act within the scope of its mandate and regulations.

Question. Follow-up: I was disturbed by a series in the Detroit Free Press a few weeks ago, stating that the Agency was limited in its ability to inform consumers of distribution patterns of recalled food, because such information is proprietary. Is this a correct statement? Should the Agency be able to release such information in the face of an imminent health hazard?

USDA answer. FSIS does provide public notification by posting a recall notification report (RNR) on its website for all recalls it coordinates. The report provides specific information regarding the recalled products such as, recalling firm, reason for recall, identifying product codes, company contacts, geographic distribution, quantity recalled, and classification. The main purpose of the RNR is to alert state and local public health officials and other responsible parties working in the public health area of product that may be hazardous to health. FSIS does not issue press releases in all cases. The purpose of Agency recall press releases is to quickly alert the public about product that may present a serious health hazard that they may have in their possession. Through this tool, the public is alerted to the potential problem and advised to return the product to the point of purchase. In general, FSIS issues press releases for all Class I Recalls dealing with products that may be in the hands of the consuming public. A Class I Recall may involve only product that is packaged and marketed for food service. In these cases, FSIS would not normally issue press releases since the product is not in the public's possession, nor is it readily identifiable to the public. FSIS does conduct recall effectiveness checks to verify that the recalling firms, and any subsequent distributors, contact any potential holders of the recalled product with instructions to immediately stop serving it and to dispose of it appropriately.

Question. Follow-up: I understand that we don't want to harm companies whose products are not hazardous, but public notification has fallen short at times. In a recall last April, the decision was made not to issue press releases because affected ground beef was not identifiable by the consumer. So, consumers may have tainted food in their freezer, but there is no public notification. What we are balancing is the risk that consumers discard all their stores of ground beef, because some of it might be affected, against the risk that some consumers who do have the tainted product become sick. What is the Agency's thinking about the "identifiable to consumers" standard at this time?

USDA answer. First, it should be noted that the Agency does provide public notification of all recalls by posting recall notifications reports on the FSIS website. Also, the recall notification reports are provided via fax and e-mail to public health and food safety officials throughout the country on the federal, state, and local levels. This notification provides the public health community with important data to use in following-up on any reported illnesses and determining if they were caused by recalled products.

The term "identifiable to the consumer" may cause some confusion. FSIS decisions to issue press releases turn on the relative health risk associated with use of the products, and on whether or not the particular products being recalled are in the hands of individual consumers. The purpose of the press release is to advise consumers who may have the products not to use them and to return them to point of purchase. For example, a recall involving products such as one or two pound packages of processed meats that are contaminated with Listeria monocytogenes and that are sold at retail stores will be the subject of a press release. A recall involving products that are sold only to food service establishments or further processors generally would not have a press release issued. In those cases, we rely on our recall effectiveness checks to verify that firms provide appropriate notification to all holders of recalled products. The notification must include appropriate instructions to stop serving or further distributing the products and to return or appropriately dispose of them. Issuing press releases in cases where consumers would not have the products involved in the recall might in fact be counter productive by causing confusion among consumers.

It should also be noted that FSIS is currently in the process of reviewing all of its recall policies and practices. It held a public meeting on the subject and is ana-

lyzing comments from stakeholders. Upon completion of analysis, recommendations on policy changes will be submitted to the Department.

Question. Last year, FDA, working with industry, produced a guidance document to assist growers in making fresh fruits and vegetables safer for consumers. Can you discuss ways that USDA and FDA are working together to get this production information to the farmer?

FDA answer. FDA is working with USDA to develop both a domestic and international educational outreach program to assist growers in making use of the Guide. Two meetings will be held in April, 1999 to develop the best approaches for training and education. FDA is the lead Agency for the international outreach program and USDA is the lead Agency responsible for development of the domestic outreach program.

FDA and USDA will assist foreign growers and packers importing food into the U.S. by encouraging appropriate application of good agricultural and management practices abroad through education, technical assistance, training programs, and cooperative research efforts. An International Working Group of representatives from FDA, USDA, USTR, USAID, and the State Department has been organized to discuss technical assistance opportunities for foreign countries. A country-by-country infrastructure needs assessment will be part of the 1999 international producer education conference.

USDA's network of agencies and programs that operate on a grassroots level provides an effective, efficient, and farmer-friendly interface for the development, delivery, and ultimate evaluation of appropriate agricultural practices for domestic produce. USDA's Cooperative State Research, Education, and Extension Service will take the lead in developing the education and outreach strategy for domestic producers. Other USDA agencies, such as the Farm Services Agency, the Agriculture Marketing Service, and the Animal and Plant Health Inspection Services, also will participate. The outreach program will utilize existing networks and programs to raise awareness of the Guide and to encourage its appropriate adoption by growers.

Question. To Dr. Woteki and Dr. Henney, re: produce safety: Last year, FDA, working with industry, produced a guidance document to assist growers in making fresh fruits and vegetables safer for consumers. Can you discuss ways that USDA and FDA are working together to get this production information to the farmer?

FDA answer. The February 1998 Initiative to Ensure the Safety of Imported and Domestic Fruits and Vegetables: Status Report to the President, called for a National Food Safety Science and Education Conference. In response, the U.S. Food and Drug Administration developed a new Guide to Minimize Microbial Food Safety Hazards for Fresh Fruits and Vegetables. USDA's Cooperative State Research, Education, and Extension Service then partnered with the Food and Drug Administration, Industry, and the Land-Grant University System to convene this first national science and education conference to implement the Guide.

The conference will convene key industry, academia, research, Federal and State government representatives to identify the educational needs of domestic growers and producers of fresh fruits and vegetables and ways to best implement FDA's new Guide. Educational and outreach strategies will be based on the Guide.

Extension specialists, growers, producers, buyers, processors, distributors, trade organizations, state and federal regulators, and educators involved in growing, harvesting, processing, and transporting fresh fruits and vegetables will participate in the conference.

Question. Dr. Woteki: The budget states that AMS plans to conduct baseline surveys of microbial pathogens on fresh fruits and vegetables. Also, USDA will conduct "a nationwide survey of fruit and vegetable producers and packinghouses . . . to establish a baseline of agricultural handling practices related to food safety." Which Agency will be doing the second survey? It is unclear whether these surveys will be linked. If they are not, we lose an opportunity to understand how growing conditions and production practices actually affect the safety of fresh fruits and vegetables. Can you comment?

FDA answer. The survey of handling practices is being conducted by the National Agricultural Statistics Service (NASS). It will be conducting a "baseline" survey of agricultural practices for fresh fruits and vegetables that will collect general information on farm practices relating to irrigation and transportation practices. The sample for this survey effort will consist of growers of fresh fruits and vegetables as well as packers of fresh produce. Once a baseline of practices is established in fiscal year 2000, the survey would be repeated every other year to measure changes in practices over time.

The AMS Microbiology Data Program will be taking samples at terminal markets and at chain store distribution centers. By sampling at these locations, overall trends can be detected in microbial counts that result form changes in handling pro-

cedures, as well as from different environmental conditions. For a particular range when current handling practices are in place, but in fiscal year 2002 showed a different range, this will be correlated to the information made about the effectiveness of changes in handling practices.

Question. To Dr. Woteki: Are AMS or any other USDA Agencies currently conducting quality inspections for imported produce? If so, how large a personnel force conducts these inspections?

FDA answer. Yes, AMS graders of fresh and processed fruits and vegetables conduct quality inspections for imported produce on a fee-for-service basis. The only imported commodities that require quality inspections are those that have domestic marketing orders in effect. Commodities not covered by a marketing order are also inspected at the request of the receiver. There are approximately 155 graders of fresh commodities and 75 graders of processed commodities who perform the quality inspections during the busiest times of the year.

Question. Given that the apparent success of Meat and Poultry HACCP is measured by performance according to the Salmonella performance standard, do you anticipate applying similar pathogen performance standards to any FDA-regulated products (e.g seafood?).

FDA answer. Yes, there are foods for which the application of a performance standard can be applied and used as a measure of HACCP performance. Seafood is not one of them. FDA has tentatively concluded that juice is one example where performance standards with HACCP may be appropriate. FDA proposed on April 24, 1998, that HACCP be mandatory for the juice industry and is currently involved in rulemaking on this matter.

Performance standards set forth requirements in terms of what is to be achieved by a given regulatory requirement, and represent a shift in focus from "command-and-control" by specifying the ends to be achieved rather than how to achieve those ends.

In the case of meat and poultry, a major impetus for the Federal HACCP program for those products was the significant number of estimated illnesses from certain pathogens. Due to the limitations in the foodborne illness reporting system in the U.S., it might be difficult to measure the effect of HACCP on a reduction in illness. However, a reduction in the counts for certain pathogens could both beneficially affect safety and serve as a reasonable surrogate for purposes of measuring program effect. In the case of juice, FDA has proposed a mandatory HACCP program, coupled with a performance standard, for the most resistant microorganism of public health significance likely to occur in the juice. This is a different kind of performance standard from USDA. The agency has proposed to require that juice be processed in a manner to achieve a 5-log or 100,000 fold reduction in the pertinent pathogen. This 5-log reduction performance standard was established to ensure that its juice HACCP program would impact the most pressing public health problem associated with juice products as well as provide a way of measuring program success.

However, there are some segments of the food industry, for which the strict application of a performance standard may not represent the best approach. Seafood is fundamentally different from other foods in that it is subject to a wide spectrum of potential hazards, some of which are unknown to terrestrial products, but suffers from no single pressing hazard. Seafood consists of literally hundreds of species from a wide variety of habitats. FDA implemented its seafood HACCP program in part to ensure that seafood processors—through HACCP—could demonstrate an understanding of both the potential hazards that could affect their products and the controls that they could apply to eliminate or reduce those hazards. Before the implementation of seafood HACCP, no such knowledge was a prerequisite to commercial production. Consequently, FDA measures program success for seafood in terms of the industry's ability to demonstrate an understanding of hazards and controls for their products through effectively implemented HACCP systems.

Question. The recent Listeria outbreak has now been linked to 20 deaths. Can each of you explain whether we can help manage this problem by doing more sampling of ready-to-eat foods? What other measures might be helpful?

FDA answer. We would be happy to provide this information for the record.

[The information follows:]

After a large listeriosis outbreak in 1985 associated with Mexican style soft cheese, a massive educational campaign was launched by FDA, CDC, and FSIS to educate at risk consumers. Medical professionals, retail food operations, pregnant women, immune-compromised people, etc., were targeted in the education effort. In 1995, CDC published a sentinel study showing a dramatic (40 percent) decline in listeriosis in the U.S. from 1989 to 1993. The article stated: "The temporal association of this reduction with industry, regulatory, and educational efforts suggests these measures were effective."

FDA instituted programs and issued guidance documents that directed our field force to sample specific products for Listeria contamination and to conduct inspections of firms processing susceptible products. Some of these activities include:

—"Domestic and Imported Cheese and Cheese Products" which specifically targets soft cheeses, both domestic producers and imported product, for examination for Listeria and other pathogens;

—"Imported Foods—General" and "Imported Seafood" programs which target ready to eat foods for examination for Listeria and other pathogens;

—"Carrier Sanitation" assignments covering inspection and sampling of interstate carriers transporting products susceptible to pathogen contamination.

—"Pathogens in High Risk Foods" program which covered sandwiches, non-dairy frozen desserts, tofu and other soy-based products and dried milk;

—"Inspectional Guidance for Firms Producing Products Susceptible to Contamination with Pathogenic Micro-organisms" which provided among other things, sampling guidance for products suspected of contamination with Listeria and other pathogens.

It is inappropriate to consider increased sampling of ready-to-eat products as a means for addressing the problem. End product sampling only identifies contamination problems after they have occurred. Effective controls must be implemented at the food processing establishment to ensure that the possibility for contamination with Listeria monocytogenes has been minimized.

FDA, with collaboration from FSIS, has initiated an assessment of the public health risk presented by Listeria moncytogenes to collect the current state of scientific knowledge to assist in reviewing our regulatory approach. Several key questions for the risk assessment to answer are: what foods contribute most to the consumption of Listeria monocytogenes, what are the numbers when a food is contaminated, how frequently are foods heavily contaminated, are some strains of Listeria monocytogenes more virulent that others, what is the extent of growth during storage, including storage at refrigeration temperatures, and what is the likelihood of illness to various individuals from consuming different numbers of Listeria monocytogenes. The findings of the risk assessment are expected to provide a scientific basis for identifying effective measures to reduce the public health risk from listeriosis. The National Advisory Committee on Microbiological Criteria for Foods (NACMF) will be utilized to assist in the review of the Listeria monocytogenes risk assessment.

Question. Estimates of burden of foodborne illness use data now 6–12 years old. Does CDC plan a comprehensive re-evaluation of the national burden of foodborne illness? When might we expect such a review?

FDA answer. CDC has undertaken a broad-based, multi-disciplinary effort to update estimates of foodborne illness using the best available information. CDC anticipates that the revised estimates will be available for public review within the next few months.

Question. To Dr. Woteki, re: pathogen testing: Last year I asked the FSIS to begin a sampling program for Campylobacter, not as a regulated pathogen, but to determine if HACCP alone will address this problem. Have you begun this sampling?

USDA answer. Campylobacter sampling in chickens has begun. Currently, there are two non-regulatory programs. In May 1998, a quantitative routine non-regulatory monitoring program started. In January 1999, the Agency started the statistically designed "Nationwide Young Chicken Campylobacter Baseline Data Collection Program."

Question. To Dr. Woteki: Do you plan to lower the Salmonella performance standard for any of the products which showed decreases from baseline in 1998? Please elaborate.

USDA answer. There are no plans to adjust the standard downward based on this preliminary data. In an effort to reduce the frequency and degree of contamination of meat and poultry products with pathogenic microorganisms, FSIS established requirements to reduce the incidence of pathogenic microorganisms on meat and poultry products. The Pathogen Reduction;/HACCP (PR/HACCP) final rule established a pathogen reduction performance standard using Salmonella as the target organism. FSIS stated that in the future it might adjust the targets for Salmonella downward, should experience warrant.

The effective date for the PR/HACCP rule was January 26, 1998, for large meat and poultry plants, i.e., those employing 500 or more employees. The effective dates for small plants and very small plants, which represent the largest number of plants, occur one and two years later, respectively. Thus, only large plants became subject to Salmonella testing in 1998.

During 1998, samples were collected from about 200 large plants. Results of the 1998 testing program are available for only four product classes: broilers, hogs,

ground beef, and ground turkey. The prevalence of Salmonella in these product classes was lower after the first year of HACCP implementation based on the samples tested. However, the results must be considered preliminary since they do not represent a random sample of all domestic meat and poultry production.

Question. Follow-up: It is stated that FSIS underestimated the costs of Salmonella sampling, and this is reflected in unanalyzed samples in the HACCP data samples sets. It is of concern that FSIS now must expand sampling to small plants in fiscal year 1999, using the same sampling protocol. Please explain how the cost underestimate occurred, whether FSIS has regained course to proceed with sampling to address the backlog, and whether the Agency feels it can catch up with HACCP implementation in small plants.

USDA answer. FSIS did not underestimate the cost of Salmonella sampling. All compliance phase samples received at the laboratory in appropriate condition are analyzed until a set is complete. FSIS has adequate laboratory capacity to analyze all scheduled Salmonella samples and there currently is no backlog of unanalyzed samples. Plans for expanding sampling to small plants in 1999 are underway; and no cost issues are anticipated in this area.

Question. Dr. Woteki and Dr. Henney: The recent Listeria outbreak has now been linked to 20 deaths. Can each of you explain whether we can help manage this problem by doing more sampling of ready-to-eat foods? What other measures might be helpful?

USDA answer. There are several steps that are underway to reduce illnesses and deaths from Listeria. Among these steps are: developing guidance to industry on "best practices" that can help to reduce the potential for product contamination; targeting consumer education for high-risk groups; initiating a study to address Listeria risks; and, conducting a quantitative risk assessment for Listeria that will determine the foods that pose the greatest risk to consumers and specific subpopulations at increased risk of contracting listeriosis.

Question. To Dr. Woteki, and Dr. Henney, re: food irradiation: Please explain the current/intended requirement for labeling of irradiated meat and poultry products. (FSIS & FDA)

USDA answer. For packages of irradiated product (i.e., all the meat or poultry contained in the package is irradiated), FSIS proposed the same labeling requirements as those specified by FDA. Regarding secondary products, i.e., products in which irradiated meat or poultry comprise one or more ingredients in the formulation, FSIS proposed that the ingredient statement should list the irradiated ingredient in the order of its level of predominance in the formulation. Presently, FDA does not have a similar requirement for the secondary product labeling of irradiated ingredients. FDA did issue an advance notice of proposed rulemaking on February 17, 1999 (64 FR 7834) concerning possible revisions to the labeling requirements for irradiated foods. Meanwhile, FSIS and FDA expect to meet and discuss the secondary product labeling issue. Both FSIS and FDA recognize the benefits of a consistent labeling policy for irradiated food.

Question. Follow-up: Do we have opportunities on the horizon to irradiate high risk fruit and vegetable products, like sprouts?

USDA answer. ARS has responded to a request from the FDA to investigate the effects of gamma irradiation on high risk fruits and vegetables such as sprouts and seeds, to inactivate the pathogens E. coli O157:H7, Salmonella and Listeria, while maintaining product quality and consumer acceptability. The research is being conducted at the Eastern Regional Research Center, Wyndmoor, Pennsylvania. In the latter part of 1999, a Gray-Star Irradiator will be installed within the Center to conduct commercial scale studies. Results on these studies should be forthcoming within 2–3 years.

FDA answer. The labeling of meat and poultry falls under the jurisdiction of the USDA.

Question. Do we have opportunities on the horizon to irradiate high risk fruit and vegetable products, like sprouts?

FDA answer. Current FDA regulations allow irradiation of fruits and vegetables only at doses that have a relatively minor effect on harmful microorganisms. When FDA issued its approval to irradiate fruits and vegetables, the primary interest was for lower doses that control insects and inhibit ripening or sprouting. Higher doses, which could have a significant effect on microorganisms, often damage the fruit or vegetable to the extent that it becomes unacceptable to the consumer. FDA recognizes that there may be specific situations where irradiation may be a useful process, either because a specific organism of concern is particularly sensitive to irradiation, or because a specific product may tolerate higher doses. FDA has been presented with preliminary scientific data showing the possible usefulness of irradiation for eliminating or reducing the levels of foodborne pathogens on seeds used to

produce sprouts. FDA would be receptive to petitions for a change in the current regulation if evidence can show that irradiation is a safe and practical process for addressing microbial risk in fruits or vegetables.

QUESTIONS SUBMITTED BY SENATOR DORGAN

For primary witnesses: Woteki, Henney & Koplan

Question. At what stage is the Council on Food Safety in its review of the National Academy of Sciences Report, and when can we expect the Council to issue its report? Will this report include recommendations to consolidate existing food safety agencies?

USDA Answer. The President's Council on Food Safety has completed its review of the National Academy of Sciences report, "Ensuring Safe Food from Production to Consumption." The Council submitted its assessment of the report to the President in March. The Council's assessment has been submitted to the Committee in answer to a question from Senator Cochran.

Although the NAS report indicates that many of the NAS committee members believe that a single, unified agency headed by a single administrator is the most viable structure for implementing the "single" voice concept, the Council's assessment recognizes that there may be many other models that would be workable.

The Council agreed with the goal of the NAS recommendation—that there should be a fully integrated food safety system in the U.S. The food safety agencies are committed to this goal, and the President's Council is confident that its comprehensive strategic plan will be a major step toward creating a seamless food safety system. To ensure that the strategic plan achieves this goal, the Council will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning and resource allocation.

While the Council recognized that certain models of reorganization may improve coordination and allow for better allocation of resources, any reorganization of food safety activities must consider the non-food-safety-related responsibilities of each agency and how these relate to the food safety responsibilities. Reorganization must not be done at the expense of these other responsibilities and activities. The Council is concerned that if not done carefully, separating food safety from non-food safety activities in each agency could act to weaken consumer and environmental protection overall.

Question. Our food safety laws apparently vary considerably as to how food safety objectives must be achieved, leading to different regulatory regimens within the various food safety agencies. Thus simply consolidating existing food safety agencies may not provide the overall efficiency or effectiveness that should be accomplished. Is the Council on Food Safety reviewing which regulatory regimens would be most effective in achieving a science-based food safety system and how existing laws may need to be amended to meet this objective? How does the Council believe that changes in these laws should be advanced in relationship to the consolidation of existing food safety agencies?

USDA answer. The NAS report identifies a need for a "national food law that is clear, rational, and comprehensive, as well as scientifically based on risk" as a major component of a model food safety system. The report concludes that it is necessary to revise the current statutes on food safety to create a comprehensive national food law.

Since the federal food safety regulatory agencies operate under very different legislative authorities, the Council will conduct a full assessment of these statutes and evaluate the degree of regulatory flexibility that already exists. The Council has decided that this legislative review will be undertaken as part of the strategic planning process. The purpose of the review will be to: 1) examine the similarities and differences in federal food safety statutes; 2) identify the "best" statutory approaches for reducing foodborne illness; and 3) assess both gaps and statutory barriers to implementation of the plan. The need for statutory changes could then be determined, and, if necessary, legislative principles developed which would form the basis for discussions with stakeholders and Congress. For example, given the recent overhaul of pesticide legislation, the Council believes that further statutory changes may not be needed for pesticides at this time.

The Council will carefully coordinate the strategic planning process that will include an assessment of possible structural models with the results of the legislative review.

FDA answer. Federal Statutes should be based on scientifically supportable risks to public health.

The Council agrees and will call on Congress to work with it to create scientifically based statutes to promote food safety. The Council will conduct a thorough review of existing statues and determine what can be accomplished with existing regulatory flexibility and what improvements will require statutory changes. The Council is reviewing all options for achieving the safest food supply possible. This includes analyzing our regulatory experiences with different food types, and holding interagency discussions on how to best optimize harmonized regulatory policies among agencies. The Council will work with Congress if new legislation is necessary to achieve a consistent, effective, and efficient food safety policy.

Question. There are those who believe that USDA has an inherent conflict of interest between its responsibilities in regulating food safety and in the promotion of the sale of agricultural commodities, particularly in the decision process within the office of the Secretary of Agriculture. How do you respond to this concern and what assurance can you provide to these critics that USDA will make food safety its priority?

USDA answer. In 1994, the Congress and Administration effectively eliminated what had appeared to some as a conflict of interest by separating the food safety and regulatory function from marketing functions related to agricultural products, two mission areas that had previously been housed together within the Department. We cooperated in enacting a major reorganization of food safety within USDA, creating the new mission area and Office of the Under Secretary for Food Safety, which oversees the Food Safety and Inspection Service (FSIS) and the U.S. Manager of Codex Alimentarius. Under that legislation, a mission area dedicated to public health was created within USDA, and the legislation mandated that this office be occupied by an individual with a proven background in public health and safety.

Question. As a cosponsor of the Safe & Fair Enforcement and Recall (SAFER) Meat and Poultry Act, I believe it is important for USDA to have the necessary authority to be able to legally require the recall of food products. Had this law been in effect in recent years, how would the Department been able to more effectively carry out its responsibilities to ensure a safe and healthful supply of meat and poultry?

USDA Answer. Mandatory recall authority would specify the particular circumstances and evidence needed for the Agency to order a product recall. Mandatory recall authority would provide FSIS with an important tool of public health protection. It would also provide the regulated industry with a full understanding of the qualifying factors under which the Agency would move to order a recall. For example, recall authority may help in cases where there was an epidemiological link between consumption of a particular food and illnesses where we did not have laboratory reports of a pathogen in the product. Under the current law there would be a question of whether we could meet the statutory adulterations standard of there being an added poisonous or deleterious substance in the food. If the producing firm upon request by FSIS choose not to recall, the Agency might not be able to prevail in an action to detain or seize the product.

Question. In recent times, there have been a number of incidents involving health concerns related to food imports. In addition, there have been concerns about the level and consistency of inspections of imported food. What steps are being taken to ensure that food imports meet the same high standards that are required of domestically-produced food?

USDA answer. Imported meat and poultry are required to be inspected under a foreign inspection system that FSIS has determined to be equivalent to our system. Then upon arrival at a U.S. port of entry, all meat and poultry shipments undergo reinspection by FSIS. At this time, 36 countries have been certified to meet our standards. These are not special or lower standards; they are standards that U.S. packers and processors must meet. In general, inspection under an equivalent system means meeting U.S. standards for microbiological pathogens and chemical residues; it also means meeting all sanitation standards applicable to U.S. meat or poultry establishments. And most importantly, all establishments exporting meat and poultry to the U.S. must meet the requirements of FSIS' Pathogen Reduction/Hazard Analysis and Critical Control Points final rule.

FSIS uses a two-part evaluation process to determine the initial eligibility of a country's food regulatory system and to verify that foreign food regulatory systems continue to be equivalent. The first part is a recurring document analysis wherein the fundamental laws, regulations, and implementing policies of an exporting country's food regulatory system are reviewed in parallel with U.S. government issuances to ensure that an appropriate legal and regulatory structure remains in place. The second part is on-site food regulatory system audits conducted first for initial system equivalence determinations in each country that applies for export of

meat or poultry to the United States and then continued thereafter annually once eligibility is granted.

As a further check on the effectiveness of an eligible country's inspection system, FSIS conducts continuous port of entry reinspection of products shipped from exporting countries. Reinspection provides evidence of how the foreign inspection system is functioning. During 1998, approximately 75 import inspectors carried out import reinspection at 150 FSIS-approved import establishments. About 3 billion pounds of imported meat and poultry were reinspected during 1998.

FDA answer. FDA's position has always been that there is a single set of standards for food products consumed in the United States, irrespective of whether the food is produced domestically or imported. The FDA's Center for Food Safety and Applied Nutrition, or CFSAN, establishes the standards that are used by FDA. The Agency determines what field operations are necessary to ensure that imported, as well as domestic, products meet those standards.

The Agency's plan for ensuring the safety of imported foods in fiscal year 2000 and beyond uses a three pronged approach. FDA will continue with its current policy of conducting outbreak investigations and containment of foodborne illness outbreaks originating from foreign countries. FDA will also expand activities at U.S. borders, including sample collections and analyses, review of products offered for entry into the U.S. via the Operational and Administrative System for Support, or OASIS, database, and cooperative interaction with U.S. Customs. FDA seeks to ensure the safe importation of food into this country and to prevent future outbreaks, by planning an expansion of its foreign activities beyond inspections to include food safety system assessments. If a foreign country's food safety system is equivalent to ours, we can leverage our resources to more effectively concentrate on those higher priority issues related to imports.

FDA's request for FSI funds in fiscal year 1999 and proposed in fiscal year 2000 will support several types of cooperative efforts with foreign nations, including evaluating food systems of foreign countries. These efforts are designed to enhance the safety of imported foods by assessing the food safety systems of individual countries. The Agency is involved with countries in five specific programs based upon the volume of imports from those countries, or FDA's desire to build upon on-going assessment activities with those nations. FDA's Import Plan calls for five assessment efforts: equivalence agreements; assessments of our NAFTA partners' food safety systems; assessments and consultations with foreign countries via the InterAmerican Development Bank, or IADB; Memorandum of Understanding, or MOU, agreements; and Low Acid Canned Foods, or LACF, assessments.

As a member of the World Trade Organization, or WTO, the U.S. is required to recognize another country's request to establish an equivalence agreement in which FDA would accept that country's measures as capable to provide the same level of health protection as is provided to consumers by the FDA system. However, FDA prioritizes the countries it will enter into agreements with on the basis of the volume or amount of trade with that country. Prior to making an actual equivalence determination, collaborations, assessments and on-site audits are conducted. In fiscal year 1999, FDA expects to complete its determination of equivalence for the Canadian seafood regulatory system. In fiscal year 1999 and 2000, FDA expects to make significant progress on seafood determinations for New Zealand, Australia, Thailand, Japan, Iceland, and Chile. Also in fiscal year 1999, FDA is working towards equivalence determinations for non-Grade A dairy products with the European Union.

The Agency is continuing to work on assessment efforts with our NAFTA trading partners, Mexico and Canada. Due to volume of imports from these two countries, FDA places a high priority on developing joint efforts as they relate to food safety. In fiscal year 1998, FDA and USDA signed a letter of intent with Mexico to cooperate on food safety issues. FDA and the Ministry of Agriculture and Livestock of Mexico, or SAGAR, developed a preliminary list of commitments that include FDA review of training materials and participation in training programs on good agricultural practices. FDA and SAGAR will sponsor two collaborative exchanges that will lay the structure and formalize lines of communication for joint projects in the areas of research, outbreak response and training. The Agency plans to complete a similar collaborative exchange with Canada in late fiscal year 1999 or early fiscal year 2000.

The IADB, which provides loan packages to developing nations, recently included food safety assessments in their initial examination of a country's systems. FDA served as a consultant to the bank and participated in food safety system assessments of Honduras, and Trinidad and Tobago. Food safety assessments are planned for Nicaragua and Costa Rica. FDA's cooperative efforts with IADB will enable the

Agency to assess the systems of developing countries that export food to the United States.

FDA's other two assessment activities build on existing assessment programs. MOU assessments are conducted in countries for which FDA has already established that certain food products produced in that country meet U.S. requirements. An assessment is conducted to ensure the country is continuing its monitoring and compliance activities. In fiscal years 1999 and 2000, FDA will conduct shellfish assessments for Chile, Canada, New Zealand, Korea, and Mexico. FDA other assessment activity involves the initiation of a pilot program for LACF with Spain and Thailand. These pilots include participation of the countries' regulatory personnel in FDA inspections of producers, an evaluation of the countries' ability to assure that products are manufactured in accordance with FDA's LACF regulations. An assessment of the pilots will be conducted in fiscal year 1999.

Question. American farmers are concerned that imported commodities may have competitive advantages because of differing environmental standards, particularly in relationship to pesticides. They are also concerned that these commodities may not meet the same health standards that are required of their production system. To what extent are imported agricultural commodities inspected for pesticide residues?

FDA answer. FSIS randomly samples products at ports of entry for drug and chemical residue analysis. The annual import residue plan sets the initial sampling rate for each country based on the volume of product exported to the United States during the previous year. In 1999, FSIS plans to collect 2,526 samples of meat and poultry for the laboratory analysis of pesticide chemicals.

A residue violation at the port of entry raises concerns about the origin country's residue controls, and in addition to placing the plant with the violation on "tightened and hold," FSIS doubles sampling of related products from the rest of the plants in the country. In 1997, there was one violation for pentachlorophenol detected at a violative level in product from Australia. There were no violative levels of pesticides detected in imported meat and poultry products during 1998.

FDA answer. Imported commodities are subject to the same pesticide tolerances as domestic commodities, and, if found to contain unlawful pesticide residues, these commodities will be subject to the enforcement provisions of the Federal Food, Drug, & Cosmetic Act. The Agency has no specific evidence that unapproved pesticides are routinely being used on commodities that are exported to this country. In the past when the Agency has determined that an unapproved pesticide is being used on a commodity being exported to this country, it has taken appropriate actions to resolve the issue. If illegal residues are found in domestic samples, FDA can take regulatory action, such as seizure or injunction. For imports, FDA can stop shipments at ports of entry. The FDA publishes an annual report of its pesticide monitoring work. Over the years, FDA has found a very low violation rate for pesticides in both domestic and imported commodities and consequently has reduced the amount of resources used to sample for pesticides.

A total of 8,594 samples of domestically produced food and imported food, most of which are agricultural commodities, from 94 countries was analyzed for pesticide residues in 1998. Of these, 7,457 were surveillance samples, which are collected when there is no evidence of a pesticide problem. No residues were found in 64.9 percent of domestic surveillance and 68.1 percent of import surveillance samples. FDA collected and analyzed animal feed samples-482 domestic, 60 import-for pesticides. The results indicated that 60.8 percent of the domestic surveillance samples and 61.7 percent of the import surveillance samples contained no residues. Non-violative residues were found in 99 percent of the domestic and 97 percent of the imported surveillance samples. The majority of the violations are due to the presence of very low levels of residues of pesticides that do have U.S. tolerances, but not for the particular commodity on which the residues were found. Most of the Total Diet Study findings for 1998 were generally similar to those found in earlier periods with residue levels well below Reference Doses and Acceptable Daily Intakes established by EPA and FAO/WHO. An adjunct survey of baby foods in 1991–1998 also provided evidence of only small amounts of pesticide residues in those foods.

FDA participates in several international agreements in an effort to minimize incidents of violative residues and remove trade barriers. A standing request for information from foreign governments on pesticides used on their food exported to the U.S. exists by way of a provision in the Pesticide Monitoring Improvements Act. Under the auspices of the North American Free Trade Agreement or NAFTA, the United States, Mexico, and Canada have established a NAFTA Technical Working Group on Pesticides or TWG. The NAFTA Pesticide TWG now serves as the focal point for all pesticide issues that arise among the three NAFTA countries. FDA has proposed to reinvigorate a residue monitoring subcommittee under the TWG to ad-

dress issues concerning pesticide residue violations. This will complement its ongoing trilateral cooperation with its counterparts in Mexico and Canada.

One of the major goals of the TWG is to ensure that pesticide registrations and tolerances and maximum residue limits in the three countries are harmonized to the extent practical, while strengthening protection of public health and the environment. A number of projects have been undertaken by the TWG to identify differing residue limits in the NAFTA countries and to determine what steps might be taken to harmonize the limits. While this is a difficult process, the TWG envisions eventual movement toward a North America pesticide registration and tolerance system so that citizens of all three countries can be assured of the safety and legality of foods produced in any one of the NAFTA countries. FDA's activities on the TWG complement its ongoing bilateral cooperation with its counterparts in Mexico and Canada.

Beyond the North American agreements, FDA continues to collaborate with New Zealand to implement a residue compliance assurance program. New Zealand, historically having excellent compliance with U.S. pesticide tolerances, is implementing a plan whereby their government would provide assurances that selected commodities exported to the United States would be in full compliance with U.S. tolerances.

The Agency determines what field operations are necessary to ensure that imported as well as domestic products using the issuance of Compliance Programs, Sampling Assignments, and Import Alerts meet those standards. FDA's Operational and Administrative System for Import Support, or OASIS, then uses these criteria to electronically screen entries of imported food to determine which shipments will be allowed to proceed into commerce without any further FDA review and which must be reviewed by FDA personnel. For those reviewed by FDA personnel, the criteria provide direction regarding those, which should be examined or detained without examination. In order to assure that FDA field personnel consistently and uniformly inspect imported food products according to these criteria, FDA periodically conducts a one-week training course in Import Investigations for Import personnel.

Question. Any food safety agency reviewing extent to which pesticides are used in other countries that are not available in U.S.?

FDA answer. FSIS is unaware of any such effort.

Question. Any inspection program designed to address concerns about these countries (using pesticides that U.S. doesn't use)?

FDA answer. Each year, FSIS reviews the residue programs for all countries eligible to export meat and poultry to the U.S. FSIS reviews the foreign residue programs to determine that these programs address all relevant public health concerns. This includes ensuring that the countries are properly controlling the use of pesticides and other compounds that are not permitted for use in the United States.

Question. Agricultural Exports—Increased production, resulting from higher yield worldwide, and lower demand have been devastating to U.S. wheat prices and exports. While the administration has increased its use of export credit programs, it has not utilized the export enhancement program. Has the Department analyzed the targeted use of the Export Enhancement Program (EEP) for a particular class of wheat, such as durum, in specific markets such as North Africa and Subsaharan Africa?

USDA answer. USDA has conducted analysis which indicates that with current market conditions where global wheat supply exceeds demand, any small domestic price benefits from using EEP would be far outweighed by lower world prices. Moreover, it would likely require that a significant portion of U.S. wheat exports be subsidized in order to achieve even a modest increase in total projected U.S. exports.

Given that analysis, this year's large world supplies and modest import demand for durum and all wheat make it highly unlikely that targeting the Export Enhancement Program to a small, select group of countries would result in any expansion of U.S. exports. In fact, it might even raise questions from countries not targeted and cause them to reduce their imports from the United States. Consequently, a reinstallment of EEP would not move additional wheat off our market and would have only a minimal impact on prices received by producers. Moreover, to the extent that EEP had a positive impact on U.S. prices, it would make the U.S. market more attractive to imports from Canada.

Question. What program or combination of programs are needed in order to regain markets and market shares for wheat?

USDA answer. In order for the U.S. to maintain and gain market share for wheat in overseas markets we must continue to work from many different angles with a combination of export programs, marketing and policy measures. All of the export-oriented programs currently administered by the Foreign Agricultural Service are

vital to maintaining and gaining U.S. market shares for wheat. We are currently using the GSM export credit guarantee programs to help countries which have financing problems; the Public Law 480 Title I food aid program to provide wheat with long repayment terms; and the President's Food Aid Initiative which is providing 5.0 million tons of wheat to assist countries to meet their food import needs.

On the marketing side, USDA is working closely with the U.S. wheat industry to provide Market Access Program (MAP) and Foreign Market Development (FMD) funding to promote U.S. wheat and educate buyers about the quality and different varieties of U.S. wheat.

On the trade policy front, we will be working in the World Trade Organization (WTO) to lower trade barriers which limit U.S. wheat export opportunities and to discipline the unfair practices of our competitors which use export subsidies and State Trading Enterprises. We also continue to work on a bilateral basis to open markets where U.S. wheat may have been banned due to phytosanitary concerns.

Question. Has the Department conducted a policy review of the effectiveness of the use of food in sanctions established for foreign policy objectives? What has been the impact on the populace of sanctioned countries and upon the American farmer of sanctions on agricultural goods?

USDA answer. USDA has not conducted a formal study on the effectiveness of including food in sanctions regimes. In many cases, sanctions on food hit innocent civilian populations, who frequently have no say in the policies of their governments. To the extent possible, our sanctions should target the decision makers responsible for the objectionable behavior who will likely be unaffected by restrictions on the provision of food.

USDA has conducted an analysis on the effect of sanctions on agricultural exports. Six countries are included (Cuba, Libya, Iran, Iraq, North Korea, and Sudan). The USDA study concluded that the impact of current sanctions on U.S. farm exports amounts to an estimated $500 million per year—a significant amount to be sure, but less than 1 percent of last year's 53.6 billion in overseas U.S. agricultural sales. Without a doubt, sanctions are hurting producers, but the likely impact on wheat prices is about 5–10 cents per bushel.

Question. The use of tax identification numbers as a method of determining eligibility for the multi-year disaster program is creating serious problems for producers who have had legitimate changes in tax identification numbers, due to death, estates, business incorporation, etc. What steps are being taken to allow these producers to work with the county FSA offices to ensure their eligibility for the multi-year disaster program?

Answer. FSA has become aware of some legitimate reasons for changes in tax identification numbers and is currently developing processes to accommodate situations involving husbands and wives, deaths, or other changes beyond the control of the producer. We are making every effort to ensure that producers who suffered multi-year losses are fairly compensated.

Question. The Report of the Senate on the Omnibus Appropriations Act last fall requested the Secretary to give consideration to producers of edible beans who had inadvertently planted edible beans on AMTA Contract Payment Acres so that these producers would not be put into economic jeopardy as result of their error. What steps have been taken to resolve this issue, and how much longer will these producers have to wait before they know how USDA will address their problem?

USDA answer. FSA is in the process of soliciting public comment on its current payment reduction formula for producers who plant fruits and vegetables on AMTA contract payment acres. The Advance Notice of Proposed Rule Making is currently in its final stages of clearing the Department and will be published in the Federal Register. Once comments are received and reviewed, USDA will take appropriate action based on public recommendations.

Question. What is the status of making hulless oats eligible for the price support loan program and loan deficiency payments? This is an important new variety that was developed by our land grant university. It has superior feeding qualities and yield, and also has potential commercially-viable non-food uses. I have been in contact with both FSA and GIPSA to request that it be recognized as an approved variety by the grading standards and that in the interim, that this oat variety should be made eligible for the commodity loan program. Will this decision be made in time for the 1999 spring planting season, so that producers will be able to choose this variety for their oat planting this crop year and be assured that it will be eligible for commodity loans?

USDA answer. The Federal Grain Inspection Service (FGIS) is currently promulgating regulations to modify oats grain standards which would redefine oats to include hulless oats. This will make hulless varieties eligible for marketing assistance loan benefits under current loan program regulations. Due to the time it takes to

fully promulgate the FGIS standards, the definition of oats would not be effective until the 2000 crop. However, the Farm Service Agency has taken administrative action which will allow producers of hulless oats to receive marketing assistance loan benefits for the 1999 crop.

Question. What is the status of making crambe eligible for the oilseeds loan program? This is an important new oilseed crop that provides an alternative crop for a significant developing market for producers in North Dakota through a cooperative structure. Since USDA is directed to give priority to cooperative development, it would make sense for USDA to expedite approval of commodity loans for these producers.

USDA answer. The Secretary, under authority provided by the Federal Agriculture Improvement and Reform Act of 1996 (1996 Act), has designated crambe as an "other oilseed" and will extend marketing assistance loans to crambe for the 1999 crop at $0.0877 per pound. The loan rate for crambe is set on a pound-per-pound basis in relation to the soybean loan rate. Extending marketing assistance loans to crambe will provide much needed financial assistance to producers until the crambe can be delivered for processing and help to encourage development of an alternative enterprise for producers consistent with the objectives of supporting greater planting flexibility and rural development.

Question. On June 8, 1998, Secretary Glickman announced at a Farm Forum in Grand Forks, ND, a program to assist livestock producers with flooded lands in the region. Subsequently, Secretary Glickman announced a broader program as part of the disaster assistance package for farmers in the region with flooded acres. When will the details of this program be announced and when can farmers expect to begin signing up for these programs?

USDA answer. The Flood Compensation Program is in its final stages of completion. A regulation is being cleared through the Office of General Counsel, software has been developed and procedures drafted. Personnel from both South and North Dakota State FSA Offices have been involved in creating this program. The Secretary designated $12 million received from the sale of grain in the disaster reserve to compensate livestock producers with eligible flooded land that was inaccessible or incapable of crop production, grazing, or haying. Section 1102 of the fiscal year 1999 Omnibus Appropriations Bill authorizes the Secretary to provide assistance to producers on a farm who have incurred multi-year losses due to disasters. Under this authority, the Secretary has allocated an additional $30 million to the Flood Compensation Program to provide assistance to any producer who has incurred multi-year crop losses due to long-term flooding. We anticipate that regulations which will allow signup to begin will be published in April. Because of a limited amount of funds, signup will have to be completed, application data downloaded, and a factor determined, if necessary, before payments can be issued. If a six week signup is allowed, payments could be issued in June.

Question. I applaud ARS for increasing its research budget for the very serious crop disease known as fusarium head blight (scab). This disease has been identified as the most serious crop disease of this century. In addition to research at ARS facilities, the budget also contains funding for the 12 state consortium of land grant universities for research on this disease. I believe funding for the consortium should be increased to its full authorized level. How will ARS coordinate the research between its facilities and the consortium to increase the effectiveness of research objectives? How rapidly can these programs be expanded to reduce the time frame for combating this disease?

USDA answer. Research on Fusarium head blight is coordinated between ARS facilities and the land grant universities by close working interactions involving scientists, research administrators and industry representatives which make up the U.S. Wheat and Barley Scab Initiative executive and steering committee members. Research objectives are jointly established and research proposals are solicited from both state and federal scientists. Proposals are evaluated and modified if necessary to avoid unnecessary duplication and to assure that all research objectives are being approached in the most effective manner.

Should additional resources be made available the research program could be rapidly expanded on existing objectives through the addition of scientific and technical support staff, both in the land grant universities and in ARS. Existing research objectives would still be relevant with emphasis on increasing resistance to scab in wheat and barley germplasm and developing integrated strategies to minimize disease losses.

Question. The Northern Great Plains ARS Research Center at Mandan has consolidated its research efforts and refocused its mission. I am pleased that ARS has worked to continue the important research at this facility that has historically provided sound production and conservation research for the Northern Great Plains.

Because of the environmental and conservation benefits of research at this facility, there have been suggestions that ARS include wildlife biology as a component of this research. Has ARS looked at the feasibility of such a component? In addition, what is the status of the preservation and maintenance of the tree cultivars that have been an important part of past research at this facility? Has ARS considered the potential of trees as part of removing carbon from the atmosphere related to climate research?

USDA answer. We agree with your assessment that the research program at the Northern Great Plains Research Laboratory in Mandan has and will continue to provide environmental and conservation benefits. While wildlife management research is not a part of the ARS mission, we could integrate wildlife considerations into our research program in two ways. First, through the addition of a Range Scientist with a background in wildlife biology to our staff to insure that improved crop and soil management systems being developed are in harmony with wildlife conservation goals. Secondly, we have close cooperation with wildlife groups such as Ducks Unlimited in Bismark and the U.S. Wildlife Service in Jamestown, North Dakota. Permanent staff employed by these groups could enhance our expertise in wildlife biology and allow us to design and implement projects that meet multi-use objectives.

We are committed to preserving and maintaining the tree germplasm currently located on land owned or leased by the Northern Great Plains Research Laboratory in Mandan. As such, we have controlled weeds, performed tree trimming, and periodically removed dead trees.

Trees certainly play a major role in sequestration of atmospheric carbon. Because of the mission of our laboratory we feel it is important to initially emphasize soil carbon storage in grazinglands and croplands. Trees could ultimately become a component of a cropping system or a grazingland management system. Their contribution to carbon sequestration would then be determined in the context of the overall system.

Question. The Northern Crops ARS Laboratory at Fargo is well situated to expand research in the new challenges facing producers in this region of the country. In particular, it has the capacity to expand research in emerging diseases both in grain and in specialty crops. Because the region is seeking to diversify with alternative crops, there is also a great need for expanded basic research in crops such as sunflower, canola and other oilseeds, and edible beans. What is the level of ARS research for alternative crops for the region? If additional funding were available, what research would ARS seek to undertake in these areas?

USDA answer. At Fargo, ND, the ARS Sunflower Research Unit is focused on reducing the cost of sunflower production by developing breeding lines and inbreds with improved yield potential and improved quality characteristics and that are used by industry to develop improved sunflower hybrids, and to increase resistance or tolerance to important sunflower disease and insect pests. Additionally, the Unit supplies the sunflower industry with new genes and germplasm by collecting wild sunflowers and developing techniques for transferring these new genes into domesticated sunflowers. The Unit also conducts research on understanding the biology and biocontrol of important insects such as the sunflower stem weevil, sunflower beetle, and banded sunflower moth. This information is used to develop improved Integrated Pest Management strategies to control these sunflower insects. In fiscal year 1999, ARS provides $1,452,600 (7 SYs) for research in sunflowers at Fargo, ND, and $254,500 (.8 SYs) for sunflower research at Mandan, ND. At Mandan, ND, ARS is studying the agronomic practices required to optimize the yield and economic returns of alternative crops including edible beans, sunflowers, and canola.

If additional funding were available, ARS would increase its efforts to understand the biology and biocontrol of sunflower insects and diseases, increase its efforts in genomics and molecular genetics of sunflowers, initiate genetic and pathology research on dry edible beans, and develop a breeding and genetics program to develop improved, better-adapted varieties of canola. With the recent development of NuSun sunflowers, good potential exits to increase the sunflower acreage in the area and the sunflower industry has identified the need for improved insect and disease control and increased efforts in molecular genetics as high priority research areas. Dry edible bean acreage in the Northern Plains has increased significantly over the past 30 years and the area now produces more than half the total domestic dry edible beans. Genetic and pathology research will aid in the development of improved dry bean varieties for the area. Much of the canola used by the United States is imported. Thus, the potential for increasing the domestic production of canola is high if improved varieties are developed.
