Question. Reviews by wheat and barley organizations of research funding at the Northern Crops Laboratory at Fargo raise concern about the adequacy of the dollar

level per scientist at the facility. How does the per scientist funding level at the Northern Crops Laboratory compare to other ARS facilities and ARS standards? If it is below optimum levels, why is that the case? What are the longer range plans to improve the funding level per scientist at this facility?

USDA answer. The annual funding level for the Cereal Crops Research Unit within the Northern Crops Laboratory (NCL) averages just over $200,000 per scientist. ARS considers funding of $300,000 to be the optimum level to support new scientists. NCL is an established (and highly productive) research unit conducting research of relevance to ARS stakeholders. However, the continuing absorption of costs required to finance annual pay increases and other increased costs of operations have eroded the purchasing power of the resources allocated to NCL and other ARS research locations throughout the nation. ARS will continue to seek additional resources through the annual budget process to improve the funding level per scientist at the NCL. Without additional funds in this unit, some positions vacated through retirements will have to remain unfilled. The fiscal year 2000 budget request related to the "emerging diseases" program area includes a $300,000 proposal for increased funding at the NCL to add a new scientist for durum wheat genetic research to study resistance to Fusarium head blight.

For Michael Dunn, Marketing and Regulatory Programs

Question. What is the status of the bonus buy for bison that is under consideration at the Department? While everyone in the bison industry agrees with the agency's determination to deal with the brucellosis-infected bison herd in South Dakota. What steps are being taken to resolve this problem and to move forward with the bison purchase on a timely basis?

USDA answer. The brucellosis issue is not delaying USDA' response to the request for a bison buy at this time. The bison industry's request is currently under consideration by the Department.

QUESTIONS SUBMITTED BY SENATOR FEINSTEIN

Question. To what do you attribute the increase in meat contamination and recalls over the past several years? What assurances can you give the Committee that the increases are not due to failures or shortcomings in the new USDA inspection process?

FDA answer. There has not been an increase in contamination of meat and poultry products. Our data indicate that over the past ten years the findings of pathogens such as Listeria monocytogenes in ready-to-eat products have decreased. Also, the incidence of reported foodborne listeriosis has decreased over the same period of time. There is no indication that the HACCP inspection system somehow has failed, thereby causing an increase in product contamination. The recent increase in meat and poultry product recalls is mainly due to the new epidemiological tools, such as PFGE analysis, we now have at our disposal. In the past, the illnesses associated with listeria outbreaks would have been considered unconnected cases. With PFGE analysis, links can now be made among such cases and specific products, which drives product recalls. FSIS has also been more aggressive in conducting testing of products already in the marketplace when there are reports of potential product contamination. When positive results are found, recalls ensue.

To the contrary, data collected during one year of a new, science-based prevention-oriented meat and poultry inspection system indicates a reduction in the incidence of Salmonella in some raw meat and poultry products. Of chicken carcasses, 20.0 percent tested positive for Salmonella before HACCP implementation compared to 10.9 percent one year after implementation-a decline of nearly 50 percent. And 8.7 percent of swine tested positive prior to HACCP versus 6.5 percent after HACCP implementation, a decrease of more than 25 percent. Ground beef went from 7.5 percent prior to HACCP to 4.8 percent after a year, a decline of 36 percent.

Question. The new HACCP program allows meat and poultry producers to run their own inspection process. As the number of plants implementing this system increase, what steps are USDA taking to insure that mistakes aren't made during the transition process?

FDA answer. HACCP programs do not allow meat and poultry producers to run their own inspection process. FSIS believes its food safety goal should be to reduce the risk of foodbome illness associated with the consumption of meat and poultry products to the maximum extent possible. This goal would be accomplished under HACCP by ensuring that appropriate and feasible measures are taken at each step in the food production process where hazards can enter and where procedures and

technologies exist or can be developed to prevent the hazard or reduce the likelihood it will occur.

HACCP provides the framework for industry to set up science-based process controls that establishments monitor, verify, validate and document as effective for controlling and reducing hazards. The Pathogen Reduction Rule, of which HACCP is a part of, delineates and clarifies the respective roles of industry and FSIS to ensure that meat and poultry products are produced in accordance with sanitation and safety-standards and are not adulterated or misbranded within the meaning of the FMIA and PPIA. The rule makes clear that the industry is responsible for producing and marketing products that are safe, unadulterated, and properly labeled and packaged.

FSIS is responsible for inspecting products and facilities to verify that the statutory requirements are being met and for taking appropriate compliance and enforcement actions when the requirements are not being met. FSIS Pathogen Reduction inspection methodology verifies plants are meeting requirements upon the date the regulatory requirements become effective and on an ongoing basis thereafter. Inspection personnel conduct basic verification inspection procedures to determine whether the establishment has instituted required systems, i.e., HACCP, Standard Sanitary Operating Procedures (SSOPs), and/or E. cold sampling. Inspection personnel then conduct inspections to verify that these food safety and process control systems are operating on an ongoing basis.

As an example, under HACCP, inspectors will perform a procedure for reviewing features of a HACCP plan in operation—such as correlating records with random observation or measurement at a critical control point—or a procedure for reviewing the implementation of an entire HACCP plan for a particular product. The objective of these activities is to determine whether, as documented in its records, the establishment is complying with the requirements for the implementation of a HACCP plan. These requirements include monitoring, verification, and corrective action so that FSIS can make determinations about HACCP system adequacy, i.e. whether the system prevents the distribution of adulterated products that may endanger public health.

Question. Last year, a GAO Report found that federal agencies cannot ensure the growing volume of imported food is safe for consumers. The report found port of entry inspections are ineffective because:

—It does not ensure that foods are produced under adequately controlled conditions

—The FDA inspects less than 2 percent of foreign shipments

—Many organisms, such as Cyclospora, are not detected through visual inspections

What steps have the FDA and FSIS taken to address the concerns raised in the GAO Report? Have the number of inspections increased? What is being done to hold importers of tainted foods accountable for their actions?

Answer. General Accounting Office (GAO) report (RCED–98–103) released April 30, 1998, recommended that the agency modify the Automated Import Inspection System (AIIS) to better identify those imported foods posing the greater health risks. FSIS concurred with the GAO recommendation. As a result, the Agency has organized a team to review the import inspection system, including inspection standards and procedures, computer support, and the AIIS. The review was organized in three phases: (1) an initial evaluation phase; (2) a redesign-and-recommendation phase to be completed by late 1999; and then (3) implementation to be completed by the end of 2000. Phase l of this process is nearing an end.

The number of import reinspections has not increased. Currently, all meat and poultry shipments that enter the United States are reinspected for transportation damage, labeling, proper certification, general condition, and accurate count. In addition, the AIIS assigns various types of inspections, which can include: product examination, net weight checks, examination of condition of containers, incubation of shelf-stabled canned products, and laboratory analyses for food chemistry, chemical residues, microbiological contamination, and species tests. Reinspection is performance-based; better performing foreign establishments have their products reinspected less frequently.

Imported meat and poultry products that do not comply with U.S. requirements are not allowed to enter U.S. commerce and are identified as "U.S. Refused Entry Product." When this occurs the broker/applicant has 45 days to either destroy, reexport, or convert the refused entry product to animal food. Subsequent shipments are subjected to intensified port of entry reinspection in order to determine that future shipments meet U.S. requirements.

Question. Under the current system, imported products are treated differently by FDA and USDA. For meat and poultry, the USDA first approves a country's safety

system and then inspects individual plants. The FDA only has the authority to inspect at the border. Why is there such a difference in the two systems? Does the FDA believe they can adequately ensure the safety of imported products with their current authority and staff budget?

FDA answer. For many years USDA has employed the following approach. First, a country's meat and or poultry system is subject to an initial equivalence judgement. Until that determination has been made, no meat or poultry product can be exported to the U.S. Second, the country is subject to on-site audits to verify that the foreign inspection system continues to meet

U.S. requirements. Third, imported product is subject to random reinspection at ports of entry.

Question. The USDA is considering rules regarding the importation of Argentine citrus products. The California Department of Food and Agriculture has expressed strong concerns that the citrus products may be infected by citrus black spot and sweet orange scab. Should the imports be allowed, what is the process to insure that tainted produce is identified before contamination spreads to domestic industries?

FDA answer. FDA is in the process of addressing the items of concern in the 1998 GAO Report. In an attempt to better influence the conditions over imported foods, FDA increased the number of foreign inspections it conducts from 40 in fiscal year 1998 to 100 in fiscal year 1999, and has requested resources to conduct 250 foreign inspections in fiscal year 2000.

FDA initiated, through the President's FSI, increased collaboration and cooperation with foreign governments in the form of education and technical assistance to foreign governments. In addition, in fiscal year 1999 and subsequent years, FDA will participate in assessments of foreign country's ability to produce products in conformance with U.S. standards or their equivalent, including Good Agriculture Procedures or GAPs, Good Manufacturing Procedures or GMPs, Seafood HACCP, Low Acid Food/Acidified Food regulations. FDA is also pursuing equivalency agreements with countries which have proven that they can produce food products under regulatory and safety systems equivalent to that imposed on domestic processors in the U.S.

FDA has long concluded that end product inspection alone cannot assure that all food products offered for entry into the U.S. meet the safety and wholesomeness standards required by the laws and regulations the Agency enforces. In fiscal year 1999, through the FSI, the Agency received additional resources to increase the amount of sampling of foreign produce offered for entry into the U.S. However, with the number of imports offered for entry into the U.S. continuing to increase in excess of 10 percent a year, it is not feasible for the Agency to divert resources from its domestic programs to maintain the current level of imported products inspected. While the number of entries examined has increased, the total percentage of entries examined will continue to decline.

FDA's Center for Food Safety and Applied Nutrition and Office of Regulatory Affairs are currently exploring with the Office of Chief Counsel, alternative strategies to deal with repeat offenders, including both foreign shippers and producers and domestic importers and brokers. Currently an imported entry found to be violative is detained and refused entry into the country. In addition, the shipper or producer of the product may have future entries designated as Detain Without Physical Examination or DWPE. DWPE causes each subsequent entry to be examined by a private laboratory at the importers expense to assure that the product does not violate FDA statutes. Some of the stronger regulatory options that the Agency is considering, are product seizures or injunctions or other court action if the violations continue.

Question. Under the current system, imported products are treated differently by FDA and USDA. For meat and poultry, the USDA first approves a country's safety system and then inspects individual plants. The FDA only has the authority to inspect at the border. Why is there such a difference in the two systems? Does the FDA believe they can adequately ensure the safety of imported products with there current authority and staff budget?

FDA answer. FDA believes that there is a single set of standards for food products consumed in the United States, irrespective of whether the food is produced domestically or imported.

However, you are correct in stating that there is a difference between USDA's and FDA's approach with regard to imports. This difference is the result of the nature of each agency's statutory authority. The biggest difference is that the USDA/FSIS system is essentially one of premarket licensing of regulated facilities. On the other hand, FDA's premarket authority is limited to premarket safety reviews of food and color additives, and does not include licensing authority for food production facilities.

In order to ensure the safety of all foods consumed in the U.S., FDA continues to develop strategies that will allow the Agency to increase inspectional activity within foreign borders. One such strategy calls for FDA to conduct audits of foreign food systems and to assess the prospect of developing future equivalency agreements. As a part of these audits, a country's infrastructure, laws, regulations, inspectional force, and regulatory follow up are evaluated. Assessments were completed for Honduras, Trinidad and Tobago in fiscal year 1998. We have tentative plans to conduct assessments for Costa Rica and Nicaragua in March 1999, and we have tentatively scheduled reviews of the infrastructure, laws and regulations related to food safety for both Canada and Mexico in fiscal year 1999. In a second strategy, FDA is conducting several types of inspections in the country of origin. Primary countries in which seafood inspections are being conducted include Ecuador, Taiwan, Phillippines, Viet Nam, and Indonesia. FDA's Low Acid Canned Food Inspections program will conduct inspections in the following primary countries: Ecuador, Brazil, Canada, Malaysia, Philippines, Indonesia, and India. The Agency is also conducting compliance inspections for land foods in Canada, Mexico, Italy, Portugal and France. Primary commodities inspected will include cheese, ready-to-eat, heat and serve snack foods, and candy, including chocolate candy.

In fiscal year 1999, through the Food Safety Initiative, the Agency received additional resources to increase the amount of sampling of foreign produce offered for entry into the U.S. However, with the number of imports offered for entry into the U.S. continuing to increase in excess of 10 percent a year, it is not feasible for the Agency to divert resources from its domestic programs to maintain the current level of imported products inspected. While the number of entries examined has increased, the total percentage of entries examined will continue to decline.

QUESTIONS SUBMITTED BY SENATOR DURBIN

Over the last 15 years, a strain of bacteria, Salmonella enteritidus (SE) has become a real threat to the safety of eggs and egg products. USDA has reported that each year more than 660,000 Americans get sick from eating eggs contaminated with SE. Further complicating the problem is the fact that some firms repackage, redate, and sell old eggs. Also troublesome is split regulatory jurisdictions and inconsistent federal and state egg safety standards—with no less than four federal agencies and hundreds of state agencies with responsibilities.

The omnibus bill directs USDA and HHS to submit a joint report on egg safety to this Committee. The report is intended to provide the status of actions taken to enhance the safety of shell eggs and egg products.

Question. What is the status of this report?

USDA answer. The report has been signed by both the Secretaries of Agriculture and Health and Human Services and is being delivered to the Committee today.

Egg Safety (directed to both USDA and FDA)

Over the last 15 years, a strain of bacteria, Salmonella enteritidus (SE) has become a real threat to the safety of eggs and egg products. USDA has reported that each year more than 660,000 Americans get sick from eating eggs contaminated with SE. Further complicating the problem is the fact that some firms repackage, redate, and sell old eggs. Also troublesome is split regulatory jurisdictions and inconsistent federal and state egg safety standards—with no less than four federal agencies and hundreds of state agencies with responsibilities. The omnibus bill directs USDA and DHHS to submit a joint report on egg safety to this Committee. The report is intended to provide the status of actions taken to enhance the safety of shell eggs and egg products.

Question. What is the status of this report?

USDA answer. The joint status report requested of the Secretaries of Health and Human Services and of Agriculture has been completed. It was delivered to the Chairmen and Ranking Minority Members of the House and Senate Appropriations committees on March 16, 1999 and a copy of it is attached to these answers. We will be happy to provide a copy for the record.

[The information follows:]

LETTER FROM DAN GLICKMAN

U.S. DEPARTMENT OF AGRICULTURE,
DEPARTMENT OF HEALTH AND HUMAN SERVICES,
Washington, DC, September 18, 1995.

Hon. THAD COCHRAN,
Chairman, Subcommittee on Agriculture, Rural Development, and Related Agencies Committee on Appropriations, U.S. Senate.

DEAR MR. CHAIRMAN: The Omnibus Appropriation for fiscal year 1999 requires the Secretaries of Agriculture and Health and Human Services to submit a joint status report to the Committees on Appropriations of the U.S. House of Representatives and the United States Senate that describes actions taken by the Secretaries of Agriculture and Health and Human Services (1) to enhance the safety of shell eggs and egg products; (2) to prohibit the grading, under the voluntary grading program of the Department of Agriculture (USDA) of shell eggs previously shipped for sale; and (3) to assess the feasibility and desirability of applying to all shell eggs the prohibition on repackaging to enhance food safety, consumer information, and consumer awareness.

Enclosed with this letter is the joint status report prepared by USDA and the Department of Health and Human Services (HHS). The first part of this report discusses the efforts taken by these two Departments from as early as 1992 to enhance the safety of shell eggs and egg products. These activities include a variety of regulatory and enforcement activities, guidance and information collection activities, research activities, educational activities, and public meetings. This report divides the efforts into HHS/Food and Drug Administration activities, USDA/Food Safety and Inspection Service activities, and cooperative interagency activities. The second part of this report describes efforts taken by USDA's Agricultural Marketing Service to prohibit, under its voluntary grading programs, the grading of shell eggs previously shipped for sale. The third part of this report describes efforts taken by both Departments to asses the feasibility and desirability of applying to all shell eggs the prohibition on repackaging to enhance food safety, consumer information, and consumer awareness.

This report reveals the close working relationship between USDA and HHS regarding shell eggs and egg products. Both Departments intend to continue this close relationship to serve the needs of the public in protecting the public health.

Sincerely,

DAN GLICKMAN,
Secretary of Agriculture.
DONNA E. SHALALA,
Secretary of Health and Human Services,

REPORT TO APPROPRIATIONS COMMITTEES OF THE HOUSE AND SENATE

Part 1:

Efforts taken by HHS and USDA to enhance the safety of shell eggs and egg products:

The efforts taken by the Department of Health and Human Services QIHS) and the U.S. Department of Agriculture (USDA) to enhance the safety of shell eggs and egg products include a variety of regulatory/enforcement activities, guidance/information collection activities, research activities, educational activities, and public meetings. For the most part, these efforts can be divided into HHS/Food and Drug Administration (FDA) activities, USDA/Food Safety and Inspection Service (FSIS) activities, and cooperative interagency activities.

FDA answer. The President's Food Safety Council released its response to the National Academy of Sciences or NAS report "Ensuring Safe Food from Production to Consumption" on March 15, 1999. The response includes a strong Administration commitment to improve the effectiveness of the federal food safety system through the strengthening of science and risk assessment, strategic planning, and better federal integration with state and local governments.

The Council strongly agrees with the goal of a unified framework for the food safety programs, while noting that there may be many organizational approaches to achieving a "single voice" for federal food safety activities. The Council will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning and resources allocation.

For the record I will provide the recommendations outlined by the NAS Report, along with a copy of the President's Food Safety Council response.

[The information follows:]

PRESIDENT'S COUNCIL ON FOOD SAFETY ASSESSMENT OF THE NAS REPORT ENSURING SAFE FOOD FROM PRODUCTION TO CONSUMPTION

EXECUTIVE SUMMARY

Americans have one of the world's safest food supplies. This is largely a result of sustained regulatory and education programs along the farm to table continuum as well as surveillance and research efforts. The federal food safety system, comprised of multiple agencies, is authorized by a diverse set of statutes and is supported by numerous key partnerships with state, local, and tribal governments. Together these agencies have created a system that has given U.S. consumers confidence in the safety of their food purchases.

As good as the nation's food safety system is, there is room for improvement. Illnesses and deaths due to contaminated food, while preventable, continue to cause considerable human suffering and economic loss. That is why, at the very beginning of his first term, President Clinton set a course to strengthen the nation's food safety system. Under the President's leadership, surveillance and research have dramatically increased, programs are better coordinated, and regulations are more prevention-oriented and science-based. But this is only the beginning. The Council on Food Safety, with the help of the public, will continue to identify problems and promote solutions.

The Council welcomes the findings and recommendations provided by the National Academy of Sciences in its August 1998 report Ensuring Safe Food From Production to Consumption. This report lays out a clear rationale for a national food safety plan, one that is based on science and risk assessment.

—The Council supports NAS recommendation I, which states that the food safety system should be based on science. In its assessment of the NAS report, the Council provides numerous examples in which this is already the case and examples of areas that need to be strengthened.

—The Council supports NAS recommendation IIa, which calls for federal statutes to be based on scientifically supportable assessments of risk to public health. In this regard, the Council will conduct a thorough review of existing statutes and determine what can be accomplished with existing regulatory flexibility and what improvements will require statutory changes.

—The Council supports NAS recommendation IIb, which calls for the production of a comprehensive national food safety plan. In fact, the development of such a plan is already underway and is one of the primary functions of the Council as specified in Executive Order 13100. One component of the plan will be exploring methods to assess the comparative health risks to the nation's food supply.

—The Council supports the goal of NAS recommendation IIIa. Here, the NAS calls for a new statute that establishes a unified framework for food safety programs with a single official with control over all federal food safety resources. The report acknowledges that there may be many organizational approaches to achieving the goal of a "single voice" for federal food safety activities. The Council will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning, and resource allocation, keeping in mind that the primary goal is food safety and public health.

—The Council supports NAS recommendation IIIb. This recommendation argues that agencies should have the legal authority and other tools needed to work more effectively with our partners in state, tribal, and local governments. Federal food safety agencies already have many of the tools identified by the NAS and have used them to establish extensive partnerships with state, tribal, and local governments. However, some tools are missing and much more needs to be done to better coordinate the federal government's interactions with other levels of government. The Council agrees that the roles of state, tribal, and local governments in the food safety system are critical and that their efforts deserve the formal recognition that partnership in a national food safety system conveys.

At the request of Congress, the National Academy of Sciences (NAS) conducted a study of the current food safety system to: (1) determine the scientific basis of an effective food safety system; (2) assess the effectiveness of the current system; (3) identify scientific and organizational needs and gaps at the federal level; and (4) provide recommendations on scientific and organizational changes needed to ensure an effective food safety system. To conduct this study, the NAS established a com-

mittee and obtained input from federal agencies and other stakeholders of the federal food safety system. The NAS issued its report on August 20, 1998.

On August 25, 1998, through Executive Order 13100, the President established the Council on Food Safety and charged it to develop a comprehensive strategic plan for federal food safety activities and to make recommendations to the President on how to implement the plan. Also on August 25, 1998, the President directed the Council to provide him with an assessment of the NAS report in 180 days. Specifically, the President directed:

> ". . . the Council to review and respond to this report as one of its first orders of business. After providing opportunity for public comment, including public meetings, the Council shall report back to me within 180 days with its views on the NAS's recommendations. In developing its report, the Council should take into account the comprehensive strategic federal food safety plan that it will be developing."

In response to the President's directive, the Council established a task force consisting of representatives from the following departments and agencies: Departments of Agriculture (USDA), Health and Human Services (HHS), and Commerce (DOC), Environmental Protection Agency (EPA), Office of Science and Technology Policy (OSTP), and Office of Management and Budget (OMB). The task force benefited from valuable input obtained at four public meetings (Arlington, VA; Sacramento, CA; Chicago, IL; and Dallas, TX) and from public comment dockets maintained by EPA, USDA/Food Safety and Inspection Service (FSIS), and the HHS/Food and Drug Administration (FDA).

In general, the Council finds the NAS report a constructive contribution to efforts to improve the effectiveness of the federal food safety system through strengthening science and risk assessment, strategic planning, and better federal integration with state and local governments. In particular, the NAS places appropriate weight throughout its report on applying science to the management of government food safety efforts. Science must be advanced within the context of these competing interests. The NAS report recommends that priorities of the nation's food safety system should be based on risk. The Council agrees with the report's thesis that a food safety system that includes regulation, research and development, education, inspection and enforcement, and surveillance should be based on science and should use various risk analyses including quantitative and qualitative risk assessments and risk management principles to achieve such a system.

The Council recognizes that a food safety system comprised of multiple agencies with differing missions and statutory authority may increase the potential for uneven adoption and inconsistent application of science-based regulatory philosophies. While different applications may provide useful information to policy makers relative to the effectiveness of various approaches, the Council's strategic plan (including its assessment of existing statutes and structures) will result in more consistent regulatory measures and philosophies. The Council is committed to identifying further improvements that would result in a seamless, science-based food safety system.

RECOMMENDATION I

BASE THE FOOD SAFETY SYSTEM ON SCIENCE

The NAS report recognizes that the United States has enjoyed notable successes in improving food safety and that with increasing knowledge, many rational, science-based regulatory philosophies have been adopted. The report suggests, however, that adoption of these regulatory philosophies has been uneven given the fragmentation of food safety activities, and the differing missions of the various agencies responsible for specific components of food safety. The greatest strides in ensuring future food safety from production to consumption, the NAS argued, can be made through a scientific, risk-based system that ensures surveillance, regulatory, research, and educational resources are allocated to maximize effectiveness.

Council Assessment

The Council strongly endorses this recommendation. Many federal food safety programs are already, or are being modified to be, science-based. The Council recognizes that scientifically robust programs will result in better identification of public health needs, and determination of the most effective means of reducing public health risk, including the most cost-effective opportunities for improvement, and improved priority setting.

The scientific information generated through surveillance, research, and risk assessment efforts will result in improved food safety only if there is a commensurate

strong effort to translate that scientific information into practical, usable information at the working level, e.g., through guidance or education. This means there must be education for all those involved in producing, manufacturing, transporting, and preparing food as well as for those persons involved in government food safety regulatory activities.

The Council's goal is to ensure that science-and risk-based decision making are central to the Administration's on-going efforts and its strategic plan. Considerable improvements have been made over the past several years. The strong scientific underpinnings of the President's Food Safety Initiative, enactment of the Food Quality Protection Act (FQPA), restructuring of food safety agencies within USDA, and many individual agency activities such as implementation of Hazard Analysis and Critical Control Points (HACCP) programs for meat, poultry, and seafood, have strengthened the overall science base of the food safety system.

The Council believes that the necessary elements of a science-based program surveillance, outbreak response, risk assessment, research, regulation, inspection, and education—are largely in place, and at improvements planned for the next 5–10 years will enhance food safety significantly. The Council will consider in its strategic plan the following elements of a science-based food safety system:

Surveillance.—Food safety agencies will continue to develop more effective ways to achieve surveillance goals and to monitor the safety of the food supply. Although FoodNet (foodborne disease surveillance system), PulseNet (foodborne pathogen DNA fingerprinting system), and the National Antibiotic Resistance Monitoring System (NARMS) provide information never before available in the United States on foodborne illnesses and the occurrence of antibiotic resistant pathogens, enhanced quantitative data on the entire range of infectious and non-infectious foodborne herds will require additional efforts.

Risk Assessment.—Risk assessment is a valuable tool for setting priorities, allocating resources, and making regulatory decisions and must be continually improved. For example, ADA watt continue to refine its risk assessment methods to determine acceptable levels of pesticides residues. Under FQPA, this approach has been strengthened to further protect all consumers, especially children, from the risks of pesticides in their diet. As currently is done for chemical hazards, the federal government needs to create and use a national microbial risk assessment capability as a means of identifying hazards and quantifying risk and assist in creating similar capacities internationally.

Research.—Through the Joint Institute for Food Safety Research, a research infrastructure has been established to improve and coordinate food safety research activities across the federal government. The Institute will continue a critical review of the federally supported food safety research that was begun through the National Science and Technology Council. Future goals in the area of research include: coordination of research planning; budget development and prioritization; scientific support of food safety guidance, policy, and regulation; enhanced communication and links among federal agencies; and enhanced communication and links with industry and academic partners through use of public-private partnerships and technology transfer mechanisms.

Education.—Food safety agencies will expand science-based education and training programs for producers, processors, distributors, food service and public health workers, health care providers, food scientists, and consumers as well as those involved in regulatory activities. It is essential to include in these programs new scientific information on foodborne hazards and their control and effective food safety management strategies.

Inspection/Preventive Controls.—FSIS and FDA will further improve and evaluate the effectiveness of inspections of domestically and internationally produced food and will continue to develop and implement science-based preventive controls such as HACCP systems and the Good Agricultural Practices. Where necessary, regulatory requirements will be established, such as additional performance standards for pathogen reduction that can be developed as more monitoring and surveillance data become available.

Consistency of Science-Based Standards.—FSIS, FDA, and EPA will work toward clear food safety standards nationally and internationally. The Conference for Food Protection brings together all 50 states for purposes of regulating retail establishments, and the model Food Code is gaining wider adoption among the states. Internationally, the Codex Alimentarius Commission (CAC) is the primary mechanism through which these activities will take place. U.S. food safety agencies should also become more active in providing technical assistance to developing countries.

Private Sector Incentives.—The federal and state regulatory agencies will work with the private sector to develop new technologies to further food safety and to encourage commercial scale-up applicable in large and small companies, and industry

adoption. Research efforts with industry, consumer, academic, and government participation could develop and validate new technologies.

Evaluation.—Evaluating the effectiveness of science based regulatory programs continues to be critical. For example, Salmonella data from the first year of HACCP implementation in poultry facilities show a trend toward fewer contaminated products. Also, by providing important information on trends in the incidence of infections with foodborne pathogens, Food Net assists in the evaluation of the effect of preventive controls. The effect of preventive controls implemented by the processed food industry on the reduction of the number of cases of listeriosis was readily apparent in the Centers for Disease Control and Prevention (HHS/CDC)-conducted surveillance effort was a forerunner of FoodNet.

A general challenge for the food safety agencies is that while they must be guided primarily by science, the agencies must also consider other factors such as technical limitations, statutory mandates, policy considerations, budget constraints, practicality, and consumer and societal preferences.

Scientific Challenges

The Council faces a number of challenges in improving the scientific base of the food safety system.

The following are a few examples of challenges that must be met to strengthen the scientific underpinnings of federal food safety efforts:

—New data are required to address the occurrence of emerging pathogens, changes in domestic food habits, a global food supply, and changes in demographics. Specific data needs are difficult to predict and obtain in a timely way. An example is the impact of E. coli O157:H7, which was unknown as a foodborne pathogen 20 years ago, but has been responsible for major outbreaks of foodborne illness in recent years.

—Gaps exist in our knowledge of microbial pathogens and in our ability to measure their impact on human health. For example, there are gaps in knowledge about the pathogens associated with fresh fruits and vegetables and the routes of contamination.

—Assessment of the total impact on health of multiple chemicals from multiple sources presents a major scientific challenge. Implementation of the new FQPA standards for pesticide residues requires EPA to assess aggregate risk from food, water, and residential exposure to a single pesticide as well as cumulative risk from multiple pesticides.

—Gaps exist in our knowledge of effective interventions, prevention, and alternatives that minimize contamination of food. For example, the existing limited body of knowledge about microbial contamination limits the ability to develop on-farm preventive controls and systems of testing. Similarly, with the advent of FQPA, more research is also needed to develop safer pesticide alternatives or crop production techniques in order to promote transition from older pest control techniques that may pose risks to newer, safer ones.

—Insufficient data exist on the entire range of infectious and non-infectious foodborne hazards. Even with the improvements made through FoodNet and PulseNet, enhancement of quantitative data on the entire range of infectious and non-infectious foodborne hazards will strengthen monitoring and surveillance programs for prevention, early identification, and prediction of emerging food safety problems.

RECENT CHANGES THAT STRENGTHEN THE FEDERAL FOOD SAFETY SYSTEM SCIENTIFIC BASE

USDA 1994 reorganization (separated public health from marketing functions)
HACCP implementation (12/97 seafood and 1/98 meat and poultry)
FQPA enactment and implementation
FoodNet/PulseNet established
FDA Fresh Produce Guidelines released
Joint Institute for Food Safety Research created
Research funding increased
Food Safety Research Database initiated
Annual Food Safety Research Conference held
Interagency Risk Assessment Consortium established

RECOMMENDATION IIA

Congress should change federal statutes so that inspection, enforcement, and research efforts can be based on scientifically supportable assessments of risks to public health.

The NAS report identifies a need for a "national food law that is clear, rational, and comprehensive, as well as scientifically based on risk" as a major component of a model food safety system. The report concludes it is necessary to revise the current statutes on food safety to create a comprehensive national food law under which:

—Inspection, enforcement, and research efforts can be based on a scientifically supportable assessment of risks to public health. This means eliminating the continuous inspection system for meat and poultry and replacing it with a science-based approach that is capable of detecting hazards of concern.

—There is a single set of flexible science-based regulations for all foods that allows resources to he Caned based on risk. that permits coordination of federal and state resources, and that makes it possible to address all risks from farm to table.

—All imported foods come only from countries with food safety standards equivalent to U.S. standards.

The NAS report states that the laws, particularly what the report characterizes as the requirement that there be continuous inspection of meat and poultry production through sight, smell, and touch (rganoleptic) inspection, create inefficiencies, do not allow resource use to reflect the risks involved, and inhibit the use of scientific decision-making in activities related to food safety, including the monitoring of imported food.

Council Assessment

The report's recommendation that federal statutes provide agencies with authority to make decisions based on scientific assessments of risks to the public health is sound. Decisions based on public health risk assessments allow agencies to make effective use of science to set food safety priorities, allocate resources to higher risk areas, and instill consumer confidence that high-risk hazards are being addressed.

Since the federal food safety regulatory agencies operate under very different legislative authorities, the Council will conduct a full assessment of these statutes and evaluate the degree of regulatory flexibility that already exists. The Council has decided that this legislative review will be undertaken as part of the strategic planning process. The purpose of the review will be to: 1) examine the similarities and differences in federal food safety statutes; 2) identify the "best" statutory approaches for reducing foodborne illness, and 3) assess both gaps and statutory barriers to implementation of the plan. The need for statutory changes could then be determined, and, if necessary, legislative principles developed which would form the basis for discussions with stakeholders and Congress. For example, given the recent overhaul of pesticide legislation, the Council believes that further statutory changes may not be needed for pesticides at this time.

In some cases, the NAS report misinterprets existing statutory requirements. For example, the report concludes that the statutes require the current method of organoleptic inspection of all carcasses. Even though the current law requires continuous inspection, it does not specify how this inspection mandate is to be carried out. The statutes do require appropriate inspection of animals prior to slaughter and inspection post-slaughter at all official slaughter and processing facilities. Among other significant food safety purposes, this continuous inspection requirement ensures use of the best sanitary dressing processes, prevention of fecal contamination, and prevention of meat from diseased animals from entering the food supply. Under the statutory flexibility that already exists, USDA has begun to develop and test a more risk-based inspection system, including adopting regulations requiring that HACCP be implemented in all slaughter and processing plants. In addition, USDA is studying how best to effect further improvements in the inspection of meat and poultry.

The food safety agencies have achieved and can continue to accomplish significant science-based improvements in their food safety programs under current authorities. However, new authorities that would improve the federal food safety system have been proposed by the President and are waiting action by Congress. Further analysis of the statutes may result in additional proposed statutory modifications..

Current Legislative Challenges

As part of its review of food safety statutes, the Council will focus on areas where regulatory jurisdiction is split between agencies and where resources could be more effectively shared between agencies. The Administration will work with Congress to

pass: the Food Safety Enforcement Enhancement Act, forwarded by the Clinton Administration and introduced during the last Congress to increase the enforcement capabilities of FSIS; and legislation that gives FDA increased authority to effectively assure the safety of food imports.

RECENT ADVANCES IN APPLYING SCIENTIFIC ASSESSMENTS OF PUBLIC HEALTH RISKS TO FOOD SAFETY

HACCP implemented for meat, poultry, and seafood
FQPA tolerance reassessment based on aggregate exposure, cumulative risk, and vulnerable subpopulations.
Single, risk-based pesticide standard for raw and processed food established
Tolerance reassessment focusing on the riskiest pesticides first
Priority registration given to "safer" pesticides
Risk Assessment Consortium established
FoodNet/PulseNet established
Good Agricultural Practices guidance for fresh produce established
Unpasteurized juice warning labels required

RECOMMENDATION IIB

Congress and the Administration should require development of a comprehensive national food safety plan. Funds appropriated for food safety programs (including research and education programs) should be allocated in accordance with science-based assessments of risk and potential benefit.

This recommendation contains two parts. The first part recommends that Congress and the Administration require preparation of a comprehensive, national food safety plan. The NAS report lists several essential features of such a plan, including a unified food safety mission; integrated federal, state and local activities; adequate support for research and surveillance; and increased efforts to ensure the safety of imported foods. The second part of the recommendation stresses that resources President's Council on Food Safety—should be allocated on the basis of science-based assessments of risk and potential benefits.

Council Assessment

The Council agrees that a comprehensive national food safety strategic plan should be developed and the development of such a plan is underway. In fact, the President's Food Safety Initiative was an initial step toward a national food safety plan. The 1997 Farm to Table report was a means of leveraging federal food safety resources through coordinated planning and cooperative work to meet common needs such as development of surveillance data, response to outbreaks, research into preventive interventions, development of risk assessment techniques particularly for microbial risk assessments, and consumer education. This initial plan also took some steps toward extending food safety planning to the state and local level.

Strategic Planning

Picking up where the Farm to Table report left off, the Council will continue and expand the strategic planning process. One of the Council's primary purposes is to develop a comprehensive strategic plan for federal food safety activities that contains specific recommendations on needed changes, including goals with measurable outcomes. The plan's principal goal is to enhance the safety of the nation's food supply and protect public health through a seamless science-and risk-based food safety system. The plan will set priorities, improve coordination and efficiency, identify gaps in the current system and mechanisms to fill those gaps, continue to enhance and strengthen prevention strategies, and develop performance measures to show progress.

Preparation of the food safety strategic plan will be a public process, and will consider both short- and long-term issues including new and emerging threats and the special needs of vulnerable populations such as children and the elderly. Once the plan is sufficiently complete, the Council will advise agencies of priorities for investing in food safety and ensure that federal agencies annually submit coordinated food safety budgets to OMB to sustain and strengthen existing capacities. In short, the President's Council on Food Safety will develop a national food safety plan and make budget recommendations to agencies and OMB to accomplish what the NAS report recommends.

The Council has defined the scope of future federal level food safety strategic planning and a process for interagency planning and public participation. An interagency task force anticipates having a draft plan ready for public review and discussion in January 2000. Even while developing this plan, the task force intends to continue its consultations with stakeholders. The following is the draft vision statement for the Council's strategic plan:

"Consumers can be confident that food is safe, healthy, and affordable. We work within a seamless food safety system that uses farm-to-table preventive strategies and integrated research, surveillance, inspection, and enforcement. We are vigilant to new and emergent threats and consider the needs of vulnerable subpopulations. We use science-and risk-based approaches along with public/private partnerships. Food is safe because everyone understands and accepts their responsibilities."

The President's Council on Food Safety held four public meetings in the Fall of 1998 in Arlington, VA; Sacramento, CA; Chicago, IL; and Dallas, TX to solicit comments on this draft vision for food safety and to identify a strategic planning process, goals and critical steps as well as potential barriers to achieving that vision.

The Council's strategic planning task force is analyzing the transcripts of the 1998 public meetings and the input received through the notice and comment process to determine the major themes, issues, and subject areas. The task force will also consider the conclusions and recommendations of the NAS report, input from the federal, state, and local government integrated National Food Safety System Project, and input from the agencies involved.

The planning process will build upon common ground and provide the forum to tackle some of the difficult public health, resource, and management questions facing the federal food safety agencies and our state, tribal and local government partners. The plan will identify areas for enhanced coordination and efficiencies, determine whether legislative changes would be beneficial, and clarify federal, state, tribal, and local government roles and responsibilities in the national food safety system. (see discussion under recommendation IIIb).

The strategic planning process will consider thoroughly the results of the legislative review outlined under the Council's assessment of NAS recommendation IIa. Examples of possible legislative proposals from such a review include:

—developing legislative proposals to eliminate current duplication of efforts by FDA and FSIS by reevaluating each agency's role in areas such as the regulation of eggs and egg products, game meats, food additives, animal drugs and biologics, and food products produced in plants under the jurisdiction of both agencies;

—modifying statutes to facilitate greater leveraging of agency resources;

—developing a legislative proposal giving FSIS explicit authority to enter into cooperative agreements for food safety risk assessment; and

—developing legislation that provides Performance Based Organization (PBO) authority for voluntary seafood inspection.

Allocation of Resources

The NAS report recommendation goes a step further than a national plan by urging that resources be allocated according to science-based assessments of risk and potential benefits. As stipulated in Executive Order 13100, the Council will ensure that agencies develop a coordinated food safety budget submission consistent with the strategic plan. The Council will develop guidance for food safety agencies to consider during the preparation of their individual budgets. The Council has created a budget task force that will:

—work with the strategic planning task force and review the draft and final strategic plans and Council budget guidance on priority areas for investment to identify budget data and other information that will be necessary to plan and coordinate agency budget submissions to OMB;

—design a uniform format for presenting food safety initiative budget components in the OMB budget process for use in both individual agencies and the unified budget submissions;

—develop necessary guidance to facilitate submission of a unified food safety initiative budget and any other food safety issues deemed appropriate by the Council;

—establish a timetable for developing coordinated food safety budget requests and for submitting information to the Council that accommodates the various agencies' budget planning processes; and

—consider the issue of whether to amend OMB Circular No. A–11 (OMB guidance to agencies on budget structure and reporting elements) to include food safety as a budget cross-cut.

Comparative Risk Assessment

An important part to both risk-based planning and resource allocation will be the development of a comprehensive comparative risk assessment of the food supply. The Council has requested the Interagency Food Safety Risk Assessment Consortium, which consists of HHS and USDA agencies and EPA, to consider how to develop a comparative risk analysis for food safety strategic planning. The Council will direct the Consortium to seek and consider public input in its analysis.

The Council believes that various steps may need to be taken to evaluate risks including: a ranking of foodborne pathogen risks based on surveillance and economic data; consideration of a broader range of food safety hazards including not only microbial risks, but also pesticides and chemicals; and finally, selection of highly ranked hazards, an evaluation of control measures, and an evaluation of net benefits. The Council must avoid applying risk assessment in a manner that is too strict, rigorous, or inflexible. Instead, the comparative risk assessment must be used to prioritize the known greatest risks at the current time, with the understanding that scientific risk estimates can, and will likely, change frequently over time.

Challenges in Planning

The Council faces the following challenges in developing a comprehensive food safety strategic plan and allocating resources based on risk:

—Developing and successfully implementing a national plan will require strong cooperation coordination, and communication, since each federal, state, and local agency has unique mandates, authorities, history, culture, and operating procedures.

—The diversity of stakeholders in food safety is enormous. It will be difficult, but imperative, that all stakeholders are represented in the Council's planning process.

PROGRESS IN STRATEGIC PLANNING

President's 1997 Farm to Table Food Safety Initiative
President's Fresh Produce and Imported Food Safety Initiative
Establishment of the Joint Institute for Food Safety Research
Establishment of the President's Council
Input from the National Academy of Sciences, Council of Agricultural Science and Technology, and other organizations
National Integrated Food Safety System project meetings
Development of a draft vision statement
Input from multiple public meetings and public comments

RECOMMENDATION IIIA

To implement a science-based system, Congress should establish by statute a unified and central framework for managing federal food safety programs, one that is headed by a single official and which has the responsibility and control of resources for all federal food safety activities, including outbreak management, standard-setting, inspection, monitoring, surveillance, risk assessment, enforcement, research, and education.

The NAS report finds that the existing regulatory structure for food safety in the United States is not well equipped to meet current challenges. Specifically, it points out that the system is facing tremendous pressures with regard to:

—emerging pathogens and ability to detect them;

—maintaining adequate inspection and monitoring of the increasing volume of imported foods, especially fruits and vegetables;

—maintaining adequate inspection of commercial food services and the increasing number of larger food processing plants; and

—the growing number of people at high risk for foodborne illnesses.

The report cites the strengths of the current food safety system, including the advent of FoodNet and PulseNet, HACCP implementation, and the Partnership for Food Safety Education. It also identifies deficiencies, which it attributes partly to "the fragmented nature of the system." The report attributes the fragmentation largely to a lack of adequate integration among the various federal agencies involved in the implementation of the primary statutes that regulate food safety, and observes that this lack of adequate integration occurs also with state and local activities. The report notes that several federal agencies are involved in key food safe-

ty functions and references more than 50 memoranda of agreement between various agencies related to food safety.

The NAS report attributes the lack of adequate integration among federal, state and local food safety authorities in part to the absence of "focused leadership" that has the responsibility, the authority and the resources to address key food safety problems. The report presents several examples of possible organizational structures to create a single federal voice for food safety. These include:

—Food Safety Council with representatives from the agencies with a central chair appointed by the President, reporting to Congress and having control of resources;

—designating one current agency as the lead agency and having the head of that agency be the responsible individual;

—a single agency reporting to one current cabinet-level secretary; and

—an independent single agency at cabinet level.

Although the report indicates that many of the NAS committee's members believe that a single, unified agency headed by a single administrator is the most viable structure for implementing the "single voice" concept, the report recognizes that there may be many other models that would be workable.

Council Assessment

The Council agrees with the goal of the NAS recommendation—that there should be a fully integrated food safety system in the U.S. The food safety agencies are committed to this goal, and the Council is confident that its comprehensive strategic plan will be a major step toward creating a seamless food safety system. To ensure that the strategic plan achieves this goal, the Council will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning, and resource allocation.

The Council's strategic plan will bring agreement on the vision, goals, and actions needed to enhance the safety of the nation's food supply and protect public health by reducing the annual incidence of acute and chronic foodborne illness. It will also clarify the roles and responsibilities of each food safety agency as well as their interactions with state, tribal, and local government partners.

While the Council recognizes that certain models of reorganization may improve coordination and allow for a better allocation of resources, any reorganization of food safety activities must consider the non-food-safety-related responsibilities of each agency and how these relate to the food safety responsibilities. Reorganization must not be done at the expense of these other responsibilities and activities. The Council is concerned that, if not done carefully, separating food safety from non-food safety activities in each agency could act to weaken consumer and environmental protection overall.

The Council also recognizes that expertise and knowledge, particularly expertise in state-of-the-art science and technology, provides a resource to food safety activities. For example, analytical methods for detection and quantification of adulterants in foods may be adapted to detection of chemical contaminants that threaten public health. Expertise in non-food safety regulatory science and legal procedures are critical when warnings are required on food labels to assure safety. In addition, reorganizations must avoid interfering with the public health framework established to identify and respond to infectious and non-infectious public health threats whether they are foodborne or not, since many of the major foodborne pathogens also produce non-foodborne disease. Thus, in its strategic planning the Council will be cognizant of the interplay between the food safety and non-food safety activities of each agency and how they affect each other.

The Council believes that there are programs that can benefit from immediate reorganization. For example, during the last two years, FDA and NOAA have been developing a proposal to transfer the NOAA Seafood Inspection Program to FDA as a Performance Based Organization (PBO) in order to operate the voluntary Seafood Inspection Program on a more business-like basis. The PRO would be formed under the umbrella of FDA and would include all seafood inspection activities now carried out by NOAA. The fiscal year 2000 budget proposes to transfer the existing Seafood Inspection Program from NOAA to FDA. This action will fully consolidate federal seafood inspection activities within one agency thereby increasing the efficiency and effectiveness of seafood oversight. It will also enhance the overall safety and wholesomeness of seafood products. Funds are provided in the President's fiscal year 2000 budget to cover the costs of transition, including training and education activities.

Factors to Consider in Organizational Restructuring

The Council assessment of structural and organizational options must take into consideration factors such as:

—There are numerous instances in the existing food safety system where the division of regulatory responsibility is not optimal. For example, within the same plant, FSIS and FDA inspectors are often responsible for different foods. FDA and FSIS also share regulatory responsibility of eggs and egg products. Examples such as these create stakeholder confusion and inefficient allocation of resources. Any reorganization must consider areas where there is significant Jurisdictional overlap.
—Many food safety issues would be difficult to resolve by a reorganization. For example, some issues like bovine spongiform encephalopathy are both animal health issues and human health issues. Foodborne disease problems may also be waterborne disease problems. Other programs, particularly research and education programs for food safety often do not operate as separate activities within the agencies, but rather draw significant strength from one another. While some projects are entirely focused on food safety, the food safety research portfolio includes many other projects in such areas as animal health and animal genetics. Reorganization must also accommodate successful partnerships such as the Partnership for Food Safety Education.

RECENT STEPS TAKEN TO CREATE A UNIFIED FEDERAL FOOD SAFETY SYSTEM

1997 President's Food Safety Initiative implemented
Interagency Risk Assessment Consortium created
President's Fresh Produce plan implemented
Federal/State Outbreak Response task force established
Joint Institute for Food Safety Research created
President's Council on Food Safety established
Restructuring of seafood inspection proposed
Partnership for Food Safety Education created

RECOMMENDATION IIIB

Congress should provide the agency responsible for food safety at the federal level with the tools necessary to integrate and unify the efforts of authorities at the state and local levels to enhance food safety.

The NAS report recommends that federal, state, and local governments function as an integrated enterprise, along with their partners in the private sector. The report identified five statutory tools required to integrate federal, state, and local food safety activities into an effective national system:

—authority to mandate adherence to minimal federal standards for products or processes;
—continued authority to deputize state and local officials to serve as enforcers of federal law;
—funding to support, in whole or in part, activities of state and local officials that are judged necessary or appropriate to enhance the safety of food;
—authority given to the Federal official responsible for food safety to direct action by other agencies with assessment and monitoring capabilities; and
—authority to convene working groups, create partnerships, and direct other forms and means of collaboration to achieve integrated protection of the food supply.

This recommendation acknowledges the "equally critical roles" of state, tribal, and local government entities with those of the federal government in ensuring food safety, and suggests that changes in federal authorizing and appropriating legislation may be necessary to achieve better integration of federal, state, tribal, and local activities. The report points out that the work of the states and localities in support of the federal food safety mission deserves "improved formal recognition and appropriate financial support."

Council Assessment

The Council agrees that the roles of state, tribal, and local governments in the food safety system are critical and that their efforts deserve the formal recognition that partnership in a national food safety system conveys. Thus, the Council supports steps taken toward the development of a more fully integrated national food safety system. While more needs to be done to optimize and develop new partnerships, the federal food safety agencies have already established extensive interactions with state and local regulatory agencies. In fact, a critical factor for the Council to consider is the manner in which existing federal/state or local activities

are integrated and coordinated. The Council believes that its strategic planning process provides a fresh opportunity for their non-federal partners to participate as primary and equal partners in the development of the future food safety system.

Some overlap occurs among federal, state, and local food safety efforts. Neither federal food safety agencies nor state and local agencies have sufficient resources to carry out a comprehensive food safety program, but all these agencies have expertise and resources that, when combined in an integrated program, would significantly enhance the impact of food safety programs.

The Council also agrees that the five statutory tools identified by the NAS are critical for ensuring good coordination between the federal government and state, tribal, and local agencies. Fortunately, the federal food safety regulatory agencies (FDA, FSIS, and EPA) already have most of the statutory tools recommended by NAS.

The Council recognizes and agrees with the report's conclusion that the lack of integration among federal, state, and local authorities often complicates the administration of regulatory programs. We need to utilize available mechanisms to leverage resources and expertise from government, industry, academia, and consumers to expand the nation's food safety capabilities beyond what any one group can accomplish. Increased awareness and knowledge of food safety in each segment of the food safety community should reduce the need for regulation of industry and decrease the incidence of contamination at every point in the food safety system in order to protect public health.

Integrated National Food Safety System (NFSS) Project

HHS, USDA, and EPA are working with state and local officials on an integrated National Food Safety System (NFSS) Project to identify appropriate roles and to develop mutually supporting common goals for all levels of government in the U.S. food safety system. This work is considered integral to the Council's strategic plan and coordinated budget recommendations and will be the basis for improved integration with state, tribal and local governments.

Under the leadership of the FDA, the Project is proceeding under existing federal, state, and local laws although all levels of government recognize that changes in some of the federal and state laws will be necessary to achieve an integrated system. The Project began with a meeting of state and local officials from public health and agriculture agencies and state laboratories representing all 50 states, Puerto Rico, and the District of Columbia, FDA, CDC, and FSIS in Kansas City in September 1998. In December 1998, six work groups and an 18 member Coordinating Committee composed of federal, state and local officials met in Baltimore, Maryland to begin to develop plans for implementing recommendations and overcoming the obstacles identified at the Kansas City meeting. Subsequent meetings will be held throughout 1999 to continue the planning process. The group estimates that a fully integrated federal/state/local food safety system will take up to 10 years to build. The Association of Food and Drug Officials, which is an organization of state and local public health officials and regulators, strongly endorses the concept of a NFSS.

The NFSS Project builds on existing systems of federal/state cooperation such as the FSIS long-term "equal to" meat and poultry system currently operating in 26 funding and EPA's delegation to states of various regulatory programs.

Challenges to Developing a National Food Safety System states with shared state and federal

The Council recognizes that the existing systems for federal, state, and local government regulation of food and pesticides have different histories and important distinguishing characteristics. The Council believes it is important to respect the nature and strengths of the existing systems and that integration must proceed in a coordinated fashion. There are numerous challenges to building an integrated food safety system:

—Establishment of a clear framework for integration. Such a framework would include the following: strong federal food safety standards, consistent training and competency of inspectors and other state/local officials, data sharing/exchange, federal oversight of state activities, and appropriate and effective enforcement. There needs to be public assurance that state and local activities are integrated with, and an extension of, the federal responsibility in order to assure consistency, accountability, and above all, enhanced consumer protection.

—Responsiveness to stakeholder concerns. Development of an integrated system needs to be responsive to stakeholder concerns to have credibility and obtain public support. For example, consumers are concerned that the economic interests of industry within states may be a source of conflict if those states have an expanded food safety role that includes activities thought to be primarily a

federal responsibility. Moreover, industry is concerned that food safety regulation will be inconsistent among the states if systems are integrated without adequate preparation of the state agencies to step into an expanded food safety role.

—Infrastructure and support. There is a potential need for legislative change at the federal or state/local level to achieve uniformity and consistency in enforcement authorities and to permit the sharing of inspection and other resources.

EXAMPLES OF FEDERAL/STATE/LOCAL COOPERATION

Milk Sanitation Program—Pasteurized Milk Ordinance
Retail Food Safety Program—Food Code
Integrated National Food Safety System Project
Interstate Shellfish Sanitation Program
States conduct 5,000 inspections of FDA-regulated plants
FSIS oversee and supports 26 state "equal to" meat and poultry inspection programs
FDA maintains more than 100 state partnerships
Conference for Food Protection
FoodNet/Emerging Infections Program
PulseNet
Epidemiology and Laboratory Cooperative Agreements
Appropriate delegation of pesticide responsibility to states
Partial funding of states for implementation of some pesticide programs and for most pesticide compliance programs
State FIFRA Issues Research and Evaluation Group
State and local government involvement in Foodborne Outbreak Response Coordination Group (FORC-G)
States conduct inspections in 250 FSIS regulated plants
FSIS supports animal production food safety outreach projects involving 11 states
FSIS supports animal production food safety workshops
HACCP based enhancement of state labs, computer capabilities, and state training
Partnership for Food Safety Education "Fight BAC!" campaign

NAS REPORT RECOMMENDATIONS

Recommendation:

The food safety system should be based on science. The Council agrees and provides numerous examples where this is already the case, including the development and implementation of the FoodNet and PulseNet systems for surveillance and identification of foodborne pathogens and the implementation of new science-based inspections of meat, poultry, and seafood. The Council has also identified areas that should be strengthened such as improving the ability to assess risks from pathogens in food.

Federal Statutes should be based on scientifically supportable risks to public health. The Council agrees and will call on Congress to work with it to create scientifically based statues to promote food safety. The Council will conduct a thorough review of existing statues and determine what can be accomplished with existing regulatory flexibility and what improvements will require statutory changes.

A comprehensive national food safety plan should be developed. The Council agrees that the development of such a plan is already underway and is one of the primary functions of the Council. One component of the plan will be exploring methods to assess the comparative health risk to the nation's food supply.

A new statue should be enacted that establishes a unified framework for food safety programs with a single official with control over all federal food safety resources. The Council supports the goal of a unified framework for food safety programs and will conduct an assessment of structural models and other mechanisms that could strengthen the federal food safety system through better coordination, planning, and resource allocation.

Agencies should work more effectively with partners in state and local governments. The Council agrees that the roles of state, tribal, and local governments in the food safety system are critical and that their efforts deserve the formal recognition that partnership in a national food safety system conveys.

Question. What pro-active efforts are being undertaken by both USDA and FDA to address egg and egg product safety?

FDA answer. On May 19, 1998, FSIS and FDA published an advance notice of proposed rulemaking concerning Salmonella enteritidis in eggs (63 FR 27502). Through this notice, the agencies sought to identify farm-to-table actions that would decrease the food safety risks associated with shell eggs. FSIS and FDA have reviewed the comments to the notice and are discussing each agency's tentative short-term plans for eggs so that long-term efforts can be pursued by both agencies.

On August 27, 1998, FSIS published a final rule implementing amendments to the Egg Products Inspection Act (63 FR 45663) which required that shell eggs packed for consume use be stored and transported under refrigeration at an ambient temperature not to exceed 45 °F (7.2 °C). In addition, the amendments required that these packed shell eggs be labeled to state that refrigeration is required. Finally, the amendments required that any shell eggs imported into the United States packed for consumer use must include a certification that the eggs, at all times after packing, have been stored at an ambient temperature of no greater than 45 °F (7.2 °C). The final regulations are not effective until August 27, 1999. FSIS has an egg refrigeration docket committee actively developing the instructions for inspection program personnel to verify that the industry is complying with the refrigeration and labeling requirements

FSIS expects to develop a proposed rule to require that processed egg product establishments implement sanitation standard operating procedures and HACCP systems, as well as pathogen reduction performance standards for pasteurized egg products. Furthermore, FSIS expects to develop a proposed rule to eliminate the current requirements for prior approval by FSIS of processed egg establishment facility and equipment specifications. Through these anticipated rulemaking activities, FSIS expects to conduct its inspection activities as consistently as possible for meat, poultry, and processed eggs.

REGULATORY/ENFORCEMENT

HHS/PDA Activates

FDA Assumes Shell Egg Traceback Responsibilities from FSIS (October 1, 1995).—Beginning with the new fiscal year, FDA assumed regulatory responsibility [1] for all aspects of investigating shell egg outbreed, tracing back egg-associated Salmonella Enteritidis (SE) illnesses to particular producers/flocks, sampling, diverting eggs, and collecting flock data to help track the spread of SE.

Proposed Rule: Refrigeration of Shell Eggs at Retail and Labeling of Shell Eggs (to be published in 1999).—FDA is preparing a draft of a proposed mile that, if finalized, would address the temperature at which eggs are to be stored at retail and would address the possibility of requiring safe handling statements on labels of shell eggs that have not been treated to destroy Salmonella microorganisms which may be present. FSIS has reviewed the draft proposal in order to ensure consistency between FDA's proposed rule and FSIS's final rule (public 27, 1998) which requires 45 F refrigeration of eggs during transport and distribution.[2]

USDA/FSIS ACTIVITIES

USDA/PSIS Active.—Egg Products Inspection (1994).—As a result of the USDA Reorganization Act of 1994, responsibility for administering egg products inspection was transferred from USDA's Agricultural Marketing Service (AMS) to USDA's FSIS. As required by the Egg Products Infection Act (EPIA), FSIS maintains continuous inspection at the approximately 80 officially inspected plants producing liquid, frozen and dried egg products. FSIS intends to propose rulemaking to implement Hazard Analysis and Critical Control Points (HACCP) in egg product establishments. The Agency also intends to propose rulemaking to remove the command and control aspects of egg products regulations and to replace them with performance standards.

Egg products are required to be pasteurized. More than 80,000 laboratory analyses for Salmonella are performed annually on the approximately 3 billion pounds of egg products produced each year. In general, product in the plant targeted for

---

[1] Beginning in fiscal year 1996, USDA no longer received the funding to research and develop the state egg quality programs and to perform tracebacks on SE. With USDA no longer performing the traceback activity and egg quality programs, FDA stepped in to continue tracebacks and FDA picked up the Quality Egg Program. Both of these activities are still continuing for FDA.

[2] *See infra* REGULATORY/ENFORCEMENT: COOPERATIVE ACTIVITIES.

Salmonella testing is voluntarily put on hold by the plant until results are available. However, in the event that product was distributed to consumers, and a positive sample is discovered, FSIS requests that the plant initiate a voluntary recall.

Refrigeration and Labeling Requirements for Shell Eggs Final Rule (August 27. 1998).—The USDA Reorganization Act of 1994 also resulted in FSIS administering provisions of the EPIA on refrigeration and labeling of shell eggs in transportation and storage. In August 1998, FSIS amended its regulations to implement these EPIA provisions. These amendments, applying to shell eggs packed for consumer use, require that: shell eggs in distribution be stored and transported under refrigeration at an air temperature not to exceed 45 F; (2) these packed shell eggs be labeled to state that refrigeration is required; End (3) any shell eggs imported into the United States packed for consumer use include a certification that the eggs, at all times after packing, have been stored and transported at an air temperature of not greater than 45 F.

Cooperative Activities:

Transportation Advance Notice of Proposed Rulemaking (ANPR) (November 22. 1996).—FDA and FSIS published a joint ANPR soliciting information on issues related to ensuring the safety of potentially hazardous foods, including eggs, during transportation. The agencies posed a range of regulatory and non-regulatory options and solicited information to help them assess the risks associated with potentially hazardous foods and decide what approaches are best suited to addressing those risks.

SE Advance Notice of Proposed Rulemaking (May 19, 1998).—FDA and FSIS issued a joint ANPR to identify farm-to-table actions which will decrease the food safety risks associated with shell eggs. The agencies intend to explore all reasonable alternatives and to gather data on the public benefits and the public costs of various regulatory approaches before implementing a farm-to-table food safety system for shell eggs. The ANPR included discussion on mitigation of risks associated with SE in eggs along the food production—distribution—consumption continuum from farm to table. This discussion included: specific analysis and discussion of production (preventing introduction of SE into laying flocks and from hens to eggs); process and distribution (preventing growth of SE in eggs); rewashing/repackaging (preventing growth of SE in eggs); retail; and preparation and consumption. Regarding rewashing of eggs, public comment was specifically solicited on whether rewashing/repacking of eggs significantly increases the risk to consumer of contracting SE related illness from these eggs. The discussion of rewash/repackaging of eggs draws attention to the current practices regarding the expiration dating of eggs in establishments that function primarily under State regulatory oversight. Processors that do not use USDA's grading service, and that are not covered by State requirements, typically choose to place a 30 or 45 day expiration date on egg cartons. Some processors do not provide any expiration date. FDA sought comment in its ANPR on whether these practices regarding expiration dating are misleading to consumers.

The information from the 1998 SE risk assessment[3], combined with comments received on the May 1998 joint ANPR on SE, will be used by FDA to assess the feasibility and desirability of applying to all shell eggs the prohibition on repackaging to enhance food safety, consumer information, and consumer awareness.

GUIDANCE/INFORMATION COLLECTION

HHS/FDA Activities:

Food Code.—The Food Code consists of model requirements for safeguarding public health and ensuring food is unadulterated and honestly presented when offered to the consumer.

This model is offered for adoption by local, state, and federal governmental jurisdictions for administration by the various departments, agencies, bureaus, divisions, and other units within each jurisdiction which have been delegated compliance responsibilities for food service, retail food stores, or food vending operations. Beginning with the publication of the 1993 Food Code (and continuing in the 1995 and 1997 editions) FDA strengthened provisions addressing shell eggs. Shell eggs are specifically included in the definition of Potentially hazardous food." Specific provisions were created to cover receipt of eggs, the proper cooking of eggs, and substitution of pasteurized eggs in the preparation of menu items and deli items that typically include raw eggs as an ingredient.

The 1997 edition added a new subchapter that created "Special Requirements for Highly Susceptible Populations." Safeguards contained in this section include a re-

[3] See infra GUIDANCE/INFORMATION COLLECTION: USDA/FSIS ACTIVITIES.

quirement that pasteurized eggs be substituted for raw shell eggs when it is necessary to mix eggs and then hold them before or after cooking, but before service.

At the Conference for Food Protection on April 24-29, 1998, as part of developing the 1999 edition of the Food Code, FDA presented to state health and agriculture officials, retail industry representatives and others a proposal to limit the use of raw shell eggs in institutionalized high risk populations.

State Egg Quality Assure Programs (1992–1994 Pennsylvania pilot—the official Pennsylvania program began in 1994).—Since 1994 when the Pennsylvania Egg Quality Assurance Program was established, FDA has worked with the states to promote voluntary adoption of quality assurance programs at the fang level. Since 1994, the New England states as a region as well as the individual states of California, New York, Ohio, South Carolina, and Utah have also adopted egg quality assurance programs.[4]

FDA reviewed and commented on industry's Five Star. Total Quality Assurance Program, a program designed for general use by the entire egg industry. This program added a different dimension to the Quality Assurance Programs already in existence in that it was an industry initiated program.

Shell Egg Pasteurization Labeling Review (May 22, 1994).—In response to a request for guidance on labeling from industry, FDA sent a letter, stating that if shell eggs meet the requirements for pasteurization, then they qualify to be labeled "pasteurized." However, care must be exercised not to imply that such eggs are fresh."

USDA/FSIS ACTIVITIES:

Salmonella Enteritidis Risk Assessment—Shell Eggs and Egg Products (June 12, 1998).—In response to an increasing number of human illnesses associated with the consumption of shell eggs, FSIS conducted a comprehensive risk assessment of SE to identify possible strategies for enhancing the safety of shell eggs. The risk assessment was completed in June 1998[5] It can be used to identify current and future interventions that provide the best public health protection returns. The specific objectives of the risk assessment were to: predict the unmitigated risk of foodborne illness from SE in eggs; identify and evaluate potential risk reduction strategies; identify data needs; and prioritize future data collection efforts. FDA scientists served as part of the resource group for FSIS' risk assessment for eggs.

COOPERATIVE ACTIVITIES

Memorandum of Undasing (MOW) between FDA and USDA Regarding the Reduction of SE Infection of Humms (May 1992)

FDA and USDA signed an MOU to endorse, and strive to meet, the goal for the reduction of SE infection of humans as stated in Healthy People 2000. The agreement addresses: egg production flocks, breeder flocks, pullet grow-out facilities, eggs during storage and transportation, labeling, research, consumer education, and retail and manufacturing establishments.

Foodborne Diseases Active Surveillance Network—"FoodNet" (1995 and continuing).—In 1995, FSIS and FDA began a collaborative project, FoodNet, with CDC to collect more precise information on the incidence of foodborne disease in the United States. This information collection included a Salmonella case-control study in 1997.

Shell Egg Pasteurization Process Review (1997).—FDA, USDA and industry representatives determined that only the methods which bring a reduction by a factor of at least 100,000 SE organisms per shell egg would qualify as acceptable process parameters for pasteurization of shell eggs. Measures that could be taken to prevent recontamination were also discussed.

Salmonella Enteritidis Review Team (January) 18, 1997)[6].—FDA, USDA, CDC, a state representative and an academic participated in a multidisciplinary review team. This team gathered to summarize the current situation regarding SE by integrating information from SE surveys of unpasteurized liquid eggs, hens slaughtered for meat after their egg producing life, and manure samples of flocks participating in Pennsylvania's Egg Quality Assurance Program with data from CDC. CDC data included the number of SE positive human stool samples which were submitted to CDC per year and the number of outbreaks of SE.

Quality Assurance Partnership Agreement with California (April 24. 1997), South Carolina (September 29, 1997), Utah (March 11, 1998), and Pennsylvania (not yet

[4] Additional states working through the process of adopting or considering egg quality programs are: Alabama, Maryland, Oregon, Virginia, Wisconsin.

[5] The report from this study is available on the FSIS Internet home page.

[6] The team met in 1996, however, its report was issued in January 1997.

finalized).—Individual partnership agreements among the appropriate FDA regional or district office, USDA, state agencies and California's, South Carolina's and Utah's Egg Quality Assurance Plans have formalized cooperative agreements to support each individual state's Egg Quality Assurance Plan. The purpose of these partnership agreements is to support the individual state's Egg Quality Assurance Plan in an integrated voluntary animal production food safety program designed to ensure the highest quality and safety of eggs. The upcoming Pennsylvania agreement will also include FDA's Center for Food Safety and Applied Nutrition as a partner.

MOU between AMS and FDA in Regard to the Administration of the Egg Products Inspection Act (EPIA) (October 1. 1997).—This MOU defines the respective authorities and responsibilities of AMS and FDA regarding the EPIA. Some of these authorities and responsibilities include AMS notifying FDA when it has reason to believe that shell eggs have been shipped in commerce in violation of the EPIA and when applications are made to import shell eggs into the United States. FDA must notify AMS of any imported shell eggs which contain violative eggs not in accordance with USDA regulations and labeling requirements. This MOU revises and replaces an MOU on this subject which went into effect on June 7, 1983.

Secretary letters recommending adoption of the Food Code (March 23, May 22, and June, 1998).—In March the Secretary of HHS sent a letter to the Heads of Operating Divisions[7] of the U.S. Public Health Service encouraging adoption and implementation of the Food Code by all governmental bodies responsible for the safety of food. In May, the Secretary of Agriculture send a similar letter to the USDA Agency Heads. In June, the Secretaries of HHS and USDA sent a joint letter to all U.S. governors and "Food Safety Colleagues" encouraging adoption of the Food Code by all government bodies responsible for the safety of food.

EDUCATION

IS/FDA Activities

FDA Consumer Article: "Handling Eggs Safely at Homer" (January 1992).—Article discussed the risks associated with eggs that are not properly stored and cooked and included consumer guidelines for the use and handling of raw eggs and the handling of foods in which eggs are an ingredient.

Food Code.—FDA's State Training Branch offers Food Code courses to food regulatory officials throughout the United States each year.

International Poultry Exposition (January 23, 1997); Midwest Poultry Federation Meeting (April 9–10. 1997).—FDA representatives spoke at these annual poultry industry meetings on issues including the latest approaches in the SE traceback programs and monitoring and regulation of eggs.

National Poultry Improvement Proven Biannual Conference (July 16–18, 1998).—FDA participated in the USDA biannual conference on aspects of the voluntary poultry improvement program. FDA presented material on the SE traceback and quality egg programs as well as encouraging adoption of a pullet improvement program to stop the SE contamination of chickens in the pullet stage.

FDA Consumer Article: "Safer Eggs: Laying the Groundwork" (September 1998).—The article discussed attempts by federal government, industry, and nutrition educators to improve the safety of egg production and distribution by educating people on the herds of eating raw and undercooked eggs, urging people to adopt safe egg-handling practices, and reminding people of the egg's importance in a healthful diet.

Consumer Education (mid-Year 1999).—FDA will prepare consumer education outreach on safe handling of eggs.

USDA/PSIS Activities

FSIS has published, either electronically on FSIS' Internet site or by hard copy, various educational materials to enhance consumer knowledge. The items listed below represent these materials which serve the on-going need for educational information on the safety of shell eggs and egg products.

"Egg Products" (December 1995).—Ellis document provides information on what egg products are, who is responsible for inspecting egg products, buying tips for egg products, and how to read egg product labels.

"Egg and Egg Product Safety" (October 1996).—This document includes information on the presence of SE in eggs, identifies segments of the population more sus-

[7] The Office of Public Health and Science of HHS and the Operating Divisions make up the US Public Health Service. The Operation Divisions include: Agency for Health Care Policy and Research, Agency for Toxic Substances and Disease Registry, Centers for Disease Control and Prevention, FDA, Health Resources and Services Administration, Indian Health Service, National Institutes of Health, Substance Abuse and Mental Health Services Administration.

ceptible to SE infections, and provides safe handling steps for consumers to follow at home to prevent most egg-safety problems.

"Advice for Safe Handling of Shell Eggs" (October 1996).—This document educates consumers on how to properly purchase eggs at the grocery store and safely store and serve eggs at home.

"Advice on Holiday Egg Recipes" (December 1996).—This document reminds consumers to be careful during the holiday season when preparing egg-based holiday recipes such as eggnog.

"Advice on Safe Handling of Meats and Eggs for Springtime Festivities" (March 1997).—This document offers advice concerning the safe handling of meats and eggs for springtime activities. Thorough cooking and proper storage of egg products is discussed.

Cooperative Activities

Consumer Education Fight BAC! (1997 and continuing).—HHS, USDA, and EPA are partners with consumer groups and industry in a consumer education campaign begun in 1997 that is ongoing and expanding. The Fight BAC! campaign covers all aspects of food safety, including information that pertains to safe handling of eggs.

National Egg Regulator/Officials (March 9–10, 1998).—FDA and USDA participated in the annual meeting of state officials engaged in shell egg and egg products regulations and programs. FDA and USDA gave presentations to update the officials on what the agencies were doing in regard to public health and safety of these foods.

RESEARCH

HHS/FDA Activities

Effect of a Variety of Stress Factors on the Immune System of Poultry and Subsequent Infection of Shell Eggs with SE (fiscal year 1998-2000).—This research Grill assess the effects on the immune system of potential factors such as competing organisms, crowding, tempers, air quality, and lighting that affect the risk of SE contamination of shell eggs.

Identification and Characterization of Virulence Determinants for SE and Vibrio vulnificus (fiscal year 1999-2000).—The ability of SE to overcome the human body's defenses from SE (and another organism, Vibrio vulnificus) are unknown or poorly understood. The goals of this research are to understand these pathogens and to develop detection systems for these pathogens based on their gene sequence.

Pathways Analysis: Assessments of the Pathogen Transmission Capacities of Disease-Cavina Insects (fiscal year 1998-2000).—The goal is to gain fundamental understanding into the relationship between foodborne pathogens and insects as methods of pathogen transport and how this relationship impacts human exposure to the pathogenic microorganism. SE will be one of the pathogens studied.

PUBLIC MEETINGS

Cooperative Activities

Joint FSIS/FDA Conference on Time/Temperature (November 18–20. 1996).—This technical conference provided a forum for information on temperature control interventions and verification techniques in the transportation and storage of meat, poultry, seafood, and eggs and egg products. One day of this conference was devoted solely to discussion of eggs and egg products, particularly issues surrounding implementation of the EPIA's 45 F ambient temperature requirement.

Industry/Federal/State Salmonella Enteritidis Food Safety Meeting (January 21, 1997).—FDA participated in this informal round table discussion organized by USDA on the role producers can have in a comprehensive strategy to reduce the risk of SE through voluntary quality assurance programs, on current research needs, and on the importance of SE monitoring and surveillance activities.

Shell Eggs and Egg Products Risk Assessment Technical Meeting (September 3, 1997).—FDA, USDA, and CDC participated in a meeting with academic institutions, industry, and consumer groups. FDA presented information on the history of eggs and egg products regulation. The meeting was devoted to presentations and discussion of the proposed risk assessment model to be used in the SE Risk Assessment of shell eggs and egg products.

Industry/Federal/State/Academic SE Working Group II Risk Assessment Meeting (January 20, 1998).—USDA and FDA participated with academia and industry in a meeting on SE risk assessment. The discussion focused on data needs and the overall areas included in the SE risk assessment for egg and egg products. The purpose of the meeting was to obtain available data for use in the risk assessments.

PART 2

Efforts taken by USDA and HHS to prohibit the grading under voluntary grading programs of USDA of shell eggs previously shipped for sale

AMS developed a proposed rule to amend the regulations governing the voluntary shell egg grading program. The proposed revisions would prohibit the USDA grade identification of eggs previously shipped for retail sale. This proposal would ensure the integrity of the USDA grade shield by providing additional assurances that officially graded eggs meet the quality standards indicated by their grade designation. The proposed rule is currently in USDA's clearance process. (HHS has no role in the grading of shell eggs under USDA's voluntary grading programs.)

PART 3:

Efforts taken by HHS and USDA to assess the feasibility and desirability of applying to all shell eggs the prohibition on repackaging to enhance-food safety, consumer information, and consumer awareness

HHS/FDA and USDA/FSIS, through the ANPR titled Salmonella Enteritidis in Eggs"[8] published on May 19, 1998 and the 1998 SE Risk Assessment,[9] began gathering information to assess the feasibility and desirability of applying to all shell eggs the prohibition on repackaging which may enhance food safety, consumer information and consumer awareness. FDA addressed the issue of whether applying to all shell eggs the prohibition on repackaging will enhance food safety by specifically requesting comment on how widespread the practice of rewashing/repackaging of eggs is and of whether any aspect of this practice significantly increases the risk that consumers will contract SE-related illness from these eggs. This ANPR addressed the issue of whether applying to all shell eggs the prohibition on repackaging will enhance consumer information by specifically soliciting comment on whether the standard labeling practices followed by producers not under the USDA grade shield program were misleading to consumers. This was further followed up in the ANPR by the questions of: whether the standard egg labeling practices are not appropriate for rewashed/repackaged eggs; how should these eggs be labeled to enable consumers to understand the nature of this product; and how to communicate other important information to the purchaser. Through the risk assessment, strategies will be examined to determine if there is a potential for the reduction in human exposure to SE.[10]

Question. What pro-active efforts are being undertaken by both USDA and FDA to address egg and egg product safety?

FDA answer. FDA and USDA have taken many pro-active efforts to address egg safety. These efforts include a variety of regulatory and enforcement activities, guidance and information collection activities, research activities, educational activities, and public meetings found in DHHS's and USDA's joint status report on egg safety. FDA would like to highlight a few items from the report. First, FDA and USDA's Food Safety Inspection Service issued joint Advance Notice of Proposed Rulemaking, or ANPR, on Salmonella enteritidus published on May 19, 1998 to identify farm-to-table actions which will decrease the food safety risks associated with shell eggs. This ANPR included questions to obtain information on the practice of repackaging and redating of shell eggs. Second, the Secretaries of DHHS and USDA sent letters to the heads of the Operating Divisions of the US Public Health Service, USDA Agency heads, US governors and Food Safety Colleagues encouraging adoption of the Food Code by all government bodies responsible for the safety of food. The Office of Public Health and Science of DHHS and the Operating Divisions make up the US Public Health Service. The Operating Divisions include the Agency for the Health Care Policy and Research, the Agency for Toxic Substances and Disease Registry, the Centers for Disease Control and Prevention, the FDA, the Health Resources and Services Administration, the Indian Health Service, the National Institutes of Health, the Substance Abuse and Mental Health Services Administration, and the Food and Drug Administration. The Food Code, which lists model requirements for safeguarding public health and ensuring food is unadulterated and honestly presented when offered to the consumer, is now available in its 1999 version. It includes additional measures for the handling of shell eggs for highly susceptible

[8] See supra REGULATORY/ENFORCEMENT: COOPERATIVE ACTIVITIES.

[9] See supra GUIDANCE/INFORMATION COLLECTION: USDA/PSIS ACTIVITIES

[10] FDA is also seeking to understand the scope of the problem of rewashing/repackaging of shell eggs. For example, FDA has consulted with a stakeholder group which took an informal survey to determine how widespread the practice of rewashing/repackaging is across the United States. The results of this informal survey were that less than 5 percent of the processors not participating in the USDA grade shield program rewash/repack their eggs.

populations. Third, DHHS, USDA, EPA joined in partnership with consumer groups and industry as part of its continuing consumer education campaign, the Fight BACTM. This campaign covers all aspects of food safety, including information that pertains to safe handling of eggs.

NATIONAL CENTER

National Center (directed to FDA).—The National Center for Food Safety and Technology located at the Illinois Institute of Technology near Chicago is a research and development facility that supports the FDA in its mission to ensure the safety of food products other than meat and poultry. It is a ten year old collaboration between the Federal government, private business, and academia. It relies on FDA funding to help address the growing incidence of food borne epidemics.

Question. What role do you see the National Center playing in the President's Food Safety Initiative?

FDA answer. Most of the cooperative research projects currently underway at the National Center for Food Safety and Technology, or NCFST, are part of the overall Food Safety Initiative. The academic/government/industry consortium at the NCFST presents a unique opportunity for examination and resolution of food safety issues, development of measures to prevent food contamination, and implementation of those measures by the food industry.

NCFST will continue to play a major role in the Food Safety Initiative. NCFST resources that are available to the FDA include the use of food processing and analytical equipment, research facilities such as a special containment pilot plant for study of pathogens under actual processing conditions, and the scientific expertise of the universities and industry scientists at the NCFST.

FDA would be happy to provide for the record some of the recent accomplishments by the Center:

[The information follows:]

FOOD AND DRUG ADMINISTRATION NATIONAL CENTER FOR FOOD SAFETY AND TECHNOLOGY ACCOMPLISHMENTS

Developed a test for rapidly detecting E. coli O157:H7 in foods. This procedure is currently being used in the food plants to improve food safety.

Organized a sprout safety task force with the International Sprout Growers Association to develop techniques for improving the safety of sprouts. Sprouts have been implicated in several foodborne illness outbreaks.

Formed a task force of 20 leading industry partners to obtain FDA approval of specific polymer packaging to be used with in-package irradiated foods. These packages will be used to protect red meats and poultry from contamination after they have been irradiated.

Contributed to the development of a high pressure process to make raw oysters safe to eat by eliminating Vibrio vulnificus bacteria. This is a new technology that, conceivably, may be accessible to small businesses and retail establishments in the future.

Conducted research to validate high pressure and ultra-violet light processes to kill pathogens in fresh fruit juices [on-going]. Once this research is finished, the processes may be very useful to small businesses.

Question. Do you envision any of that increase going to the National Center?

Answer. Based upon FDA's past experience, the Agency may temporarily increase funding to NCFST to supplement planned research projects. When FDA originally formulated its' $3.7 million request for research, the Agency did not incorporate an expansion of activities for NCFST. However, since the NCFST is central to the FDA's research activities aimed at developing and evaluating techniques to prevent food contamination, FDA may direct resources to the Center for support. In fiscal year 1998, FDA expended an additional $175,000 on two major research projects that helped address the growing incidence of foodborne epidemics.

SUBCOMMITTEE RECESS

Senator COCHRAN. Well, let me thank all of you for your participation in our hearing today. I think it has been an excellent hearing focusing on the budget request to deal with the problems of food safety in our country. We will give this request very careful attention, and also the legislative proposals that are pending in the Senate, to make the process more efficient and more effective.

[Whereupon, at 11:24 a.m., Tuesday, March 16, the subcommittee was recessed to reconvene at 9:30 a.m., Tuesday April 27.]

DEPARTMENT OF AGRICULTURE

OFFICE OF THE UNDER SECRETARY FOR FOOD SAFETY

STATEMENT OF CATHERINE E. WOTEKI, UNDER SECRETARY FOR FOOD SAFETY

ACCOMPANIED BY:

DR. EILEEN KENNEDY, DEPUTY UNDER SECRETARY FOR RESEARCH, EDUCATION AND ECONOMICS

TOM BILLY, ADMINISTRATOR, FOOD SAFETY AND INSPECTION SERVICE

DR. ENRIQUE FIGUEROA, ADMINISTRATOR, AGRICULTURAL MARKETING SERVICE

DENNIS KAPLAN, DEPUTY DIRECTOR, OFFICE OF BUDGET AND PROGRAM ANALYSIS

STATEMENT OF CATHERINE WOTEKI

Senator COCHRAN. Dr. Woteki, you may proceed.

Dr. WOTEKI. Thank you, Mr. Chairman and members of the subcommittee. I am pleased to appear before you today with my colleagues from the Department of Health and Human Services to discuss the President's food safety initiative and the fiscal year 2000 budget for food safety.

I am going to be emphasizing our request within the Department of Agriculture, as well as talking more broadly about the President's Food Safety Initiative. And because the food safety activities within the Department of Agriculture are really dispersed among seven different agencies, there are several people who are here with me today that I would like to introduce to the subcommittee.

Dr. Eileen Kennedy, who is the Deputy Under Secretary for Research, Education and Economics, oversees four of those agencies; Mr. Tom Billy, the Administrator of the Food Safety and Inspection Service; and Dr. Enrique Figueroa, who is Administrator of the Agricultural Marketing Service.

We very much appreciate that copies of our written testimony will be inserted into the record. And I will then briefly summarize that testimony.

But before I begin that, I would like to thank you and the members of the subcommittee for looking favorably on the administration's request last year for the President's Food Safety Initiative and also for the department's fiscal year 1999 budget requests as they related to agencies that support our food safety efforts. The funding has helped us to make some very substantial progress that is more fully discussed in the written testimony.

PRESIDENT'S FOOD SAFETY INITIATIVE

I would like now to turn to the President's Food Safety Initiative. The fiscal year 2000 budget request is, as Dr. Henney indicated,

the third year that the administration has submitted a coordinated request to maximize the use of our resources toward achieving improvements in the safety of the food supply.

The request builds on the strategy outlined in the May 1997 report to the President that was entitled, "Food Safety from Farm to Table, a National Food Safety Initiative."

Now the coordinated activities that we have undertaken through the initiative have greatly enhanced the capacities of both the States, as well as the Federal Government, to better monitor the incidence of specific foodborne diseases, to more rapidly respond when there are outbreaks of these illnesses, and, we hope, to diminish future outbreaks, to identify foodborne hazards that pose the highest public health risk, and also to direct resources to minimize those risks and, lastly, to develop education programs aimed at improving food safety practices and therefore improve food safety for Americans.

The FightBAC!™ campaign is an example of one of those activities undertaken under the initiative. As you can see from the poster here, it includes four very simple messages for consumers. The messages were actually developed through a public-private partnership.

INTER-AGENCY COOPERATION

The agencies represented at the table here, the Centers for Disease Control, the Food and Drug Administration, the Department of Agriculture, as well as the Department of Education, all participated in the development of this campaign, along with industry and representatives of consumers.

We believe that the investment in the initiative is already paying off. FoodNet monitoring of foodborne illnesses and the PulseNet DNA fingerprinting technologies have already been used, as Dr. Koplan described, to monitor as well as to initiate actions in response to foodborne outbreaks of disease.

We have also established a foodborne outbreak response coordination group, in which USDA agencies, the Food and Drug Administration and the Environmental Protection Agency have been working closely with States to develop better procedures to respond to foodborne disease outbreaks.

The Food Safety Inspection Service and the Food and Drug Administration have recently signed a memorandum of understanding to share information gained from inspections in food plants for which both agencies have regulatory responsibilities.

These are just a few examples of the payoff from the Food Safety Initiative's emphasis on cooperation and on partnerships to further improve the safety of the Nation's food supply; but these are all works in progress.

We anticipate the continued emphasis on investment in these areas, such as research coordination through the Joint Institute for Food Safety Research, will continue to pay dividends in enhanced safety of the food supply.

This last initiative, the Joint Institute for Food Safety Research, is another example of cooperation among and between the agencies. In this case, this activity is being co-chaired by Dr. Kennedy for the

Department of Agriculture and Dr. Bill Raub for the Department of Health and Human Services.

PRESIDENT'S COUNCIL ON FOOD SAFETY

While much progress is being made, we recognize that there is also room for further improvement. That is why last August President Clinton established a Council on Food Safety to develop a comprehensive strategic plan for federal food safety activities and to make recommendations to the President on how to implement the plan.

The President also directed the council to assess the findings and recommendations of the National Academy of Sciences for scientific and organizational changes needed to ensure an effective food safety system in the United States. The council's response was released yesterday. And it supports all the goals contained in the academy's recommendations to strengthen the food safety system. The council has already begun to develop a strategic plan and to coordinate the development of food safety budgets.

As part of its work, it will review food safety statutes and focus on areas where regulatory efforts can be strengthened or where jurisdiction is split between agencies and where resources could be more effectively shared between agencies.

SAFE AND FAIR ENFORCEMENT AND RECALL OF MEAT AND POULTRY ACT

The administration will work with Congress to pass the Safe and Fair Enforcement and Recall of Meat and Poultry Act that Senator Harkin introduced this session.

This act would fill one of the gaps identified by the academy report and strengthen the authorities of the Department of Agriculture in three key areas. These are notification, recalls, and civil penalties.

FISCAL YEAR 2000 BUDGET REQUEST

With respect to the Food Safety Initiative's budget request for fiscal year 2000, six of USDA's agencies are requesting a total of $151 million to support the President's Food Safety Initiative. This request is an increase of $34.8 million over the fiscal year 1999 level.

The initiative budget for the Food Safety and Inspection Service includes increases in the amount of $2.9 million to address food safety risks in three critical areas. The first is emergency coordination with the states in investigating foodborne illness outbreaks.

The second is validation of the ability of State laboratories to meet pathogen testing requirements; and the third is pathogen testing in Federal laboratories of State-inspected meat and poultry products.

The budget request for research, education, and economics includes increases in the amount of $25.7 million that would support the work that is done by all four agencies within that mission area.

These include such areas as research on the development of new pathogen intervention technologies, particularly emphasizing the pre-harvest level; research that will lead to better understanding of

how the use of antibiotics in food-producing animals increases the risk of emergence of micro-organisms that are resistant to specific antibiotics; emphasis on integration of research and education activities in food safety for producers as well as for the general public; and also the conduct of economic analyses necessary to evaluate the effectiveness of various risk reduction strategies that are under consideration for further reducing foodborne illness.

The sixth agency represented in the President's initiative within the Department of Agriculture for fiscal year 2000 is the Agricultural Marketing Service. Their request is for $6.2 million to establish microbiological baselines for pathogens in fruits and vegetables.

Particularly for these agencies in REE and AMS, these research and education and survey activities are supportive of both the Food and Drug Administration's and the Food Safety and Inspection Service's regulatory missions. They are also responsive to the needs of producers and processors.

I would like to turn now to talk specifically about the Food Safety and Inspection Service's accomplishments. I would like to very briefly summarize them, as well as their budget request.

HACCP IMPLEMENTATION

In January of this year, we reached another milestone. At that date over 2,500 large and small plants that account for 92 percent of meat and poultry production were operating under the new HACCP system, the Hazard Analysis Critical Control Points approach.

The agency recognized from the very beginning that small plants, which had to reach this goal in January of this year, those that employed between 10 and 499 employees, that they had fewer resources to draw on than large plants. Because of this, we prepared for implementation of the rule in the small plants by providing extensive technical assistance. [Chart.]

This chart shows what we believe, that HACCP implementation is a success. In January of a year ago, the large plants, those that employed more than 500, which are shown on the left and numbered approximately 300 plants, implemented this system; 274 of those plants were fully successful in their HACCP implementation. Regulatory actions were taken in 26 plants.

For the small plants, those employing between 10 and 499 employees—those are shown in the second set of bars—there were, 2,198 that were fully successful in implementation of HACCP. And regulatory actions were taken in 13 cases.

In order to arrive at this successful implementation, the agency, as well as the organizations and the plants themselves, had to undertake a lot of activities. FSIS provided technical assistance through a variety of different means. We appointed a national HACCP small plant coordinator, established a network of contacts and state coordinators, and conducted small plant demonstration workshops throughout the country.

The agency encouraged large plants to act as sponsors for the small plants, in order to help them develop their HACCP plans. And many, many of these large plants did step up and do that.

The agency, in addition, held a series of 20 meetings around the country to answer questions from the small plant owners and managers. Each field supervisor made personal visits to each plant to assist in their preparations for HACCP implementation.

So these are just some examples of the extensive outreach activities that the agency undertook. I think an enormous amount of credit also goes to the plants themselves, the companies, as well as to their trade associations, and to the universities that worked extremely hard to provide assistance and training to the members, as well as to the small plants.

The very smallest of the meat and poultry plants, those that employ less than ten people, will need to implement HACCP in January of 2000. FSIS is planning to continue these outreach activities and is committed to ensuring a smooth transition for these very smallest of plants.

A year ago there were a lot of questions that were raised about whether HACCP would really work; and I think that we can tell you now that we have answers to those questions. New data from the first year of testing in large plants show that the prevalence of Salmonella in broilers, swine and ground beef and ground turkey was substantially lower after HACCP implementation than in the baseline studies conducted before implementation. [Chart.]

If you look at the chart on the top, for those four categories of products, the first column of numbers are the baseline prevalence levels for Salmonella in these four types of products. You can see in the second column the one year's data of performance testing for Salmonella in these four categories of products, that there have been declines in the range of 50 percent for broilers and a quarter to a third for the other three categories of products.

These data indicate that the Administration's science-based inspection system has already had a significant effect on the safety of food that American families eat by reducing the prevalence of Salmonella in these types of products.

Dr. Koplan has described the new data that are available from the FoodNet surveillance system that also indicate parallel declines in human illnesses attributable to Salmonella.

I am also pleased to indicate that the compliance with the requirements of the rule has also been excellent. This second chart, the one on the bottom, shows that 88 percent of large plants with completed sample sets are actually meeting the government's Salmonella standard. We have similarly high compliance data for the remainder of the requirements of the rule.

Those establishments that are not meeting or that did not meet the standards were required to take immediate corrective actions. The agency also has throughout this first year of implementation, and will continue in the future, to publish quarterly enforcement reports so that the public can follow the progress on HACCP implementation.

FISCAL YEAR 2000 FSIS BUDGET REQUEST

Now with respect to FSIS's budget request, the budget for fiscal year 2000 proposes a program level of $742 million, of which $653 million would be appropriated under current law. This is a net increase of $36 million over the 1999 current estimate.

The 2000 budget includes increases for pay costs to meet our statutory obligation to provide inspection services and also a programmatic increase to implement our farm-to-table food safety strategy.

The request also provides funding for the staffing and operations of the Office of the U.S. Manager for the Codex Alimentarius. The Food and Drug Administration, the Centers for Disease Control, the Environmental Protection Agency and the Department of Commerce, along with USDA agencies, all participate in and also support the U.S. Codex activities.

The 2000 budget includes increases to help the Food Safety and Inspection Service's inspection workforce make the transition to a new HACCP environment, including conversion of 638 inspection positions to consumer safety officer positions.

In these new positions, our employees will be responsible for conducting scientific testing and inspections in plants and also in product distribution. Some of these personnel will be deployed to cover critical inspection vacancies in the nearly 3,400 very small establishments that will be coming under HACCP in January of next year.

In the near future, we will be transmitting to Congress the legislation necessary to support the 2000 budget proposal to recover the full cost of providing Federal meat, poultry, and egg products inspections through user fees. The user fees exclude grants to States and special assistance for State programs.

The overall impact on prices as a result of these fees has been estimated to be less than a cent per pound of meat, poultry, and egg products production.

The implementation of the user fee authority would be designed to be fair and equitable, promote accountability and efficiency and minimize the impact on the competitive balance among affected industries. Appropriated funds are requested to convert the program, the Federal program, to user fees and also for maintaining State inspection programs.

Mr. Chairman, members of the subcommittee, I again thank you for the opportunity to appear before you today, representing the seven agencies in USDA with direct and supportive roles for food safety, and also to discuss with you the administration's goals to enhance food safety. We certainly look forward to working with you.

PREPARED STATEMENT

My colleagues and I are happy to answer any questions that you may have.

[The statement follows:]

PREPARED STATEMENT OF CATHERINE E. WOTEKI

Mr. Chairman and Members of the Subcommittee, I am pleased to appear before you today to discuss the President's Food Safety Initiative and fiscal year 2000 budget for Food Safety within the Department of Agriculture.

Before I begin, I would like to thank you for looking favorably on our fiscal year 1999 budget request. This funding has helped us make progress in fulfilling our Federal responsibilities of maintaining a safe food supply while we continue to make improvements in food safety research and in the inspection of meat, poultry, and egg products.

USDA FOOD SAFETY OVERVIEW

USDA has adopted a farm-to-table approach for improving food safety. The farm-to-table approach views agricultural production, food processing, and food retailing as integrated and interdependent systems. Consequently, actions taken to reduce foodborne hazards must be directed across the food production, distribution, and consumption continuum rather than focused on any individual component. However, our farm-to-table strategy recognizes that our statutory authorities limit regulatory oversight and enforcement to prescribed areas. Therefore, our strategy relies upon voluntary adoption of quality control programs at the production level, and partnership with States, the private sector, and research and education agencies to strengthen the base for such voluntary programs.

Reorganization

Much has been said about the need for organizational and structural change and improved coordination in the Federal government's food safety system. The Administration has been actively engaged in organizational and program changes to improve coordination and eliminate conflicts, enhance coordination of responses to public health issues and emergencies, and coordinate research planning and prioritization.

Office of the Under Secretary for Food Safety: In 1994, the Congress and Administration cooperated in enacting a major reorganization of food safety within USDA, creating the new mission area and Office of the Under Secretary for Food Safety, which oversees the Food Safety and Inspection Service (FSIS) and the U.S. Manager of Codex Alimentarius. Under that legislation, a mission area dedicated to public health was created within USDA, and the legislation mandated that this office be occupied by an individual with a proven background in public health and safety.

This action also effectively eliminated what had appeared to some as a conflict of interest by separating the food safety and regulatory function from marketing functions related to agricultural products, two mission areas that had previously been housed together within the Department.

The Food Safety and Inspection Service: FSIS, which is the USDA regulatory agency reporting to the Under Secretary for Food Safety and is responsible for the safety of meat, poultry, and egg products, also underwent a major reorganization. Among its most significant features were the establishment of a more efficient field organizational structure and the establishment of a new Office of Public Health and Science to provide scientific focus, leadership, and expertise to address the most important public health risks related to meat, poultry, and egg products.

Codex Alimentarius

Codex Alimentarius is the major international mechanism for encouraging fair international trade in food while promoting the health and economic interests of consumers. Management of Codex Alimentarius, which coordinates U.S. activity in Codex, is aimed at establishing international uniformity in food safety standards. Over the last year, I chaired a new Codex Steering Committee, which includes both policy and technical groups and has an expanded membership involving additional Federal Agencies including: the Departments of State and Commerce, the Office of the U.S. Trade Representative (USTR), Environmental Protection Agency (EPA), Food and Drug Administration (FDA) and Centers for Disease Control (CDC), and USDA agencies. We are pleased that the Administrator of FSIS is a vice chair of Codex Alimentarius and that he brings his public health experience to this international organization.

Office of the Under Secretary for Research, Education and Economics

The 1994 reorganization of USDA centralized research activities in the newly created mission area of Research, Education and Economics (REE). Food safety research is largely funded through two USDA agencies: the Agricultural Research Service (ARS) and the Cooperative State Research, Education and Extension Service (CSREES). Together in fiscal year 1998 the REE agencies conducted and funded about $64 million in food safety research. The centralized research focus enables the Department to better leverage appropriated funds.

The REE research activities are intended to meet the needs of the regulatory agencies to achieve improved food safety through HACCP implementation and other initiatives. To that end, ARS, the intramural research arm of USDA, and FSIS have yearly food safety and research budget and planning sessions. These sessions provide one mechanism to ensure that proposed research initiatives address the specific priorities of FSIS. In addition, FSIS consults closely with other USDA agencies to ensure that its critical research and information needs are being met.

In fiscal year 2000, ARS will conduct pre-harvest food safety research to study animal pathogen resistance to antibiotics, study pathogen infestation in animal waste, and examine the risks associated with transmission of zoonotic pathogens from animals to humans. ARS will also conduct post-harvest research to enhance detection and measurement of microbial pathogens during the handling, distribution, and storage of fresh fruits and vegetables to determine the sources of contamination and risks of disease transmission, an effort which will provide important information to producers and, of course, to the Department of Health and Human Services (HHS).

CSREES supports food safety research via several funding mechanisms—formula funds, National Research Initiative competitive grants, special research grants awarded by a competitive process, and special site-specific grants that are appropriated by Congress. For example, in fiscal year 2000 CSREES will provide the necessary training to small retail establishments in helping them to implement HACCP. CSREES will also administer competitive grants for food safety-related projects.

The Economic Research Service (ERS) collaborates with other Federal and USDA agencies to assess the costs of foodborne illness and the economic implications of different options to improve food safety.

President's Food Safety Initiative

For the third consecutive year, USDA and the Department of Health and Human Services (HHS) have coordinated the President's Food Safety Initiative to protect the health of the American public by improving the safety of the Nation's food supply. Through joint planning, we are maximizing the use of our resources and achieving substantial improvements in food safety. This process began with the May 1997 report to the President, entitled, Food Safety from Farm-to-Table: A National Food Safety Initiative. The report recognized foodborne illness as an emerging public health hazard that required aggressive government action, identified critical gaps in the food safety system for controlling or eliminating foodborne pathogens from the food supply, and proposed a strategy for closing those gaps.

Both USDA and HHS have focused on building a strong, scientific foundation for a farm-to-table food safety system. The coordinated activities have greatly enhanced the capacities of the States and the Federal government to better monitor the incidence of specific foodborne diseases, rapidly respond to outbreaks of foodborne illness and diminish future outbreaks, identify foodborne hazards that pose the highest public health risks and direct resources to minimize those risks, and develop education programs aimed at improving safe food practices and therefore, food safety for Americans.

The 1999 initiative is building on gains made in these areas, and places increased emphasis on ensuring the safety of domestic and imported fresh produce and imported foods, targeting retail food safety education, transforming traditional meat and poultry inspection systems to science-based HACCP systems, and developing scientific information and tools to control a greater range of food safety hazards. Significant gains have already accrued with direct benefits to the public health. I'd like to share some of these achievements with you.

The PulseNet (DNA fingerprinting) and FoodNet (monitoring of foodborne illness) technology has already been used in several instances to reduce foodborne outbreaks. State and Federal health officials used PulseNet data to detect and limit the size of foodborne illness outbreaks in products such as alfalfa sprouts, mesclun lettuce mix, ground beef, cheese curds, and Salmonella Agona in cereal.

The most recent Listeria monocytogenes outbreak was also detected from widely dispersed reports of incidences of patient illness. It was tracked by fingerprinting and traced to one source—a meat products plant. In the past, such a geographically scattered outbreak would have continued for months longer. Therefore, while we are saddened by the results of the outbreak, we are pleased that the system worked to halt shipment of even more potentially contaminated products and resulted in a sharp decline in illness following the company's voluntary recall.

While we cannot quantify the number of illnesses prevented, by identifying outbreaks and taking appropriate regulatory actions and public notifications much earlier than we otherwise would have, we believe that the number of potential illnesses in these particular cases was substantially reduced.

FoodNet sites identified Campylobacter as the most common cause of foodborne disease, although it has rarely caused outbreaks of illness since the 1980s. These findings led to new interagency efforts in research and surveillance to better understand how this pathogen enters the food chain and how to control it. Within FoodNet, there are now special studies to determine which foods and behaviors are associated with Campylobacter, E. coli O157:H7, and some Salmonella.

We're also working very hard on our outreach program to consumers. In 1996, the Secretaries of USDA, HHS, and Education along with industry, consumer groups, and public health officials, established the Partnership for Food Safety Education. This public-private partnership was established in order to promote safe food practices. The Partnership also developed the "Fight BAC!" character to promote consumer safety practices. The life-size "BAC" character and "BAC" puppets are used to deliver food safety messages to adults and school age children. More than 100 national, State, and local organizations from the public health, government, consumer, and industry sectors support the "FIGHT BAC!" campaign and disseminate education materials. These "BAC Fighters" will maximize the campaign's national outreach and provide important links into thousands of communities nationwide.

We have also worked with the States to develop a website that links all food safety agencies—at the Federal, State, and local level—together. The "Gateway to Government Food Safety Information" website can be accessed at www.foodsafety.gov.

President's Council on Food Safety

In August 1998, the President issued an Executive Order creating the Council on Food Safety. Throughout 1999, the Council, co-chaired by the Secretaries of Agriculture and Health and Human Services, the President's Science Advisor, and the Head of the Office of Science and Technology Policy, will work to meet the President's goal of developing a comprehensive food safety strategy and coordinating food safety budgets that will result in further improvements in the safety of the food supply and will ensure the most effective use of Federal resources.

The strategic plan will take into consideration the findings and recommendations of the National Academy of Sciences (NAS) report and input from the public. The NAS report, initiated in 1997 at the request of Congress, provides an examination of the scientific and organizational needs of an effective food safety system. Upon completion of its evaluation of the current food safety system, the Council will make additional recommendations on how to advance the efforts identified in the President's Food Safety Initiative. The Council held four public meetings to receive input concerning important elements of the food safety system.

USDA, HHS, and EPA are identifying new opportunities to improve food safety, avoid duplication, and leverage agency resources. This process is greatly enhanced by the Joint Institute for Food Safety Research (JIFSR), which was created by Executive Order in July 1998. By creating the JIFSR and setting it within the Council, the President has re-emphasized the importance of establishing a seamless, science-based food safety system. This represents an efficient and effective way to ensure the implementation of a farm-to-table food safety strategy that reduces the level of foodborne illness in the most effective way possible.

This vision also reflects the findings from the National Academy of Sciences (NAS) report, Ensuring Safe Food from Production to Consumption, that an effective food safety system is a coordinated, interdependent system composed of government agencies at all levels, as well as other stakeholders. NAS found that the successful integrated operation of a food safety system requires that officials at all levels of government work together in support of common goals of a science-based system.

USDA RESPONSE TO NAS REPORT

Part of the President's direction to the Council was to prepare comments and information for him concerning the report by the National Academy of Sciences (NAS) requested by the Congress and issued last summer. Each Department has reviewed the report carefully.

The NAS report, Ensuring Safe Food from Production to Consumption, identifies a desire for a "national food law that is clear, rational, and comprehensive, as well as scientifically based on risk" as a major component of a model food safety system. USDA certainly agrees with the NAS that our food safety systems should be science-based and should utilize risk analysis whenever possible.

The document also notes that the continuous inspection system of meat and poultry through sight, smell, and touch creates inefficiencies, and should be replaced by a science-based approach that is capable of detecting hazards of concern.

Even though the current law requires continuous inspection, it does not specify how this inspection is to be carried out. The statutes do require appropriate examination of animals prior to slaughter and examination post-slaughter at all official slaughter and processing facilities. Among other significant food safety purposes, this continuous inspection requirement ensures use of the best sanitary dressing processes, prevention of fecal contamination, and prevention of meat from diseased animals entering the food supply.

Under the statutory flexibility that already exists, USDA has begun to develop and test a more risk based inspection system, including adopting regulations requir-

ing that HACCP be implemented in all slaughter and processing plants. In addition, USDA is studying how best to effect further improvements in the inspection of meat and poultry.

Statutory Differences

It should be noted that there is a fundamental difference between the statutes that govern the inspection and oversight of meat, poultry, and egg products, implemented by FSIS, and the statutes for other foods, enforced by HHS via the Food and Drug Administration.

It is FSIS' statutory responsibility to ensure that no meat and poultry that may be adulterated receives the mark of inspection and enters the marketplace. Companies slaughtering or processing meat and poultry have a legal obligation to report such activity to FSIS, and FSIS is obligated to provide appropriate inspection to the plant. FSIS also has the responsibility to ensure that only countries that maintain inspection systems for meat, poultry, and egg products that are equivalent to the U.S. systems may export these products to American consumers.

FDA's statutory responsibility is much different. FDA is obligated to remove adulterated foods from the marketplace. FDA has the authority to inspect establishments producing food but does not provide daily inspection of even high-risk food products at this time.

USDA will continue working through the Council to analyze and coordinate our resources to provide science and risk based research, comparative risk analysis, surveillance, inspection, and education to carry out the recommendations of the NAS report.

FSIS ACTIVITIES

HACCP Implementation

On January 25, 1999, a milestone was reached in our strategy for making significant gains in improving the safety of America's food supply. On this date, over 3,000 large and small plants accounting for 92 percent of meat and poultry production were operating under HACCP plans. We recognized from the very beginning that small plants, those with between 10 and 499 employees, had fewer resources to draw on than large plants. Because of this, we prepared for implementation of the rule in small plants by providing extensive technical assistance.

We appointed a National HACCP Small Plant Coordinator to coordinate the various activities underway to assist small plants. We established a network of contacts and State coordinators around the country to disseminate information on HACCP and provide technical guidance to small plants. We also conducted small plant demonstration workshops throughout the country to provide guidance and technical assistance to small plants, asked large plants to act as sponsors for small plants in order to help them develop their HACCP plans, and held a series of 20 implementation meetings around the country to answer any questions on HACCP. Field supervisors made personal visits to each plant to assist in their preparations for HACCP implementation. HACCP coordinators were identified in all affected States. These are just a few examples of the initiatives we put in place to assist small plants with HACCP implementation.

Of course, credit needs to be shared. Numerous industry associations and academic institutions worked extremely hard to provide assistance and training to their members and to plants in their vicinity. Small plant management also deserve much of the credit for their hard work in preparing for HACCP implementation.

As you know, in January 1998 approximately 300 large plants implemented HACCP, accounting for 75 percent of the volume of meat and poultry production in the United States. Large plants had approximately a 92 percent compliance rate during the first 9 months of implementation. Where a few problems did occur, enforcement actions were implemented and establishments responded by modifying and strengthening their HACCP plans. Implementation in large and small plants has been smooth thanks to the efforts of both industry and government.

Very small plants, those with fewer than 10 employees, will implement HACCP in January 2000. We will continue our outreach by holding nationwide public meetings and workshops to prepare very small plants for HACCP. We are committed to ensuring a smooth transition to HACCP for very small plants.

One year ago, many questions were raised about whether HACCP would really work. I believe we have the answers to those questions now. Data released at the beginning of March based on the first 12 months of testing in large plants show that the prevalence of Salmonella in broilers, swine, ground beef, and ground turkey was substantially lower after HACCP implementation than in baseline studies conducted before implementation.

The first data released for ground beef samples showed 7.5 percent testing positive for Salmonella prior to January 1998 and only 4.8 percent testing positive after HACCP implementation, a decline of 36 percent.

The new data for broilers and pork continue positive trends reported several months ago. Of broiler carcasses, 20.0 percent tested positive for Salmonella before HACCP implementation, compared to 10.9 percent after implementation. That's a decline of over 45 percent. On swine carcasses, 8.7 percent tested positive prior to HACCP versus 6.5 percent after HACCP implementation, a decrease of more than 25 percent. As for ground turkey, 49.9 percent tested prior to HACCP versus 36.4 percent after HACCP implementation. This represents a decline of nearly 27 percent.

These data, while preliminary, indicate that the Administration's science-based inspection system has already had a significant effect on the safety of food American families eat by reducing the prevalence of Salmonella. Salmonella is a potentially deadly bacteria that in the past had sickened as many as 3.8 million Americans a year and cost billions of dollars in lost productivity and medical costs annually.

Compliance with the requirements of the rule has been excellent. For example, 88 percent of large plants with completed sample sets are meeting the government's Salmonella standard, and we have similarly high compliance data for the remainder of the requirements of the rule. Those establishments that did not meet the standards were required to take immediate corrective action. We have been putting out quarterly enforcement reports so the public can follow our progress, and we should have a new enforcement report out soon.

New Inspection Models

As USDA focuses on HACCP implementation throughout the industry, it has begun development of a project to design new inspection models that better address current public health risks in the meat and poultry supply. These changes will improve the efficiency and effectiveness of inspection oversight and permit better use of Department resources.

State Cooperative Meat and Poultry Inspection Programs

FSIS oversees and supports (with more than $40 million annually) 26 State inspection programs for meat and poultry. These cooperative programs permit States to inspect product for distribution within their own boundaries. The State inspection programs must be equal to the Federal program conducted by FSIS. All State plants required to enter the program have implemented HACCP. Very small plants are required to implement HACCP in January 2000.

Information Sharing

FSIS has a trained inspection force in every Federally inspected meat and poultry slaughter and processing plant in the United States. In some cases, products are being processed in the same plants that fall under the jurisdiction of FDA because these are food products that do not contain meat or poultry. FSIS and FDA are in the process of establishing and implementing a Memorandum of Understanding (MOU) to facilitate appropriate sharing of information among senior agency field personnel regarding safe food production in these plants.

Modernizing Information Technology

As one step in the adoption of new information technologies in inspection programs, FSIS has developed an interactive computer system—the Field Automation and Information Management (FAIM) system—for its own use, and is encouraging states to adopt it by sharing the costs of implementation. The system permits the field inspection force to have access to regulations, scheduling information, and appropriate information regarding enforcement. It can also be used for training. FSIS has conducted discussions with FDA regarding FAIM's applicability to its inspection system.

Food Code and International Standards

USDA is also working more closely with its counterparts at the Federal, State, and local level to encourage national uniformity in food safety standards through support and endorsement of the Food Code. The Food Code provides guidelines for maintaining food safety in restaurants, grocery stores, nursing homes, and other institutional and retail settings.

Because world trade in agricultural commodities continues to grow, USDA is working through the Codex Alimentarius Commission to encourage international uniformity in food safety standards. Responsibility for oversight of the U.S. Manager of Codex is located in the Office of Under Secretary for Food Safety.

Voluntary Quality Control Programs

The Animal Production Food Safety Staff in FSIS is an excellent example of developing partnership with States to encourage the voluntary implementation of quality control programs at the animal production level. The education of small producers is of particular concern as we move forward with HACCP implementation in small plants. We believe that changes in the marketing of animals will be expected by plants operating under HACCP, and we want to help producers be ready for these changes.

FY 2000 USDA FOOD SAFETY BUDGET REQUEST

FSIS Budget Request

The FSIS fiscal year 2000 budget proposes a program level of $742 million, of which $653 million would be appropriated under current law. This is a net increase of $36 million over the 1999 current estimate. The 2000 budget includes increases for pay costs to meet our statutory obligation to provide inspection services and a programmatic increase to implement our farm-to-table food safety strategy. The 2000 budget includes increases to help the FSIS inspection workforce make the transition to a new HACCP environment, including conversion of 638 inspection positions to Consumer Safety Officer positions.

In these new positions, employees will be responsible for conducting scientific testing and inspections in plants and in product distribution. Some of these personnel will be redeployed to cover critical inspection vacancies in nearly 3,400 very small establishments. These redeployments and upgrades will increase the professional qualifications of the inspection workforce.

In the near future, the Administration will be transmitting to Congress the legislation necessary to support the 2000 budget proposal to recover the full cost of providing Federal meat, poultry, and egg products inspection through user fees. The user fees exclude Grants to States and Special Assistance for State Programs. Requiring the payment of user fees for Federal inspection services would not only result in savings to the taxpayer, but would also ensure that sufficient resources are available to provide the mandatory inspection services needed to meet increasing industry demand and assure consumers of appropriate oversight and enforcement. The overall impact on prices as a result of these fees has been estimated to be less than one cent per pound of meat, poultry, and egg products production. The implementation of the user fee authority would be designed to be fair and equitable, promote accountability and efficiency, and minimize the impact on the competitive balance among affected industries. Appropriated funds are requested to convert the Federal program to user fees and for maintaining State inspection programs.

Food Safety Initiative Budget Request

Six of USDA's agencies are requesting a total of $151 million to support the President's Food Safety Initiative, an increase of $34.8 million over the fiscal year 1999 level. With the additional funds, the agencies will improve our ability to identify food safety hazards, develop more effective control strategies, and improve our response to outbreaks of foodborne illnesses when they occur.

In support of the President's Food Safety Initiative, the budget for FSIS includes increases in the amount of $2.9 million to address food safety risks in three critical areas: emergency response coordination with the States in investigating foodborne illness outbreaks; validation of the ability of State laboratories to meet HACCP pathogen testing requirements; and pathogen testing in Federal laboratories of State-inspected product.

The budget for Research, Education and Economics (REE) includes increases in the amount of $25.7 million to: expand research for the development of new pathogen intervention technologies at the pre-harvest level, initiate research that will lead to a better understanding of how the use of antibiotics in food-producing animals increases the risk of emergence of micro-organisms that are resistant to specific antibiotics, integrate research and education in food safety, and provide the economic analysis necessary to evaluate the effectiveness of various risk-reduction strategies for reducing foodborne illness. This amount will be distributed to the following agencies within REE: Agricultural Research Service ($11.7 million), Cooperative State Research, Education, and Extension Service ($11.0 million), Economic Research Service ($0.5 million), and the National Agricultural Statistics Service ($2.5 million).

The budget for the Agricultural Marketing Service, within Marketing and Regulatory Programs (MRP), includes $6.2 million to establish microbiological baselines for pathogens on fruits and vegetables.

CONCLUSION

Thank you again for the opportunity to appear before you today and discuss the Administration's goals to enhance food safety. I look forward to working with you and my colleagues and I will be happy to answer any questions you or other Members of the Subcommittee may have.

CONSUMER SAFETY OFFICES

Senator COCHRAN. I have a few questions that I will ask at the outset and then yield to other Senators for their comments and questions.

One thing that I noticed in your statement, Dr. Woteki, is the mention of the redeployment of Food Safety and inspection service personnel. I noted that you have something called a Consumer Safety Officer, which is a new phrase. Tell us what the Consumer Safety Officers will be doing and where they will be deployed.

Dr. WOTEKI. Well, I would like to ask Mr. Tom Billy, the FSIS Administrator, to join me at the table. While he is getting up to do so, let me just briefly say that one of the objectives that we are trying to achieve through the development of this new job classification series is an upgrading of the technical expertise that exists within the FSIS inspection workforce.

There are many jobs, both within plants, as well as jobs that compliance officers and others do, that require these additional technical background and skills.

part of what the agency's major goal in creating this new series is to create the opportunity to both upgrade within our workforce those who have these skills, as well as to recruit from outside.

Mr. Billy has been spending quite a bit of time thinking about how those Consumer Safety Officers are going to be going about doing their work. I would like him to respond.

Senator COCHRAN. Mr. Billy.

Mr. BILLY. Good morning. The shift to a HACCP-based approach not only brings with it a number of scientific components but also the need for inspectors to be able to use the tools of science and statistics to make judgments about process control. We need a different kind of inspector than we have traditionally had.

This new classification series—and that is what it is—will provide us with the kind of person with a college degree and a certain number of credit hours in the sciences that will enter the workforce and, with training, be able to carry out our responsibilities of oversight and verification under this new HACCP-based system.

It also fits well with some of the other roles we play in compliance. I might add that it is the backbone in terms of the classification series in FDA for their field inspection force. So it is well tested and I think will serve us well as we look to the future.

Senator COCHRAN. There has been one suggestion that some of these redeployed personnel may be assigned to the distribution system, as well as in grocery stores or in other areas.

My question is: If that is true, what analysis have you done to see whether you are overlapping with State and local public health department inspections and Food and Drug Administration inspections that are already being carried out in those areas?

Dr. WOTEKI. Well, Senator, I understand that there has been some concern raised by State officials about overlapping respon-

sibilities. I do want to assure you, as we have assured them, that as we are developing this plan and moving forward in doing some tests, we will not be duplicating those responsibilities.

I would like to ask Mr. Billy again to describe to you in some detail the approach that the agency is taking.

Mr. BILLY. We have, for many years, in fact decades, had a presence in the marketplace represented by our compliance officers that visit retail establishments, and check products. It is one of the final verifications under HACCP that in fact products are in compliance with our requirements.

They also investigate consumer complaints about products. When we find problems, we take the appropriate regulatory follow-up action. We conducted over 26,000 such verifications last year. These consumer safety officers and many of our compliance people will continue that type of responsibility.

In addition, we have been working very closely in conjunction with FDA and with the Food Protection Conference, which is an organization set up by the states to oversee their regulation of the retail sector. We plan to continue to work closely in that framework to assist the state and local authorities in terms of making sure that, with regard to meat, poultry and egg products, there are proper, effective standards in place, and those regulatory people are trained in ways to make sure that those standards are being met.

We have worked this through the States. We have an ongoing training program for retail inspectors at the State level. It is in cooperation with FDA. It is done through satellite down-link type of approach. We are providing important training so that those people at the State and local level can carry out their responsibilities.

INSPECTION OF IMPORTED FOODS

Senator COCHRAN. We have had hearings in the Senate chaired by Senator Susan Collins, chairman of the permanent Subcommittee on Investigations of the Governmental Affairs Committee. Those hearings have indicated that there is really a need to do more in the imported food area, particularly with respect to the inspection of fruits and vegetables and many other commodities coming into our country.

Will it be part of the administration's effort of consolidation and reorganization to see that this area, which has not been sufficiently covered by inspection personnel, is addressed? I think Dr. Henney may have more responsibility statutorily in this area than others. Would you like to respond to that?

Dr. HENNEY. Mr. Chairman, while we all share an interest in imported food products, I think the particular sector that you are talking about, particularly produce is within our jurisdiction. And within the request that we are giving you today, about $17 million of the $30 million request is targeted towards our inspectional capability.

With this money we would be able to develop more tools for our inspectors to use. We would be able to inspect domestically, as I said, at least in our high-risk areas once a year.

But more importantly and to your question, our foreign inspections would double, not only with inspections of foreign food proc-

essors, but we would be able to continue evaluating the systems that are used by foreign countries to access their adequacy and determine if their systems are equivalency to our own.

Senator COCHRAN. One part of our law suggests that the imports into the country will not be permitted in some areas of processed foods, foods that have been processed in other countries, that they have to abide by the same kind of inspection regime and safeguards that our domestic slaughterhouses and processors have to follow.

How is that law enforced in terms of inspections to verify that the right kinds of practices are occurring in other countries and stopping the importation of food products that do not comply with that rule?

Dr. WOTEKI. Well, Senator, I might respond to that question. The legislative authorities for the Department of Agriculture essentially require that any country shipping, exporting meat and poultry products to the United States, has a system that will provide the same level of consumer protection as the U.S. system.

The Food Safety and Inspection Service is implementing that legislative authority using a three-pronged approach.

The first level is for any country that wants to export meat or poultry products to us, that we first of all review their statutes, we review their regulations to assure that they do have a system in place of inspections that will be considered, or could be considered, to be equivalent to our own.

The second prong is actual visits to meat packing establishments to inspect that indeed what is going on within those plants is meeting that country's system, which has been determined to be equivalent to our own.

Then the third prong is when a product is imported into the United States, when it reaches the port, it is reinspected. So I think we have a good program in place for meat and poultry that assures that imported products do meet the same level of protection that we have here for domestically produced products.

Senator COCHRAN. Thank you.

Senator Kohl?

COORDINATION OF FOOD SAFETY INITIATIVES

Senator KOHL. Thank you, Senator Cochran. Any initiatives such as the Food Safety Initiative that crosses agency and departmental lines clearly requires high levels of cooperation and coordination. For all of you, what steps are being taken to ensure that all food safety initiatives and activities are properly coordinated?

Is there any one agency or person responsible for taking the lead on food safety initiatives? And what steps are needed to improve communication and cooperation among the agencies?

Dr. WOTEKI. Senator, we have actually the President's Food Safety Council that is co-chaired by Secretary Glickman, Secretary Shalala and Dr. Neil Lane. It was established by presidential directive in August of last year. I alluded to the council's activities in my opening statement. The council is working on developing a strategic plan for food safety. It is working to develop coordinated budgets.

So I believe that certainly the council is playing a very important role in providing very high level oversight and directions to the actions and activities of the many agencies that are involved in food safety.

Beyond that, we also have a number of different coordinating mechanisms that are in place. One of them is that there are periodic meetings of a group of principals who are responsible for food safety. Another I alluded to also in my opening statement, the Foodborne Outbreak Response Coordination Group.

So there are a number of different activities that we have underway so that we can be sharing information, developing plans, coordinating our activities, not only at the federal level but also involving the states as well.

Senator KOHL. Dr. Henney?

Dr. HENNEY. I, like Dr. Koplan, have returned back to federal service after a five-year hiatus. And I must say my observation is very similar to his in terms of being quite gratified at the level of cooperation that there is between and among the federal agencies, and particularly our important partners at the State level.

I think Dr. Woteki is very correct in her observations that at a very high level of government, there is oversight of policy and budget development.

But I think more importantly is the day-to-day issue that worries the average American citizen, that is: is my food safe. At an operational level, the people working within the agencies when an outbreak does occur are working on initiatives to see that outbreaks are prevented. These efforts are is very intense and very tightly coordinated.

Senator KOHL. Mr. Koplan?

Dr. KOPLAN. The only thing I would add is, at the daily working level, we now have assignees from each other's agencies working in our own agency. This is something that had not occurred before. It is tremendously helpful on a daily basis to anticipate problems that can come up and to facilitate communication.

These folks know who to call in the other agency when something is needed and know how the other agencies work. I know CDC has assignees in both of my colleagues' organizations, working daily on their issues, and informing them about what we are doing in that area as well. It is a very helpful mechanism.

FOODBORNE DISEASE OUTBREAK

Senator KOHL. All right. I have been provided by the FDA a map of the United States which shows foodborne disease outbreaks for the period of January to July of 1998. I understand this map is based on information provided by the Centers for Disease Control and Prevention. This map indicates that some states with relatively low populations, such as Wisconsin and Kansas, have a large number of outbreaks compared to other states with relatively high populations, such as Texas, Florida and New York.

What is the actual definition of foodborne disease outbreak? Is the period shown on this map representative of incidents of outbreaks generally? And to the extent that outbreaks were a problem in Wisconsin during the period shown on this map, what is the FDA or any other agency doing to help control this problem?

Dr. Henney?

Dr. HENNEY. Senator Kohl, I appreciate your question, knowing that I lived in Kansas for six years. Those are very important states to me. I believe the definition of an outbreak involves an illness of two or more persons related to a particular food.

I think that I would go back to what I said in my opening statement. The map that you see is only reflective of that period of time. If we would look at a snapshot of what happened last week or another six-month period, it might involve highly urban areas or different states altogether.

The way food is distributed in this country, the foods that can be affected in terms of a foodborne illness makes this a very complex kind of issue. But we do try to give snapshots of what is going on at any period of time. We can usually track it back to a particular kind of food.

INCIDENCE OF FOODBORNE ILLNESS

Senator KOHL. So are you saying that what we see on those maps, which would indicate that Wisconsin and Kansas have an unusually high incident, that that is not representative or would not be representative over a period of time?

Dr. HENNEY. That is exactly correct. It might be that Kansas and Wisconsin had a particular distribution of a type of food, and it was only eaten by that population. It may very well be that the Department of Health or the physicians seeing those patients that were affected were particularly alert to a situation. It is a multi-factor kind of issue, I think, that could be observed in any state.

Perhaps Dr. Koplan could add a little bit more to that.

Dr. KOPLAN. One thing I would add, in keeping with Dr. Henney's last comment, is that for a disease surveillance, another factor that one must consider is the quality of the surveillance in that locality. Some places that are more aggressive and have people reporting more will show a higher incidence.

From past experience over many years in public health, I can tell you that your state has one of the better state health departments. Dr. Davis who is in charge of infectious disease epidemiology is superb. This may reflect the increased incidence that has been found.

It may also indicate that in a given year even one outbreak can cause many more cases of illness than the previous year. One must look over a longer trend.

One of the things that we are doing to address this issue is, as part of these initiatives, to try to come up with a better estimate of the real incidence of diarrheal diseases around the country, so as to make comparisons from one state to another a little more controlled. We are in the process of doing that now. Over the next few months, we hope to have better data that permits the kind of comparison that gets around the issue: Is surveillance better in one place than another?

Senator KOHL. Thank you.

Senator COCHRAN. Senator Durbin.

PREPARED STATEMENT

Senator DURBIN. Thank you, Mr. Chairman. At the outset, I would like my opening statement be made part of the record.

Senator COCHRAN. It will be.
Senator DURBIN. Thank you.
[The statement follows:]

PREPARED STATEMENT OF SENATOR DURBIN

Mr. Chairman, thank you for calling this hearing today. Food safety is a subject that affects every person in our country every day. Unfortunately, we all too often take the safety of our food supply for granted. But, recent outbreaks—from ham at a church picnic to imported raspberries to eggs to recalls of hot dogs and ground beef—remind us of the food safety dangers that can many times prove deadly.

I come at this topic from several different angles. First, I'm a consumer. I want the food supply to be as safe as possible for my family and especially for my almost three-year-old grandson. Second, I have a deep respect for those who grow and produce our food and fiber. American agriculture does produce the safest and most abundant food in the world. But, I believe that we can always do more to ensure it is safe. And, finally, when I served on the House Appropriations Subcommittee on Agriculture, I was on the front lines of earlier efforts to improve food safety, from Hazard Analysis and Critical Control Point—HACCP—to funding for additional meat inspectors.

I congratulate this Administration on its hard fought efforts to improve the safety of our food supply. The Pathogen Reduction and HACCP systems regulations are proving to be a significant advance in food safety. The President's Food Safety Initiative is gaining steam and drawing more cooperation within the Executive Branch. I was pleased to join Senator Harkin last year when we took the funding question to the Senate floor and found that almost three quarters of our colleagues agreed that the President's initiative on food safety should be adequately funded. But, we can always do better.

With regard to improving the safety of our food supply, allow me to mention a topic that I believe to be the next logical step to more effective regulation, lower costs, and clearer goals in our food safety battle.

Currently, there are at least 12 different Federal agencies and 35 different laws governing food safety and inspection functions. With so many bureaucrats in the kitchen, it is no wonder that breakdowns occur. Overlapping jurisdictions, Federal agencies without accountability, and resources that are wasted are just inexcusable. A single, independent agency that will focus our policy and improve the enforcement of food safety inspection is really overdue.

The General Accounting Office (GAO) has called for the consolidation of our country's food safety and inspection functions hundreds of times in the last decade. I have found Congressional reports that date back as far as 1949 that lament the fragmented structure of the Federal government's approach to food safety. The most ironic example is the Senate Governmental Affairs Committee hearings on the adequacy of Federal food safety inspection in 1977—led by Chairman Ribicoff of Connecticut and Ranking Member Percy of Illinois. The Committee report contained the following passage: "Divided responsibility for regulating food production has resulted in a regulatory program which is often duplicative, sometimes contradictory, undeniably costly, and unduly complex. We believe the bifurcated food regulation system should be unified in a single agency."

I serve on the Governmental Affairs Committee with Chairman Cochran and others. Last Congress, we held four subcommittee hearings into the safety of imported foods and the idea of a single, independent agency was discussed—twenty years after the Committee concluded that the current structure just didn't make sense.

Vice President Gore, in the National Performance Review, also made a case for a unified approach to food safety.

And, this past summer the National Academy of Sciences (NAS) released their findings on how the Federal government deals with food safety and inspection. I don't think it will surprise anyone that the NAS concluded that one of the more important short-term goals should be fixing the overlap and finding a way for all of the agencies and departments to work together in a unified manner.

In the next few weeks, I'll be reintroducing legislation that consolidates our food safety and inspection functions into a single, independent agency. I hope the Administration and my colleagues will join me in this discussion. I believe it is a topic that is simply too important to ignore any longer.

Let me quickly touch on a couple of other topics. First, egg safety. Last year, Secretary Glickman issued an administrative order that barred the practice of repackaging eggs. I followed up that initiative with language in the Omnibus Appropriations bill that codified the order. I am pleased to report that those packers that par-

ticipate in the voluntary USDA egg grading system are no longer allowed to repackage eggs, a dangerous practice that oftentimes leads to redating and selling of old eggs. The language also called for a joint USDA-FDA report on egg safety to Congress. We're still waiting for that report. Also, the GAO is undertaking a thorough evaluation of egg and egg product safety. I hope USDA and FDA will work with us as we attempt to reassure the American consumer that the eggs they buy are indeed safe. When more than 660,000 Americans get sick every year from eating eggs contaminated with Salmonella enteritidis (SE), we need to do better.

Finally, in Illinois, we have what some have described as a secret weapon in the fight to detect and prevent foodborne illnesses. It's called the National Center for Food Safety and Technology at the Illinois Institute of Technology near Chicago. It is one of a kind. The National Center is a research and development facility that supports the FDA in its mission to ensure the safety of food products other than meat and poultry. It's a ten-year-old collaboration between the Federal government, private business, and academia. And, I can tell you from first-hand experience, it's working. In the coming weeks, I'll be asking my colleagues on this Committee as well as the FDA to work with me in order to help the National Center continue its pursuit of solutions to our food safety problems.

Mr. Chairman, Senator Kohl, thank you for organizing this hearing today. Food safety is a matter that should be a high priority for all of us. I look forward to working with you and the Administration as we go the extra mile to reassure consumers that we're doing all we can to continue to supply the safest food in the world.

FOOD SAFETY PROGRAMS

Senator DURBIN. I would like to acknowledge the presence of Dr. Henney and Dr. Woteki. I have not met Dr. Koplan, but I thank him for joining us. I have worked with Dr. Henney for many years at the Food and Drug Administration, I've always respected her contribution. I am happy that she is in a leadership position there. And, I am looking forward to continuing working with her.

Dr. Woteki, with the USDA, thank you again for all that you have done. The Centers for Disease Control enjoy an excellent reputation in this area also.

I was curious yesterday when the White House announced its statement on the National Academy of Sciences report. It included a provision or recommendation which said, "A new statute should be enacted that establishes a unified framework for food safety programs with a single official with control over all federal food safety resources."

I think that is fairly clearly stated. I am happy to hear it, of course, because for 50 years on Capitol Hill we have been debating that very same issue. Whether we are finally going to take the dozen different federal agencies that inspect food and put them under one coordinated leader, I think that is a clear result or recommendation from this report.

The oddity is in Washington, Spin City USA, we have press releases from the Grocery Manufacturers of America, as well as the National Food Processors Association, which conclude just the opposite, that this report does not suggest that there will be a single official heading these food safety agencies.

I would recommend to the people in industry that they take a closer look at the actual recommendation in that report. I would also suggest to them that it is in their best interest to work with us, to coordinate this effort, rather than resist it. The agencies represented here and the work that they do is important, but it can be improved upon.

And if we can avoid duplication and avoid overlap, the food industry should be in our corner. They should be working with us,

not throwing out these press releases creating the smokescreen of opposition to what is just plain common sense.

HACCP COMPLIANCE

Let me go into three specific areas where I think we can definitely improve the situation. Let us talk about HACCP compliance, I noticed Dr. Woteki raised that issue. The first year of HACCP implementation in meat, poultry and seafood showed radically different results between the FDA and the USDA.

While the large meat and poultry plants had a compliance rate of over 90 percent, the compliance rate for the seafood industry was only 30 percent. The FDA found that 70 percent of seafood plants had "serious or critical" violations of HACCP rules.

Forty percent of those plants were not even implementing the new requirements. For imported seafood, the record was even worse. Eighty percent of seafood importers had serious or critical violations.

Some have criticized the FDA's system for failing to have frequent inspections and mandatory testing and say it is little more than an industry honor system. I would like, Dr. Henney, if you would respond to that.

FREQUENCY OF INSPECTION UNDER HACCP

Dr. HENNEY. Senator Durbin, let me respond in terms of speaking a little bit about the differences in approach of the two departments in terms of what has been done by agriculture with respect to meat and poultry and our approach with respect to seafood HACCP.

I think as Dr. Woteki mentioned, USDA, as they approached implementing a HACCP program, has taken a stepwise or a phase-in approach to it. We took the approach of looking at all domestic process inspectors and having them inspected within the first year. So we are looking everywhere from the smallest mom and pop kind of shop to very large seafood processors.

Our frequency of inspection is annual. We are very rigorous in that.

Senator DURBIN. Excuse me, Dr. Henney. How does that compare with Dr. Woteki at USDA? How frequently do you inspect?

Dr. HENNEY. They do a continuous——

INSPECTIONS

Senator DURBIN. So it is a daily inspection, as opposed to an annual inspection.

Dr. HENNEY. It is continuous. I do not know if that is daily or—it is more than annual.

Senator DURBIN. So we have an annual inspection for seafood, a daily inspection for meat and poultry. Does that give a lot of confidence to consumers in America? I do not think so.

Dr. HENNEY. I think that the HACCP approach, because it is science-based, and if there is an appropriate plan in place and it is implemented well, an annual approach for this kind of inspection is reasonable. We are looking at different kinds of things when you talk about meat and poultry compared to seafood.

In meat and poultry you have a number of bacteria that are found in much greater frequency. We have to look in seafood not only for some of those kind of issues, but also important chemical and physical property issues as well. So the HACCP program is very comprehensive with respect to seafood.

With respect to the rate of compliance, the 70-percent rate meant that we left a letter with those processors. When you look at the actual violations that occurred, the kind of companies that are considered volative, is at a rate of less than five percent. And that compares with the total food that we inspect in all of our programs which has a 6-percent volative rate.

So while I do believe that there is a need to be concerned and that we get more of the processors in compliance. I think in the very first year we expected a fairly high percentage of the seafood industry not being compliant with this new system. We intend to take a multipronged approach to do that.

But we were actually pleased to look at that end product of the volative rate not being higher than what we see in the total food system.

Senator DURBIN. Dr. Henney, I would disagree with that and say that when 40 percent of the plants were not even implementing the new requirements, I do not think that is a good result. I think we can do better.

INSPECTION OF IMPORTED PRODUCT

Let me give another example. Imported meat and poultry products are subject to a two-stage approval process by USDA. First, the exporting countries meat and poultry inspection system must be approved by USDA.

Then the individual plant must be inspected by USDA before it can ship meat to the United States. Even then, it is subject to random verification checks at the border.

And the Food and Drug Administration only has the authority to inspect food at the border, but has the staff to check less than 2 percent of import shipments. The Food and Drug Administration cannot send inspectors to foreign countries except by invitation, even when they are checking the source of food involved in an outbreak in the United States.

Again, Dr. Henney, that seems such a dramatic difference between the standards that are being used. For the consumer, the fact that we are talking about a polish ham, as opposed to some processed food in a can, really does not make a big difference.

They expect everything on the shelf having gone through some government inspection, whether USDA or FDA, to be safe for their family. And yet we still have this wide disparity in the standards that are used.

I am not blaming you for this. Congress has the blame for this. We have created this mess. But do you believe, as I do, that unless we can harmonize these two inspection systems, we cannot give consumers in America the assurance they need about the safety of the food they eat?

Dr. HENNEY. Senator, I said at the time of my confirmation hearings that an inspection system, an inspection force that is limited

to inspecting less than 2 percent of foreign imports is less than credible.

And I think that is one reason why we are bringing forward this budgetary request that would greatly enhance our ability to inspect not only at the borders, but to do some of those foreign inspections that you speak about.

Senator DURBIN. I am not going to dwell any longer, because Senator Harkin, who has been a real leader on this issue is next. And I am sure he has some important questions that he wants to ask and is anxious. [Laughter.]

EGG SAFETY INSPECTIONS

I do want to say that we are waiting for a report is egg safety inspection. The incredible, edible egg is inspected by so many different Federal agencies in so many different ways and with little or no assurance for the consumers.

We did have, thanks to Secretary Glickman's leadership, an initiative about repackaging eggs. So I think the industry is more attentive to their responsibility to consumers.

But I will be looking forward to that report. And believe me, if I have been critical today, the criticism should really be self-directed. Congress for 50 years has created this mess. We have to work with you to straighten it out. And I sincerely hope that the response of the industry to this National Food Safety Council report yesterday is no indication that they are going to be resistant. They should be working with us.

Thank you, Mr. Chairman.

Senator COCHRAN. Senator Harkin.

PREPARED STATEMENT

Senator HARKIN. Thank you, Mr. Chairman. And I would like to also ask that my statement be made a part of the record in its entirety.

Senator COCHRAN. Without objection, it is so ordered.

[The statement follows:]

PREPARED STATEMENT OF SENATOR HARKIN

Good morning, Mr. Chairman, Dr Woteki, Dr. Henney and Dr. Koplan. Mr Chairman, I applaud you for this unified approach to our study of Federal food safety programs. The Food Safety Initiative, now in its third year, represents an integrated approach to the problem of food safety, and it is fitting to discuss funding issues in this holistic context.

Let me first express my regards to each of the Agency officials here today, and recognize the tremendous progress we have made in the past three years. We are just beginning to see the benefits of these efforts, as Dr. Koplan has reported, in decreased illness rates for Salmonella and Campylobacter. "Fingerprinting" of pathogens, advances in testing methods, and the ongoing work of inspectors, scientists, epidemiologists and regulators, have changed the way we understand and respond to foodborne illness. This, and the successful implementation of HACCP systems for meat and poultry inspection, are helping us respond more effectively to illness or, even better, to prevent it entirely.

I am pleased that the Agencies are addressing the problem of safety in fresh produce. Consumption of these products brings reductions in cancer and other chronic diseases, and yesterday's Wall Street Journal reported that the produce department is a crucial draw for consumers in their choice of grocery stores. But we have a number of emerging problems with this part of our food supply. The absence of domestic regulatory standards for fresh fruits and vegetables is a problem that hampers our ability to assure safety, both domestically and abroad. I plan to intro-

duce legislation in the near future that will help assure the safety of these products for American consumers, by setting Federal standards.

In the 105th Congress, I introduced legislation to grant the Secretary of Agriculture the authority to mandate a recall of adulterated meat and poultry products. I introduced the legislation again on the first day of this Congress. Events of the last year and a half have only convinced me further that this is a necessary authority. Dr. Woteki, I look forward to working with you to give the USDA the tools it needs to keep our food safe.

I intend to give my strongest support to full funding for the President's Food Safety Initiative. The Initiative is a complete menu of innovative programs. PulseNet, the genetic fingerprinting network, is a leap forward in the way we manage illness and outbreaks. FoodNet can finally give us answers about victims of foodborne illness, and why they got sick. The Produce Initiative offers an integrated research strategy to allow us to enjoy these healthful foods safely. NARMS, the National Antimicrobial Resistance Monitoring System, is a model system to predict resistance problems in foodborne pathogens. Each of these programs draws on the best that each of the three Agencies here has to offer, and each one has already shown its value.

Each year bring new successes with the Food Safety Initiative, and new challenges from emerging pathogens. This is a race we can't afford to lose. I applaud the work done by my colleagues, and by our food safety leaders in the Agencies. I look forward to working with each of you to assure the best possible system to protect our consumers.

FOOD SAFETY PROGRESS

Senator HARKIN. I would like to pick up where Senator Durbin just left off. But first of all, let me just say a couple of things. I do applaud the work that all of you are doing in this unified approach to food safety funding. I think it is making a significant difference, having watched it now over 20-some years.

And I believe the Food Safety Initiative instituted by the administration now in its third year is promoting this type of integrated approach. And it seems we are making some progress.

I want to personally thank each of the agencies who are here today for the progress that we have made in those 3 years, everything from genetic fingerprinting—I think that is an important step forward—research methodologies, the HACCP programs that are now implemented. I think it has made us respond more effectively to outbreaks. But also, I think it is giving a little bit higher rate of confidence among people, that we are really attacking this problem.

Every time I go into a grocery store and I walk around, whether it is fresh meats, or fresh fruits and vegetables—and I am going to focus a lot of my comments or questions in that area—you just realize how much trust people have, picking up stuff off the shelves and taking it home and eating it. Just think of the inherent trust they have. They are trusting the store and the people who put it out there. But I believe that periodically they see signs that say "USDA inspected," "FDA inspected." And they believe that the Government is also doing their job to keep them safe.

CHANGES IN FOOD DISTRIBUTION SYSTEM

While we have done a reasonably good job in the past, in the last, 15 or 20 years the changes we have made in our food distribution system in this country have been phenomenal.

Meat processed and slaughtered in California is on a store shelf in North Carolina the next day. And part of that meat is in Michi-

gan, part of it is in New Mexico, and just all over the place. It used to be that a small supplied supply a small area.

The same is true of fruits and vegetables. You had small suppliers. We had warehouses. You go there, and they would supply a small area. The distribution is nationwide now. It is very hard to track distribution now.

RECALL AUTHORITY

I have a couple questions and concerns, first of all, Dr. Woteki, on recall authority. I introduced a bill in the 105th Congress. I reintroduced it again earlier this year, with Senator Daschle, on the first day of the session. S. 18 gives the Department of Agriculture mandatory recall authority. A lot of people are surprised to find out that he does not have that authority, that it is only by request.

Recent events that we have had convinced me that we do need to have this kind of authority. If you had that authority, could it be useful? How would it have worked on any of the recent outbreaks, for example? How do you view the issue of mandatory recall authority?

Dr. WOTEKI. First of all, I thank you for introducing the bill, because it does respond to three areas that the administration and Secretary of Agriculture feel very strongly are areas in which additional enforcement authorities are badly needed.

The mandatory recall area that is included in the bill is an area where you are absolutely correct, we do not have the authority to mandate a recall. We request that companies voluntarily conduct recalls. Now I do need to point out that by and large, most companies, the vast majority of companies, do respond and do respond quickly to requests from the department to conduct a recall when there is a problem. But there are occasions when there is foot dragging. There are some very rare occasions, such as ones we have encountered in this last year, where the mandatory recall authority would have been extremely helpful.

I think it is also important to point out that the mandatory notification requirement also contained within the bill is an area in which we also believe that it would make our food safety system much stronger, if the department had that authority. Currently, both producers, the slaughter and processing houses, as well as some of their customers, are doing more and more product testing for pathogens present in foods. Yet they are not required to report those results to the department; and there have been instances where we do not know whether product that has been tested positive has been removed from commerce.

We do believe that that mandatory notification authority would also be very important to the department. We think both mandatory recall and notification are very important.

The third is the civil penalties area. Clearly in HACCP systems, it would be also very important to have the ability to level fines. The Secretary has frequently testified on this topic, and he is fond of using the term that he has the atomic bomb authority. He can withhold inspection, he can withdraw inspection and essentially close down a company.

But there are many different types of situations, either systems failures within HACCP plants, violations that occur outside of offi-

cial plants, or cases of economic adulteration in which the ability to level civil penalties, we believe, would be the appropriate type of enforcement to take. It would get companies to pay attention to these important problems. We believe that the bill, the authorities within the bill, would be very important for also filling this gap in our current approach toward food safety.

REGULATORY STANDARDS FOR FRUITS AND VEGETABLES

Senator HARKIN. I hope we can get some action on that this year. As I said, and just to repeat for emphasis sake, distribution system has changed radically, but our system has not changed to meet requirements.

And that leads me, Dr. Henney, into this other area of great concern, and that is the issue of fresh fruits, vegetables and produce. I dare say 15 years ago, when I walked into my local Safeway in the middle of winter, you did not find raspberries from Guatemala, and lettuce from Mexico and tomatoes from Mexico and Chile and places like that.

You might have gone to one of the places like Sutton Place Gourmet or something like that, and maybe you would find it there. But now it is all over. And more and more we are hearing stories of outbreaks of pathogens and other problems in our produce, in our fruits.

I have a two-part question. First, I understand the FDA is working with industry to develop some voluntary guidelines on produce safety. Your comment on that.

Second—and here is what I think Senator Durbin was getting at—when it comes to meat and poultry inspection, we have national standards. We have standards that we have implemented by law so that if a country wants to ship meat and meat products into this country, we can have them meet those standards. And it is not a violation of the World Trade Organization or anything else.

But in produce and in fruits and vegetables, we do not have those. So that if we try to do something, they will claim it is a violation of WTO. And they are probably right, because we do not have these national standards.

So I want to get to the issue of absence of regulatory standards for fruits, vegetables and produce and how that hampers our ability, not only here but also abroad.

Having said that, I will give you a heads up. I am working on legislation—I have talked to you about it—to set Federal standards in these areas I think a lot of people probably think we have, these standards now, but we do not. So I would like any comments that you have on that line.

Basically, are you working on the voluntary guidelines? Second, this whole issue of domestic regulatory standards and how that is hampered.

Dr. HENNEY. Senator Harkin, let me take the first part of your question and ask the Director for the Center for Foods, Mr. Joe Levitt, to join me in terms of giving you a more comprehensive response in respect to the second part of your question.

I think that the voluntary standards or the work that we have with industry with respect to fresh fruits and vegetables has been the subject of a guidance document that was issued recently. It is

contained in this booklet. It is the first step and first approach to try to get a handle on the issue that you raised.

One issue is our having access and availability of fresh fruits and produce to us year round from many different sources and yet trying to minimize any particular microbial infections that may be present on that food, whether it is domestic or imported. But let me ask Mr. Levitt to respond to the second part of your question.

Mr. LEVITT. The first part, also, the guide that Dr. Henney held up, was produced last year using the funds that the Congress provided for fiscal year 1998. For fiscal year 1999 we are actively working with colleagues at the Department of Agriculture to roll out that guide to fresh fruit and vegetable processors, both domestically and overseas.

We are working with Dr. Kennedy's group domestically and with the Foreign Agricultural Service overseas. And we, between us, have two conferences that are scheduled in April in order to do that. And we have a joint steering committee. So that this is a fully coordinated effort.

I think your question in terms of should there be more mandatory standards, I think that right now is more a function of where we are in time and on the science. We started with this guide largely because of what was known to date.

A lot of the areas that Dr. Henney and others have mentioned in terms of a changing food supply, one of the major areas of the Food Safety Initiative is research into new methods, not just for detection, but also for prevention.

And I think when we look at whether this should be a mandatory program, should it be a voluntary program, the first question is: What are you going to mandate? I think as a precursor we first need more research in what are the preventive controls that would be effective in reducing pathogens in fresh fruits and vegetables at the level that we would want to see.

But in terms of where we are right now, we are—we believe where the science is, is at the voluntary guidance stage, which we think is an important first step tied to a very comprehensive research effort.

REGULATORY STANDARDS

Senator HARKIN. You asked me a question. Okay. I will give you an answer. For example, if we do not have mandatory standards on the washing of fruits and produce, and the source of the water that is used to clean them, how can we impose that on another country? We do not. If we can wash produce, and fruits with surface water, they can in other countries. That is one area. It does not take a lot of research. I do not think that is too highly scientific.

Secondly, if we do not have standards on warehousing procedures for fruits and vegetables and produce in open buildings where rats can get in and birds fly through and bird droppings can fall on the food, if we do not do that, how can we mandate that in another country?

Those are just a couple, very simple, off the shelf. I do not know that it requires a lot of research for that.

Mr. LEVITT. The requirements that we do have in place stem from our statute in terms of our general provisions against adulteration and sanitation. And so, I mean, the statutory framework does provide a basis on which we regulate both domestically and looking at products coming in from other countries. So we use a general statutory umbrella.

I was listening to your question more in terms of should there be specifically targeted regulations of fresh fruits and produce. And as I said, we are moving in that direction. But in terms of what we have done so far, we have felt that, this is where we are right now.

Senator HARKIN. The absence—I am still trying to get to this central question. The absence of national standards, how does that inhibit you from doing your work in other countries, if we do not have national standards, domestic regulatory standards, like we do for meat and poultry? We want to get to the issue of produce. I am still in a little haze about the answer to the question.

Mr. LEVITT. Well, the first——

Senator HARKIN. We talked about the voluntary guidelines. I know you are working on that. I am talking about the next step, the next step of getting domestic regulatory standards. Now is your answer to my question that you do not have enough information or we do not have enough research, we do not have enough data now for domestic regulatory standards?

Mr. LEVITT. That is correct in terms of a comprehensive set of national standards. And that is why we moved with the guidance, which is where we felt the support was. We have a joint advisory committee, which we operate with the Department of Agriculture, the National Advisory Committee for Microbiological Criteria. This issue was raised directly, and these are experts from around the country in terms of what do we know now, what is the right step based on what we know.

That does not mean that is where any of us would like to be, but we need to—in these areas, we need to both drive the science, drive the prevention and let the regulations reflect the state of science. We all are looking for science-based solutions, as we have with our HACCP programs.

OUTBREAKS FROM FRUITS AND VEGETABLES

Senator HARKIN. Dr. Koplan, what do you see from CDC in terms of outbreak of pathogens in produce and fruits and vegetables? What is your experience? I mean, what have we seen lately?

Dr. KOPLAN. In the last few years, you know, there have been some widely publicized outbreaks. Raspberries of a couple of years ago——

Senator HARKIN. Strawberries.

Dr. KOPLAN [continuing]. Strawberries, sprouts. As with——

Senator HARKIN. That was Salmonella, if I am not mistaken, in the sprouts, was it not? Was it Salmonella?

Dr. KOPLAN. Salmonella and E. coli.

Senator HARKIN. And E. coli.

Dr. KOPLAN. They, as well as most processed and unprocessed can be contaminated.

FOOD IRRADIATION

Senator HARKIN. Lastly, and I am sorry, Mr. Chairman, food irradiation. I remember 13 years ago, 14—it was 1985—we had a luncheon downtown, a bunch of us Ag types. You may have been there for all I know. There was a luncheon of all irradiated foods. We had it down at the National Press Club. I know we had irradiated strawberries, irradiated meats off the shelf, and discussed how long the shelf life would be and how it would destroy all these pathogens. That is 14 years ago.

Now we are moving ahead on the meat and poultry end of irradiation. But it seems to me that this lends itself to fruits and vegetables and things like sprouts. I am just wondering what is happening. How come we are not moving ahead more aggressively in this area?

Dr. HENNEY. Senator Harkin, actually we are looking at a variety of methodologies in terms of safe food processing. I was out at our district office in Chicago last week and paid a visit to the Moffett Center.

They are not only looking at the issue which you raised, which is food irradiation, in the sprout area they are looking at things like chlorine washes, they are looking at high pressure methodology, they are looking at electron beam methodology, as other techniques that could be used in terms of interventions to make the food supply safer.

So I think we are not only looking at irradiation as the only process that might help the issue of food safety.

Senator HARKIN. Well, Mr. Chairman, I just—you know, food irradiation, electron beam radiation right now is being used in the marketplace. And companies are selling these to sterilize pharmaceutical equipment and stuff like that, high speed. So if they can have it, why could it not happen with food?

I always had a question why we could not move to that system. That would seem to me to almost give you the highest level of assurance that you would have no pathogens on your food, at least when you bought it. What you did with it after that is your own—that is up to you. But at least when you bought it in the store, you would have a high level of assurance there would not be any pathogens there.

Thank you.

Senator COCHRAN. Thank you, Senator.

Senator Dorgan.

INSPECTION OF IMPORTED FRUITS AND VEGETABLES

Senator DORGAN. Mr. Chairman, thank you. I will be brief. I regret that we had a classified hearing this morning on energy and the Armed Services Committee on the Chinese espionage issue. And so I was necessarily delayed. But this is a very interesting and important issue. And a number of my colleagues have done more work in this area than I have. But I would like to ask just a couple questions.

The discussion here sort of reminds me of the creative tension that exists on the issue of regulation. And especially in recent

years, regulation is kind of a bad word here on Capitol Hill. I come down on the side of more regulation with respect to food.

I think regulation is the only connection to that trust that Senator Harkin described when someone goes into a grocery store and picks up a strawberry and takes it home and eats it. The trust that they have that somehow that food that found its way to that shelf was food safe for them and their family to eat, I think, comes from effective regulation.

Let me ask you a question. Food that comes into this country by an importer that does not meet FDA standards and you discover that in a refrigerated container at the dock, what happens to that food?

Dr. HENNEY. Senator Dorgan, let me give you a little bit of a snapshot into what happens. We would have sampled it. We would have found it to be contaminated. As we are sampling, we have the importer hold that particular cargo until it can be released, when we notify them that it can be released. If it is found to be contaminated, it is no longer allowed in the food supply.

Senator DORGAN. It is destroyed?

Dr. HENNEY. I believe so.

Senator DORGAN. My understanding is——

Dr. HENNEY. I have my center director for the field operation here, but it is essentially held and often times deplaned and then—I do not know if destruction is the right word. So perhaps he could supply me with the correct word. But it is taken out of the food supply.

U.S. CUSTOMS-FDA COOPERATION

Senator DORGAN. My understanding is that it is denied entry, but that we do not have the authority to require it be destroyed. I might be wrong about that. But I visited a dock recently, and I was particularly interested in what Customs was doing.

In one of the warehouses they were unloading some frozen broccoli from Poland, a huge container of frozen broccoli from Poland. They were looking for contraband. And so I was just curious. I said, "Well, do you know anything about this broccoli?" Not that frozen broccoli would have any great appeal to me. But I said, "Do you know under what conditions this might have been produced in Poland? Is this a reputable importer?"

Dr. Woteki talks about the farm-to-table approach. Clearly we cannot do a farm-to-table approach with respect to frozen broccoli coming from Eastern Union.

So I asked the Customs folks, "Tell me about frozen broccoli here. Who would be here to make sure that that broccoli comes into our country to go to a restaurant or a grocery store to be sold to consumers with some confidence that that was not produced with an herbicide or a pesticide that would be prohibited here and would be harmful to our health?"

Their answer was, "Well, that is not Customs. That is FDA."

And I said, "I would expect that. So how much inspection occurs?"

Well, the answer was what I expected as well, that we have a very, very small amount of resources for a large amount of food coming into this country.

And then I said, "Well, what happens on the dock here if they ship in food that the FDA decides is not able to enter this country?"

And they said, "Well, the authority does not exist to destroy it. We cannot require the importers to destroy it."

So they are able to move it back someplace and then, I suppose, they may mix it with some other things and try to move it in someplace else, or ship food that is inappropriate for this country to some other unsuspecting population somewhere else.

I would like you to look into that, because if we need to give you some additional authority to say to an importer that is trying to foist upon us some contaminated food, that if you try to do that, we will destroy it on you. I mean, maybe we need to give you that authority.

Dr. HENNEY. Mr. Dorgan, Mr. Dykstra does correct me, in that we do not have the authority to order that it be destroyed. And reexportation is possible. I would like to assure you that the work that we do at the docks, however, is coordinated, and I believe coordinated quite well, with Customs.

We developed a system with Customs a few years ago known as the OASIS system, so that we do know of product that is coming into the country, have a reasonably good handle on countries that we might have a concern about or a particular broker. So this is an issue that we have given quite a lot of attention to.

Senator DORGAN. And I appreciate that. And I also appreciate the effort and the work that you are doing in these areas, all three agencies. I would just observe that the farm-to-table approach, which our farmers understand and acknowledge is a useful thing, because they want to move to the American table a quality product that is free from question about contamination. That is in the interest of our farmers. We understand that.

But I worry with the global economy and the lack of resources you have and the staggering job just to try to deal with all of this coming into the country that we do not have the same capability of implementing a farm-to-table program dealing with import of foods.

And I guess I just ask your impression of that. What additional resources would you need and what kind of authority would you want in order to give us some measurable improvement in feeling that our imported food is meeting the same standards as the food we produce in this country?

Dr. HENNEY. Well, Mr. Dorgan, with respect to budgetary needs of the proposal we are bringing forward this morning, there is money targeted to increase our level of foreign inspections and increase our work at the dock. And so we would hope that you would look favorably on that request.

With respect to additional authorities, I would appreciate the opportunity to meet with you and your staff on that to see what might be most appropriate. I did not come with a particular list in that regard.

Senator DORGAN. Let me just add my voice to the comments of Senator Durbin. I think it is rather byzantine that over so many decades has grown, I guess, a fracturing of the authority for dealing with food safety issues. I think it would make a lot of sense

for us to try to pull some of that together and merge some of those responsibilities.

And I understand each agency involved would have some concern about that. But the description, if you have a cheese pizza, you may not be inspected in a decade, and if you have a pepperoni pizza, you are inspected every day, consumers might wonder about a government that decides that that is the right approach.

And that is just because all of this has developed over a good number of years, and we have not stopped to bring it all back together in a way that I think would make some sense.

Well, Mr. Chairman, I was necessarily late. You are good to allow me to question at the end.

And let me just thank the agencies for coming. I also share Senator Durbin's critical concerns that much of this really relates to us here in the Congress. You know, we need to provide the resources. If we decide what we want with respect to food safety, we need to provide the resources. If we believe reorganization is necessary, we have to do that.

And so I look forward—the leadership of the chairman of this subcommittee is very important. And I admire the work he has done. I look forward to working with other members of this subcommittee on these issues.

Thank you very much.

INTERAGENCY FOOD SAFETY INITIATIVE

Senator COCHRAN. Thank you, Senator, for your comments and your participation in our hearing and in the work on these issues.

Let me ask a couple final questions before we conclude our hearing. There has been some comment about the President's Food Safety Initiative. Our panel has mentioned that in statements that have been presented to the committee this morning. And there is some confusion in my mind about what is and what is not a part of the President's Food Safety Initiative. We see, for example, that FDA's seafood HACCP funding is counted as a part of this initiative, but the FSIS HACCP program is not.

When you look at the entire budget of the Food Safety and Inspection Service, $600 million plus, only $18 million of that is counted. The President's budget does not even request funding for a lot of the mandated programs of the Food Safety and Inspection Service.

On the other hand, there are some other programs where the base funding of ongoing activities that predate the announcement of the President's Food Safety and Inspection Service are counted in the funding levels for the Food Safety Initiative.

So it is very confusing. Can any one of you help us define what the President's Food Safety Initiative is and is not? Dr. Woteki?

Dr. WOTEKI. I will take a run at that, Senator. It is actually all laid out in that May 1997 report to the President. In that report we identified, we collectively, the agencies here, six areas that were gaps that were not receiving sufficient attention and funding for particular emphasis in a budgetary initiative.

One of the six areas was the development of a surveillance system at CDC that would help us in responding much more quickly, first to identify outbreaks of disease and then to help in response.

The report proposed additional funds for risk assessment, an area that we are increasingly relying on, but for which we need methods developed, and also funding to conduct some of these risk assessments.

In the case of the Food and Drug Administration, their inspection programs are identified in that report as being areas in which, particularly for the food system, they have responsibility for the food sector which was an area in which an infusion of new funds was identified as being badly needed.

We also identified research in the report as being an area in need of a focused infusion, a focused investment, of new funds, particularly emphasizing pathogens in foods, as well as some areas that we are particularly concerned about: the development of resistence to traditional processing approaches, heat tolerance, for instance, in pathogens, or increasing resistence to antibiotics because of use in food animals. These were areas of research that if we had some additional funds, we could make some real breakthroughs.

We also identified education, farm-to-table, but in particular with an emphasis on consumers as being an important area for additional new funding as well. So these half-dozen areas in that initial report in 1997 is really a kind of roadmap to the President's Food Safety Initiative.

In addition, that report also identified and committed us to doing some longer range strategic planning, which is now being undertaken under the auspices of the President's Council Food Safety.

Senator COCHRAN. Dr. Henney, do you have any comments about that?

Dr. HENNEY. No. I believe that Dr. Woteki has outlined very well the areas that were identified specifically for the Food Safety Initiative. You are very right. We have many other activities in the food arena where we are making requests for budgets or asking for funding in particular types of ways. But I think the areas that Dr. Woteki has identified have been consistent through the Food Safety Initiative.

PROPOSED RULEMAKING ON IRRADIATION OF RED MEAT

Senator COCHRAN. Dr. Koplan, any other comments on it? There is one area where we heard some comment this morning, and it is about the proposed rulemaking issuing a regulation governing irradiation of red meat. We understand this is in the 60-day comment period that ends in April, at the end of April.

My question is: At the close of the comment period, what do you anticipate in terms of the agency implementing rules or regulations to make this added food safety technology available to industry? What is the timeframe that is anticipated?

Dr. WOTEKI. Well, I think to a certain extent that is going to depend on the nature of the comments. They will be reviewed promptly. Clearly, this is a high priority for us to do a prompt review and response. At this point, I have not personally looked at the comments that have been received, so I do not have a sense for how complex they are, what kind of challenges they are going to offer.

If the responses that are coming in are generally favorable, there should be little impediment then to a rapid review and issuing of a final——

Senator COCHRAN. Is this process similar to a public opinion poll, or is it science-based?

Dr. WOTEKI. Well, it is most definitely science based. As part of the comment period on any of our rules, we frequently data submitted from the industry, from academic scientists and from others that needs to be reviewed and taken into consideration.

FOOD SAFETY EDUCATION

Senator COCHRAN. One thing that always strikes me as interesting in news reports about foodborne illnesses or so-called outbreaks—which you have reminded us is two or more people suffering from the same malady, I guess, as a result of a foodborne contaminant—is that after the initial big headline and the first couple of paragraphs, there is the line in there: But if the food, whatever it is, was cooked, there is no danger of illness, or less likely danger, than we have just been advertised exists.

I wonder to what extent are the agencies involved—CDC may be involved in this, too—in trying to help ensure that we all have all of the story, and we get the information that we need in order to make judgments, not just about an overall impression of the quality of the food that we have access to, but how we should prepare it, the thorough cooking that is required, the handling of food, and the like. Are we doing enough in that area? And, does this budget provide the funding that you need in order to have outreach programs that make a difference in this area?

Dr. HENNEY. Let me take a crack at that. I think one of the programs that we are all very much committed to, that Dr. Woteki mentioned in her testimony, was the FightBAC!™ campaign.

And that is to have consumers keep constant vigilance in terms of the things that they can do to make sure that their food is safe. It comes down to chilling, cooking, cleaning and making sure that there is no cross-contamination as they prepare food.

And I think from the individual consumer, who is preparing food in the home, to particularly people who are preparing food for others, those kind of four basics need to be very strongly ingrained.

We have taken, as a part of the Food Safety Initiative, this educational program very seriously. I think that we are trying to impress this message far and wide. I know that, speaking for the FDA, we have undertaken many an initiative using the basic structure of the FightBAC!™ really all across the country using our district offices as the hub for outputting that kind of message.

But I do take your point that there are things that we need to do all the way through the system, anywhere from that first preparation of a product, to an inspection, all the way to the table that is important to make sure that our food is safe.

Senator COCHRAN. Well, there is some discretion, too—I do not know which agency maybe has the controlling authority—on which kinds of contaminations are advertised or given great notice. It is almost like the federal Government decides which episode to release and which not to release. Is that true? That is coming to me through some of the material that I have reviewed in preparation

for this hearing. I did not realize that there was that kind of discretion being exercised by the agencies.

Dr. WOTEKI. Well, if you are referring to information that is released about recalls——

Senator COCHRAN. Maybe that is it. Yes.

Dr. WOTEKI [continuing]. There are different categories of potential hazards to the public that are used for categorizing each recall-type situation.

Senator COCHRAN. That is what I read. That is exactly what I read.

Dr. WOTEKI. Some of those situations, where the consumer has the ability to identify the product and return it, are the cases in which we go to the media and publicize so that consumers can take actions to protect themselves.

Frequently what happens, when there is an outbreak of disease, and a recall is associated with it, there is a stepped up level of testing that is then done. So you may see a cluster of recalls that are related to a particular organism. That is what has happened with the Listeria situation that Dr. Koplan described in his testimony.

There can be a clustering in time of outbreaks and then recalls that are associated with a specific organism.

FIGHT BAC

Senator COCHRAN. Dr. Koplan.

Dr. KOPLAN. Yes. You know, over the last 50 years we have probably investigated thousands of outbreaks, many of them foodborne outbreaks, and view all of these as an opportunity to educate the public about what risk factors are present and how to avoid future problems like this.

I think what you see here in the FightBAC!™ campaign is a terrific example of something that is at the end of the chain of developing data, information and science. It begins with surveillance in the community. Are we seeing those 2, 5, 100, 1,000 cases of something associated with a common food, then investigating it? Is it an outbreak? What is the cause. Then doing some more studies to determine what are the specific risk factors. Those risk factors are addressed by the four different elements of the FightBAC!™ campaign.

We have a group of college students who begin to cook for themselves for the first time alone in a dorm, and they use a common cutting board to cut up raw chicken and then to prepare their salad. That is the separate piece.

You have folks who will buy shrimp in a market and leave it on the counter for a long period of time and then decide to cook it. There are a series of elements that from our science background and doing case control studies, doing surveillance, investigating, provide the science base for health education program. We link all those in a chain.

Senator COCHRAN. Dr. Woteki.

Dr. WOTEKI. One final comment about the FightBAC!™ campaign is to just reemphasize that it is a public-private partnership. A substantial amount of the funding for the campaign has come from the private sector.

In addition, the agencies here have all participated in the development of those messages and, as Dr. Henney indicated, in the distribution of that educational message.

The current program under development under the FightBAC!™ campaign is going to be oriented toward school-aged children, which is also part of what Dr. Henney referred to as the constant need for education and then reinforcement of this message at all ages, because school-aged children are also preparing food at home, as well as their parents. Education needs to be conducted throughout the age continuum.

SUBCOMMITTEE RECESS

Senator COCHRAN. Well, let me thank all of you for your participation in our hearing today. I think it has been an excellent hearing focusing on the budget request to deal with the problems of food safety in our country. We will give this request very careful attention, and also the legislative proposals that are pending in the Senate, to make the process more efficient and more effective.

[Whereupon, at 11:24 a.m., Tuesday, March 16, the subcommittee was recessed to reconvene at 9:30 a.m., Tuesday April 27.]

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2000

TUESDAY, APRIL 27, 1999

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 9:30 a.m., in room SD–138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.

Present: Senators Cochran, Kohl, Dorgan, and Durbin.

DEPARTMENT OF AGRICULTURE

STATEMENT OF SHIRLEY R. WATKINS, UNDER SECRETARY FOR FOOD, NUTRITION AND CONSUMER SERVICES

ACCOMPANIED BY:

SAMUEL CHAMBERS, ADMINISTRATOR FOR THE FOOD AND NUTRITION SERVICE

DR. RAJEN ANAND, EXECUTIVE DIRECTOR, CENTER FOR NUTRITION POLICY AND PROMOTION

DENNIS KAPLAN, DEPUTY DIRECTOR OF BUDGET, LEGISLATIVE AND REGULATORY SYSTEMS, OFFICE OF BUDGET AND PROGRAM ANALYSIS

OPENING REMARKS

Senator COCHRAN. This subcommittee will please come to order. This morning our subcommittee continues our review of the proposed budget for the next fiscal year that begins in October of 1999 as it relates to the functions and activities of the Department of Agriculture and the Food and Drug Administration.

This morning we are concluding our hearings on this year's budget and we have with us to discuss the Food and Nutrition Service budget, Ms. Shirley Watkins, who is Under Secretary of Food, Nutrition, and Consumer Services; Dr. Rajen Anand, Executive Director of the Center for Nutrition Policy and Promotion; and Dennis Kaplan with the Budget Office of the Department of Agriculture.

The Food and Nutrition Service manages 15 nutrition assistance programs funded at approximately $36 billion. The agency is the largest agency funded each year in the Agriculture appropriations bill.

The President's budget includes proposals to improve the nutritional status of program recipients, continue Y2K compliance and fund activities to monitor and improve program and financial integrity.

We appreciate very much the efforts of this Under Secretary to aggressively deal with problems relating to food stamp fraud and abuse. We hope that further success can be achieved by fully implementing the electronic benefit transfer program.

The budget request also proposes that the Food and Nutrition Service continue its role of providing nutrition education and food and commodities to the general public with increased funding for the Food Stamp Program, The Emergency Food Assistance Program, WIC, and the Child Nutrition Programs.

We will be interested in comments from the Under Secretary about how this budget will achieve those goals. We appreciate having the benefit of your written testimony and we will make it a part of the record in full. Before proceeding to summarize it, however, I'm going to yield to my distinguished colleague from Wisconsin, the senior Democratic member of this subcommittee for any comments he would like to make at this time. Senator Kohl.

Senator KOHL. Thank you, Senator Cochran. I have a statement that I will insert into the record.

PREPARED STATEMENT

Senator COCHRAN. It will be inserted and printed into the record without objection.

[Statement follows:]

PREPARED STATEMENT OF SENATOR HERB KOHL

Our hearing today is on the subject of nutrition and public health. I want to extend a welcome to Secretary Watkins from the Department of Agriculture and her associates with the Food, Nutrition and Consumer Services. I again want to welcome Dr. Jane Henney of the Food and Drug Administration.

The last hearing before this subcommittee was on the topic of food safety, and in many ways it is fitting that today's hearing follows that subject. It is well that we dedicate resources to ensure the food we eat does not make us sick, but I worry that not enough attention is given to ensure that the food we eat makes us healthy. When I look at the common diets of many Americans, I grow concerned about what long-term health risks await many of us. More and more Americans, especially young people, are turning more to foods of convenience than to meals of substance. I am especially concerned that wholesome beverages, such as milk, are being replaced by sodas and other less nutritious drinks, even in the arena of our public schools where education should include lessons on how to live not only a productive life, but a healthy one as well.

Nutrition programs represent, by far, the largest levels of funding in our appropriations bill. Not only does this fact point to how important these programs are, but they also suggest how difficult they may be to manage. The effects of welfare reform of a few years ago are still being felt and those effects are present in the administration of our nation's nutrition programs. A few years ago, large carry overs in the WIC program, possibly one of the most successful and popular program's funded by Congress, raised issues about how best to manage the programs resources. Today, declining rolls in the food stamp program are resulting in surpluses far in excess of the President's original estimates and again bring into question how best to manage these programs.

Dr. Henney joined us recently during our hearing on food safety, but the responsibilities of FDA are much broader in scope than that single topic. During our hearing on food safety, it was pointed out how much technology has changed and foods grown in one part of the world can be marketed a few days later in another part of the world. Changing technologies also may affect public health. Today, a person exposed to a deadly virus can board a plane in a distant part of the world and within a matter of hours that plane can touch down in Los Angeles, Dallas, Atlanta, or Milwaukee and suddenly a disease that once seemed remote is on our door step. The challenges to FDA are great and I look forward to Dr. Henney's testimony today as we proceed to determine how we can best work together.

Senator COCHRAN. Ms. Watkins, welcome. You may proceed to describe your proposed budget in any way that you think will be helpful to the committee.

We apologize to you and the other panel which will follow you for having to shorten the expected duration of the hearing because of a full committee hearing that's being called at 10 o'clock to review the supplemental emergency request for military funds for Kosovo.

We will try to complete this hearing so we can get over there before that ends and be a part of that hearing. You may proceed.

THE FOOD AND NUTRITION SERVICE FISCAL YEAR 2000 BUDGET REQUEST

Ms. WATKINS. Mr. Chairman, thank you very much and, Senator Kohl, I appreciate all of the support that you have given us for our nutrition assistance programs at USDA. And I'm grateful for the opportunity to be able to present the fiscal year 2000 budget request for the agency.

With me in the audience is the Deputy Under Secretary Julie Parodis and the Administrator for FNS, Sam Chambers.

I'd like to begin very briefly and discuss some of the issues that are in our 2000 budget request which in total is a $36.5 billion request for the year 2000.

About one in five people participated in one or more of our nutrition assistance programs. And those programs help us to combat critical diet and health risk factors that contribute to four out of ten of the leading causes of death in the United States.

As you know, Mr. Chairman, we meet during a period of unparalleled economic success for our Nation. Nonetheless, it is especially important in good economic times that we remember the role of the public nutrition assistance programs in promoting the nutritional well being of low income families and the need for these programs by the working poor remains extremely strong.

Our program that serves as a safety net for nutrition assistance is the Food Stamp Program which reaches one in fourteen people. We're requesting $22.5 billion in fiscal year 2000 to support our food stamp requirements.

FOOD STAMP PROGRAM

This includes the food stamp benefit reserve of a billion dollars and $1.268 billion for Nutrition Assistance Programs for Puerto Rico, $75 million for the Food Distribution Program on Indian Reservations and $100 million for commodity purchase for the TEFAP program, The Emergency Food Assistance Program.

We know that food stamp participation has fallen by over nine million participants and that's a drop of a third between March of 1994 and November of 1998 and that participation is not surprising. But part of the drop is attributable to the strength of the economy and the success of Welfare Reform in moving families from welfare to work and part can be traced to the new restrictions on participation of certain legal immigrants and able-bodied adults without dependents. But the magnitude of the decline points to other factors that are a reason for a great deal of concern.

Between 1995 and 1997, food stamp participation fell five times as fast as poverty, suggesting that many of the poor families that left the program have left the program despite their eligibility and these working families, especially those leaving the welfare system, need to be made aware that they may still be eligible for food stamp benefits.

Although the Ag, Research Extension and Education Reform Act restored some food benefits, in this budget we're requesting an additional restoration of $10 million for those legal immigrants who are elderly and vulnerable.

We propose to restore eligibility to qualified non-citizens with lawful permanent resident status on August 22nd, 1996, once they reach the age of 65.

CHILD NUTRITION PROGRAMS

In the Child Nutrition Programs, which we are responsible for, we are requesting a total of $9.5 billion in fiscal year 2000. These programs include the school meal programs that play a key role in maximizing our children's potential.

We expect that schools will serve more free meals in fiscal year 2000 and there are several possible explanations for this trend.

First, we have direct certification for many children who are eligible for free meals even though many of them wouldn't have been eligible with an application, but they do come forward in direct certification.

And, second, Title I funding is tight and there is a strong incentive in school districts to identify the number of children who are eligible to receive free meals.

And, finally, the technological improvements have reduced the stigma of participation by maintaining the confidentiality and the identity of those eligible students.

We currently are serving about 26 million children daily in the School Lunch Program and that's about 50 percent of the total enrollment. But participation in the breakfast program is only about 7 million and then only about 16 percent of low income children in the School Lunch Program participate in the Summer Food Service Program.

So we plan to make these programs more accessible to more children so that they will have benefits of good nutrition.

The reauthorization proposal provided snacks in after school programs. So we will be working aggressively to ensure that that participation grows in 2000 in both school programs and child care centers.

The after school program has been very successful based on the early indications of information that we've had from the school districts and child care centers.

We also in the Reauthorization Act had provision to pilot test a research project for breakfast in six school districts to determine the effects of breakfast on learning and behavior in schools.

We have requested $13 million in fiscal year 2000 to do a very rigorous pilot study to ensure that we have the best data possible on breakfast and learning. To make sure that child nutrition programs are as effective as they can be, we have requested a modest

$2 million to restore the Nutrition, Education and Training Program.

Some people have argued that NET is no longer necessary since we have Team Nutrition that has been successful.

But we need to make a clear distinction between these two programs. The grants that states receive under the NET program provides state level infrastructure that delivers the materials that we develop through Team Nutrition.

The Team Nutrition funds are used to develop model nutrition programs. And we seriously need to look at the NET and make certain that we understand the difference between NET and Team Nutrition. Both of those programs need our support.

WIC PROGRAM

The other program we are responsible for is the WIC program. Since early 1993, WIC participation has increased about 37 percent or about 2 million new clients. And in fiscal year 2000, our budget request is for $4.1 billion. This funding amount supports the President's commitment to fund the average monthly participation of 7.5 million.

Between fiscal years 1997 and 1998, the average monthly food cost per person rose by only one-half of 1 percent while the general food inflation rose by only 2 percent. So we are doing quite well with the WIC program and very proud of that.

We'll continue to work on WIC and look at all of the possible changes that we can make in the program with our new regulations that we have sent to OMB.

We're also expanding the WIC Farmers' Market Nutrition Program which greatly benefits not only WIC participants, but small farmers. In fiscal year 1998, the program reached 32 states, the District of Columbia, two Indian Tribal Organizations. And during fiscal year 1999, we're adding Alabama, Guam and two more additional Indian Tribal Organizations.

COMMODITY ASSISTANCE PROGRAM

The Commodity Assistance Program. We are improving the nutritional quality of commodities and providing benefit delivery through electronic ordering and delivery system and it's called electronic data interchange.

In fiscal year 2000, we are requesting $152.2 million to support the commodity assistance program which includes an additional $5 million to support the expansion of the Farmers' Market Nutrition Program and this increased from $15 million in fiscal year 1999.

We're also making major changes to our commodity distribution program. So you will notice that we have a reinvention program for commodity distribution program that involves ASFSA and our state commodity distributing agencies as well as the industry.

FOOD PROGRAM ACCOUNT

In addition, our FPA account which is our Food Program Administration account, we're requesting $119.8 million and that's an increase of $11.3 million.

We've requested this to support our strategy of achieving a higher level of effectiveness in concert with our state partners in the integrity and oversight of our food assistance programs.

In each program, whether it's WIC, food stamps, commodity distribution, school meals, we've placed nutrition as the foundation of all of our policies and all of our activities including staffing changes so that nutrition is reflected.

We've developed educational materials which we are sharing between programs with a consistent nutrition message so that there is no confusion on what we're trying to accomplish.

We're also working very closely with the Human Nutrition Research Laboratories as well as ARS, CSREES and other USDA mission areas. We believe that it is the role and responsibility of the Department of Agriculture's Food, Nutrition and Consumer Services to deliver a consistent nutrition education message across programs.

PREPARED STATEMENT

Mr. Chairman, I hope that has given you a bird's eye view of what we're trying to accomplish through the year 2000 budget request. I'll be happy to answer any questions that you may have or the members of the committee.

[The statement follows:]

PREPARED STATEMENT OF SHIRLEY R. WATKINS

Mr. Chairman and Members of the Subcommittee. Thank you for the opportunity to present the fiscal year 2000 budget request for the Food, Nutrition and Consumer Services (FNCS). As the Under Secretary for FNCS, I am responsible for America's domestic Nutrition Assistance Programs which include the anchor programs of Food Stamps, Child Nutrition and the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), administered by the Food and Nutrition Service. I am also responsible for the Center for Nutrition Policy and Promotion (CNPP) which is the lead Federal agency in promoting effective human nutrition. I am accompanied today by Samuel Chambers, the Administrator for the Food and Nutrition Service (FNS). Mr. Chambers was appointed to this position in August 1998. Prior to being named FNS Administrator, Mr. Chambers was the Director of the Michigan Family Independence Agency for Wayne County in Detroit, Michigan. I am also accompanied by Dr. Rajen Anand, the Executive Director for CNPP and Stephen Dewhurst, the Department's Budget Officer.

The mission of FNCS is to reduce hunger and food insecurity by providing children and needy people access to food, a healthful diet and nutrition education in a manner which is supportive of American agriculture and inspires public confidence. These programs are vital to our Nation since about one in five Americans participate in one or more nutrition assistance programs. The critical importance of our mission is clear—poor diet is a significant contributing factor in 4 out of the 10 leading causes of death in the United States. Heart disease, cancer, stroke and diabetes which are significantly impacted by diet, account for 1.4 million deaths annually or about two-thirds of total deaths in the United States. Diet also plays a critical role in other health concerns such as obesity, hypertension, and osteoporosis. Taken together, these diet related diseases cost society an estimated $250 billion each year in medical cost and lost productivity.

Mr. Chairman, this Administration has led the Nation to a period of unparalleled economic success. With record job creation, low unemployment, and expectations of continued low inflation, the outlook for the future remains bright. Yet it is essential that in good economic times we remember the role of Federal nutrition assistance in harnessing our agricultural abundance to help low- income families. The need for these programs by low-income needy families remains strong.

By fighting hunger and promoting good nutrition, these programs help to ensure the well-being of all Americans, as well as play a critical role in supporting those who are making the difficult transition from welfare to work. Even as we celebrate

prosperous times for our country, let us not lose sight of the role of nutrition assistance in lifting families out of poverty.

PROGRAM HIGHLIGHTS

Food Stamps

Food Stamp Program (FSP) participants represent a broad cross-section of the Nation's poor. The Food Stamp Program provides a critical nutrition safety net for virtually all low-income people, including children, working poor families, and the elderly. Welfare reform legislation, however, has sharply tightened the eligibility criteria and made some groups of individuals ineligible. Many immigrants and unemployed adults without children are no longer entitled to food stamps. The Agricultural, Research Extension and Education Reform Act of 1998 (1998 Act) restored food stamp benefits to some of our legal aliens and we are thankful for that. In this budget, we are requesting additional restoration for those legal aliens who become elderly and vulnerable. We are making significant strides in the Food Stamp Program and our other programs, as well. Let me take this opportunity to give you a few examples.

The Agency is leading the way on new benefit delivery technologies. By the end of fiscal year 1998, more than 50 percent of all food stamp benefits were issued using Electronic Benefit Transfer (EBT). FNS is continuing its efforts to provide needed technical assistance associated with State EBT implementation and to provide ground breaking technology in the development of a multi-program delivery system for WIC and food stamp benefits.

In November 1998, the Food Stamp Act of 1977 was amended to require food stamp State agencies to take certain actions to ensure that food stamp coupons are not issued in the name of deceased individuals. Each food stamp State agency is required to enter into a cooperative agreement with the Social Security Administration (SSA) which would result in the SSA providing information on deceased individuals to the State agency. The State agency would in turn ensure that food stamp benefits are not issued to these individuals.

Welfare Reform Implementation—FNS continues to support States Welfare Reform efforts while providing technical assistance as State policies evolve. On November 1, 1998, Food Stamp Program eligibility was restored to about 225,000 legal aliens made ineligible by Welfare Reform. FNS developed guidance for States on implementation and bilingual materials for immigrants. FNS also worked with the Social Security Administration (SSA) on a notice to Social Security Income (SSI) recipients to advise them that they may again be eligible for food stamp benefits.

Claims Collection/Tax Offset—Claims collections for overissued food stamps increased to $200 million in fiscal year 1998, including over $73 million in collections from tax offset. This represents a 71 percent increase in five years in total annual claims collected.

Child Nutrition

FNS administers the Child Nutrition Programs, which include the National School Lunch and School Breakfast programs as well as the Child and Adult Care and Summer Food Service Programs. These programs serve meals to millions of children in schools and other settings each day. For example, in 1998 everyday more than half of all children enrolled in school ate a Federally supported school lunch. These programs are very important because providing nutritious meals and nutrition education to these children helps them to be more productive and increases their likelihood for success in school. Well-educated and healthy children mature into productive and healthy adults. The William F. Goodling Child Nutrition Reauthorization Act of 1998 (Goodling Act) increases our ability to help children. The Goodling Act authorizes us to reimburse snacks that are served to children between the ages of 12 and 18 in after school care programs by schools that participate in the School Lunch Program and by child care centers that are located in low-income areas and participate in the Child Care Food Program. In addition, The Goodling Act authorizes us to pilot test a school breakfast project in selected elementary schools in six school districts. These pilot test schools will provide breakfasts, at no cost, to all participating students. During the pilot test we will carefully evaluate the effect of eating school breakfast on children's behavior and educational performance. The Administration's budget provides $13 million to conduct this test.

WIC

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) continues to be one of our top priorities. The Clinton/Gore Administration is committed to ensuring that every eligible mother, infant and child is provided the opportunity to receive WIC benefits. In fiscal year 1998, average monthly participa-

tion was almost 7.4 million persons. The WIC Program is very important to me and others at FNS. We are making the effort to support this great endeavor and it is working. For instance:

—FNS continues to promote breastfeeding as the best form of nutrition for infants. Currently, States are spending more than $51 million for breast feeding promotion. The agency sponsors semi-annual meetings of the Breastfeeding Promotion Consortium—health professionals representing government, advocacy and public health interests in breastfeeding promotion. In 1997, FNS implemented a WIC National Breastfeeding Promotion Campaign, in cooperation with WIC State agencies. The goal of the Loving Support Campaign is to raise awareness of the importance and benefits of breastfeeding among WIC-eligible women, fathers, family health care providers and the public, to help create a community environment that accepts and supports a woman's decision to breastfeed. Over 48 WIC agencies are currently participating in the campaign by creatively using the Loving Support materials—brochures, media spots, posters and with consistent breastfeeding themes and messages. USDA participated with the Department of Health and Human Services (DHHS) in the sponsoring and development of a Health Care Physicians' and Providers' Breastfeeding Support Kit by Best Start. The breastfeeding kits were developed for health care professionals to complement the Loving Support Campaign materials which focus on consumer education.

—Over the past 10 years, WIC per person food costs have actually declined or reflected very modest increases due to the diligent cost containment efforts of State and FNS partnerships. We are making improvements in the integrity of the WIC Food Delivery System. During fiscal year 1998, FNS issued a proposed rule that would require the disqualification of any WIC vendor who has been disqualified from the Food Stamp Program. In addition, uniform sanctions would be established for the most serious violations.

—The agency is aggressively pursuing activities to advance EBT systems that improve benefit delivery and client services in the WIC Program. The agency is working with individual State initiatives to research, plan, fund and implement WIC EBT systems. Several States are pursuing hybrid benefit delivery systems at point-of-sale which would combine on-line food stamp benefit redemption with off-line WIC benefit authorization. FNS has earmarked $3.5 million in grants for WIC EBT in fiscal year 1999.

—FNS and the Center for Disease Control are working with nonfederal partners to increase access to immunization through the WIC Program. Currently, nearly three quarters of all local WIC agencies assess immunization status and make appropriate referrals to immunization services for children.

—Currently, the WIC Farmers' Market Nutrition Program encompasses 35 State agencies, providing fruits and vegetables to WIC participants. During 1998, the Farmers' Market Nutrition Program was expanded to five new States—Alaska, Arkansas, Florida, Georgia and Mississippi. The President's budget transfers the program from WIC to the Commodity Assistance Program and increases funding of this vital program from $15 million to $20 million to support expansion into additional States.

WIC is without a doubt one of the best nutrition assistance programs ever initiated. It provides mothers access to nutrition education, healthcare referrals, and supplemental foods rich in needed target ingredients that they otherwise could not afford, WIC babies thus get a healthier start in life.

Commodity Assistance Programs

In our Commodity Assistance Programs, we have enhanced the flexibility of State and local agencies in serving needy populations—that is, agencies operating the Commodity Supplemental Food Program can now serve women, infants and children and the elderly as needed. Although the women, infants and children population remains the top priority, States are no longer required to seek permission from FNS to convert caseload between the women, infants and children population and the elderly.

Program service has been improved through redesigned inventory systems. Federal inventory is now replenished based on historical data, rather than requiring organizations to place orders five months prior to delivery. This significantly reduces the need for organizations to adjust orders and increases their ability to have the foods they need on hand.

The Emergency Food Assistance Program

In The Emergency Food Assistance Program (TEFAP), the ability (in fiscal year 1999) for States to have latitude in using administrative funds for food is a tremen-

dous plus for the program. We have been able to purchase a greater variety of healthful foods for TEFAP. In fiscal year 1998, bonus commodities donated to States reflected a significant increase from fiscal year 1997.

FNS recognizes there is a critical link between nutrition and health. To that end, we have formed strategic partnerships to promote better nutrition among participants in our nutrition assistance programs.

This past July, I attended a statewide meeting in Los Angeles, California. At that time the California Nutrition Network—a group of 200 partners from the private, non-profit and public sectors launched the California 5 a Day—for Better Health campaign. The State Health Director indicated that this program offers the Network an opportunity to improve the health of Californians on a larger scale than previously thought possible. Mr. Chairman, this is merely one example of how FNS programs and our public/private partnerships can change the dietary habits of not just benefit recipients but all Americans. USDA believes people need to know how to use their nutrition assistance benefits in a manner to keep them healthy. We not only want to get food to the people who need it—we want to provide them with the skills, information and motivation they need to support healthy eating.

The Administration must also ensure both the program and financial integrity of each program and the timely delivery of benefits to all qualified recipients. Our Food Program Administration (FPA) account is a critical component of the Agency's mission. Most of the administrative support for the nutrition assistance programs is funded from FPA. FNS staff continue to be committed to finding new and innovative approaches to improve program integrity and program services and have had numerous successes. I will have more to say concerning new initiatives in this account.

In addition to the nutrition assistance programs, FNCS operates the Center for Nutrition Policy and Promotion. The Center is the focal point for advancing and coordinating nutrition promotion and education policy. The Center provides important research and analysis and collaborates with public, private and non-profit organizations to expand access to critical nutrition information.

FISCAL YEAR 2000 REQUEST

The Administration is committed to reducing domestic food insecurity, and the FNCS fiscal year 2000 budget request encompasses critical proposals essential to achieving this objective. We at FNCS, are striving to promote the long-term health and productivity of working families and enhance public confidence through increased program integrity.

Our fiscal year 2000 budget request of $36.5 billion reflects our commitment to the President's initiatives in Welfare Reform by supporting "Welfare to Work", as well as initiatives in the National Performance Review by promoting and enhancing program integrity. I would like to take a few moments to focus on the key aspects of the budget request and our policy goals. The testimony of Samuel Chambers, is being submitted for the record, and will present the technical aspects of our request.

PROMOTING THE LONG-TERM HEALTH AND PRODUCTIVITY OF WORKING FAMILIES

We are grateful for restoration of food stamp benefits to some legal aliens under the 1998 Act. Nonetheless, more needs to be done to better serve and meet the food needs of others still vulnerable. A substantial number of elderly legal aliens who were in the country as of August 22, 1996, have not had benefits restored. Therefore, we are proposing legislation to restore eligibility to qualified aliens who were lawfully residing in the United States on August 22, 1996 once they have reached the age of 65.

We are requesting $22.5 billion for the Food Stamp Program, a slight decrease from fiscal year 1999. This estimate includes a benefit reserve of $1 billion—a $900 million increase from fiscal year 1999. The Food Stamp Program is the primary source of nutrition assistance for low-income families. Its mission is to ensure that all households have access to healthful diets through food assistance and nutrition education. Although we are committed to maintaining the food assistance safety net for all low- income people and teaching life-long healthful eating habits, we also recognize the importance of implementing programs that help people obtain and keep jobs. As part of the Food Stamp Program operations, States conduct an Employment and Training (E&T) program to assist program participants in gaining the skills, training or experience that will increase their ability to obtain regular employment. In fiscal year 2000, we are requesting $330 million to support the E&T program. In addition, during fiscal year 1999 States will be allowed to use any unspent fiscal year 1998 E&T funds, in accordance with the provisions of the 1998 Act.

Included in our request for the Food Stamp Program is $7 million to support a nutrition education program, a program designed to provide information on eligibility to underserved groups such as the elderly and the working poor. The full benefits of the FSP can be realized only if we provide the resources, the information and the skills necessary to enable low-income families to purchase and prepare a healthful, nutritional diet.

In the Child Nutrition Programs we are requesting resources of $9.5 billion—an increase of $331 million. Most of this modest increase is the result of projected increases in enrollment and the increasing number of children participating in the school meals programs. I am pleased that we have included in our request $2 million for Nutrition Education and Training activities. It is important to provide some level of funds for instructing teachers in nutrition education and teaching children about the relationship of nutrition and health. We are also requesting $13 million for a three-year school breakfast research pilot authorized by the Goodling Act. It is critical for members of Congress, parents, teachers, and school board officials to know the answer to the question: Does the consumption of a breakfast at school positively impact a child's potential for success? Finally, our request for resources to support the important Team Nutrition program remains at the fiscal year 1999 level of about $10 million.

For the WIC Program, our request is $4.1 billion—a nominal $181 million increase from fiscal year 1999. The request will support average monthly participation of 7.5 million needy women, infants and children receiving the nutrition education and food benefits of this most important assistance program and fulfill the Presidents goal of WIC full participation.

In our Commodity Assistance Program (CAP), we are requesting $155.2 million—a netincrease of $9 million. This request includes $20 million for the Farmer's Market Nutrition Program (FMNP), an increase of $5 million over the fiscal year 1999 FMNP level which has been funded in the WIC appropriation in prior years. The $20 million request will not only sustain the current program level in 35 State agencies but will also permit continued expansion in these States and allow new States to join the program as well. As you know, the CAP also supports the Commodity Supplemental Food Program for women, infants and children as well as the elderly and will support the same caseload level in fiscal year 2000 as in fiscal year 1999; our request for TEFAP administrative expenses is $45 million—the same level as for fiscal year 1999.

Finally, we are requesting $150 million for the Nutrition Program for the Elderly—a $10 million increase from fiscal year 1999. The increase will allow funding in the Nutrition Program for the Elderly to keep pace with the proposed increase in the home-delivered meals program administered by the Department of Health and Human Services. Alternatively, the increase would allow a slight increase in the rate of assistance per meal, which was eroded over the years as a result of inflation, to better support the meal service providers.

In our Food Program Administration account, we are requesting $119.8 million—an increase of $9.3 million above fiscal year 1999. The full amount of the increase being requested is to support FNCS moving to a higher plane in concert with our State partners regarding the integrity and oversight of all FNCS programs. I will talk specifically about some of these initiatives as I address the Program Integrity area.

PROGRAM INTEGRITY

The Food and Nutrition Service is continually seeking better ways to improve integrity in all of the programs it administers. A few examples follow.

In 1998, FNS requested and received funding from the Economic Research Service to initiate two new program integrity related surveys—(1) a study concerning the extent of food stamp trafficking after Welfare Reform which will update fiscal year 1995 estimates, and (2) a survey of successful State computer matching activities compiled as an easy reference document to be used by other States in finding solutions to their own problems.

The Goodling Act increases the WIC program's ability to ensure that only eligible persons are certified for WIC. The law requires the physical presence of applicants and income documentation of WIC program participants. States are implementing procedures to comply with these changes.

In 1997 and 1998, FNS expanded its program integrity efforts in the Child and Adult Care Food Program (CACFP). In 1997 the Agency issued Management Improvement Guidance for Family Day Care Homes and in 1998 issued similar guidance for Child Care Centers. These manuals provide guidance in the prevention of fraud and abuse, while also providing better practices for training State monitors.

Starting in fiscal year 1999, and continuing through fiscal year 2003, $1 million of the CACFP funding, as authorized by the Goodling Act, will be used to improve CACFP integrity and oversight in such areas as establishing improved management practices for all levels of CACFP administration, enhanced assistance to States in their oversight responsibilities and an increased level of oversight throughout the Program. Also, as part of its comprehensive integrity strategy, the agency will reconvene the CACFP Integrity Task Force to assist in developing materials and training and providing increased on-site presence.

Our fiscal year 2000 budget request contains initiatives that focus directly on the concerns of this Administration and the Congress regarding integrity in FNCS programs. As I indicated earlier, the increase in our FPA request for fiscal year 2000 supports program integrity. I will discuss them in three segments.

We are requesting an increase of $6 million that will assist us in maintaining the accuracy of the Food Stamp Program Quality Control (QC) System to reduce error rates and/or avoid error rate increases. The QC system measures the accuracy of recipients' food stamp benefits. States with a high percentage of inaccurate cases face fiscal sanction and those with very low levels receive enhanced funding. It is imperative that the system remain statistically sound and legally defensible in order to provide accurate management information and to support State billings, appeals, and settlement actions. We will also implement new data matching programs. In addition, staff will work directly with States on State specific management improvements. We expect that this investment will save over $50 million due to reduced overpayment errors.

We also recognize the importance of continuing and expanding our integrity efforts in the Child Nutrition Programs. Specifically, in addition to our Coordinated Review and audit efforts, we are requesting $2 million to identify and reduce errors in the School Lunch Program. We are concerned that free lunch participation continues to climb, despite reductions in poverty and improvements in the economy.

We are requesting $1.3 million for several additional initiatives. First is additional staff for the oversight of State Automated System Development activities. In order to protect the considerable program and financial interests of the Federal government, it is essential that FNS maintain oversight of Advance Planning Documents submitted by State agencies. Second, in the area of retailer integrity, resources will be devoted to enhance FNS' ability to oversee retail store operations and detect and sanction stores violating program rules. Onsite undercover investigations will increase. Staff will ensure that retailer applications and re-authorizations are processed timely and thoroughly. Review of State and EBT processor accounting, processing and reporting will be enhanced. Third, additional staff will be deployed to oversee Food Stamp Program State administrative expenses which total about $1.6 billion. We believe this to have enormous possibilities for cost reduction. With adequate oversight, we conservatively estimate achievable savings of 3 percent—equivalent to about $55 million. Fourth, resources will be used to exploit EBT data to detect stores trafficking in food stamp benefits utilizing the Anti-Fraud Locator using EBT Retailer Transactions (ALERT) system, a newly developed and implemented automated system that analyzes food stamp EBT transactions to detect possible fraudulent activity in stores. Fifth, additional resources will be deployed to assist in eliminating backlogs and implementing the FSP participation in the Department of Treasury's replacement of its tax and salary offset methods. Sixth, staff would be assigned to assist States and Indian Tribes in all aspects of the commodity distribution programs.

All of these initiatives have cost saving implications to the American taxpayer. We believe our request represents a minimal investment with paybacks of enormous values.

Finally, we are requesting funds for studies in support of the Agency's nutrition assistance programs. In the Food Stamp Account, our request is $10.7 million, in the Child Nutrition Account our request is $3 million; and we are requesting $3.5 million for WIC-related research. The absence of study and demonstration funds at FNS over the last few years has limited the depth of FNS support to Congressional staff, decreased our ability to respond to States, and restricted us from providing practical research-based guidance to the managers of our programs. The study funds are appropriately located in FNS because of the need to target these funds to action-oriented and program specific needs. FNS will use the study funds to assist in formulating its nutrition policy, measure program impacts and integrity, and advise Administration officials and Congress of the potential costs and effects of legislative proposals that are under consideration.

CONCLUSION

Mr. Chairman, I am sure you agree that FNCS provides a comprehensive nutrition safety net of services designed to assist those most in need. In order to successfully carry out our mission we have formed a cadre of coalitions and partnerships with organizations and agencies with a shared interest. Thanks to your support and the support of this Subcommittee, over the years, our programs have made a tremendous difference in the lives of those we serve. This concludes my statement. I will be happy to answer any questions you may have.

ELECTRONIC BENEFIT TRANSFER

Senator COCHRAN. Thank you very much, Ms. Watkins. Let me compliment you on your efforts to strengthen the programs under your jurisdiction, to make sure that the benefits get to those who are eligible and to eliminate fraud and abuse of the programs.

I've been impressed with some of the Inspector General's work in this area too. I think we have to recognize that that's been a very important aspect of the effort to eliminate fraud and abuse in these programs.

We understand the electronic benefit transfer program is designed to deal with some of these problems of abuse. Is that your observation that it is being successful? And, what is the outlook for having 100 percent delivery of food stamps by electronic benefit transfer?

Ms. WATKINS. Mr. Chairman, my observation is the same as yours. And we are pleased that we've been able to have a great deal of success in working with the Inspector General. We expect to have by 2002, which is the scheduled date, all of the EBT systems in place. We're currently serving over 50 percent and delivering over 50 percent of the benefits by Electronic Benefit Transfer.

Senator COCHRAN. Now is my understanding correct that when you have the EBT program in force in every state that it will be possible for those who have food stamps to carry them across state lines and use them in states other than those states that were issuing the food stamps? Is that a problem? Is that going to result in difficulties for grocery stores or places that redeem these stamps?

Ms. WATKINS. That currently is a problem, Mr. Chairman. But we are working on an interoperability study to eliminate that as a problem. And we've already begun the process and we're waiting for the results of that interoperability study. That has been a request from some states and we are working very aggressively on that.

We don't see that as a problem for grocers once we get the interoperability working. We think that people will be very pleased with that.

We had a six-month pilot that started on March 1st. And we will actually need to identify the cost for interoperability. We will be working on looking at cost during the pilot study.

FOOD STAMP PROGRAM

Senator COCHRAN. We heard you in your opening statement make comments about the need to increase funds to make food stamps available to elderly legal aliens. You say $10 million is included in this request for that purpose.

How do you come up with that $10 million figure? Is that based on an estimate of elderly legal aliens who would be eligible for the benefits?

Ms. WATKINS. Yes, it is, Mr. Chairman. And we looked at those legal aliens who are in the country and would not be eligible. We wanted to make certain that we were taking care of those seniors who were legal and at age 65 would be eligible for the program benefits.

Senator COCHRAN. The budget also has a request for 7 million additional dollars to support a nutrition education program for those who receive benefits from the food stamp program. Is this a new program and how does the agency plan to implement it?

Ms. WATKINS. This is an aggressive effort for us to provide nutrition education for food stamp recipients. Early on we had indicated that we wanted to serve food stamp recipients and provide adequate nutrition information so they could make wise food choices. And that is a part of that.

We do have, in our reorganization with the staff, a person who is working on nutrition education in the Food Stamp Program. This is the first time we have had in the agency a person working specifically on food stamp nutrition education. And she will coordinate that with CSREES, ARS and ERS and our delivery of those services in addition to working with colleges and universities who are in the land grant system.

Senator COCHRAN. One reason that my questions so far have centered on the food stamp program is that it is the largest program that is administered by this agency. The budget this year has $22.5 billion projected for food stamp benefits. Let me ask you this.

We've noticed over the last few years, the budget requests for food stamps have greatly exceeded what's really needed as it turns out. I think I asked at last year's hearing why is the model so wrong. And if it is wrong, why is it continually used from one year to the next. It doesn't seem like there's any improvement in the projections being closer to the realities. It always seems to be overestimated by a considerable amount. Are you using any different economic assumptions this year in coming up with a request or how are you coming up with the request?

Ms. WATKINS. We're not using a different economic model, Mr. Chairman. One of the things that we've noticed and you may notice in the budget that we are asking for is funds for outreach for food stamp recipients.

One of the things that has happened is that we have more people who are eligible and not participating in the program. What we've seen is that participants are increasingly going to food banks and soup kitchens and pantries instead of applying for food stamp benefits for which they are eligible. Many people who are a part of the TANF program or were on TANF did not realize that they were still eligible for food stamps.

We've had some incidents in some states where people were being sent to food banks and soup kitchens. And we've indicated to them that those eligible recipients must be made aware that they are eligible for food stamps. So that's why you have the difference.

As I indicated, the number of food stamp recipients is down dramatically. Yet the poverty rate is 5 percent. So we do have a dis-

crepancy there and I can understand your concern. But when we have states who are sending people to the soup kitchens and food banks, then those people don't know that they are eligible for food stamp benefits and that's why we want to do an outreach to let people know that they are eligible.

Senator COCHRAN. I have some other questions on some of the other programs. I'm going to defer those until my colleagues have had a chance to ask some questions. Senator Kohl.

SOFT DRINKS

Senator KOHL. Thank you, Senator Cochran.

Ms. Watkins, I'm concerned about the dietary habits of many Americans and especially our children. As you know, soft drinks are becoming the beverage of choice for many of our young people. Last month I wrote a letter to Secretary Glickman regarding this trend and the role that the USDA might play in promoting a healthy diet for young people. Would you please comment on this trend and provide your thoughts on how best to encourage our young people to consume more healthy beverages such as milk rather than soda pop?

Ms. WATKINS. Mr. Kohl, you're exactly right. The trend has gone upwards. There has been a thousand percent increase in purchases in schools for soft drinks and a decline of about 25, 26 percent of the milk consumption. We are very concerned that our children's dietary needs are placed in jeopardy when schools are using those funds to supplement school funds. We do have a serious situation in how we need to address the nutrition and dietary habits of children and how we look at that.

We are trying to, as you perhaps know, our regulations are lacking in strength to do something about the sale of soft drinks in schools. We are trying to address that and figure out—how do we change the school environment. And that's going to be a little difficult. We're going to need a lot of support if we should move in that direction.

Senator KOHL. All right. What role could the USDA child nutrition programs play in this context?

Ms. WATKINS. We can develop standards and work with schools and provide technical assistance, but a great deal of effort is going to need to be developed around how you work with school administrators, superintendents, school principals and teachers in that effort. And I think we are going to need a lot of support from the Department of Education as we move in the direction of developing standards for school meals that are served in schools to protect the nutritional integrity of the program.

Senator KOHL. All right. Thank you, Senator Cochran.

Senator COCHRAN. Senator Dorgan.

FOOD BANKS AND THE FOOD STAMP PROGRAM

Senator DORGAN. Mr. Chairman, thank you very much. Ms. Watkins, thank you for appearing today.

Let me ask you a question about a survey released by Congressman Tony Hall recently. As you know, Tony heads an organization dealing with hungry issues. I sit on the board of that organization, but he's talking about the increase in the number of people using

food banks across our country increasing 22 percent in the last year. And, conversely, the Congressional Research Service reports that the number of people using the food stamp program has fallen dramatically in the last couple of years. Those two reports seem to be contradictions to me. Can you give us your analysis of what's happening?

Ms. WATKINS. We've had several roundtables around the country and many hungry tours and we are finding pretty much the same thing that Congressman Hall has identified in his information. We are seeing more people standing in line in food banks and fewer people actually participating and applying for food stamps.

We're supporting the food bank system with TEFAP that goes out to food pantries and that also has increased. And we are proposing information on a campaign that's focused on the elderly and the working poor and encouraging states to inform their TEFAP eligible households who might be confused about their eligibility. So that's what we're doing.

We need to make certain that we are strengthening our Food Stamp Program which is the safety net. It's our nutrition safety net for the working poor.

Senator DORGAN. I support the TEFAP program and always have. I think if a reduction in the usage of food stamps indicates that there are fewer hungry people, that's wonderful. But that seems to be at odds with Mr. Hall's and your observation that you have longer lines at soup kitchens and so on. I don't think you answered the question. What could explain a substantial decrease in the usage of food stamps at a time when more people appear to be hungry because they show up at food banks and soup kitchens to be fed?

Ms. WATKINS. Partly, as I indicated in my presentation very briefly, it's due to the strength of the economy and partly due to the new restrictions for legal immigrants and the able-bodied who are the unemployed adults without dependent children.

But there are other factors in there. We currently are looking at some data that has been collected to help us to try to determine where the gaps are and where those people are who are eligible and not participating in the program.

Senator DORGAN. So you think some of the restrictions that have been imposed are telling people who perhaps have need of food stamps or who are hungry that you've got to go to a food bank some place or to a soup kitchen. You can't access food stamps.

You probably can't do it now, but give me your analysis later, if you would, with your staff. How do we reconcile those two conflicting reports? And I appreciate your tentative answer to it. If you have additional information, I'd like it.

SCHOOL BREAKFAST PROGRAM

One last brief question, Mr. Chairman. The project on school breakfast relating behavior and education performance to school breakfast, I happen to think that's a remarkably good idea. But it seems to me that, as I was thinking about this, somebody must have evaluated that 2 years, 5 years, 10 or 20 years ago.

If you have a breakfast program, do students' grades improve? Is their behavior better? Has that not been evaluated before?

Ms. WATKINS. There are several studies including a study that was done by Harvard, including schools in Baltimore as well as Philadelphia. There was also a study done by the Minnesota Department of Education. There was an earlier study done by Tufts in the early eighties on school breakfast and performance. But there has not been a rigorous study done using a controlled group of students and students actually participating in the breakfast program.

We have never been able to do one involving all children with breakfast provided for all children and that's the intent of the study. And there are so many different tests. We had a breakfast symposium last Thursday, and the science researchers indicated to us that the only significant piece of compelling evidence we have is attendance. We do know that attendance goes up. But we've not done a rigorous study in any of those universities on what happens to cognitive development, and that would be the intent, to find out if all children are served breakfast what happens to the cognitive development. Will we see those increases as is indicated in the Massachusetts study?

Senator DORGAN. Ms. Watkins, I bet you and I know the answer to that study.

The late Nicky Lenner and I held a hearing one day many years ago when a young 12-year-old boy named David Bright from New York said words I'll never forget. He said, "No 12-year-old boy like me should have to lay his head down on his desk in the afternoon at school because it hurts to be hungry."

I bet I know the answer to this study. I'm glad you're doing it, and I hope that all of us recognize the value of these programs.

Mr. Chairman, thank you very much.

Senator COCHRAN. Thank you, Senator.

In the budget request you have $13 million, as you pointed out, for a pilot breakfast program. Six elementary school districts would participate, as I understand it, and $10 million of the $13 million being requested is to evaluate the pilot program. This would be free breakfast for all the students in the schools as I understand it.

How do you come up with the $10 million cost for evaluation of the program and only $3 million that would be used, I guess, to buy the food or make the breakfast available to the students?

Ms. WATKINS. The breakfast that we would have available—we already have reimbursement rates established for a school breakfast. So that would be those children who would not be eligible for a free or reduced price breakfast. And if we looked at the $10 million, that's necessary to cover the standardized test and collecting the 24-hour dietary recall and performing the nutrient and dietary information. This would involve thousands of children because we are talking about doing a total of 72 schools.

Senator COCHRAN. How many?

Ms. WATKINS. Seventy-two schools in the six districts. So that we would have a control group and the group who was actually participating in the test.

Senator COCHRAN. Have the districts been selected?

Ms. WATKINS. The districts have not been selected.

Senator COCHRAN. How do you know there will be that many schools? Are these just geographical districts or not school districts?

Ms. WATKINS. These would be school districts, the six school districts and then you would choose 30——

Senator COCHRAN. If you haven't already selected them, how do you know how many schools are in those districts?

Ms. WATKINS. Well, you don't. But you would end up with—72 is what we're projecting and that's what we based everything on.

One of the things that would happen is—if you don't have the technology in the school districts, then we're going to either have to do it manually or provide the new technology to do interoperability from the management data collected in the classroom and the data collected in the cafeteria. So there are now opportunities for connecting the two. So that may cut down on some expense.

When we did this, we had no awareness at that time that they were looking at interoperability between what is collected at the cash register at point of sale and what is going on in the classroom and collecting that data. So that has some potential for dropping the cost, but we need to look at that very carefully as we determine the number of students and schools participating. I certainly would like to see that happen rather than trying to hand calculate all of the data that we're going to be looking at.

Senator COCHRAN. I would encourage you to explore the option of having the National Food Service Management Institute conduct the evaluation of the program.

Have you made a determination at this point how you're going to evaluate it, whether you will contract that out with that $10 million or would you hire new people?

Ms. WATKINS. We will have to contract this out because of the enormous task that will be needed in providing the adequate data. We certainly will take your suggestion of using the Institute in helping us to formulate some of the study data.

NUTRITION EDUCATION AND TRAINING

Senator COCHRAN. The request for child nutrition programs includes funding of $2 million for a nutrition education training activity. Is that a realistic amount to be distributed in a nationwide program?

Ms. WATKINS. Mr. Chairman, it certainly isn't. But that was the amount that we could come up with and it certainly is not going to be adequate. But we needed to have an amount of money to restore NET or Nutrition Education and Training across this country. We have no funds in the budget for the 1999 school year. So we are really struggling with how we're going to and what we're going to be able to do with the $2 million. But it certainly is better than not having any moneys at all.

Senator COCHRAN. The $2 million would be in addition to the $10 million requested for the NET program generally?

Ms. WATKINS. The $10 million is for Team Nutrition and that's for us to develop model nutrition education materials that can be delivered by those people in the states for nutrition education not only for school nutrition personnel, but also for teachers, administrators, and parents.

CHILDREN'S FOOD GUIDE PYRAMID

Senator COCHRAN. The Department recently published a new children's food guide pyramid. I wrote a letter to the Secretary and to you, I think, about some complaints that I had heard about how that was developed and decisions made about what to put at the top and what to put at the bottom; in other words, the things to illustrate what is good for you and what is bad for you. Could you tell us what process you followed in the development of the new food pyramid?

Ms. WATKINS. Sure, Mr. Chairman. And we appreciate your interest in the children's Food Guide Pyramid. And what we did was to use a variety of focus groups. We used information from the Dietary Guidelines. And we used information that we received from caregivers and parents.

This is an adaptation for young children ages 2 to 6 and there were no real changes. We wanted to make it so that little children could understand how to use the Food Guide Pyramid. We based it on food consumption data information for children of those ages, 2 to 6. And we also added physical activity. We used lower numbers for serving sizes.

One of the things that we had heard from parents and caregivers and consumers is that they did not understand the original pyramid and how to use the serving sizes or they didn't understand what a serving size was. So we wanted to make that clear on the children's food guide pyramid. And we also included those serving sizes.

I don't know if Dr. Anand wants to add anything that I may have missed.

Senator COCHRAN. Dr. Anand.

Dr. ANAND. Yes. We actually took three years to develop the Food Guide Pyramid for Children. It really validates the original pyramid. The Food Guide Pyramid is based on three factors, as Shirley mentioned.

One is the Dietary Guidelines. Number two is the RDA, the Recommended Daily Allowance. And number three is the dietary patterns of what children are eating. So the foods that are depicted on the poster are the foods that most children eat. Then physical activity was added.

This research actually validates the original pyramid and we're very happy it does that. It is not a new thing. It's really the same thing. The only thing that has changed, as Shirley has mentioned, the food that is depicted is more realistic and there is also the physical activity mentioned there.

Senator COCHRAN. In most of our experiences, the serving size is how much is in the container at least, that's the case of ice cream. [Laughter.]

Let me ask you, was this funded from the Food and Nutrition Service budget or how was it paid for? Were outside groups involved in paying for it?

Mr. ANAND. No. The only thing that was not funded by CNPP was some research and focus group which were funded by FNS. All the money came from the budget of CNPP. There was no money from outside.

WIC PROGRAM

Senator COCHRAN. On the WIC program, the request is an increase of $193 million to support what the budget describes as the "full" WIC participation estimate. As I understand it, that's a monthly average program participation rate of 7.5 million women, infants and children.

What evidence is there that participation will rise to that level of participation per month during the next fiscal year?

Ms. WATKINS. We use the same guidelines that we have used in the past. You might know that we are working on some new standards and trying to determine with the assistance of ERS and validate whether or not those standards are adequate and if we've used the right model.

That was one of the things that we were requested to do last year and we're following up. So we've used the same standard, Mr. Chairman, this year as we've used in the past for WIC.

One of the things that happens to us in trying to ensure that we're meeting the mark on those WIC numbers, the states work really, really hard to stay within their budget. They know that they cannot go beyond the numbers for WIC. So they monitor those very carefully. And oftentimes they are afraid to go beyond that.

So the numbers are very, very fragile if you look at what we do in trying to keep the numbers within the state's budget. So it's very difficult for us to get an exact number because those numbers fluctuate. So with the new model, we are hopeful that we can come up with something either better or validate that the model that we're using is adequate.

Senator COCHRAN. Does this same optimism apply to the average cost of per person per month, which includes a food cost ingredient. I understand that the estimated WIC package per person cost per month for 1999 is $44.47 and that it's projected in the budget to increase to $45.46 in fiscal year 2000.

I'm curious to know whether or not this is in line with other rates of inflation that are being assumed in the budget or whether this is a separate analysis and how you come up with that projected food cost increase of 79 cents per person per month? And, what is the basis of the projected increase in administrative costs as well, which are expected to increase 20 cents per participant per month from fiscal year 1999 to fiscal year 2000?

Ms. WATKINS. We're continuously working with the states to ensure that their food costs are in line. We've worked very aggressively.

I was in California last week and they are working with their states—working with the state to determine whether or not they are living within the current milk prices. And they are working to keep those milk prices down so that their costs are down. And they are going to end up saving over $20 million which would allow them to provide more WIC benefits to clients.

So the states are working very hard. Now that's the standard inflation rate that we've used and it was provided by OMB. So that's the standard rate.

Senator COCHRAN. I have some other questions on the WIC program particularly how you come up with the carry-out estimates

and other projections that are made in this program which we will just submit and ask you to answer for the record.

On one part of the program, the farmers market nutrition program for WIC beneficiaries, is there any evidence that this program increases with participants consumption of fresh fruit vegetables?

Ms. WATKINS. It does, Mr. Chairman. And we're real proud of that because in some instances our WIC recipients do not have access to fresh fruits and vegetables. And we're using this as a way to help them increase their fruit and vegetable consumption which is a real concern for us for all of our program recipients.

Senator COCHRAN. Thank you. Senator Kohl, do you have any additional questions?

Senator KOHL. I have no additional questions. Thank you.

Senator COCHRAN. My good friend from Illinois has arrived, former chairman of this subcommittee on the House side.

WIC BUDGET CUTS

Senator DURBIN. Thank you very much, Mr. Chairman and Senator Kohl.

I apologize for being a little late and I wanted to ask a question. Perhaps my colleagues here can help me with the answer. If I'm not mistaken, in the debate on the budget resolution, there was a suggestion of some rather substantial cuts in domestic discretionary spending.

Some protection was put in the budget resolution for the Department of Defense and some education programs. It is not my recollection that there was any protection put in there for the WIC program. Is that correct?

Ms. WATKINS. That's correct.

Senator DURBIN. And if I'm not mistaken, the agencies that were not protected, as we calculated it, could face up to a 12 percent cut in their budgets from this year's current appropriation.

Do you have any calculation as to what the cuts might be in WIC if we followed the budget resolution as enacted by the Senate and the House?

Ms. WATKINS. It's based on what Dennis has advised me. We're talking about some 900,000 recipients in the WIC program.

Senator DURBIN. Being eliminated?

Ms. WATKINS. Yes.

Senator DURBIN. Out of a total universe of how many?

Ms. WATKINS. 7.5 million.

Senator DURBIN. 7.5 million currently served and 900,000 would be eliminated?

Ms. WATKINS. Right.

Senator DURBIN. I can recall in my earlier incarnation in the House that someone said that one out of four infants in America is served by the WIC program. Is that statistic still accurate?

Ms. WATKINS. Yes, it is.

Senator DURBIN. So that does not include all of the potential infants and mothers who could be served, could be eligible for this program, does it?

Ms. WATKINS. Correct.

Senator DURBIN. The 7.5 million represents what percentage of eligible mothers and children for WIC services?

Ms. WATKINS. The 7.5 indicates 80 percent of those who are eligible and that's the formula that we've used.

Senator DURBIN. So roughly it's somewhere under 10 million eligible, 7.5 million currently served and our budget resolution, unless something is done in terms of the allocations to this subcommittee and others, could result in about 900,000 being removed. Is that an accurate statement?

Ms. WATKINS. Right.

Senator DURBIN. I think that is a serious problem for those of us who believe that WIC is absolutely essential for healthy mothers and healthy babies. That is a step backwards. That is a step toward the dark ages of our failing to realize the importance of this program.

I sincerely hope that Senator Cochran and Senator Kohl and myself and others can prevail on those who are making the budget allocations to make certain that the WIC program does not lose ground and perhaps gain some ground so that more and more children can be born with the possibility of a good start in life.

Thank you, Ms. Watkins. Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Ms. Watkins, that concludes our questions of you and this panel appreciates very much your cooperation with our committee. We look forward to working with you during the balance of the year.

SUBMITTED QUESTIONS

Ms. WATKINS. Mr. Chairman, I want to thank you and this committee because without your support and help we would not be able to do the kind of job that we do. And we certainly appreciate all of the work that you do in helping us to provide the very best that we can for the people who are most needy in this country. Thank you very much.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD STAMP PROGRAM

Question. Interoperability and portability of food stamps will involve limited costs of electronically routing transactions across state lines. Will the interoperability pilot program validate the costs?

Answer. We are hopeful that the interoperability pilot project will provide better information as to how much interoperability would cost. This project, on which the Food and Nutrition Service (FNS) is working with States and the Electronic Benefits Transfer (EBT) Council of the National Automated Clearinghouse Association (NACHA), began in March 1999 and will run through September 1999. Most interested parties believe the actual cost for nationwide interoperability would be low and we expect this study to support that belief.

Question. Would USDA be able to pay these costs using savings achieved by electronic conversion, given the need to no longer lease terminals on state borders which allow food stamp recipients to shop in either state?

Answer. FNS has no authority to pay 100 percent of the costs of interoperable EBT transactions. Our statute provides for sharing State costs for administering the Food Stamp Program at a 50 percent reimbursement rate. Contracts for EBT services are between each State and its vendor or vendors. FNS is not a party to EBT contracts and does not directly pay for EBT services. FNS reimbursement to States

has a special limitation that operational costs must not exceed those of the paper issuance system being replaced. This cost neutrality limitation was part of the legislation allowing EBT as a State issuance option for Food Stamp Program (FSP) and remains in place although legislation now mandates EBT for the FSP by October 2002.

We have supported interoperability by initiating technical specifications for EBT data, developing our Retailer EBT Data Exchange system, and working with NACHA on the Quest Operating Rules. We support States that chose to include interoperability as part of the services procured through their EBT contracts. Of course, we will reimburse States for 50 percent of all their EBT costs, including any fees for transactions across State lines, as long as the cost neutrality measure is not exceeded.

We, as well as most other EBT observers, expect the cost for interoperability to be low. We believe the interoperability study being conducted with NACHA may show the costs to be even lower than those expectations. These are costs that we believe would be easily covered by the EBT savings realized by both the Federal and State governments.

With regards to terminals installed across State borders, we do not have data on how many stores are equipped across State borders, though we believe the numbers are relatively small. We are hoping to get additional information on these retailers through the interoperability project currently underway.

However, it should be noted that EBT contracts generally hold that border stores are to be equipped in accordance with State-established criteria, and State contract prices generally do not increase as more stores are added. Consequently, there is typically no incremental cost in EBT contracts that can be attributed to additional border stores. Moreover, at least in preliminary discussions, EBT contractors are saying that they will not reduce their charges to States if already-equipped border stores no longer need to be equipped.

Question. In November the Food Stamp Act was amended to require food stamp State agencies to enter into a cooperative agreement with the Social Security Administration (SSA) to ensure that food stamps are not issued to the deceased. What is the status of these cooperative agreements, and how do the agencies plan to ensure that food stamps are not issued to the deceased?

Answer. Prior to the enactment of Public Law 105–379 (an Act to amend the Food Stamp Act of 1977 to require food stamp State agencies to take certain actions to ensure that food stamp coupons are not issued for deceased individuals, to require the Secretary of Agriculture to conduct a study of options for the design, development, implementation, and operation of a National database to track participation in Federal means-tested public assistance programs, and for other purposes) on November 12, 1998, FNS and SSA engaged in discussion to determine the best method for exchanging SSA's Death Master File (DMF) data with food stamp State agencies. Two options were discussed—making minor system modifications to SSA's State Verification and Exchange System (SVES) or advising the State agencies to purchase the DMF data from the Department of Commerce. An agreement was reached in which SSA would make the modifications to SVES.

SSA recently advised FNS that it has now determined that more extensive system modifications will be necessary to make the DMF available through SVES.

FNS intends to work with SSA to develop a new work plan for incorporating death match into SVES.

Question. The Community Food Security Grants Programs are funded from the Food Stamp program account. What other grant programs are funded from this account?

Answer. Funds for local versions of the Food Stamp program are provided to The Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands and to American Samoa. These grants are made in fixed amounts. Other grants from the Food Stamp Program account include: grants to Tribes for administrative expenses in the Food Distribution Program on Indian Reservations (FDPIR) which are negotiated between the individual Tribe and the appropriate FNS Regional office; grants to States for food stamp administrative expenses in which FNS matches State expenses dollar for dollar; grants for food stamp Employment and Training (E&T) which are distributed on a formula basis to States to cover 100 percent of their E&T costs and E&T grants to States for expenses over their share of the 100 percent grants and to cover participants job hunting expenses, both of which match States expenditure dollar for dollar.

COMMODITY ASSISTANCE PROGRAMS

Question. Commodity assistance programs are now required to replenish their inventory based on historical data, not by placing orders five months prior to delivery. How has this new requirement affected the cost of running the program?

Answer. The primary purpose for redesigning the system was to improve customer service. Using historical data to determine the types of commodities to be purchased will help ensure that the types of commodities preferred by program participants are available on a timely basis and spend less time in Federal, State and local inventory. The historical data approach is used only in FDPIR and the Commodity Supplemental Food Program, which are food package programs and, therefore, need an adequate supply of specific foods to meet program requirements. This approach has not affected the cost of administering these programs. In fact, it has the potential to reduce costs. While we have yet to see any reductions in inventory because of major changes in the food package, the process of placing orders much closer to the time when the food will actually be needed can reduce the length of storage time and the amount of inventory necessary to sustain service to program participants. This will result in reducing storage costs incurred by Indian Tribal Organizations and State agencies.

ELDERLY FEEDING

Question. The fiscal year 2000 budget request proposes a $10 million increase for the Nutrition Program for the Elderly so that this would allow a slight increase in the rate of assistance per meal. How much does the agency expect that the rate of assistance per meal will increase?

Answer. Since fiscal year 1995, funding and participation in the Nutrition Program for the Elderly (NPE) has been as follows:

Fiscal year	Appropriation	Reimbursement per meal	Number of meals
1995	$150,000,000	$0.5973	251,060,000
1996	150,000,000	0.5864	246,394,000
1997	140,000,000	0.5857	247,306,000
1998	140,000,000	0.5607	249,918,000
1999	140,000,000	0.5540	[1] 252,667,000

[1] Estimate.

The appropriation for NPE was decreased from $150 million in fiscal year 1996 to $140 million in fiscal year 1997 and has remained at this level for three years. However, since fiscal year 1996, the number of meals served has increased by 6,273,000, thus reducing the rate of reimbursement from $0.5973 in fiscal year 1995 to $0.5540 in fiscal year 1999 (a drop of $0.0433 per meal). The $10 million increase in funding requested for fiscal year 2000 would allow for a rate of about $0.5935 per meal assuming service of about 252.7 million meals. The amount of additional funds requested would result in an increase of $0.0395 in the reimbursement rate over the fiscal year 1999 rate, but the rate would still be $0.0038 less than the fiscal year 1995 rate, assuming participation remains steady at the fiscal year 1999 estimated level.

SCHOOL BREAKFAST PILOT

Question. The Goodling Act authorizes the Food and Nutrition Service to pilot test a school breakfast project in selected elementary schools in 6 districts. How will the 6 districts be chosen for the pilot program?

Answer. School district selection will be structured to ensure that the demonstration can assess the feasibility and impacts of a universal breakfast program in a wide variety of different school districts. Although specific selection criteria are yet to be determined, FNS anticipates that school districts will be selected to ensure diversity on a number of district characteristics including geographic region, community type (urban, suburban, rural), school district size, and economic levels of students' households.

Question. Will the pilot be in only one State or several?

Answer. To ensure diversity among pilot school districts it is anticipated that these districts will be selected from a number of different States.

Question. Is Mississippi being considered as an option for the pilot program?

Answer. Selection of the pilot sites will not take place until funding is appropriated for the study. If Mississippi nominates school districts to participate in the pilot, those districts will receive the same consideration as all school districts nominated by other State agencies. Final selection criteria have not yet been determined, but will be structured to ensure that a reliable and valid evaluation can be conducted.

Question. What is the protocol for this pilot program, including the evaluation?

Answer. A study design and general framework for assessing the educational and nutritional outcomes, behaviors and attitudes associated with participation in a universal-free school breakfast program is currently being developed. This document will identify key evaluation design and implementation issues that must be resolved for a robust evaluation including:

—specification of the treatment and comparison and/or control groups;
—means of assigning groups to a treatment condition;
—sample design considerations including sizes and characteristics of each group identified;
—data collection strategies including frequency and nature of data collection;
—required response rates;
—relevant outcome measures and controlling variables on which data will be collected;
—and analyses of data to be collected.

FNS expects that a pretest-posttest control group design will be used. Within each of the selected districts, an equal number of schools would be randomly assigned as universal-free schools and control schools. To permit the evaluation of pilot projects to distinguish the effects of the pilot projects from other factors, schools selected as treatment and control sites within the chosen districts should exhibit similarities on a number of school characteristics such as school enrollment, student academic proficiency and economic levels of students' households. Measurements would be taken before and after implementing the universal-free breakfast program. Where necessary, statistical adjustments will be used to enhance group comparability.

Question. Will one protocol be used in all 6 districts or will each participating district have its own protocol?

Answer. FNS anticipates that protocols will be established so there is replication of the treatment across different pilot sites. Allowing each participating district to establish its own protocol would seriously hamper the study's ability to attribute any observed effect to the universal-free breakfast program.

CHILD NUTRITION PROGRAMS

Question. In the fiscal year 2000 budget proposal there is an increase in the appropriations for Team Nutrition and for Coordinated Review so that Federal staff can operate the program in lieu of State personnel. How does this improve the program integrity and reduce costs of the programs?

Answer. The only increases proposed for these two programs is to fund the cost of pay raises for Federal employees. The reference to Federal staff operating the program in lieu of State personnel is an error. That reference applies to State Administrative Expenses (SAE) funds used by Federal employees when the Federal government is required to operate programs when the State is unable or unwilling to do so.

Team Nutrition is a Departmental effort which provides States and schools with nutrition education materials for children and families, and technical assistance materials for school nutrition service directors, managers and staff. State agency partners provide training and technical assistance to support these programs in local schools. The guidance provided under Team Nutrition helps ensure that program meal requirements are adhered to and meals served to children are healthful and nutritious.

The Coordinated Review Effort (CRE), on the other hand, is a uniform system of review procedures used by both State agencies and the Food and Nutrition Service (FNS) to assess the accuracy of the claims for reimbursement submitted by school food authorities through on-site evaluations of program operations. CRE was developed in consultation with State agencies as a management tool to improve regulatory compliance and program accountability in the National School Lunch Program (NSLP). In addition to program oversight, FNS has developed handbooks and other technical assistance materials to be used by States in carrying out their CRE responsibilities. As a result of this activity, program integrity is strengthened and costs reduced by helping ensure that program meals are served to eligible children and supported by accurate meal counts.

Question. Please provide a detailed accounting on how the funds made available for the school meals initiative have been used in fiscal years 1998 and 1999, and what is proposed for fiscal year 2000?

Answer. The following table provides a detailed accounting on how the School Meals Initiative funds have been used by spending category. The fiscal year 1999 allocations represent the current spending plan and the fiscal year 2000 allocations are projected.

SCHOOL MEALS INITIATIVE: SPENDING BY CATEGORY

	Fiscal year 1998	Fiscal year 1999 (estimate)	Fiscal year 2000 (proposed)
Food Service Training and Technical Assistance:			
Technical Assistance Materials	$2,023,499	[1]$2,991,400	[1]$1,900,000
Print and Electronic Food Service Resource Systems	475,000	475,000	475,000
NFSMI Cooperative Agreement for Food Service	500,000	800,000	800,000
Children's Education Resources	549,166	[1] 787,600	[1]1,700,000
In-school Education Materials			
Community Education Materials			
Food Service Training Grants to States	4,000,000	4,000,000	4,000,000
USDA/FNS Direct Training and Education	27,050	([2])	[2] 50,000
Children's Communications and Technology	50,000	50,000	200,000
Team Nutrition Partnership Support	92,364	337,000	300,000
Resources for Team Nutrition Schools			
Partnership Network Support			
Evaluation & Administration	282,921	[3] 559,000	[3] 583,000
Total	8,000,000	10,000,000	10,008,000

[1] Includes resources for the Child and Adult Care Food Program (CACFP) and Summer Food Service Program (SFSP).
[2] No direct training is planned for fiscal year 1999. The NSLP and CACFP meetings are planned for fiscal year 2000 that should include direct training and education to Program cooperators.
[3] Includes full funding of the staff years allocated to the School Meals Initiative.

Question. Identify and include the use of any unobligated balances from funds provided in fiscal years.

Answer. The following table provides a breakdown of funds obligated in the year in which appropriated and funds carried over into the next fiscal year. The fiscal year 2000 budget estimates that all of the funds available in fiscal years 1998 and 1999 will be obligated. Additional information which has become available since December now indicates that some funds from fiscal years 1998 and 1999 will be unobligated.

SCHOOL MEALS INITIATIVE

Fiscal year appropriated	Funds Obligated in year appropriated	Funds carried over and obligated in the next fiscal year
1998	$7,148,778	$851,222
1999 (est.)	8,600,000	1,400,000

Question. The fiscal year 2000 budget proposes to restore funding of $10 million to the Nutrition, Education, and Training (NET) program. The budget also proposes funding $2 million for Nutrition Education and Training activities in the Child Nutrition Programs. How will the use of this funding differ from the way NET funds are to be used? How would this funding be used differently from funding provided for training of school food service personnel in the School Breakfast and Lunch Programs?

Answer. The President's budget for the fiscal year 2000 includes $10 million in funding for Team Nutrition and $2 million for the Nutrition, Education and Training (NET) Program. Team Nutrition is a Federally-directed nutrition, promotion and technical assistance effort to support the implementation of the School Meals Initia-

tive (SMI) in the NSLP and the School Breakfast Program (SBP). Team Nutrition has been successful in gaining grassroots support for SMI implementation at the local level and has provided many high quality training and technical assistance resources. Further, it has focused National attention on the need to improve the quality of school breakfasts and lunches and provide nutrition education to the Nation's children, which will enable them to improve eating behaviors that can influence their school performance and health in later years. The Department's $10 million request for Team Nutrition will allow it to continue this Federal-level effort.

In order for Team Nutrition to be successful, it needs an established infrastructure to deliver the ongoing technical assistance and training required to support the new nutrition standards and menu planning systems established under the SMI. The NET Program is that infrastructure as a direct grant-to-States program which is the nutrition education and food service training component of the Child Nutrition Programs. It offers the vehicle to transport Team Nutrition benefits to the 94,000 schools across the Nation in an educationally effective and cost efficient manner. The $2 million included in the President's budget represents the minimum necessary to maintain this infrastructure while we work with Congress to ensure an appropriate level of future funding for NET.

Question. The fiscal year 2000 budget request proposes an increase of $2 million to identify and reduce errors in the School Lunch Program. What errors exist in the School Lunch Program and how has this cost been calculated at $2 million?

Answer. Errors in the School Lunch Program can be grouped into two categories: (1) inaccurate payments that result from the actions of households applying for benefits and (2) inaccurate payments that result from errors made by administering schools and school districts.

Category one includes such things as households inaccurately reporting income on applications for free or reduced price meals and becoming approved for free or reduced price meals, but not notifying schools during the school year when household income rises above the eligibility threshold for free or reduced price meals. Category two includes such things as schools (a) incorrectly approving children for free or reduced price meals; (b) incorrectly recording the payment status (free, reduced price, or paid) of students on documents (i.e., rosters) used to distribute free and reduced price benefits (e.g., meal tickets); and (c) making errors in counting meals served and/or in reporting meals served to USDA.

USDA's Income Verification study (1988) found that about 15 percent of the households approved for free or reduced price meals were ineligible. More recently (1997) USDA's Office of the Inspector General (OIG) performed an audit of school districts' verification of free or reduced price meal applications in Illinois. The OIG's audit produced findings similar to those of USDA's Income Verification study.

The funds requested would allow us to consider whether changes to current application and verification procedures would be cost-effective. The level of resources requested is based on the cost of similar research efforts and represents a modest investment relative to the $7.1 billion spent annually (1998 cost) on the School Meals Programs.

COMMUNITY FOOD PROJECTS COMPETITIVE GRANTS PROGRAM

Question. The Community Food Projects Competitive Grants Program (CFP) was established in 1996 to support projects designed to increase food security in communities by meeting the needs of low income people. How much funding was provided for this program in fiscal years 1996, 1997, 1998, 1999, and how much is estimated for fiscal year 2000? How many grants were awarded for each of these fiscal years? Do these grants allow communities and/or for-profits and non-profits to set up gleaning recovery programs?

Answer. This program is managed by the USDA Cooperative State Research, Education and Extension Service. Community Food Projects received $1 million in 1996 and $2.5 million each in fiscal years 1997 and 1998. It is estimated that there will be $2.5 million in both fiscal years 1999 and 2000. In fiscal year 1996, 13 grants were awarded. In fiscal year 1997 and 1998, 18 grants were awarded each year. The fiscal year 1999 Request for Proposals for the program closes on June 4, 1999; accordingly, 1999 grants have not yet been awarded.

Under the authorizing statute for the program, only non-profit organizations may receive funds; therefore for-profit entities and local government agencies are not directly eligible to receive funds.

A small number of grantees in this program have incorporated some gleaning and food recovery activities into their broader community food project activities. However, under the authorizing statute for the program, projects that are solely focused on food recovery and gleaning would generally not rank high in the funding review

process because they would not meet all the standards for wide-ranging community food projects as defined by the law. Consequently, while some number of food recovery and gleaning projects have applied for funding under this program, we have generally not been able to award them grants. This is one reason the Department has requested funding and authorization for a new grant program that would specifically make awards to food recovery and gleaning projects to help them expand their infrastructure.

FOOD PROGRAM ADMINISTRATION

Question. An increase of $9.3 million is proposed for food program administration for fiscal year 2000. Of this amount $2 million will be used to identify and reduce errors in the National School Lunch Program. Please identify the proposed allocation of the $6 million for food stamp program integrity efforts and the $1.3 million for additional program and financial integrity initiatives.

Answer. The $6 million increase for Food Stamp Program integrity efforts will be used to maintain store management and the accuracy of the Quality Control (QC) System which maintains oversight of Food Stamp Program benefits totaling approximately $19 billion annually. In order to support State billings and settlement actions, it is important that the QC system remain statistically valid and legally defensible. With final regulations now in place to bill States under the liability provisions of the Mickey Leland Childhood Hunger Relief Act of 1993, the Food and Nutrition Service (FNS) contemplates billing approximately 20 States each year for liabilities totaling about $60 million. It is necessary that FNS ensure the integrity of the QC system both to control billings and increase State payment accuracy.

The $1.3 million for additional program and financial integrity initiatives will be used to support staff for the oversight of the following:

Review of State Automated System Development activities.—50 percent or more of State system's life cycles have been exceeded and must be replaced; others suffer from Welfare Reform and Year 2000 initiative impacts. In order to protect the Government's program and financial interests, FNS must maintain a determined oversight posture for technical review and oversight of Advance Planning Documents (APDs) submitted by State agencies.

State administrative expense.—The Office of the Inspector General audit report findings concluded that administrative expense reviews conducted by FNS were found to be inadequate, in part, due to FNS' limited resources in this area.

Retail store operations.—Oversight in this area will include maintaining the number of undercover investigations; ensuring timely and thorough handling of new retailer applications and re-authorizations; and providing detailed guidance for reviews of State and EBT processor accounting, processing and reporting systems, etc.

Question. How is the agency using the $752,000 increase provided for fiscal year 1999 for program and financial integrity advancement?

Answer. In the Food Stamp Program the funds are being used to support ongoing efforts to improve payment accuracy, recipient fraud, claims management, and retailer integrity. Payment accuracy efforts include increased State technical assistance and monitoring Quality Control reinvestment and other State agency corrective action plans. A major claims initiative that began in fiscal year 1997 uses special reviews to assess the integrity of the recipient claims system in each State agency. The reviews focus on timely claim establishment, collection and reporting and integrity of the data contained in the claims accountability system. All State claims systems are scheduled to be in compliance by the end of fiscal year 2001. In the retailer integrity area the agency is implementing a new tool that allows us to detect fraud by monitoring transactions that occur at stores. We are now able, in some instances, to detect fraud and take action to eliminate it.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. The agency developed a Strategic Plan which outlines the goals it plans to achieve incrementally by fiscal year 2002. The agency has also developed the fiscal years 1999 and 2000 Annual Performance Plans which supports the Strategic Plan and specifies those annual goals and objectives for both years.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. The agency has identified strategic and annual performance goals and management initiatives the agency plans to achieve for fiscal year 2000 and beyond. In support of this effort, each senior manager within the agency develops an annual

detailed plan of action which provides specific activities that will be undertaken to support our annual goals. Each senior manager provides a bi-annual report to the Administrator which outlines specific accomplishments. The Administrator uses this internal management tool as a means to assess the agency operations and management performance.

Question. How is performance information being used to manage the agency?

Answer. The FNS Annual Performance Plan identifies strategic and annual performance goals as well as management initiatives the agency plans to accomplish. The agency continuously monitors and evaluates its progress toward achieving these goals. As a result the information serves as one of many variable used by the Agency to determine policy and effect program changes. Accordingly, this data is one very important underpinning of most management decisions made at FNS.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. We use data such as Food Stamp Program participation, school lunch and breakfast meal service data, general economic indicators such as unemployment level and income, and demographic data such as school enrollment as the basis for our budget projections. Therefore, program performance data is the major driver behind all FNS budget requests.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. As required in annual performance planning, FNS has incorporated a number of program and policy changes into its annual performance plan and goals. The final results of our fiscal year 1999 efforts will be fully reviewed in the fiscal year 1999 Annual Performance Report, but by the end of fiscal year 1999, FNS expects to:

—implement a policy and provide technical assistance to States to restore food stamp eligibility for those legal immigrants authorized under the Agricultural Research, Extension, and Education Reform Act of 1998;
—begin development of a National Food Stamp Program nutrition education strategy;
—propose an incentive system to increase claims collection in the Food Stamp Program;
—increase to 38 the number of States delivering Food Stamp Program benefits through electronic benefits transfer (EBT);
—complete a demonstration project to explore the cost and feasibility of using scrip in conjunction with EBT to make food stamp purchases at farmer's markets;
—secure implementation by over 40 States of the WIC National Breastfeeding Campaign;
—bring 4 new States into the Farmers' Market Nutrition Program;
—implement regulations to improve State oversight of the Summer Food Service Program;
—secure participation by 45 State commodity distribution agencies in the FNS Electronic Data Interchange (EDI) system;
—reduce State paperwork burden in the commodity distribution programs;
—complete a new customer satisfaction survey of schools receiving commodities through the National School Lunch Program;
—and distribute to all school food authorities a Step-by-Step Guide to working with small farmers to buy fresh produce.

With regard to the procedures of plan implementation, FNS is currently undertaking a project to integrate all of its current planning activities, including the development and execution of strategic and annual performance plans, into a single process. The resulting unified process will help to ensure that the priorities identified in strategic and annual planning are fully reflected in the agency's budget and work-planning processes.

Significantly, the planning integration project is also tasked with devising a strategy to communicate the strategic goals and objectives to FNS employees and partners on an ongoing basis. This communication is a critical step in ensuring that all those involved with Federal nutrition assistance understand the agency's key goals and objectives, and their roles and responsibilities in reaching them.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The fiscal year 1999 & 2000 Food and Nutrition Service (FNS) Annual Performance Plans (APP) identify the strategic and annual performance goals, as well as management initiatives the agency plans to accomplish the goals. The resources required to achieve these goals are provided in the APP at the strategic goal

level. FNS uses a matrix format to link these resources to the major program activities outlined in the Program and Financing schedules.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. FNS's current budget structure is set up by major program and account activity. The APP and Strategic Plan structure reflect goals that may span more than one program account. However, the basic structure is similar. Therefore, the agency does not plan to make any changes to the account structure at this time.

Question. Does the Agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000?

Answer. There are a number of performance indicators for which reliable data will not be available for inclusion in the first Annual Performance Report. In particular, while verification of the achievement of goals related to the Child Nutrition Programs, the WIC Program, and the Food Distribution Programs is based in many instances on administrative data, validation of these findings through evaluations or other independent mechanisms is often not possible.

In a number of instances—for example, for performance goals dealing with program integrity in the Child and Adult Care Food Program (CACFP), and nutrition quality of meals in the Summer Food Service Program (SFSP)—FNS had planned to conduct studies that would provide strong data to set performance baselines and measure progress in reaching performance goals. However, the loss of funding for studies and evaluations forced the agency to rely instead on less-rigorous methods to evaluate our progress, or to change the goals to ensure that they were measurable.

Question. If so, what steps are planned to improve the reliability of these measures?

Answer. Currently, FNS is working to revise its strategic plan, to better reflect its unifying mission and purposes and to make the plan more useful as a strategic management tool. As part of this process, the agency is reexamining its performance indicators to improve their ability to reflect actual performance, including program outcomes. It will also seek ways to validate its measures through evaluations or other data sources.

It is important to note that the agency's loss of funding for studies and evaluations has significantly hampered its ability to develop new analytical and evaluation tools to measure and report performance. As noted above, FNS intended to use a portion of this funding to set performance baselines and measure progress in reaching performance goals. Restoring this funding for studies and evaluations, as requested in the President's budget, is a critical step in enabling FNS to find new approaches to better measure its performance in achieving its strategic goals and objectives.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. The Food and Nutrition Service periodically updates its budget estimates based on program performance. The next update will occur during the Midsession Review this coming July. If the changes are major, they will be submitted to Congress and will also be considered in future funding requests.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full cost of all associated activities performed in support of that goal? For example, are overhead costs fully associated to goals?

Answer. Each goal identified in the Agency's Annual Performance Plan has been resource loaded and reflects the fiscal and capital costs as well as the human resources required to achieve the goal.

FOOD PROGRAM STUDIES AND EVALUATIONS

Question. The Economic Research Service was given the responsibility in fiscal year 1998 and again in fiscal year 1999 to manage the research program for the nation's food assistance programs. Does the Food and Nutrition Service believe it has had adequate involvement in the determination of program priorities?

Answer. The Food and Nutrition Service and the Economic Research Service (ERS) have made a good faith effort to create a practical study agenda that responds to the operational needs of the Nutrition Assistance Programs. This effort helped shape some of ERS' funding decisions and resulted in an agreement between the two agencies that allows FNS to pursue some of our operational study priorities with ERS funding support. However, because the agencies have fundamentally different research goals and methods, the agency firmly believes that effective program management can best be supported by locating the studies and evaluation functions

within FNS. This will ensure tat important policy issues in FNS programs are addressed in the agenda.

Effective program management requires a strong study and evaluation function that is sensitive and responsive to emerging policy issues and the needs of program operators. This is best achieved by maintaining such a function within the agency responsible for Federal Nutrition Assistance Programs. While both FNS and ERS have important roles to play in developing research that supports the FNCS mission, managing the right kind of applied studies and evaluations requires the program expertise, sensitivity to evolving policy issues, and relationships with multiple stakeholders that can only be developed and sustained within FNS.

Question. For fiscal year 1999, the Appropriations Act provided that the Economic Research Service transfer $2 million of the funds provided for food and nutrition research to the Food and Nutrition Service to conduct evaluations and analyses. How does the Food and Nutrition Service plan to spend those funds?

Answer. The plan for using these funds in support of the agency's mission is shown below.

FOOD AND NUTRITION SERVICE FISCAL YEAR 1999 RESEARCH PLAN

Food Stamp Microsimulation and Related Analyses.—Microsimulation is one of the core tools the agency uses to estimate the budgetary and distributional consequences of program changes and alternative policies under consideration by the Congress and others.

This project will support: (1) analyses of the effects of proposed changes in the Food Stamp Program on the number and characteristics of participants and program costs; (2) acquisition of new survey data as they become available, updates of the simulation models with the more current data, and appropriate documentation; (3) enhancement of modeling capabilities to accommodate changes in the Food Stamp Program, changes in other cash assistance programs received by food stamp participants, and new technologies; and (4) research on the characteristics and behavior of food stamp and other low-income households to support future model enhancements and improvements.

Comparison of School Nutrition Dietary Assessment Data.—In 1993 USDA released the results of the School Nutrition Dietary Assessment Study (SNDA I) which, among other analyses, examined the nutrient content of the meals provided in the National School Lunch Program (NSLP) and School Breakfast Program (SBP). The Recommended Dietary Allowances (RDAs) and the Dietary Guidelines for Americans were used as standards against which to compare the meals. Following the study, FNS significantly revised the nutritional standards that School Food Authorities were required to meet. In order to assess the progress that has been made from the time of the first study, in 1995 FNS awarded a second contract to examine the nutrient content of meals.

This project will compare the nutrient content of the school meals in 1993 and 1998. This comparison may require extensive recalculation of the 1993 data. For example, recalculations may be required because the actual nutrient values of some foods have changed over time or because our ability to measure nutrient values has improved. This project would recalculate the nutrient values so that valid comparisons can be made.

Impact of SBP on Learning.—In recent years, a limited number of researchers have conducted studies focusing on the relationship between student breakfast consumption and academic performance. Unfortunately, these studies have had serious methodological and implementation flaws. In order to address this unresolved question, the William F. Goodling Child Nutrition Reauthorization Act of 1998 authorized FNS to conduct a pilot study that would examine the impact of a universal School Breakfast Program on student performance in a limited number of schools. The pilot study is subject to appropriation, and was not funded in fiscal year 1999. The President's fiscal year 2000 budget requests the funding needed to field this study. In order to conduct the study in a timely manner, FNS will use fiscal year 1999 funding for the initial design and development. This project will address numerous complex design and implementation issues that must be resolved before fielding the pilot. For example, this project would determine the most scientifically sound measures of student academic performance, as well as the identification of school districts with the necessary demographic characteristics to conduct such a study.

Quick-Turnaround Budget Analyses and Expert Review.—This funding will support quick turnaround studies providing tabulations of extant data bases and short reports that are needed to support the fiscal year 2000 budget request, inform development of the fiscal year 2001 budget, and respond to related Congressional inquir-

ies. These services are available through the WIC General Analytic Projects contract and the Child Nutrition Analysis Projects contract. Expert review of draft reports, needed to ensure the high quality of study products, will be obtained through these contracts or through direct small purchases with the reviewer.

Question. When the food and nutrition research program was transferred to the Economic Research Service in fiscal year 1998 only the funds for the research were transferred. The Food and Nutrition Service retained in its base the funds it devoted to the management of this program. It has been two years since the Congress moved the study and evaluation funding to the Economic Research Service. One of the Food and Nutrition Service's complaints in the past has been that it does not have the funds to manage and oversee its programs. Since your workload in the area of studies and evaluations has significantly changed and the Congress did not reduce the Food and Nutrition Service's salaries and expenses accordingly, how have you effectively used the staff previously devoted to studies and evaluations to address staffing needs in other areas?

Answer. The staff responsible for studies and evaluations continue to have significant responsibilities that are critical to the success of the agency mission. These responsibilities include work on assessing the impact of potential policy alternatives on program costs and participants; development and clearance of regulatory and civil rights impact analyses; preparation of proposals for the annual agency budget request; responses to Congressional, State and public inquiries; and strategic planning.

In addition, the study and evaluation function has not gone away. The agency is now using its in-house talent to gather and analyze empirical data to improve program operations. Staff also stay abreast of external research on nutrition, welfare and health programs in order to assess and communicate their implications for FNS officials. In addition, though the ability to procure the services of contract research firms has diminished, we continue to manage a significant number of contracts funded through previous appropriations. While the decrease in funding seriously constrains the comprehensiveness of our activity, the study and evaluation staff continue to provide ongoing advice to program managers on the impacts of FNS programs as well as on how to improve customer service, program integrity, administrative efficiency, and measurement of performance results.

Y2K EMERGENCY FOOD RESPONSE

Question. According to the Robert T. Stafford Disaster Relief and Emergency Assistance Act, the Department's Food and Nutrition Service (FNS) is the primary agency for the emergency support function to identify, secure and arrange for the transportation of food assistance to affected areas following a major emergency. Should a food emergency situation occur due to Y2K-related problems or panic-induced stockpiling, what preparations has FNS made to address this situation?

Answer. Because there are USDA foods for on-going Nutrition Assistance Programs in every State that can be used to feed the general public in emergencies, and because our current assessment indicates that there should not be any widespread Y2K problems with the food supply or distribution network, FNS has not set up a special food reserve exclusively for Y2K. However, we continue to work with our State partners, food suppliers, and other agencies in USDA to ensure that our indicators are correct. In the coming weeks and months, our efforts will be focused on developing and preparing contingency plans to ensure that there are alternative sources of food available throughout our communities in the unlikely event there is a Y2K-based interruption in the food supply.

Question. What level of funding has been set aside by the Department and FNS to deal with the potential need to quickly obtain and distribute food should such a food emergency occur as a result of Y2K?

Answer. In the unlikely event that there is a food shortage severe enough to be considered an emergency as a result of Y2K problems, State inventories located in warehouses, schools and charitable institutions could be used to provide nutrition assistance. Additionally, a Presidential declaration of emergency would invoke the provisions of the Robert T. Stafford Disaster Relief and Emergency Assistance Act and enable the Secretary to authorize the expenditure of funds available under Section 32 of the Act of August 24, 1935. Section 32 funds would be used to purchase and deliver any additional food needed to provide nutrition assistance.

Question. What is USDA's total annual expenditure for stocks of commodity foods that are used for USDA-sponsored food programs, including emergency food assistance?

Answer. The total expenditure for commodities purchased for use in domestic nutrition assistance programs is anticipated to be at or above $1,041,000,000 by the

end of fiscal year 1999. This includes $658 million for Child Nutrition Programs, $90 million for The Emergency Food Assistance Program, $76 million for CSFP, $53 million for FDPIR, and $164 million in surplus removal commodities donated for use in all domestic Nutrition Assistance Programs. USDA does not maintain a separate inventory of commodities for use in emergency or disaster situations. Commodities stored at the Federal, State and local levels can be made available for use in these situations. Normally, commodities purchased for schools and stored at the State or local level are the first commodities used in emergency or disaster situations. However, USDA is exploring the possibility of accelerating commodity purchases for delivery prior to the end of the calendar year. The commodities would be placed in Federal inventory and made available for distribution in the event that food shortages occur as a result of Y2K problems.

Question. What types, how much, and where are these commodity foods stored.

Answer. The types of commodities purchased for USDA-sponsored Nutrition Assistance Programs includes frozen beef, chicken and pork; canned meats and fish; canned and frozen vegetables; canned and frozen juices; dry and canned beans; processed and ready-to-eat cereals; flour and flour mix; cheeses; pasta products; peanut products; rice; and infant products.

The majority of the commodities purchased are delivered directly from the manufacturer to State and local warehouses. However, a minimum level of four months inventory is maintained in Federal warehouses in Carthage, Missouri and Exeter, California. The commodities stored in these warehouses are primarily for use in the FDPIR and the CSFP. Federal inventory at the end of fiscal year 1998 was 30.2 million pounds valued at $18.2 million dollars. This level of inventory is necessary to maintain uninterrupted service to participants in these programs. However, inventory levels vary significantly from time to time during a year and between years, depending on the availability of commodities purchased under agricultural support programs, which cannot be predicted with any degree of certainty.

Commodities stored in Federal warehouses can be made available for use in emergency and disaster situations. However, foods purchased for schools and stored in State or local warehouses are usually the first commodities used in such situations. In addition to the commodities purchased on a regular basis for use in domestic Nutrition Assistance Programs, $500,000 is available through a direct appropriation to FNS for use in purchasing commodities in response to an emergency or disaster situation. USDA is exploring the possibility of accelerating commodity purchases for delivery prior to the end of the calendar year. The commodities would be placed in inventory in Federal warehouses and made available for distribution in the event that food shortages occur as a result of Y2K problems.

Supplemental Nutrition Program for Women, Infants, and Children (WIC)

Question. Please provide the WIC participation, food and administrative cost rates for each month in fiscal year 1998 and in fiscal year 1999 to date.

Answer. Monthly WIC participation levels, and food and nutrition services and administration (NSA) costs for fiscal year 1998 and for fiscal year 1999 to date are provided:

Fiscal year	Month	Participation	Food cost per person	NSA cost per person
1998	October	7,425,255	$31.47	$10.98
	November	7,271,569	31.60	9.39
	December	7,236,854	31.63	12.13
	January	7,332,302	31.98	14.48
	February	7,315,333	31.55	10.68
	March	7,394,810	31.46	9.55
	April	7,418,120	31.69	11.97
	May	7,358,478	31.59	12.09
	June	7,402,206	31.65	10.94
	July	7,410,399	31.87	12.48
	August [1]	7,412,586	32.11	10.50
	September [1]	7,414,565	32.53	18.92
1999	October [1]	7,449,781	31.87	11.67

Fiscal year	Month	Participation	Food cost per person	NSA cost per person
	November [1]	7,340,512	32.24	10.85
	December [1]	7,283,599	32.38	10.96
	January [1]	7,332,945	32.72	11.44
	February	7,266,734	32.95	12.56

[1] Indicates these amounts are not yet final; obtained from preliminary State reports for months in which financial activity is not closed-out (verified and reconciled).

Question. The budget indicates a $100 million projected carryout in each of fiscal years 1999 and 2000. Is the $100 million still the most recent projection of the carryout for fiscal year 1999? If not, what is the current estimate?

Answer. The $100 million projected carryout is our most recent estimate. Question. What is the projected "carry forward" by states into each of fiscal years 1999 and 2000?

Answer. We project that States will spendforward approximately $22 million into each of fiscal years 1999 and 2000.

Question. Based on actual monthly costs per participant to date, is the fiscal year 1999 average monthly cost per participant still projected to be $44.47 for fiscal year 1999, $32.63 for food costs and $11.84 for administrative costs?

Answer. WIC program cost estimates for fiscal year 1999 have not changed.

Question. If not, what are the most recent estimates?

Answer. WIC program cost estimates for fiscal year 1999 have not changed.

Question. The Secretary has the authority to use up to $10 million in unspent funds for infrastructure, special project grants, and breastfeeding promotion and support activities. Please indicate how these funds were spent in each of fiscal years 1997 and 1998 and in fiscal year 1999 to date.

Answer. The amounts spent by category for each of the requested fiscal years follows:

In fiscal year 1997, approximately $10 million was allocated for these purposes as follows:

Infrastructure Grants to State Agencies	$7,201,444
Special Project Grant to State Agencies	1,999,995
Breastfeeding Promotion and Support & Infrastructure Projects	798,556
Total	9,999,995

The Department allocated a total of $7.2 million to WIC State agencies for State-specific infrastructure grants to help support the overall goal of reaching more participants and providing quality program service. Grants were awarded to 35 State agencies on a competitive basis. The following table summarizes the breakout of the categories of how the funds were expended.

Categories of Funds Expenditures	*Total Funds Allocated*
Automated Management Information and Integrated Data Systems	$5,497,578
Electronic Benefit Transfer (EBT) Projects	595,218
Service Integration, Coordination & Co-Location	166,700
Breastfeeding Promotion and Support	152,888
Management Technologies and Improvement of Access to Services	120,612
Facility Renovation and Non-ADP Purchase	668,448
Total	7,201,444

The Food and Nutrition Service (FNS) awarded $2.0 million to six State agencies to support special State projects in fiscal year 1997. The special State projects are of National or Regional significance and are relevant to current WIC policy issues, designed to produce a demonstrable impact and be transferable to other WIC programs. The projects also suggest innovative or creative approaches to improving the delivery of WIC services.

The following table summarizes fiscal year 1997 special project grants.

State agency	Project	Amount allocated
Illinois	Feeding with Love: The Impact of Nutrition Education on the Bottle Feeding habits of WIC Preschoolers.	$182,111
Mississippi	Breastfeeding Promotion and Support	399,745

State agency	Project	Amount allocated
Montana	Integrated Data for Evaluation and Assessment	600,000
New York	Barriers to Retention among Infants and Children in the WIC Program.	215,198
North Carolina	A Model for Evaluating and Monitoring the Effectiveness of the WIC Program for Children.	508,808
Virginia	Distance Training on Community-Based Nutrition Education for WIC Professionals: Implementation and Evaluation.	94,133
Total		1,999,995

The remaining funds, approximately $800,000, were used to support breastfeeding promotion and support activities and infrastructure projects of National significance, including an Electronic Benefit Transfer project. Several publications were developed and produced and other breastfeeding promotional efforts have been conducted, as well as a training course in pediatric nutrition and a co-location best practices handbook.

In fiscal year 1998, approximately $9.4 million was allocated for these purposes as follows:

Infrastructure Grants to State Agencies	$4,319,300
Special Project Grant to State Agencies	478,716
Breastfeeding Promotion and Support, EBT & Infrastructure Projects	4,587,369
Total	9,385,385

The Department has allocated a total of approximately $4.32 million to WIC State agencies for State-specific infrastructure grants to help support the overall goal of providing quality program service. Each of our 7 Regional offices initially received $525,000 for allocation to WIC State agencies and grants were awarded to 26 State agencies on a competitive basis. During the grant period, additional funds became available that were used to augment existing grant awards. The following table summarizes the breakout of the categories of how the funds were expended.

General Infrastructure Funds

Categories of Funds Expenditures	*Total Funds Allocated*
Automated Management Information and Integrated Data Systems	$2,531,803
Electronic Benefit Transfer (EBT) Projects	475,735
Breastfeeding Promotion and Support	352,833
Management Technologies and Improvement of Access to Services	467,158
Facility Renovation and Non-ADP Purchase	491,771
Total	4,319,300

The Food and Nutrition Service (FNS) awarded $478,716 to New York to support special State projects in fiscal year 1998. As done in past years, FNS funds special State projects of National or Regional significance that are relevant to current WIC policy issues, designed to produce a demonstrable impact and be transferable to other WIC programs. The New York project was titled "Nutrition Education Video Series for WIC Farmers Market Nutrition Program".

The final $4.59 million of the nearly $9.4 million total is being used to support breastfeeding promotion and support activities and infrastructure projects of National significance, including Electronic Benefit Transfer projects. Several publications were developed and produced on breastfeeding promotion and support and other promotional efforts have been conducted. Three States, Ohio, New Mexico and Wyoming, received EBT funding totaling approximately $4.1 million.

In fiscal year 1999, the $10 million has been allocated for these purposes as follows:

Infrastructure Grants to State Agencies	$3,675,000
Special Project Grant to State Agencies	2,000,000
Electronic Benefit Transfer Projects (EBT)	3,500,000
Breastfeeding Promotion and Support, EBT & Infrastructure Projects	825,000
Total	10,000,000

The Department will award a total of $3,675,000 to WIC State agencies for State-specific infrastructure grants to help support the overall goal of providing quality program service. Each of our 7 Regional offices received $525,000 for allocation to WIC State agencies and are in the process of awarding these grants on a competitive basis. The following table summarizes the breakout of the categories of planned expenditures:

Categories of General Infrastructure Grant Funding	*Total Funds Allocated*
Automated Management Information and Integrated Data Systems	$2,429,496
Service Integration, Coordination, & Co-Location	125,000
Management Technologies and Improvement of Access to Services	418,541
Facility Renovation and Non-ADP Purchases	701,963
Total	3,675,000

The Food and Nutrition Service (FNS) has set aside $2,000,000 to support special State projects in fiscal year 1999. As done in past years, FNS funds special State projects of National or Regional significance that are relevant to current WIC policy issues, designed to produce a demonstrable impact and be transferable to other WIC programs. The projects also suggest innovative or creative approaches to improving the delivery of WIC services.

The final $4,325,000 is being used to support breastfeeding promotion and support activities and infrastructure projects of National significance, including Electronic Benefit Transfer projects. At this time, we anticipate competitively awarding about $3.5 million for State EBT projects. The remaining funds will be used in a variety of ways to support breastfeeding activities.

Question. A number of changes were made in the WIC Program by last year's Child Nutrition Program Reauthorization Act (Public Law 105–366) Please indicate the impact, if any, this new statute will have on WIC Program or participant costs.

Answer. The Special Supplemental Nutrition Program for Women, Infants and Children (WIC) is a discretionary program with funding determined by annual appropriations. Thus P.L. 105–366 had no direct impact on total program costs. In addition, we do not anticipate any change in per-participant cost as a direct result of any of the reauthorization provisions and thus the President's fiscal year 2000 WIC budget request does not reflect any costs or savings which are attributable to reauthorization provisions.

However, the legislation did include numerous non-budgetary modifications to the program. These include provisions designed to improve the certification process and strengthen vendor management and oversight. A summary of the WIC provisions of Public Law 105–366 is provided for the record.

Supplemental Food Programs Division Regulatory Implementation Plan

[William F. Goodling Reauthorization Act of 1998]

Statutory Provision	*Program Affected*
Sec. 203(a)(1). Requires physical presence, except in certain circumstances	WIC
Sec. 203(a)(2). Requires documentation of income, except in certain circumstances	WIC
Sec.203(b). Requires local agencies to provide education or educational materials relating to the effects of drug and alcohol use by pregnant, postpartum, or breastfeeding women on developing children	WIC
Sec. 203(c). Allows the Secretary of Agriculture to provide, in bulk quantity, nutrition education materials developed under the WIC Program to CSFP State agencies at no cost to that program	WIC, CSFP
Sec. 203(d). Provides State agencies with greater flexibility in the use of funds recovered from vendors and participants	WIC
Sec. 203(e). Requires State agencies to implement a system designed to identify participants participating at more than one WIC site	WIC
Sec. 203(f). Requires State agencies to identify high risk vendors and conduct compliance buys on such vendors	WIC
Sec. 203(g). Reauthorizes the WIC Program through 2003	WIC
Sec. 203(h). Allows State agencies to use food funds to purchase breast pumps	WIC
Sec. 203(i)(1) (2) and (4). Extends nutrition services and administration (NSA) funding authorization and makes a technical amendment	WIC

Statutory Provision	*Program Affected*
Sec. 203(i)(3). Reduces from 15 percent to 10 percent the threshold which the Secretary of Agriculture may reduce a State agency's NSA funding if its actual NSA expenditures exceed its per participant NSA grant	WIC
Sec. 203(i)(5). Allows State agencies that submit a plan to reduce average food package costs per participant and to increase participation above the level estimated for the State agency to convert food funds to NSA, based on the estimated participation increase rather than actual increase	WIC
Sec. 203(j). Requires State agencies to offer infant formula rebate contracts to the bidder offering the lowest net price, unless the State agency demonstrates to the satisfaction of the Secretary of Agriculture that the weighted average retail price for different brands of formula in the State does not vary by more than 5 percent	WIC
Sec. 203(k). Extends the requirement that the Secretary to use up to $10 million in unspent funds for infrastructure, special project grants and breastfeeding promotion and support activities	WIC
Sec. 203(l). Requires State agencies to consider, in selecting retail stores, the prices the store charges for WIC items compared to other stores' prices. Also requires State agencies to establish procedures to ensure that selected stores do not subsequently raise prices to levels that would make them in eligible	WIC
Sec. 203(m). Requires the Secretary to establish, in consultation with State agencies, retailers, and other interested parties, a long-range plan for developing and implementing information systems (including electronic benefit transfer (EBT) systems). Also, State agencies are prohibited from requiring retail stores to pay the costs of EBT systems prior to USDA completing a report on the issue	WIC
Sec. 203(n). Allows State agencies to spend back not more than 1 percent of food funds and not more than 1 percent of NSA funds, respectively. Food funds backspent must be used for food benefits; NSA funds backspent can be used for either food or NSA costs. It would also allow a State agency to spend forward NSA funds for NSA purposes, an amount equal to not more than 1 percent of total grant funds. Finally, State agencies would be allowed, with the prior approval of the Secretary, to carryforward NSA funds in an amount not to exceed one-half of 1 percent of total grant funds for the development of a management information system, including an EBT system	WIC
Sec. 203(o). Allows program income as a match source; allows State agencies who wish to increase the value of benefits to recipients to compete for expansion funds; and eliminates specific State Plan ranking criteria and preferences; Secretary is only required to use objective criteria	FMNP
Sec. 203(p). Requires State agencies to permanently disqualify WIC vendors convicted of trafficking in food instruments or selling firearms, ammunition, explosives, or controlled substances for food instruments. The disqualification would be effective on receipt of the notice of disqualification, and the vendor would not be entitled to compensation for revenues lost as a result of disqualification. A State agency would be permitted to waive the disqualification in certain circumstances	WIC
Sec. 203(q). Allows a court to order a person convicted of trafficking in WIC food instruments to forfeit all property, real and personal, used in a transaction or attempted transaction, to commit, or to facilitate the commission of a violation (other than a misdemeanor) of Program laws or regulations	WIC

Statutory Provision	*Program Affected*
Sec. 203(r). Requires the Secretary to conduct a study of the effect of States' cost containment practices in selecting vendors and approved food items on: program participation, access to and availability of prescribed foods, voucher redemption rates and food selections by participants, participants with special diets or specific food allergies, participant use of and satisfaction with prescribed foods, achievement of positive health outcomes, and program costs. A report to Congress is due not later than 3 years after enactment	WIC
Sec. 203(s). Requires the General Accounting Office to conduct a study that assess: the cost of delivering WIC services (including the cost of cost containment efforts), the fixed and variable costs incurred by State and local government for delivering WIC services, the quality of WIC services delivered, and costs incurred for personnel, automation, central support, and other activities to deliver services, and whether the costs meet Federal audit standards for allowable costs. A report to Congress is due no later than 3 years after enactment	WIC

Question. Please report on the Department's latest efforts to contain WIC Program costs.

Answer. In fiscal year 1998, infant formula rebates saved the WIC Program approximately $1.35 billion, the most lucrative of the program's cost containment measures. State agencies also employ a variety of other measures to contain food costs. These measures include, but are not limited to, limiting the type and package size of WIC approved foods; limiting authorized food selections by, for example, requiring participants to select lowest cost or store brand products; carefully selecting and monitoring vendors; and contracting with manufacturers to obtain rebates on WIC foods in addition to infant formula.

In addition, the Department will soon be publishing proposed regulations that implement cost containment statutory provisions of the WIC Program reauthorization legislation, the William F. Goodling Child Nutrition Reauthorization Act of 1998. These provisions include the requirement that States consider, in selecting retail stores, the prices stores charge for WIC food items compared to the prices charged by other stores, and requires States to establish procedures to ensure that selected stores do not subsequently raise prices to levels that would make them ineligible.

Question. Eligible overseas military personnel are authorized to receive WIC benefits. Do you agree with the National Association of WIC Directors that funding for WIC overseas come from armed forces budget?

Answer. WIC's authorizing law does not authorize WIC services to be provided outside of the United States or its territories. While USDA supports the provision of benefits to military personnel serving overseas, funding for such benefits should come from the Department of Defense appropriation.

Question. Eligible overseas military personnel are authorized to receive WIC benefits. Do you agree with the National Association of WIC Directors that WIC programs overseas mirror state-side programs to ensure that returning eligible military and civilian personnel are fully eligible to participate in the WIC programs in transfer locations?

Answer. Both USDA and the Department of Defense agree that there should be a continuation of WIC-type services once personnel leave the States for overseas assignment. As such, if a WIC-type program were to be developed for military personnel serving overseas, such a program should be as close as possible to the domestic WIC Program.

Question. What is the Food and Nutrition Service doing to advance Electronic Benefit Transfer (EBT) systems that improve benefit delivery and client services for the WIC Program?

Answer. The Food and Nutrition Service continues to facilitate the design, development and implementation of EBT for WIC by providing State agencies with special WIC EBT infrastructure development funds and technical assistance. Since fiscal year 1994, FNS has provided $10,500,000 to State agencies that are preparing to move from paper-based service delivery systems to EBT. FNS has developed a National vision and goals for WIC EBT including the development of EBT systems in 7 States by the year 2000. FNS has developed functional guidelines for WIC EBT and has been actively involved in developing National standards for WIC electronic transaction processing.

Question. Funding for WIC, Food Stamp, and Child Nutrition program studies and evaluations was transferred to the Economic Research Service in fiscal year

1998. The explanatory notes indicate that $538,145 in WIC funds were spent for studies, evaluations, and technical assistance in fiscal year 1998. Was this funding available from prior-year appropriations?

Answer. Of the total $538,145 presented in the explanatory notes, $354,293 was from the WIC fiscal year 1998 appropriation and $183,852 was carryover from the WIC fiscal year 1997 appropriation.

Question. How was this $538,145 spent?

Answer. A table providing a detailed listing of the use of this $538,145 in WIC funding is provided for the record.

Item	*Amount*
Technical Assistance [1]	$399,808
WIC Advisory Council	30,000
WIC Participant & Program Characteristics 94–96	19,675
WIC Modeling and Analytic Project	18,111
WIC Nutrition Education Assessment Study	24,393
WIC Infant Feeding on WEB	357
Printing	15,096
Electronic Distributing of FNS Reports	15,000
Study of Savings in Medicaid or Indigent Care for Newborns from Participation in WIC	4,293
WIC Census/Single Audit Clearinghouse	11,412
Total	538,145

[1] These funds were used for a wide variety of technical assistance projects designed to support State agencies in their efforts to deliver a quality program effectively and efficiently. Some of the major items include:

—Printing of "After You Deliver", a publication which was developed for State agencies for use in exit counseling for postpartum women who will soon be categorically ineligible for WIC benefits. The publication reminds participants of important health messages learned during WIC participation, including the importance of a healthy diet, the critical need for folate for women in reproductive years, the importance of immunization of young children, the dangers of alcohol, tobacco and drug use, and an encouragement to breastfeed for subsequent births. State agencies also were each provided with a reproducible electronic disk of the publication for their own printing purposes.

—Reprint, storage and shipping of USDA inventory of Nationally-developed WIC materials for free distribution upon request from WIC State and local agencies, such as USDA's required civil rights poster, WIC's Infant Nutrition and Feeding Guide, How WIC Helps, After You Deliver, Tickle Your Appetite, Drugs and Alcohol Can Hurt Your Unborn Baby and reproducible negatives and electronic printing disks for State agencies.

—Meeting facilities, equipment and expert speakers for two meetings of the Risk Identification and Selection Collaborative (RISC) in which medical experts research and present technical information on specific nutritionally related medical and dietary risks for use in determining and modifying WIC nutritional risk criteria to RISC members. RISC is an ongoing partnership between FNS and the National Association of WIC Directors for continuing study of the state of the art of nutritional risk for WIC eligibility purposes.

—Meeting support funds for conferences promoting and supporting WIC goals and objectives such as the Healthy Mothers, Healthy Babies Coalition's annual breastfeeding conference and National Association of WIC Directors annual conference speaker honorariums; National Association of WIC Farmers Market Nutrition Program Directors annual conference, including training sessions for new and prospective State agencies.

—A grant to the American Academy of Pediatrics (AAP) to conduct a National meeting for State AAP and WIC breastfeeding coordinators.

—A grant to the Association of State and Territorial Public Health Nutritionists to conduct a survey of the public health and community nutrition workforce consistent with Government Performance Report Act commitments regarding public health professionals' recruitment and retention.

—A grant to Johns Hopkins University for an unsolicited proposal to study the influence of males on breastfeeding incidence and duration.

WIC FARMERS' MARKET NUTRITION PROGRAM

Question. The fiscal year 1999 Appropriations Act makes $10 million immediately available for the WIC Farmers' Market Nutrition Program and another $5 million available once it is determined that these funds are not needed to meet current caseload levels. Has the $5 million contingent amount for the program been released and, if so, when was it released?

Answer. On December 8, 1998, we allocated $12,613,879 in base grant amounts to currently operating WIC Farmers' Market Nutrition Program State agencies, which included $613,879 of the additional $5 million. On April 2, 1999, we allocated all but $85,793 of the remainder of the $5 million, based on funding requests for new State agencies and expansion requests for current State agencies.

Question. The WIC farmers' Market Program serves WIC participants. Why does the administration propose that it be funded under the Commodity Assistance Program account rather than the WIC program account?

Answer. While the WIC Farmers' Market Nutrition Program does serve WIC recipients, it also serves farmers. WIC recipients not only get the advantages of fresh, unprocessed produce, they also have an opportunity to be more closely connected to the real source of food, the farmer. Farmers, in turn, are able to market the fruits of their labors directly to customers. The regular WIC Program and WIC farmers' Market program both deserve independent funding sources with the funds for one program not being dependent on the adequacy of funds for the other.

Question. How many WIC participants received benefits through the WIC Farmers' Market Program in fiscal year 1998?

Answer. The number of WIC recipients that received benefits from the WIC Farmers' Market Nutrition Program in fiscal year 1998 was 1.325 million.

QUESTIONS SUBMITTED BY SENATOR DORGAN

FOOD STAMP PROGRAM

Question. According to a recent survey conducted by Congressman Tony Hall's office of food banks across the country, the number of people utilizing food banks has risen dramatically, an average of 22 percent in the last year. Can you give us some insight as to why you think this is occurring?

Answer. We, too, have heard from food banks and other emergency food providers who report strong and rising demand for assistance. The specific reason for this demand is not entirely clear. But clearly the fact that reported demand for food banks and other emergency food programs is rising suggests that a significant number of households are not getting adequate food. At the same time we have heard form community leaders and advocates around the country that the nutrition assistance needs of many are no longer being met by the Food Stamp Program due to policy and procedural changes.

We have observed that food stamp participation has fallen by 9.7 million persons between March 1994, the peak, and February 1999, the latest month for which information is available. This drop can be explained partly by a strong economy and the strength of welfare reform and new restrictions on the participation of certain legal immigrants and able-bodied unemployed adults without dependent children.

But other factors may be at work. Between 1995 and 1997 food stamp participation fell five times faster than poverty, suggesting that many poor families have left the Food Stamp Program despite continued eligibility. Some of these families might not be aware of their eligibility; others may have been discouraged or even prevented from participating in food stamps by State or local agencies. It would not be surprising to find that many of these former program participants would need to turn as a result to the emergency food network as an alternative source of assistance.

Question. Conversely, the Congressional Research Service reports that the number of people using the Food Stamp Program has fallen dramatically in the last couple of years. Can you give me any insight into the reasons for this dramatic decline?

Answer. Food stamp participation has fallen dramatically, by 9.7 million persons between March 1994, the peak, and February 1999, the latest month for which information is available. Part of this drop can be explained by the strength of the economy and the success of welfare reform, which helped move many families from welfare to work. Part of the drop is due to new restrictions on the participation of legal immigrants and able-bodied unemployed adults without dependent children.

But other factors may also be at work. Between 1995 and 1997, food stamp participation fell five times as fast as poverty, a sign that the nutritional needs of some low-income people may be going unmet. The number of people in poverty fell by 850,000 over this period while the number of food stamp participants fell by 4.4 million, suggesting that many poor families have left the program despite their continuing eligibility. Some families who leave welfare for work may not be aware that they still may be eligible for food stamps; in other instances, State or local agencies may have discouraged or prevented those eligible for benefits from applying. In either case, this should not happen.

Question. Can you explain why it appears that the Food Stamp Program's role is declining so dramatically, yet food banks are reporting a sharp increase in the number of people utilizing their services?

Answer. There is, as yet, no unequivocal explanation for this pattern. We have, however, heard from community leaders and advocates around the country who are

concerned that the nutrition assistance needs of many are no longer being met by the Food Stamp Program, due to policy and procedural changes.

While some food stamp recipients have left the program because the strength of the economy and the success of welfare reform has improved their economic situation, others have left for reasons that have little to do with their need for nutrition assistance. Some are no longer eligible for food stamps because they are an immigrant or an unemployed, childless adult. Some may not be aware of their eligibility for food stamps. And others may have been discouraged from participating in the Food Stamp Program by administrative or procedural barriers. As a result, it would not be surprising to find that many of these former program participants would need to turn to the emergency food network as an alternative source of assistance.

Question. Please detail the impact on current participants in the Food Stamp Program of the proposed fiscal year 1999 Supplemental Appropriations Bill reduction of $521 million. How will this reduction affect the FNCS's ability to assist current participants in the program?

Answer. The proposed reduction of $521 million in the fiscal year 1999 Supplemental Appropriations Bill will have no impact on current participants in the Food Stamp Program. Of the Food Stamp Program funds available in fiscal year 1999, at least $1.45 billion will lapse due to lower-than-expected participation during this fiscal year. Therefore, a reduction of $521 million, as proposed in the fiscal year 1999 Supplemental Appropriations Bill, will not affect the Food, Nutrition and Consumer Service's ability to assist current Food Stamp Program participants.

Question. Please provide the amount of funds requested to restore benefits to elderly legal aliens.

Answer. The Agriculture Research, Extension, and Education Reform Act restored food stamp benefits eligibility to any individual who was residing in the United States on August 22, 1996 and was 65 years of age, as well as other groups of legal immigrants. We estimated at the time the bill was passed that it would cost $50 million in fiscal year 1999 to restore benefits to the elderly portion of this population.

Question. How many elderly legal aliens have been added to receive food stamp benefits?

Answer. It is too early to measure exactly how many elderly legal immigrants were added to the Food Stamp Program as a result of The Agriculture Research, Extension, and Education Reform Act. The latest data we have now on the citizenship status of food stamp participants is the Food Stamp Quality Control data for fiscal year 1997. The restoration of benefits did not begin until November 1998.

At the time the bill was passed, we estimated that 65,000 elderly legal immigrants would have food stamp eligibility restored in fiscal year 1999.

Question. Is this the biggest group being "inadvertently" denied benefits?

Answer. No. There are two large groups of legal immigrants who have not had their Food Stamp Program eligibility restored by the Agricultural Research bill. These two groups include:

—parents of U.S. born children (who have always been eligible for benefits) and parents of legal immigrant children (who had their eligibility restored under the Agricultural Research, Extension, and Education Reform Act of 1998) who were in the United States before the enactment of welfare reform; and

—new immigrants who arrived in the country after the enactment of welfare reform. These include elderly, disabled, children, their parents, and other smaller subgroups. However, given economic constraints, we believe that resources should be targeted to the group of elderly immigrants helped by our proposal who are particularly vulnerable and in need of assistance.

CHILD NUTRITION PROGRAM

Question. Under Secretary Watkins testimony stated that the Child Nutrition Reauthorization Act of 1998, allows USDA to "pilot test" a school breakfast project at no cost to participating students in selected elementary schools. During the pilot test USDA will evaluate the effect of eating school breakfast on children's behavior and education performance. Given that the appropriation language for fiscal year 1999 does not fund the pilot test and, it is our understanding that ERS has the funds to conduct evaluations, can FNCS move funds from another account, such as the Food Program Administration account, to fund the pilot test?

Answer. The William F. Goodling Child Nutrition Reauthorization Act of 1998 (Public Law 105–336) authorizes funding for demonstration school breakfast projects, which are to include a rigorous evaluation. No funds were provided for the demonstrations in fiscal year 1999. We have estimated that the demonstrations would cost approximately $13 million over three years—$10 million for evaluation

costs and $3 million to fund added meal costs in the demonstration sites. These funds are requested in the President's fiscal year 2000 budget.

The $12 million funding for studies and evaluations of the Nutrition Assistance Programs that appears in the 1999 budget of the Economic Research Service (ERS) is not adequate to conduct the school breakfast demonstrations. This funding is needed to address other priority issues. For example, Public Law 105–336, authorized a study of cost containment practices in the Special Supplemental Nutrition Program for Women, Infants and Children (WIC), and fiscal year 1999 appropriations report language specifically expressed the Congressional expectation that this WIC study be conducted. The $2 million portion of the funding allocated to the Food and Nutrition Service is largely used to support microsimulation modeling needed for developing Food Stamp Program legislative and budget impact estimates.

For fiscal year 1999, appropriations language prohibits the Food and Nutrition Service (FNS) from using funds from the Food Stamp, Child Nutrition, or WIC program accounts for research or evaluation. FNS has determined that there is no prohibition on use of Food Program Administration (FPA) funds for research activities, as research and analysis is a legitimate and necessary activity for proper program management. Thus FNS would not legally be prohibited from funding the $13 million for demonstrations using the FPA account.

However, given the amount of funds needed, funding the demonstrations through FPA is not possible. FNS' current FPA resources are fully committed to staff and other program management needs. Diversion of these resources to fund the demonstrations would leave FNS unable to meet its most fundamental program management responsibilities. Diminishing resources cannot keep pace with changing program needs and the implementation of new legislation. Welfare Reform, Government Performance and Results Act (GPRA), the Chief Financial Officer (CFO) Act, the Healthy Meals for Healthy Americans Act, to name a few, have imposed significant, new, and ongoing administrative burdens on already strained staff years and funds. FNS' programs have expanded in size and complexity and the agency has been called to improve the nutrition of program recipients, strengthen program integrity and implement Electronic Benefits Transfer (EBT) Nationwide. FNS employees are so overburdened that they are forced to discontinue important work and react as crises arise, rather than look ahead and plan for the future.

Recent Office of the Inspector General (OIG) and General Administration Office (GAO) audits reflect insufficient staff assigned to ensure compliance with statutory requirements in areas such as retailer integrity and food stamp fraud, the agency's financial statements, documentation and collection of food stamp recipient claims, frequency of management evaluations required by program regulations, oversight of the Child and Adult Care Food Program (CACFP), oversight of advanced planning documents, and State cost allocation and claiming.

FNS' insufficient staffing level is a result of administrative funding reductions which have required an 18 percent cut in staff since 1993. Additionally, the agency has cut all non-labor expenses, such as travel and training, by more than five percent each year since 1994. Accordingly, FNS is in no position to target FPA funds for this demonstration.

NUTRITION EDUCATION AND TRAINING PROGRAM

Question. I am concerned that Congress eliminated funding in fiscal year 1999 for the Nutrition Education and Training Program (NET). This is a small program but it has a big impact in North Dakota and other states. There is a lot of confusion in Congress about the NET Program and the Team Nutrition Programs. For the record, please provide a clarification of the programs.

Answer. The Department recognizes that there is confusion about the respective roles of Nutrition Education and Training (NET) and Team Nutrition. There is an unfortunate misperception that they are overlapping programs that do much the same thing. In fact, however, the two programs are complementary. Team Nutrition develops education and technical assistance materials designed to address issues of National concern to a wide range of audiences, including food service professionals, community organizations, families and, most important of all, children. Team Nutrition also provides Federal assistance for States' training efforts through Team Nutrition grants. However, NET provides a vital counterpart to these Federal efforts at the State level. Through NET, State Child Nutrition agencies are able to provide materials and assistance that are tailored specifically to the needs of their States. Moreover, by making grants available to local operators, NET is able to support creative initiatives at the local level for a very modest investment. Finally, NET provides the ongoing training and technical assistance necessary for the efficient operation of the Child Nutrition Programs, and the NET infrastructure is used by many

States to carry out training and technical assistance projects funded through Team Nutrition Grants. For all of these reasons, NET and Team Nutrition are not competitors, but partners.

NUTRITION ASSISTANCE PROGRAM

Question. FNCS has formed strategic partnerships to promote better nutrition and healthy eating habits among participants in the nutrition assistance programs. Please provide details on FNCS's strategic partnerships and the latest efforts to promote better nutrition and program participation.

Answer. Both FNS and the Center for Nutrition Policy and Promotion (CNPP) have formed strategic partnerships with a wide range of government agencies to promote better nutrition and healthy eating habits among participants in Federal Nutrition Assistance Programs, and among the population at large. A list of key strategic partnerships is provided below.

In addition, FNS and CNPP collaborate on an ongoing basis with the Department of Health and Human Services (DHHS) to coordinate policies and programs, including such agencies as the Centers for Disease Control and Prevention (CDC), the National Center for Health Statistics (NCHS), the Office of Disease Prevention and Health Promotion (ODPHP), the Health Resources and Services Administration (HRSA) (including the Maternal and Child Health Bureau), the Administration on Aging (AOA), the Indian Health Service (IHS), and others.

FNS and CNPP also participate in many National efforts to communicate sound eating and health behaviors, such as the National Dietary Alliance, the National Healthy Mothers, Healthy Babies Coalition, Bright Futures, the Healthy People 2010 National Health Objectives working groups, and many others.

Partnerships with FNS and CNPP Involvement

USDA Dietary Guidance Working Group.—CNPP chairs this group, and FNS and CNPP serve as partner agencies. The Working Group promotes consistency in USDA dietary guidance across USDA agencies and DHHS agencies, and ensures that dietary guidance accurately reflects the USDA/DHHS Dietary Guidelines, is supported by research-based knowledge, and is objective in its presentation.

USDA Human Nutrition Coordinating Committee.—CNPP co-chairs this committee with the Agricultural Research Service (ARS), and FNS participates as a partner agency. It is designed to: 1) ensure communication among agencies involved in human nutrition within the Department, and 2) explore and recommend positions on human nutrition-related policy issues.

Thrifty Food Plan Working Group.—CNPP has convened this group, with FNS as one of the partner agencies, to obtain input and support from Federal partners in maintaining and updating the Thrifty Food Plan.

Joint USDA/DHHS Nutrition Education Committee for Maternal and Child Nutrition Publications.—FNS and CNPP both participate in this committee, which provides a systematic mechanism for USDA and DHHS agencies to report plans and progress related to maternal and child nutrition education, to avoid duplication and facilitate coordination, and to make more effective use of resources. The materials developed and shared through this committee benefit FNS Nutrition Assistance Program participants.

Federal Steering Committee for the Dietary Reference Intakes.—CNPP and FNS are members. The Committee interfaces with representatives of the Institute of Medicine's Food and Nutrition Board regarding work to be done to update the 1989 RDA's to the new Dietary Reference Intakes. Work is funded by various Federal agencies and by Health Canada, who are represented on the steering committee.

Nutrition and Food Safety Education Task Force.—FNS and CNPP are both involved in this interagency task force, which serves as a forum for the exchange of materials and ideas on nutrition education and food safety—materials and ideas that are used to benefit FNS Nutrition Assistance Program participants.

Diet Appraisal Research Group.—CNPP chairs this group. Its purpose is to communicate and share results of diet appraisal research being conducted by the Federal government.

Partnerships with FNS Involvement

Team Nutrition.—FNS has partnered with an extensive network of organizations at the National, State, and community levels to develop and implement the diverse range of Team Nutrition projects, programs and activities throughout the country.

Nutrition Support Networks.—These networks, supported through a combination of State, private, and Federal matching funds, bring together strategic partners at the State level to deliver nutrition education and promotion to Food Stamp Program recipients. The networks emphasize the Dietary Guidelines, and rely on integrated

community-based efforts, State flexibility, and use of innovative social marketing approaches to nutrition promotion.

American Academy of Pediatrics, Committee on Nutrition.—FNS maintains an active liaison relationship with the Academy concerning all aspects of nutrition related to infants, children, and adolescents. FNS acquires data which will form the scientific basis for nutrition policy and nutrition promotion projects designed for FNS Nutrition Assistance Program participants.

Interagency Committee on School Health (ICSH).—FNS is a partner in this committee which is sponsored jointly by the U.S. Department of Agriculture, U.S. Department of Education, and U.S. Department of Health and Human Services. The purpose of the ICSH is to increase the overall effectiveness of Federal efforts to provide leadership to improve the education and health of school-aged children and youth through promotion and implementation of school health programs. It is concerned with all Federal policies and programs, and other activities, related to the promotion and implementation of school health programming in elementary and secondary schools.

Bright Futures in Practice.—Nutrition Committee: FNS is a partner in this committee, which has developed a Nutrition Implementation guide to complement the Bright Futures publication on health care supervision of infants, children, and adolescents.

Welfare Reform, Nutrition, and Data Needs Working Group.—FNS and the National Center for Health Statistics co-chair this working group of the Interagency Board on Nutrition Monitoring and Related Research. The group holds quarterly meetings to focus on whether existing and planned data collections will be adequate to assess nutritional status under welfare reform. The meetings involve representatives from the major Federal agencies and many private groups active in anti-hunger, nutrition and welfare matters.

Girl Power and You Initiative.—FNS is a partner in this initiative, which addresses the special information needs of adolescent African-American girls regarding nutrition, physical activity and urban growth.

Physical Activity Initiative Advisory Committee.—FNS is a partner in this committee, which is developing physical activity initiatives for children and adolescents.

Head Start Bureau Nutrition Education Liaison.—FNS provides consultation in the area of the nutrition component of the Head Start Program and serve on related ad hoc or continuing committees, as convened.

Breastfeeding Promotion Consortium.—FNS created this active consortium to facilitate communication and coordination among organizations interested in breastfeeding promotion.

National Healthy Mothers/Healthy Babies Coalition's Breastfeeding Promotion Committee.—FNS is a partner in this committee which promotes public education efforts in maternal and child health through collaborative activities and the sharing of information among professional, voluntary, and government organizations. Through this alliance, FNS actively promotes public education efforts related to breastfeeding, which improves the health and nutrition status of infants and children participating in FNS programs.

Surgeon General's Advisory Committee on Infant Mortality.—FNS is a partner in this committee, which provides guidance and focuses attention on the policies and resources required to address the reduction of infant mortality, including improved nutrition of FNS' target audience of low income nutrition assistance program participants.

Oral Health Promotion Efforts.—FNS is a partner in the Surgeon General's Federal Coordinating Committee Report on Oral Health and in the Planning Committee on the Surgeon General's Conference and Workshop on Oral Health. In these roles, FNS supports and assists in the development of the Surgeon General's Report on Oral Health and related activities and contributing a perspective on oral health as related to FNS food assistance program participants. FNS is also partnering with the DHHS Oral Health Initiative team in an effort to promote oral and dental health among our similar target audiences.

Partnerships with CNPP Involvement

Dietary Guidelines Advisory Committee.—CNPP is Co-Executive Secretary with ARS and HHS. The committee reviews and revises the 1995 Dietary Guidelines. This activity is authorized under the National Nutrition Monitoring and Related Research Act of 1990, which directs the Secretaries of USDA and HHS to issue jointly at least every five years a report entitled Dietary Guidelines for Americans. CNPP will take the lead in developing the consumer publication for the Guidelines to be issued in 2000.

Dietary Guidelines Alliance.—CNPP is a liaison member. The Alliance was formed by the American Dietetic Association, Federal government agencies, and private-sector food commodity, trade and consumer interest organizations to develop positive, simple, and consistent messages to help consumers achieve healthy, active lifestyles.

SCHOOL LUNCH PROGRAM—COUNTRY-OF-ORIGIN LABELING

Question. There is a lingering perception that food products from some countries might pose greater risks than those from others. For example, a March 1997 outbreak of hepatitis A among Michigan schoolchildren was linked to frozen strawberries purchased for the school lunch program that were grown in Mexico. Please describe the measures FNCS has taken to restrict imported foods from the School Lunch Program.

Answer. As you know, a "Buy American" provision has applied to schools for many years. The recent reauthorization legislation for the Child Nutrition Programs codified the provision in that authorizing statute by requiring schools participating in the school lunch and breakfast programs to purchase, to the extent practicable, unmanufactured food products grown or produced in the United States and food products manufactured in the United States substantially from agricultural products grown or produced in the United States. The Department has advised schools of this new legislation and is including this provision in a final regulation that should begin formal clearance procedures shortly.

It must also be emphasized that the commodities which the Department acquires and donates to schools as part of the assistance provided under the school lunch program must be produced domestically. This is because the Department acquires them to help stabilize the agricultural economy. In the wake of the strawberry situation to which you refer, the Department has intensified its procedures for ensuring the integrity of foods acquired for distribution to schools and other institutions.

Question. There is a lingering perception that food products from some countries might pose greater risks than those from others. For example, a March 1997 outbreak of hepatitis A among Michigan schoolchildren was linked to frozen strawberries purchased for the school lunch program that were grown in Mexico. How does FNCS handle foods purchased with non-federal dollars?

Answer. As you know, Federal reimbursement for school meals represents only part of the total funds in the school food service account. Other monies come from State reimbursement, meal charges paid by children who do not qualify for free meals and revenues generated by the sale of competitive foods. These non-federal funds are not subject to the "Buy American" provision of the law. However, other restrictions on the use of the food service account do apply. These restrictions are intended to ensure that the food service account is used to provide nutrition benefits to children.

PROGRAM AND FINANCIAL INTEGRITY

Question. The FNCS must ensure both the program and financial integrity of each program and the timely delivery of benefits to all qualified recipients.

Please provide a detailed list of program integrity studies.

Answer. A list of all 53 program integrity studies conducted by the agency in recent years is attached.

FOOD STAMP PROGRAM INTEGRITY STUDIES

FSP General General

Study of State Law Enforcement Agreements.—by Leo Allman, Systems Planning Associates, and Christopher Logan, Abt Associates, September 1996.

FSP Quality Control

Evaluating the Hunger Prevention Act Quality Control Reforms: A Report to Congress.—by Gregory Mills, Nancy Burstein, Margaret Hart, David Hoaglin, and Dorothy Rosenbaum, Abt Associates, September 1991.

Reforming the Negative Action Quality Control System: A Report to Congress by Jenny Genser and Steven Carlson, Office of Analysis and Evaluation, July 1990.

Redesign of the Negative Action Quality Control System in the Food Stamp Program: Final Report by Gregory Mills and David Hoaglin, Abt Associates, June 1990.

Treatment of Incomplete and Out-of-Scope Case Reviews in Food Stamp Quality Control by Morris Hansen and Benjamin Tepping, Westat, June 1989.

Stratification and Estimation in Food Stamp Quality Control by Morris Hansen and Benjamin Tepping, Westat, June 1989.

Evaluation of the Federal One-Tier Quality Control Pilot Project by Lee Bawden, Pamela Holcomb, Neal Jeffries, Wayne Vroman, and Douglas Wissoker, The Urban Institute, May 1989.

Redesign of the Negative Action Quality Control System in the Food Stamp Program: Feasibility Report by Gregory Mills, Mary Beth Sullivan, and David Hoaglin, Abt Associates, January 1989.

FSP Error Reduction

Evaluation of Grants to States for the Reduction of Payment Error in the Food Stamp Program by Cynthia Holmes, Mary Kay Sistik, and Robert Cook, KRA Corporation, September 1996.

Process Analysis as a Means to Error Reduction in the Food Stamp Program: Final Report and Project Summary by MAXIMUS, Inc., February 1993.

User's Guide: Contingency Model for Food Stamp Program Error Reduction by MAXIMUS, Inc., February 1993.

Error Reduction in the Food Stamp Program: Assessment of the Error Controls Profile and the Contingency Model by Linda Maxfield, Cindy Brach, Dean Conley, Kyle Conley, Deborah Chassman, and Ann Toch, MAXIMUS, Inc., February 1993.

The Relationship Between Overpayments and Underpayments in the Food Stamp Program: Updated Analysis by Gregory Mills, Abt Associates, August 1991.

The Effect of Caseload Characteristics and Socioeconomic Conditions on Food Stamp Payment Error Rates: State Level Analysis by Michael Puma, Abt Associates, February 1989.

Reducing Food Stamp Overpayments: More Frequent Recertifications and Monthly Reporting by Gregory Mills, Abt Associates, December 1988.

The Relationship Between Overpayments and Underpayments in the Food Stamp Program by Gregory Mills, Abt Associates, September 1988.

State-Initiated FNP Demonstration Project Assistance and Evaluation by Applied Management Sciences, August 1988 (3 volumes).

State Administrator's Quality Control Demonstration and Evaluation Handbook by Applied Management Sciences, August 1988.

FSP TRAFFICKING

Synthesis Report for the Food Stamp Participant Trafficking Study by Anne Ciemnecki, Lara Hulsey, James Ohls, Irving Piliavin, Mercer Sullivan, and Josh Rossol, Mathematica Policy Research, July 1998

The Extent of Trafficking in the Food Stamp Program by Theodore Macaluso, Office of Analysis and Evaluation, August 1995.

Food Stamp Program Integrity Methodological Feasibility Study by James Lubalin and Jenny Schnaier, Research Triangle Institute, March 1991.

FSP Verification and Matching

The Cost-Effectiveness of the Income and Eligibility Verification System in Arizona and Michigan by Nancy Fasciano and Sheena McConnell, Mathematica Policy Research, April 1995 (two volumes).

The Income and Eligibility Verification System Targeting Demonstrations: Findings and Guidelines for State Food Stamp IEVS Programs by Myles Maxfield and Susan Allin, Mathematica Policy Research, April 1995.

State Census of Income and Eligibility Verification System (IEVS) Procedures by Susan Allin, Mathematica Policy Research, March 1992.

Computer Matching: A Review of Exemplary State Practices by David Greenburg and Regina Yudd, The Urban Institute, November 1990.

State and Local Computer Matching Operations by Demetra Nightingale and Regina Yudd, The Urban Institute, November 1990.

Costs and Benefits of the National Disqualification Reporting Network by Mark Menne and William Hamilton, Abt Associates, November 1989.

Preventing Fraud and Abuse in the Food Stamp Program: The Use of Computer Assisted Verification of Applicant-Reported Information by Michael Puma, Abt Associates, January 1989.

FSP Claims Collection Claims Collection

Optimal Thresholds in the Collection of Food Stamp Program Claims by Myles Maxfield, Mathematica Policy Research, December 1995.

Claims Collection Tracking and Aging Systems by Linda Wray, Mathematica Policy Research, November 1990.

State and Local Claims Collection Operations by Sharon Long and Linda Wray, Mathematica Policy Research, (undated).

FSP Retailer Operations

Retailer Pre-Authorization Visit Demonstration: Final Summary Report by Christopher Logan, Julie Masker, John Blomquist, Abt Associates, March 1998.

Food Stamp Program Guidebook for FCS Store Visit Contractors by Abt Associates, September 1997.

Evaluation of Food Retailer Compliance Management Demonstrations in EBT-Ready States and Related Initiatives by Christopher Logan and Paul Elwood, Abt Associates, April 1997.

Food Stamp Coupon and WIC Voucher Management Practices and Program Educational Needs of Food Stamp Retailers by Richard Mantovani, Johnnie Daniel, Harry Liu, and Katy Hoffman, Macro International, December 1995.

Child Nutrition Programs Integrity Studies

Early Childhood and Child Care Study: Nutritional Assessment of the CACFP: Final Report Volume II, Abt Associates, Inc. July 1997

Private Nonprofit Sponsors in the Summer Food Service Program, Mathematica Policy Research, Inc., January 1994

National Study of the Adult Component of the Child and Adult Care Food Program (CACFP) Final Report—Volume I: Results, Volume II: Technical Appendices and Tables, Mathematica Policy Research, Inc. (not released until 3/94), October 1993

The School Nutrition Dietary Assessment Study: School Food Service, Meals Offered, and Dietary Intakes, Mathematica Policy Research, Inc., October 1993

Child Nutrition Program Operations Study—Second Year Report, Abt Associates Inc., June 1992

Review Systems for the National School Lunch Program, Office of Analysis and Evaluation, Food and Nutrition Service, March 1992

Child Nutrition Program Operations Study—First Year Report, Abt Associates Inc., August 1991

Study of Income Verification in the National School Lunch Program, Abt Associates Inc., February 1990

Federal Review Final Report, Office of Analysis and Evaluation, Food and Nutrition Service, February 1990

Study of the Child Care Food Program (CCFP), Abt Associates Inc., August 1988

An Evaluation of the Summer Food Service Program, Mathematica Policy Research, Inc., July 1988

WIC Vendor Management Systems and Practices, Professional Management Associates and the Office of Analysis and Evaluation, Food and Nutrition Service, December 1990

Question. The FNCS must ensure both the program and financial integrity of each program and the timely delivery of benefits to all qualified recipients.

In addition, describe what problems have been found and what solutions are being considered.

Answer. The studies have addressed a wide array of problems and solutions. Some selected examples include:

Eligibility Determination

FNS studies have documented best error reduction practices and made the information available to States. FNS studies have addressed eligibility verification practices and cost-effective thresholds for the collection of financial claims against food stamp recipients.

FNS research developed the most accurate annual State-level estimates of the number of persons in poverty. Annual State-level estimates of the number of persons eligible for the WIC Program are a critical component of the formula used to

allocate WIC funding to States. Prior to development of these estimates, FNS had to rely on information from the decennial census that was as much as 10 years out-of-date.

Timely Work Requirements

FNS studies supported faster implementation of new work requirements for able-bodied food stamp recipients. FNS' analyses have guided State identification of the target population, waiver decisions and disbursements of Employment and Training funds.

Nutritional Integrity

FNS research determined the nutrients provided to school children in school lunches and breakfasts. This information was the foundation for the recent, historic changes in the School Nutrition Programs. For the first time since the program began in 1946, school meals are now required to meet the standards for healthy meals. Data from the School Lunch and Breakfast Cost Study provided critical information to conduct a cost-benefit analysis of alternative menu planning options used in the School Meals Initiative for Healthy Children.

Vendor Management

FNS studies demonstrated the feasibility of reducing fraud by using private-sector firms to visit stores before they get Food Stamp authorization. The FNS evaluation identified specific procedures to encourage and avoid.

An FNS study generated the only data-based, National estimate of the prevalence of trafficking in the Food Stamp Program. FNS analyzed 11,000 undercover investigations of food stores to establish a baseline estimate of $815 million in trafficking—just under four cents of every benefit dollar issued—for fiscal year 1993. An update for the current period will be available later this year.

FNS studies have been used to uphold sanctions imposed upon food retailers engaging in fraudulent EBT transactions, as well as to develop systems to target store investigations effectively. One study resulted in a 45 percent improvement in targeting of investigations while freeing 35 staff years per year for more productive uses.

Administrative Efficiency

FNS studies supplied the foundation to develop and expand electronic benefit transfer (EBT). Agency studies proved the financial cost-effectiveness of EBT and continue to inform decisions on how to use EBT data to fight fraud, extend electronic service to farmers' markets, and balance cost with service.

FNS documented the Federal cost savings associated with participation in the WIC Program. FNS demonstrated that $1 dollar invested in prenatal WIC participation for very low-income women saves an average of $3 in Medicaid costs during the first 60 days after an infant's birth. FNS studies provided the ability to determine the adequacy of Federal meal subsidies for the National School Lunch and School Breakfast Programs. FNS determined that the combined Federal subsidy for free lunches and breakfasts covered the average cost of producing these meals, suggesting that the current reimbursement rates are appropriate.

FNS research was instrumental in determining the future of the Commodity Donation Program. FNS research provided the impetus for substantial improvements in the Commodity Donation Program, rather than abandoning the program in favor of alternatives such as Commodity Letter of Credit or Cash-in-lieu of Commodities. The efficiency of USDA purchasing and delivery systems was assessed along with the relative importance of USDA commodity donations to schools.

QUESTIONS SUBMITTED BY SENATOR BYRD

SCHOOL LUNCH/SCHOOL BREAKFAST PROGRAMS

Question. Chairman Cochran, Senator Kohl, and members of the Subcommittee, I am pleased to be here today to review the U.S. Department of Agriculture's (USDA) nutrition assistance programs, and the Food and Drug Administration's (FDA) programs.

The Food and Nutrition Service (FNS) administers the USDA food assistance programs. The programs administered by the FNS provide a federal safety net to ensure that Americans do not go hungry. While the programs under the FNS are all significant, today, I will limit my questions to FNS's National School Lunch Program.

First, I want to note that Ms. Martha C. Hill of Madison, West Virginia is serving as the National President of the American School Food Service Association, the professional association for persons actively engaged in the delivery of food service in schools. I am proud that Ms. Hill has earned this distinguished recognition, and I commend Ms. Hill for her many years of selfless and honorable dedication to betters the lives of countless young people. Ms. Hill and other school lunch providers in West Virginia are actively promoting the highest standards for school food service and nutrition programs, and she has worked to enhance learning and quality of life through nutrition programs in West Virginia and the nation. Secretary Watkins, please provide me with a report on your agency's impact on the school lunch and breakfast program in West Virginia.

Answer. West Virginia is one of our most progressive States in implementing policies and procedures to enhance the nutritional benefits of the National School Lunch Program (NSLP) and School Breakfast Program (SBP). The foundation for their success is strong State policies that complement Federal policy. Their policies have resulted in providing healthy school meals and improving student access to the programs. For example, all public schools must provide school breakfasts, unless they have been granted a waiver. However, they recognize that mandating a breakfast program is not enough to increase student participation. Adequate time to eat and student friendly customer services, such as their "grab and go" breakfast option and breakfast bars are important. Other factors in improving access to the lunch and breakfast programs have been computerized counting and claiming systems; a family billing system, which has reduced any social stigma associated with the programs; offering a variety of food; and using direct certification procedures.

The State's "Standards for School Nutrition" exceed the Federal requirements. In general, foods of minimal nutritional value cannot be sold or served during the school day and all other foods available must meet the Dietary Guidelines. Team Nutrition has significantly contributed to the success of promoting nutrition education. A high percentage of West Virginia schools have enrolled as Team Nutrition schools. Additionally, West Virginia has enhanced the programs' effectiveness with Team Nutrition Training grants, industry grants and grants from advocacy organizations. In 1998, West Virginia was recognized for their outstanding achievements in Child Nutrition by being awarded a Dan Glickman Pyramid of Excellence Award for School Nutrition Programs.

Question. Please provide me with a report on proposals that would enhance the FNS support to West Virginia school child nutrition policy.

Answer. Through the years, FNS has supported West Virginia child nutrition policy. To assist in West Virginia's comprehensive school health initiative, we worked with West Virginia to develop a multi-use free and reduced price application which would allow parents to request information about the State's Medicaid Program. That application became a model for other States.

We anticipate that West Virginia will benefit from the new afterschool snack reimbursement in the NSLP and Child and Adult Care Food Program (CACFP). Afterschool snacks are intended to give children a nutritional boost and draw them into supervised activities that are safe, fun and filled with learning opportunities. Snacks served in afterschool care programs under the NSLP in a school or in the attendance area of a school where at least 50 percent of the enrolled children are eligible for free or reduced price meals will be reimbursed at the free rate. These schools are "area eligible." Snacks served in afterschool care programs in schools that do not meet this criteria, that is, they are not area eligible, will be reimbursed at the free, reduced price and paid rate depending on the child's economic status. For the period July 1, 1998, through June 30, 1999, reimbursement is $0.5325 for free snacks, $02675 for reduced price snacks, and $0.04 for paid snacks. Additionally, Team Nutrition Training (TNT) grant projects have been and continue to be successful in promoting nutrition education. West Virginia received TNT grants in 1995, 1996, 1997, and they have applied for a 1999 grant. The 1999 grants have not yet been awarded.

SMALL FAMILY FARMERS IN APPALACHIA

Question. Mr. Secretary, I have become increasingly concerned about the plight of the small farmer of Appalachia. These farmers work hard on land most often held in the same family for generations, and I believe these farmers merit federal investment to ensure their future productivity, and more importantly, to preserve a heritage that I deem essential to this nation's moral fiber. There seems to be much talk about small family farmers, but I am dismayed at federal programs that define "small" to include ninety-five percent of all American farmers.

Therefore, (1) I would appreciate a report on the status of the small family farmer of Appalachia, including their numbers, and their chances of future survival. (2) I would also appreciate a report on any current plans that you might have for this important farming segment.

Answer. I share your concern for small farmers. In July, 1997, I appointed a National Commission on Small Farms to provide recommendations for improving the viability of small farms. This Commission recommended that small farms be defined as those farms with annual sales under $250,000. In the Appalachian region of Virginia, West Virginia, Kentucky, Tennessee, and North Carolina approximately 95 percent of the 290,000 farms are considered "small" farms.

Using USDA's 1997 Agricultural Resource Management Study, the Economic Research Service has described additional characteristics of farms in Appalachia which I will provide for the record. According to this report, approximately three-quarters of the farms are in a favorable financial position because they have a positive income and low debt. Only 2 percent have negative income and high debt which puts them in a vulnerable situation. Survival for these farms and the limited resource farms is the most problematic.

Our programs and plans for small farms, including those of Appalachia, reflect the recommendations of the National Commission on Small Farms The Commission's report, *A Time to Act*, released in January 1998, included 146 recommendations to improve USDA service to small and beginning farmers. Many of these recommendations have been implemented by USDA, including the establishment of the Office of Sustainable Development and Small Farms at USDA and the formation of the Council on Small Farms chaired by the Deputy Secretary.

The Department has also restructured responsibilities of the FSA county committees, forcefully addressed long-standing civil rights issues, and streamlined loan processing. Legislation has removed restrictions on subsequent lending to borrowers approved for debt restructuring. USDA has supported producer-friendly tobacco settlement proposals, and expanded small farm research, extension and cooperative development programs in response to commission recommendations. Small farm training and outreach programs throughout the Department have been strengthened. USDA has also supported mandatory price reporting and country-of-origin labeling for beef and lamb, and has reorganized GIPSA to protect producers from unfair trade practices.

The USDA budget for fiscal year 2000 includes $60 million for the Fund for Rural America, and proposes full funding for FSA direct ownership and operating loans, although at lower levels than appropriated with emergency funding in 1999. The budget also increases funding for the Sustainable Agriculture Research and Extension Program (SARE), the Appropriate Technology Transfer for Rural America program (ATTRA), Rural Cooperative Development Grants (RCDG), and outreach initiatives under the Section 2501 program.

Sustainable Agriculture Extension, Renewable Resources Extension, and CSREES 1862/1890 formula funding for small farm programs would continue at current levels. The CSREES small farm initiative proposed in the budget for 1999 is proposed again for funding in 2000, and an increase in small farm program funding is projected under the National Research Initiative.

Small farm marketing efforts are supported with continued funding for the Federal State Market Improvement Program (FSMIP), increased funding for the WIC Farmers Market Program, National Organic Standards, Wholesale Market Development, and strengthened livestock and poultry industry analysis. Small farm conservation initiatives include increased funding for the Stewardship Incentives Program (SIP). Further detail on the requests for additional funding can be found in the chart that is provided for the record.

[The information follows:]

DATA FROM USDA'S 1997 AGRICULTURAL RESOURCE MANAGEMENT STUDY

Almost two-thirds of Appalachian farmers either say that they are retired, but still farming, or that they have a major occupation other than farming. Households associated with these two groups depend on sources of income outside the farm. Another 13 percent are classified as limited resource farms. They have low farm sales, few assets and low household income. The Appalachian region has a higher proportion of these limited resource farms than most other regions.

On average, total farm operator household income in 1997 for the region was $48,485. This is comparable to the average U.S. household and reflects the off-farm income received by farm households. Net farm income for farms in the Appalachia region was about $10,000. Many farms, even the small ones, have multiple owners and this net income from farming is shared with those owners.

It is typical for farms to have financial losses in any given year, so the asset base that farmers have is very important. The average farm business in the Appalachia region had farm assets valued at $302,430 in 1997. Even the low sales farms where the operator lists farming as the principal occupation have substantial assets at $377,115. Farms in the region are not heavily leveraged as the average debt-to-asset ratio was 0.06.

The Economics Research Service has prepared the following table that summarizes the characteristics of Appalachian farms.

SELECTED CHARACTERISTICS OF FARMS IN THE APPALACHIA REGION, 1997

Item	Limited resource	Retirement	Residential/ lifestyle	Low sales/ Farming occupation	High sales/ Farming occupation	Large family	Very large family	Non-family [1]	All farms
Farms	37,177	51,860	132,473	50,736	10,027	5,006	3,177	.....	292,000
Percent of farms	12.7	17.8	45.4	17.4	3.4	1.7	1.1	.....	100.0
Gross cash income	$5,398	$11,975	$8,619	$26,573	$135,724	$271,713	$579,683	.....	$28,478
Total expenses	5,976	9,744	10,119	22,935	94,950	204,147	361,816	.....	23,160
Net cash income	−577	2,239	−1,499	3,637	41,774	67,566	217,867	.....	5,318
Net farm income	3,131	8,200	3,261	9,190	44,128	61,906	193,453	.....	10,404
Value of assets	76,317	263,212	263,306	377,115	570,043	795,846	1,220,030	.....	302,430
Liabilities	1,675	7,663	12,623	17,962	65,069	127,057	289,030	.....	18,774
Debt-to-asset ratio	0.02	0.03	0.05	0.05	0.11	0.16	0.24	.....	0.06
Financial position (percent):									
Favorable	79	91	72	76	78	73	60	.....	77
Marginal income	10	7	26	23	7	14	6	.....	20
Marginal solvency	1	2	.....	1	11	11	4	.....	2
Vulnerable	10	.....	1	.....	5	2	5	.....	2
Income from off-farm	9,600	32,425	61,207	44,649	21,848	25,106	43,168	.....	44,157
Total household income	$8,827	$33,571	$58,740	$56,847	$50,438	$66,042	$184,614	.....	$48,485

[1] The sample for non-family farms in the Appalachian region does not allow statistically reliable estimates. There are approximately 1,500 non-family farms. We do not collect household income for the operators of these farms.

[1] Includes Forestry Incentives Program, Forest Stewardship Program, and Stewardship Incentives Program.

QUESTIONS SUBMITTED BY SENATOR FEINSTEIN

CHILD AND ADULT CARE FOOD PROGRAM

Question. In March, the USDA Inspector General released his audit of California's Child and Adult Care Food Program (CACFP). The audit focuses on ten sponsors whom USDA already suspected of fraud. These sponsors receive over 20 percent of the total $150 million in CACFP funds that go to California, so USDA feels that the extensive fraud being committed by these sponsors is indicative of tremendous problems within the California Department of Education's program. How long have these problems been occurring in California, and why have they not been addressed before?

Answer. The Food and Nutrition Service (FNS) was aware that State and Federal program reviews had identified problems with program abuse and mismanagement by child care institutions and facilities. FNS requested that the Office of Inspector General (OIG) audit the Child and Adult Care Food Program (CACFP) in its efforts

to determine the adequacy of program financial and administrative controls. The findings of the OIG validated the concern expressed by FNS, that select institutions were negligent in their administration and operation of CACFP. After OIG performed extensive work at the local level, they began their review of the State of California's oversight of the CACFP. FNS was not aware of the full magnitude of the problems in California until OIG completed their work at the State level. It was at this time, that FNS became aware of the systemic nature of the problems.

Question. What steps does the Food and Nutrition Service plan to take to ensure that the State of California complies with the audit's recommendations to increase its oversight of high-risk sponsors, review all sponsor budgets, and improve coordination among the various units that administer the program?

Answer. FNS has increased its oversight of the CACFP in California and is working with the State agency to ensure there are sufficient training and organizational controls in place for the CACFP. Since the issuance of the first management alerts and subsequent individual audits of sponsors and the State agency, FNS has been working with the State agency to strengthen CACFP integrity. In early 1998, FNS began working with the State agency to prioritize its resources to those sponsors which fit a problem sponsor profile and has continued working with the State agency to identify high-risk sponsors. In January 1999, FNS participated with the Office of Inspector General and the State agency in training State agency staff on sponsor fiscal management practices and identifying high-risk sponsors. To improve the coordination among the various units that administer the program, the State agency reorganized its audit function and created an Integrity Committee composed of audit, review, administrative, and management staff to determine effective plans of action for individual sponsors, and coordinate and determine State agency actions needed to ensure sponsor integrity. FNS' efforts with the State agency are ongoing and will be aided by additional funding now available to FNS through appropriations that are specifically earmarked for its integrity initiatives.

Question. Will the Inspector General seek any monetary penalties against the State or against individual contractors?

Answer. FNS establishes overclaims based on audit findings, not the Office of Inspector General. Further, program regulations do not allow for monetary penalties to be assessed against the State or local program operators. However, where a determination is made that Federal funds were not spent in accordance with the regulations, States are required to establish monetary overclaims and pursue the recovery of funds from local program operators. FNS may impose fiscal action against the State for failure to take appropriate collection actions against local program operators. In California, the State agency has established and pursued claims against program operators identified by the Office of Inspector General.

Question. The audit also found that the Food and Nutrition Service's oversight of the California program has not been sufficient. What steps are you taking to improve that oversight?

Answer. In its continuing effort to improve program management, FNS has increased oversight of the State agency's administration of the CACFP. The FNS Western Regional Office (WRO) has been working extensively with the State agency to address the OIG's audit findings and focus attention, resources and actions on issues identified through the audit to help the State agency to prioritize its resources to those sponsors which fit a problem sponsor profile. The FNS-WRO has worked closely with OIG pertaining to the actions taken by the State agency to correct problems, and has participated with the OIG and the State agency in training State agency staff. In March 1999, FNS conducted an evaluation of the State agency's program operations for the purpose of determining program compliance as well as offering technical assistance to improve program operations.

A task force of State and Federal representatives provided assistance to FNS in the development of guidance materials for sponsoring organizations of family day care homes and centers as well as independent centers. CACFP standards for family day care home providers were published and distributed to State agencies in May 1997, and standards for independent and sponsored centers were published and distributed to State agencies in February 1998. These are comprehensive guides that address the local level operational problems that have been identified by the Inspector General. Additionally, FNS is currently developing a training program designed for all State agency staff directly involved in the administration of the CACFP. This National training initiative will occur at different locations around the country and will take place during the first half of fiscal year 2000. The purpose of the training will be to strengthen program management and will focus on institution budget and management plans, monitoring systems, internal controls and determinations of serious deficiencies. FNS' efforts with the State agency are ongoing and additional resources for this effort have been provided by specially appropriated funds to FNS.

FOOD STAMP CASELOAD REDUCTIONS

Question. In 1994, 27.5 million people were collecting food stamps. In 1998, that number dropped to 19.8 million, a 28 percent reduction in the caseload. This dramatic drop is not fully explained by the strong economy and low unemployment. The actual number of people in poverty has not fallen nearly as dramatically; 36.6 million Americans were living in poverty in 1997, compared with 38.1 million in 1994. Has USDA seen a pattern of states discouraging families from applying for food assistance?

Answer. USDA has not identified a pattern on a Nation-wide basis. We believe there is substantial compliance with our rules on access to food stamp benefits. However, we did detect instances of local departments implementing restrictive procedures in two urban areas. In each such instance, USDA reviewed the situation and is working closely with the State and Local agencies to assure that corrective measures are implemented.

Question. What actions is the agency taking to better publicize the food stamp program and ensure that all eligible families who want assistance are served?

Answer. When Secretary Glickman released the US Action Plan on Food Security on March 26, 1999, he announced a National campaign "to inform those who are unaware of their eligibility that there is help for struggling families to get proper nourishment while they regain their economic footing." The campaign was spurred by recent information indicating that participation is falling faster than can be explained by a strong economy alone. We are particularly concerned that working families, the elderly and households with immigrant members have information about their eligibility and access to the program.

FNS is currently finalizing our short-term and long-term strategies to meet the Secretary's goals. However, many activities are already underway. Some of the activities focus directly on our customers, that is eligible households who may not realize they are eligible for benefits. Other activities aim to enlist the assistance of our State partners, the welfare agencies that directly service recipients and the National, State and local organizations who work with or advocate for our customers. To ensure that eligible households have access to information, on April 9, 1999, we inaugurated a 1–800 number (1–800–221–5689). Persons who call are sent basic information on Food Stamp Program (FSP) eligibility and how to find their local welfare agency that can provide benefits if they are eligible. Information that has been available in hard copy and through the FNS web page will be updated to ensure that it both contains needed information and is customer-friendly. In addition to printed materials we will also use our web page to make material available for downloading and local reproduction by anyone providing program information services.

Since food stamp eligibility is determined by State and county welfare agencies, they and their cooperating community organizations are key to ensuring both that information on eligibility and how to apply is available and that welfare agencies and others make the application process user friendly. FNS is engaged in several efforts to encourage local activities to make sure that eligible families who want assistance are served. On January 29, 1999, FNS Administrator Sam Chambers wrote all State commissioners reminding them of application processing regulations and enlisting their assistance in making the FSP accessible to households that are leaving TANF for work but who remain eligible for food stamps. Our Regional administrators are talking to their States about this issue and the agency is supporting the efforts of community organizations who provide information and assistance to low income citizens. Secretary Glickman's Pyramid of Excellence Award for program operators offers an opportunity to showcase best practices in client services. FNS will be seeking out and awarding State and local agencies that provide excellent information and service and will be sharing with others the methods that have been successful.

FOOD STAMP RESTORATION FOR LEGAL IMMIGRANTS

Question. How many legal immigrants do you expect to become eligible for food stamps under the Administration's budget proposal?

Answer. We estimate that 15,000 legal immigrants will become eligible and choose to participate in the Food Stamp Program.

Question. Do you know how many of the newly eligible recipients live in California?

Answer. Prior to the enactment of welfare reform, nearly one third of legal immigrant food stamp recipients lived in California. Therefore, it is reasonable to suppose that roughly 5,000 new participants, representing one third of the 15,000 new participants Nationwide, will live in California.

Question. Does the Administration support further food stamp restorations for legal immigrants, such as the proposal in the Fairness for Legal Immigrants Act to restore food stamps to all legal immigrants who were in the country in 1996?

Answer. When the President signed welfare reform legislation in 1996, he stated that some provisions went too far. Legal immigrants, individuals who have entered the country legally and have played by the rules, were especially affected.

The Agricultural Research, Extension, and Education Reform Act, enacted in 1998, restored eligibility to the most vulnerable legal immigrants who were legally in the United States at the time welfare reform was enacted.

A substantial number of legal immigrants who were in the country as of August 22, 1996, have not had food stamp benefits restored. The Agricultural Research, Extension, and Education Reform Act was a "down payment", but did not help everyone. The Fairness for Legal Immigrants Act goes much further in restoring eligibility for all those legal immigrants residing in the country on August 22, 1996. However, given limited resources, the Administration budget focuses on restoring benefits to those that were here before August 22, 1996, but who joined the ranks of the elderly after that date.

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

Question. President Clinton has pledged full funding for WIC, but in California WIC administrators are being forced to cut 25,000 participants from the rolls this year due to inadequate funding and a 12 percent jump in the price of milk. How much of the requested increase in WIC funds will go to California, and how many more women and children will these funds serve?

Answer. In February, California did in fact instruct its local agencies to cut caseload levels, which would have resulted in a total caseload reduction of approximately 25,000. However, due to the State agency's recent efforts to control costs by reducing the maximum reimbursement amounts paid to WIC vendors for all foods except infant formula, California now estimates that the savings from this step should provide enough funds so that these caseload reductions will not be necessary.

We have not yet calculated State agency grants for fiscal year 2000, and therefore do not know the specific grant amount that would be allocated to California. If adequate funding is available, California will receive its prior year grant plus an amount for inflation. The number of additional participants that California will be able to serve in fiscal year 2000 will be dependent on their food costs. Currently, California's food costs are one of the highest Nationally for geographic State agencies; we will continue to offer technical guidance and support to the State on controlling food costs through various cost containment initiatives, including vendor management.

Question. Is the Administration considering any additional increases to the WIC program to offset the high cost of milk?

Answer. Fiscal year 1999 food cost estimates in the President's fiscal year 2000 budget were constructed to take into account the relatively high cost of milk projected for fiscal year 1999. The administration is not planning to request a supplemental appropriation for fiscal year 1999 due to the higher milk costs.

Question. The California WIC Association has raised serious concerns regarding the Food and Nutrition Service's proposed funding formulas rule. Among other issues, California is concerned that the salary component of funding allocations may be reduced; that proposed food inflation adjustments will not be sufficient; and that USDA is not appropriately calculating estimates of WIC eligibility in the State. What steps are you taking to address these concerns in the rulemaking process.

Answer. A large number of comments were received on this issue from a variety of sources. The Department will give careful consideration to all comments in the development of the final rule.

QUESTIONS SUBMITTED BY SENATOR KOHL

CHILD NUTRITION—SODA IN SCHOOLS

Question. As I mentioned in my opening statement, I am concerned about the dietary habits of many Americans, especially our youth. I am aware that soft drinks are becoming the beverage of choice for many young people, which concerns me greatly. In fact, I wrote a letter to Secretary Glickman last month regarding this trend and the role USDA should be playing in promoting a healthy diet for our young. Would you please comment on this trend and provide your thoughts on how

best to encourage our young people to consume more healthy beverages, such as milk, rather than soda pop?

Answer. We in the Department of Agriculture share your concern that consumption of soft drinks appears to be increasing in our schools. As you know, the Department's regulations for both the National School Lunch Program (NSLP) and the School Breakfast Program (SBP) prohibit the sale of foods of minimal nutritional value, including carbonated beverages, in the food service area during meal periods. However, as a result of court rulings, they may be given away as long as the food service account is not used to purchase them, and they may be sold elsewhere in the school. And of course, children may select whatever foods they wish when they are outside the school.

Since children have so many opportunities to select foods both inside and outside the school, there needs to be a three-way partnership to teach children to make sound food choices. First, the school meal programs need to provide children with a model of what an appealing and healthy diet can be. To this end, the Department continues to take an aggressive approach to ensuring that school meals meet nutrition standards, and we are providing State and local food service professionals with technical assistance to help them serve foods that provide the basic nutrients children need to grow and be healthy. The second partner is the education community. As I noted, other foods are available in the school, and we are working with our counterparts in the S. Department of Education to make State and local school officials aware of these nutrition issues so that they can lend their support to our efforts. The third and most important partner is the family. For our efforts to be successful, the family needs to be involved in helping children to learn the lesson of healthy eating. So much of what children learn in this area they learn at home, and we are working to help parents recognize the importance of balanced meals for health and well being.

Question. What role could USDA Child Nutrition programs have in this context?

Answer. We have a pivotal role in this undertaking. First, we need to provide a model food program, and this means helping our local food service professionals plan and prepare meals that contain nutritious foods. Just as important, we are working with our partners at the U. S. Department of Education and we are developing and distributing technical assistance materials for school administrators so that we can make the larger education community aware of the competition that foods of minimal nutritional value create for the reimbursable school lunch and breakfast. Finally, through Team Nutrition, we are developing and distributing materials designed to educate children, their parents and the community at large about the importance of sound nutrition and the necessity for children to eat balanced meals. As part of this overall undertaking, the Department is sponsoring a forum in June to discuss the role of school environments in promoting healthy eating behaviors in children. This forum will include experts in nutrition, health, education fields, advocates, political leaders and federal officials; and one of the prime objectives will be to explore ways that public and private groups can work together to reshape the social, educational and physical environment of schools to support dietary behaviors that contribute to a better quality of life for future generations.

CHILD AND ADULT CARE FOOD PROGRAM—WELFARE CHANGES

Question. The Child and Adult Care food program was established to make sure free or reduced cost nutritious meals are available to children and adults in day care settings—whether they be family day cares or day care centers. I believe that this program is essential in getting good food to those who need it most—the young and the vulnerable. The program also serves to increase the quality of child care since participation in it requires far more frequent inspections than required by Federal or most State laws.

However, I have heard some complaints that the 1996 welfare law changes to this program set up a complicated new reimbursement system—especially for family day cares—that has led to more paperwork than food provision. I also know that at least 12 states are not participating in this program at all because of an outdated provision that dictates to them what mix of Federal pools of money they must use in order to be eligible for the Child and Adult Care Food Program (CACFP). These are problems that need to be fixed by the authorizing committee, I understand, but I would like to know from you today: What can you do under current law to lend technical assistance to states and CACFP sponsors to make sure we maximize the number of young children receiving healthy meals under this program?

Answer. In reference to the two-tier reimbursement structure, from the beginning of the implementation process, the Food and Nutrition Service (FNS) has been very aware of the need for technical assistance. For this reason, the agency made it a

high priority to provide training on the new system to all State and Regional staff in January and February of 1997, well in advance of the July 1, 1997, implementation date. It is our understanding that all State agencies held similar training sessions for their sponsoring organizations in the spring of 1997. In addition, Under Secretary Watkins and agency staff made presentations on the two-tiered reimbursement system at several National and Regional conferences, including Save the Children/The Sponsor's Forum, the Sponsor's Association, and the California Roundtable—comprised of regional, State, and local program operators and advocacy organizations.

With regard to States' pooling of subsidies for low-income child care, which affects the ability of for-profit centers to participate in CACFP, you are correct in noting that this is a feature of the National School Lunch Act. The law requires that at least 25 percent of a for-profit center's enrollment or licensed capacity be supported by Title XX funds. This requirement provides a basis for determining that a for-profit center is actually serving a substantial percentage of low-income children.

However, since the advent of the Child Care Development Block Grant (CCDBG) in 1990, Title XX is no longer the primary source of Federal subsidies for low-income child care. In order to counter the diminishing Title XX funds used in child care, many States have, after discussion with USDA, included their reduced Title XX funds in a funding pool along with other subsidies such as the CCDBG. As you note, thirteen States currently have no for-profit participation in CACFP because they have not used Title XX funds to subsidize child care; other States have very low levels of for-profit participation because they do not pool Title XX child care funds with other sources of Federal support for low-income child care.

To ensure that States are aware of the acceptability and advantages of pooling, the Department plans to reissue guidance on pooling to all State CACFP directors in the near future.

MEALS IN AFTER SCHOOL CENTERS

Question. The Child Nutrition Act reauthorization provides snacks for participants in certain after school centers and full meals to children under 12. This is becoming more vital as we see more and more children in—or in need of—after school and off-hour evening programs while their parents work. Has USDA given any thought to the effects of expanding the full meal allowance to all children as a way to improve educational performance and to encourage children ages 12 to 17 to participate in after-school programs—programs that have proved successful in keeping these older kids safe and away from criminal activity?

Answer. The National School Lunch Act as amended by the William F. Goodling Child Nutrition Reauthorization Act of 1998, made provisions for snacks to be provided to children in afterschool programs designed to meet the needs of the at-risk population through the age of 18. The snacks would be provided to children in structured after-school activities through the National School Lunch Program (NSLP) and the Child and Adult Care Program (CACFP). FNS has also been working together with the Department of Education on a variety of programs geared to meet the needs of children in after-school programs. Under Secretary Watkins and a number of other agency officials have participated in a number of after-school rollout events across the country, and we hope to see many more.

While the law authorizes only a snack in the at-risk component of NSLP and CACFP, we believe this to be a good start. The snack will greatly assist schools and non-profit organizations in keeping the interest of these adolescents through a structured activity coupled with the nutritious snack. Although we do not provide reimbursement for a full meal served in at-risk programs, we do encourage after-school care programs to provide more food to older children to meet their increased nutritional needs. This being said, we believe an expansion of the snack program to a full meal would greatly increase program costs. At this time, the effectiveness of providing snacks for afterschool programs needs to be evaluated before further changes should be considered so that any additional adjustments to the program can be better focused.

WIC IMMUNIZATION

Question. The WIC Program has long been one of the most popular and successful programs in the federal government. In addition to the direct nutritional benefits, there are other long-term health benefits from WIC program features such as the WIC Immunization program.

Could you please summarize the status of the WIC-related programs and provide your views on the value of their long-term benefits?

Answer. The WIC Program recently celebrated its 25th Anniversary. Since the Program's inception in 1972, population-based research has increasingly demonstrated the importance of the kinds of supplementation, education, and referral services the program provides to both short-and long-term educational and health outcomes.

Research studies have provided a substantial body of evidence concerning WIC's effects on birth outcomes, health care costs, diet and diet-related outcomes, infant feeding practices, immunization rates, and cognitive development.

Birth Outcomes and Health Care Costs

Infants who are born premature or at low birth weight account for a disproportionate share of health care costs, but studies suggest that the WIC Program has been playing an important role in improving birth outcomes and containing costs.

A series of reports published since 1990 have found that pregnant women who participate in WIC during their pregnancies have significantly longer pregnancies, fewer premature births, a lower incidence of moderately low and very low birthweight, fewer infant deaths, and a greater likelihood of receiving prenatal care relative to similarly low-income women who do not participate in WIC. Associated with these improvements in birth outcomes were significant savings in health care costs.

The 1990 WIC Medicaid Study found that prenatal participation in WIC by low-income women was associated with savings of $1.77 and $3.13 in Medicaid costs in the first 60 days postpartum for each dollar spent on WIC.

A more recent study (WIC: Analysis of the 1988 National Maternal and Infant Health Survey, 1995) found similar relationships among WIC participation and birth outcomes in a Nationally representative sample of WIC participants, suggesting that the positive effects of WIC are not limited to the most disadvantaged segments of the low-income population

Diet and Diet-Related Outcomes

The WIC Program provides participants with a supplemental food package high in nutrients that are critical to periods of rapid growth and development such as pregnancy and early childhood, and which are also important during postpartum recovery and lactation.

The National WIC Evaluation found that children participating in WIC had higher mean intakes of iron, vitamin C, thiamin, niacin and vitamin B6, without an increase in food energy intake, indicating an increase in the nutrient density of the diet.

Other studies have documented reductions in iron deficiency anemia associated with WIC, and an increase in fruit and vegetable consumption among WIC participants who received Farmers' Market coupons through WIC.

Infant Feeding Practices

The American Academy of Pediatrics currently recommends that infants be fed breastmilk or an iron-fortified infant formula from birth to 12 months of age, and that other foods not be introduced until the infant is four to six months of age. Introduction of cow's milk in the first year of life is associated with intestinal bleeding, anemia, and allergies.

Two FNS studies to date (WIC Breastfeeding Report, 1992 and WIC Infant Feeding Practices Study, 1997) have found that overall rates of breastfeeding initiation among WIC participants are below Healthy People 2000 and 2010 goals, consistent with their more disadvantaged socioeconomic status. However, both studies found that those who receive breastfeeding advice and support from WIC are more likely to breastfeed than similarly low-income women who do not receive such advice and support.

WIC also increases the likelihood of appropriate feeding among non-breastfeeding women. The National WIC Evaluation found that WIC infants were significantly more likely to be fed infant formula than controls. They were also significantly less likely to be fed whole cow's milk in the first year of life. More recent data from the 1988 National Maternal and Infant Health Survey also found that WIC infants were less likely to be fed cow's milk than eligible non participants. The WIC Infant Feeding Practices Study (1997) found that early introduction of cow's milk is not a common problem among WIC mothers. It also found that women who received infant feeding advice from WIC were less likely than others to introduce cereal into their infants' diets inappropriately early.

Immunization Rates and Regular Source of Medical Care

Over the last several decades, vaccines have significantly reduced the number of people contracting life-threatening illnesses such as typhoid, measles, and polio. However, immunization rates are lower among low-income individuals. A regular

schedule of immunizations is prescribed for children from birth to two years of age, which coincides with the period in which many low-income children participate in WIC.

The National WIC Evaluation found significantly improved rates of childhood immunization and of having a regular source of medical care associated with WIC participation. Since then, emphasis on immunization status assessment, education, and referral have increased.

Cognitive Development

Cognitive development influences school achievement and behavior.

The National WIC Evaluation found that by ages 4 to 5 years, children enrolled in WIC prenatally had better vocabulary scores, and children enrolled in WIC after the first year of life had significantly better memory for numbers.

In summary, the evidence indicates that WIC facilitates the receipt of timely and appropriate immunizations and prenatal care, assists in the development of healthy eating habits for pregnancy and for life, prevents poor birth outcomes, and reduces anemia and other dietary problems. In doing so, WIC prevents problems that are known to hinder early learning and long-term educational outcomes. It may also play an early role in the prevention and management of debilitating conditions such as cancer and heart disease that often strike adults in later years, and which have been increasingly linked to diet.

FOOD STAMP PROGRAM—EFFECTS OF WELFARE REFORM

Question. We see in USDA's budget materials that Food Stamp participation is falling while requests for the WIC program continue to climb. How do you account for the fall in one program and an increase in the other?

Answer. The Food Stamp Program is an entitlement program designed to respond to changing needs during times of economic expansion and contraction. Legislative changes in eligibility criteria affect participation levels from one year to another, and people who are eligible for food stamps must also choose to apply for them.

Food stamp participation has fallen dramatically, by 9.7 million persons between March 1994, the peak, and February 1999, the latest data we have. Part of this drop can be explained by the strength of the economy and the success of welfare reform, which has helped to move families from welfare to work. Part of the drop is due to new restrictions on the participation of legal immigrants and able-bodied unemployed adults without dependent children.

But other factors may also be at work. Between 1995 and 1997, food stamp participation fell five times as fast as poverty, a sign that the nutritional needs of some low-income people may be going unmet. The number of people in poverty fell by 850,000 over this period while the number of food stamp participants fell by 4.4 million, suggesting that many poor families have left the program despite their continuing eligibility.

Unlike the Food Stamp Program, participation in the Special Supplemental Nutrition Program for Women, Infants and Children (WIC) increased from 6.5 million in fiscal year 1994 to 7.4 million in fiscal year 1998. WIC serves a different population, with families with incomes of up to 185 percent of the poverty line eligible.

As the economy has improved in recent years, the number of persons estimated to be eligible for WIC has declined somewhat. Yet, there are still many unserved eligible mothers, infants and children. Our best estimates indicate that current participation is more than 1 million persons below the number eligible to participate.

Question. To what extent are these changes results of Welfare Reform?

Answer. From 1994 to 1997, over 800,000 legal permanent residents and 500,000 ABAWDS left the food stamp roles. The numbers, however, do not reflect the impact of immigrant restorations and new Employment and Training funds in Agriculture Research. To the best of our knowledge, no one has yet been able to determine what percent of the drop in food stamp participation is attributable directly to the success of welfare reform in moving people from welfare to work. In January 1998, the Congressional Budget Office observed that the rapid decline in food stamp caseload was something of a mystery. The same can be said today. While several contributing factors are easily identified, including the success of welfare-to-work efforts, the relative importance of these factors has so far resisted quantification.

Question. What special management and/or budgetary problems is USDA experiencing in the administration of the Food Stamp, WIC, and other programs as a result of Welfare Reform?

Answer. In addition to the direct impact of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA) on the Food Stamp Program (FSP), there are a number of management issues that resulted from the Act's elimi-

nation of the Aid to Families with Dependent Children (AFDC) program, and the creation of the Temporary Assistance to Needy Families (TANF) program:

—*Ensuring FSP Access*.—Since passage of PRWORA, Food Stamp caseloads have fallen more quickly than can be explained fully by the changes in eligibility rules, the strength of the economy and the success of welfare reform. The drop in FSP participation, which significantly exceeds the decline in the poverty rate, suggests that many poor families have left the program despite their continuing eligibility. Problems related to the transition to TANF may be a factor; the TANF emphasis on moving people off cash assistance may have inadvertently reduced Food Stamp Program participation. Some families who leave TANF for work may not be aware that they still may be eligible for food stamps; however, we did detect limited instances of local departments implementing restrictive procedures in two urban areas. In each such instance, USDA worked closely with the State and local agencies involved to review the situation and to assure that corrective measures were implemented.

—*Administrative Cost Offset*.—Soon after passage of PRWORA, Congress recognized that States might charge the FSP for administrative costs that were previously paid by AFDC and grandfathered into the TANF grant amount. As a result, Congress enacted an administrative offset provision to prevent "double payment" of these costs by the Federal government. For fiscal years 1999 through 2002, FNS will reduce Federal amounts otherwise paid to States for administrative costs of the FSP by amounts HHS determined were grandfathered into the TANF grant. The agency began implementing this provision on April 1,1999.

—*FSP/TANF Conformity*.—FNS finds increasing interest from States to make FSP rules conform to TANF rules—which vary from State to State—or to make FSP rules support TANF work philosophy. In certain cases, States have been given the opportunity to do so. For example, States can conform some of their sanction policies to match TANF sanctions; 7 States have decided to reduce FSP benefits for non-compliance with TANF rules. While this option gives States additional flexibility, it also adds to administrative complexity and burden at the Federal level. Many conforming changes proposed by States increase Federal costs, or adversely effect household eligibility.

—*Quality Control*.—One important FSP/TANF conformity issue is quality control. Under TANF, States are no longer required to administer a quality control system to measure benefit accuracy; in addition, TANF requires new measures of State performance. States have expressed concerns about operating quality control for the food stamps alone, and have suggested that FNS consider new performance measures that are integrated with the TANF requirements for new measurement systems.

—*Public Charge Issues*.—Implementation of welfare reform legislation has raised questions about whether non-citizens who participate in Food Stamps, Child Nutrition and WIC programs are "public charges"—non-citizens who must rely on the U.S. government for support. Public charge status potentially can result in deportation, denial of entry into the United States, or denial of changes in alien status.

Working with the Immigration and Naturalization Service (INS), FNS has determined and communicated to State program cooperators that participation in Food Stamps, Child Nutrition and WIC programs does not render a non-citizen a public charge. This FNS policy is based on interim guidance from the INS, which is in the process of issuing more formal guidance. However, it is evident that Federal and State governments must continue to work to communicate and educate at local grassroots levels to assure that civil law groups, program operators, advocates, universities, and participants themselves all fully understand that alien status has no bearing on eligibility for Food Stamps, Child Nutrition or WIC programs, and that such participation does not constitute a public charge issue.

—*Indian Tribal Issues*.—TANF permits Indian tribes to directly administer TANF. Tribes are beginning to administer TANF and as a result FNS is seeing more interest from tribes in the administration of the FSP as well. FNS is considering how to respond to this interest, given that the Food Stamp Act allows tribal administration of the FSP only if States cannot administer the program.

Question. Currently, the State of Wisconsin is requesting you to exercise waiver authority provided by Welfare Reform that would allow the state to privatize certain elements of the Food Stamp program? What is the status of this request?

Answer. The State of Wisconsin submitted its waiver on August 5, 1998. On October 5, 1998, FNS requested clarification from the State about a number of program, finance, and technology issues. Our letter also requested clarification about how the State would evaluate the demonstration project. The State's initial request did not

include a research design describing how the demonstration would be evaluated. At the State's request, we have participated in several conference calls to assist the State in its development of a research design. The State submitted its research design on March 1, 1999. We are in the final stages of reviewing the waiver and will be providing the State with a final answer soon.

Question. Have similar waivers for other states been granted? Why or why not?

Answer. FNS has not approved any waiver allowing a State to privatize the Food Stamp Program's certification and eligibility determination process. One demonstration waiver request from the State of Arizona was denied December, 1998, because FNS determined the State's request did not ensure program access for food stamp applicants and recipients. More specifically, the request did not provide adequate justification to waive the requirement for the use of merit employees (public) in the certification process that results in the final determination of program eligibility. FNS can waive Food Stamp Act requirements to test alternative methods that would further improve administration and meet the nutrition assistance goals of the Food Stamp Program.

To date, FNS has denied one waiver request (Arizona) and is in the process of reviewing a demonstration waiver request from the State of Wisconsin. The State of Florida submitted a demonstration waiver request to FNS January, 1998. FNS is waiting for a response to our request for clarification on a number of issues. Finally, the State of Texas sought to privatize the Food Stamp Program's certification process Statewide. The State of Texas was not seeking a demonstration waiver request. The Administration advised the State that the Food Stamp (and Medicaid) certification process must, by law, be conducted by public employees. Question. The Washington Post reported last month that welfare reform has resulted in a certain "chilling effect" among certain parts of our population, especially immigrants who are eligible for benefits, as a reason for the decline in program utilization.

Question. Is that the case with the Food Stamp Program?

Answer. Restrictions on participation by legal immigrants may have deterred participation by their children, many of whom retained eligibility for food stamps. Between September 1996 and September 1997, participation among U.S.-born children living with their legal immigrant parents fell significantly faster than participation among children living with native-born parents. During this period, the number of participating U.S.-born children living with legal immigrants fell by 37 percent, versus 15 percent of children living with native-born parents. The source of data for this is the Food Stamp Program Quality Control data.

STUDIES AND EVALUATIONS

Question. For the past couple of years, the Studies and Evaluation functions of the Food and Nutrition Service have been placed with the Economic Research Service. Is there proper coordination between the nutrition programs and other USDA agencies regarding information?

Answer. The Food and Nutrition Service and the Economic Research Service (ERS) have made a good faith effort to create a practical study agenda that responds to the operational needs of the Nutrition Assistance Programs. This effort helped shape some of ERS' funding decisions and resulted in an agreement between the two agencies that allows FNS to pursue some of our operational study priorities with ERS funding support. However, because the agencies have fundamentally different research goals and methods, the agency firmly believes that effective program management can best be supported by locating the studies and evaluation functions within FNS. This will ensure tat important policy issues in FNS programs are addressed in the agenda.

Effective program management requires a strong study and evaluation function that is sensitive and responsive to emerging policy issues and the needs of program operators. This is best achieved by maintaining such a function within the agency responsible for Federal Nutrition Assistance Programs. While both FNS and ERS have important roles to play in developing research that supports the FNCS mission, managing the right kind of applied studies and evaluations requires the program expertise, sensitivity to evolving policy issues, and relationships with multiple stakeholders that can only be developed and sustained within FNS.

Question. Secretary Watkins, would you like to comment on reasons for which these activities should be returned to the Food and Nutrition Service?

Answer. In a nutshell, I firmly believe that effective program management requires a strong study and evaluation function that is sensitive and responsive to emerging policy issues and the needs of program operators. This is best achieved by maintaining the study and evaluation function within the agency responsible for critical Nutrition Assistance Programs.

Restoration of FNS study and evaluation funding is critical to the effective management, administration, and oversight of Federal Nutrition Assistance Programs. Lawmakers, Federal and State policymakers and program operators need access to high-quality, practical research findings grounded in the experience of program operators. Managing the right kind of applied studies and evaluations requires the program expertise, sensitivity to evolving policy issues, and relationships with multiple stakeholders that can only be developed and sustained within FNS.

The ability to establish and carry-out the study agenda is an essential tool in managing the nutrition programs under my jurisdiction. The importance of effective strategic planning for results requires timely data and analysis. Under the current arrangements, the research foundation for strategic planning, problem definition, policy change and innovation rests in another mission area within USDA. This division between research and program operations has made management of program improvements and ongoing operations significantly more difficult.

NUTRITION, EDUCATION AND TRAINING PROGRAM (NET)

Question. One of the things that the Child Nutrition Act reauthorization did not do last year was to return the Nutrition, Education, and Training (NET) program as a mandatory item. Consequently, no funding was provided for NET in fiscal year 1999. Please describe the effect this lack of funding has had on the administration of feeding programs this year.

Answer. Because there has generally been no funding for NET activities this year, the traditional support that NET has provided to the programs has been unavailable. While we do not have conclusive data, the information available to us suggests that training and technical assistance efforts have been greatly diminished due to the lack of funding, and if funding is not restored as soon as possible, the positive impact of NET will cease to exist and the infrastructure that has taken years to build will dissipate. For these reasons, it is vitally important that the program receive the minimal funding requested in the President's budget and that a solution to permanent funding for NET be found.

Question. Please explain the primary reasons this funding should be restored.

Answer. NET performs an extremely valuable service to the Child Nutrition Programs by providing a link at the State level for Federal training and technical assistance efforts. Moreover, NET enables States to tailor materials and assistance specifically to the needs of their local operators. Finally, by making grants available to local operators, NET is able to support creative initiatives at the local level for a modest investment. In short, NET provides a significant complement to other programs, such as Team Nutrition, which are intended to help local professionals plan and prepare meals which are both nutritious and appealing.

Question. I have noted from time to time, public announcements in various locations that up to 25 percent of the areas children go to bed hungry every night. These announcements are usually associated with appeals for contributions to food banks or some other form of food assistance outlet. Still, given the level of assistance provided through USDA and other federal, state, local, and charitable organizations. I am struck by what seems a very high percentage of children in the United States living in this condition. Please provide information relating to the status of hunger in the United States, especially among the young, elderly, and other vulnerable populations and the level to which USDA programs are meeting those needs.

Answer. Despite America's ability to produce more food than it can consume, food insecurity and hunger still exists. In September 1997, on the occasion of the first National Summit on Food Recovery and Gleaning, we released the results of USDA's comprehensive effort to measure the extent of hunger as commonly understood by most Americans. Our estimates are based on the pattern of responses among about 45,000 households in a supplement to the Current Population Survey (a Nationally representative sample selected and interviewed by the Bureau of the Census).

The results tell us that hunger existed among persons in 4.2 million households, about 4.1 percent of all households, at some time during the year ending in April 1995. Not all households are equally likely to experience hunger. A larger proportion of households with children (5.3 percent) and a smaller proportion of households with elderly (1.9 percent) experienced hunger. Black and Hispanic households with children were about twice as likely to experience hunger as their White counterparts. Households headed by single women were four times more likely to experience hunger than households headed by married couples. And the chance of experiencing hunger increased as income fell.

The Nation's Nutrition Assistance Programs—food stamps, school meals, WIC—are in the front lines of the fight to end hunger and improve nutrition. More than

18 million people receive food stamps, over 26 million receive a school lunch, and over 7 million women, infants, and children receive supplemental foods. But everyone can and should play a role. Earlier this year, Secretary Glickman unveiled his Community Food Security Initiative to create partnerships that will help communities help themselves, to work at the grass roots to weed out hunger.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

FOOD AND DRUG ADMINISTRATION

STATEMENT OF JANE E. HENNEY, M.D., COMMISSIONER

ACCOMPANIED BY:

MICHAEL A. FRIEDMAN, M.D., DEPUTY COMMISSIONER FOR OPERATIONS

ROBERT J. BYRD, DEPUTY COMMISSIONER FOR MANAGEMENT AND SYSTEMS, CHIEF FINANCIAL OFFICER

DENNIS P. WILLIAMS, DEPUTY ASSISTANT SECRETARY FOR BUDGET, DEPARTMENT OF HEALTH AND HUMAN SERVICES

OPENING REMARKS

Senator COCHRAN. Our next panel this morning is from the Food and Drug Administration. We're pleased to welcome the Commissioner, Dr. Jane Henney. Also with the Commissioner, we have Dennis Williams, Deputy Assistant Secretary for Budget of the Department of Health and Human Services; Dr. Michael A. Friedman, Deputy Commissioner for Operations; and Robert J. Byrd, Deputy Commissioner for Management and Systems, and FDA's Chief Financial Officer.

Earlier this year, the committee held a food safety hearing at which Dr. Henney and others appeared to help us consider the budget request as it related to food safety initiatives and our effort to make sure that a healthy wholesome food supply continues to be available to America's consumers.

FDA has a very important role to play in that, and important statutory responsibilities, along with the Department of Agriculture and other agencies. So, we had that hearing already. Today's hearing will look at other obligations and activities of the FDA that are funded in this budget request.

We're aware of a lot of the initiatives of this agency. Its responsibility extends from medical devices to animal drugs to blood products. Not only does it regulate these domestic products, but it also has the responsibility of monitoring imports of these same products to ensure their safety and effectiveness for the public's use and consumption.

Dr. Henney, welcome. We ask you to make whatever comments and description of the budget request that you think will be helpful to our committee. Thank you very much.

Dr. HENNEY. Mr. Chairman, members of the committee, I am truly honored to address you as the Commissioner of Food and Drugs. It's a privilege today to present the agency's plans and expectations as reflected in the administration's proposed budget for fiscal year 2000.

I would also like to take this opportunity to share with you my thoughts on where I hope to lead the Food and Drug Administra-

tion, both the tasks that I believe are most urgently demanding the agency's attention and perhaps as important, my approach to these tasks which emphasizes a commitment to heighten effectiveness and an openness to our constituencies.

Many of the things that I remembered about FDA's dedication to the health and safety of Americans have not changed since I left the agency several years ago but I am reminded on nearly a daily basis how much has changed since I was last here.

The FDA Modernization Act, the administration's reinventing government initiatives and the Prescription Drug User Fee Act have triggered significant changes in many of the agency's processes and outcomes.

One of the most important changes that has followed the FDA Modernization Act is a renewed commitment to listen and learn from those affected by FDA regulations—consumers, patients and the industry. I firmly believe that we must seek out and listen to the views of all.

My early focus has also been on an issue within the agency. As I promised in my confirmation testimony, I have conducted a reorganization study of the office of the commissioner. And, as a result, I have realigned certain functions within the commissioner's office and moved other functions to the centers.

The steps I am taking will reduce the size of the office of commissioner by approximately 12 percent while moving those resources closer to where the programmatic work of the agency is most appropriately conducted.

However, I am here today to request your support for a substantial increase in FDA's budget, indeed, the largest requested increase in the agency's history.

This request is intended to allow us to begin to rebuild our capabilities, to strengthen our science base, the foundation of sound regulatory decisions, and to continue several long-range high priority programs that are vital for the protection of the public health.

As large as this budget request is, it provides only the first steps toward rebuilding an effective agency able to carry out its basic responsibilities and to respond to emerging public health problems.

Among those priorities, number one, is the full implementation of the FDA Modernization Act. I am committed to the full and effective implementation of this law both in its letter and spirit. Recognizing the priority that Congress gave to enactment of the FDA Modernization Act, the FDA has devoted unprecedented resources to implementing the new statute within the timeframe set forth in the Act.

The agency has completed over 80 FDA modernization actions and has met nearly all of its statutory deadlines at the same time continuing to perform the other important tasks that the American people have come to expect from us.

As directed by the Act, FDA has undertaken a comprehensive analysis of what needs to be done to meet the agency's statutory obligation. FDA has identified three programmatic areas that must be addressed beginning with the fiscal year 2000 budget in order to meet statutory obligations and to provide the level of public health protection expected by American consumers.

These three areas are injury reporting, product safety assurance and pre-market application review.

With respect to injury reporting, at present no integrated system for the reporting, monitoring and evaluation of all FDA regulated product related injuries currently exists. Therefore, the administration is requesting a total of $15.3 million to begin critically needed improvements to the FDA injury reporting system.

With respect to product safety assurance, FDA is responsible for monitoring the safety and quality of a rapidly growing number of increasingly complex products from domestic and foreign sources.

FDA's ability to meet this responsibility through inspections and enforcement actions even in conjunction with its state partners has significantly declined. The agency is, therefore, requesting $52.2 million in fiscal year 2000 to increase its inspectional and enforcement capabilities.

Third, pre-market application review. Although FDA product review times in programs benefiting from user fees have shown dramatic improvements, other categories of product reviews for which we did not receive user fees continue to suffer from unacceptably long review times.

While we will continue to undertake management initiatives to attempt to meet these deadlines, the administration is asking for $28 million in both new appropriated funds and new added user fees to improve review times for food additive petition reviews, food contact substantive reviews and the more complex of the medical device reviews.

A second area of major priority for the agency is to strengthen the science base of the agency. I believe this is an urgent issue. The increasing investments made in both basic and applied research by the National Institutes of Health and the pharmaceutical, biotech and medical device industries will result in a burgeoning growth of new products.

FDA must have the scientific sophistication necessary to understand and adequately and properly evaluate these products.

With respect to a third area of high priority, as you have already mentioned, Mr. Chairman, I did appear before this committee on March 16th to address food safety issues.

The agency did receive additional appropriations for food safety in fiscal year 1998 and 1999 and it has used these funds to lay a solid foundation for improving our food safety programs. Our fiscal year 2000 budget request includes $30 million for food safety activities.

A fourth area is the safety of the blood supply. Each year more than 3.5 million Americans receive blood from volunteer donors. While blood and blood derivatives can be life saving, blood products can pose risk to patients. At the same time, shortages of blood can be life-threatening.

The administration is requesting $6.2 million for FDA's blood safety initiative as part of the overall increase of $52.2 million which as I mentioned before is requested for product safety assurance.

A fifth area is tobacco. The administration recently has renewed its commitment to reducing young people's use of tobacco products. We are pleased that the Supreme Court has agreed to hear the

case regarding FDA's regulation of tobacco. Our budget request before you includes a $34 million increase in funding for our tobacco program.

In conclusion, Mr. Chairman, and members of the committee, FDA is an agency that has prided itself on being a can-do agency. But it is clear that the agency can't do everything without additional resources. The funds that we are asking you to appropriate in this budget will make great strides towards moving us toward these goals.

PREPARED STATEMENT

I make a public commitment to you today that if we are given these funds we will spend them wisely and well.

[The statement follows:]

PREPARED STATEMENT OF JANE E. HENNEY

INTRODUCTION

Mr. Chairman, members of Congress, ladies and gentlemen, my name is Jane Henney. I am honored to address you as the Commissioner of Food and Drugs. It is my privilege today to present the Agency's plans and expectations as reflected in the Administration's proposed budget for fiscal year 2000. I also would like to take this opportunity to share with you my thoughts on where I hope to lead the Food and Drug Administration in the coming months: both the tasks that I believe most urgently demand the Agency's attention, and perhaps as important, my approach to those tasks, which emphasizes a commitment to heightened effectiveness and an openness to our constituencies.

Let me begin by offering a few reflections on my first five months as Commissioner. Fortunately, many of the things that I remembered about FDA's dedication to the health and safety of Americans have not changed since I left the Agency several years ago. The FDA is filled with energetic, hardworking, talented people. There are strong traditions throughout the Agency of protecting and promoting the public health. These are traditions that I will seek to preserve. I also am reminded, on a daily basis, of how much has changed since I was last here. The FDA Modernization Act (FDAMA or the Act), the Administration's Reinventing Government initiatives, the Animal Drug Availability Act, and the Prescription Drug User Fee Act have triggered significant changes in many of the Agency's processes and outcomes.

One of the most important changes that has followed FDAMA is a renewed commitment to listening to those affected by FDA regulation: consumers, patients, and the industry. FDAMA directs the Agency to be in touch with all of its constituencies. I firmly believe that we must seek out and listen to the views of all. This is critical to the continued effectiveness of the Agency. As an old English proverb says, "Only the wearer knows where the shoe pinches."

As I will explain in more detail later, the Agency has formally undertaken its statutory obligation to consult with stakeholders. In the same spirit, I, too, have undertaken in my first months in office to meet with members of the regulated industry, consumers, and the academic community. I have visited seven FDA field offices and have plans to visit nearly all of our districts throughout the country during the coming year. These visits have allowed me not only to meet and hear directly from FDA's field staff, but to meet with important constituencies in each district, as well. For example, when visiting our district office in Denver, I met with the Southwest Medical Device Grassroots Coalition, a group of device manufacturers. While in Chicago, I held an open forum to listen to the concerns of drug, device, and food manufacturers, State officials, academics, and consumer representatives. And, while visiting our district offices in Cincinnati and Miami, I met with a wide range of consumer groups, including groups representing the elderly, persons with HIV, and minority communities.

I also am committed to fostering our co-operation with other federal and State agencies. In Philadelphia and Chicago, I met with local transportation officials and Customs representatives to tour shipping and airport cargo terminals that serve as major ports of entry for such products as fresh fruits and vegetables, and saw firsthand where and how FDA investigators and our State and federal partners examine incoming products. And I met with the heads of the Departments of Agriculture and

Health of Ohio, Kentucky, and Florida to discuss our partnership with the States on many important issues, including mammography and food safety.

I also have used my travels to the District Offices to meet with representatives from the academic community with whom I intend the Agency to form stronger alliances. I am particularly interested in harnessing the intellectual capabilities of the academic community and other science-based agencies. For example, on my trip to the Cincinnati District Office, I asked the Dean of the University of Cincinnati Medical School to tour our laboratory facilities with me. Exchange is a two way street—opportunities for health professionals, students, and faculty members alike exist and our facilities and likewise our scientists will benefit from access to the great educational research institutions in this country. I also visited Chicago's National Center for Food Safety and Technology (NCFST) at the Moffett campus, a major food safety research and education center established in 1987 by FDA and the Illinois Institute of Technology, with participation from the food industry and the University of Illinois. The NCFST, which is currently working on a wide range of projects relevant to FDA's food safety initiative, serves as an outstanding model of collaboration between industry, academia, and government.

In my first five months, my focus also has been on an issue closer to home. I know that the Subcommittee is concerned about the size and structure of the Office of the Commissioner. I have undertaken a formal review of the Office with the goal of creating a more streamlined, efficient office that will provide leadership without compromising programmatic functions. I can assure the Subcommittee that I will keep you informed as I make decisions about specific changes in the Office of the Commissioner.

That is a thumbnail sketch of the last five months. Today, the Administration is asking for a substantial increase in FDA's budget, indeed, the largest requested increase in the Agency's history. This budget request is intended to allow us to begin to rebuild our capabilities, to strengthen our science base, the foundation of sound regulatory decisions, and to continue several long-range, high priority programs that are vital for the protection of the public health. As large as this budget request is, it provides only the first steps toward rebuilding an effective Agency able to carry out its basic responsibilities and to respond to emerging public health problems.

PRIORITIES

Implementation of FDAMA

I will now discuss the substantive issues that I intend to make priorities during my term as Commissioner. First, and most important to me, is the implementation of FDAMA. The passage of FDAMA was the culmination of several years of work by Members and staff from both the House and the Senate and from both sides of the aisle. The Act's final text represented countless hours of negotiation involving Congressional staff, the Administration, the regulated industry, and representatives from consumer, patient, and health professional organizations. The result of this process was sweeping legislation that touches on nearly every facet of the Agency's mission and thus impacts nearly every citizen in the country.

Let me emphasize, as I did in my confirmation testimony, that I am committed to the full and effective implementation of FDAMA—both the letter and spirit of the law. I embrace the principle that the best organizations find ways to constantly improve themselves. Such organizations re-examine their processes, tasks, and goals, and use their daily experiences to refine their efforts in approaching the next task. FDAMA provides the Agency with valuable opportunities to conduct such a re-examination and challenges us to change. Making continual changes based on past performance with an eye on the goal of improvement is essential to FDA's effectiveness. As someone once said, "Every time history repeats itself, the price goes up." While FDA has many great traditions, it can never afford to stop evolving in response to the diverse and changing needs of those it serves.

Recognizing the priority the Congress gave to enactment of FDAMA, FDA in turn has devoted unprecedented resources to implementing the new statute within the time frames set forth in the Act. As you know, the passage of FDAMA imposed a daunting array of challenges on the Agency. FDAMA explicitly required that the Agency complete over 60 regulations, guidance documents, notices, reports, and other tasks, including studies or lists. Many of the statutory requirements had specific deadlines for completion. In addition, in order to have full and proper implementation that was consistent with the letter and spirit of the law, FDA needed to make numerous conforming changes to existing regulations, and to issue guidance to clarify new provisions. The Agency has already completed over 80 FDAMA-related actions. In completing this impressive amount of work, the Agency met nearly

all of its statutory deadlines—while continuing to perform all of the other important tasks that the American people have come to expect.

These implementation tasks were not simply numerous, but important. The Act addresses everything from the evidentiary standard for devices to the review process for health claims on food. Some of these provisions clarify longstanding Agency practices or procedures, others codify important practices to assure their full and consistent application, and still others establish important new programs for the Agency to administer.

Some of the high profile initiatives completed within this past year include:

—Guidance to industry on the streamlined development and approval process for new therapies for serious and life-threatening conditions;

—Publication of a final rule on the information that manufacturers can offer about the uses of medicines that are not approved.

—Implementation of a process to obtain financial incentives for conducting studies on the use of drugs in children;

—Development of exemptions from pre-market notification for certain low-risk medical devices;

—Clarification of the procedures for administrative appeals of decisions made by the Agency; and

—Guidance to industry on "health claims" that can be made for foods based on authoritative statements from scientific bodies.

Aside from the completion of the tasks listed above, the Agency has worked to ensure that those affected by FDAMA, both inside and outside the Agency, have received appropriate information about the new law. FDA has held internal training sessions, as well as a series of public meetings to discuss specific provisions in the law. We also have received many suggestions from our stakeholders on implementation.

As I mentioned earlier, section 406(b) of FDAMA required FDA to consult with our stakeholders prior to submitting the Agency's plan for statutory compliance with the Act to Congress last November. In order to comply with this requirement, FDA reached out to the general public and to those segments of society most directly affected by FDA to solicit their views on how the Agency can best meet its public health mission. FDA held eight public meetings to hear the views of our stakeholders on how we could do our job better. The Agency heard from more than 75 different speakers at meetings attended by more than 600 people.

We heard several consistent messages from those who participated, including the following:

—FDA should assure that its processes are equitable, open, and transparent;

—FDA should collaborate with other government agencies, academia, and international organizations to better coordinate the protection of the public health; and

—FDA should be commended for reengineering its processes to make them even more efficient and effective, and should continue these activities, as well as efforts to reduce the burdens of complying with regulatory procedures.

This is good advice. But, to paraphrase La Rochefoucauld, it is not enough to receive good advice; we must also have the wisdom to profit from it. In this case, the Agency not only listened carefully to the advice it received, but took that advice seriously in developing a realistic plan for complying with our statutory obligations. The completed plan was published in the Federal Register last November.

I would like to highlight briefly one of the statutory obligations that we have not been successful in meeting, however, and that we are unlikely to be able to meet without additional resources. The statute requires FDA to conduct inspections every two years of establishments that make prescription drugs and higher risk medical devices. FDA's ability to conduct these inspections has fallen considerably over the past few years, even as consumer expectations concerning the safety of the products they use continues to rise. As a result of the healthy economy, many new businesses have been formed in the past five years, increasing dramatically the number of establishments to be inspected. Between 1990 and 1998, the number of firms to be inspected rose from 89,000 to 114,000, an increase of 26 percent. To raise the frequency of inspections of all product areas, and to improve the quality of FDA's laboratory capabilities, bringing FDA closer to conformance with its statutory obligations, the Administration is requesting $52.2 million.

FDAMA also included the reauthorization of the Prescription Drug User Fee Act of 1992 (PDUFA). PDUFA is among the most successful Agency programs in history. Within its first five years of implementation, the increased resources provided by PDUFA to hire additional review staff has resulted in cutting the average review times for new drugs in half, without compromising the high standard that FDA has traditionally applied in weighing the risks and benefits of drugs and thereby in de-

termining their safety and effectiveness. PDUFA is widely regarded by Congress, industry and patient groups as an example of how to achieve success through funding increases tied to ambitious performance goals. I will work to make sure that the Agency continues this performance under PDUFA for the next five years.

I would like to take a moment to update you on the improvements made in product review times in fiscal year 1998. The Center for Drug Evaluation and Research (CDER) increased the speed of its review in all user fee drug categories. The median total time to approval for new original drugs was 12 months, compared with 14.4 months in 1997. For priority drugs, that is, those drugs considered to be of potentially exceptional public health value, the median approval time was 6.4 months. Several important drugs were approved in 6 months or less, including efavirenz for treatment of HIV and AIDS (just over 3 months), and fomivirsen for treatment of CMV retinitis (4½ months).

Approval times also decreased for the most important categories of biological products. For products containing a substance or combination of substances never before approved for the U.S. market, the median approval time dropped from 12 months in 1997 to 11.5 months in 1998. Moreover, the median approval time for priority products dropped to 6.9 months, from 8.9 months in 1997. Among the important new products approved under the new Fast Track program were Trastuzumab, a new breast cancer therapy, and Etanercept, a new treatment for severe rheumatoid arthritis. These two therapies are also among a growing number of bioengineered products that are approved each year, demonstrating how the investment in biotechnology is fulfilling its promise.

Although FDA product review times in programs benefitting from user fee expenditures have shown dramatic improvements, other categories of product reviews for which we do not receive user fees have seen some improvement, but continue to suffer from unacceptably long review times. Programs for which we do not receive user fees include blood and blood components, animal drugs, generic drugs, medical devices, and food additives. Section 406(b) of FDAMA directs the Agency to find ways to meet the statutory deadlines for review of all product categories. While we will continue to undertake management initiatives to attempt to meet these deadlines, we believe that prospects for significant improvement in review times for these product areas are dim without additional resources, especially as technology yields more complex products, developed at a much faster pace. The Administration is therefore asking for $28 million in both new appropriated funds and new additive user fees to improve review times in areas of particular concern: food additive petition reviews, food contact substance reviews, and medical device reviews.

The increases in the speed of review for products covered by PDUFA, of which FDA is justifiably proud, raise an important question. In the quest for more rapid reviews, has the Agency compromised the standards that govern the approval of new products? The answer is no. FDA has a critical obligation to the American public to ensure not only that life-saving drugs and devices are available in a timely way but that they are safe and effective. Several well-publicized market withdrawals of new prescription drugs in 1997 and 1998 have led some people to conclude that faster drug reviews are resulting in the approval of unsafe products. The products in question were two diet drugs, dexfenfluramine and fenfluramine (the "fen" component of "fen-phen," a combination fenfluramine and phentermine that was widely used off-label), terfenadine (Seldane) for treatment of allergies, mibefradil (Posicor) for treatment of hypertension and chronic stable angina, and bromfenac (Duract), a painkiller.

Let me assure you that the agency has carefully reviewed these withdrawals with this question in mind, and has concluded that there is no relationship between the speed of approval of these products and the reasons for their withdrawal. Some of these drugs were approved years ago: fenfluramine in 1973, and terfenadine in 1986. Moreover, FDA's review shows that, since the advent of PDUFA and more rapid review times, the percentage of drugs withdrawn from the market has actually decreased. One important finding of FDA's review of the product withdrawals was that drug approvals are necessarily made on the basis of limited information about a few thousand patients given the drug during clinical trials. Inevitably, a more complete picture of a drug's toxicity is developed as a drug is administered to a much larger group of patients after it reaches the market. For this reason, Injury Reporting is an increasingly crucial component of drug safety assurance, especially with respect to relatively rare or unpredictable problems that may not have evidenced themselves completely in the initial more limited and more rigorous setting of the clinical trials. The importance of Injury Reporting is also great for products, like foods and dietary supplements, for which there is no premarket review. Although product-related injuries are a significant cause of injury and death in the U.S., no integrated system for the reporting, monitoring, and evaluation of all FDA

regulated product-related injuries currently exists. Therefore, to reduce the incidence of deaths and disability resulting from injuries with FDA-regulated products, the Administration is requesting a total of $15.3 million to begin critically needed improvements to FDA's Injury Reporting system.

This initial investment will begin to build the foundation for a modern, integrated system for spontaneous reports. Spontaneous reporting systems are used to find rare or unexpected types of injuries. Additional investments will be needed in subsequent years to make a comprehensive system a reality. To gain a better understanding of the whole range of injuries from FDA-regulated products, active surveillance systems based in large health care systems will be needed. The Agency is not requesting the resources required to develop active surveillance systems adequate to study the epidemiology of all product-related injuries, but plans in the future to build a more comprehensive system upon the groundwork provided by this budget. Funds for limited implementation of a sentinel site program for medical devices are also included in the budget request.

As I have already stated, I believe that FDA has accumulated a very impressive record on implementing FDAMA, especially considering the ambitious timeframes that had to be met in the first year. You have my assurance that these efforts will continue as we fully implement of FDAMA.

Strengthening the Agency's Science Base

My second priority is to strengthen the science base of the Agency. Sound scientific principles must underpin our decisionmaking and guide the critical policy decisions that we make. FDA's investigators must have adequate scientific training to make good decisions in the field. Our product review teams sit in judgment of applications resulting from work done by the nation's leading scientists and the review teams must apply sound, often cutting-edge science to product reviews. This is an urgent issue. The increasing investments made in both basic and applied research by the National Institutes of Health and the pharmaceutical, biotech and medical device industries will inevitably result in a burgeoning growth of new products that must be reviewed by FDA before they come to the marketplace. FDA must have the scientific sophistication necessary to understand and adequately evaluate these products. I am committed to seeing that our scientific expertise matches the complexity of the new products moving toward the market, for our decisions will be only as strong as our expertise.

There is a compelling need for an adequate scientific foundation in almost all of FDA's activities and for a strong, scientifically-skilled workforce. First and foremost FDA is a science-based regulatory agency. It is therefore critical that we invest wisely in those that we recruit for these tasks. It is also imperative that we have mechanisms and resources available to see that we maintain a presence in the world of science. We can ill afford to have our staff become stagnant, for if this were to occur, our decisions would become inappropriately risk-averse—or worse—wrong. We will need to pay particular attention to improving our recruitment and retention of our best scientists and to leveraging the intellectual power of other science-based governmental agencies and academia.

The results of a strong science base can have wide-ranging benefits for the public health. Let me offer a few experiences that illustrate the importance of ensuring that FDA's scientific capabilities are of the highest order.

In several cases, scientists at FDA's Center for Devices and Radiological Health (CDRH) have been able to pinpoint the cause of reported injuries from medical devices, and in at least one instance, help correct a product defect, when even the manufacturers were unable to do so. In the first case, when new small bore catheters were used to administer continuous spinal anesthetics, patients began to suffer nerve damage and even paralysis. The cause of these injuries was unknown until FDA scientists discovered the source of the problem through laboratory testing and analysis: the slow flow rate through the small bore catheters decreased mixing of anesthetic with spinal fluid, causing nerves to be bathed in nerve-damaging concentrations of anesthetics.

In the second case, a new device used to close holes in the heart by means of a spring-loaded umbrella inserted into the heart by a catheter began to cause severe complications when used in children. Several children required emergency surgery after developing tears in the structure of their hearts. FDA scientists were able to identify the role of the device in these complications, and helped the manufacturer to redesign a safer device by changing the shape of the springs used to open the umbrella.

In the third case, FDA had been receiving reports of sporadic implantable cardiodefibrillator and pacemaker failures resulting in hundreds of problems and three deaths. No one understood the pattern of the failures in these devices until

FDA scientists identified a common cause: helium was leaking from the body of the pacemaker into the electronic clock, destroying the vacuum in the clock's timing crystal. The damage to the clock in turn caused the pacemaker to fail.

Well-qualified and trained scientists can also identify dangerous products even before they reach the market. Scientists in the Center for Drug Evaluation and Research were able to prevent a potentially dangerous drug from entering the U.S. market, because they recognized that seemingly innocuous laboratory results signaled a high likelihood that the drug would cause serious liver injury. A new drug application (NDA) was submitted for Dilevalol, a drug in the usually safe class of blood pressure drugs known as beta blockers. FDA scientists saw that the drug had caused several cases of increased liver enzymes associated with modestly elevated bilirubin. Although these effects were not in and of themselves harmful, the scientists knew from their training and experience that such effects predict serious liver injury, which had not been recognized by the drug's manufacturer. When the manufacturer reviewed the post-marketing experience with the drug in Portugal, serious injuries were in fact found, and the drug was withdrawn worldwide.

Highly trained scientists at CBER familiar with, and able to improve upon, the latest test methods, also were able to avert the withdrawal of an important childhood vaccine by demonstrating that an apparent threat to the safety of the vaccine did not in fact exist. In the summer of 1995, scientists at the Swiss National Center for Retroviruses, using a new and highly sensitive assay, detected the presence of retroviruses in the vaccine for mumps, measles, and rubella (MMR). Because retroviruses can be highly infectious, the Swiss government informed the World Health Organization that it was considering withdrawing the MMR vaccine. This proposed action required FDA to consider whether to withdraw the MMR vaccine from the American market. CBER scientists quickly undertook research which showed that the assay used by the Swiss had detected a form of retrovirus which was not infectious, thus establishing that the vaccine did not pose a risk of infection to children. In addition, our scientists have been able to modify the assay to make it more precise in its ability to discriminate between true infectious retroviruses and normal cellular enzymatic activity in a vaccine.

This example also illustrates the global nature of the public health issues that FDA must address and underscores the importance of working with our international partners, including the World Health Organization, to ensure that global standards for marketing new products and for addressing emerging infectious diseases are as high as possible.

Other significant scientific contributions that FDA is often alone in providing, and that must be supported and strengthened, include:

—development of rapid and sensitive methods to analyze foods for microbial contaminants;
—swift identification of pathogens in the food supply by our field laboratories, preventing widespread illness;
—development of methods to ensure identity, purity, and potency of vaccines;
—examination of adverse interactions between drugs that may be prescribed at the same time,
—evaluation of degradation and molecular changes in implantable device materials;
—development of risk assessment and risk management models, and
—development of test systems to improve the review of new products for safety and efficacy.

These examples underscore our need to support the scientific skills of those entrusted with carrying out FDA's many responsibilities. We must invest in maintaining and enhancing those skills to ensure that our decisions and actions continue to be grounded in the best science and continue to command respect in this country and around the world. Indeed, we cannot afford to do otherwise.

Food Safety

Another area that I have identified as a high priority is the safety of our food supply. Last month, I appeared before this subcommittee to address that portion of our budget. At that hearing, members of the subcommittee raised several issues to which I would like to respond briefly today.

The subcommittee questioned the success of our Hazard Analysis and Critical Control Point (HACCP) system for seafood. We believe that this program has been a great success despite the fact that some problems were identified for a majority of the seafood firms in the first year of implementation. Only 4½ percent of those inspections were serious enough to require official action. The seafood industry is a uniquely complex one, consisting of more than 4,000 domestic seafood producers—mostly small businesses—processing more than 300 varieties of seafood from numer-

ous different habitats. Consequently, instant compliance was never expected. Rather, gradual and steady progress was the goal. In this respect, the program is on track:

—FDA dramatically increased its inspection frequency of the seafood industry to at least once a year to provide steady, consistent feedback to industry regarding HACCP.

—FDA created a seafood HACCP guidance document for the industry that essentially contains all the agency's knowledge on hazards and controls. This document is being adopted by other countries.

—FDA has focused on educating firms to understand how to identify and fix problems in order to accomplish a fundamental cultural change in the industry.

—The HACCP program has served as a catalyst for the formation of the Seafood HACCP Alliance, a consortium of Federal and State agencies, academia, and industry, to develop low cost training for industry in basic hazards and controls.

The subcommittee also questioned our actions in the area of produce safety. FDA believes the steps we have taken in this area have successfully helped to prevent foodborne illness. As with seafood, improving the safety of produce is extremely complex. The agency must consider the differing cultivation, harvesting, packaging, and shipping practices for a wide variety of fruits and vegetables with differing physiological characteristics to determine what preventative interventions are appropriate. Unfortunately, our scientific knowledge in this area is limited. While we are using our food safety dollars to increase research in this area, we believe that educational activities will be most productive in preventing foodborne illness at this time.

The agency has taken numerous steps toward our goal of minimizing foodborne illness associated with fresh produce:

—FDA has developed a guidance document on Good Agricultural Practices and Good Manufacturing Practices to minimize microbial hazards in fresh fruits and vegetables. This document is in the process of being adopted by the CODEX Food Hygiene Committee as the international standard for produce production.

—FDA has initiated educational programs on production and processing for domestic and international producers.

—FDA and USDA have jointly undertaken an ambitious research program for both post- and pre-harvest production of produce.

—FDA and USDA have jointly undertaken a survey of the agricultural community to better understand current agricultural practices in order to determine how to maximize public health impact while minimizing economic impact on the agricultural community.

We have come before this committee for three years in a row asking for additional funding to protect the public from foodborne illness. While the diversity of products we regulate make our job a difficult one, we believe that we have done the best job possible in improving the safety of the food supply. With the additional funding we have requested for fiscal year 2000, we will be able to move that much closer to our goal of putting a strong, science-based food safety system in place that maximizes public health.

Blood Safety

Each year more than 3½ million Americans receive blood from volunteer donors. While blood and blood-derivatives can be life-saving, blood products can pose risks to patients. Among the most serious of these risks is the possibility of transmission of undetected infectious diseases. At the same time, shortages of blood can be life-threatening. The safety and adequacy of the blood supply and blood products is one of the highest priorities of the FDA and the Department of Health and Human Services, and is one of my priorities as well.

FDA already has taken many steps to address this issue. The Agency has developed a Blood Action Plan to increase the effectiveness of our scientific and regulatory actions and to ensure greater coordination with our PHS partners. The Action Plan addresses such issues as (1) evaluation, scientific investigation, and management of emerging infections that may pose a threat to the blood supply, (2) reinventing blood regulations with the goal of simplifying paperwork and moving to a standards-based approach to blood safety, and (3) the ability to notify product users in the event of recalls or other situations in which particular blood products may pose a risk to patients.

FDA also has significantly increased its oversight of the blood industry. The Agency now inspects all blood facilities at least every two years, and problem facilities are inspected more often. FDA also provides the industry with detailed and updated guidance on how to ensure blood safety, and holds regular workshops for the blood industry, the academic community, and health care providers.

Several key issues in blood safety still must be addressed. The technology associated with disease detection in blood donors is continually improving, but risks to those who receive donated blood and blood products remain. For a number of serious and life-threatening infections, including HIV infection, there is a limited period after a would-be blood donor has been infected in which the infection is not detectable by available methods. Blood donated during this period can transmit infection. We must therefore find ways to further reduce the window period during which infection with HIV and Hepatitis A, B, and C is undetectable. We also must reduce the risk to patients from bacterial contamination of blood and from blood bank errors.

One of the greatest threats to the blood supply is posed by unknown or emerging agents that are not inactivated or removed during processing. This is an ever-present threat because new infectious agents that may endanger the blood supply may emerge at any time. FDA must have a strategy for managing, and the resources to address, each new infectious agent as it is identified.

Finally, the Agency and the industry must find ways to manage blood and blood product shortages. Many shortages arise when FDA discovers violations of quality control procedures or other hazards that result in manufacturing plant closures or require the removal of products from the marketplace. The goal of ensuring safe blood and blood products thus competes with the goal of providing an adequate supply of blood and blood products, and achieving an appropriate balance is a constant challenge. The Administration is requesting $6.2 million for FDA's blood safety initiative, as part of the overall increase of $52.2 million requested for product safety assurance.

Tobacco

The Administration recently has renewed its commitment to reducing young people's use of tobacco products. Every year over 400,000 Americans die from tobacco-related illnesses, almost all of whom began use of tobacco as children. A program that successfully keeps tobacco from children has the potential for unprecedented improvements in public health. FDA's budget request includes an increase in funding for its tobacco program to assure progress in all states towards the President's goal.

The first two provisions of FDA's tobacco rule, a federal minimum age of purchase and a requirement that retailers check photo identification, went into effect in 1997. In fiscal year 1997, the FDA initiated a $4.9 million pilot enforcement program in 10 states, contracting with state and local governments to conduct compliance checks of retail outlets that sell tobacco.

In fiscal year 1998, with a new $34 million appropriation for the tobacco program, FDA built upon the success of the pilot program and expanded its enforcement and outreach programs to 41 states, plus the District of Columbia and the Virgin Islands. By fiscal year 2000, the Agency plans to contract with or have an enforcement presence in all 50 states and most territories.

The preliminary results from our enforcement and outreach efforts are encouraging. In fiscal year 1998, FDA's State partners conducted over 39,000 compliance checks, including reinspection of those retailers found to have violated the rule. FDA expects to conduct approximately 189,000 compliance checks during fiscal year 1999, as new states begin enforcement efforts. The preliminary violation rate from over 69,000 checks conducted through March has been approximately 25 percent, ranging from a low of approximately 11 percent to a high of 43 percent. States with low violation rates typically have had their own very active enforcement efforts in addition to FDA activity. We anticipate that these rates will vary widely as more states begin conducting compliance checks for the Agency. Also in fiscal year 1998, FDA began seeking civil money penalties from those retailers found to have sold tobacco to minors at least twice.

To assist its enforcement efforts, the Agency launched a multi-media advertising campaign, including radio, print, and billboard advertising. A free retailer kit using humorous illustrations and a folksy approach was created to make it easier for retailers to comply with the new regulations. The campaign reminds retailers and clerks to check young people's photo identification and tries to defuse some customers' resentment towards the new rules and urges them to cooperate with retailers.

Litigation concerning FDA's assertion of jurisdiction over tobacco continues in federal court. Following the District Court's 1997 decision upholding FDA's assertion of jurisdiction and the access provisions of the regulations, the Fourth Circuit issued a decision in 1998 finding both FDA's assertion of jurisdiction and issuance of regulations invalid. January 19, 1999, the government filed a petition for a writ of certiorari with the Supreme Court. Under the rules of the Fourth Circuit and the Su-

preme Court, the age and ID provisions of the rule continue in effect, pending Supreme Court review.

For fiscal year 2000, the Administration is seeking a $34 million increase in the tobacco program. With this increased funding, the Agency plans to inspect an increased number of retail outlets that sell tobacco and will intensify its efforts in certain targeted-demonstration areas. Outreach efforts are planned to be expanded to include the creation of new billboard material, print, radio and in-store advertising and the expansion into two new and important media—television and news weeklies.

Bioterrorism

In an era of global instability, there is growing concern about the possible deployment of biological and chemical agents by certain third world countries. FDA has been called upon by the President to help respond to the threat of bioterrorism. The Agency is in a unique position to assist in this effort by reviewing products that may be used to treat illnesses caused by biological and chemical agents, as well as to assist in the rapid development of diagnostic tools and treatments for disease outbreaks that could be caused by such weapons. In fiscal year 2000, FDA is requesting a total of $13.4 million for this Presidential initiative as part of the Public Health and Social Services Emergency Fund. Additionally, in fiscal year 1999, there is a supplemental request to provide FDA $3.3 million in funding to engage in anti-bioterrorism activities. While this request is not before you, it is very important to us.

THE BUDGET

The President's budget includes an increase of $95.5 million for injury reporting, product safety assurance, and application review activities, many of which respond to goals laid out in FDAMA. At the same time, because of the absorption of pay raise and other inflationary costs for the past several years, FDA has had to reduce its staffing substantially, and the increases requested will enable us to sustain our core public health responsibilities and to add staffing in key areas where FDA's science base must be strengthened.

This $95.5 million increase includes a request for $20 million for design and for the first phase of construction of a new District Office and Laboratory in Irvine, California. This facility not only will enable us to bring our Los Angeles laboratories up to date, it will eliminate severe security problems at our present Los Angeles office.

In addition, we are requesting increases totaling $77 million for the Presidential initiatives on food safety, tobacco, and countering bioterrorism.

Our total request for fiscal year 2000 is for total spending authority of $1.35 billion, of which $1.16 billion is for budget authority, with the remaining $196 million derived from user fees and other sources. I would like to emphasize that the only new user fees we are proposing, $17 million for the review of new medical devices, food additives, and food contact substances, would expand our programs in these areas, rather than fund current activities. As we know from our past experience with PDUFA, user fees work best when several principles are adhered to: 1) Consensus of need by the Congress, industry, and Administration, 2) The fees are applied to the timely review of products, and 3) Aggressive but realistic performance goals are set. The legislation to authorize these fees will be submitted shortly by the Administration to the Congress. I also would note that there is a proposed increase of $13.1 million for PDUFA activities under our current five-year plan for continued improvement in the review of new drugs. Lastly, we are requesting $3 million in transition costs and projecting $12.7 million in user fees for the voluntary seafood inspection program currently operated by the Department of Commerce. This program is proposed to be transferred to FDA in fiscal year 2000. A legislative proposal will be submitted to make this a Performance Based Organization under the Vice President's program for reinventing government.

I am also pleased to be able to report to you that there is $56 million in the General Services Administration's fiscal year 2000 budget request for design and initial construction of new consolidated laboratories for FDA at the former Naval facility in White Oak, Maryland. While facilities are now under construction at College Park, Maryland, for our headquarters Foods program, FDA's other headquarters laboratory programs are widely dispersed and in need of state-of-the-art facilities. The initial phase of construction at White Oak will provide new laboratories and animal holding space for several of our human drug laboratories. As additional facilities are constructed in future years, more of our scientists will be able to utilize the most up-to-date laboratory technology, and will be able to work together, permitting the most productive use of the Agency's scientific resources. Coordination

among all of FDA's headquarters programs will be improved, as will operational efficiency.

CONCLUSION

I want to thank you for the opportunity to testify before you today. It is often said, Mr. Chairman, that FDA is America's most important consumer protection agency, because it regulates a quarter of all consumer spending. The products that comprise that trillion dollars in annual sales are ones we rely on every day—over-the-counter and prescription drugs, contact lenses, microwave ovens, most of the food we eat—the list goes on and on. Americans have high expectations for the safety and reliability of these goods. The industries that make these products and the scientific advances that fuel their innovations are vigorous and growing. FDA needs the resources and scientific expertise to keep up with that growth, or both consumers and industry will suffer.

FDA is an Agency that has prided itself on being a can do agency. But it is clear that the Agency can't do everything without additional resources. We must make sure we can capture and analyze and take appropriate action on the adverse events that occur each year from products we regulate. We must be able to inspect the companies that make those products as the Congress has directed us to do. And all important new products must get to the market as quickly as possible, consistent with our mandate to assure safety and effectiveness. The funds that we are asking you to appropriate in this budget will make great strides toward moving us toward these goals. I make a public commitment to you today that, if we are given these funds, we will spend them wisely and well.

TOBACCO

Senator COCHRAN. Thank you very much, Dr. Henney. I had a group in my office the other day from Mississippi complaining about the FDA sting operations that are designed to enforce the rules against selling tobacco to teenagers.

The point they were making to me was in our State of Mississippi, the attorney general has his own enforcement program which involves city and county law enforcement officials. They also have a training program.

Mississippi is one of the states that filed one of the first suits, maybe the first suit or settled the first suit. So funds are available for trying to do a better job of curtailing teenage tobacco use.

And then they tell me there is now an FDA sting operation or enforcement operation in Mississippi. The first fine is $250. Subsequent fines can go as high as $15,000. These are fines that are imposed on store owners, convenience stores, and service stations that sell gasoline and liquor.

My question is it seems like we're spending a lot of money and this group is convinced this is a duplicative and wasteful use of federal funds when there is a state program.

They also tell me the state enforcement officers promptly advise the store owner of any violation of the rules. The officer explains to the clerk who was involved what they did wrong, what they should have done, what the penalties are. If they do it again, they write a letter to the store owner.

In the case of the FDA operations, they do not notify the store owners promptly. I am told sometimes it's months that go by or weeks before the store owner is advised that there has been a violation. Then the citation is received. There's an appeals process. They tell me that no one to their knowledge has had any successful appeal of an FDA citation.

They don't see the point in having the feds down there as well as the state involving local enforcement officials.

And so I'm passing this on because I asked them to put all of this in a letter to me so I would understand all of the complaints that have been submitted to this group. And I pass that on and ask for your comments.

Dr. HENNEY. Senator Cochran,

Mr. Chairman, I would appreciate hearing from the group directly and hope that you will also send along their letter to me so that we can get a full picture of the extent of their concerns.

I think that there certainly are differences about the program. I think that I would be remiss if I did not mention that our work with the state coordinator in Mississippi together with the state attorney general has been one of the most positive relationships that we have had with states.

We rely on state law enforcement officials through contracts with the state to carry out our compliance checks. But as we continue to improve our own program, I am most receptive to the kind of feedback you are receiving.

With respect to the fines or penalties associated, I think it would be important for you and others to know that if the convenience store or 7-Eleven store does not meet our standard on the first review, they are simply given a warning. There is not a fine associated with that. It is only on subsequent times of noncompliance that the fine process starts kicking in.

I think we do need some clarification around the specific issues and hopefully we can work together as we all try to solve, and get our arms around, this issue of teenage smoking.

REORGANIZATION OF THE OFFICE OF THE COMMISSIONER

Senator COCHRAN. I appreciate that very much. And I will pass on to you the specific information that I have received.

I was interested in hearing your proposal to reorganize the Office of Commissioner with the goal of streamlining and making it more efficient.

Have you completed the formal review to the extent that you can tell us some of the specific things that you have in mind about the current size and functions of the office?

Dr. HENNEY. Mr. Chairman, I asked a group to undertake this study for me very early on as I came into the agency. I think that they worked very diligently conducting a number of interviews, analyzing functions, resources and the like and made recommendations to me.

I announced to the staff of the FDA this week the extent of those reorganizations, the kind of programmatic endeavors that had been in the office of the commissioner that would now be transferred to the centers and other activities. We want to get more of the real resources down into the centers where they can be appropriately applied to our day-to-day and programmatic work.

But I will be glad to provide you for the record a copy of the memo that fully outlines the changes and the extent of the changes involved.

[The information follows:]

MEMORANDUM FROM JANE E. HENNEY, M.D.

Date: April 22, 1999
From: Commissioner of Food & Drugs
Subject: Restructuring of the Office of the Commissioner
To: FDA Staff

My first four months as FDA Commissioner have been interesting and challenging. I feel fortunate to have the opportunity to work with such dedicated and talented staff. I have thoroughly enjoyed being reacquainted with the people of FDA both here in the Washington area and in the field offices. I have learned a great deal about our innovative programs across the Agency in these last few months.

At every opportunity I have reiterated my five priorities for my tenure as FDA Commissioner: full and complete implementation of the FDA Modernization Act of 1997; restoring and enhancing FDA's science base; and fund the Administration's initiatives of food safety, blood safety and tobacco.

During my confirmation hearing in addition to stating my priorities, I also committed to reviewing the size and structure of the Office of the Commissioner (OC) with an overall goal of creating a more streamlined, efficient office that will provide leadership without compromising programmatic effectiveness. At my request, a four-person task force made up of staff from the Centers and from the Office of the Commissioner reviewed and analyzed the OC structure and functions as they currently exist and made recommendations to me for improvement. My specific goals were:

To create an Office of the Commissioner for which the principal focus was to provide leadership in building effective, two-way communication between the Agency and all of our stakeholders including: patients, consumers, Congress, the Administration, Agency employees, the regulated industry, health care professionals, and other scientific advisors.

To enable us to implement the Agency's priorities and to develop Agency policy with primary input from the Center Directors, the Associate Commissioner for Regulatory Affairs, and with legal advice from the Chief Counsel.

To streamline the OC to make the overall Agency more effective and efficient with roles and responsibilities clearly delineated.

To retain in OC only those staff functions which cannot be reasonably and more effectively performed in the Centers or the Office of Regulatory Affairs (ORA).

Using the basic recommendations from the task force, the major changes that will occur with the reorganization are as follows: The Office of the Commissioner will return to using a single deputy managerial model. Dr. Michael Friedman will assume this important role. The Center Directors and the Associate Commissioner for Regulatory Affairs will report directly to the Commissioner.

Within the immediate office of the Commissioner, a new position will be established, the Senior Associate Commissioner. I have asked Dr. Linda Suydam, currently the Associate Commissioner for Strategic Management, to assume this role. Her responsibilities will include coordinating all activities within the Office of the Commissioner, as well as directly supervising the following offices: Chief Mediator and Ombudsman staff, Office of the Executive Secretariat, Office of Public Affairs, Office of Orphan Products Development, the Internal Affairs staff, Advisory Committee Oversight, and the Office of Tobacco Programs.

Several other functions within the Office of the Commissioner will be realigned. The former position of Deputy Commissioner for Policy will be converted to Senior Associate Commissioner for Legislation, Policy and Program Planning. I have asked Mr. William Hubbard to assume the duties of this position. He will oversee the functions of policy coordination, legislative affairs, and planning and evaluation.

As a result of the growing importance of international policy and activities, Deputy Commissioner Sharon Smith Holston has been asked to lead the consolidation of all of these activities under a new Office of International and Constituent Relations. The Offices of Consumer Affairs, Women's Health and Special Health Issues will continue to report to Ms. Holston.

The Office of Management and Systems will continue to be led by Deputy Commissioner Robert J. Byrd. This Office will be relatively unchanged in function except that many of the transactional functions of management will be decentralized to the Centers, and as previously mentioned, the Office of Planning and Evaluation will move to the policy grouping.

Ms. Holston and Mr. Byrd will carry the title of Deputy Commissioner for International and Constitutent Relations and Management and Systems respectively. In keeping with my intention to move to a single deputy model; however, these titles will remain with the current incumbents as long as they are in these jobs and convert to Senior Associate Commissioner thereafter.

The Office of Equal Employment and Civil Rights will report directly to the Commissioner with Ms. Rosamelia Lecea continuing as its Director. Ms. Lecea has been requested to reassess how her Office is leading the complaint management process and to assume the diversity program functions previously carried out in the immediate Office of the Commissioner.

The Office of Chief Counsel led by Ms. Margaret Jane Porter will remain unchanged.

The reorganization will specifically move some functions now residing in the Office of the Commissioner to the Centers or ORA. Other functions will remain in OC but will be regrouped. A limited number of functions will be abolished altogether, and I have requested that, in those few instances where functions are being abolished, a special Placement Committee be established to assist employees in locating suitable reassignments in one of the Centers or ORA.

Please be assured that no employee will lose his or her job and that all employee rights will be protected, and every effort will be made to accommodate individual employees. I am also fully committed to working with those bargaining unit employees who are represented by the National Treasury Employees' Union (NTEU) and to fully comply with our collective bargaining requirements to assure that our specific obligations are met.

I would like to take this opportunity to thank all FDA employees for your hard work and continued commitment to the public health, especially the employees in the Office of the Commissioner. Each of you works to make the programs of the Food and Drug Administration excellent. Your individual and collective contributions are pivotal to our success. I know that change is never easy, but I ask for your support as we implement this reorganization and work together in the days ahead.

Senator COCHRAN. Thank you very much.

SCIENCE BASE

We also understand from your statement your emphasis on the strengthening of the science base of FDA and your commitment to seeing that scientific expertise in the agency matches the complexity of the new products that are coming into the marketplace and the complexity of the marketplace itself.

There are some interesting challenges that we know the agency faces. Would you please tell us what your specific goals are for improving the science base? How you plan to go about improving the recruitment and retention of the best scientists available to you?

Dr. HENNEY. Mr. Chairman, the goal of maintaining and strengthening the science base is to make sure that the scientists that work at the agency or the expertise from outside that the agency draws on is always at the top of its game in terms of scientific credibility, scientific currency, scientific analysis and ability to review very complex issues that come into the agency.

How to achieve that goal will take a number of initiatives on our part. Clearly there are issues around recruitment and retention and making sure that we have ongoing opportunities for continuing education, be they didactic or be they of a practical nature for our own scientists.

Certainly they will involve how we better leverage the intellectual capital from across this country, be it in other federal agencies or be it in academia or even the regulated industry. And we are working together to develop a plan for how we achieve this.

I think, as you might see, our budget next year will be a bit more transparent in terms of what we want to do ultimately in terms of this issue of strengthening the science base and that is how we are now constructing our discussions for next year's budget planning process.

I would, also, say that in addition to having top-notch scientists, they need a top notched and first-rate facility to work in. And currently in the Washington, D.C., area we are spread around in many, many different facilities. It limits our capability and capacity for having strong comprehensive reviews because there is just the time delay, the geographic diversity has challenges all of its own.

And so this year in GSA's budget, there is a proposal to finally develop the full plan for the consolidation of FDA's headquarters here in the Washington area and to build construct one building on that site, the first of multiple buildings that would come on line.

I would hope that the Senate and the full Congress would look upon that request favorably because it will under-gird and strengthen our efforts to maintain a strong scientific base for the agency.

AQUACULTURE

Senator COCHRAN. Thank you. I have other questions and I will submit most of them for you to respond to for the record.

But let me point out one other parochial concern and that is in my state, we have a big new aquaculture industry and it requires drugs that are approved by FDA and other efforts to control disease.

There has come to my attention the fact that aquaculture drug data packages recently submitted to the FDA Center for Veterinary Medicine are not being reviewed in a timely fashion.

I'm told that the Center is more than six months behind in completing reviews of these submissions. I want to bring this to the attention of the agency leadership and ask that you look into it and try to ensure that a more timely review of aquaculture drug data submissions takes place, if possible.

Dr. HENNEY. Mr. Chairman, I clearly don't know the specifics of the case but will be glad to look into it for you and get back to you promptly.

[The information follows:]

The situation that you asked about regarding an, aquaculture drug submission from Mississippi is an example of the pressures FDA must deal with as new industries emerge. In 1991, CVM developed a program to educate the aquaculture industry about the animal drug approval process. CVM hired a specialist in aquaculture who spoke frequently before industry groups in order to help there understand the steps necessary to get new aquaculture drugs approved, CVM also developed several written documents to provide guidance to the aquaculture industry. As a result, this aquaculture industry responded to the new challenge and developed numerous coalitions that generated a significant amount of new data necessary for drug approvals.

The aquaculture drug development program created a burgeoning workload for CVM. At the same time, FDA faced reduced budgets and significant staffing shortages. In the face of staffing shortages, FDA has been unable to direct adequate resources to many critical areas, including aquaculture drug review, illustrating why FDA is asking for additional review resources for fiscal year 2000.

Senator COCHRAN. Thank you. The Senator from Wisconsin.

COST OF PRESCRIPTION DRUGS

Senator KOHL. Thank you, Mr. Chairman.

Dr. Henney, people all across the country talk about the continuing rise in the cost of prescription drugs. In fact, I believe that it is more serious in this country than perhaps anywhere else in the world.

I'd like to ask you what the FDA is doing about this problem and I would also like you to comment on the extent to which the long delays in the approval of generic drugs makes the problem more serious than it might be otherwise.

Dr. HENNEY. Senator Kohl, I think the first and foremost responsibility of the agency to pharmaceutical development in this country is making sure that those products that do come to market are safe and effective.

We have little control and have been given little responsibility for drug pricing or drug pricing issues. I think that our colleagues within the industry would speak to you about their own investments and trying to recoup that in terms of their research and development.

But as we review products, we have little ability to look at issues related to drug costs except in the area which you raise and that is the review, the timely review of generic products.

And while I think that I have alluded to, in my testimony, areas that have not benefited from the user fee program, some have longer review times than the areas that have benefited from user fees.

Let me give you a flavor of the difference. Currently our average review time for prescription drugs is approximately twelve months. For generic drugs, it's approximately 18 months.

But to get a flavor of how often reviews of generic drugs occur, there is nearly a new generic drug approved every single day. In fact, I think last year there was some 354 generic approvals given. So it is not as if generics are not coming to market. Could they be done in a more timely fashion with additional resources? The answer to that is probably yes.

But I think that this particular group of people that work on generic drugs, have, through a series of management initiatives, really cut down review times in very significant ways in the past few years from a time in which these reviews took over 30 months to now taking 18.

Is there a way to go? The answer is probably yes. Are there the resources in the program to review them within the same time as prescription drugs? Not quite yet.

Senator KOHL. I thank you very much. I thank you, Mr. Chairman.

Senator COCHRAN. The Senator from Illinois.

SINGLE USE MEDICAL DEVICES

Senator DURBIN. Thank you, Mr. Chairman. And thank you, Dr. Henney, for joining us today. I'm glad that you're head of the FDA. I recall working with you in years gone by and I've always respected the fact that you brought extraordinary expertise to the agency then and extraordinary leadership now. And I'm happy to have you here before us.

I'd like to ask you about several specific areas of concern. One of them relates to an article which appeared in Forbes Magazine sometime earlier this year. I don't have the exact date on it. But it relates to single use medical devices.

As it turns out, many medical devices used in hospitals today are purchased with the understanding that they are disposable or sin-

gle use devices. In fact, they are being reprocessed and used over again without the knowledge of the patients in most instances.

There has been a growing concern that these reprocessed disposable devices may be dangerous to the patients. There have been stories about tips of catheters breaking off and contamination of these devices when they're being reused.

I notice that France has banned the use of disposable medical devices and other countries are starting to look at this more carefully. There is a competing interest here. The company that makes the devices would surely like to sell more and not see their devices reused to the detriment of their profit margin.

And then, of course, hospitals are hoping to cut costs by using reprocessed disposable devices. I'm basically going to ask you from the consumer and patient's point of view, what do you think our policy should be and what is the FDA doing to address it?

Dr. HENNEY. Senator Durbin, first of all, it is great to be back and to have the opportunity to work with you and all of the members.

I appreciate your compliment on my expertise. But on the issue that you raise, I think I'm going to ask the real expert on this who is Dr. Jacobson, the current acting director for the Center on Devices.

Dr. JACOBSON. First of all, let me compliment you for asking a really tough question. This is one that we've been very concerned about as well. Up until now we've taken the approach that in the absence of data that there was a problem, we've been taking a conservative approach to what we should do because, as you said, there are a number of things to be considered here not the least of which is that the hospitals themselves are doing a lot of reprocessing. And we're not getting a lot of adverse reaction reports.

All that being said, we are concerned about the safety of some of the higher risk devices. It used to be that only things like surgical instruments were reprocessed routinely. But now much more complicated devices are being reprocessed—devices that may pose a higher risk if they're not reprocessed carefully both from the materials aspects, that is can the materials stand up to the reprocessing, as well as from an infection control aspect. Are reused devices being adequately cleaned, disinfected, and sterilized prior to use?

In May FDA is co-sponsoring a meeting on re-use with the American Association for the Advancement of Medical Instrumentation, and number of other co-sponsors. We are bringing together all of the experts we can find to sit down and talk about this issue. What needs to be done. What action should FDA be taking. We have really put a lot of work into it.

Senator DURBIN. Is there any requirement if a reprocessed disposable device is used that there be an entry in the medical record of the patient of that fact?

Dr. HENNEY. Pardon me?

Senator DURBIN. If a hospital decides to reprocess a single use device, a catheter for example, and use it in the treatment of a patient, are they required to put in the medical record of that patient that they used a reprocessed catheter?

Dr. HENNEY. Senator Durbin, I do not believe that they are required to do that.

Senator DURBIN. Would it not be difficult to really track the incidents or problems without that information?

Dr. JACOBSON. Yes. That is one of the issues.

Senator DURBIN. I'm glad to hear that you're addressing it and it's something of concern, I'm sure, not only to me but to anyone, if you go in the hospital to know whether or not you're receiving the best treatment with the best possible medical devices.

Thank you, Dr. Jacobson.

OFF-LABEL PROMOTIONS

Let me ask you about off-label promotions. This is something that has come up over the years where people have said that drugs originally approved for specific use turn out to have value in other applications. Many drug companies cannot justify in their own minds going through the process, again, for those off-label applications. Doctors know that they have some value. And the question remains as to whether or not these off-label applications are being sufficiently monitored to protect consumers and patients.

I'd like to ask how much the review of off-label promotions is presently costing the FDA and whether or not the company is benefiting from these off-label promotions should share in the agency's cost of reviewing their promotional literature.

Dr. HENNEY. Senator Durbin, the issue of off-label use was addressed, in part, in the FDA Modernization Act which tried to strike a balance between providing non-misleading information and the tension that had always been there for the real life situation of drug promotion. At the time of review of a drug and the appropriate labeling of that drug, what is considered is what is in the application; what population was this drug or product studied on; and that defines what's on the label.

As the drug moves into the marketplace and further study of the drug is done or further trials of how the drug is used for other purposes, physicians have found other uses far beyond the labeled indications.

Oftentimes these are written up in the medical literature and now through the Modernization Act, those kinds of materials can be appropriately provided to other physicians.

The caveat also in the Modernization Act is that within a reasonable period of time—I believe the time period is some two to three years—the company must come in with data so that the agency is in a position to analyze that off-label use as to whether it can now go on the label. So that is part of the solution to the question you pose.

I think that we still have concern, in part, at times when off-label use has created real safety issues. Probably the most recent episode of that where it led to the agency having to recall product and remove product from market was the case of the diet drug combination Phen/Fen.

Those were drugs that were used together in a way never provided for on the label. It was clearly an off-label use and the result of that meant an absolute removal of the products from the market.

Senator DURBIN. What I'd like to zero in on is that safety is paramount. There's nothing more important. I'm trying to get down to the bottom line of the resources of the FDA to deal with it.

If a drug company is coming in for approval of a new drug and they, of course, want to sell it for on-label applications and indications, then it's my understanding that they defray some of the costs of the FDA in reviewing that drug. But when it comes to the off-label application, it's my understanding that the FDA bears the full brunt of the cost. Is that correct?

Dr. HENNEY. Senator Durbin, no, I do not believe that is correct because the proposal would come in as a supplement. And those supplements are covered under the user fee program if we're talking about a prescription drug. So we would receive resources in order to conduct the review of that supplement.

Senator DURBIN. How about the promotions, the money to review off-label promotions. Do you receive any compensation from the drug companies for that purpose?

Dr. HENNEY. Senator Durbin, no, we do not.

Senator DURBIN. Do you know what that costs the FDA to do?

Dr. HENNEY. I would be more than glad to provide you that for the record. And we could provide you what we do in terms of promotion in general and any monitoring we've done of the off-label area.

[The information follows:]

FDA does not have positions devoted solely to the review of off-label promotions. The specific cost to the FDA of reviewing all off-label promotions is not tracked and the following description is meant to provide a rough estimate of FDA's Center for Drug Evaluation and Research contribution.

Staff in the Division of Drug Marketing, Advertising, and Communications (DDMAC) check for the inclusion of off-label uses of a drug in their routine review of promotional materials. Last year, ten regulatory reviewers monitored submissions by drug companies, as required under the postmarketing reporting requirements (21 CFR 314.81). These submissions consisted of promotional materials that included reprints, sales aids, journal ads, monographs, videos, broadcast ads, etc. Reviewers checked these materials for compliance with the regulations, consulted with others in CDER when necessary, and took enforcement actions on materials that contain violative claims or issues. Violative claims or issues include, for example, misleading presentations, lack of risk information, and off-label uses. FDA receives no money from drug companies for enforcement actions.

Regarding other off-label submissions, on November 20, 1998, 21 CFR Part 99 was published entitled, "Dissemination of Information on Unapproved/New Uses for Marketed Drugs, Biologics, and Devices." This rule is intended to implement section 401 of FDAMA which amended the act to permit drug, biologic, and device manufacturers to disseminate certain written information concerning the safety, effectiveness, or benefits of a use that is not described in the product's approved labeling. This information can be disseminated to health care practitioners, pharmacy benefit managers, health insurance issuers, group health plans, and Federal and State Government agencies. The information to be disseminated must be about a drug or device that is being legally marketed; it must be in the form of an unabridged reprint or copy of a peer-reviewed journal article or reference publication; and it must not be derived from another manufacturers clinical research, unless that other manufacturer has given its permission for dissemination. Sixty days prior to the dissemination, the manufacturer must submit to FDA a copy of the information to be disseminated and any other clinical trial information that the manufacturer has relating to the safety or effectiveness of the new use. The manufacturer must include a copy of a protocol to support the new use and agree to submit a supplemental application (covered under the user fee program) for that use within a specified period of time, unless a supplemental application already has been submitted or FDA has exempted the manufacturer from that requirement.

For drugs, the review of FDAMA section 401 submissions involves personnel from DDMAC and elsewhere within CDER. Accurate estimates for the amount of time this involves are not available. However, we can roughly estimate that this activity involves 100 percent time for 1.2 FTE per year for DDMAC personnel and 100 percent time for 1.0 FTE for other CDER staff. This costs the Agency approximately $250,000 per year on off-label promotion activities.

Senator DURBIN. Thank you.

ORPHAN DRUG PRODUCT DEVELOPMENT

I included a colloquy on the floor last year about another area, the orphan drug product development. It appeared to me that the Food and Drug Administration was using some of the funds which we appropriated for that purpose for other purposes. And in the colloquy I tried to make it clear that we wanted the orphan drug product development money to be spent for that purpose.

Are you familiar with the agency procedure and whether it is using these funds for another purpose?

Dr. HENNEY. Senator Durbin, I am very aware of your interest and concern about the orphan drug program. It has been highly successful in moving products to the marketplace where there is a small population, if you will, to use these drugs.

I think it has been a real success story of the agency. It has been a program that in nearly all of the budget restrictions and reductions that the agency has had to undergo in the past few years—was protected from those kind of cuts.

This past year when we had to absorb additional cuts, we did ask the orphan drug program to take a proportional share to meet the increases needed for payroll. I do not think that it will significantly impair their ability to do a good job this year. But we cannot stand for it to happen another year in a row.

Senator DURBIN. Mr. Chairman, I have two or three more questions. But if you would like to ask, I can come back on a second round.

Senator COCHRAN. No. Why don't you go ahead and finish. I've just got a couple more questions I want to ask and then I will submit the rest so we get over to the military supplemental hearing.

PRESCRIPTION DRUG ADVERTISING

Senator DURBIN. One of the real revolutions in terms of prescription drugs in modern times has been the advertising and promotion of these drugs to the general public.

There was a time when the promotion of a prescription drug was confined to medical journals and direct contact by drug representatives with doctors, for example. Now we find drugs like Claritin and others, prescription drugs that are being promoted in general television and magazine and newspaper advertising.

They usually—I think they're required to make some record of the contraindications and warnings associated with the drug in magazines that borders on ridiculous, to turn the page and see on the other side of a full colored ad for a prescription drug, something that looks like the fine print from the old days of Pravda where you're supposed to try to work your way through it and figure out what the dangers of this drug might be.

I'm concerned. I understand what the drug companies are up to. They clearly want patients to say to doctors. I just heard about a new drug. Didn't I read in The Washington Post this morning there's a drug that's going to help me lose some weight. What about it, doctor, can I have that. That's the natural feeling on this.

There seems to be an interest by the FDA to make sure that the consumers are well informed about the dangers of certain drugs

even beyond what their doctors might tell them with the development of the so-called MedGuides that were to be distributed by the pharmacies to the consumers directly.

We got embroiled in that controversy last year as to whether we should restrict the distribution of these MedGuides. And I think we ended up with half a loaf when it was all over.

Could you tell me what the FDA policy is in terms of these MedGuides, not only the mandatory MedGuides for the most dangerous drugs but the voluntary distribution of these MedGuides to these consumers?

Dr. HENNEY. Senator Durbin, you raise several different issues within the context of your question.

With respect to the MedGuides, they are restricted, if you will, to the most significant or dangerous products.

With respect to the issue of direct to consumer advertising, like most issues that the agency deals with there are at least two very strongly held opinions.

One is that there is not enough information provided to patients to make an informed choice and the other that even if this does cause a patient to query their health professional about a product that they have read about, it provides an opportunity for an encounter of that patient and that health professional discuss their health condition and why or why not they are suited to that product or others.

So there is real debate on the issue of the direct to consumer advertising. I think from the agency's point of view, our strongest emphasis has to be on seeing that the information provided is balanced and not misleading. And I think that we are trying with the increased use of this direct to consumer advertising and to see that this proper balance is struck.

Senator DURBIN. I hope that the Congress will support you in that. I think as it is legal for these companies to advertise direct to consumers, we have an obligation at the governmental level to make certain that consumers are well informed about the adverse effects that a drug might have on them personally.

SEAFOOD INSPECTION

I have a couple of other questions about seafood inspection. But I'm going to send you a direct letter on that.

I'd just like to ask you one other final question before making an observation and that is I am an advocate for a single food safety inspection agency. We have so many different agencies. The federal government, including yours, that have a responsibility here and so many different standards between, for example, the U.S. Department of Agriculture and the Food and Drug Administration.

What is the frequency of inspection by the FDA of the food processing agencies that are under your jurisdiction?

Dr. HENNEY. Senator Durbin, I would ask Mr. Levitt if he could give you that precise information but as my memory serves me it is close to once every ten years in terms of many of the processing plants that we can inspect.

This issue is one that I tried to raise within the context of that part of the budget that looks at our post marketing surveillance capabilities; where we have not been able, because of limited re-

sources, to meet our food inspection goals within the context of our current budget.

Joe, could you be more precise about the answer.

Mr. LEVITT. Thank you.

Number one, seafood—let me take it in tiers—seafood inspection is now once every year. That is thanks to the appropriations that are provided by the Congress.

Senator DURBIN. And I might say just for the record. In context, meat and poultry inspection is on a daily basis. Seafood inspection is on an annual basis.

Proceed.

Mr. LEVITT. Okay. Thank you.

It is our goal to be able to do an annual inspection—in all of the, what we consider, high risk establishments, that is establishments that process products that are at high risk of microbiological contamination.

There are about 6200 such firms. The money that we have requested in this year's budget submission would allow us to do that. We have raised the frequency of those and we're now doing those every two to four years but we would like to get that down to one year.

The remaining firms are then food processors which would be regular food companies. And then we also have food warehouses which are also food establishments. We try to titrate overall—if you include all the food warehouses, the federal government is inspecting on the order of seven to ten years.

If you include states which also have a presence in a number of these areas, that the time comes down significantly. One of our goals is to increase our cooperation and collaboration not just with other federal agencies, as you've mentioned, but also with the states so that together we can provide the kind of food inspection presence that I think the consumer wants.

INTERNATIONAL INSPECTIONS

Senator DURBIN. In terms of international inspections, do you do any overseas inspections of food exporters to the United States?

Mr. LEVITT. We have a relatively small program that is growing. This year we are doing 100 overseas inspections. In our proposal in the budget before you; we would be able to more than double that to about 250 inspections.

Senator DURBIN. Out of a universe of how many plants that are subject to our jurisdiction?

Mr. LEVITT. Certainly, you know, many more than that. We are also——

Senator DURBIN. In the hundreds? In the thousands?

Mr. LEVITT. It is certainly in the thousands.

We are, I might add, complementing our overseas inspection effort, recognizing the magnitude that we're working with, complementing direct inspections with both technical assistance and foreign assessments.

In fact, yesterday and today at the University of Maryland, we're conducting a conference in conjunction with USDA on imported fresh fruits and vegetables. There are representatives of over 100 countries participating.

When I was at the Conference there was a lot of interest in providing for many of our trading partners the kind of food standard practices that we want to see here. It was good to see the enthusiasm that those people brought.

Senator DURBIN. Thank you. I think most Americans would be stunned to hear this. They believe that the level of inspection is going along at a much more frequent rate. That is not to take away anything from your agency.

I happen to think that the billion dollars that is appropriated for the Food and Drug Administration is one of our best investments at the federal level. But I think that, frankly, consumers across America are asking for us to do a better job and we need to provide you with the resources to accomplish that.

Mr. LEVITT. Thank you. That is why each year we are asking for increments at each stage.

Senator DURBIN. I'll close by saying that I believe there's a request for an increase of some 19 percent in your appropriation, if I'm not mistaken, for fiscal year 2000. And among the purposes is food safety, product safety, pre-market review and the like.

I'm afraid that under the budget resolution which we've enacted you may see a cut in your budget as opposed to a 19 percent increase. I hope that's just not the case. I just believe that we are shortchanging the safety of consumers across America if we do that.

Thank you, Mr. Chairman.

PHYSICIANS PAY COMPENSATION

Senator COCHRAN. Thank you, Senator Durbin.

I notice in the budget submission this statement about physicians pay compensation: "The fiscal year 2000 request reflects the administration's proposed cap on the increase of physician compensation at 6 percent. FDA's prorated share of the resulting reduction is $2.3 million which was taken from each of the affected program areas."

My question is what is that about? Is that an administration edict? Is this sort of budget gamesmanship? Does this really mean that physicians are going to get their compensation increased at something higher than 6 percent if there's not a cap ordered or included in the budget? Do we have to legislate this cap? Is this a previously legislated cap and it's just recited in here?

Dr. HENNEY. Mr. Chairman, I am glad you raised the issue but I am equally glad that Mr. Williams has volunteered to answer your question.

Mr. Williams: Mr. Chairman, this does not require legislation but it does—it is an increase. It's a limit on how much can be spent. It's not a reduction but a limit on the increase. And it arises from a concern by OMB about the level of physician compensation in the department and they've asked us to review our situation and to report back to them.

And it is obviously also in the context of a balanced budget. The Office of Management and Budget is seeking opportunities to economize where possible.

So we are to examine the effect of this limit and we expect to have further dialogue with the OMB. As far as we know, we are the only agency subject to this limit.

There are other agencies that employ physicians and have physician compensation systems similar to ours. But as far as we know, we're the only agency subject to this limit.

BIOTERRORISM

Senator COCHRAN. The budget proposes also a $13.4 million transfer to the FDA for anti-bioterrorism activities as part of the public health and social services emergency fund.

Specifically, my question is what is the FDA's role in this presidential initiative and what FDA activities will be supported with the $13.4 million transfer?

Dr. HENNEY. Mr. Chairman, the major thrust of the agency's effort with respect to the bioterrorism initiative is around the whole issue of vaccine development and the review of those products; an area where we have considerable expertise that we can bring to this issue.

A small portion of the amount requested is for the issue of food as it might be used in the event of bioterrorism or a bioterrorist attack. But it is a very small portion of this particular budget.

Senator COCHRAN. Let me thank you, Dr. Henney and your colleagues for your assistance to our committee.

We appreciate your presence and the fact that we had to reschedule this hearing and then had the full committee schedule another hearing on top of our schedule. So we had to speed this along a little faster than we would have liked. We appreciate your understanding and your patience with us the morning.

SUBMITTED QUESTIONS

Senator COCHRAN. We have additional questions that we will submit to you in writing to be answered for the record.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR THAD COCHRAN

INJURY REPORTING

Question. For fiscal year 2000, FDA is requesting a $15.3 million increase to begin to improve FDA's Injury Reporting system. Dr. Henney, you indicate in your testimony that "no integrated system for the reporting, monitoring, and evaluation of all FDA regulated product-related injuries currently exists." FDA currently has several programs to gather information on adverse events/injuries associated with the misuse or failure of FDA-regulated medical products and foods, including MedWatch, the Adverse Events Reporting System, FoodNet, the National Antimicrobial Resistance Monitoring System, and the Vaccine Adverse Events Reporting System. Is your plan to integrate these systems or to replace them with an entirely new Injury Reporting System?

Answer. Our intention is to have an integrated "system" for the reporting, monitoring and evaluation of adverse events and product defects associated with FDA-regulated products. Such a system is not merely defined by electronic/computerized hardware and software but an entire program of implementing effective interventions, a comprehensive system for effectively communicating risk information to health care providers and consumers who need it, as well as effective processes to continuously evaluate and improve all of our risk-associated activities. We believe that some components of this overall system do not currently exist in the Agency

and that other areas need enhancement and integration, such as many of the reporting systems listed in your question. There is no plan to replace existing reporting systems with a new system.

Question. Please describe how the Injury Reporting System FDA envisions will operate.

Answer. FDA's strategic goal is to minimize injuries, illness and deaths occurring from the use of FDA-regulated products, and improve the quality of available health care. The true risks associated with products become apparent only after they are in widespread use. Ongoing accurate identification and measurement of risks associated with all medical products, foods and cosmetics is the first step in an overall risk management strategy. Minimization of injuries also involves implementation of effective interventions, a comprehensive system for effectively communicating risk information to health care providers and consumers who need it, as well as effective processes to continuously evaluate and improve all of our risk-associated activities.

The "ultimate system" would begin with an integrated science-based mechanism for reporting, monitoring and evaluating adverse events and product defects associated with FDA-regulated products. In addition, full funding would provide FDA the resources to hire the necessary professionals trained to manage and track the flow of reports and to conduct the essential epidemiological, statistical and medical and scientific evaluations quickly enough for early intervention when significant problems arise. Current information systems are inadequate and are not systematically linked with any ability to share data electronically. Additionally, lack of connections with health care facilities, academia, and broad-based health information databases make it difficult to quickly explore potentially serious problems or conduct thorough investigations, e.g., FDA rarely has any denominator data available to evaluate the significance of specific reported problems.

One of FDA's primary objectives is to develop and implement a system which will improve the quality of information on adverse events and product defects associated with FDA-regulated products. Prompt identification of new, previously unrecognized problems with FDA-regulated products has the potential to decrease morbidity and mortality associated with those products and maximize their safe use. Thousands of deaths and injuries could be avoided, or their consequences reduced, through a comprehensive strategy aimed at finding out why incidents occur and implementing strategies to prevent them from happening again. A full understanding of the causes of product-related deaths and injuries is necessary to ensure that causes attributable to product labeling, design, or composition are addressed in the premarket review programs, where required. For products for which premarket review programs do not exist, such as dietary supplements and cosmetics, FDA needs information about the safety and usage patterns of such products in order to develop appropriate responses.

Accurate, complete, and efficient operation of adverse event reporting systems is only the first step in the management of product injury. Reported events must be analyzed, and other sources of data must be accessed to make sense of the reports and to determine what action, if any, is needed. All FDA safety programs need access to various medical databases. Successful use of these databases requires investment of time by FDA project managers, programmers, and epidemiologists, as well as investment in computing equipment. Modest funding increases for both staff and access to databases through contract vehicles are included in the proposal. In addition, funding for initiation of a sentinel site program for medical device adverse event reporting required by FDAMA is included. This active surveillance concept, if successful, may offer another mechanism by which FDA could acquire additional information regarding the nature, extent, and frequency of injuries due to FDA-regulated products.

Finally, the request includes funding for risk communication activities, particularly for professional and consumer outreach and education . These are intended to both improve the quality and scope of adverse event reporting by the health care community, and to communicate safety issues. Broader communications with health care professionals will be essential in ensuring that improved knowledge about product injuries actually improves people's health.

Question. Dr. Henney, you indicate that $15.3 million is the initial investment to implement an injury reporting system and that additional investments will be required in subsequent years to make a comprehensive system a reality. What is the estimated cost of the system FDA is planning?

Answer. The Agency performed an analysis and determined that $64.5 million in funding would be required for a comprehensive system. The fiscal year 2000 request includes $15.3 million to begin to address this. Such a system would include construction of an Agency-wide reporting system for product injuries, linkage with external databases to provide baseline data on the rate and characteristics of injuries,

strengthening of FDA's scientific research efforts in the area of epidemiology, and developing effective outreach and educational programs to facilitate better reporting and improve overall product-related risk management throughout the health care system.

Question. Dr. Henney, you indicate in your prepared statement that funds for the "limited implementation of a sentinel site program for medical devices are also included in the budget request". Would you please explain this program. Is this included in the $15.3 million increase requested to initiate an Injury Reporting System?

Answer. Yes, funding for this project is included in the $15.3 million increase requested for FDA's overall plan for injury reporting systems. FDA has substantial evidence of gross under reporting of adverse events from device users. In response to this concern, FDA initiated the Sentinel Surveillance pilot program to identify barriers to reporting and explore methods to improve both the quality and quantity of data from the clinical community. Sec. 213 of the 1997 FDA Modernization Act provides the Agency with the opportunity to implement a national Medical Device Surveillance Network, the design of which is based on extensive research from the pilot program, other surveillance systems, and safety experts. The system would provide more timely and better quality data and allow FDA clinicians and analysts to more accurately identify and assess medical device-related problems. Mandatory universal user facility adverse event reporting would be phased out. The Medical Device Surveillance Network will consist of a random sample of eligible health care facilities, stratified by type and perhaps several other variables. The sample would consist primarily of hospitals with additions of other types of care and/or specialty facilities e.g. maternity, children's etc. as needed. Facilities recruited into the Network would be encouraged to report all device-related problems, whether or not the problem resulted in a patient injury. As demonstrated in the pilot program, being alerted to potential problems prior to patient injury will allow FDA to focus on prevention. The availability of population exposure and denominator data from the Surveillance Network will allow FDA to quickly and reliably evaluate the extent of a problem and its impact on the public health. In addition, the Agency would have options for reducing or eliminating unnecessary user facility reporting costs. The Agency expects that industry will save approximately $19 million in reporting costs.

Question. How much is requested for this medical device sentinel site program?

Answer. FDA requested an overall increase of $15.3 million in the fiscal year 2000 budget for injury reporting and of this amount, the device program was allocated $3.2 million to implement phase one of a national Medical Device Surveillance Network.

Question. What level of funding is now being spent on these existing programs to collect information on adverse events, product defects, and product defects associated with FDA-regulated products?

Answer. We estimated our fiscal year 1998 base spending for these activities to be approximately $28 million, including approximately $11 million for information management systems.

TRANSFER OF THE COMMERCE SEAFOOD INSPECTION PROGRAM TO FDA

Question. The fiscal year 2000 budget proposes the transfer of the voluntary Seafood Inspection Program from the Department of Commerce to FDA. Why is the transfer of this program being proposed?

Answer. Transfer of the Seafood Inspection Program from the Department of Commerce to FDA will improve the safety of seafood in several ways. Establishing a Performance Based Organization or PBO at FDA will establish FDA as the sole seafood agency with one federal HACCP standard, thereby promoting efficiency, effectiveness, and consistency of seafood regulation. This centralization will help both domestically and internationally. In addition, the PBO will provide the potential of additional trained inspectors to implement the HACCP regulations, resulting in increased frequency of inspection. Consumers will benefit by improved food safety from an increased federal regulatory presence and a single HACCP standard established by FDA.

Question. The budget proposes that the Seafood Inspection Program be transferred from Commerce to FDA through appropriations language. Why isn't the Administration seeking legislative authority through the appropriate authorizing committees of the Congress for this transfer?

Answer. While the Administration has requested appropriations language to transfer the program as is, without establishing it as a Performance Based Organization or PBO, the longer term solution is authorizing legislation that would establish the Seafood Inspection Program as a PBO with the Department of Health and

Human Services. Department of Health and Human Services is currently working with the Department of Commerce and other parts of the Administration to finalize a draft proposal that would accomplish such a PBO. We are eager to work with Congress to achieve this goal.

Question. The current costs of the Seafood Inspection Program are covered by user fee collections from industry. The budget proposes that the program continue to be financed through user fee collections derived from the seafood industry. Why will the transfer of this program result in an additional $3 million cost to the American taxpayer?

Answer. Of the one time transfer cost of $3 million in budget authority requested, $1.5 million is requested for training. The Agency, in conjunction with the National Marine Fisheries Service, plans to provide FDA HACCP training for Seafood Inspection Program inspectors . This training will enhance and ensure uniformity in inspection approaches and the application of inspection techniques and safety standards at the federal level. In addition these resources may provide for some general training similar to the basic training provided to newly hired investigators and inspectors, which includes food and drug law, evidence development, interviewing techniques, and quality auditing. The balance of the requested funds will be used to educate the industry regarding the PBO, provide for other administrative or transitional costs and establish an operating reserve.

Question. What are the "transition costs" to FDA related to the proposed transfer of this program?

Answer. The budget request also includes $200,000 in anticipated start-up costs to facilitate the transfer and establishment of the PBO. These costs include information technology and other administrative costs associated with the transfer of the PBO.

Question. The budget indicates that the Administration will submit a legislative proposal to the Congress to make the Seafood Inspection Program a Performance-Based Organization under the auspices of FDA. Would you please explain this proposal more fully.

Answer. FDA and the Department of Health and Human Services are currently working with the Department of Commerce and other parts of the Administration to finalize a draft proposal that would transfer the Seafood Inspection Program of the National Marine Fisheries Service in the Department of Commerce to FDA in the form of a Performance Based Organization or PBO. A PBO is a quasi-public organization that is located in a federal agency but operated like a business in that it is to be financially self-sustaining. Although the federal agency oversees the PBO, the PBO is given a great deal of autonomy to run day-to-day operations, particularly in the areas of personnel and procurement, in order to respond quickly to customers' needs and marketing conditions.

The seafood inspection PBO would continue to perform the voluntary, fee-for-service inspection, grading, certification, and training services for the seafood industry and other customers currently performed by the Seafood Inspection Program in the Department of Commerce. In addition, FDA would be able to utilize these trained inspectors to perform regulatory HACCP inspections under one Federal HACCP standard.

Question. Would this legislative proposal be submitted if the program remains within the Department of Commerce?

Answer. We assume, if Congress rejects the $3 million requested in budget authority, that the proposed transfer and establishment of a PBO would be delayed, and that the Seafood Inspection Program currently authorized would continue to operate as it has for many years within the Department of Commerce. The legislation will be transmitted before the fiscal year 2000 appropriations bills are enacted

Question. Will the transfer of the seafood inspection program from Commerce to FDA improve food safety? If so, how?

Answer. Yes, the transfer of the Seafood Inspection Program currently located at the Department of Commerce to a PBO within FDA would improve food safety. First, such transfer would establish FDA's HACCP standard as the single safety standard at the federal level. Because the FDA standard would be employed uniformly in both voluntary and regulatory inspections, increased compliance with the seafood HACCP regulations will result. Second, the transfer would increase the federal regulatory presence throughout the seafood industry. The legislation would authorize FDA to commission PBO inspectors to perform regulatory inspections and would also allow FDA to rely on the results of the voluntary inspections to fulfill its regulatory obligation, perhaps eliminating the need for FDA to perform an additional regulatory inspection of a facility participating in the voluntary program.

PRODUCT SAFETY ASSURANCE

The budget requests an increase of $31.8 million in FDA's salaries and expenses appropriation to achieve statutory time frames for inspections. The justification indicates that this additional funding will, among other things: (1) allow FDA to leverage the Agency's enforcement capability internationally by working toward regulatory agreements with the European Community and other nations so that imports meet quality and safety standards, (2) increase the frequency of inspections for domestic products across-the-board, and (3) provide for targeted inspections on those areas with the most potential for serious injuries.

Question. What level of funding is now being devoted to FDA's enforcement of imports?

Answer. In fiscal year 1999, FDA is devoting $83.3 million and 941 FTE to the enforcement of imports. 15. ORA, OEA

Question. What regulatory agreements are currently in effect with other nations to assure that imports meet quality and safety standards?

Answer. We would be happy to provide for the record a table which shows what regulatory agreements are currently in effect with other nations.

INTERNATIONAL COOPERATIVE AGREEMENT

PRODUCT SAFETY ASSURANCE

Question. What additional agreements is FDA working towards?

Answer. We would be happy to provide for the record a table which shows what proposed regulatory agreements FDA is currently working to implement. [The information follows:]

PROPOSED INTERNATIONAL COOPERATIVE AGREEMENTS

	Subject
AUSTRALIA/Drug GMPs	Agreement on drug GMPs and pre-approval program.
AUSTRALIA/CVM EOLs	Exchange information on animal pharmaceuticals.
CANADA & MEXICO Scientific & Regulatory Areas.	Cooperation in scientific and regulatory fields of health
CANADA/MEXICO/Emergency Info	Agreement to enhance cooperation and to continue to exchange timely information in emergency situations.
CANADA/Seafood MRA	Mutual acceptance of seafood inspection results.
CHILE/Fresh Fruits & Vegetables MOC	Exchange of information and technical cooperation with regard to food safety control practices to protect public health and to facilitate trade of selected fresh fruit and vegetables.
CHINA/Ceramicware	Covers ceramicware intended for use in the preparation, serving, or storage of food or drink.
EU/Veterinary Products	Focus on developing a framework for working towards equivalence of systems. USDA and USTR are also parties to the agreement.

PROPOSED INTERNATIONAL COOPERATIVE AGREEMENTS—Continued

	Subject
KOREA/Shellfish Extension	Assure that imported fresh frozen molluscan shellfish are safe and wholesome and meet NSSP sanitation principles.
UKRAINE/Drugs and Biological Products	Importation of drugs and biologics into Ukraine.

DOMESTIC INSPECTIONS

Question. You indicate that the goal is to increase the frequency of inspections for domestic products (except for foods) to once every two years, as mandated by statute, through FDA inspections and additional state contracts. For drugs, biologics (registered blood banks), animal drugs, and medical devices, this would be inspecting the manufacturer every two years.

What is the current inspection level for each of these areas?

Answer. The current inspection level in fiscal year 1999 for a two-year statutory interval, by category, is drugs 22 percent, biologics 43 percent, animal drugs and feed 27 percent, and medical devices 26 percent. Successful biennial inspections would mean that inspections for each area should be at the 50 percent level. Although there is no statutory interval for food manufacturers, high risk food inspection levels are currently at 33 percent.

Question. What inspections are now being performed through state contracts and what additional contracts are being sought?

Answer. Currently, FDA has contracts with states to conduct inspections under the following areas: 40 food contracts; 19 medicated feed contracts; 49 MQSA contracts; and, 17 tissue residue contracts. We are planning to conduct a feasibility study to see how best to expand this program with the funds requested in the fiscal year 2000 budget.

Question. What is the inspection goal for foods? How frequently are inspections being performed now?

Answer. FDA established three primary inspection goals for foods in fiscal year 2000. The goals reflect the Agency's strategy in addressing risk with regard to both domestic and imported foods. These goals are for FDA to increase the frequency of high-risk domestic food establishment inspections to once every one to two years, and annually beginning in fiscal year 2001, achieve adoption of the Food Code by at least 35 percent of the states, and increase the number of inspections/evaluations of foreign food establishments from 100 to 250.

FDA is currently inspecting the 54,000 establishments in its inventory every 7 to 10 years. However, the Agency also has contracts with states to conduct inspections. This has increased the frequency of inspections to once every 4 to 5 years.

Question. What is the current domestic inspection funding and staffing levels and what increases are being sought?

Answer. The current domestic inspection funding is $87.7M and staffing level is 984 FTE. The increase sought for domestic inspections is $15.4M and 80 FTE. We would be happy to provide a table that displays a breakout of these totals by program area.

RESOURCES FOR DOMESTIC INSPECTIONS

[Dollars in millions]

	Current FDA domestic inspection staffing level (FTE)	Current FDA domestic inspection funding
TOTAL FDA	984	$87,730
FOODS	368	33,541
BIOLOGICS	185	15,649
HUMAN DRUGS	203	16,720
ANIMAL DRUGS	53	4,276
DEVICES/RAD HEALTH	175	17,544

The increase sought for domestic inspections is $15.4M and 80 FTE. The increases will be used to improve the frequency of inspections for domestic products through

increased inspections and state contracts. These efforts will not fully meet the statutory requirement of once every two years for biologics, human/animal drugs, and medical devices, as mandated by statute, but will improve product safety and quality systems conformance. The inspectional emphasis will be on high-risk product areas, i.e., for Medical Devices, Class II and III Manufactures only. We would be happy to provide a table that displays a breakout of these totals by program area.

FDA—INCREASES IN PRODUCT SAFETY ASSURANCE DOMESTIC INSPECTIONS ONLY

[Dollars in millions]

	Increase of staffing level (FTE)	Funding increase
TOTAL FDA	80	$15,400
FOODS	27	4,000
BIOLOGICS	13	3,200
HUMAN DRUGS	15	1,900
ANIMAL DRUGS & FEEDS	9	1,500
DEVICES/RAD HEALTH	16	4,800

Tables include Postmarket inspections only.
Tables do not include domestic sample collections and analyses, research, and Premarket inspections.
Tables do not include Tobacco and Other activities.

Question. What level of resources will be targeted on areas with the most potential for serious injuries?

Answer. We would be happy to provide a table that displays a breakout of these totals by program area.

FISCAL YEAR 2000 DOMESTIC INSPECTION FUNDING BY PROGRAM

[Dollars in millions]

	Staffing level (FTE)	Funding
TOTAL FDA	1,655	$199,600
FOODS	399	37,900
BIOLOGICS	236	22,900
HUMAN DRUGS	489	45,600
ANIMAL DRUGS & FEEDS	91	8,300
TOBACCO	28	42,000
OTHER ACTIVITIES	163	15,000
DEVICES	249	27,900

DOMESTIC INSPECTIONS—HIGH RISK AREAS

Question. What high-risk areas have been identified?

Answer. The high risk areas in the medical devices program that have been identified are those products that are intended for surgical implant into the body or to support or sustain life and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

A limited example of those products include: cardiovascular devices, pacemakers, stents, intra-aortic balloon and control systems, cardio-electrodes, defibrillators, implantable orthopedic devices, infusion pumps, anesthesiology devices, ventilators, condoms, surgical gloves, intra lens, peritoneal dialysis systems, surgical lasers, electro-surgical products, and many others.

High risk areas in the human drugs program include adverse drug event investigation and follow-up, nontraditional drugs, drug products with microbiological contamination issues, controlled release dosage forms, stability problems, process validation issues, medical gas manufacture and delivery, and Y2K readiness

It is important to consider that a prolonged priority-based program will cause us to not inspect for very long periods important numbers of drug firms in the lower priority levels. This lack of contact causes broad scope drift to out of compliance situations. The biennial inspection allows us to interact with companies and provide

the kind of direction which may keep many firms from going out of compliance, while also finding those with the violative conditions and practices requiring full compliance attention. Over the long run biennial inspections keep many companies, especially he smaller ones from being involved in serious compliance problems.

The biologics program high-risk areas that have been identified are registered blood banks; source plasma operations; and biological product manufacturing establishments. The Food and Drug Modernization Act of 1997 or FDAMA requires FDA to perform biennial good manufacturing practice, or GMP inspections of registered biologic firms.

The high risk areas in the animal drugs and feed program include Bovine Spongiform Encephalopathy or BSE—an immediate health hazard; illegal drug residues in Meat and Poultry; National Milk Monitoring, a chronic public health risk; feed contaminants, an acute public health risk involving mycotoxins, pesticides, dioxins, microbials, contamination response issues, etc.; and Drug Process and New Animal Drug and Medicated Feed Inspection where experience has shown reduced coverage causes increased lack of statutory compliance, thus an increased public health risk.

The Foods high risk areas include ready to eat products which will undergo no or minimal processing, such as heating, freezing, washing, that would eliminate a pathogenic organism on the food. These products include fresh fruits and vegetables, bakery goods, cheeses, cooked pasta dishes, etc.; heat and serve products which normally receive a heat treatment prior to final consumption by the consumer; all low acid canned and acidified foods which if not properly processed may present a potential hazard to health in the form of botulism; seafood products particularly those that are scrombotoxic e.g. mahi mahi, pompano, tuna, salmon, swordfish, those susceptible to ciguetera, e.g. grouper, snapper, Spanish mackerel and those susceptible to other natural toxins including paralytic fish poison, amnesic shellfish poison, gemphlotoxin, etc.; and infant formula.

SPENDING PRIORITIES

Question. In its plan for Statutory Compliance, FDA indicates that "significant additional resources, as well as prioritization of FDA activities, are essential if FDA is to meet its statutory requirements on a sustained basis and to meet public expectations". It is unlikely that significant additional resources will be available to this Committee given that spending must be brought below the fiscal year 1999 levels to comply with the statutory caps on discretionary appropriations. Given this, what can you tell us about FDA's plans to prioritize its activities and redesign its internal operations and processes to better utilize its existing resources to meet its statutory obligations and to meet newly emerging challenges?

Answer. In an effort to meet its statutory obligations and emerging public health challenges, FDA must continuously and carefully examine its priorities. Our focus on risk-based decision making , the use of third parties in the regulatory process, technologic enhancements, and systems reengineering will all contribute to a better, more efficient use of resources. Involving our external stakeholders, as well as state and federal government collaborators becomes increasingly important in an environment of diminished resources. These constituents help the Agency in understanding emergent issues, and they contribute ideas to improve our systems.

Within this scenario of funding limits, FDA's overall strategic directions that are outlined in the FDA Modernization Act "Plan for Statutory Compliance" remain as viable approaches to a fiscally uncertain future.

FDA's six strategic directions mentioned here include establishing risk-based priorities, strengthening the scientific and analytical basis for regulatory decisions, working more closely with external stakeholders, continuing to re-engineer FDA processes, adopting a systems approach to Agency regulation, and capitalizing on information technology. We believe that these six strategic directions constitute a framework for managing environmental changes of many different sorts—fiscal, scientific, human resource, consumer preferences, and so forth. Even with this strategic framework, however, the outcomes become a matter of degree in relation to the resources available to address those statutory or public health priorities.

Question. Given the likelihood that this Committee will not have additional resources available to it above the fiscal year 1999 level, what priority would you place on the increases FDA requests for fiscal year 2000?

Answer. FDA has requested an increase of $216 million in appropriated funding for fiscal year 2000. This increase request resulted from a comprehensive analysis of our current performance levels and those levels needed to achieve our statutory obligations. Our experience tells us that without additional resources, progress toward many very important outcomes cannot be achieved.

For example, $95.5 million of the increase request is intended to boost the public health infrastructure. That includes reducing injuries from the improper use of FDA regulated medical products, protecting consumers and industry from unsafe products by enhancing inspectional coverage of domestic and imported products, and reducing delays in getting important new products on the market. Without additional funding, FDA cannot meet its statutory obligations in the short-term or the long-term. Even with system-wide improvements in setting priorities and increasing efficiencies, the diminishing resources cannot be overcome because the future cost of rebuilding the public health infrastructure will be considerably higher than the incremental maintenance of the existing system.

Other components of the increase request include the Presidential Initiatives for addressing bioterrorism, preventing tobacco use among youth, and food safety, as well as mammography quality standards. Without increased resources, FDA will be ill-equipped to respond to those priorities.

PREMARKET APPLICATION REVIEW

Question. The fiscal year 2000 budget requests an increase of $11 million for premarket application review to improve FDA review times for premarket approvals to meet statutory requirements, supplemented by $17 million in collections from proposed new "additive" user fees.

The budget justification submitted to this Committee indicates that premarket review of food and color additive petitions "is one particular area where FDA recognizes the need to improve performance." How has the agency worked over the past several years to improve its level of performance in this area within existing resources?

Answer. In April 1995 and May 1996 FDA reported to a Congressional oversight committee regarding the premarket review of food and color additive petitions. At the time of the 1995 hearings FDA had an inventory of 295 petitions of all types.

FDA has implemented several activities to improve the level of its performance. In late 1995, and again in late 1996 FDA's Center for Food Safety and Applied Nutrition or CFSAN, reallocated resources within the Center to transfer 23 employees from other programs to the premarket review program for food and color additives. In addition, FDA provided an influx of 7 million dollars for infrastructure improvements and for third party reviews to provide scientific input into premarket reviews to help reduce the number of overdue petitions and speed the review of newer petitions. By the end of fiscal year 1996, FDA had reduced the 1995 petition inventory of 295 by more than 100 petitions. Since the 1995 hearing FDA has received over 220 food and color additive petitions, including over an increase of more than 50 percent in the number of petitions submitted from fiscal year 1997 to fiscal year 1998, and has successfully completed the review of over 100 of those approximately 220. The current inventory is approximately 220 petitions.

Since April 1995, CFSAN also has codified a threshold of regulation process for exempting low-risk food additives migrating from food packaging from the requirement of a food additive petition. FDA estimates that this process has thus far eliminated the need for over 200 petitions to be submitted to the agency.

Question. The FDA plan for statutory compliance issued in November of 1998 indicates that FDA has successfully adopted a number of innovations and re-engineering approaches to improve review performance, but has now reached the point where additional improvements in performance for non-PDUFA statutory requirements cannot be met without additional resources. What innovations and re-engineering approaches has FDA adopted to improve review performance times?

Answer. PDUFA is a successful model both in terms of reduced review times and terms of facilitating the development of needed products. In other areas, however, this is a problem because there is a mismatch between the enormous societal investment in new product development and the resources available to FDA to fulfill its expanded role of facilitating the development of these new therapies. The consequence is evident in FDA's performance plan. In Medical Devices, it is estimated that the percentage of Premarket Applications reviewed within 180 days will drop from 83 percent to 70 percent between fiscal year 1998 and fiscal year 1999. In Veterinary Medicine, the percentage of New Animal Drug Applications and Abbreviated New Animal Drug Applications reviewed within 180 days is projected to decrease from 75 percent in fiscal year 1998 to 65 percent in fiscal year 1999. Even if review times are maintained, this will be achieved by devoting increasing proportions of the science base resources to application review. But, with resources that keep pace with America's R&D investments, FDA can hope to keep up with industry's scientific and technological advances, and not only reduce review times in all areas of product review, but also play the vital role in shaping a more efficient and produc-

tive product development process in accordance with the new FDAMA mission statement.

Question. How have review times been improved through these innovations and approaches?

Answer. I would be happy to provide a detailed report of how review times have been improved for each of FDA's review activities.

Center for Devices and Radiological Health

FDA continued with its major reengineering effort, initiated in 1997, to improve the device review program and make it more responsive to stakeholders. FDA also made substantial progress in implementing the device provisions of the FDA Modernization Act (FDAMA). FDA anticipates that improvements and changes that arise from reengineering and FDAMA activities, when fully implemented, will enhance performance levels beyond fiscal year 1999. The table below shows that for fiscal year 1998, FDA met its goal in reviewing 510(k) first actions within the statutory time limit but a lot improvement is still needed in the review program for 510(k) final actions, PMAs, and PMA supplements.

[In Percent]

Goal Statement	FDA Performance in fiscal year 1996	Performance in fiscal year 1997 (reengineering Initiated)	Performance in fiscal year 1998	Statutory Performance
Complete review of PMA first actions within 180 days and HDE actions within 75 days	51	74	79	100
Review final actions for PMA Supplements within 180 days	69	65	89	100
510(k) firstactions within 90 days	94	98	99.6	100
Complete 510(k) final actions within 90 days	65	70	75	100

Center for Drug Evaluation and Research

These initiatives are directed at reducing the total time to approval of generic drugs (ANDA's), not specifically to reduce review times. (As background, approval times include agency review times as well as time with firms to address any deficiencies identified by agency reviewers. Average review times for original ANDA and major amendments has not changed by much in several years, i.e., we review about 50 percent of the ANDA's within 180 days.)

However, as a result of these initiatives, total time to approval of generic drugs has decreased as shown:

Fiscal year	*Median approval time in months*
1995	28.2
1996	4.7
1997	9.6
1998	8.7

Center for Veterinary Medicine

Review times for the Animal Drugs and Feeds Program have not yet improved. FDA's move away from the traditional review process for New Animal Drug Applications toward the phased review process has added a small amount of work to the review of applications. However, this change is expected to increase animal drug availability, reduce the overall animal drug development time, and reduce the time and costs to sponsors for developing new animal drugs.

Center for Biologics Evaluation and Research

The Prescription Drug User Fee Act (PDUFA) has resulted in more and better applications that can be filed immediately, and reviewed and approved more quickly. New products get on the market faster, and the American consumer and the pharmaceutical industry benefit. The cumulative effects of additional human and financial resources; the use of project management methodology to guide the review process and monitor the increasing workload; the elimination of overdue applications; and the increased emphasis on timeliness as a performance measure, have signifi-

cantly improved Agency and industry performance, predictability, and accountability.

The median approval time (from application receipt to approval) for PDUFA product license applications (PLAs) and biologic license applications (BLAs) at CBER has declined dramatically from 31.3 months in fiscal year 1993, to 12.0 months in fiscal year 1997. (CBER's performance against the fiscal year 1998 12-month review performance goals will not be available until the end of fiscal year 1999, 12-months after the end of the fiscal year.) In fiscal year 1993, the year before PDUFA became effective, CBER's median PLA/BLA approval time was 31.3 months for PDUFA-type applications.

FDA's review performance with non-PDUFA license applications has also improved, however, not as dramatically as with the PDUFA applications. In fiscal year 1997, CBER's median approval time for non-PDUFA PLAs/BLAs was 8.3 months compared to 23.3 months in fiscal year 1993.

Question. And, why has the agency now reached the conclusion that no further improvements can be made without additional resources?

Answer. For the past several years, the Agency has made concerted effort to reengineer its application review process. However, we do not foresee any additional improvements on the immediate horizon that will have a substantial impact Improvements at this point are likely to have only minor savings for the review process. This is a serious concern if the rate of submissions of new applications continues to increase as it has over the past few years. With reengineering efforts and implementation of FDAMA activities, FDA has made substantial progress in many aspects of its application and review program. For example, review times for certain applications have decreased significantly and backlogs have been eliminated. However, improvements in other areas are still needed and prospects for these improvements are dim without additional resources. The Agency has been asked to take reductions each year to streamline operations, while expending substantial reviewer and other resources to implement other initiatives. Just as was the case for PDUFA applications, with additional resources to hire more reviewers and improve the information technology infrastructure, the Agency can achieve the levels of performance the American people deserve.

NEW USER FEES

Question. The fiscal year 2000 budget indicates that user fee legislation will be submitted to the Congress to enable FDA to expand its programs for the review of new medical devices, food additives, and food contact substances.

When will these legislative proposals be transmitted to the Congress?

Answer. Proposed legislation to authorize new fees to enhance the quality and timeliness of premarket review for both direct and indirect food and color additives, and for medical devices is in clearance within the administration. The legislation is anticipated to be completed shortly and submitted to the appropriate committees in Congress.

Question. What fee schedules were assumed as the basis of the budget estimate that an additional $17 million can be collected and available to the FDA in fiscal year 2000 from these proposed new user fees, if enacted into law?

Answer. The budget proposes FDA be authorized to charge fees totaling $17.0 million in fiscal year 2000 to improve performance in review of medical device applications and food and color additive petitions. It also requests a premarket notification program for food contact substances established under the FDA Modernization Act. FDA proposes a device user fee program that will generate approximately $7 million in premarket review fees associated with high-risk devices and device registration fees each year of its existence. The Agency also proposes a foods premarket review fee program that will generate approximately $10 million in fees, $4 million for food additive petitions and $6 million for a premarket notification program for food contact substances. The exact amounts of the individual fees will be forthcoming with the transmittal of the Administration's legislative proposal.

The Food and Drug Administration Modernization Act of 1997 amends section 409 of the Food, Drug, and Cosmetic Act to establish a process whereby the manufacturer or a supplier of a food contact substance can notify the FDA of the intent to market certain food contact substances and, unless FDA objects to the notification within 120 days, the manufacturer may proceed to market the product. This premarket notification program for food contact substances is a replacement for the food additive petition, or FAP, process for the majority of food additives that are food contact substances. It also is an alternative to the Agency's threshold of regulation or TOR process for exempting food additives from the requirement of an approval regulation.

The Agency expects that this notification process will be very attractive to industry because a notification will require information comparable to that in an FAP or TOR submission, but will automatically become effective after a 120-day review period if FDA does not object to the marketing of the substance for the proposed use. Unlike food additive approvals, premarket notifications will be proprietary since such notifications will authorize the marketing of substances only for the substance identified in the notification and not similar or identical substances prepared by someone other than the manufacturer listed in the PMN. Based upon these two factors, the Agency expects to receive a larger number of notifications than it presently receives as FAPs and TOR submissions for food contact substances.

As amended, section 409 requires that the Agency object to a premarket notification within 120 days of its filing in order to prevent a food contact substance from being marketed. While food contact substances are used such that they typically enter the diet only at relatively low levels, they also may be or contain toxic chemicals. Therefore, it is essential that the Agency have the necessary resources to complete the review of PMNs within the allotted time and identify those substances that have not been shown to be safe. Likewise, it is important to ensure that existing resources in the FAP and TOR programs are not redirected prematurely.

Food Additive Petitions will still be required for certain food contact substances of greatest public health concern and for food additives added directly to food. These required petitions are typically the most resource intensive to review. FDA's program for premarket review of food additive petitions needs adequate support to meet goals established under the Government Performance and Results Act, to reduce the current petition inventory, and to make progress towards meeting statutory time frames, as mandated by Section 903 of the Federal Food, Drug, and Cosmetic Act, as amended by FDAMA. Thus, if the resource demands of the PMN program are not adequately provided for, resources from the related food additives program may need to be redirected to PMN, with the result that goals of the food additives program would be undermined.

Legislation would authorize collections of additive user fees to support costs of review of food and color additive petitions and would conform the current additive user fee authorization to the fee authorization for food additives. Fees would be assessed on each person who submits a food or color additive petition and on food ingredient manufacturing establishments as defined in the bill. Revenue from the fees would be used to increase resources available for the review of food additive and color additive petitions and related activities, with the goal of significantly expediting these reviews and supporting more prefiling discussions and consultations with petitioners.

Regarding device user fees, as indicated by FDAMA requirements, Congress and Agency stakeholders expect more timely and interactive PMA reviews. Accordingly, FDA will use these additive device user fees to significantly increase the effort devoted to PMA and PDP reviews, including enhancing the timeliness and quality of the review process as well as increasing interactions and consultations with industry. In addition, the user fee revenue will enable FDA to stay current with increasingly complex new technologies, update review standards and provide high quality, timely guidance to industry and reviewers. The medical device strategy is to concentrate resources on high risk, high impact products or work areas where they are likely to have the greatest impact on public health. With the proposed user fees, the percentage of reviews completed within established time frames will increase, average review times will go down, and the FDA will be able to support increased interaction with industry.

Question. Has the FDA consulted with the affected industries in the development of these user fee proposals?

Answer. In the area of food additives, review fees are proposed for increasing support for the review of food and color additive petitions, and funding the program, established in FDAMA, of premarket notification for food contact substances, or so-called indirect food additives such as food packaging materials.

With regard to food contact substance premarket notification, it is our understanding that this program is generally supported by the affected industry. Further, the program as incorporated in the Senate version of the FDAMA legislation included a user fee provision that we understand was supported by industry.

With regard to fees to support the review of food and color additive petitions, we understand a group of the larger companies that produce food additives directly added to food and several major trade groups of the food industry have endorsed the concept of user fees, as long as those fees are additive to the base budget, are targeted explicitly to improving the timeliness of petition review, and are accompanied by clear, publicly articulated performance goals. The industry is also concerned that any fee program include legislative and management changes to the re-

view process. We certainly agree with the principles expressed, and believe we can work with the industry and consumer groups on process changes that we can all endorse.

FDA is requesting a total of $7.0 million in medical device fees to improve the quality and timeliness of its medical device review process. Growth in the size of the device industry and in the complexity of new medical devices will continue to challenge the FDA unless additional resources for device reviews are available. The proposed user fee funding will enable the FDA to expedite review of PMA/PDP applications and achieve statutorily established performance goals by 2002. In 1997 during FDAMA discussions, the device industry made it clear they wanted substantive review and decisions in 90–180 days from submission.

Question. Will the Administration's proposals affect small businesses or will small companies be exempt?

Answer. The vast majority of the device industry are small businesses, 96 percent have fewer than 100 employees and 98 percent have fewer than 500 employees. Therefore, fees are being focused on PMA applications, which tend to be submitted by larger firms, and some waivers for small businesses are being considered. Administration officials are in the process of discussing this proposal with industry.

GENERIC DRUGS

Dr. Henney, this Subcommittee for the past two years has directed additional funding to the Office of Generic Drugs. An increase of $1 million was provided for each of fiscal years 1998 and for fiscal year 1999.

Question. Please provide the total funding level and full-time equivalent staffing level for the Office of Generic Drugs in each of fiscal years 1997, 1998 and 1999.

Answer. I would be happy to provide a table that displays that information.

OFFICE OF GENERIC DRUGS RESOURCES

Fiscal Year	Funding Level/ Operating Budget	FTE Ceiling
1997	$8,991,000	127
1998	9,693,000	132
1999	10,693,000	132

Question. Please indicate how the full-time equivalent staffing positions for the Office of Generic Drugs were allocated in each of fiscal years 1997, 1998, and 1999.

Answer. We do not calculate staffing allocations based on ceiling levels. However, I will provide a chart with information about the on-board staff by discipline.

OGD ON-BOARD STAFF BY DISCIPLINE

Discipline	Fiscal year 1997	Fiscal year 1998	Fiscal year 1999
Chemistry Reviewers	47	48	44
Bioequivalence Reviewers	24	22	25
Consumer Safety Officers/Project Managers/Techs	17	17	15
Clerical (Secretaries/Clerks, TIA's)	10	11	11
Labeling Reviewers	9	11	11
Legal, Administrative, Management	8	9	7
Microbiologists	2	2	4
Application Examiners	2	2	2
Medical Officer	1	1	1
Computer Specialists		1	2

Question. What is the fiscal year 2000 total funding request and full-time equivalent staffing level for the Office of Generic Drugs?

Answer. The total funding request for the Center for Drug Evaluation and Research's Generic Drug Evaluation program for fiscal year 2000 is 366 full-time equivalents, and a total request of $38,298,000. This total includes a $1.9 million proposed increase in funding for the Office of Generic Drugs, which would include funds for 11 additional FTE.

Question. For fiscal year 2000, the President's budget proposes to add 11 more full-time equivalent positions to the Office of Generic Drugs and to increase funding by $1.9 million. If this Subcommittee ultimately approves that increase, what assurances can you provide the Subcommittee that the funds will go towards the hiring of more generic reviewers and not be diverted to other areas of the Center for Drug Evaluation Reviews (CDER) or the Office of Regulatory Affairs?

Answer. The requested resources will be directed toward the review of generic drugs to provide additional review staff as well as infrastructure support and improvement for the Office of Generic Drugs. As in years past, if concurrent cuts in resources are mandated in the Agency, the Center will not be able to protect the generic drugs program from such cuts. Therefore, the additional resources would have to, at least in part, offset any mandated reductions. If approved, this increase for the Office of Generic Drugs will provide improved general information technology infrastructure environment which currently results in delays in approvals of generic products; expedite the transition toward electronic review; allow the Office to recruit hire, and train new generic drug reviewers; maintain the system for electronic reviews and the database for use by reviewers, or archival submissions for the Entry Validation Application program introduced by CDER's Office of Pharmaceutical Science in 1997 for electronic structured submissions of bioequivalence data that accompanies generic drug applications; enhance systems to include electronic microbiology and labeling data and other related initiatives e.g., online copies of labeling.

Question. While the Office of Generic Drugs has made some positive improvements in its approval times for drug applications, it still falls short of meeting its statutory obligation to approve applications within a 6-month period. According to FDA's own figures, the average approval time in 1998 was 18 months, three times more than the statutory period. Equally troubling is the fact that since 1994, the number of generic applications pending over the 6-month period has grown from 54 to 127 in 1998. What amount of resources does FDA need to meet the 6-month approval time required by law?

Answer. The increase of $1.9 million, including 11 FTE, will not allow FDA to meet the statutory requirement to review abbreviated new drug applications (ANDA's) within a 6-month period.

As background regarding ANDAs, the Food, Drug and Cosmetic Act states in Section 505(b)(4)(A), "Within one hundred and eighty days of the initial receipt of an application under paragraph (2)... the Secretary shall approve or disapprove the application." Therefore, either an approval or disapproval is considered by FDA to be a final action. The agency makes every attempt to meet this requirement; however, for a number of reasons it is not always possible to do so. After receiving a disapproval action, manufacturers frequently resubmit applications that address the deficiencies indicated in the disapproval action.

Neither the Center nor the Office of Generic Drugs has conducted a study on the budgetary needs to review the majority of applications within 180 days given the current review environment. However, we believe the needs are substantial and would have to include the needs of other Agency components that play a supporting but critical role in the generic drug review process.

At this time, we believe that the key to addressing current review backlog and improving action times is increasing the number of chemistry, microbiology, and labeling reviewers within OGD. In addition, funding is needed for research to support the development of scientifically rigorous bioequivalence testing methodologies for nonsytemically absorbed drug products. The review and approval of such products are often subject to challenge by innovator firms. The stronger the scientific support of these approvals, the more likely it will be the Office can successfully meet innovator challenges.

RELOCATION COSTS

Question. The fiscal year 2000 budget requests an increase of $4.64 million for one-time costs associated with the relocation of the Center for Food Safety and Applied Nutrition to its new College Park, MD, facility.

Will the $4.64 million fully satisfy the costs of installation of the building's telecommunications system and security equipment costs?

Answer. The fiscal year 2000 budget request included funds for one-time costs to cover those items that must be purchased early to prepare the building for occupancy. The $4.64 million will satisfy the major portion of the building's telecommunications system, as well as most of the security equipment costs.

Question. You indicate that occupancy of the new facility is scheduled for early 2001. Will this move result in an increase in GSA rental of space costs or relocation costs in fiscal year 2001?

Answer. Preliminary discussions with GSA have indicated that the addition of the College Park rental payment along with the elimination of the FB–8, Switzer Building, and Vermont Avenue rental payments will result in a relatively similar or slightly lower annual rental costs. Until final rental costs are received from GSA, FDA is unable to determine the exact amount, if any, of the change in rental costs. There will be one time expenses to move the existing laboratory and office equipment and furnishings from Washington to the College Park location in fiscal year 2001.

Question. What additional costs are anticipated?

Answer. Additional costs are anticipated for a number of expenses including new laboratory equipment needed due to laboratory design, audio-visual equipment for the auditorium, training and conference rooms, some furniture, special computer requirements, an electronic database and microfilming to compensate for smaller library size and other items. Funding for these additional costs will be requested in the fiscal year 2001 budget.

TOBACCO

Question. The fiscal year 2000 budget proposes to double funding for FDA's youth tobacco prevention activities to $68 million from $34 million in fiscal year 1999. Would you please tell us how FDA is spending its current resources (1) on State contracts for inspection of retail outlets that sell tobacco, (2) on its multi-media advertising campaign, and (3) on product regulation, etc.

Answer. The fiscal year 1999 budget is divided into two active components: enforcement and outreach. Twenty-two million dollars is budgeted for contracts with states and territories to enforce the age and ID provisions of the regulations. Ten million dollars is budgeted for outreach efforts. Two million dollars is budgeted for salaries and overhead. The Agency did not budget money for product regulation while the Supreme Court considers the case. However, certain limited activities are ongoing in the regulation area for example, the agency, in conjunction with other agencies within DHHS, is conducting an 18 month research project into the efficacy of the FTC tar and nicotine testing procedure at the request of the FTC.

Question. How effective have we been in each of these areas to date, and will the fiscal year 2000 requested funding enhance these efforts?

Answer. In 1997, over a 3 month pilot period, the program completed 1,400 compliance checks. In fiscal year 1998, the Agency completed 30,095 checks, and in fiscal year 1999 the Agency has contracted to perform approximately 200,000 checks. 48,778 compliance checks have been completed so far in fiscal year 1999. With the enhanced funding requested, FDA could inspect 400,000 facilities and could ensure that many retailers in America were visited at least once a year.

In order to determine the effectiveness of these activities, FDA is working with other agencies within DHHS to coordinate data and surveillance needs. These needs include monitoring tobacco use by youth, retailer compliance rates etc. FDA itself has established a computerized tobacco database to gather the results from its compliance checks, including the number of violations, the amount of civil money penalties, etc. The database will allow FDA to measure the effectiveness of its own enforcement efforts. Finally, the Agency conducted the first of many tracking studies to evaluate the effectiveness of its outreach efforts. Findings from the first ten media markets indicate that awareness of salient provisions of the tobacco regulation rose following FDA outreach campaign.

Question. Please provide a table providing a breakdown of the FDA tobacco budget for the past three fiscal years, indicating the available funding and obligations by fiscal year for each aspect of the program, advertising, compliance, enforcement, product regulation, etc.

Answer. I would be happy to provide a table which shows a breakdown of the FDA tobacco budget.

TOBACCO BUDGET

[In millions]

Category	Fiscal year 1997	Fiscal year 1998	Fiscal year 1999
Enforcement [1]	$2.0	$16.4	$22.0
Outreach [2]	1.0	12.8	10.0
Salary & Overhead	1.9	2.0	2.0

TOBACCO BUDGET—Continued

[In millions]

Category	Fiscal year 1997	Fiscal year 1998	Fiscal year 1999
Information Technology	.....	2.8	.....

[1] Enforcement includes enforcement, compliance, state contracts etc.
[2] Outreach includes national advertising, retailer education, maintenance of a hot line, etc.

Question. Dr. Henney, you indicate in the prepared statement that in fiscal year 1998, FDA began seeking civil money penalties from retailers found to have sold tobacco to minors at least twice. What were the collections from these civil penalties in fiscal year 1998 and in fiscal year 1999 to date?

Answer. So far, the civil money penalties that have been assessed and paid have amounted to over $223,000. These amounts were collected from retailers found to have violated the rule twice and in a few cases three times. First violations result in a warning and second violations result in a complaint seeking $250 fine. Mitigating circumstances in some cases can justify a reduction in the fine below $250. The program has just started processing civil money penalty complaints for third violations. The fine for a third violation by the same retailer is $1500. All civil money penalty fines are payable to the U. S. Treasury.

In fiscal year 1998, the program collected $42,625 in civil money penalties from second time violators. In fiscal year 1999, the program has collected, to date, $181,000 in civil money penalties from second and third time violators.

Question. Are these receipts available to the FDA or are they deposited in a Department of Treasury receipt account?

Answer. The checks are made out to the US Treasury and are not credited to FDA's use.

Question. The Substance Abuse and Mental Health Services Administration (SAMHSA) has been conducting enforcement efforts for years. Why should the FDA duplicate their efforts by conducting their own training for their enforcement and their own sting operations?

Answer. The FDA and SAMHSA efforts are not duplicative. Under the Synar program, SAMHSA oversees a program that conditions the states' receipt of substance abuse block grants on certain tobacco control activities. The Synar program is built around statistical sampling of youth access to tobacco products. The FDA program currently consists of direct enforcement of two provisions of the Agency's final tobacco rule. These provisions establish 18 as the minimum age of sale of cigarettes and smokeless tobacco products, and require retailers to verify age by demanding photographic identification from customers under the age of 27 seeking to purchase cigarettes or smokeless tobacco products. The FDA rule contains many other access and advertising restrictions that are not in effect. FDA and SAMHSA closely coordinate their efforts. In fact, states are permitted to include their Synar compliance checks in the checks that are being conducted under contract to FDA.

Question. Many retailers have complained that notifications of violations are taking too long, sometime up to four months, and due to the high turnover rate of employees, the information provided comes too late to use for secondary training of clerks. What has the FDA done to address this problem?

Answer. Retailers are entitled to timely notification of violations of the FDA tobacco rule. We have made significant progress in providing more timely notification. Today, 90 percent of the letters informing retailers of a first violation of the tobacco rule are mailed within 2 weeks of the date of the inspection. In addition, FDA allows inspectors to return at the end of the day or the end of the shift to notify a retailer of a violation of a comparable state law prohibiting the sale of tobacco products to minors. We are also piloting a program in which investigators immediately notify a retailer of a violation of the FDA tobacco rule or a comparable state law.

PRESCRIPTION DRUG USER FEE ACT

Question. What are the fiscal year 1998 and current fiscal year 1999 base appropriation levels for prescription drug review and approval activities which are enhanced by collections from the Prescription Drug User Fee Act user fees?

Answer. The Prescription Drug User Fee Act specifies certain conditions that must be met each fiscal year based on the FDA's Salaries and Expenses appropriation before the FDA can collect any fees. One of these conditions is that the amount of FDA's Salaries and Expenses appropriation are equal to or greater than the amount of appropriations for the salaries and expenses of the Food and Drug Ad-

ministration for fiscal year 1997 multiplied by the adjustment factor applicable to the fiscal year involved. For making this comparison, FDA's 1997 Salaries and Expenses appropriation must be adjusted each year by an adjustment factor, which is defined in section 735(8) of the Act. The term 'adjustment factor' applicable to a fiscal year is the lower of the Consumer Price Index for all urban consumers, representing the United States city average, for April of the preceding fiscal year divided by such Index for April, 1997, or the total of discretionary budget authority provided for programs in the domestic category for the immediately preceding fiscal year, divided by such budget authority for fiscal year 1997. Over the period of time since 1997, due to low inflation, the Consumer Price Index has been the lower of these two factors, and thus determines the adjustment.

For fiscal year 1998 only, the fiscal year 1997 Amendments to PDUFA specified that the base required appropriation be the same as that for fiscal year 1997. For fiscal year 1999, the consumer price index of April 1998 (162.5) divided by the Consumer Price Index of April 1997 (160.2) gives an adjustment factor of 1.0144. This factor is applied to the fiscal year 1998 base Salaries and Expenses appropriation that was $819,871,000. For fiscal year 1999, the FDA appropriation minimum is $831,743,368.

For fiscal year 1998, FDA's total Salaries and Expenses appropriation, excluding user fees, was $857, 501,000. For fiscal year 1999, FDA's total Salaries and Expenses appropriation, excluding user fees and $82,866,000 in GSA rent, was $888,001,000.

Since the fiscal year 1998 amount exceeds the fiscal year 1997 amount, and the fiscal year 1999 amount exceeds the fiscal year 1997 amount, as adjusted, the conditions of the Prescription Drug User Fee Act have been met.

The other appropriations requirement specified in PDUFA is that the amount FDA spends on the process for the review of human drug applications be as much as in Fiscal 1997, adjusted in Fiscal 1999 and following years in a similar manner as the adjustment factor for the salaries and expenses appropriation. In Fiscal 1997, FDA spent $147,959,689 within its Salaries and Expenses Appropriation on the process for review of human drug applications. In Fiscal 1998, FDA was required to spend the same amount, but actually spent $151,836,635. In Fiscal 1999, FDA will be required to spend, exclusive of fees, $150,083,965 on the drug application review process. FDA expects to spend at least that much.

FISCAL YEAR 2000 APPROPRIATION BASE FOR PDUFA

Question. What is the base level assumed in the fiscal year 2000 budget request?

Answer. For Fiscal 2000, the Consumer Price Index (CPI) is the lower of the two possible adjustments. Based on the CPI-U for April of 1999 (166.2 versus 160.2 in April 1997), the required base appropriation for FDA's Salaries and Expenses, excluding user fees and GSA Rent, will be $850,681,524. If this amount were not appropriated, the FDA would be unable to continue to collect fees under PDUFA. In addition, FDA will be required to spend $153,501,250 within its Salaries and Expenses appropriation for the process for the review of new human drug applications.

These calculations do not include the amounts of FDA's Salaries and Expenses Appropriation that is for payment of GSA Rent for fiscal year 1999 and fiscal year 2000. Prior to fiscal year 1998, FDA's rent payments to GSA were appropriated in a separate appropriation for the purpose of limiting those costs to FDA. These GSA rent payment were capped at $46.5 million. For fiscal year 1999, the Administration proposed including GSA Rent within FDA's Salaries and Expenses Appropriation at a level of $82.9 million, and Congress appropriated the funds in that fashion.

This substantial increase in FDA's GSA Rent costs would distort the purpose of the base appropriation requirements in PDUFA if the current GSA Rent costs are included in the calculation, while for comparability the fiscal year 1997 costs are adjusted to include what was then a separate appropriation for these costs. Since the changes to PDUFA passed by Congress in 1997 specify fiscal year 1997 as the new base year for this calculation, we believe that FDA's Salaries and Expenses appropriation should be the basis for calculating whether FDA's appropriations for its operating budget have increased as required by PDUFA, and this requires adjusting fiscal year 1999 and subsequent years to exclude GSA Rent costs.

PDUFA FEE COLLECTIONS

Question. Please provide a summary of PDUFA collections over the past five fiscal years, indicating how much has been spent in each year and the balance, if any, carried over into subsequent fiscal years.

Answer. Under PDUFA, any fees collected and not spent by the end of a fiscal year continue to remain available to the Agency in future fiscal years. These reve-

nues are referred to as carryover balances. The net result of operations in fiscal year 1998 provided a carryover balance of $67,518,297. This balance is a result of a one-time spike in fiscal year 1998 collections, attributable to collection of the second half of application fees for many prior fiscal year submissions, receipt of full application fees for all fiscal year 1998 submissions under the amended PDUFA procedures passed in 1997, and constraints on spending because of concerns regarding the shortfall in fee revenues in fiscal year 1999. I will be happy to provide a table reflecting the carryover balances with explanation for the record.

[The information follows:]

SUMMARY OF PDUFA COLLECTIONS, OBLIGATIONS AND CARRYOVER BALANCES

Fiscal year	Beginning		Year-End	
	Carryover	Collections	Obligations	Carryover
1994	$19,582,996	$53,730,244	$39,951,020	$33,362,220
1995	33,362,220	70,953,500	74,064,015	30,251,705
1996	30,251,705	82,318,400	85,053,030	27,517,075
1997	27,517,075	93,234,125	84,289,046	36,462,154
1998	36,462,154	132,671,143	101,615,000	67,518,297
1999	67,518,297			

The carryover balances do not include estimated receivables from fiscal year 1998 and prior years, which total $13,759,458.

While the carryover balance grew substantially in fiscal year 1998, there are also a number of claims on these funds. These claims are as follows: (1)

—Collection ceiling: PDUFA imposes a collection ceiling which prohibits the Agency from keeping fees in excess of the amount specified in appropriations for each fiscal year through fiscal year 1997. Amounts collected that exceed the collection ceilings will be refunded. Under FDAMA, balances collected in excess of amounts specified in appropriations after fiscal year 1997 may be kept, and used to reduce fee charges that would otherwise be made in a later fiscal year.

—Operating funds: FDA must ensure adequate operating funds in the first 4 months of each new fiscal year. Each year, two-thirds of the PDUFA fees, including product and establishment fees, are not paid until January 31. The FDA needs to carry forward some operating costs into each new fiscal year to cover expenses until the fees are received.

—Perfommancegoals: Approximately $25 million from the carryover balance has been allocated to FDA components in fiscal year 1999 to assure that perfommance goals for fiscal year 1999 will be met.

BUILDINGS AND FACILITIES

Question. The fiscal year 2000 budget proposes a $20.4 million increase in FDA Buildings and Facilities account to fund a portion of the construction of the Los Angeles Laboratory and Office project. Given the limitations on discretionary appropriations, what is the urgency of initiating construction of this project?

Answer. The original lease for the Pico Boulevard facility in Los Angeles expired in 1992. The agency negotiated a six-year extension with two additional one-year options, and funded several necessary renovations to the aging and obsolete facility. The final lease option for the existing Los Angeles laboratory expires on March 31, 2000. The facility has aged far beyond its useful life. The lab cannot efficiently handle necessary increases in staff to support the expanded import work, and at this point the infrastructure of the existing 30 plus year old facility will no longer accommodate renovations desperately needed to bring the building up to current laboratory standards. If funding is not received to begin construction of the replacement facility, the agency will have no other option but to consider closing the laboratory, and moving the functions elsewhere.

The fiscal year 2000 budget request includes a funding of $20.4 million to begin construction. The replacement laboratory will serve to consolidate three Los Angeles district sites, the laboratory on Pico Boulevard, the current district office in Irvine, and the San Pedro resident post, into one location, replacing three existing leases currently costing $2 million annually.

Expected benefits from the construction of the new Los Angeles laboratory include providing a much safer location and a vastly improved working environment for FDA and state laboratory personnel. A concentration of scientific talent will be

available which will permit better management of the analytical workload and provide significant improvement in operational efficiency. Also, better analytical coverage will be provided during emergencies. Additional benefits include a more efficient use of costly analytical equipment and better equipped laboratories in a state-of-the-art facility.

Question. What is the total cost of the project and what phase of the project will be funded with the $20.4 million requested?

Answer. The fiscal year 2000 budget requests $20.4 million for Phase I. This phase includes the construction of the core and shell for the entire building with major mechanical and electrical infrastructure systems. Phase II completes the mechanical and electrical infrastructure and completely fits-out both the laboratory and the office at an estimated cost of $20.0 million. The total estimated construction cost of $40.4 million is based upon receiving total project funding in fiscal year 2000. This cost includes laboratory casework, fume hoods, construction management and escalation costs to a midpoint of construction. The estimated construction cost does not include funding for furniture, telecommunication systems, or security systems. Funding for furniture and the telephone system will come from the FDA appropriations in the year in which they are needed. The security system is estimated to cost approximately $310,000 and the telephone infrastructure is estimated to cost approximately $300,000. The request for funding to cover these costs will be included in our fiscal year 2001 budget request.

Should Phase II funding be provided in fiscal year 2001, the construction cost will need to be adjusted for inflation. Based upon receiving funds for Phase I in fiscal year 2000 the construction contract for Phase I would be awarded in late 1999 and would take approximately one year to complete. If the remaining funds for Phase II are appropriated in fiscal year 2001, the construction contract would be awarded in late 2000 and would take approximately one year to complete. This construction schedule would result in a projected move-in of early to mid 2002.

Question. Funding of $9.8 million was provided in fiscal year 1995 to purchase land and begin engineering and design work for replacement of the Los Angeles Laboratory and Office. Is the land purchase and engineering and design work for this project complete?

Answer. Yes. The site, a 10 acre land parcel located at the corner of MacArthur Boulevard and Fairchild Road adjacent to the campus of the University of California at Irvine, California was purchased by FDA in September 1996. The balance of funds was used to design the new laboratory and office facility. The architectural firm in joint venture with a consulting engineer firm is in the process of completing the design for the new facility. The design is expected to be complete in mid 1999. The solicitation for construction proposals will be advertised shortly thereafter to be able to award a construction contract in November 1999 should fiscal year 2000 funds be appropriated.

Question. Funds have been provided over the past four fiscal years to continue the modernization of the Arkansas Regional Laboratory at Jefferson, Arkansas. Would you please give us an update on this project.

Answer. The construction of the Arkansas Regional Laboratory or ARL project was separated into three phases to best utilize the available funding. Phase I includes the foundation, substructure, superstructure, exterior enclosure, and the roofing for the laboratory building as well as major building systems, such as fire protection, heating/ventilation/air conditioning, and electrical. Phase II continues the construction of the laboratory building by completing the building systems and providing some office and laboratory fit-out. Phase III provides the renovation of the existing Building 50 in its entirety and completes the common ORA/NCTR administrative and support area.

In October 1997, White Construction Company of Clarksdale, Mississippi, was given notice to proceed on Phase I of the project. Since that time White Construction has also been given notice to proceed on Phase II and a portion of the Phase III work. The projected completion date for Phases I & II is December 1999. The laboratory building project is currently approximately 60 percent complete. Current work includes finishing the building enclosure and installation of the building systems. The fiscal year 1999 appropriation included $3 million to begin the construction on a portion of Phase III that includes exterior demolition, structural, and masonry work as well as some roofing repairs. The Phase III portion of the awarded work is approximately 15 percent complete. Current Phase III activity involves demolition of the existing Building 50 exterior masonry.

FDA requested $3.0 million in fiscal year 2000 towards completing Phase III. Approximately $7.0 million in additional funding will be needed in subsequent fiscal years to complete Phase III. The construction contract FDA awarded included as an option, the construction of Phase III. When FDA awarded just a portion of the Phase

III work in December 1998, the contractor escalated the remaining costs, which are currently fixed until November 1999. In order to exercise this option at the current cost estimates, the balance of ARL funding would need to occur in fiscal year 2000. Should this not be forthcoming all costs for the project are expected to increase. Therefore, any request in fiscal year 2001 or beyond would include an escalation increase in construction, construction management, and A/E post design services costs for completion of the project.

OFFICE OF COSMETICS AND COLOR AND RELATED FIELD ACTIVITIES

Question. What is the total funding and staffing levels for the Office of Cosmetics and Color and its related field activities in each of fiscal years 1997, 1998, and 1999?

Answer. I will be happy to provide the total funding and staffing levels for the Office of Cosmetics and Color and its related field activities in each of fiscal years 1997, 1998 and 1999. to the Committee.

[The information follows:]

	Dollars	FTE
Fiscal year 1997:		
Headquarters	4,389	46
Field	1,795	26
Fiscal year 1998:		
Headquarters	2,825	29
Field	405	5
Fiscal year 1999:		
Headquarters	4,405	43
Field	1,795	15

Question. What funding and staffing levels are proposed for fiscal year 2000?

Answer. I will be happy to provide that information to the Committee.

[The information follows:]

	Dollars	FTE
Fiscal year 2000:		
Headquarters	4,405	43
Field	1,795	15

CLINICAL PHARMACOLOGY PROGRAM

Question. The conference agreement on the fiscal year 1999 appropriations act makes $700,000 available for Clinical Pharmacology program competitive grants. The justification indicates that the FDA will make available $500,000 to continue the operation of the four previously-competed grantees in this program throughout fiscal year 1999. Please provide for the record the amount of the grant award provided to each of the four previously-competed program grantees for fiscal year 1999, and how the remaining $200,000 provided for the program is being allocated.

Answer. The Agency has had to absorb pay raise and other inflationary costs, forcing the Agency to reduce operating funding in all parts of the Agency. In particular, the Agency has had to substantially reduce its extramural research contracts, including the Clinical Pharmacology program. For fiscal year 1999, the FDA asked the current grantees what they would need to continue through the end of the fiscal year. $500,000 is the amount the grantees determined they would need collectively to continue through the end of the fiscal year. Those programs that do not receive new funds will receive no-cost extensions to enable them to use previously-awarded funds to cover this time period. If it turns out that one or more of the grantees requires more funding than presently anticipated through the end of the fiscal year, then funding up to the full amount of $700,000 specified will be awarded.

FDA will grant a six-month extension in the amount of $369,129 to the University of Illinois at Peoria, and a three-month extension in the amount of $130,871 to Meharry Medical College. Both Peoria and Meharry have concurred with FDA's proposal for a low cost extension based upon their fiscal year 1998 expenditure rates to continue their projects through the end of the fiscal year. Mayo has requested, but not demanded, additional fiscal year 1999 funds. SUNY has agreed to a no-cost

extension, if FDA confirmed in writing our long standing promise that they will continue to be given no-cost extension so long as they have unobligated federal funds. 58. OFM

Question. Are funds included in the fiscal year 2000 request for the Clinical Pharmacology Program?

Answer. No, funds are not included for the Clinical Pharmacology Program in fiscal year 2000.

Question. What level of funding is included in the request for this program?

Answer. There is no funding request for this program.

Question. Please describe the Clinical Pharmacology Program and its purpose.

Answer. The Clinical Pharmacology Program is a program to support a grant for establishment of a clinical pharmacology training program since there is currently a nationwide shortage. The purpose of the grant is to: (1) increase the number of trained biomedical scientific personnel in clinical pharmacology, and (2) establish a clinical pharmacology training program at a medical school currently without such a program.

Question. Please provide for the record the total funding provided for the Clinical Pharmacology Program in each year since the program's inception. Indicate how the funds were awarded in each fiscal year, showing the recipients of the funds and the amount awarded to each.

Answer. I will be happy to provide that information to the Committee.

CLINICAL PHARMACOLOGY PROGRAM

	Mayo Foundation	Meharry Medical College	University of Illinois	State University of New York
Fiscal year 1993	$201,532	$536,558	$749,998	$411,912
Fiscal year 1994	247,000	538,976	748,084	516,000
Fiscal year 1995	201,532	536,558	749,998	411,912
Fiscal year 1996	201,532	536,558	749,998	411,912

REVIEW OF AQUACULTURE DRUG SUBMISSIONS

Question. The growth of the United States Aquaculture industry requires legally safe and effective drugs to control disease. The industry in my State of Mississippi has formed a variety of partnerships and has developed many Aquaculture drug data packages that recently have been submitted to the FDA's Center for Veterinary Medicine for review. I am told, however, that the Center is unable to complete reviews of these Aquaculture drug data packages in a timely manner, and they are over 200 days overdue.

Is the Center aware of this problem and what is being done to ensure the timely review of Aquaculture drug data submissions?

Answer. Yes, the Center for Veterinary Medicine, CVM is aware of the problem and is doing what is can to ensure timely review of aquaculture drug submissions as well as submissions for all other animal drug products.

The situation in is an example of the pressure FDA must deal with as new industries emerge. In 1991, CVM developed a program to educate the aquaculture industry about the animal drug approval process. CVM hired a specialist in aquaculture who spoke frequently before industry groups in order to help them understand the steps necessary to get new aquaculture drugs approved. CVM also developed several written documents to provide guidance to the aquaculture industry. As a result, the aquaculture industry responded to the new challenge and developed numerous coalitions that generated a significant amount of new data necessary for drug approvals.

The aquaculture drug development program created a burgeoning workload for CVM. At the same time, FDA faced reduced budgets and significant staffing shortages. In the face of staffing shortages, FDA has been unable to direct adequate resources to many critical areas, including aquaculture drug review, illustrating why FDA is asking for additional review resources in fiscal year 2000.

RULE ON CFCS

Question. The appropriations justification indicates that FDA plans to comply with the fiscal year 1999 conference report directive and publish a proposed rule on

CFCs by September 1, 1999. Could you please give us a better idea of where FDA is in the process of preparing this proposed rule, what the FDA timetable is for issuing the final rule?

Answer. The FDA has completed its assessment of all the submitted public commentary on the ANPR related to the use of CFCs in metered-dose-inhalers. While the FDA has no explicit timetable, nor are all aspects of the publication of the NPR within FDA control, the FDA takes the conference report directive seriously, and is working to meet that directive for the publication of a Notice of Proposed Rulemaking.

ORPHAN DRUG RESEARCH GRANT PROGRAM

Question. I note from the budget justification that FDA has reduced the funding for Orphan Product Grants from the $11,542,000 level provided by the conference committee on the fiscal year 1999 Appropriations Act to $11,150,000. Why?

Answer. FDA has reduced staffing and cut operating costs across the board to absorb pay raise and other inflationary costs. For fiscal year 1999, we thought it was appropriate for the orphan product grant program, even though it is an important program to us, to absorb a small reduction in funding, from the prior budgeted level of $11.5 million to $11.1 million.

Question. How much of the funding provided for Orphan Drug Research Grant Program is taken to cover overhead and administrative costs? Please provide an accounting of these costs for fiscal year 1999.

Answer. In fiscal year 1998 FDA's cost to administer the Orphan Product Drugs program was $1.6 million for payroll and $.2 million in operating expenses. In fiscal year 1999 the cost to administer the Orphan Drugs program is estimated at $1.8 million for payroll and $.1 million for operating expenses. For fiscal year 2000 the estimated expenses to administer the Orphan Drugs program for payroll will cost FDA an estimated amount of $1.6 million and an estimated amount of $.1 million in operating expenses.

OVER-THE-COUNTER SUNSCREEN MONOGRAPH

Question. Last year, the FDA indicated to the Committee that the final rule for over-the-counter (OTC) sunscreen drug products was to be published no later than May 21, 1999, the date set by the FDAMA. Please update the Committee on the schedule for publishing this final rule.

Answer. The Agency remains committed to meeting the requirements of the FDA Modernization Act, FDAMA, regarding the issuance of regulations for OTC sunscreen drug products not later than May 21, 1999.

OFFICE OF SEAFOOD INSPECTION

Question. How much is included in the fiscal year 2000 budget request for the Office of Seafood Inspection?

Answer. FDA's request for increased funding for the Office of Seafood Inspection activities in fiscal year 1999 was $27 million. If received, the Office of Seafood Inspections will remain at the $27 million level in fiscal year 2000.

Question. Does the fiscal year 2000 budget request include continued funding for a grant to the Interstate Shellfish Sanitation Commission?

Answer. Yes, The Interstate Shellfish Sanitation Commission, or ISSC, grant will be funded jointly by way of an Interagency Agreement between the FDA's Center for Food Safety and Applied Nutrition, or CFSAN, and the National Marine Fishery Service, Department of Commerce. The cost of the ISSC grant is $275,000. FDA funds $200,000 of the grant.

Question. Please give us a summary report on the work being carried out by the Interstate Shellfish Sanitation Commission.

Answer. The Interstate Shellfish Sanitation Commission (ISSC) is a consortium of State shellfish control officials, representing both environmental and public health agencies; including the FDA, the Environmental Protection Agency (EPA), and the Department of Commerce's National Marine Fisheries Services. The major goal of the ISSC is to improve information exchange and transfer among States, Federal agencies, industry and the consumer, and to strengthen State activities by providing them with procedural and policy guidance, technical training, research and materials for consumer education.

In the improvement of information exchange and transfer among States, federal agencies, industry, and consumers, the ISSC has been involved in at least fifteen activities to facilitate this aim. For example, the ISSC participated in various fora supporting international shellfish restoration, the regional shellfish sanitation as well as CFSAN's priorities. Furthermore, relevant information regarding illness out-

break, recalls of shellfish and Biotoxin methodology research and the Food Code has been provided to States, consumers and ISSC membership.

The ISSC also has reported important procedures and policy statements to guide States in executing the NSSP in areas such as Vibrio parahaemolyticus outbreaks, Vibrio vulnificus controls and regulations for implementation of HACCP in State shellfish programs.

Important undertakings of the ISSC include interaction with States in resolving problems between States or between FDA and a State regarding conformity to the NSSP; communicating procedures and policy statements to guide States in executing the NSSP, and interacting with States and FDA in the development of uniform and effective state program evaluation criteria; providing program auxiliary support in facilitating State involvement in technical training, research and consumer education; and coordinating the collection and maintenance of information relating to U.S. coastal waters classified for shellfish harvesting and coordinate the development of a digitized mapping network (SIMS).

Significant accomplishments include providing World Health organizations (WHO) with information explaining ISSC integration of HACCP into the NSSP; reviewed and commented on a FDA Shellfish Program Review Workshop Report; utilized the ISSC unresolved issue process to resolve State of Florida non-compliance with the NSSP; coordinated and provided third party involvement for FDA shellfish plant inspections in the State of Florida; utilized the ISSC unresolved issue process to address Gulf Oyster Industry Council complaints regarding the Texas Department of Health response to the 1998 Vibrio parahaemolyticus outbreak in Galveston Bay.

The ISSC will continue to interact with States to implement Vibrio vulnificus consumer educational programs, develop risk reduction controls for Vibrio vulnificus, and develop criteria for assessing Vibrio vulnificus risk reduction controls while at the same time, obtain information from States and industry to provide consistent and coordinated input to FDA in implementing a Model Shellfish Ordinance.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. For the past several years, FDA's Office of Planning and Evaluation, OPE, has coordinated performance-based management systems across the Agency in order to meet the intent of the Government Performance and Results Act, GPRA. We have used a multi-level approach that promotes the use of performance management practices. This has included intensive training for senior and mid-level managers, participation in internal and external performance management conferences and workshops, development of a GPRA-focused web site, development of a liaison network between planning and budgeting staff within our Centers, and periodic Agency-wide planning meetings to discuss performance planning and improvement.

The Food and Drug Administration Modernization Act, FDAMA, of 1997 has become a top priority for the Agency. FDAMA established a new mission and specific performance targets that impact not only what the agency does but how it goes about achieving those goals. I would be happy to provide you with further information.

New Mission and Specific Performance Targets

GPRA and FDAMA together emphasize performance management. As a result of the legislative mandates, FDA has been able to focus its energies on ways to achieve long range results through strategic, year-to-year performance planning. This process has resulted in six strategic directions for the future:

—Establish risk-based priorities
—Strengthen the scientific and analytical basis for regulatory decisions
—Work more closely with external stakeholders
—Continue to re-engineer FDA processes
—Adopt a systems approach to Agency regulation
—Capitalize on information technology

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. FDA's senior executives and key managers play a primary role in setting the Agency's strategic and performance goals. For both the GPRA annual performance plan and the FDA Modernization Act's Plan for Statutory Compliance, senior executive and key managers worked together to define performance levels that emphasize public health and safety results within the context of available resources. Assessing progress toward achieving the performance levels set forth in the GPRA and FDAMA plans is of growing importance at multiple levels within the Agency.

A second accountability issue relates to the capability of Agency managers to understand the changing context of FDA's responsibilities and to set priorities within that evolving context. For FDAMA and GPRA, FDA's senior leadership identified agency-wide strategic directions in order to focus energies on those areas of critical public health and safety importance. This ability to see the changing shape of the environment speaks directly to the question of accountability for achieving results.

Question. How is performance information being used to manage the agency?

Answer. FDA has used performance information for many years to communicate its mission in protecting public health and safety. For example, performance relating to new product evaluation, product safety assurance, food safety, and injury reporting systems are reflected in the wide array of communications from FDA. In addition, those data become the basis for continuously improving the quality and efficiency of Agency activities from year to year.

Of growing importance is the use of performance information to help identify funding needs. FDA's 1998 analysis helped us to forecast the resources needed to achieve full statutory compliance based on past performance information. This type of analysis lends itself well to building strong cases for changes in funding levels. GPRA and the FDA Modernization Act require more intensive and sophisticated performance tracking, which in turn translates into more meaningful knowledge for fiscal decision making.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. FDA has a good understanding of the resource requirements needed to achieve most of its performance goals. Inspectional coverage of food establishments, review time for new drug applications, assessment of mammography facility quality, and tobacco enforcement are a few examples of areas in which good performance data are available or will be available soon. With that information, we can demonstrate how resources impact program performance. For example, our 1998 analysis of the "gap" between available resources and the necessary resources to achieve the highest performance possible helped illustrate FDA's continuing need to set risk-based priorities.

As we gain experience in implementing GPRA, we continue to improve our ability to evaluate the impact of changes in funding level on our programs and our ability to achieve the performance commitments outlined in the Annual Performance Plan. In some instances, changes in funding level may require an increase or decrease in program efforts and target level of performance. It may require development of new performance goals.

Over the past few years, FDA has practiced several strategies for operating with reduced resources in spite of an increasing workload. These strategies have included reducing program efforts, refocusing program efforts to target the highest priority health risks, re-examining the role we play in protecting public health relative to other government agencies, third parties, industry; and so forth. Some of those strategic changes have caused us to change our activity measures. In some instances, for example, the number of inspections conducted is not as appropriate a measure as the percentage of products approved by third-party sources. However, changes in approach will not change the agency's desire to improve health outcomes.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. FDA's performance planning coupled with statutory commitments found in FDAMA have laid a groundwork for systematic program enhancements. Across the Agency a series of themes reflects this commitment to performance improvement. I would like to provide this information for the record.

Systematic Program Enhancements

—*Establish Risk-Based Priorities*.—as evidenced by "fast track" processes to address the most urgent therapeutic needs so that these therapies can enter the marketplace rapidly but safely.

—*Adopt A Systems Approach*.—as evidenced by the Food Safety Initiative, the integrated adverse event reporting initiative, and the import monitoring systems that build upon the knowledge and capabilities of other governmental and independent sources.

—*Work More Closely with External Stakeholders*.—as evidenced by progressively sooner and more frequent dialogue between FDA officials and regulated industry representatives on matters such as electronic submissions of applications, drug labeling improvements, standards, third-party reviews, and training needs.

—*Re-engineer FDA Processes*.—as evidenced by various regulatory simplification strategies including a new phased review process for animal drugs that enables

the Agency to provide periodic feedback to product sponsors throughout the drug review process.

—*Strengthen the Science Base for Regulatory Decisions*.—as represented by cooperative research agreements with FDA, professional societies, and industry in order to provide a venue to organize and conduct research on critical questions about pharmaceutical manufacturing that can help to inform regulatory decision makers in such areas as supplement submission requirements or bioequivalence studies after there are manufacturing changes.

—*Capitalize on Information Technology*.—as exemplified by automation of portions of the drug review process, posting new drug therapy information on the Internet for access by consumers and patients, and expanding the use of electronic communications not only to disseminate information of particular importance to stakeholders but also to receive their comments and suggestions, all of which help to reduce the for communicating adverse effect information.

FDA has found that by promoting Agency-wide, systematic strategies for enhancing performance that the intent of GPRA and other statutory requirements can be appreciated. The effect is, that instead of being isolated within those components of the Agency that understand performance planning best, the best ideas relating to program results are shared openly and cooperatively.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The performance goals in the annual performance plan link directly to the budget. Each individual performance goal supports a somewhat broader program strategic goal, which in turn supports a major FDA program. In the performance plan, budgeted amounts, both dollars and FTE, are aggregated at the program strategic goal level. So, for each major program area, the total budget request represents the total of the program strategic goal amounts. I will provide this information for the record.

Major Program Area	*Number of Program Strategic Goals*
Foods	4
Human Drugs	3
Biologics	3
Animal Drugs and Feeds	3
Medical Devices and Radiological Health	6
National Center for Toxicological Research	3
Tobacco	3

The process used to link performance goals to budget activities involved program managers, planners and budget representatives from each major program area, their field counterparts, and analysts in the Office of Planning and Evaluation and the Office of Financial Management in the Office of the Commissioner. It involved several steps, the most significant of which was the gap analysis. This activity brought agency decision-makers together to look carefully at the difference between current agency performance and specific performance targets established by statute, such as FDAMA. In this way we could focus on resources needed to close the gap between actual and intended performance.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. At this time, we believe the budget justification and the annual performance plan structures work well as complementary documents. While we continue to look for ways to incrementally improve these documents and the manner in which they are used within the Agency, we have no plans to make major changes to their structure.

In FDA's annual performance plan, budget amounts are set at the program strategic goal level, which is one level above the performance goal. For each program strategic goal, between one and twelve related performance goals have been developed. Therefore, while budget amounts are not assigned to each individual performance goal, budget amounts are specified for these clusters of related performance goals.

In both the budget justification and the annual performance plan, dollar amounts are identical at the program level as well as the Agency level. When viewed from the performance goal perspective, the aggregate of FDA's individual performance goals equals the Agency's appropriation.

Integration of the budget and the annual performance plan is a continuous learning process. We continue to look for meaningful ways to relate Agency outcomes with resource allocation decisions. With no single answer on the horizon, we continue to emphasize Agency results as a key driver for fiscal decisions.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. The fiscal year 2000 Results Act performance plan includes the final goal statements for the Agency's fiscal year 1999 performance plan. FDA will report on the fiscal year 1999 final goal statements by the March 2000 deadline.

We expect to have reliable data for each performance goal. Depending on the nature of the goal statement, either metric, milestone, or system improvement, the data will be presented either numerically or descriptively. Strengths, weaknesses, or other qualifying statements will provide additional information about the Agency's performance toward that goal.

FDA's Office of Planning and Evaluation, OPE, produces guidance documents and training programs, as well as arranges individual consultations with program managers to promote good performance planning practices. An important aspect of that guidance has been information about data reliability, verification and validation. Since this will be the first time that results will be reported, we anticipate a considerable amount of discussion during calendar year 1999 on strategies to assure data reliability. By the time we report on the fiscal year 2000 performance goals in 2001, we expect to be more proficient at managing and reporting performance information.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. FDA has developed the capacity to measure performance in most areas. This is prerequisite to any discussion about basing funding requests on performance.

Baseline data exist for the vast majority of our performance goals. In areas such as regulatory compliance, product evaluation, both pre-and post-market, and standards development the Agency has a history that enables us to compare performance with fiscal resources. However, many of these past year performance measures have been output-oriented. Similarly, many FDAMA objectives are output-oriented. This means that while they may be relatively easy to measure, they may not fully capture the important public health and safety outcomes with which FDA is charged.

To address our commitment to health and safety outcomes, we have aggregated the performance goals into program strategic goals. These program strategic goal statements and their associated resources are scrutinized and carefully worded to see that they emphasize outcomes. We anticipate that the majority of program strategic goals will be stable from year-to-year, although modifications may be necessary.

Equipped with data showing prior years' performance, we can justify requested increases or decreases in funding.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. FDA's annual performance plan includes its highest priority, mission-critical performance goals. Various associated activities that support or relate to these goals may not be fully articulated in the performance plan even though they may be important to the Agency's accomplishing that goal. Nevertheless, we have taken into account these activities such that the aggregated costs shown at the program strategic goal level reflects the estimated full cost of the individual performance goals and their associated activities.

Base amounts and proposed increase amounts include full costs, including overhead, associated with those goal statements and associated activities.

QUESTIONS SUBMITTED BY SENATOR BOND

REGULATORY REVIEW

Question. In light of your past remarks highlighting an increased focus on the science-based nature of the Food and Drug Administration, what is the agency doing to ensure that regulatory considerations reflect a 1999 level of scientific understanding?

Answer. The Science Board Subcommittee on FDA Research was established in March 1996, to provide preliminary recommendations to the parent advisory committee, the Science Board to the Food and Drug Administration, on appropriate criteria for determining the quality and mission relevance of FDA-sponsored laboratory investigation. The subcommittee unanimously and emphatically affirmed that, " the presence in the FDA of a vigorous, high quality, intramural program of scientific

research provides the essential foundation of sound regulatory policy and performance, and ensures that the FDA is, and will continue to be, best positioned to carry out its statutory responsibilities to protect, promote and enhance the health of the American people."

To this end, the Agency has placed renewed emphasis on improving its science base, in support of making sound regulatory decisions. All Centers are actively reviewing their science programs and developing approaches, both internal and collaborative with other parts of the scientific community, to build on its existing scientific expertise. Each Center's research program is being reviewed by committees of external, world class scientists. The role of these committees is to develop a better understanding of the scope and needs of each Center's research program and to make recommendations on how to better target research towards FDA's regulatory responsibilities and on how to improve and modernize its infrastructure to meet the challenges of the future.

I have asked the Deputy Commissioner, Dr. Michael Friedman, to take the lead role in working with the Centers and the rest of the scientific community to develop strategies for fostering an environment that assures that regulatory decisions are based on the best science available.

Maintaining an expert science base requires a significant amount of resources to hire and train scientific experts and to build and equip laboratories that make use of the most modern and efficient technology. Therefore, the Agency is requesting additional resources in the fiscal year 2000 budget to strengthen its science base, including research, necessary to ensure that its regulatory decisions reflect the state-of-the-art science.

Question. Specifically with respect to autologous tumor vaccines and the workshop FDA conducted in conjunction with the National Cancer Institute on December 10–11, 1998, has FDA reached any conclusions about how to deal with the unique challenges presented by these therapies so that potentially valuable research in this area can proceed? (I am still awaiting a response to my March 22 letter to Dr. Henney on this issue.)

Answer. The Agency shares your interest in the development of potential new cancer therapies, and is providing the following information regarding actions taken since the workshop on Tumor Vaccines. An internal Center for Biologics Evaluation and Research Tumor Vaccine working group met to discuss critical issues pertaining to dendritic cells as tumor vaccines. This group is working with sponsors to characterize products for phenotype and functional activity to ensure lot-to-lot consistency. FDA is also encouraging sponsors to develop potency assays and as a result, several sponsors have already initiated the development of potency assays for autologous and allogenic tumor cell vaccines. In addition, CBER is setting up a scientific program to develop potency assays for autologous tumor cells as tumor vaccines and to determine the identity and potency of dendritic cells, to help sponsors develop a scientifically sound test for product development.

CBER is collaborating with the National Cancer Institute, NCI regarding tumor vaccine research and standards. CBER and NCI scientists met to discuss the issues regarding the critical supply of interleukin–4, a key cytokine necessary for the activation of dendritic cells for autologous tumor vaccines. As a result of joint efforts by CBER and NCI, the sponsor has agreed to supply this critical biological reagent to investigators for development of autologous dendritic cell based tumor vaccines.

On April 10, 1999, CBER scientists participated in the National Tumor Vaccine and Cell Therapy working group meeting organized as a satellite meeting of American Association of Cancer Research. This group discussed various aspects of immunotherapeutic approaches for cancer. One of the sessions, chaired by a CBER scientist, focused on autologous vaccines. Discussion with several hundred scientists at the meeting led to the conclusion that characterization of potency for autologous tumor cells is necessary to ensure lot-to-lot consistency.

CBER scientists provide extensive consult on a daily basis to numerous investigators and sponsors on tumor vaccines including autologous tumor vaccines product development. FDA will continue to work with all sponsors on the development of tumor vaccine products, as well as other promising therapies for cancer and other life-threatening diseases, so that patients can benefit from safe and effective new therapies as quickly as possible.

Question. What is being done to make sure that current evaluation of biologics is done pursuant to a science-based approach?

Answer. To provide effective regulatory review of biological products, which include vaccines, blood products, allergenic extracts, certain diagnostic products, and biotechnology-derived products, FDA's Center for Biologics Evaluation and Research, CBER conducts active, mission-related regulatory research to maintain and expand its knowledge of fundamental biological processes. Regulatory research

projects are prioritized based on CBER's knowledge of the type of cutting edge technology being employed by the scientific community, Government, academia and industry that is most likely to result in innovative products or may pose unknown health threats.

To ensure scientific expertise in biological product application review, CBER uses what is referred to as the "research/reviewer model." In this model, the application review personnel spend a portion of their time in research-related activities. CBER researchers are fully integrated into the application review process. CBER researchers participate in the following regulatory procedures: review of initial new drug applications, and biologic license applications; development of policy and guidance documents; meetings with sponsors and advisory committees; participation in pre-license and biennial inspections; and evaluation of adverse drug reactions and risk assessment.

CBER also collaborates with the NIH, the Centers for Disease Control and Prevention, the Health Resources and Services Administration and the Health Care Financing Administration on public health issues.

REUSE OF SINGLE USE MEDICAL DEVICES

Question. A recent Forbes magazine article (March 22, 1999) explored the reuse of single-use medical devices and whether this practice poses a threat the patients. I understand the Office of Science and Technology (OST) at FDA has done a study on the issue with results expected soon. What is FDA's position on this issue?

Answer. A FDA research team is evaluating the effect of cleaning procedures and sterilization procedures on the material and mechanical properties of materials likely to be in devices that are designated for single use but are known to be candidates for reuse by physicians and user facilities. The study initially focused on generic materials and then was extended to specific cardiac catheters such as balloon angioplasty catheters, electrophysiology catheters, and cardiac ablation catheters. These are devices that come in contact with blood. These catheters presented special problems in terms of complexity, e.g. many channels, narrow lumens, lumens closed at one end, and delicate materials and design. Data obtained to date indicate or suggest that cleaning and sterilization of these devices can be very difficult. The material properties and device performance can be affected by re-sterilization. Changes in device performance that may result from resterilization are model specific and a general statement cannot be made for all of the device models in a given category. It has been noted that minor changes in a given model have been observed to have potentially substantial effects on the ability to reprocess. This information will be presented at the FDA/AAMI Conference on Reuse of Single Use Devices on May 5–6, 1999 in Crystal City, Virginia. These data will be considered carefully when FDA makes its decision on how to address the issue of reuse of single use devices.

Question. Does reuse of these supposedly single-use medical devices put patients at risk?

Answer. FDA is concerned that if a single use device is going to be reused, it must be done safely. FDA published a Compliance Policy Guide, CPG 300.500, several years ago that focused on hospital operations. That CPG stated that there is a lack of data to support the general reuse of single use devices. If an institution chooses to engage in this practice, the CPG stated that the hospital should demonstrate that the device can be adequately cleaned and sterilized; that the physical characteristics or quality of the device will not be adversely affected; and that the device remains safe and effective for its intended use. This CPG is still in effect. FDA is also conducting research to try to obtain data to answer the public health questions associated with reuse of single use devices.

Question. What, if anything, do you intend to do about this issue?

Answer. FDA is and will continue to use its mandatory and voluntary Medical Device Reporting Program to keep track of infections, injuries, and other adverse events reported by manufacturers and device users involving the reuse of single use devices. FDA is enlisting the cooperation of other organizations to obtain reuse experience data. FDA is currently working with the Health Care Financing Administration to include questions about device reuse during HFCA inspections of user facilities.

Although FDA does not have specific information regarding the efficacy of these processes, it is evaluating reuse literature and information from equipment manufacturers and conducting research to gain additional knowledge of the effects of reprocessing on device materials.

FDA is also assessing whether additional regulation or other attention to reprocessing is needed. At the May 5–6, 1999 FDA/AAMI conference, attention will be focused on regulatory and public health considerations regarding this practice. FDA

will continue to work with groups represented at that conference to resolve outstanding issues and concerns and consider new regulatory approaches. One factor that needs to be carefully thought through are the costs and benefits of reprocessing on device users and patients.

Question. Could you provide me with information about how the FDA sets its criteria for certain foods (such as breads, pastas, and cereal products) to be called "enriched"?

Answer. Historically, the addition of nutrients to foods has been undertaken as a public health measure to promote nutritional public health goals. The enrichment of white flour and bread, and other cereal grain products, has been an effective safeguard in improving the nutrient intake of the U.S. population and, therefore, preventing nutrient insufficiencies.

Under Title 21 of the Code of Federal Regulations, §104.20 FDA sets forth its fortification policy and principles for the rational addition of nutrients to foods. FDA will provide for the record the criteria in these fortification guidelines that apply to "enriched foods".

[The information follows:]

ENRICHED FOODS

(1) A nutrient(s) may be added to a food to correct a dietary insufficiency recognized by the scientific community to exist and known to result in nutritional deficiency disease.

(2) A nutrient(s) may appropriately [1] be added to a food to restore such nutrient(s) to a level(s) representative of the food prior to storage, handling, and processing (including milling and refining).

(3) A nutrient(s) may be added to a food in proportion to the total caloric content of the food, to balance the vitamin, mineral, and protein content.

(4) A nutrient(s) may appropriately be added to a food that replaces traditional food in the diet to avoid nutritional inferiority.

(5) A nutrient(s) may be added to foods as permitted or required by applicable regulations established elsewhere in Chapter I of Title 21.

Question. As you may know, the Centers for Disease Control and Prevention recommends that women of childbearing age consume 400 micrograms of folic acid daily to help prevent birth defects, yet I understand the FDA criteria for "enriched" foods only requires a substantially lower amount of folic acid to be present. Has FDA considered changing it's criteria for "enriched" foods to require more folic acid in these products?

Answer. In establishing the levels of folic acid for the fortification program, FDA had to balance the competing factors of increasing the intakes of women of childbearing age to a significant degree while not increasing the intakes of all gender and age groups to levels that could cause adverse effects. In dealing with these competing issues, FDA sought input from many sources. For example, FDA consulted frequently with other agencies in the Public Health Service, CDC and NIH, and held three public meetings with its Food Advisory Committee and an ad hoc Working Group. Also, the fortification regulations went through notice and comment rulemaking procedures. FDA considered all comments to the docket in finalizing this rulemaking.

The fortification regulations became fully effective in January, 1998. At this point, FDA is actively collaborating with other federal government agencies to monitor both the safety and effectiveness of the current folic acid fortification program. As new data become available and as the evidence supports the need for change, FDA, in consultations with other PHS agencies, will consider adjustments in its folic acid fortification program as supported by such evidence.

---

[1] A nutritient added to a food is appropriate only when the nutrient: a) is stable in the food under customery conditions of storage, distribution, and use, b) is physiologically available from the food, c) is present at a level at which there is a reasonable assurance that consumption of the food containing the added nutritient will not result in an excessive intake of the nutrient, considering cumulative amounts from other sources in the diet, and d) is suitable for its intended purpose and is in compliance with applicable provisions of the Federal Food, Drug, and Cosmetic Act and regulations governing the safety of substances in food.

QUESTIONS SUBMITTED BY SENATOR MCCONNELL

TOBACCO RULE

Question In papers filed with the Fourth Circuit Court of Appeals, the FDA indicated that it would limit its activities to enforcing the minimum age restriction and identification requirement, pending review by the Supreme Court.

In addition, you stated in your confirmation hearing that you would not expand on the youth access activities that were ongoing before the court's ruling. You also assured the House Agriculture Appropriations subcommittee that the FDA is not spending any money for any purpose beyond enforcing the minimum age and identification requirements.

However, your budget justification indicates that in fiscal year 2000, the FDA will begin to conduct activities related to product regulation.

Your budget justification also indicates that the FDA plans to begin studying how to enforce the advertising and marketing provisions of the FDA rule that the Fourth Circuit and the District Court have invalidated. In fact, the FDA just published a Federal Register notice soliciting comment on the paperwork requirements that would be imposed by its advertising regulations.

Question. A spending money beyond the enforcement of its minimum age regulations, despite your assurances to the Congress and to the Fourth Circuit Court of Appeals that the FDA would limit its activities to minimum age enforcement pending further court decisions or congressional action?

Answer. The budget justification describes activities related to product regulation that are all within FDA's current legal authority. For example, the agency would allocate a limited amount of funds to begin to develop a scientific and regulatory framework to properly analyze issues posed by current and new tobacco products as well as by existing products for the treatment of nicotine dependence. This would include pursuing research issues raised by new or so called "less hazardous" nicotine delivery devices. It would also include continued assistance with other DHHS agencies to the Federal Trade Commission in the analysis of the public health issues raised by the testing and reporting of the tar and nicotine content of cigarette smoke.

The recent Federal Register notice on agency information collection activities was a request for an extension, pursuant to the Paperwork Reduction Act of 1995, of the collection approved by the Office of Management and Budget, OMB in 1996. The 1996 OMB approval covered several reporting and recordkeeping provisions of the 1996 tobacco rule. Due to litigation, these provisions were not made effective, although the district court upheld some of the provisions. However, the litigation has not affected or suspended the expiration date for the OMB approval. Consequently, FDA requested an extension of the OMB approval because, in the event the regulations become effective, a valid OMB approval of the rule's information collection provisions is necessary for those provisions to be enforceable. If OMB approval expired and the regulations became effective, persons subject to the rule would not be required to respond to the information collection provisions, and those provisions would have no legal force and effect until the agency requested and received a new OMB approval. The request to renew OMB approval places no new burdens on the industry, and maintains the status quo for the regulations until the litigation is resolved. In addition, it is much less resource-demanding for the agency to request an extension of OMB approval than to let the approval expire and seek a new OMB approval after the litigation is resolved.

Question. Do the FDA's contracts with the states regarding enforcement of the FDA's minimum age regulations permit the states to use such funds to enforce the states' own minimum age requirements?

Answer. Under our contracts, states are permitted to use the results of FDA compliance checks as a basis for separately proceeding with enforcement action under comparable state laws. FDA funds cannot be used to enforce state law. Using their own funds, the states can use the results of our inspections to proceed under state law.

Question. If not, what will happen to these funds if the Supreme Court affirms the Fourth Circuit's decision?

Answer. It is premature to speculate about how the Supreme Court might rule in this case.

QUESTIONS SUBMITTED BY SENATOR BURNS

CODEX ALIMENTARIUS

Question. Since the WTO now uses Codex Alimentarius standards in the dispute resolution process, are the US. Government's efforts sufficiently funded to ensure that U.S. policies are adopted by Codex?

Answer. While the FDA cannot respond on behalf of other U.S. Government agencies, FDA believes that increased funding for Codex activities would enhance U.S. efforts to ensure both public health and fair trade.

The Codex mandate is to protect the health of consumers while ensuring fair trade practices. As the importance of Codex in setting standards that are recognized by the WTO grows, FDA must use a greater percentage of its base resources each year to prepare for and represent U.S. interests at critical Codex meetings. Further, as the number and complexity of Codex issues increase so also must FDA resources be expended on Codex increase. Today's efforts extend far beyond the presence at Codex Committee meetings. They involve substantial preparation for the increasingly complex technical issues, e.g., risk assessment and risk management, interagency discussions, attendance at many key Codex working group meetings, a very important increased involvement with non-governmental organizations, and an enhanced advocacy effort to obtain foreign government agreement with U.S. positions. These additional or enhanced responsibilities require adequate funding if they are to be done successfully. The current resources expended on Codex, in our judgement, are insufficient to adequately fulfill the needs that the U.S. Government now has with respect to Codex.

Question. Does FDA currently have sufficient resources to fully participate in Codex meetings and proceedings?

Answer. FDA does not have a defined budget for Codex activities. While the U.S. Codex Office, which has oversight over U.S. Codex activities, resides in the USDA Food Safety and Inspection Service, most of the Codex activities are decentralized throughout government agencies, including FDA. Since the beginnings of the Codex Alimentarius Commission in 1962, FDA has devoted considerable resources to ensuring that Codex international food standards reflect the level of safety and quality expected by the U.S. consumer. Currently FDA provides the U.S. Delegate or the Alternate Delegate to 13 of 16 Codex Committees; a portion of 39 individuals time approximately 11 FTE plus staff support, is involved with the work of Codex. Recognizing both the responsibility of FDA under the Food and Drug Administration Modernization Act of 1997, FDAMA, and the increased importance and level and type of activities with Codex mentioned in Question 91, additional resources for Codex related activities would be beneficial. The new responsibilities with Codex, increased number and technical complexity of the Codex issues, the increased frequency of working group meetings, the need for increased communications with other U.S. governmental agencies and with non-governmental organizations on Codex issues, and the need to assist in advocacy efforts to help assure U.S. success on Codex issue, are all added responsibilities since the recent 1995 advent of the WTO Trade Agreement with only a minimal addition of resources. Additional resources are needed to better enable FDA to properly carry out its Codex responsibilities.

STATUTORY REVIEW TIMES—MEDICAL DEVICES

Question. Meeting statutory review times is a key element of the statute and one that I believe should be the agency's highest priority. Given the fact that user fees are not likely, what other ways do you intend to meet this statutory obligation?

Answer. Meeting statutory review times is certainly among our highest priorities in promoting the public health. However, without additional resources, FDA is unlikely to be able to meet the statutory review times for non-user fee programs such as the device review program. While FDA will continue with its reengineering initiatives and the implementation of FDAMA, significant additional improvements in review times for the complex 510(k) applications and PMA applications are unlikely without additional funding. FDA will continue to redirect resources to high-risk, high-impact product areas where direct intervention helps consumers and health care professionals the most. FDA's direct involvement in some low-risk product areas will continue to be examined and acceptable alternatives to direct FDA involvement will be considered while ensuring that adequate consumer protection is maintained. In addition, FDA will continue to work with industry to encourage broader use of regulatory options like third party review for 510(k)s, special and abbreviated 510(k)s, and product development protocols, PDPs.

Question. Assuming that user fees are not enacted, how would you reallocate the $19 million, which has been requested in appropriations, to ensure that device reviews do not fall further behind?

Answer. FDA's plans, as reflected in the Administration's proposed budget for fiscal year 2000, are to focus increased appropriated funding on injury reporting and product safety assurance activities. The appropriated increase requested in fiscal year 2000 reflects the Administration priority of restoring the balance between postmarket activities and review activities. Since the postmarket surveillance resources had been redirected to device review for the past several fiscal years, the fiscal year 2000 increase will be used to rebuild the postmarket portion of the program. In addition, the core budget for the medical device program has been relatively unchanged since fiscal year 1995 despite increases in Federal pay and inflation. This has effectively decreased the purchasing power of the annual appropriations received by the device program by about 4—5 percent per year.

FDA and the Administration believe that the requested budget increase for this program is necessary for the promotion and protection of the public health. FDA estimates that there may be as many as 300,000 injuries and deaths per year associated with device use. FDA is requesting $3.2 million to implement the first phase of a National Sentinel Reporting Network that will keep FDA and the medical community better informed about device problems involving device misuse or user error. In addition, as devices become more complex and the device industry continues to grow domestically and internationally, it becomes increasingly critical for FDA to work towards achieving statutory timeframes for inspections and be in a position to enforce new standards for various products. Although with the requested increase of $15.8 million for product safety assurance for devices, FDA will improve product safety and quality systems conformance, the Agency still will not meet its inspectional statutory requirements. Since FDA has already reallocated declining resources from postmarket to review over the past several years, we cannot afford to do so in the future. FDA has estimated that it would take an additional $12.8 million to fully meet its statutory review obligations for 510(k)s, PMAs, and PMA supplements. Without the enactment of user fees, FDA will maintain fiscal year 1999 performance levels by continuing with its reengineering initiatives as well as continuing to redirect resources to high-risk, high-impact product areas where direct FDA intervention helps consumers and health care professionals the most.

Question. You have announced that your number one priority is implementation of the letter and spirit of FDAMA. How do you justify a budget with no additional appropriated funds for one of FDA's most important functions medical device reviews?

Answer. Through FDAMA, Congress and Agency stakeholders expect more timely and interactive PMA reviews. Accordingly, FDA's fiscal year 2000 budget proposes to use these additive device user fees to significantly increase the effort devoted to PMA and PDP reviews, including enhancing the timeliness and quality of the review process as well as increasing interactions and consultations with industry. In addition, the user fee revenue will enable FDA to stay current with increasingly complex new technologies, update review standards and provide high quality, timely guidance to industry and reviewers. The medical device strategy is to concentrate resources on high risk, high impact products or work areas where they are likely to have the greatest impact on public health. With the proposed user fees, the percentage of reviews completed within established time frames will increase, average review times will go down, and the FDA will be able to support increased interaction with industry.

USER FEE LEGISLATION

Question. You have stated that a consensus is needed among Congress, FDA, the industry and consumers before a user fee program will work. Yet, you have proposed a program with little detail and no proposed legislation. Why not go through more appropriate processes to open up this dialogue?

Answer. Proposed legislation to authorize new user fees to enhance the quality and timeliness of premarket review of both direct and indirect food and color additives, and for medical devices is currently in clearance within the administration. The legislation is anticipated to be completed shortly and submitted to the appropriate committees in Congress. While we have not had any specific discussions with the authorizing committees about the proposed new fees in the fiscal year 2000 budget, the Administration intends to initiate such discussions following submission of the requisite legislative proposals. These proposals will take into consideration the discussions held regarding previous proposals.

COLLABORATION AND FDAMA

Question. Working with the regulated industry can often produce better products in a more efficient way. Since you have pledged to improve agency-industry relations, will you commit to reversing the FDAMA noncollaboration policy and encourage the use of agency-industry working groups to address key FDAMA implementation issues?

Answer. FDA has no noncollaboration policy. In fact, the Agency has recognized the value of receiving input from its constituents before issuing guidance documents or regulations to implement FDAMA. Because of the very demanding statutory deadlines placed on the Agency, in the interest of time, the Agency has generally relied on the processes that it has in place, namely notice and comment rulemaking and Good Guidance Practices. At the same time, it has also recognized that there are times when it would be important to meet with outside groups to hear their views on implementation issues and to discuss drafts of FDAMA documents that were made available to the public at large. The Agency also has established public dockets for written comments related to specific FDAMA provisions and has specifically invited such comment. In addition, the Agency already has held a number of public meetings to discuss FDAMA implementation. These practices will continue to be available in the future.

Question. Enactment of FDAMA was the first step in a process intended to change the culture at FDA. Essentially, the vision was to provide life-saving, life-enhancing products to patients quickly, efficiently and safely. Yet there are reports that frontline staffers have yet to be fully informed or fully trained in the full requirements of FDAMA. What steps do you intend to take to make the full promise of FDAMA a reality at your agency, especially with those staffers who deal most immediately with manufacturers?

Answer. The Agency is fully committed to implementing FDAMA. Part of implementation includes ensuring that staff are adequately trained regarding the new law, and that provisions are being implemented consistently across the Agency. One of the most effective ways to do this is to develop guidance on different provisions that can be given to those both inside and outside the Agency. As you know, the Agency has already completed dozens of guidance documents, and will continue to do so. In addition, the Agency often holds training sessions with its staff in order to ensure consistent application of its regulations. For example, our Center for Devices has quarterly meetings to review past IDE decisions so that each division can hear from each other and work harder to develop a more consistent approach. Companies are allowed to ask for reconsideration of their IDEs at these meetings, in order to make this process very open and accommodating. We feel that these sort of training exercises are very helpful to increase the quality and consistency of our product reviews, and will continue them in the future. In addition, each Center has held training sessions specifically on FDAMA and its related issues.

Question. The agency has not yet issued any guidance documents as promised in the November 18, 1998 final regulation implementing section 404 of FDAMA. When will those guidance documents be issued?

Answer. The FDA Center for Biologics Evaluation and Research, CBER, and the Center for Drug Evaluation and Research, CDER, published in accordance with the Good Guidance Practices, a Draft Guidance for Industry: Formal Dispute Resolution: Appeals Above the Division Level on March 19, 1999. This is presently a draft for comment. The Center for Veterinary Medicine, CVM, is in the process of issuing dispute resolution draft guidance that will contain a new procedure for resolving a scientific dispute. The CVM has had in place for some time, a procedure for the handling of an internal review of an appeal. This draft guidance will be issued for comment and finalized in a separate action following consideration of the comments. FDA's Center for Devices and Radiological Health, CDRH, is establishing new procedures for resolving scientific disputes which were published April 17, 1999, in a Federal Register notice announcing the availability of a draft guidance document, Resolving Scientific Disputes Concerning the Regulation of Medical Devices—An Administrative Procedures Guide to Use of the Medical Devices Dispute Resolution Panel (64 F.R. 22617). Comments on this proposed guidance are being accepted through July 26, 1999. These documents can be accessed from FDA's home page at www.fda.gov. I would be happy to provide a list of the topics currently on that website by FDA center.

Center for Devices and Radiological Health

General:

—Guidance for Staff, Industry, and Third Parties Implementation of Third Party Programs Under the FDA Modernization Act of 1997 (Issued 10/30/98)

—List of Devices for Third Party Review Under the FDA Modernization Act of 1997 (Updated 2/8/99)
—List of Accredited Persons for 510(k) Review under the FDA Modernization Act of 1997 (Updated 4/14/99)

—Guidance for Industry: Standards for the Prompt Review of Efficacy Supplements, Including Priority Efficacy Supplements—5/15/98
—Guidance for Industry: Classifying Resubmissions in Response to Action Letters—5/14/98
—Guidance for Industry: Submitting and Reviewing Complete Responses to Clinical Holds—5/14/98

Question. What is the agency's legal reasoning for not using notice and comment rulemaking to establish these procedures?

Answer. The Agency has taken the position that the current appeals procedures in place are adequate, and that is would be helpful to clarify that certain decisions may be taken to an advisory committee, at FDA's discretion. It was recommended that additional guidance would be helpful for industry, which is why the Agency agreed to issue guidance clarifying its current regulations.

Question. Will they contain any new procedures for resolving scientific disputes?

Answer. There have been several developments in this area that I would like to address more specifically in a document for the record:

RESOLVING SCIENTIFIC DISPUTES

Center for Biologics Evaluation and Research

The Center for Biologics Evaluation and Research (CBER)and the Center for Drug Evaluation and Research (CDER) have published, in accordance with the Good Guidance Practices, a Draft Guidance for Industry: Formal Dispute Resolution: Appeals Above the Division Level on 3/19/99. This is presently a draft for comment. The URL for this document is www.fda.gov/cber/gdlns/disputedft.pdf . This lays out the procedures that sponsors or applicants may use to request resolution of a dispute. It includes the procedures for requesting a review by an Advisory Committee under revised 21 CFR 10.75.

CBER has also written and posted a Standard Operating Procedure for dispute resolution. It contains the internal procedures for CBER staff to follow. It is SOPP #8005—Major Dispute Resolution Process <8005.htm> and can be found on the internet atwww.fda.gov/cber/regsopp/8005.htm .

All of CBER's recent guidance documents explain the options for dispute resolution, including scientific disputes, usually by referring to the guidance document mentioned above.

Center for Drug Evaluation and Research

There is draft guidance document entitled, "Guidance for Industry: Formal Dispute Resolution: Appeals Above the Division Level" available on the internet at www.fda.gov/cder/guidance/index.htm. This guidance document is intended to provide guidance for industry on procedures adopted by the Center for Drug Evaluation and Research (CDER) and the Center for Biologics Evaluation and Research (CBER) for resolving scientific disputes that cannot be resolved at the Division level.

In addition, CDER's manual of policies and procedures includes a document entitled, "Resolution of Disputes: Roles of Reviewers, Supervisors, and Management; Documenting Views and Findings and Resolving Differences." This document is also available on the internet (www.fda.gov/cder/mapp.htm). This document provides a general description of the roles of the reviewer, supervisors and team leaders, and management in arriving at institutional decisions in the drug application review process; guidance on how each individual involved in the scientific review process is to document his or her views or findings; and a procedure for resolving differences.

Center for Veterinary Medicine

The Center for Veterinary Medicine (CVM) is in the process of issuing dispute resolution draft guidance that will contain a new procedure for resolving scientific disputes. The Center has had in place for some time, a procedure for the handling of internal review of appeals. The dispute resolution draft guidance will be issued for comment and finalized in a separate action following consideration of the comments. The draft guidance simplifies the existing procedures for the handling of a request for an internal review and describes the new procedure for a review of a scientific controversy by the advisory committee. These appeal procedures apply to a decision that affects animal drugs and other products regulated by the CVM.

Center for Devices and Radiological Health

FDA's Center for Devices and Radiological Health (CDRH) is establishing new procedures for resolving scientific disputes. On April 17, 1999, CDRH published a Federal Register notice announcing the availability of a draft guidance document, Resolving Scientific Disputes Concerning the Regulation of Medical Devices—An Administrative Procedures Guide to Use of the Medical Devices Dispute Resolution Panel (64 F.R. 22617). Comments on this proposed guidance are being accepted through July 26, 1999.

To implement section 404 of FDAMA and to comply with 21 CFR 10.75, the center is proposing to establish a new Medical Devices Dispute Resolution Panel, which will operate under FDA's Medical Devices Advisory Committee. In addition to serving as a useful forum in which scientific disputes in general can be aired, the Dispute Resolution Panel would implement four provisions of the Federal Food, Drug, and Cosmetic Act:

—Section 514(b)(5)(B) of the act requires the establishment of an advisory committee to take referrals of any matter concerning the establishment, amendment, or revocation of a performance standard which requires the exercise of scientific judgment.

—Section 515(g)(2)(B) of the act requires the establishment of an advisory committee to take referrals of petitions for review of: (a) the approval, denial, or withdrawal of approval of a premarket approval application, or (b) the revocation of an approved product development protocol (PDP), a declaration that an

approved PDP has not been completed, or a revocation of an approved Notice of Completion that permitted marketing of a device developed under a PDP.

—Section 522(b) of the act, which was added by section 212 of FDAMA, requires a process to resolve any disputes concerning the need for FDA to order a manufacturer to conduct postmarket surveillance for more than 36 months.

—Section 562 of the act requires FDA to provide a procedure for review of all scientific disputes regarding the regulation of medical devices, including review by an appropriate scientific advisory panel, but only to the extent that other provisions of the act or FDA regulations do not already provide a right of review.

FDA believes its current procedures already provide methods to obtain review of most, if not all, scientific disputes. The establishment of the Dispute Resolution Panel provides an additional, more focused, procedure for the timely review of scientific disputes. This draft guidance document sets forth guidelines that will govern the operation of the Medical Devices Dispute Resolution Panel. Those guidelines include the appointment of a CDRH Ombudsman, who will be designated to receive, review, and make recommendations with respect to requests for review by the resolution panel. CDRH intends to ensure that a center ombudsman is in place before the final guidance goes into effect.

Question. Why did the agency chose not to establish a stand-alone dispute resolution mechanism?

Answer. The Agency felt that there were adequate dispute resolution mechanisms already in place, but that it would be helpful to clarify our regulations concerning the availability of advisory committees for certain types of appeals. This change has been finalized, and the Agency has issued guidance on this regulation. Therefore, a stand-alone mechanism was not necessary.

QUESTIONS SUBMITTED BY SENATOR KOHL

COST OF PRESCRIPTION DRUGS

Question. I hear from many constituents about the continuing increase in the cost of prescription drugs. In fact, I understand the problem of rising drug costs in the U.S. is among the most serious in the world.

What is FDA doing to help control the rising price of prescription drugs.

Answer. FDA plays an important, but indirect, role in helping control the price of prescription drugs. The agency carries out this role through the operation of a highly efficient and effective generic drug review process. As generic drugs are approved and enter the market place they reduce the cost of medication to the U.S. public.

Question. To what extent is the approval of generic drugs slowing these rising costs and if it is significant, why is FDA not doing more to encourage the availability of generic drugs?

Answer. Generic drugs reduce the cost of medication to the U.S. public when they enter the market place. If there are delays in the approval of the generic drugs beyond the patent and/or exclusivity period, then the U.S. public will not receive the full benefit of generic approvals.

We believe that the key to encouraging the availability of generic drugs is increasing the number of chemistry, microbiology, bioequivalence, and labeling reviewers, as well as support staff within the Office of Generic Drugs. In addition, funding is needed for research to support the development of scientifically rigorous bioequivalence testing methodologies for nonsystemically absorbed drug products. The review and approval of such products are often subject to challenge by innovator firms. The stronger the scientific support of these approvals, the more likely it will be the Office can successfully meet innovator challenges. Additionally, increasing the quality of industry submissions—abbreviated new drug applications; accelerating implementation of the electronic submission initiative on an industry-wide level; and increasing the level of training and professional development received by reviewers and review support staff would also help improve the availability of generic drugs.

FDAMA

Question. Please describe the progress at FDA in meeting the challenges of the recent FDA reform legislation.

Answer. Published in November 1998, the FDA Plan for Statutory Compliance addresses requirements set forth in Section 406 of the FDA Modernization Act, FDAMA. This plan outlines the actions necessary to bridge the gap between what FDA is required to do by statute and what it is able to accomplish with current resource levels. The first official progress report will be issued in late 1999. However,

the Agency is able to report on several accomplishments toward meeting the letter and intent of the legislation.

As the first year anniversary of the enactment of FDAMA, the Agency had met nearly all of the deadlines for implementing the many varied provisions of the law. In many cases the agency was able to complete these initiatives well ahead of schedule. In April 1999 FDA convened a live, national teleconference for the purpose of discussing the Agency's progress in implementing FDAMA and to seek additional input on specific performance targets. Highlights showing FDA's progress in meeting challenges of the reform legislation are being posted on the FDA web site at http://www.fda.gov/opacom/7modact.html. We will provide selected examples for the record.

—Biologics—FDA has issued over 50 guidance documents which will assist industry in getting products to market more quickly while continuing to ensure the same high level of safety and efficacy.

—Drugs—FDA has finalized the industry guidance for submission of New Drug Applications in electronic form and posted it on FDA's web site.

—Devices and Radiologic Health—FDA has shifted resources from low-risk to high-risk products, and involved stakeholders earlier during application review process.

—Food Safety—FDA held public meetings on health claims and nutrient content claims on foods based on authoritative statements, including proposal to permit such health claims on dietary supplements.

—Veterinary Medicine—FDA is conducting research to determine if the Agency can require fewer animal studies or reduce the number of animals needed in studies to support certain new animal drug applications.

Question. How is it affecting the budget?

Answer. The FDA reform legislation has drawn attention to the fact that current levels of funding are insufficient to meet the Agency's statutory obligations. Successful implementation of the FDA Modernization Act, FDAMA, depends on a commitment of resources focused on the Agency's overall public health and safety responsibilities. In light of the increasingly complex public health challenges facing the Agency in the 21st century, success will depend on innovative approaches by FDA, creative collaboration with stakeholders, prioritization of activities, and an adequate long-term resource investment to implement the necessary changes.

The affect of this legislation on FDA's budget is somewhat unclear. Inflation has reduced the real resources available for certain FDA responsibilities delineated in FDAMA. These include inspections to ensure product safety; review of devices, food additives, blood products, animal drugs, and generic drugs; and adverse event reporting and follow-up. Statutory requirements for new product review times and for inspectional coverage are not being met in all areas, due in part to budgetary limitations. Preparing and executing the budget, therefore, challenges the Agency to applying its strategic decision framework that focuses on the highest priority commitments.

Question. In what ways does FDA plan to restructure the agency to meet these challenges?

Answer. The FDA Modernization Act, FDAMA, defines the Agency's new mission. In that mission, Congress indicates not only the regulatory and public health responsibilities of FDA, but also the manner in which those roles are carried out. One key statement in the mission is that the Agency shall carry out its responsibilities, "in consultation with experts in science, medicine, and public health, and in cooperation with consumers, users, manufacturers, importers, packers, distributors, and retailers of regulated products."

With this in mind, several changes have been planned. The newly reorganized Office of the Commissioner, OC, will have as its principal focus to provide leadership in building effective, two-way communication between FDA and all stakeholders including: patients, consumers, Congress, the Administration, Agency employees, the regulated industry, health care professionals, and other scientific advisors. The OC will retain only those staff functions which cannot be reasonably and more effectively performed in those centers or offices that interface most directly with stakeholders. Other short-term changes will address a growing emphasis on international policy and activities, women's health, consumer issues, and systems improvement.

The emphasis of FDAMA on the involvement of stakeholders is changing the manner in which restructuring decisions can be made. As we compile the suggestions of our constituents, strategies for enhancing FDA's effectiveness as a scientific, regulatory agency will become more evident. Subsequent decisions regarding organizational structure will be made as appropriate for the Agency within the context of the rapidly changing national and global environment.

Question. Would you please comment on these reports and the obvious challenges of moving quickly, but not too quickly?

Answer. Although the FDA process is faster, every application is reviewed thoroughly and completely. In addition, the FDA standards for approval, which include how many patients must be studied in clinical trials and what benefits must be demonstrated, have not changed. Available evidence shows that shortened review times under the Prescription Drug User Fee Act Program have not led to less safe products being approved for marketing.

None of the U.S. safety withdrawals over the last 18 years, 13 of which were drugs, involved drugs that underwent particularly fast reviews. In fact, the fastest of these reviews was for the drug mibefradil which took 15 months—well above the current average review time under user fee performance goals. Many drugs are reviewed faster. A forthcoming article in a peer reviewed medical journal will provide a thorough analysis of new drug safety withdrawals showing them to be unrelated to approval time or approval year.

BIOTERRORISM

Question. Please explain FDA's role in the administration's Anti-Bio Terrorism policies.

Answer. FDA has a primary role in creating and maintaining a stockpile of pharmaceuticals and biological products and furthering research, design, development and approval of diagnostics, antibiotics, therapeutics and vaccines to be used to prevent and treat the exposure to deadly chemical and biological agents. This is an integral component of the Department of Health and Human Services' overall responsibility is to meet the Nation's public health and medical needs associated with terrorist events. The President's fiscal year 2000 budget for DHHS contains a request for $230 million for these purposes. The FDA, CDC, NIH, Substance Abuse and Mental Health Services Administration, and Office of Emergency Preparedness, working closely with the Department of Defense and the Department of Veterans Affairs have developed a four-pronged approach to prepare for and respond to a biological or chemical attack. The four priorities include revamping the public health surveillance system; strengthening our medical response capability; creating and maintaining a stockpile of pharmaceuticals and biological products; and enhancing research, design, development and approval of diagnostics, antibiotics, therapeutics and vaccines. FDA' s counter-bioterrorism initiative focuses on the priorities for creating and maintaining a stockpile of pharmaceuticals and biological products, and furthering research, design, development and approval of diagnostics, antibiotics, therapeutics and vaccines. I would like to provide additional information for the record.

BIOTERRORISM INITIATIVE

FDA's Stockpile Responsibility

FDA is responsible for ensuring the safety, purity, and potency of biological products intended for use in the diagnosis, treatment, prevention, or cure of diseases or conditions resulting from exposure of the American people to these deadly biological and chemical agents in this country or on foreign. FDA must evaluate the safety and effectiveness of these products prior to their release to the public. In addition, FDA must continue to ensure the safety and efficacy of these products through the inspection of manufacturing facilities for compliance with regulations, verification that product lots conform to preapproval standards and product consistency prior to their release into distribution, and evaluation of surveillance reports, such as adverse experience reports.

The release of a biological weapon, producing mass civilian or military casualties, will create a public health crisis in the United States requiring extraordinarily large amounts of antibiotics, antivirals and vaccines for treating those who become ill or for protecting those who may have been exposed. If such products are unapproved, FDA must be prepared to review them quickly and efficiently to assure their safety and efficacy. In addition, FDA will play a role in establishing any needed requirements for critical pharmaceutical supplies to be available to these biowarfare victims in less than 24 hours. This requires FDA to identify the biological or chemical agents that present the greatest threats, estimate the potential size of the population that may be affected, determine the best prophylaxis or treatment options, and then decide how best to assure immediate access to sufficient quantities.

The proposed stockpile would assure an immediately available quantity of appropriate pharmaceutical and biological products that would meet the needs of the affected population in the event of the release of a chemical or biological weapon. The need for a stockpile at several strategic locations around the United States is based

on the fact that some pharmaceutical products, required exclusively during a biological or chemical weapon attack, would not otherwise be available on a timely basis and in sufficient quantity. Normally these products are not found in the marketplace in adequate amounts to meet a mass casualty need and production lead times may be too long if there is a bioterrorism incident. The products in this type of stockpile, however, require careful monitoring for potency and sterility and will have to be replaced from time to time.

Research and Development

FDA is actively working on the interagency group to identify the agents that pose the greatest threat, to outline the current capabilities to deal with these agents, and to identify the goals and research needs necessary to respond to a potential bioterrorist attack using these agents.

In order to facilitate the development, approval, and continued safety and efficacy of the products, FDA scientists must plan and conduct research on the methods of testing safety, purity, potency, and efficacy of these products. The public health of the United States cannot risk the wide distribution of products that are unsafe. Based on their research, FDA scientists will be able to develop industry-wide testing techniques, standards and methods; to improve existing products; and promote the development of new products. FDA needs to conduct research regarding the agents that bioterrorists may use in order to further understand the agents and the effect they will have on humans who are exposed to them and to have a better understanding of the proposed treatments when FDA reviews applications.

Terrorist events involving biological agents will be very different in character from those employing chemical agents. Moreover, preparedness for and response to an attack involving biological agents are complicated by the large number of potential agents, most of which are rarely encountered naturally, their sometimes long incubation periods and consequent delayed onset of disease, and the potential for secondary transmission. In addition to naturally occurring pathogens, agents used by bioterrorists may be genetically engineered to resist current therapies and evade vaccine-induced immunity.

A research program to counter bioterrorism must address disease priorities, with initial emphasis on microbes such as smallpox and anthrax. For the longer term, research must target agents and diseases such as Ebola virus, brucellosis, plague, turalemia, viral encephalitides, viral hemorrhagic fevers and botulism. While current research programs are understandably focused on a few microbes that have the greatest potential for use as a weapon of mass destruction, in the future, additional research programs must address other potential microbial agents of bioterrorism.

A research program to produce vaccines and therapeutics for biological weapons faces the challenge of not being able to proceed with human Phase III efficacy clinical trials. Given ethical and safety concerns that would rule out infecting human subjects with a deadly organism in order to test a vaccine or therapeutic, trials with humans cannot be undertaken. Therefore, the regulatory process for approval of treatments or preventative medicines and diagnostics may need to be modified to permit the emergency use of antibiotics/therapeutics and vaccines that have been shown to be safe and efficacious in animal models. FDA has drafted a proposed rule to allow animal data to be used.

Since it is likely that an intentional release of a bioweapon will become apparent in the form of a disease outbreak, emphasis must also be placed on the development, evaluation and approval of rapid diagnostics. The ability to rapidly identify and characterize a suspected biological agent will permit speedy treatment and/or prophylaxis. The rapid diagnostic technologies to be developed should be capable of detecting known biological agents as well as genetically engineered organisms.

FDA's proposed activities and corresponding outcomes include:

Activities:

—Research and review activities related to expeditious development and licensure of new vaccines and therapeutics;

—Timely application reviews of new drugs and biological products and new uses of existing products;

—Participation in the planning and coordination of public health and medical response to a terrorist attack involving a biological or chemical agent;

—Participation in the development of rapid detection and decontamination tests for agents of bioterrorism such as C. botulinum, E. coli, B. Anthracis;

—Assuring the safety of regulated foods, drugs, medical devices and biological products; and arranging for seizure and disposal of affected products;

—Development of techniques to detect genetic modifications of micro-organisms which make them more toxic or resistant to antibiotics or vaccines;

—Rapid determination of a microbes sensitivity to drug therapy;

—Rapid determination of the mechanism of replication and pathogenicity/virulence of organisms, including those elements which can be transferred to other organisms in order to circumvent detection, prevention or treatment;
—Enhanced ADR surveillance capabilities.

Outcomes:
—Safe and efficient products to prevent, either prior to or subsequent to exposure, and treat toxicity of biological and chemical agents;
—Methods to rapidly detect, identify and decontaminate hazardous organisms;
—Increased ability to ensure the safety of the food supply;
—Increased ability to provide appropriate medical care and a public health response.

FIELD CONSOLIDATION

Question. Please explain the status of FDA field consolidation and the budgetary impact of those actions.

Answer. FDA began this initiative in 1994 with approval from the Secretary of Health and Human Services to proceed with streamlining field laboratories. The Agency was unable to maintain eighteen field laboratories due to rising rent and maintenance costs, overcrowding, and inadequate and obsolete laboratory space. Many leases for facilities built to FDA specifications in the 1960's were expiring. Faced with the prospect of acquiring new and more expensive replacement leases for special purpose laboratory space, the plan to focus and consolidate shrinking resources evolved. Nine of eighteen field laboratories will be closed, with staff and functions consolidated. Five large multi-purpose laboratories in New York; Atlanta; Jefferson, Arkansas; Seattle; and Los Angeles; and four smaller specialty laboratories in San Juan; Winchester, Massachusetts; Cincinnati; and Philadelphia will house the FDA field analytical science activities. Savings in estimated rent, maintenance and utilities from the start of the project in 1994 through 2014 are estimated to be in excess of $90 million. FDA will maintain its inspection, investigation, and compliance presence in all locations where laboratories are closed.

In 1997, laboratories were closed in Chicago, Buffalo and Cincinnati. In 1998 the laboratory in New Orleans was closed. The Baltimore laboratory will close in 1999; and, Dallas, Detroit and Minneapolis laboratories will close in 2000.

The new FDA field multi-purpose laboratory at NCTR in Jefferson, Arkansas is under construction with occupancy expected in December 1999. With a partial appropriation of $3 million in fiscal year 1999, FDA has recently awarded a contract to begin the third and final phase of the project, the renovation of Building 50 at NCTR, which will house joint ORA and NCTR administrative and support staff and services. $10.3 million will complete phase III; $3 million is requested in fiscal year 2000.

In 1995, $9.8 million was appropriated to FDA for land acquisition and design for the new laboratory and district office facility in Los Angeles. Land was purchased on the campus of the University of California at Irvine, and design is virtually complete. The fiscal year 2000 request includes $20.4 million, which is approximately one-half of the $40.4 million needed to complete construction of this much needed multi-purpose laboratory facility.

A new laboratory annex to the existing facility in Atlanta came on line last spring, and the facility is fully operational. The multi-purpose laboratory in Atlanta is complete and has been accepting additional staff from closing laboratories.

A new multi-purpose laboratory and office facility in Jamaica, Queens, New York, to be leased through GSA, is well underway with an expected occupancy in January 2000.

FDA has recently renovated the drug specialty laboratory in San Juan; expanded the drug specialty laboratory in Philadelphia; and, moved into a new facility in Cincinnati which houses the district office and the National Forensic Chemistry Center.

Question. As you are aware, I am concerned about the rising cost of drugs. I am also supportive of the goals of the Orphan Drug Act and the benefits it provides for people with rare disorders. However, concerns have been raised that implementation of the Act, in some instances, has had the effect of stifling competition and, ultimately, raising drug costs to consumers. Specifically, these concerns focus on those cases in which the exclusivity of one drug has expired, yet competition is still not allowed if there is another similar drug for which exclusivity is still in effect.

Commissioner Henney, please review and report to me on the implementation of the Orphan Drug Act in terms of the exclusivity rule and the effect it is having on competition in the market place and the ultimate cost to consumers.

Answer. The 7-year exclusive marketing period after approval for a designated orphan product is one of the most meaningful incentives of the Orphan Drug Act. As

of May 1, 1999, 189 orphan products have been marketed over the last 16 years. This exclusivity, like patent terms, restricts competition intentionally. Orphan drug exclusivity provides an additional economic incentive for sponsors to invest in the research and development for what are generally limited patient groups and markets. Many orphan products have no other source or basis for intellectual property protection. The exclusivity bar does not preclude products which show either greater efficacy or safety from being approved by FDA. FDA does not maintain nor have access to economic, pricing, or other financial data for these or any other regulated products. A premise of the orphan products program is that the most costly product is one that is neither known nor available when needed. FDA believes that consumers are served best when a proven safe and efficacious treatment is marketed and available when needed. In many cases, an orphan product displaces other restrictive and more costly care and improves the quality of life for the patient and affected family.

QUESTIONS SUBMITTED BY SENATOR HARKIN

OTC SUNSCREEN MONOGRAPH

Question. "Skin cancer is a serious public health problem in the United States, and regular use of sunscreen is considered an important element of sun protection. The FDA Modernization Act requires that FDA publish regulations for OTC sunscreens. In addition, Congress specifically directed FDA to address the review of foreign sunscreen ingredients as part of the OTC sunscreen monograph.

"Would you discuss how FDA is proceeding with this monograph, and what sort of timeline you foresee for its publication?"

Answer. A final sunscreen monograph published was in the Federal Register on May 21, 1999, (64 FR 2766). The Agency addressed the process for including sunscreen active ingredients based solely on foreign data and marketing experience in Comment 13 of the preamble to the final rule.

TOBACCO FUNDING

Question. Would you please describe in more detail what share of the money appropriated for the FDA initiative against youth smoking goes out to state authorities for their use in carrying out compliance checks and any other smoking prevention activity?

Answer. In 1997, $2 million (out of $4.9 million) went to state contracts to enforce the rule. In 1998, $16.4 million went to state contracts. In 1999, the Agency has allocated $22 million towards state contracts.

Question. Please describe in a more detailed breakdown just how the funding for this initiative is used, that is, the types of activities that are supported, how the money is distributed among these activities, and how the money is apportioned between federal and state level activities.

Answer. In fiscal year 1997, FDA designed a pilot program and infrastructure to enforce the rule. The Agency, consistent with its practices in other areas, determined that it would commission state and local officials to enforce the federal rule—specifically to conduct unannounced visits to retailers using adolescents younger than 18, who would attempt to purchase cigarettes or smokeless tobacco. Initially, the Agency contracted for enforcement in 10 states. In fiscal year 1997, contracts were awarded to Florida, Illinois, Washington, Texas, Massachusetts, Colorado, Pennsylvania, Minnesota, Arkansas, and California. These states were required to conduct approximately 200 to 400 inspections per month. Compliance checks began in the first state in August 1997. These contracts resulted in approximately 20,000 compliance checks during the 10 month pilot program.

In fiscal year 1998, the Agency expanded its enforcement efforts and solicited bids from all 57 states and territories to contract with FDA to do compliance checks. By the close of fiscal year 1998, FDA had signed contracts with 43 states and territories totaling $16,382,912. Under these contracts, the states will conduct approximately 186,500 compliance checks by September 30, 1999. The average contract is approximately $390,000. With the signing of each new contract, FDA's headquarters or regional staff trains the designated state and local officials. Headquarter staff has also spent countless hours answering questions from tobacco retailers and providing technical assistance to the states.

All 10 states who participated in the pilot program, renegotiated contracts to continue doing compliance checks in their states. In at least two states, the programs had been so successful that the states chose to expand the initial limited coverage provided by the first contract. In Arkansas, for example, the pilot contract provided

for compliance checks to be conducted only in and around Little Rock. Similarly, in Colorado, only a few counties were included in the original contract. In both cases, the subsequent contracts substantially increased the areas of the state that would be included in the investigations.

The existing contracts resulted in 39,439 attempted and completed compliance checks during fiscal year 1998, including reinspection of retailers found to have violated the rule. The Agency's legal staff devised and established the framework for the imposition of civil money penalties, sent out complaints, and negotiated or litigated contested cases. In fiscal year 1998, FDA began seeking civil money penalties from those found to have violated the rule's restrictions on sales to minors for a second time. In fiscal year 1999, FDA began investigations of retailers who have been found to have already violated the rule two times. The agency anticipates seeking civil money penalties for third violations within the first quarter of fiscal year 1999. A penalty schedule for violations of other portions of the regulation will be developed when these provisions go into effect.

In the second half of fiscal year 1998, the Agency contracted with Battelle Memorial Institute to study the tobacco program's business processes, outline the program's work flow and conduct a requirements analysis. From this requirements analysis, Battelle proposed a system design to automate the program's processes. In addition, Battelle presented a proposed plan to obtain and maintain a list of retailers selling tobacco in each state that would be more complete, accurate and user friendly than the lists constructed by the Agency during its first full year of operation.

Based on the design, Battelle has launched a multi-year effort to provide reliable retailer lists and an infrastructure designed to maintain the list and make it user friendly for FDA and for all contracting states. Battelle will also design and implement an information technology system which will automate all the program's various functions, including contracting, outreach, enforcement, compliance checks, litigation, collection of civil money penalties, etc. The new system will increase the efficiency of the program and will improve communications internally as well as with state contractors and with other stakeholders. The various system design components will be implemented incrementally as they are developed beginning in early 1999. The entire system should be operational by 2001. The amount dedicated to this multi-year project in fiscal year 1998 is $2.8 million.

In fiscal year 1998, the Agency designed a comprehensive outreach program designed to inform retailers and ensure compliance. This multi-faceted program consisted of advertising, direct mail, press events and materials, exhibits and speeches, and dissemination of materials requested via a hotline or mail order.

In fiscal year 1998, the Agency designed a multi-media advertising campaign, including radio, print, and billboard advertising. A free retailer kit using humorous illustrations and a folksy approach also was created to make it easier for retailers to comply with the new regulation. A series of focus group discussions were held with retailers, sales clerks, young people between 18 and 27, children ages 12 to 18, and the general public to test the advertising campaign and retailer kits. During fiscal year 1998, approximately 500,000 retailers kits were produced and sent to stores across the country.

The FDA conducted a tracking study in 10 media markets to evaluate the effectiveness of the campaign. Findings indicate that awareness of the photo identification age provision rose dramatically from approximately one-third of retailers to more than one-half of all retailers. In addition, there was a three-fold increase in recall of the fine for repeat violations in the test markets. Further, in test markets, twice as many clerks used 27 as the cut-off age after the campaign compared to before the campaign. Importantly, retailers reported that minors were somewhat less likely to try to buy tobacco and retailers said that customers were less likely to be irritated when asked to show photo identification as a result of the advertising campaign. By the close of fiscal year 1998, the Agency had obligated approximately $12.5 million for outreach activities. This covers the costs of the paid advertising campaign as well as the printing and dissemination of nearly a half million retailer kits.

In 1997, $2 million (out of $4.9 million) went to state contracts to enforce the rule. In 1998, $16.4 million went to state contracts. In 1999, the Agency has allocated $22 million towards state contracts.

SUPREME COURT AND TOBACCO

Question. What is FDA's response to the Supreme Court's granting of certiorari to review the Fourth Circuit case?

Answer. The Administration stated on the day of the Supreme Court announcement that it was pleased that the Court has agreed to hear this important public health case.

Question. It is my understanding that FDA retains full authority pending the Supreme Court decision to carry out the photo I.D. and minimum age rules, in cooperation with its state partners. Is that correct?

Answer. Yes, pending the outcome of the Supreme Court's consideration of this case on the merits, FDA continues to have the authority to enforce the age and photo ID provisions of the tobacco rule.

Question. Given the history of the tobacco industry in marketing tobacco products to young people, and frankly in not being truthful about so many of its activities, does it not make sense that the industry should provide at least some of the resources needed to carry out the efforts of FDA and its state partners to prevent kids from taking up smoking? For example, under the Prescription Drug User Fee Act, an industry regulated by FDA provides some of the resources for FDA activities.

Answer. Funding via industry user fees is not contained in the Administration's fiscal year 2000 budget request for FDA's tobacco program.

Question. Now, the situation regarding tobacco is not exactly the same, of course, but it seems there is an even stronger case in many respects for having the tobacco industry support FDA activities than there is for prescription drug user fees. What is FDA's position on obtaining resources from the tobacco industry to support FDA smoking prevention efforts?

Answer. Funding via industry user fees is not contained in the administration's fiscal year 2000 budget request for FDA's tobacco program.

QUESTIONS SUBMITTED BY SENATOR DORGAN

PRESCRIPTION DRUGS

Question. As the FDA Commissioner knows, U.S. consumers pay on average 30–60 percent more for the exact same medications than consumers in Canada, the United Kingdom, and Sweden. Part of the reason for this is that federal law and regulation have essentially created a closed market for prescription drug manufacturers.

What are the statutory barriers to allowing free trade of prescription drugs?

Answer. Under the Federal Food, Drug, and Cosmetic Act, the Food and Drug Administration must approve all new drugs, including prescription drugs, before they may be commercially distributed in the United States. This review function performed by FDA provides an essential protection to the health of the American people by helping ensure that the drug products that are available are safe and effective for their intended use. To obtain approval, the sponsor of a drug, usually the manufacturer, must submit sufficient information to the agency in the form of either a new drug application for innovator drugs that are not generic equivalents of currently marketed drugs or an abbreviated new drug application for generic equivalents of currently marketed drugs. Information that must be included in the application includes the chemical composition of the active chemical entity, the identity and composition of excipients and other inactive ingredients, and information concerning the place and methods of manufacture. On the basis of that application, as well as information obtained through inspections, FDA reviewers determine whether the drug is safe and effective for a particular use. If a sponsor does not file a new drug application with FDA, FDA cannot approve the drug, and the drug cannot be commercially distributed in the United States. A limited exception to the prohibition on distribution of unapproved new drugs exists to permit non-commercial distributions of unapproved new drugs intended solely for investigational use by experts qualified by scientific training and experience to investigate the safety and effectiveness of drugs.

One provision of the Prescription Drug Marketing Act, Public Law 100–293 § 2(4), which was incorporated into the Federal Food, Drug, and Cosmetic Act, may also affect the importation of approved drugs. Congress enacted this provision pursuant to its finding that, "Large amounts of drugs are being reimported to the United States as American goods returned. These imports are a health and safety risk to American consumers because they may have become subpotent or adulterated during foreign handling and shipping." Accordingly, Congress passed 21 U.S.C. § 381(d)(1), which prohibits the reimportation of a prescription drug or insulin that was manufactured in the United States, and exported, unless the drug is reimported by the manufacturer of the drug or FDA authorizes reimportation of the drug for emergency medical care.

Finally, other provisions of the Federal Food, Drug, and Cosmetic Act which prohibit the distribution of adulterated or misbranded drugs, could act to deny admission to certain entries of prescription drugs, depending on the condition of the drugs.

Question. What barriers exist in FDA's statute to prohibit pharmacies from purchasing pharmaceuticals in other countries when those products are approved for sale in the U.S. and produced at FDA-certified facilities?

Answer. The Federal Food, Drug, and Cosmetic Act does not prohibit the purchase of approved prescription drugs in other countries. However, one provision of the Prescription Drug Marketing Act, which was incorporated into the Federal Food, Drug, and Cosmetic Act, may affect the subsequent importation of approved prescription drugs, if those drugs were originally manufactured in the United States. This provision, 21 U.S.C. § 381(d)(1), prohibits the reimportation of a prescription drug or insulin that was manufactured in the United States and exported, unless the drug is reimported by the manufacturer of the drug or FDA authorizes reimportation of the drug for emergency medical care.

IMPORTATION PRESCRIPTION DRUGS

Question. During a recent meeting with Deputy Commissioner Michael Friedman, he identified 3 barriers that prevent consumers and pharmacists from importing prescription drugs from other countries to take advantage of lower prices: 1) GATT, which prevents the U.S. from treating its trading partners differently; 2) the Prescription Drug Marketing Act, which permits only pharmaceutical manufacturers to re-import their drugs into the U.S.; and 3) the Federal Food, Drug and Cosmetic Act, which requires the FDA to ensure that drugs are made using good manufacturing practices.

Can the FDA Commissioner recommend what changes could be made in the law to facilitate the importation of FDA-approved prescription drugs without undermining the public's safety?

Answer. The first and third items discussed above might act as barriers to the importation of prescription drugs that are not manufactured pursuant to an FDA-approved new drug application and, therefore, not in compliance with the Federal Food, Drug, and Cosmetic Act. However, they are not likely to have an impact on the importation of prescription drugs manufactured pursuant to an FDA-approved new drug application.

With regard to item 1, GATT and other United States trade agreements limit the United States' ability to distinguish arbitrarily among its trading partners. For example, if the United States were to put to the side all other legal concerns, including concern with compliance with the Federal Food, Drug, and Cosmetic Act, and decided to allow the importation of unapproved drugs manufactured in Country A, but to disallow the importation of unapproved drugs manufactured in Country B, the United States might be accused of making an arbitrary distinction between Country A and Country B. This concern is not relevant when the United States decides to allow the importation of approved drugs from Country A, but to disallow the importation of unapproved drugs from Country B. That distinction is on its face a reasonable one, based on the laws of this country designed to assure public health and safety.

With regard to item 3, the Federal Food, Drug, and Cosmetic Act requires all manufacturers, processors, packers and holders of drugs to conduct their operations in conformity with current good manufacturing practice. All United States manufacturers, and all foreign manufacturers who manufacture drugs pursuant to approved new drug applications, are required to adhere to current good manufacturing practice. Neither the Federal Food, Drug, and Cosmetic Act, nor the regulations promulgated thereunder, attribute to approved prescription drugs that have traveled outside the United States a presumption that the drugs were, or were not, handled in accordance with current good manufacturing practices. All such determinations would be based on the individual circumstances surrounding the handling of the drugs. However, when drugs are handled outside the United States, we have very little information regarding handling conditions. A concern about poor handling during extended foreign shipments of drugs manufactured in the United States led to the passage of a provision of the Prescription Drug Marketing Act, PDMA. The PDMA provision, 21 U.S.C. § 381(d)(1), could impede the importation by a consumer of FDA-approved prescription drugs because it prohibits the reimportation of a prescription drug or insulin that was manufactured in the United States, and exported, unless the drug is reimported by the manufacturer of the drug or FDA authorizes reimportation of the drug for emergency medical care. In passing this legislation, Congress expressly found, "Large amounts of drugs are being reimported to the

United States as American goods returned. These imports are a health and safety risk to American consumers because they may have become subpotent or adulterated during foreign handling and shipping." Public Law 100–293 § 2(4). FDA has also concluded that this provision provides greater assurance that recalls of prescription drug products will be conducted effectively. For example, if a manufacturer's records indicate that a drug has been distributed in Asia, not the United States, the manufacturer will provide all recall notifications to entities in Asia. United States consumers may hear nothing about the recall.

You have asked FDA to recommend changes to this provision that would facilitate the importation of FDA-approved prescription drugs without undermining the public's safety. However, FDA believes that this provision affords the public an important safeguard. As part of the FDA Modernization Act of 1997, Congress recently amended section 381(d)(1) to include insulin, a non-prescription drug, within the prohibition on reimportation. FDA supported that extension because insulin is temperature sensitive and requires refrigeration. Adverse storage conditions during international transport could cause the drug to become subpotent, could compromise the stability of the drug, or could cause physical changes in the drug, such as precipitation and clumping. Any of these changes could affect the effectiveness of the insulin dose administered to a diabetic patient.

These concerns apply also to prescription drugs, since handling and storage conditions can affect the effectiveness of all drugs encompassed by 21 U.S.C. § 381(d)(1).

Question. The Prescription Drug Marketing Act of 1987 prohibits the re-importation of drugs produced in the United States to this country by anyone other than its manufacturer. I understand that the policy goals of this law were to prevent the counterfeiting, mislabeling, or adulteration of drugs sold to American consumers.

Are there other ways to achieve these same goals without curtailing competition?

Answer. The agency lacks the economic expertise to analyze the effect on competition of this law, or alternative formulations. Moreover, the agency does not have data on the volume of prescription drugs that are manufactured in the United States in accordance with an approved new drug application, but distributed outside the United States.

FSI FUNDING

Question. The budget request includes funding for the Food Safety Initiative in the amount of $79 million, including an increase of $30 million and 156 FTEs. Can you describe in more detail how funds will be used to develop a food safety net?

Answer. The $79 million is a total for the Food Safety Initiative and includes the $24 million increase in fiscal year 1998, the $25 million increase in fiscal year 1999, and the $30 million request for fiscal year 2000. I would be happy to proved additional information for the record.

Performance Goals for the Food Safety Program

Funding for the Food Safety Initiative will be used to develop a food safety net based on the following:

—The performance goals for the Food Safety Program represent major milestones in FDA's efforts to achieve significant improvements in the safety of the Nation's food supply.

—Each of the performance goals is tied to one or more of the six elements identified in the President's Food Safety Initiative as being critical to efforts to improve the safety of the Nation's food supply. These six elements are improved foodborne disease surveillance, improved interagency coordination on responses to foodborne illness outbreaks, increased food safety education, improved compliance monitoring, effective risk assessment techniques for microbial pathogens, and improved techniques for pathogen detection, control and prevention. Moreover, the activities reflected in the performance goals are designed to help the Agency improve its ability to address food safety issues that currently pose significant threats to the health and well being of American consumers. These threats include emerging pathogens, bacterial toxins contamination, poor food handling practices in the home and retail establishments, and uninspected imported foods, especially fresh fruits and vegetables. By the year 2001 it is expected that data generated by foodborne disease surveillance will be adequate to establish baselines against which FDA and other federal agencies can begin to assess the impact that their programs are having on reducing the number of foodborne illnesses that occur annually.

—Additionally, benefits gained in terms of improving the safety of the food supply from NARMS in the past are multiple: NARMS has made contributions to food safety when CDC provided information to public health departments on the presence, in specific areas of the country, of Salmonella typhimurium DT104,

a multi-drug resistant pathogen identified by NARMS; the NARMS report has been utilized by food animal producers to identify problems associated with drug resistance in some food animal populations; NARMS has also been a source of well characterized isolates from food animals for researchers developing rapid assays to identify human pathogens in food, such as the Salmonella typhimurium DT104 rapid assay announced by the Secretary of the Department of Agriculture. Benefits to be gained in the future in terms of improving the safety of the food supply from increasing the numbers of isolates tested in NARMS are: 1) an increased ability to detect outbreaks of food-borne disease early in an outbreak and earlier recall of adulterated products preventing exposure of larger proportions of the population, 2) improved ability to identify the source of resistant human food-borne pathogens, 3) improved characterization of the magnitude and type of resistance in food animal populations to be used in policy development and risk assessments and 4) improved capability to determine the magnitude of resistance transfer in food-borne pathogens.

—The research conducted will facilitate our ability to determine the contribution of animal feeds to the development of antibiotic resistance in food-producing animals. Information strategies can be developed to reduce the level of pathogens in animals feeds, thereby reducing the exposure of food-producing animals to pathogens and will provide the basis for the development of strategies to reduce the pathogen load in food-producing animals, which contributes to the persistence of resistance pathogens.

Question. How does this program compliment and support the recommendations of the President's Council on Food Safety/National Academy of Sciences Report to develop a comprehensive national food safety plan?

Answer. I would be happy to describe this compliment for the record.

In the May 1997 report—"Food Safety From Farm to Table: A National Food Safety Initiative", the food safety agencies made a commitment to prepare a 5-year comprehensive strategic plan, with the participation of all concerned parties. On August 24, 1998, President Clinton signed an Executive Order to create the President's Council on Food Safety, giving the responsibility for the development of a comprehensive strategic plan for federal food safety activities to the Council. The Council will develop a comprehensive plan to improve the safety of the nation's food supply by establishing a science-based food safety system. The plan will address the steps necessary to achieve this improved system, focusing on key public health, resources, and management issues that include measurable outcome goals.

The National Academy of Sciences report, "Ensuring Safe Food From Production to Consumption," made the following recommendations. Following each recommendation is a statement indicating how FDA is already involved in addressing these concerns.

—Recommendation One: The food safety system should be based on science. FDA provides numerous examples where this is already the case, including the development and implementation of the FoodNet and PulseNet systems for surveillance and identification of foodborne pathogens and the implementation of new science-based inspections of seafood. FDA has also identified areas that should be strengthened such as improving the ability to assess health risks from pathogens in food.

—Recommendation Two: Federal statutes should be based on scientifically supportable risks to public health. The President's Council on Food Safety, of which FDA is a part of, will call on Congress to work with it to create scientifically-based statutes to promote food safety. The Council will conduct a thorough review of existing statutes and determine what can be accomplished with existing regulatory flexibility and what improvements will require statutory changes.

—Recommendation Three: A comprehensive national food safety plan should be developed. The first steps to lay the groundwork have already been taken, the food safety agencies have participated in interagency strategic planning sessions and drafted a vision statement encompassing the agencies' vision for the U.S. food safety system and the roles of all those involved in food safety.

—Recommendation Four: A new statute should be enacted that establishes a unified framework for food safety programs with a single official with control over all federal food safety resources. The Council supports the goal of a unified framework for food safety programs and will conduct an assessment of structural models and other mechanisms to strengthen the federal food safety system through better coordination, planning, and resource allocation.

—Recommendation Five: Agencies should work more effectively with partners in state and local governments.

The Council, of which FDA is a part, held four public meetings (October—December 1998) to engage consumers, producers, industry, food service providers, retailers,

health professionals, State and Local governments, Tribes, academia, and the public in the strategic planning process.

The base of the Food Safety Program encompasses Surveillance, Research, Risk Assessment and Education. This base lays and strengthens a strong scientific foundation for a nationally integrated food safety system. The system begins with identifying pathogenic microorganisms in animals, conducting HACCP surveillance activities at slaughter facilities, and monitoring activities to prevent or contain outbreaks of food-borne illness. Antimicrobial resistance fits into all aspects of the foundation—surveillance, research, risk assessment and education due to the use of antibiotics in food-producing animals for therapy and growth promotion purposes. The Animal Drugs and Feeds portion of FSI focuses on developing and expanding the National Antimicrobial Resistance Monitoring System (NARMS) as a surveillance tool that will enable us to detect emerging resistance and take appropriate public health action in response. This will allow us to target education on proper use of antimicrobials, conduct research to develop a better understanding of the mechanisms of the transfer of antibiotic resistance among bacteria, and carry out risk assessment to identify the level of antibiotic resistance that poses public health risk and to direct resources to minimize those risks.

The Food and Drug Administration is in constant communication with other federal food safety agencies to ensure that proper surveillance and research activities are being undertaken and to reduce the level of duplication to a minimum. NARMS, which was established in January 1996, is a collaborative effort among the FDA, USDA, and CDC which was initiated in response to public health issues associated with the approval of fluoroquinolone products for use in poultry. We also work very closely with USDA on research related activities. Scientists from USDA were actively involved with the development of our research plans, in large measure to avoid duplication of effort. In addition, scientists from FDA participated in the planning activities of these same agencies. This process has continued to keep the other agencies apprised of our ongoing activities as well as their activities, explore areas for collaborative research efforts, and be able to respond to changing research needs and priorities.

Question. Explain in detail your partnerships with Federal and state departments of agriculture and health on food safety.

Answer. A national, rapid, effective response to foodborne illness outbreaks requires a coordinated effort that crosses agency lines, while recognizing the unique statutory responsibilities of each federal, state, and local agency involved. This requires agreement about roles and responsibilities of public health officials at all levels and the most expeditious manner of operating within those parameters in responding to outbreaks, collecting epidemiologic data, and quickly initiating traceback investigations.

From the outset of the President's Food Safety Initiative, the Administration has recognized the need for strengthening partnerships between Federal agencies and State and local public health agencies. In the first two years of the Food Safety Initiative, additional funds were provided to improve coordination between all agencies involved in the food safety system. Within the framework of the initiative, additional funds helped establish the successful working relationships for implementing FoodNet, PulseNet, NARMS, Foodborne Outbreak Response Coordinating Group-FORC-G-, the Risk Assessment Consortium, and the Partnership for Food Safety Education. In addition, Food Safety Initiative funds have enabled food safety agencies to provide training and materials to State and local agencies for expanding and improving their on-going inspection and compliance capabilities, food safety education efforts, and foodborne illness surveillance capabilities.

Great progress has also been made by cooperative Federal agencies in implementing HACCP systems for seafood, meat, and poultry and a comprehensive initiative for ensuring the safety of fruits and vegetables. Other efforts include the coordination of activities for ensuring the safety of food during transportation and at the retail level. These are complex issues involving numerous Federal, State, and local officials. The partnerships established and strengthened under the President's Food Safety Initiative have contributed to the ability of Federal food safety agencies to leverage resources, avoid duplication, and provide the basis for an integrated and seamless food safety system. Additional partnerships will be formed with the states to increase the number of high risk, non-meat and poultry, food inspections and to enhance the capabilities of states to improve food safety at the retail level.

In September, 1998, representatives of food safety agencies from all 50 states, Puerto Rico, and the District of Columbia met with HHS and USDA in Kansas City to discuss how federal, state, and local food safety activities could be better integrated to provide a more effective and efficient food safety system. The State representatives strongly support the concept of a nationally integrated food safety sys-

tem building on the current Federal-State partnerships. The 2000 budget proposal includes funds for HHS, with USDA, to accelerate their planning with the states, including opportunities for public input, so as to be fully prepared to begin implementing such a system. To further foster progress toward a seamless, science-based food safety system, the 2000 budget includes funds to enable USDA and HHS to develop stronger ties with State food safety agencies.

USDA is currently providing the training and equipment necessary for State personnel in the 25 State meat and poultry inspection programs to assure that State programs implement meat and poultry HACCP requirements that are 'at least equal to' the Federal program of continuous inspection. Providing the 25 State meat and poultry inspection programs access to Federal computer networks will facilitate the coordination of inspection coverage between the two programs and ensure a consistent approach to inspection and an efficient allocation of resources. In addition, legislation will be proposed to authorize the Secretary of Agriculture to enter into Federal-State cooperative agreements that provide for State meat and poultry inspection programs to enforce Federal meat and poultry inspection laws and regulations with their State as part of a seamless national inspection program. Products shipped under such new Federal-State cooperative agreements would be permitted to enter interstate commerce.

Another major aspect of the 2000 budget proposal is to significantly increase HHS efforts to coordinate its Federal inspection responsibilities with State and local agencies. Through grants, contracts, and other mechanisms, FDA will utilize State-conducted inspections to increase the frequency of coverage for domestic firms. With the additional resources, HHS estimates that a combination of Federal and State inspectors will be able to reduce the existing inspection cycle from once seven years for any particular establishment to a risk-based approach that enable highest risk operation to be inspected once a year.

Encouraging the use of preventive control measures, such as HACCP and the Food Code, by the retail food industry will be the third major focus of cooperative federal-state activity. HHS and USDA, have worked, through the Conference for Food Protection, a forum for all stakeholders to have input into the code development process, with the states to promote use of safe practices in retail food operations and adoption of Food Code provisions, including HACCP. The Food Code is a model that provides scientifically sound technical and legal basis for regulating the retail segment of the food industry. It is the Federal government's best advice on a comprehensive system of regulation to ensure food in restaurants, retail food stores and institutional establishments is safe.

The target audience of the Food Code is the 75 State and territorial agencies and over 3,000 local agencies directly regulating over one million retail operations. In fiscal year 2000, the agencies will continue to work with and provide training, assistance, and resources to improve the safety of food products at retail.

DHHS, with the assistance of USDA, will also work cooperatively with foreign governments to evaluate foreign food production and inspection systems. Under the initiative, DHHS and USDA will increase the number of international arrangements for assuring food safety to facilitate the mutual understanding of the risks associated with foreign products, exclusive of meat and poultry, and the control measures necessary to reduce those risks. FDA will also follow-up on foodborne illness outbreaks associated with imported products and work toward equivalence determinations for other countries.

FDA in collaboration with CDC and USDA established and is expanding the National Antimicrobial Resistance Monitoring System, NARMS, to detect potential hazards through systematic collection, analysis and interpretation of antimicrobial susceptibility surveillance data. Seventeen state and local health departments, including CA, CO, CT, FL, GA, KS, Los Angeles County, MA, MD, MN, NJ, New York City, NY, OR, TN, WA, and WV, submit human clinical isolates of non-typhoid Salmonella and E. coli and began submitting human S. typhi and Shigella isolates in January 1999. Campylobacter isolates are submitted by eight health departments and, in addition, MN, GA, MD and OR are submitting Campylobacter isolates from poultry retail samples. A pilot study involving these four states to monitor the resistance of human and poultry Enterococcus isolates to 27 antimicrobials began in 1998. Three veterinary sentinel sties were recently added to NARMS in the states of CA, WA, and NY. In addition, our Office of Research serves as a PULSENET laboratory, collaborating with the USDA laboratory at Athens, GA on Campylobacter samples and collaborating with USDA on molecular identification of Salmonella samples.

FDA provided USDA with a list of priorities for research funding by USDA. This is based on the fiscal year 1999 Appropriation directive that directs the USDA to consult with FDA regarding food safety research objectives of that agency and rec-

ommends that $5M of the funds provided for the food safety component of the National Research Initiative, USDA, be used to meet those needs.

FDA plans to develop an international database with WHO for food-borne organisms and susceptibility patterns, if funding will allow, to share information globally that will improve our ability to detect emerging pathogens and their resistance patterns.

Question. Part of the increase requested is to expand educational activities in preventing food borne illness for fruits and vegetables and seafood. In addition, FDA admits scientific knowledge in this area is lagging.

How will the requested increase be used to minimize food borne illness associated with fresh produce including seafood? How will the requested increase be used to minimize food borne illness associated with fresh produce including seafood?

Answer. Regarding fresh produce, we have determined that the most effective mechanism to promote use of the voluntary guidance is through education and outreach efforts by FDA and USDA. Efforts will be directed to growers and producers who supply produce to the U.S. market and be developed in cooperation with industry groups, state and foreign governments and trade organizations.

While we are not always able to identify the specific cause of contamination in many cases of foodborne illness, in most cases we know the potential sources of pathogens and can take steps to protect public health with regard to those sources. The guidance is based on current sound science and knowledge of the common pathways for pathogens on fresh produce, which include manure, water, workers, field sanitation, packinghouses, and transport operations. The guidance recommends well-accepted methods to minimize the potential for microbial contamination of fresh produce.

In addition, FDA and USDA are jointly accelerating the research outlined in the fiscal year 1998 President's Food Safety Initiative, to develop new technologies to more rapidly identify and eliminate or reduce levels of pathogens; developing research-based educational programs targeting producers, processors, handlers, and consumers; and assisting in providing guidance and procedures to reduce or eliminate contaminants; and with FAS, providing technical assistance to foreign countries, where appropriate, to improve the safety of their products.

Question. How does FDA propose to implement educational programs on production and processing for domestic and international producers to protect the public from food borne illness?

Answer. In order to develop credible and useful education programs, FDA is meeting with both domestic and foreign growers and producers of fresh fruits and vegetables to begin the process for determining how to develop an education and outreach program to address the Good Agricultural Practices "Guide to Minimize Microbial Food Safety Hazards for Fresh Fruits and Vegetables." A National Food Safety Science and Education Conference was called for in the February 1998 "Initiative to Ensure the Safety of Imported and Domestic Fruits and Vegetables: Status Report to the President." In April 1999, two workshops were held. The first was geared toward growers and producers of fresh fruits and vegetables grown in the United States. The goals of the workshop were to enhance the coalition building process for those involved in implementing the "Guide"; determine education and outreach needs of growers and producers and the most effective and efficient methods of meeting those needs; identify research needs in support of implementation of the "Guide."

Attendees included extension specialists, growers, producers, buyers, processors, distributors, trade organizations, state and federal regulators, and educators who are involved in growing, harvesting, processing and transporting fresh fruits and vegetables.

The focus of the second conference, designed to harmonize with the domestic conference, began the process of determining how to develop an education and outreach program for growers and producers of fresh fruit and vegetables imported into the United States. Foreign and domestic scientific experts, foreign government agriculture and health officials, and industry representatives discussed applications of the guide. Representatives from donor organizations addressed infrastructure improvements needed to enhance food safety. Participants addressing goals similar to the domestic workshop, also identified key elements for a base training model on good agricultural practices for fresh produce and called for an alliance of government, industry and academia to address these training needs. An analysis of information gleaned from both conferences is currently underway and "next steps" are being determined.

On another front, a grant has been provided for development of a domestic curriculum covering the "Guide," which will serve as a basic core component course. Efforts are also underway to begin a database of available courses to be housed at

the FDA/USDA Foodborne Illness Education Information Center at the National Agricultural Library.

Question. How many outbreaks of food borne illness have occurred to date this year as compared to last year?

Answer. We will provide a chart for the record with the information we have been able to obtain.

[The information follows:]

	State	Onset date range	No. ill/ hospitalized	Number lab confirmed	Vehicle	Agent	Source comments
Salmonella Anatum in Orange Juice.	FL	Mid Jan—early Mar	4/?	4	Fresh Squeezed Unpasteurized Orange Juice.	Salmonella Anatum	Nokomis Groves (retail) No IS.
Salmonella Thompson	CA	Late Feb—Late Mar	>60/?	([1])	Unknown	Salmonella Thompson	Possible Mexican Restaurant connection.
WIC program Infant Formula-Vomiting, projectile vomiting, and diarrhea.	FL	Feb-present	?/?	0	Infant Formula	Unknown Samples being analyzed for B. cereus and Staph toxin, & Chemical Screen.	Nestle Carnation Many lots suspect.
Chinese Restaurant-Salmonella Enteriditis.	CA	Jan 99	?/?	?	Suspect Eggs	Salmonella Enteriditis	Isolate(s) confirmed as PT 4 and sent to CDC.
Party in Maryland-Salmonella.	MD (party)	Apr 17	25/?	12	Chicken salad	Salmonella	Same caterer in Delaware for all 3 events.
	MD (church)	Apr 16	2+/?	2		Group D	
Group D	DE	Apr 17	1/?	1		(not confirmed Enteriditis yet).	Same caterer in Delaware for all 3 events.
Infant Formula-Enterobacte r Sakazaki..	FL	Apr/May?	1/1	?	Similac with Iron	Enteroba cter Sakazaki	Unknown where organism isolated from (patient, pro-duct), FDA sample to be collected.

QUESTIONS SUBMITTED BY SENATOR FEINSTEIN

MICROBIAL RESISTANCE

Question. What is the FDA's position on the proposal to ban or phase out the use antibiotics in animals if the same drugs are used by humans?

Answer. FDA is engaged in discussions to resolve questions about appropriate uses of antibiotics, and the Agency is very concerned about the ever-expanding antibiotic resistance in organisms that cause illness in humans. Our draft framework document, "Proposed Framework for Evaluating and Assuring the Human Safety of the Microbial Effects of Antimicrobial New Animal Drugs Intended for Use in Food-Producing Animals", sets out a conceptual risk-based process for evaluating the microbial safety of antimicrobial drugs intended for use in food-producing animals. This document has been released to the public and has been the subject of a great deal of appropriate public debate.

FDA has the authority under Section 512 of the Federal Food, Drug, and Cosmetic Act to withdraw approval of applications of new animal drug products, including antimicrobials, when certain conditions are met such as drugs shown to be unsafe under approved conditions of use. Sponsors of applications for such products must be given an opportunity for a hearing on the proposed withdrawal. Section 512 also gives FDA the authority to suspend an approval if the Secretary finds the drug poses an imminent hazard to the health of man or animals. In such cases, sponsors must be given an opportunity for an expedited hearing on the suspension. That section also gives FDA the authority to withdraw an approval through a notice-and-comment rulemaking process.

If FDA suspends or withdraws an approval, any product covered by the suspension or withdrawal that is subsequently offered for sale is considered adulterated and subject to seizure or other remedies.

Question. If the U.S. were to ban the animal use of antibiotics, what would be the impact on the price and quality of meat and poultry available for consumption?

Answer. For FDA to ban growth promoting antibiotics by withdrawing all current approvals would require the Notice of Opportunity of Hearing process. This process could take 3–5 years, if the process proceeds on a similar timeframe for previous withdrawals, hopefully giving the industry time to develop alternatives. A definitive answer would require a market analysis. In the absence of such an analysis, however, we estimate that the impact on price and quality would be minimal because of the time available for industry to develop alternatives.

Question. This proposal forces companies to prove that there is no risk to human health before new antibiotics are approved for animal usage. What steps is the FDA taking to address human resistance to existing antibiotics being used in livestock feed?

Answer. FDA's proposed framework document specifies that currently approved antimicrobials for food-producing animals will be addressed on a risk prioritized basis. Thus, if the framework is implemented FDA would place highest priority on evaluating those currently approved drugs that are classified Category I, those that are the same as or closely related to human antimicrobial drugs that are essential for treating a life-threatening disease or important for treating a food borne illness.

FDA has the authority under Section 512 of the Federal Food, Drug, and Cosmetic Act to withdraw approval of applications of new animal drug products, including antimicrobials, when certain conditions are met, such as drugs shown to be unsafe under approved conditions of use. Sponsors of applications for such products must be given an opportunity for a hearing on the proposed withdrawal. Section 512 also gives FDA the authority to suspend an approval if the Secretary finds the drug poses an imminent hazard to the health of man or animals. In such cases, sponsors must be given an opportunity for an expedited hearing on the suspension. That section also gives FDA the authority to withdraw an approval through a notice-and-comment rulemaking process.

Question. The proposal is currently in the "discussion" phase. What is your time frame to formally propose these guidelines and when do believe it can be implemented?

Answer. Based upon the increasing evidence that therapeutic and non-feed uses of antimicrobials in food-producing animals may select for resistant bacteria of public health concern, in November 1998, the Agency announced new guidance, number 78 in this area. The Agency stated that FDA now believes it is necessary to evaluate the human health impact of the antimicrobial effects associated with all uses of all classes of antimicrobial new animal drugs intended for use in food-producing animals. Following the publication of this guidance, the Agency developed another document entitled, "A Proposed Framework for Evaluating and Assuring the Human

Safety of the Microbial Effects of Antimicrobial New Animal Drugs Intended for Use in Food-Producing Animals". This document outlines proposed microbiological safety assessments for all food animal uses of antimicrobials but categorizes requirements based upon public health risks associated with the product use. It is imperative that FDA institute the principles outlined in the framework document as soon as possible to control the public health hazard from development of resistance in food-borne pathogens and their transfer to humans. Based on the comments received to the framework document, the Agency intends to revise guidance number 78 as soon as possible. FDA intends to provide the industry with guidance on how to conduct pre-approval studies which can be used to predict the development of resistance in food-borne pathogens.

The key component of FDA's overall strategy on antimicrobial resistance is a national surveillance program that monitors resistance among enteric pathogens in both animals and humans. This has already been implemented. In 1996, the FDA, the Centers for Disease Control and Prevention and the U.S. Department of Agriculture established the National Antimicrobial Resistance Monitoring System: Enteric Bacteria, NARMS, to prospectively monitor changes in antimicrobial susceptibilities of zoonotic enteric pathogens from human and animal clinical specimens, from healthy farm animals, and from carcasses of food-producing animals at slaughter.

ELECTRONIC SUBMISSIONS

Question. It is my understanding that the FDA is considering allowing applicants to electronically submit for approval drug labeling information. This would appear to significantly accelerate the approval process.

Is that true? If so, what is the status?

Answer. The initiative to enable electronic submission of New Drug Applications, or NDAs, began in August 1997—the effective date of the FDA's Electronic Records; Electronic Signatures rule, 21 CFR Part 11. In September 1997, CDER published the first edition of guidance enabling applicants to submit electronic patient Case Report Tabulations, CRTs and Case Report Forms, CRFs CRTs and CRFs represent 2 of 18 sections of an application and normally comprise 60–75 percent of the entire volume of a paper NDA. In January 1999, CDER published a second edition of "Guidance for Industry—Providing Regulatory Submissions in Electronic Format—NDAs" which enabled applicants to submit almost the entire NDA, including product labeling, in electronic format.

Since the inception of the electronic NDA program in September 1997, CDER has received the equivalent of over 10 million pages of NDA information in electronic format.

The electronic NDA program is the initial phase of a larger initiative within FDA called "Electronic Regulatory Submissions and Review", ERSR. The goal of the ERSR initiative is to develop processes to enable the electronic submission and review of all regulatory documents submitted to CDER by 2002. In addition to NDAs, it is expected that the electronic submission of many other types of regulatory filings will be enabled including Post Marketing Adverse Experience Reports, Investigational New Drug Applications, and Drug Master Files.

Question. If such a program were implemented, how much time and personnel could be saved and moved to other operations?

Answer. At the present time, the submission of electronic NDA information instead of paper filing, including product labeling, is voluntary. Our experience thus far shows us that electronic submissions have been favorably accepted by the drug industry. The number of electronic submissions versus paper submissions continues to rise and we expect this trend to continue as we continue to expand the program to include additional submission types.

It is tempting to focus on the potential for electronic NDAs to create cost savings and the opportunity to reprogram resources to other operations. But while we do expect cost savings, at this time the primary driving force behind the Electronic Regulatory Submissions and Review or ERSR program is to contain the historically growing costs to manage and store the volume of paper we receive, and, more importantly, to help reduce review time for important new drugs and make them available to the public without lowering the high standards of safety and effectiveness the public expects. CDER has been very successful in reducing review times over the past few years to meet performance goals established by the Prescription Drug User Fee Act, PDUFA, and now PDUFA II. ERSR will contribute to this by helping to reduce the time consuming administrative tasks during a review such as search time for reference information, eliminating manual creation of data sets for analysis,

quicker navigation through an application, and eliminating re-typing of text from applications.

REUSE OF SINGLE USE MEDICAL DEVICES

Question. FDA approves some devices for one-time or single use only such as endoscopes and catheters used in non-invasive surgery. These are difficult to clean and were never intended for reuse. But according to a March 22 article in Forbes magazines, some hospitals may be reusing some devices intended by the manufacturer and the FDA for one-time use. In my view, this practice, if it is occurring, raises questions of cleanliness and patient safety. The article cites a burgeoning reprocessing industry to serve hospitals.

What action is FDA taking?

Answer. FDA is carefully evaluating this practice and plans to increase our presence in this area. FDA and AAMI will co-sponsor a 2 day conference on May 5–6, 1999 in Crystal City, Virginia to look at a number of issues that exist regarding this practice including, ethical issues such as informed consent; regulatory or legal issues such as even handed regulation of manufacturers and reprocessors; scientific issues such as whether a device intended for a single use only can be safely reprocessed and reused; and economic issues such as whether manufacturers are labeling devices as "single use" for economic reasons only or whether there other reasons that they can not be reused. FDA is committed to working with the groups represented at the conference to resolve these types of issues and to ensure improved public health protection relative to this practice.

A FDA research team is evaluating the effect of cleaning procedures and sterilization procedures on the material and mechanical properties of materials likely to be in devices that are designated for single use but are known to be candidates for reuse by physicians and user facilities. The study initially focused on generic materials and then was extended to specific cardiac catheters such as balloon angioplasty catheters, electrophysiology catheters, and cardiac ablation catheters. These are devices that come in contact with blood. These catheters presented special problems in terms of complexity, e.g. many channels, narrow lumens, lumens closed at one end, and delicate materials and design. Data obtained to date suggest that cleaning and sterilization of these devices could be very difficult. The material properties and device performance can be affected by re-sterilization. Changes in device performance that may result from resterilization are model specific and a general statement cannot be made for all of the device models in a given category. It has been noted that minor changes in a given model have been observed to have potentially substantial effects on the ability to reprocess. These data will be considered carefully when CDRH makes its decision on how to address the issue of reuse of single use devices.

Question. Do you agree that this is in fact happening?

Answer. Yes, reprocessing of single use devices is occurring within both hospitals and clinics and in third party reprocessing facilities, who perform these activities at the request of the hospitals and clinics. The main reason that some hospitals state they have made the decision to reuse single use or disposable products is to cut hospital-operating costs. Capitation has reportedly had a significant impact on the need for hospitals to reduce costs whenever possible.

Question. Are you trying to determine if it is occurring?

Answer. FDA is aware that reprocessing and reuse of single use devices is occurring in hospitals and clinics. FDA inspects third party reprocessors and has been actively involved in evaluating an monitoring this practice for some time.

Question. What assurances can you give me that devices approved for one-time use will not be reused?

Answer. Some single-use medical devices are being reprocessed and reused. FDA's concern is and has been the safety and effectiveness of the reprocessed devices. FDA published a Compliance Policy Guide, CPG 300.500, several years ago that focused on hospital operations. That CPG stated that there is a lack of data to support the general reuse of single use devices. If an institution chooses to engage in this practice, the CPG stated that the hospital should demonstrate the device can be adequately cleaned and sterilized; the physical characteristics or quality of the device will not be adversely affected; and that the device remains safe and effective for its intended use. This CPG is still in effect.

TRAINING OF RESOURCES

Question. Some drug, device and biotech industry representatives have indicated that FDA personnel have difficulty getting and maintaining appropriate expertise

to review applications. This is understandable , particularly in the drug and biotech areas, where advances can be very rapid and complex.

What steps is FDA taking to ensure that FDA staff are knowledgeable so that they can adequately review applications?

Answer. We will be happy to provide the answer for the record.

FDA's Center for Drug Evaluation and Research, CDER, has a long established scientific education program, dedicated to ensuring that CDER reviewers stay abreast of their scientific fields. The science education program for CDER reviewers has been revitalized to include the following activities available on an on-going basis for all CDER reviewers:

—Committee for Advanced Scientific Education (CASE), focused on identifying and evaluating scientific education programs for CDER reviewers

—Weekly Scientific Seminars and Scientific Rounds, dedicated time each week for CDER reviewers to learn from invited guests, experts in their fields (in the seminars), as well as each other (Scientific Rounds) on topics specifically relevant to the Drug review process

—Development of CDER and reviewers/discipline core competencies. a program that has identified the critical tasks, knowledge, and skills required to do the job of a reviewer. We are now in the process of preparing learning paths with the information collected. These learning paths will be used to develop specific training programs for reviewers in areas critical to the drug review process

—Special seminars and workshops, such as the recent "Drugs and the Liver: What they do to each other" two-day workshop, especially relevant to the recent liver toxicity issues related to CDER work; as well as the "Genetics" workshop, a program co-sponsored with Pharma and BIO to introduce many new scientific concepts to CDER staff

—Targeted policy training programs designed to ensure that CDER staff understand and can apply the guidances and regulations for industry before they become final, such as the recent Pediatric Exclusivity training program where almost 500 CDER reviewers were trained in less than a month on a critical area.

We are also in the process of developing two additional programs for CDER: one dedicated to bringing academicians on sabbatical to CDER for a two to four week period to develop and deliver specific scientific courses, while working directly with CDER reviewers; the second dedicated to providing time for CDER reviewers to develop their expertise in a specific area and time to develop a course for their colleagues in that area.

In addition, many of our programs are videotaped, so that staff who are unable to attend the live program may review the video tape.

The Center for Biologics Evaluation and Research, CBER, developed a reviewer training program in 1993 with the advent of user fees, and hiring of large numbers of reviewers. The purpose of the training was to provide consistent information across the Center, in a forum where staff could hear the same information at the same time. The program was designed to provide the basic information required to perform a review of a biologics application. Over time, the program has gone through many iterations to include changes in processes, new regulations and guidances, and new ways of doing business.

The reviewer training program was developed by a curriculum committee comprised of office representatives who were involved in the review process. It included 9 major modules on the phases of review, including the overview of the regulation of biologics, investigational new drug applications INDs, product license applications, PLAs, establishment license applications ELAs, clinical aspects and good manufacturing practices GMPs. Over time, the GMP sessions were moved into the inspection training program as prerequisites to the inspection workshops.

In early 1998, based on requests from Center staff a new curriculum committee was established to develop the research/review model that was more specific in nature, and which impacted on the actual review. These programs included not only the basic regulatory issues but also the research issues that supported the regulatory review. Topics such as lot-release and surrogate endpoints have been delivered, as have been programs on the International Conference on Harmonization, ICH. In development are programs dealing with process validation, assay validation, and other manufacturing issues.

To ensure scientific expertise in biological product application review, CBER uses what is referred to as the "research/reviewer model." In this model, the application review personnel spend a portion of their time in research-related activities. CBER researchers are fully integrated into the application review process. CBER researchers participate in the following regulatory procedures: review of initial new drug applications, and product license applications; development of policy and guidance documents; meetings with sponsors and advisory committees; participation in pre-li-

cense and biennial inspections; and evaluation of adverse drug reactions and risk assessment.

In addition to formal reviewer training, computer-applications training is provided in order to receive and review submissions electronically. This includes the Agency standard Microsoft suite applications as well as JMP for statistical reviews, and Adobe Acrobat to read the electronic submissions.

CBER coordinates with the other Centers on programs of joint interest such as the Center for Devices and Radiological Health's FDAMA training for device reviewers and the Center for Drug Evaluation and Research's packaging guidance.

Regarding professional development, many of CBER's physicians participate in this program by working in clinics, labs and other health-care settings for a specified number of hours each year. The purpose of this participation is to both enhance their current skills, and to maintain state of the art knowledge of medicine.

TAMOXIFEN

Question. I have been told that tamoxifen may be listed as a carcinogen in the National Toxicology Program, in their 9th report, and that FDA has made a recommendation that it be listed in another pharmaceutical category which would create less alarm and could better convey the risks and benefits of tamoxifen. Some breast cancer advocates are concerned that listing tamoxifen in the carcinogen report could create great confusion.

Will the drug be listed in the carcinogen report? If so, why?

Answer. We agree with the concern that you raise. Whether or not tamoxifen will be listed in the Ninth NTP Report on Carcinogens is not the decision of the FDA. That decision will be made by Secretary of DHHS in consultation with the Director of the National Toxicology Program, NTP. We have appealed to NTP that if it needs to be listed, tamoxifen and other pharmaceutical agents be listed in a category by that name separate from other substances listed as carcinogens in the Report for the very reason that you state.

Question. Has FDA made a recommendation? If so, what was your recommendation? If not, are you planning to make a recommendation.

Answer. The FDA made a recommendation to NTP in a conference telephone call with myself and Dr. Friedman on April 20, 1999. The recommendation was that if tamoxifen is going to be listed in the NTP Report on Carcinogens, it should be listed along with other pharmaceutical agents in a category separate from non-pharmaceutical chemicals. This would emphasize the need to consider the benefits of drugs and the fact that substances listed under this heading have all undergone extensive review by the FDA prior to approval of their use as drugs. The pharmaceutical category should clearly and fully convey the potential benefits of the drugs. In the case of tamoxifen, for example, its use decreases the overall incidence of cancer in the indicated high-risk population.

TOBACCO ACTIVITIES

Question. Unfortunately, last year, Congress did not pass a tobacco bill and affirm FDA's jurisdiction over tobacco products. In my view, FDA should regulate tobacco products and discourage the use of tobacco.

What activities are you currently conducting?

Answer. In fiscal year 1997, FDA designed a pilot program and infrastructure to enforce the rule. The Agency, consistent with its practices in other areas, determined that it would commission state and local officials to enforce the federal rule—specifically to conduct unannounced visits to retailers using adolescents younger than 18, who would attempt to purchase cigarettes or smokeless tobacco. Initially, the Agency contracted for enforcement in 10 states. In fiscal year 1997, contracts were awarded to Florida, Illinois, Washington, Texas, Massachusetts, Colorado, Pennsylvania, Minnesota, Arkansas, and California. These states were required to conduct approximately 200 to 400 inspections per month. Compliance checks began in the first state in August 1997. These contracts resulted in approximately 20,000 compliance checks during the 10 month pilot program.

In fiscal year 1998, the Agency expanded its enforcement efforts and solicited bids from all 57 states and territories to contract with FDA to do compliance checks. By the close of fiscal year 1998, FDA had signed contracts with 43 states and territories totaling $16,382,912. Under these contracts, the states will conduct approximately 186,500 compliance checks by September 30, 1999. The average contract is approximately $390,000. With the signing of each new contract, FDA's headquarters or regional staff trains the designated state and local officials. Headquarter staff has also spent countless hours answering questions from tobacco retailers and providing technical assistance to the states.

All 10 states who participated in the pilot program, renegotiated contracts to continue doing compliance checks in their states. In at least two states, the programs had been so successful that the states chose to expand the initial limited coverage provided by the first contract. In Arkansas, for example, the pilot contract provided for compliance checks to be conducted only in and around Little Rock. Similarly, in Colorado, only a few counties were included in the original contract. In both cases, the subsequent contracts substantially increased the areas of the state that would be included in the investigations.

The existing contracts resulted in 39,439 attempted and completed compliance checks during fiscal year 1998, including reinspection of retailers found to have violated the rule. The Agency's legal staff devised and established the framework for the imposition of civil money penalties, sent out complaints, and negotiated or litigated contested cases. In fiscal year 1998, FDA began seeking civil money penalties from those found to have violated the rule's restrictions on sales to minors for a second time. In fiscal year 1999, FDA began investigations of retailers who have been found to have already violated the rule two times. The agency anticipates seeking civil money penalties for third violations within the first quarter of fiscal year 1999. A penalty schedule for violations of other portions of the regulation will be developed when these provisions go into effect.

In the second half of fiscal year 1998, the Agency contracted with Battelle Memorial Institute to study the tobacco program's business processes, outline the program's work flow and conduct a requirements analysis. From this requirements analysis, Battelle proposed a system design to automate the program's processes. In addition, Battelle presented a proposed plan to obtain and maintain a list of retailers selling tobacco in each state that would be more complete, accurate and user friendly than the lists constructed by the Agency during its first full year of operation.

Based on the design, Battelle has launched a multi-year effort to provide reliable retailer lists and an infrastructure designed to maintain the list and make it user friendly for FDA and for all contracting states. Battelle will also design and implement an information technology system which will automate all the program's various functions, including contracting, outreach, enforcement, compliance checks, litigation, collection of civil money penalties, etc. The new system will increase the efficiency of the program and will improve communications internally as well as with state contractors and with other stakeholders. The various system design components will be implemented incrementally as they are developed beginning in early 1999. The entire system should be operational by 2001. The amount dedicated to this multi-year project in fiscal year 1998 is $2.8 million.

In fiscal year 1998, the Agency designed a comprehensive outreach program designed to inform retailers and ensure compliance. This multi-faceted program consisted of advertising, direct mail, press events/materials, exhibits and speeches, and dissemination of materials requested via a hotline or mail order.

In fiscal year 1998, the Agency designed a multi-media advertising campaign, including radio, print, and billboard advertising. A free retailer kit using humorous illustrations and a folksy approach also was created to make it easier for retailers to comply with the new regulation. A series of focus group discussions were held with retailers, sales clerks, young people between 18 and 27, children ages 12 to 18, and the general public to test the advertising campaign and retailer kits. During fiscal year 1998, approximately 500,000 retailers kits were produced and sent to stores across the country.

FDA conducted a tracking study in 10 media markets to evaluate the effectiveness of the campaign. Findings indicate that awareness of the photo identification age provision rose dramatically from approximately one-third of retailers to more than one-half of all retailers. In addition, there was a three-fold increase in recall of the fine for repeat violations in the test markets. Further, in test markets, twice as many clerks used 27 as the cut-off age after the campaign compared to before the campaign. Importantly, retailers reported that minors were somewhat less likely to try to buy tobacco and retailers said that customers were less likely to be irritated when asked to show photo identification as a result of the advertising campaign. By the close of fiscal year 1998, the Agency had obligated approximately $12.5 million for outreach activities. This covers the costs of the paid advertising campaign as well as the printing and dissemination of nearly a half million retailer kits.

In 1997, $2 million (out of $4.9 million) went to state contracts to enforce the rule. In 1998, $16.4 million went to state contracts. In 1999, the Agency has allocated $22 million towards state contracts.

TOBACCO ACTIVITIES

Question. What is the status of court challenges to FDA's rulemaking on tobacco?

Answer. On April 25, 1997, the District Court in Greensboro, North Carolina, ruled that FDA has jurisdiction under the Federal, Food, Drug and Cosmetic Act (FD&C Act) to regulate nicotine-containing cigarettes and smokeless tobacco as drug delivery devices. The Court upheld all restrictions involving youth access and labeling and struck down, as unsupported by the statutory provision relied on by the Agency, the rules advertising restrictions. The Court stayed implementation of all provisions, except those involving age and ID, pending appeal. Appeal was taken and oral argument was held in August 1997 and reargued on June 9, 1998 in the Fourth Circuit Court of Appeals. On August 13, 1998, the Fourth Circuit issued its decision, finding the FDA's assertion of jurisdiction and issuance of regulations invalid.

On April 26, 1999, the Supreme Court granted FDA's Petition for a Writ of Certiorari that requested the Supreme Court to review the August 14, 1998 decision of the United States Court of Appeals for the Fourth Circuit. The granting of the petition continues a stay of the issuance of the Fourth Circuit's mandate while the Supreme Court considers this case. The FDA regulations prohibiting the sale of tobacco products to minors and requiring photographic identification for certain sales therefore remain in effect pending the Supreme Court's final decision.

Question. What role do you think FDA should play in assuring product safety and discouraging tobacco use?

Answer. FDA's final tobacco rule is expressly designed to discourage and reduce tobacco use by young people. This is the cornerstone of our regulation. The agency is also prepared to pursue research initiatives that address product safety issues, such as tar and nicotine delivery, and tobacco and pharmaceutical products that raise questions related to reducing exposure to and harm from tobacco products.

ON-LINE DRUGGISTS

Question. The February 15, 1999 Boston Globe ran a story saying that "the first major Internet pharmacy, Soma.com, went on line with a prescription service" and has "filled thousands of orders through a distribution center in Ohio." Others such as AARP and Merck-Medco also have online ordering.

Do you view this as a good development. Do you have any concerns about patient records privacy?

Answer. If online pharmacies and their pharmacists are appropriately licensed and comply with all applicable federal and state requirements, they can provide benefits to consumers. For example, they can provide increased competition in the retail market for prescription drugs, OTC drugs, and other health-related products. Such competition may result in increased services and convenience, and reduced costs to consumers.

However, online pharmacies that do not meet federal and state requirements that have been established to protect and promote the public health may impose considerable risks to consumers. These risks include questions about the authenticity, potency, and purity of the product sold to them.

In addition, if consumers are obtaining prescription drugs online without a prescription or are relying on the prescribing services of the online provider, they may be incurring significant risks. They may not be communicating complete and accurate medical information about their condition or the drug may not be appropriate because of other medical conditions or other drugs they are taking.

Although patient medical and prescription record privacy is an important consumer issue, FDA has no information about whether or how online pharmacies protect medical records. Those matters are generally regulated by the states.

Question. Does FDA has a role in regulating these "pharmacies"? Should you?

Answer. FDA does not generally regulate pharmacies. FDA regulates products and certain activities related to those products, particularly when carried out by or on behalf of a manufacturer, packer, or distributor. Under the Federal Food, Drug, and Cosmetic Act, FDA can take action against illegal promotion, such as labeling and advertising, of a prescription drug; illegal labeling of an over-the-counter drug; the importation, sale, or distribution of an adulterated or misbranded drug; the importation, sale, or distribution of an unapproved new drug; and the sale or dispensing of a prescription drug without a valid prescription. The States, however, have traditionally regulated the dispensing of drugs. Internet sites that carry out any of the above illegal acts are subject to regulatory action by FDA or the appropriate state agency.

DRUG TESTING

Question. Many groups charge that clinical trials for drugs have traditionally largely used the "white, middle class male model," and have not sufficiently used women, children, the elderly or minorities. In the case of women, I know women of childbearing age would be especially cautious and should be. However, participation is voluntary and on an informed consent basis. And yes, children do represent a special case.

Don't you agree that testing drugs only on men is not sufficient?

Answer. CDER's position is that testing of drugs only in men is not sufficient. The 1993 gender guideline entitled "Guideline for the Study and Evaluation of Gender Differences in the Clinical Evaluation of Drugs", clearly states that we expect drugs to be tested in the full range of people who are expected to use them. In addition, in the case of serious and life threatening diseases, the agency published a proposed rule in 1997 entitled "Investigational New Drug Applications; Proposed Amendment to Clinical Hold Regulations for Products Intended for Life-Threatening Diseases" that would permit us to put on clinical hold, that is, stop from proceeding, a trial that excluded either women or men based solely on their reproductive capacity.

Question. What steps have you taken and are you taking to require manufacturers to expand the pool of participants in clinical trials?

Answer. Two important steps have been noted above, the 1993 guideline and the proposed rule for which we are reviewing comments. In addition, we emphasize to our review divisions the importance of communicating and emphasizing our expectations at the critical meetings with industry that occur during drug development, such as end of phase 2 meetings. We also have a regulation that permits us to refuse to file, that is, not accept for review, any application that lacks appropriate subpopulation analyses. Finally, it is worth noting that we are nearing completion of a system that will permit us to track compliance with these regulations.

Question. The January 28 USA Today magazine reported, "According to FDA, voluntary compliance with 1993 guidelines encouraging the participation of women in trials has been insufficient." Why is that?

Answer. We believe, and our examination of internal data supports, that the Gender Guideline is an effective and appropriate means of promoting enrollment of women into clinical trials. In our response to FDAMA, we explained that after careful examination of all our guidance relating to enrollment of women and minorities in clinical trials our conclusions was that additional guidance is not needed. However, in those instances where the disease is life threatening and early access to any therapy may be critical, we wish to have the regulatory authority to place on clinical hold a trial that excludes either men or women solely on the basis of their reproductive potential.

QUESTIONS SUBMITTED BY SENATOR DURBIN

ORPHAN DRUG FUNDING

Question. What assurances do we have that the money appropriated for Orphan Drug Development will not be used for other purposes by the FDA ?

Answer. FDA's history has been to fund orphan grants. This is shown in recent budgets and committee documents in prior years, by a steady level of funding for the grants program despite the Agency having to absorb payroll cost increases. This steady level of funding for the orphan drug program has been at the expense of other programs. This past year, FDA had to absorb additional cuts and asked the orphan drug program to take a proportional share of these reductions to meet the increase needed for payroll. It is not expected that this will be necessary again next fiscal year.

Question. Rare diseases have very little opportunities for development of drugs to treat them. Therefore, the funds appropriated for the Orphan Drug Development are very important for patients with rare diseases who have nowhere else to turn for cures. As I stated at the hearing, Senator Cochran and I engaged in a colloquy urging FDA not to cut Orphan Drug Development funds. What has FDA done to address this colloquy ?

Answer. FDA agrees that the Orphan Drug Development program is important and is striving to maintain the orphan drug program and the current level of appropriated dollars and FTE.

MEDGUIDES

Question. Easy to understand information on correct drug usage and inappropriate drug usage is very important to consumers. What is the time-line for FDA's implementation of the Medguide rule for those products that pose a significant public health risk if misused ?

Answer. The rule that will require that products posing a serious and significant public health concern necessitating distribution of FDA-approved patient labeling called "Medication Guides" was published on December 1, 1998, and will become effective June 1, 1999. After June 1, FDA will notify manufacturers with affected products that they must draft and submit for FDA review, patient labeling as specified in the rule. We expect that the vast majority of these products will be identified at the time of initial submission for approval, and we anticipate using the rule to require FDA-approved Medication Guides for only a small number of products currently being marketed. Once a product's Medication Guide is approved, it will be required to be distributed to patients along with the product.

FDA's Center for Drug Evaluation and Research is currently drafting an internal process guide for reviewers to help ensure that products that pose a "serious and significant public health concern" are expeditiously identified and a draft Medication Guide is submitted. In the meantime, an interim process has already been put in place in recognition of the June 1, 1999, effective date of the rule.

RE-USE OF SINGLE USE MEDICAL DEVICES

Question. The unauthorized re-use of medical devices that were designed for a single use may pose a significant threat to public health. Given that there is little documentation of the re-use of products, how does the FDA propose to track infections or injuries that may result from the inappropriate re-use of single use devices ?

Answer. FDA has an established regulation, Medical Device Reporting under 21 CFR Part 803, for the reporting of adverse event reports for all medical devices. FDA will continue to use this system for tracking infections, injuries and other adverse events reported by manufacturers and users involving the reuse of single use devices. Reports have been received where reuse was indicated but the information obtained to date has been insufficient to demonstrate that the reprocessing of a single use device has caused a reported adverse event.

FDA recognizes the need to continually educate manufacturers and users about the Agency's adverse event reporting requirements and types of events that need to be reported. FDA will also enlist the cooperation of other organizations to obtain reuse experience data. FDA is currently working with the Health Care Financing Administration to include questions about device reuse during HCFA inspections of user facilities.

Question. Should patient consent be sought when a medical facility seeks to use a secondhand device on that patient?

Answer. While most patients would probably choose a new device over a reprocessed one if given the choice, physicians frequently make choices for their patients without consulting them. These choices are made in an effort to administer the most effective medical care for the patient and includes decisions such as the type of device to use, the particular application or use and duration of use of that device, the type and amount of drug or antibiotic to administer, etc. Physicians routinely review the patient's medical history, including allergies, to make these decisions and oftentimes do not obtain specific informed consent. Use of a reprocessed single use product may be safe and appropriate depending on the specific device, how and where it will be used, and other considerations, including cost. Although FDA does monitor informed consent on clinical research with FDA-regulated products, FDA does not regulate the practice of medicine.

Question. Does FDA have information on the efficacy of sterilization or reprocessing of these devices?

Answer. FDA has access to data and information for the resterilization and reprocessing of single use devices that are performed by third party reprocessing firms. These firms reprocess under contract with hospitals and clinics and they are inspected by the FDA under the Quality System regulation, 21 CFR Part 820. The inspections are broad-based and cover the firm's quality assurance activities from the receipt and handling of incoming materials to the final packaging, labeling and release of the device. The inspections are designed to determine whether the reprocessing activities are validated—that is to demonstrate that the processes employed do not adversely affect device materials or functionality. When significant deficiencies are identified, follow-up regulatory action is considered. FDA has little data on the efficacy of resterilization and reprocessing in hospitals because the Agency does not inspect those operations. However, to the extent that those operations

caused an adverse event in a hospital, user facilities are required to report those event to FDA.

A FDA research team is presently evaluating the effect of cleaning procedures and sterilization procedures on the material and mechanical properties of materials likely to be in devices that are designated for single use but are known to be candidates for reuse by physicians and user facilities. The study initially focused on generic materials and was later extended to specific cardiac catheters such as balloon angioplasty catheters, electrophysiology catheters, and cardiac ablation catheters. These are devices that come in contact with blood. These catheters presented special problems in terms of complexity, e.g. many channels, narrow lumens, lumens closed at one end, and delicate materials and design. Data obtained to date indicate or suggest that cleaning and sterilization of these devices can be very difficult. The material properties and device performance can be affected by re-sterilization. Changes in device performance that may result from resterilization are model specific and a general statement cannot be made for all of the device models in a given category. It has been noted that minor changes in a given model have been observed to have potentially substantial effects on the ability to reprocess. These data will be considered carefully when CDRH makes its decision on how to address the issue of reuse of single use devices.

Question. What does FDA view as their role in regulating reprocessors?

Answer. FDA is currently reviewing whether additional regulation or other oversight of reprocessing is needed. FDA will continue to work with groups represented at the FDA/AAMI Conference on Reuse of Single Use Devices to resolve outstanding issues and concerns and consider new regulatory approaches. One factor that needs to be carefully thought through are the costs and benefits of reprocessing on device users and patients.

Reprocessors are divided into two categories, in-hospital reprocessing and third party reprocessing. FDA has jurisdiction over both types of reprocessors. For in-hospital reprocessing, FDA currently provides no routine direct oversight; however, if a serious adverse event occurred in a hospital involving a device, FDA would typically conduct an investigation. Additionally, FDA does receive and monitor adverse event reports and may initiate follow-up activities at a hospital, distributor, manufacturer, or other facility, as needed. The user facilities doing the reprocessing are liable for adverse outcomes.

Third party reprocessing is currently regulated by FDA in the following way. Firms that reprocess single use devices are required to register their establishment with FDA, list the devices they reprocess, comply with the FDA Quality System regulation for the design, manufacture, testing, packaging, and release of those devices, report adverse events under the Medical Device Reporting regulation, and label their products appropriately as outlined in 21 CFR Part 801, Labeling.

QUESTIONS SUBMITTED BY SENATOR BYRD

GENERIC DRUG APPLICATIONS BACKLOG

Question. The Food and Drug Administration (FDA) is the responsible federal agency for implementing policies designed to protect the health of the nation against impure and unsafe foods, drugs, and cosmetics, as well as other potential hazards. Today, I have several questions regarding the Office of Generic Drugs, and the premarket Food Contact Notification program.

The generic drug industry, including Mylan Laboratories, Inc., headquartered in West Virginia, has alerted me that consumers and all purchasers of pharmaceutical products, including the federal government, could realize substantial savings if the FDA adhered to its statutory deadline for the Office of Generic Drugs (OGD) to review generic drug applications, known as Abbreviated New Drug Applications (ANDA), within 180 days.

Please provide me with a report on the backlog of pending generic drug applications in the OGD, and what actions are being taken to meet the statutory deadlines and reduce backlog?

Answer. The backlog of original applications under the old counting system, was 714 on March 31, 1999. Of the 714 applications, 154 had been pending with the agency longer than 180 days. We have now reduced the total time to approval. Many, but not all, of those initiatives do help the agency meet the statutory deadlines and reduce backlog.

Question. Please estimate the cost of the backlog to consumers and the federal government.

Answer. The Agency does not have the information to measure or estimate the cost of the backlog of pending generic drug applications to the consumer. FDA estimates that it would need approximately 105 additional FTE to review the generic drug applications within 180 days, thus alleviating the majority of the backlog.

With regard to the pre-market Food Contact Notification (FCN) program, the FCN provisions of the FDA Modernization Act of 1997 are intended to expedite introduction of advanced food packaging materials while assuring the protection of public health. FCN has a significant impact on the Kanawha Valley Union Carbide plant in West Virginia that develops food contact materials, and I have the following questions:

Question. The FDA reform legislation that Congress enacted in 1997 included a streamlined regulatory process for approving food contact materials. What is the status of the implementation of the new FCN program?

Answer. FDA was allocated $500,000 to develop guidance, regulations, and procedures necessary to implement the notification program for food contact substances should that program be funded in fiscal year 2000.

On March 12, 1999 FDA held a public meeting at which the agency shared its tentative plans for guidance and regulations and for the administration of the notification procedure. The agency requested comments at this meeting on the agency's tentative plans and on the draft documents that the agency will use as the basis for completing guidance materials for the notification program. FDA is currently reviewing the comments.

FDA expects to publish Federal Register documents in mid-summer 1999. The first will announce the availability of guidance for preparing notifications and guidance on the administration of the process. The second, to be published simultaneously, will propose regulations for the implementation of the process. The Agency is currently hiring critical personnel for the implementation of the notification process.

FDA has and is acquiring a capability to incorporate cutting edge science and technology into the review process that will facilitate the review of notifications for food contact substances, while concurrently developing an electronic workflow tracking system to track the progress of the review for notifications for food contact substances.

Question. The FDA Modernization Act authorized $3 million for the FCN program. In today's dollars, is this amount adequate to implement the FCN program as envisioned?

Answer. Secretary of DHHS submitted a cost estimate for the fiscal year 2000 Premarket Notification, PMN, program for food contact substances on April 22, 1999 to the Senate Appropriations and Health, Education, Labor and Pensions Committees. FDA calculated a cost of $6.04 million to fully operate the premarket notification program.

CONCLUSION OF HEARINGS

Senator COCHRAN. This is the final hearing in our committee's review of the fiscal year 2000 budget request for activities and programs that are funded under the jurisdiction of this committee.

We appreciate all Senators and staff who have helped in this effort to review the budget and to understand the request from the administration and to make sure that we provide the funds that are needed to carry out the statutory obligations of these agencies and this department.

We thank you all for your cooperation. The committee stands in recess.

[Whereupon, at 11:20 a.m., Tuesday, April 27, the hearings were concluded and the subcommittee was recessed, to reconvene subject to the call of the Chair.]

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 2000

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

MATERIAL SUBMITTED BY AGENCIES NOT APPEARING FOR FORMAL HEARINGS

[CLERK'S NOTE.—The following agencies of the Department of Agriculture did not appear before the subcommittee this year. Chairman Cochran requested these agencies to submit testimony in support of their fiscal year 2000 budget request. Those statements follow:]

DEPARTMENT OF AGRICULTURE

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION (AARCC)

PREPARED STATEMENT OF ROBERT E. ARMSTRONG, EXECUTIVE DIRECTOR

Mr. Chairman and members of the Subcommittee. I am pleased to testify today on the President's fiscal year 2000 budget request of $10 million for the Alternative Agricultural Research and Commercialization Corporation (AARCC). It is a pleasure to provide you with an update on the Corporation's investment successes and the effect the AARC Corporation is having on the economy of rural America.

I would like to offer the subcommittee a short background on how we got to where we are today. Congress created the AARC Center in the Food, Agriculture, Conservation, and Trade Act of 1990, and reauthorized it in the Federal Agriculture Improvement and Reform Act of 1996 as a wholly-owned corporation of the Federal Government within the U.S. Department of Agriculture (USDA). AARCC's creation followed a 1987 report of the New Farm and Forest Products Task Force. The Task Force met for 2½ years and recommended developing and commercializing a wide array of new farm and forest products using the excess production capacity of American agriculture as a way to revitalize ailing segments of rural America. The Chairman of AARCC's Board of Directors, Jeff Gain, served on that Task Force.

The idea of using agricultural materials as the raw materials for manufacturing and commercializing the things of everyday life is not new. In fact, the motto of USDA reads: Agriculture is the Foundation of Manufacture and Commerce. That was written in 1862. In more recent times, the Chemurgic Council advocated for agriculture to be the supplier of our raw materials. The Council was established in 1935 under the leadership of Wheeler McMillen, with financial support from Henry Ford. Other notables on the Council included Thomas Edison, Irene du Pont, MIT President Karl Compton, Nobel Laureate and physicist Robert Milliken, General Motors Vice President Charles Kettering, and Sears, Roebuck & Company Board Chairman Robert E. Wood. The USDA's four regional research laboratories grew out of this effort and were built in 1938–1941 for the express purpose of finding new uses for farm products.

Many historical examples exist of efforts to use agricultural materials for the manufacture of non-food and non-feed products. George Washington Carver devoted his life's work to this effort. Henry Ford even built a car body from vegetable plastic

and plant fibers. Today we are beginning to see a move in Europe to a car that can be totally recycled. Across many industrial sectors we are seeing a move toward a bio-based economy. In fact, the head of a major oil company was recently quoted as saying that the world is entering "the last days of the Age of Oil."

The advantages of a bio-based economy are numerous, but three in particular are worth noting. First, such an economy uses agricultural materials that are domestically produced and annually renewable. I am certain the geopolitical and economic advantages of such a source of raw materials is not lost on the members of this Subcommittee. Second, unlike petroleum—our current main source of raw materials—it is not economical to ship bio-based raw materials long distances for processing and manufacturing. The processing and manufacturing must take place close to the source of the materials, and that means jobs in rural America. Finally, using bio-based materials means that at the end of a product's lifetime, it can be composted and used to grow the next year's supply of raw materials. Thus, an economy based on biology, instead of geology, takes full advantage of America's agricultural production capacity, provides jobs for rural America, and contributes to the well-being of the environment.

As you know, the AARC Corporation's mandate is to assist or invest in companies that are commercializing non-food/non-feed products , processes, or technologies that use raw materials derived from agriculture, forestry, or animal by-products. Through its investment activities, AARCC is a leading force in the effort to put America at the forefront of a global bio-based economy. Like any investment firm, AARCC measures its success through the success of the firms in which it has invested. AARCC also measures its success through the impact it has in rural America. Let's examine some of the factors AARCC uses to gauge its progress.

The return on investment (ROI) is a standard measure for any investment firm. In AARCC's case, it is of particular interest, because we have been entrusted with the public's money. Typically, a venture capital firm focusing on the type of start-up and early-stage companies that AARCC does, would not anticipate repayments beginning until 6 or 7 years after an investment was made. In AARCC's case, our business plan projects a minimum of $100,000 and a maximum of $300,000 in repayment by this point in time. By the end of fiscal year 1998, AARCC had received $450,911.65 in repayments. AARCC is ahead of its ROI projections.

Another important measure is the amount of private capital that AARCC is able to attract into its client firms. The legislation requires fifty cents of private money to be matched against every dollar of AARCC investments. The actual ratio we see is approximately $3.50 of private money for every dollar of AARCC investments. Thus, since AARCC began its investment activities, we have attracted approximately $130 million from the private sector into rural America.

The expanded use of agricultural land is an additional factor that AARCC considers when making investments. Each year, about 10 percent of America's agricultural production capacity is fallow. AARCC is helping to put that land back into use. Since 1993, we estimate approximately 250,000 acres have been put back into production to grow the raw materials used by AARCC companies to manfacture their various products.

The most important measure of all is job creation in rural America. It is also the most difficult number to determine as it involves both direct jobs in the companies, as well as indirect jobs in the broader economy. Using various approaches to calculate the number, we estimate that AARCC has contributed—both directly and indirectly—to the creation of approximately 7,500 jobs in rural America.

Finally, I want to discuss AARCC's efforts with other Federal agencies to help the government realize the promise of Executive Order 13101, Greening Government Through Waste Prevention, Recycling, and Federal Acquisition. Working through USDA's Bio-based Products Coordinating Council and the Office of the Federal Environmental Executive, AARCC helped develop language for the Executive Order that encourages Federal purchasing agents to use set-asides and references to procure both recycled and bio-based products. Many of the bio-based products available to government purchasing agents today are made by AARCC-supported companies.

In conclusion, on behalf of the members of the Board of Directors of the AARC Corporation, I respectfully ask the Subcommittee to support the President's budget request of $10 million. With adequate appropriations, AARCC can continue its move towards privatization—as directed in the Federal Agriculture Improvement and Reform Act of 1996—and be an engine for development in rural America.

Mr. Chairman, I would be pleased to answer any questions you or your colleagues may have about the AARC Corporation.

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE

PREPARED STATEMENT OF DR. COLIEN HEFFERAN, ACTING ADMINISTRATOR

Mr. Chairman and Members of the Committee, I appreciate the opportunity to present the proposed fiscal year 2000 budget for the Cooperative State Research, Education, and Extension Service (CSREES), one of four agencies in the Research, Education, and Economics (REE) mission area of the United States Department of Agriculture (USDA).

CSREES works in partnership with the land-grant university system, other colleges and universities, and other public and private research and education organizations, in concert with the Secretary of Agriculture and the intent of Congress, to initiate and develop agricultural research, extension, and higher education programs. These programs are carried out by land-grant universities and other partners.

This strong partnership has supported great successes that have far reaching impacts on our Nation, the food we eat, the environment in which we live, and the quality of life of our citizens. For example, land-grant researchers are rapidly developing vaccines for some of the nation's most dreaded livestock diseases. A Mississippi State researcher has developed a single-injection, inexpensive vaccine that is estimated to reduce poultry deaths resulting from coccidiosis by up to 80 percent. Composting and recycling have benefitted farmers and homeowners as well as municipalities, landfills, and other operations. Through the coordination efforts of extension specialists, 1.2 million tons of yard waste is kept out of California landfills annually. At the Virginia Polytechnic Institute and State University, the Crop and Soil Environmental Science Department experienced a tenfold student enrollment increase and a 100 percent job placement rate in the last 10 years, demonstrating the need for agriculture college graduates. New Mexico State University scientists have discovered a method for controlling the Colorado potato beetle, the potato's most destructive pest, by inserting a gene in the potato that acts as a natural beetle repellent but does not harm humans or animals. These are just four examples from a long list of accomplishments of our university partners. They illustrate the success of a strong Federal/State partnership focused on agricultural knowledge that addresses broader issues in production, rural communities, the agricultural system, the environment, and people.

The fiscal year 2000 budget proposes an increase of 2.6 percent in discretionary funds. As reflected in the proposed increases, CSREES is committed to three overarching themes in its fiscal year 2000 budget:

Targeting High Priority Programs.—CSREES' goal is to target high priority research, education, and extension programs to meet the shared goals of the Federal/State partnership. These priorities include programs in food safety and programs that expand outreach to minority-serving institutions and help producers meet requirements under the Food Quality Protection Act.

Expanding the use of competitively-awarded Grants.—Agriculture needs to attract the best scientists, extension agents, educators, and other professionals to address key agricultural problems. We believe that this is best accomplished through competitive programs that are adequately funded. The CSREES commitment to improving the science base for agriculture through competitive grants is reflected in the $81 million increase for the National Research Initiative (NRI). The increase will enable the NRI to attract more of the best scientists, including those just beginning their careers, from a large scientific community which remains eager to seek solutions for agriculture but which has been discouraged by funding uncertainties. The $81 million increase will provide the resources needed to enhance and develop scientific areas that are critical to agriculture today, such as agricultural genomics, food safety, environment and natural resource management, and competitiveness and profitability of agriculture. Experience has shown that a significant portion of competitively-awarded grants go to land-grant institutions. Providing additional funding through the NRI, as well as mandatory programs, such as Section 401 of the 1998 research act and the Fund for Rural America, and the new Integrated Activities programs, will result in a substantial increase to land-grant institutions.

Integration of Research, Extension, and Education.—The CSREES commitment to integrating research, extension, and education, is reflected in the integrated grant authority established in the CSREES budget in accordance with Section 406 in the Agricultural Research, Extension, and Education Reform Act (AREERA) passed by Congress in June 1998. An increase and redirection of $72.8 million is provided in the budget for integrated research, education, and extension activities related to small farms, water quality, food safety, improved pest control, and food recovery and gleaning. This integrated grant authority allows the agency to support programs

that solve problems through multifunctional research, extension, and education activities without the distinction resulting from separate legislative authorities for research and extension. This approach is expected to promote a stronger linkage between research, extension, and education to ensure that the knowledge and technology generated by research is delivered to the end-users, including producers, consumers, communities, and students. The Integrated Research, Education, and Extension Grants Program is a competitively-awarded program under which eligibility includes all colleges and universities to ensure diversity in problem-solving approaches.

In developing a budget around these themes, the recurring challenge to CSREES has been to ensure that its programs are responsive to national needs, as expressed by stakeholders and as reflected in Department and Administration priorities.

FISCAL YEAR 2000 BUDGET HIGHLIGHTS

Achieving sustained long-term improvement in the competitive position of United States agriculture relies critically on the Federal government's assurance that producers and marketers have access to the basic tools for success. Studies have shown that successful producers (farmers, ranchers, and foresters) are better educated, more apt to adopt new technology, have lower costs of production, and take better advantage of or have more opportunities for spreading production and marketing risk across alternative enterprises and mechanisms, than their less successful counterparts. The fiscal year 2000 CSREES Budget proposes $4 million for a Small Farms Initiative that will develop research, education, and extension programs in appropriate marketing strategies for small farms, business skills for small farmers, and help beginning farmers establish viable farm operations and enterprises.

Food safety is dependent upon a production system that is well-integrated into an environment that is as pathogen-free as possible, a food processing and handling system free of pathogen contamination, and an educated public to ensure that both producers and consumers know their role in providing for the safe production, handling, and consumption of food. Food security is dependent upon an efficient and productive agricultural system based on healthy crops and livestock. The fiscal year 2000 budget proposes $15 million for an integrated research, extension, and education food safety program in support of the President's Food Safety Initiative. This integrated program will focus on research to improve the safety of food products and education and extension programs to create a public that is more informed about food safety issues.

Increases are proposed also to support the development and application of new technology and management practices to replace the traditional pest controls that are at risk of being restricted or prohibited due to the Food Quality Protection Act of 1996 (FQPA). The budget proposes $10 million to support long-term development and implementation of innovative pest management funds for major acreage crops, fruits, and vegetables through an integrated research, education, and extension competitive grants program. A $3 million increase is proposed for the development of alternative pest controls for fruit and vegetable crops to replace pesticides at risk of not meeting the new FQPA requirements.

An additional $5 million is proposed for development of practical management alternatives and technologies for commodities affected by the methyl bromide phaseout now scheduled for 2005 under recent amendments to the Clear Air Act. These programs, in conjunction with increased funding for the Pest Management Alternatives, Minor Crop Pest Management, the Expert IPM Decision Support System, the Pesticide Applicator Training Program, and sustained funding for the Integrated Pest Management research and extension programs, will ensure a more safe and secure food and fiber system.

Establishing the scientific basis for optimal health, developing knowledge of the eating habits of Americans, and modifying food intake behavior are critical components to having a well-nourished population. An increasingly important component to having a well-nourished population is empowering our communities to build their capacities to meet a greater share of their food needs. The fiscal year 2000 Budget proposes a $15 million Food Recovery and Gleaning Program to improve methods of collection, transport and storage of recovered and gleaned food, to enhance the technical assistance and education network, to empower local communities to establish and administer food recovery programs, and to develop and extend knowledge about technical issues in food recovery such as food safety and volunteer development. An increase of $2.3 million above the 1999 level also is proposed for the Expanded Food and Nutrition Education Program (EFNEP) to support nutrition education programs aimed at meeting the need of undernourished segments of the population, especially children.

As a Nation, we increasingly value the environment—clean air and water, unique ecosystems, and pristine land. We recognize that, given the vast amounts of land being used in agricultural or forest production, we must ensure that our production practices, as well as our public policies and programs affecting these practices, are consistent with the dual objectives of promoting competitiveness while preserving natural resources and environmental quality. To achieve these goals, a better understanding of the complex interactions between agricultural production and the environment is needed. Water Quality is a serious national concern as reflected in the President's Clean Water Action Plan. We propose an integrated research and extension water quality program that will support projects to address such issues as the linkage between agricultural practices and outbreaks of harmful algal blooms, which can lead to conditions that cause massive fish-kills, human health problems, and significant economic losses to the seafood industry. An increase of $0.5 million is proposed in the Sustainable Agriculture Research and Education Program to expand the availability of scientifically sound and practical methods for farmers and ranchers to achieve profitability, environmental stewardship, and quality of life for families and communities.

Americans recognize that their quality of life depends largely on economic, physical, and institutional factors affecting their families, businesses, and communities. The fast pace of changes in these factors, and their increasingly complex interactions, present a growing challenge. CSREES in partnership with the land-grant university system, enhances the capabilities of individuals, families, and communities to improve their quality of life. The fiscal year 2000 budget proposes an increase of $1 million for the Children, Youth, and Families at Risk program to enhance child care programs for those segments of the population in greatest need, including limited resource families, isolated farm and rural families, and families needing child care during non-traditional hours, such as families of migrant farm laborers.

CSREES strategies to ensure responsive and effective management of USDA's extramural research, extension, and education programs include: strengthening the Federal/State partnership; integrating research, extension, and education activities as appropriate; improving information management systems which are accessed by both internal and external users; and participating in efforts to improve financial management within USDA. The fiscal year 2000 budget proposes an increase of $1 million for the Research, Education, and Economics Information System (REEIS). Increased funding will support the broad implementation of the system to enable CSREES and the REE mission area to meet the reporting requirements of the Government Performance and Results Act and facilitate implementation of the provisions of the Agricultural Research, Extension, and Education Reform Act of 1998.

In response to USDA Civil Rights Action Team recommendations to address disparities in funding and enhance the Department's cooperative efforts with institutions of higher education that are primarily devoted to the needs of minority students, a number of increases are included in the CSREES budget. An increase of $0.3 million is provided for the Hispanic Serving Institutions Education Grants program; an increase of $3.6 million is provided for the 1890 Institutions Facilities program; an increase of $1.4 million is provided for the Extension Services at 1994 Institutions program; an increase of $667 thousand is provided to establish a new 1994 Institutions competitive research program; and an increase of $3.3 million is provided for the Extension Indian Reservations Program. Additionally, eligibility under the new Integrated Authority programs is open to all colleges and universities, including the 1890 and 1994 land-grant institutions.

In addition to the increase for the Hispanic Serving Institutions Education Grants program, funding is provided for other higher education programs to continue ongoing efforts to support graduate and undergraduate education aimed at improving instructional capabilities in food and agricultural sciences.

The fiscal year 2000 Budget also includes mandatory funding of $120 million for the Initiative for Future Agriculture and Food Systems under Section 401 of AREERA for competitive research, education, and extension grants to address critical and emerging agriculture issues. Mandatory funding also is available under the Fund for Rural America, where approximately $30 million is to be provided for a wide range of research, extension, and education activities. The budget also supports funding for the Community Food Projects grants program at $2.5 million (supported with mandatory funds provided by the Food and Nutrition Service Food Stamp Program).

An increasing portion of Federal funds will be distributed competitively to address the most critical needs of the agricultural community and fund the most highly meritorious projects. The increases proposed for competitive programs are partially offset by decreases in formula funds and non-competitive projects slated for reductions

due to constrained budget resources. The additional flexibility provided in the Agricultural Research, Extension, and Education Reform Act where a portion of the formula funds can be used to support either research or extension projects, allows states more authority to use Federal funds in addressing their highest priority needs.

The advent of the 21st century finds us poised to meet the many challenges facing the food and fiber system. The President's fiscal year 2000 Budget Request for CSREES reflects the commitment of the Administration to further strengthen the problem-solving capacity of Federally-supported agricultural research, extension, and higher education programs.

DEPARTMENTAL ADMINISTRATION

PREPARED STATEMENT OF SALLY THOMPSON, ACTING ASSISTANT SECRETARY, ADMINISTRATION

Mr. Chairman and members of the Subcommittee, it is a pleasure to present the President's budget proposal for fiscal year 2000 for USDA Departmental Administration. I am currently filling a dual role as the Acting Assistant Secretary for Administration and as the Chief Financial Officer. As Acting Assistant Secretary for Administration, I will be discussing the central administrative functions of the Department including: human resource management, government ethics, procurement policy and property management, facilities construction and operations, small and disadvantaged business utilization, program and administrative outreach, administrative law and Hazardous Waste Management. Ms. Rosalind Gray, Director of the Office of Civil Rights, will submit a separate statement on the civil rights progress and activities at the Department of Agriculture. I will also provide the Subcommittee with a separate statement covering the Office of the Chief Financial Officer.

We appreciate the support provided by this Subcommittee in recent years that has allowed us to continue critical administrative operations and the additional funding to continue essential support to the Department's civil rights effort.

Departmental Administration conducts varied and diverse oversight and support to provide quality leadership and service to the USDA agencies that deliver programs and services to the public. To give some idea of the wide range of these responsibilities, here are just a few examples of our on-going activities.

GOVERNMENT ETHICS

During fiscal year 1998, the Department established the Office of Ethics to oversee a vigorous government ethics program in USDA. With close coordination with the Office of the General Counsel and the U.S. Office of Government Ethics, this staff office is reviewing the ethics programs throughout the Department to assure that an effective ethics program is maintained within each of the Department's mission areas. An ethics Web site which provides training information and financial disclosure forms has already been established.

WELFARE TO WORK

The Office of Human Resource Management has coordinated the Department's implementation of the President's Welfare to Work Initiative. As of December 1, 1998, USDA had hired 374 employees from the welfare rolls. As a result, we have already achieved the Department's goal for the year 2000.

WORKPLACE CONFLICT MANAGEMENT

During fiscal year 1998, we established a Conflict Prevention and Resolution Center in USDA headquarters. Through this office, we are working with the agencies to identify potential areas of employee conflict and to train employees and management personnel to recognize and deal with potentially dangerous situations. We are actively engaged in the President's Interagency Working Group on Alternative Dispute Resolution, and in December 1998 we issued the USDA Handbook on Workplace Violence which was distributed to all employees.

BRINGING RURAL AMERICA VENTURE OPPORTUNITIES—BRAVO

The Office of Small and Disadvantaged Business Utilization has initiated the Bringing Rural America Venture Opportunities program to increase the participation of American Indian owned businesses with USDA. The BRAVO initiative establishes partnerships among rural communities, Indian nations, 1890 institutions, The

Hispanic Association of Colleges and Universities, Native American educational institutions, small disadvantaged companies, private companies, and government organizations. Large technology companies currently doing business with USDA provide mentoring and support. Initial projects are focusing on establishing businesses to provide software development, maintenance and technical support for USDA. Employees are being recruited/trained from Indian Reservations and economically disadvantaged surrounding areas. Participating USDA agencies will direct a small percentage of already budgeted and approved software development contracts to support this initiative. The President has endorsed this program as a way of addressing equal employment opportunity for American Indians.

CONTINUITY OF OPERATIONS PLANNING

Last year the President assigned the Cabinet officers the responsibility for developing a comprehensive plan to assure that the capability exists to continue essential government functions in the event of localized or general disaster. We are developing the Continuity of Operations Plan which includes: emergency delegations of authority (where permissible and in accordance with law); safekeeping of vital resources, facilities and records; emergency acquisition of resources necessary to reestablish essential functions; and alternative work sites.

DEPARTMENTAL ADMINISTRATION BUDGET REQUEST

The fiscal year 2000 Budget request for Departmental Administration is $36,117,000 which is $3,949,000 more than the fiscal year 1999 appropriation. The primary elements of this increase are: $931,000 to strengthen and expand the leadership and coordination capabilities for the Office of Outreach and expand outreach activities to minority and limited resource customers; $1,639,000 for the Office of Civil Rights to continue efforts to correct past weaknesses and strengthen USDA civil rights activities; and $1,050,000 for mandatory pay cost including the Office of Civil Rights. Absorbing these pay increases would require cuts in the program areas put in place with the fiscal year 1999 appropriation.

OUTREACH FOR SOCIALLY DISADVANTAGED FARMERS

For fiscal year 2000, we are requesting $10,000,000 for grants and contracts to community based organizations and certain educational institutions to provide outreach and technical assistance to socially disadvantaged farmers. This is an increase of $7,000,000 over the amount provided in fiscal year 1999. The current program supports 27 community based organizations and land-grant colleges that provide technical assistance and training to approximately 8,700 participants, primarily low-income farmers and ranchers, with a service area of 394 counties in 21 states. Our outreach efforts included town-hall meetings, workshops, and farmer field day activities that reached more than 107,000 people. Where the program is available, it has been successful in reducing the rate of land loss among small, limited-resource farmers. The budget increase will allow eight additional entities and double the number of counties to provide technical assistance and training that will help reverse the decline in the number of minority farmers and ranchers. This increase would also fulfill the Civil Rights Action Team Report recommendation to fully fund this program.

AGRICULTURE BUILDINGS AND FACILITIES AND RENTAL PAYMENTS

The fiscal year 2000 Budget requests $166,364,000 for Agriculture Buildings and Facilities and Rental Payments. This is an increase of $29,180,00 including $21,000,000 for South Building modernization, $7,485,000 for increased rental payments to GSA, and a net increase of $695,000 for building operations and maintenance.

USDA STRATEGIC SPACE PLAN

In our efforts to help reduce costs associated with housing our Washington area employees, USDA is implementing a long term plan to consolidate USDA Headquarters into two government-owned locations which will provide modern and safe facilities as well as enhance program operations. The Plan includes the new USDA Office Facility at the Beltsville Agricultural Center in Prince George's County, Maryland, and the modernization of the South Building in downtown Washington, D.C. Construction of the Beltsville Facility is complete and occupancy began in January 1998. We anticipate full occupancy by the end of fiscal year 1999. The new complex is an award winning facility for energy savings. In addition, we are pleased to note that USDA will be receiving the 1998 Government Award from the National

Industries for the Severely Handicapped, due in great part to our contract with Melwood, a community rehabilitation program, to operate this facility. The contract provides employment for over 60 people and is the first of its kind. It will provide new opportunities for the disabled in non-traditional careers such as building engineering.

The South Building is over 60 years old, eligible for listing on the National Register of Historic Places, and in dire need of repair and renovation to make it safe, efficient, and functional. The required renovation work includes fire protection systems; abatement of hazardous materials such as asbestos, PCB light fixtures, and lead paint; replacement of old, inefficient heating, ventilation and air conditioning systems for improved energy conservation and air quality; upgrade of electrical and plumbing systems; improved accommodations for disabled persons; and accommodation of modern office telecommunications systems. Construction of Phase 1—interior reconstruction of Wing 3—began in September 1998. The fiscal year 2000 funds are requested for the construction of Phase 2—interior reconstruction of Wing 4. The design for Phase 2 has been substantially completed so that a construction contract can be awarded as soon as funds become available.

HAZARDOUS WASTE MANAGEMENT

The Department requests $22,700,000 for the Hazardous Waste Management Program, an increase of $7,000,000 over the fiscal year 1999 level, to meet the minimum needs of the Comprehensive Environmental Response, Compensation and Liability Act; the Resource Conservation and Recovery Act; and related state and local laws. We must meet the challenge of cleaning up contaminated lands under USDA's jurisdiction. Our prior year activities generally concentrated on identifying contaminated sites, assessing the problems, and developing cleanup strategies. We are moving out of the investigation phase of these sites and conducting more complex and costly response actions. We have more than 2,000 contaminated sites remaining to clean up and restore. These remaining sites tend to be the most costly. For example, the cost of cleanup of problems caused by other responsible parties on facilities and lands that we manage, including abandoned mines and landfills, is estimated to exceed $2 billion. If we do not ensure that these sites are cleaned up in a timely manner, the potential for fines, penalties and law suits could rapidly exceed the cleanup.

CONCLUSION

Mr. Chairman and members of the Subcommittee, this concludes my statement on the Departmental Administration budget for fiscal year 2000. I want to reiterate our appreciation for the strong support which this Subcommittee has given us.

ECONOMIC RESEARCH SERVICE

PREPARED STATEMENT OF SUSAN E. OFFUTT, ADMINISTRATOR

Mr. Chairman and members of the Committee, I am pleased to have the opportunity to present the proposed fiscal year 2000 budget for the Economic Research Service.

MISSION

The Economic Research Service provides economic and other social science research and analysis on efficiency, efficacy, and equity issues related to agriculture, food, the environment, and rural development to improve public and private decision making.

BUDGET

ERS's appropriation for 1999 of $65.8 million consists of the 1997 appropriation level ($53.1 million), an increase of $12.2 million to evaluate food stamp, child nutrition, and WIC programs, and an increase of $.5 million to estimate the benefits of food safety. This appropriation was adjusted to $64.9 million with the move of Office of Energy to the Office of the Chief Economist. ERS continues implementation of its streamlining strategy and plans to maintain staff in 1999 at its current level of 525 full-time equivalents. ERS continues to make full use of early-out and buy-out authorities. In the future, ERS must manage its staff levels to maintain its nonsalary program of agricultural data purchases and cooperative university research necessary to support its analytical program.

The agency's request for 2000 is $55.6 million, a net decrease of $9.3 million from the adjusted 1999 appropriation. The net decrease consists of seven parts: a $.9 mil-

lion increase for enhancing commodity market analysis; a $.7 million increase for a study on carbon sequestration; a $.3 million increase for the U.S. Global Climate Change National Assessment; a $.5 million increase for estimating the benefits of food safety; a $.3 million increase to meet the analytical information needs of small farmers, niche marketers, other casualties of an industrializing agricultural sector; a $.2 million increase to assess the potential impacts of electric utility deregulation; and a $12.2 million decrease for evaluations of food stamp, child nutrition, and WIC programs. Funding for these evaluation studies in 2000 is included in the Food and Nutrition Service (FNS) budget.

ERS CONTRIBUTIONS TO MISSION AREA GOALS

ERS shares five general goals with its fellow agencies in the Research, Education, and Economics mission area: a highly competitive agricultural production system, a safe and secure food supply, a healthy and well nourished population, harmony between agriculture and the environment, and enhanced economic opportunity and quality of life for all Americans. These goals are fully consistent with the U.S. Department of Agriculture mission.

Goal I: The agricultural production system is highly competitive in the global economy.

ERS helps the U.S. food and agriculture sector effectively adapt to changing market structure and post-GATT and post-NAFTA trade conditions by providing analyses on the linkage between domestic and global food and commodity markets and the implications of alternative domestic policies and programs on competitiveness. ERS economists analyze factors that drive change in the structure and performance of domestic and global food and agriculture markets; provide economic assessments of competitiveness and efficiency in the food industry; analyze how global environmental change, international environmental treaties and agreements, and agriculture-related trade restrictions affect U.S. agricultural production, exports, and imports; and provide economic analyses that determine how fundamental commodity market relationships are adjusting to changing trade, domestic policy, and structural conditions. ERS will continue to consider how the potential for increased commodity price and farm income variability affects market performance and interacts with Federal policies and programs. These analyses will include short- and long-term projections of U.S. and world agricultural production, consumption, and trade. ERS has increased the frequency of reporting on commodities' outlooks, even as it endeavors to strengthen the analysis that leads to an understanding of reported observations. In addition, ERS will continue preparation for the new World Trade Organization round (that will include agriculture) by analyzing the economic effects of Uruguay Round policy disciplines; assessing the economic effects of state trading and tariff-rate quota allocations; and assessing regional trade initiatives. In this latter category, ERS experts will take a more in-depth look at China's evolving role in world agricultural markets. ERS will conduct research on the changing structure (for example, vertical integration, concentration, and contracting) of the food marketing chain and will also analyze the effectiveness and use of alternative marketing strategies and risk management tools in mitigating farm income risk, including tools available from both private and public sector providers.

ERS analyses can help guide and evaluate resource allocation and management of public sector agricultural research, a key to maintaining increases in productivity that underlie a strong competitive position for U.S. farmers. ERS economists track and endeavor to understand the determinants of public and private spending on agricultural R&D; evaluate the returns from those expenditures; and consider the most effective roles for public and private sector research entities.

Enhancing Commodity Market Analysis

The request for an increase of $854,000 in fiscal year 2000 is to assure continued Agency strength in and sufficient capacity for commodity outlook analysis. Principal means for obtaining this assurance will be through the development of strategic alliances with Land Grant universities and other public institutions performing commodity market analysis, and improvement of the breadth, ease, and timeliness of access to USDA commodity market data and information. These plans preclude the development of information gaps or limited access to private market data and analysis as barriers to efficient production and marketing decisions by American farmers, marketers, or traders.

Information Needs of Small Farmers

Because small, limited resource, and socially disadvantaged farmers are particularly dependent on publicly disseminated market data and information, it is critical

for the efficient functioning of the entire American sector (not just the largest operations) that any differences in the nature of information most useful to strategic decision making by small and larger, more advantaged farmers be well understood by the public providers of commodity market analysis. The request for a one-time increase of $350,000 will assure that ERS has this knowledge by funding a study to discover the unique information needs of unique and disadvantaged groups in the American agricultural sector. Increasing the capacity to meet these unique information needs is supportive of the small farm initiative.

Goal 2: The food production system is safe and secure.

ERS focuses on improving the efficiency and effectiveness of public policies and programs designed to protect consumers from unsafe food by analyzing benefits of safer food and the costs of food safety policies; efficient and cost-effective approaches to promote food safety; and how agricultural production and processing practices affect food safety, resource quality, and farm workers' safety. This research helps government officials design more efficient and cost-effective approaches to promote food safety. Specifically, the ERS research program provides detailed and up-to-date appraisals of the benefits of safer food, such as reducing medical costs and costs of productivity losses from foodborne illnesses caused by microbial pathogens. In addition, ERS has undertaken new research on the costs to industry and consumers of alternative food safety policies, including assessment of the distribution of costs across the food industry and across demographic groups.

Understanding how food prices are determined is increasingly important in responding to domestic and international market events and opportunities that promote the security of the U.S. food supply. As the farm share of the food dollar declines, accurate retail price forecasts depend more heavily on understanding the marketing system beyond the farmgate. ERS systematically examines the factors that help set retail prices, including an assessment of the roles of the transportation, processing, manufacturing, wholesaling and retailing sectors, the impact of imports and exports, and linkages to the total economy.

Food Safety Risk Assessment Initiative

A project to assess the risks and benefits of pathogen control options is proposed for fiscal year 2000 at $453,000 as part of the President's Food Safety Initiative. A fundamental barrier to evaluating food safety programs and policies is imperfect knowledge about the sources of risk along the food chain and how these might be addressed by pathogen control options. Efforts to estimate the benefits and costs of options to reduce foodborne illnesses are hampered by lack of knowledge about how pathogen control efforts will eventually affect public health. Further research on risk assessment by economists, in collaboration with other scientists, will provide decision makers with better estimates of the benefits and costs of efforts to promote food safety. Ensuring that our efforts to improve food safety are carefully targeted and prioritized on the basis of cost-effectiveness is central to our goal of providing the Nation with the safest possible food supply. This initiative is a part of the President's food safety initiative and the produce and imported food safety initiative.

Goal 3: The nation's population is healthy and well-nourished.

ERS helps identify efficient and effective public policies that promote consumers' access to a wide variety of high-quality foods at affordable prices. ERS economists analyze factors affecting dietary changes; assess impacts of nutrition education and the implications for the individual, society and agriculture; and provide economic evaluations of food nutrition and assistance programs. The Agency studies the implications for producers and consumers of movement towards adoption of the dietary guidelines; the trends and determinants of American's eating habits; evolution of food product trade; and the determinants of food prices. Analysis of nutrition education efforts considers what kinds of information motivate changes in consumer behavior, the food cost of healthy diets, the influence of food assistance programs on nutrition, and the implications of healthy diets for the structure of the food system. Because trade in high valued agricultural products, including processed food, now exceeds the value of bulk commodity flows, ERS will spend more time to disaggregate the components of these trade flows, understand their relationships to international investment and strategic behavior of U.S. food firms; and investigate the implications for U.S. consumers of a globalized food marketplace.

Goal 4: Agriculture and the Environment are in Harmony.

In this area, ERS analysis helps support development of Federal farm, natural resource, and rural policies and programs that promote long-term sustainability goals, improved agricultural competitiveness, and economic growth. This effort requires analyses on the profitability and environmental effects of alternative production

management systems and on the cost effectiveness and equity of public sector conservation policies and programs. ERS analysts focus on evaluating the benefits and costs of agricultural and environmental policies and programs in order to assess the relationship between improvements in environmental quality and increases in agricultural competitiveness. In this vein, ERS provides economic analyses on the linkages between biodiversity and sustainability issues and agricultural performance, competitiveness, and structure.

Carbon Sequestration Initiative

We request an increase of $700,000 in fiscal year 2000 to assess the economic potential for using agricultural lands to sequester atmospheric carbon. This will increase the use of production practices that build organic soil carbon that enhance the quality and productivity of affected lands. This will also be in accordance with U.S. commitments to mitigate greenhouse gas emissions under the Kyoto Protocol, as well as assessing the potential to target existing USDA conservation programs to include carbon sequestration. Possible "carbon sinks" include shifting marginal agricultural lands into forests, shifting croplands into permanent grasses, and adopting production practices that result in higher levels of soil carbon. Expanding the quantity of U.S. farm land in forests and grasses could complement existing USDA conservation goals of reducing soil erosion, improving water quality, and enhancing wildlife habitat.

U.S. Global Change Program National Assessment

ERS will continue to participate in and support the U.S. Global Change Program National Assessment. An increase of $300,000 is requested to develop a detailed understanding of the consequences of climate change for various economic sectors, geographic regions, and the nation as a whole. The Administration strongly believes that increased funding for climate change initiatives as described above will make U.S. agriculture better prepared to reduce and respond to the impacts of those changes in the future.

Goal 5: Enhanced economic opportunity and quality of life for rural Americans.

The ERS contribution to improving opportunity and quality of life in the U.S. is based on analysis that identifies how investment, employment opportunities and job training, and demographics affect rural America's capacity to prosper in the global marketplace. ERS economists analyze rural financial markets and how the availability of credit, particularly Federal credit, spending, taxes, and regulations influence rural economic development. ERS analyzes the changing size and characteristics of the rural and farm populations and the implications of these changes in human capital, including skill development, on the performance of rural economies. In addition, ERS studies the economic structure and performance of non-farm economic activities in rural areas, including the fairly widespread rebound in population growth in non-metropolitan counties. The relevant analyses will involve monitoring rural earnings and labor market trends with emphasis on regional and other disaggregations in order to provide insight into the determinants of variation in trends among non-metro counties. Such work should yield a better understanding of the factors that promote rural vitality and the opportunities for effective public sector intervention.

Because the effects of changes in welfare programs may vary between rural and urban residents due to differences in labor markets and other aspects of a regional economy's structure, ERS social scientists will track implementation of recent program changes to understand any differential impacts. In particular, ERS analysis can help anticipate changes in participation across assistance programs, including those for which USDA has primary responsibility, in rural housing and in food. Another opportunity for understanding whether rural America faces unique circumstances will come with analysis of a recently-completed survey of the rural manufacturing sector.

ERS continues to monitor the financial situation of the farm sector, establishing farm business organization and performance benchmarks. This task includes study of the financial position of farmers who employ technological advances and innovative risk management strategies in their businesses, compared with the financial position of farmers who use more traditional approaches. Previous work on the use of production and marketing contracts by farmers will be extended to identify contractors by class to better define the role of non-farm businesses in the industrialization of farms. Analyses of financial performance will also measure the comparability of returns between farm and non-farm small businesses and assess the financial viability of commercial and non-commercial size farm operations.

Electric Utility Deregulation

In fiscal year 2000, ERS proposes a study to assess the potential impacts of electric utility deregulation on rural America. Electric utility deregulation began with the passage in 1992 of the Federal Energy Policy Act and has continued as State legislatures and regulatory agencies consider further deregulating the delivery of electricity to industrial and residential consumers. While these steps could result in substantial savings nationwide, the savings will not be uniformly distributed. The resulting changes will have important impacts on the competitiveness and well-being of agriculture, other businesses, and communities in rural America, as well as on rural electric cooperatives and USDA's electric utility loan programs. Recently the agency initiated work to better understand the issues involved in electric deregulation and to assess the impact of projected swings in electric utility rates on regional economies. The request for $200,000 will allow ERS and its cooperators to expand upon this early work and assess the potential impacts of deregulation on the Department's rural utility loan programs, on the competitiveness of rural businesses and communities, and on rural households.

CUSTOMERS, PARTNERS, AND STAKEHOLDERS

The ultimate beneficiaries of ERS's program are the American people whose well-being is improved by informed public and private decisionmaking leading to more effective resource allocation. ERS shapes its program and products principally to serve key decision makers who routinely make or influence public policy and program decisions. This clientele includes White House and USDA policy officials and program administrators/managers, the U.S. Congress, other Federal agencies and State and local government officials, and domestic and international environmental, consumer, and other public groups, including farm and industry groups interested in public policy issues.

ERS carries out its economic analysis and research in four divisions. ERS depends heavily on working relationships with other organizations and individuals to accomplish its mission. Key partners include: the National Agricultural Statistics Service (NASS) for primary data collection; universities for research collaboration; the media as disseminators of ERS analyses; and other government agencies and departments for data information and services.

CLOSING REMARKS

I appreciate the support that this Committee has given ERS in the past and look forward to continue working with you and your staff to ensure that ERS makes the most effective and appropriate use of the public resources. Thank you.

NATIONAL APPEALS DIVISION

PREPARED STATEMENT OF NORMAN G. COOPER, DIRECTOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you to discuss the fiscal year 2000 budget request for the National Appeals Division.

INTRODUCTION

The National Appeals Division (NAD) was established by the Secretary of Agriculture pursuant to the Reorganization Act of 1994. The Act consolidated the appellate functions and staffs of several USDA agencies to provide for hearings on appeal of adverse agency decisions, and review of appeal determinations by the NAD Director. NAD appeals currently involve program decisions of the Farm Service Agency, Risk Management Agency, Natural Resources Conservation Service, Rural Business-Cooperative Service, Rural Housing Service, and Rural Utilities Service. NAD is headquartered in Alexandria, Virginia, and has regional offices located in Indianapolis, Indiana; Memphis, Tennessee; and Lakewood, Colorado. NAD's staff of 133 includes 75 hearing officers Nationwide.

MISSION

Our mission is to conduct evidentiary administrative appeals hearings and reviews arising out of program decisions of specific USDA agencies. Our strategic goal is to conduct timely hearings and issue timely and well-reasoned determinations that correctly interpret applicable regulations. In addition, in States covered by the United States Court of Appeals 8th Circuit, NAD Hearing Officer's adjudicate applications for fees under the Equal Access to Justice Act (EAJA). NAD's mission is

statutorily specific, but the administration is dynamic and challenging, given the complexities of changing laws, regulations and policies.

FISCAL YEAR 2000 BUDGET REQUEST

NAD is requesting $12,699,000 in direct appropriations for fiscal year 2000. This request represents an increase of $981,000 over the fiscal year 1999 appropriation. The increase is comprised of $392,000 for pay costs and $589,000 for training costs.

NAD employees must possess a broad, in-depth knowledge of many areas, including adjudication procedures as well as the laws and regulations of subject agencies. The hearing and review officers must stay abreast of changes in the law, regulations and agency policies, in order to issue determinations that are legally correct. Continuous training and development is essential to providing the public a competent and fair administrative appeal system that recognizes the rights of program participants and promotes the lawful operations of agency programs. NAD's budget request for training will be used to sustain high-quality training that is critical to accomplishing our goal.

We are also requesting $392,000 to offset the anticipated fiscal year 2000 federal pay raise. Our budget has remained fixed at the current level since fiscal year 1997. We cannot continue to absorb pay cost increases without jeopardizing our ability to provide an effective administrative appeals system.

CONCLUSION

NAD's administrative appeals process is a cost-effective service for program participants to have adverse agency decisions fairly and impartially adjudicated in a timely manner consistent with the intent of Congress. The initiatives in the fiscal year 2000 budget will help ensure that we accomplish our mission in a more efficient and effective manner, making correct determinations and continuing to assure the rights of all participants in appeals. The initiatives provide the groundwork for accomplishing the goals and objectives outlined in NAD's Strategic Plan and annual performance plan. More importantly, these initiatives assure farmers, ranchers, cooperatives, agencies, and others an avenue to a fair and equitable adjudicative process. I would like to provide for the record a copy of the brochure that describes these initiatives.

That concludes my statement, and I am looking forward to working with the Committee on the fiscal year 2000 National Appeals Division budget.

OFFICE OF THE CHIEF ECONOMIST

PREPARED STATEMENT OF KEITH COLLINS, CHIEF ECONOMIST

This statement discusses the functions and fiscal year 2000 budget request of the Office of the Chief Economist, or OCE.

OCE is a small staff of analysts located in Washington, D.C., plus one weather officer field unit in Mississippi. OCE reports directly to the Secretary of Agriculture and has four primary missions: (1) provide economic analysis to the Executive Branch and Congressional policy officials on alternative policies, programs and regulations; (2) serve as a focal point for the collection and reporting of economic and weather data, forecasts and projections related to agricultural commodities, and the performance of the agricultural economy; (3) provide economic and policy analysis on issues related to energy and new uses in agriculture; and (4) conduct statutory review and oversight responsibilities related to risk assessment and cost-benefit analysis of major USDA regulations. OCE also coordinates several activities that cut across USDA mission areas, which include global climate change, sustainable development and agricultural labor.

OCE has four functional units: the Immediate Office; the World Agricultural Outlook Board; WAOB; the Office of Risk Assessment and Cost-Benefit Analysis, ORACBA; and the Office of Energy Policy and New Uses, OEPNU. Some recent activities and accomplishments in each of these four areas are briefly discussed.

IMMEDIATE OFFICE OF THE CHIEF ECONOMIST

The immediate office, with a staff of nine, directs a wide range of analysis related to policy, program and legislative proposals, and regulations. The focus is on the most substantial, complex and controversial issues, usually at the request of the Secretary, other Administration officials, or members of Congress. The most important products are briefings, and briefing and analysis papers prepared on tight deadlines. These analyses generally focus on short- to medium-term effects, involve

staff from other agencies, and apply the results of existing, basic economic research to specific policy issues. The immediate office staff is also responsible for regulatory review. A key role of the staff is to coordinate analyses among USDA agencies. Examples of key activities during the past year are:

OCE works with other agencies to assess program options and guide effective Departmental decision making with respect to key program provisions. OCE provided numerous assessments to the Secretary and the administration on the state of the farm economy as conditions eroded in many areas during 1998. OCE led the development of the USDA proposal to OMB for emergency assistance to producers in 1998. OCE worked closely with the Marketing and Regulatory Programs mission area to address issues in concentration. OCE helped develop program options and analyzed proposed regulatory actions submitted by the public on ways to deal with concentrated markets. OCE provided continual advice and analysis to the Secretary on dairy policy, including Federal Milk Marketing Order reform. OCE coordinated Departmental analysis of proposed settlement between tobacco companies and State Attorneys General and buyout proposals for tobacco producers. OCE continues to assist the Animal and Plant Health Inspection Service—APHIS—in verifying compensation claims for producers, handlers and others affected by Karnal bunt regulations and assisted in drafting regulations, cost-benefit analyses, and decision memoranda dealing with Karnal bunt. OCE analyzed models of the Standard Reinsurance Agreement, or SRA, to assist the Risk Management Agency in their 1999 SRA negotiations with the crop insurance industry. The models were used to analyze the budget implications and industry rates of return of various reinsurance proposals, including reinsurance for catastrophic and revenue products.

OCE was an active member of the U.S. interagency group on climate change and was part of the country delegation attending meetings of the United Nations Framework Convention on Climate Change—FCCC—in Buenos Aires, Argentina and Bonn, Germany. OCE was instrumental in elevating the issue of carbon sequestration in the UN Intergovernmental Panel on Climate Change and the FCCC Subsidiary Body for Scientific and Technical Advice. OCE took the lead to coordinate an interagency group to assess the potential of sequestering carbon through forest management and crop land practices.

In the area of small farm issues, OCE participated in a Departmental interagency task force established to review and provide advice on implementation of the recommendations from the National Commission on Small Farms. OCE participated in the Secretary's Transportation Summit and on a special task force created to monitor and improve the performance of the western rail system. This task force initiated a new report, that provides an early warning of potential railcar shortages and bottlenecks in the movement of grain and grain products.

OCE served on the Economic Options Committee of the United Nations Technical and Economic Assessment Panel for the Montreal Protocol. The Committee prepared a report on economic issues pertaining to implementation of the scheduled phase out of ozone depleting substances. Included in the report are analyses of various alternatives for reducing production and consumption of ozone depleting substances.

During the past year, the staff reviewed analyses supporting Significant and Economically Significant regulations issued by the Department. The staff provided critical review and guidance in the Department's regulatory analyses for regulation of retained water in poultry and meat, storage temperature for eggs and meat imports. In addition, the staff assisted the Forest Service in developing the supporting analyses for revisions of timber sale contracts regulations and the proposed road construction.

OCE worked with the Department of Labor, National Economic Council, and the Immigration and Naturalization Service to streamline and improve for farm employers and employees the H–2A temporary agricultural worker program. The staff helped to develop a new program to assist farm employer's in California meet their labor needs and prospective workers to find work under California's welfare reform act. OCE staff maintained an Internet web page to provide the public information on farm employment rules and regulations, farm safety, and worker protection from pesticides.

OCE coordinates sustainable development activities within USDA. This is done chiefly through USDA's Council on Sustainable Development, chaired by the Director of Sustainable Development, which develops, coordinates, and integrates the principles of sustainable development into policies and programs across all mission areas of the Department. During the past year, the Director served as the lead USDA member of the U.S. delegation to the UN meetings on sustainable development. The Director also co-chaired USDA's Council on Sustainable Development, which implemented a Sustainable Agriculture Learning Initiative to bring together sustainable agriculture farmers with bankers and insurance specialists.

OCE advised Congress through testimony and staff briefings on the effects of the developments in markets, prices and income prospects and on global climate change.

WORLD AGRICULTURAL OUTLOOK BOARD—WAOB

The WAOB prepares world agricultural and weather assessments and coordinates USDA' work related to agricultural outlook, projections, weather, and remote sensing. The Board issues a monthly publication known as the World Agricultural Supply and Demand Estimates report and oversees long-term USDA forecasts required for preparation of the Federal budget. The Board also operates and manages the Joint Agricultural Weather Facility, JAWF, in cooperation with the National Oceanic and Atmospheric Administration, NOAA, and is home to the Department's Chief Meteorologist. In addition, the Board provides technical assistance and coordination for USDA's remote sensing activities.

Coordinating USDA Economic Forecasts.—The WAOB plays a critical role in assuring that the Department's commodity information system responds to today's rapidly changing world. The Board's mission is to ensure that USDA's intelligence on domestic and foreign agricultural developments is timely, accurate, and objective, and to speed the flow of that information to producers, consumers, and policy makers.

One of WAOB's primary functions is to coordinate and review all USDA forecasts and analyses of foreign and domestic commodity supply and demand conditions. USDA's Interagency Commodity Estimates Committees are chaired by staff of the WAOB. The purpose of these committees is to assure that sound information from domestic and international sources is fully integrated into the analytical process and that USDA's economic forecasts are objective, thorough, and consistent. The committees, with representatives from the Economic Research Service, Farm Service Agency, Foreign Agricultural Service, Agricultural Marketing Service, and WAOB, are responsible for developing official estimates of supply, utilization, and prices and reviewing economic reports issued by USDA agencies. In fiscal year 1998, the Board reviewed and approved for release approximately 150 reports.

In addition, daily market highlights and weekly briefing reports were prepared for the Secretary and top staff, weekly weather and economics briefings were presented to the Under Secretary for Farm and Foreign Agricultural Services, and international weather highlights were published in the Weekly Weather and Crop Bulletin.

Each month, the WAOB publishes the World Agricultural Supply and Demand Estimates [WASDE] Report, which forecasts production, trade, utilization, prices, and stocks. Coverage includes U.S. and world grains, oilseeds, and cotton and U.S. livestock and poultry products and sugar. Release is simultaneous with the U.S. Crop Production report. WASDE is internationally viewed as a benchmark for agriculture and provides timely knowledge of world commodity markets that is increasingly critical to our export-led farm economy. Equally important, the WASDE report gives early warning of changing crop production and supply prospects in the United States and in other countries.

Oversight of Long-Term USDA Commodity Projections.—WAOB chairs the Department's Interagency Agricultural Projections Committee that oversees preparation of long-term projections for farm commodities, the U.S. agricultural economy, and world agricultural trade. The Economic Research Service has the lead role in preparation of the projections. WAOB's role is to ensure a strong multi-agency effort and sound analytical procedures for the projections. The projections are used for a variety of analytic and mandated functions of the Department, such as preparing the USDA portion of the President's budget. These "baseline" projections provide an objective, rigorous, and thorough view of the likely path of the farm sector over the long term.

The most recent set of long-term projections, Agricultural Baseline Projections to 2008, was publicly released in February 1999 at the Department's annual Agricultural Outlook Forum. The projections reflect the adverse impact that poor worldwide growth prospects and increasing world supplies have on prospects for U.S. agricultural trade in the near to medium term. Nonetheless, despite problems in the next few years, more favorable long-term world economic growth supports gains in exports and farm income as we pass 2000. The overall farm financial picture shows assets accumulating faster than liabilities throughout the projection period, a sign that the sector as a whole remains fundamentally sound.

The annual USDA Agricultural Outlook Forum, conducted under OCE's leadership, is a public meeting on farm, food, and trade prospects. The Forum was planned in consultation with a large number of agencies, making this a true USDA team effort. The Chief Economist invited, and sessions were organized by, the Agri-

cultural Marketing Service; Animal and Plant Health Inspection Service; Grain Inspection, Packers and Stockyards Administration; Natural Resources Conservation Service; Foreign Agricultural Service; Economic Research Service; Farm Service Agency; and the Risk Management Agency. The Forum is rich with USDA's expertise on risk management, marketing, grain inspection, plant and animal health, and soil and water conservation.

Outlook Forum 1999, the seventy-fifth annual meeting, took place in late February 1999. Attendance, topping 1,100, was the highest in recent years. The program featured a spectrum of issues affecting the future of agriculture, discussed from many vantage points. In addition to near-term and long-range agricultural prospects, topics ranged from new marketing strategies to the impacts of biotechnology and environmental regulation. Speakers were drawn from farming, agribusiness, environmental groups, government, and academia. Extensive media coverage and posting of speeches on the Internet shortly after the Forum ensured the timely dissemination of information presented.

Monitoring Weather Impacts on Agriculture.—USDA places a high priority on incorporating weather-based assessments into all analyses. The focal point for this activity is the Joint Agricultural Weather Facility, JAWF. JAWF staff continually monitor global weather and assess its probable impact on agricultural output. JAWF briefings, reports, and special alerts are key inputs to the development of USDA crop yield estimates for both competitor and customer countries. JAWF weather assessments are made available to the public through the Weekly Weather and Crop Bulletin, the WAOB home page, and the news media. WAOB's Chairperson and Chief Meteorologist briefed government officials and news media frequently on changing crop conditions.

Disseminating USDA Numbers to the Public.—As commodity prices are affected less by Government programs and more by market forces, the need for objective and current market information is becoming especially critical. The WAOB recognizes the need for rapid information dissemination and strives to place the WASDE report Weekly Weather and Crop Bulletin in the hands of farmers and other users as quickly as possible. The goal is to provide simultaneous access at a minimum cost to all market participants.

WAOB improved electronic access to the monthly WASDE report. The WASDE report is now posted instantly on the WAOB home page as well as forwarded to the USDA "Economics and Statistics" web site at Cornell University. In addition, WAOB took the lead in upgrading the usefulness of the Cornell University site for USDA information by overseeing a redesign and expansion of the help section.

Interagency Initiatives.—The JAWF worked closely with the National Water and Climate Center of USDA's Natural Resources Conservation Service and with NOAA Regional Climate Centers on a Unified Climate Access Network to provide on-line access to weather and climate data from a variety of sources. At the request of the World Meteorological Organization, JAWF staff prepared and delivered a training course on agricultural data management procedures, attended by 17 participants from over 10 countries in Ljubljana, Slovenia. JAWF staff represented the United States at the WMO Commission for Agricultural Meteorology in Accra, Ghana.

Also, JAWF put updated sections of its popular handbook Major World Crop Areas and Climatic Profiles on the Internet, and is working with the U.N. Food and Agriculture Organization to develop an expanded CD–ROM version using geographic information system—GIS—technology.

WAOB increased cooperation and dialogue with the Office of the Federal Coordinator for Meteorology of the National Oceanographic and Atmospheric Administration. This interchange has renewed cooperation in support of USDA weather needs. NOAA's National Weather Service recently announced that the agency will adopt USDA National Agricultural Weather Information System, NAWIS, language and accept it as the Administration's position with respect to authorizing this activity.

Weather Data Receiver Upgraded.—WAOB established a satellite downlink for National Weather Service, NEWS data at the USDA's Kansas City computer center. This downlink gives access to more reliable and comprehensive data, helping to improve crop-weather analysis in support of USDA forecasts. It also will make it possible to share timely weather data with other agencies such as the Forest Service and with field offices in USDA's new agricultural weather observing network.

Remote Sensing Activities.—At WAOB's request, the Defense Intelligence Agency—DIA—opened its archive of more than 10,000 satellite images to USDA and has agreed to provide scenes requested by the Department at no cost. Normally, such images would cost USDA $400 to $4,400 each. DIA now provides USDA with a list of new imagery acquisitions every two weeks. In addition, WAOB successfully negotiated an agreement with a private vendor to provide radar imagery to the Foreign Agricultural Service, Farm Service Agency, Forest Service, and the Natural Re-

sources Conservation Service at no cost. In return, USDA will provide DIA with evaluations of the usefulness of radar imagery in fulfilling agency missions.

1890 Institution Partnership.—For the third consecutive year, WAOB supported an ongoing partnership with the University of Maryland Eastern Shore, an 1890 Institution. The goal of this partnership has been to introduce UMES faculty and students to agriculture-related occupations.

Technical Cooperation with China.—WAOB continued an information exchange with China that has yielded substantial analytical benefits to the Department. The Chairperson traveled to Beijing, Guangxi Province, and Sichuan Province with specialists from the National Agricultural Statistics Service and the Economic Research Service. Through participation in this project, USDA has substantially improved its information base with respect to the present and future of China's agricultural sector.

Information Exchange with South Africa.—WAOB continued an initiative with South Africa to share meteorological technologies and data, under the auspices of the United States/South Africa Bi-National Commission. WAOB arranged for a technical exchange between the developers of the "Oklahoma Mesonet" and scientists representing South Africa's Agricultural Research Council, and is now receiving real-time weather data collected by South African counterparts.

Understanding Grain Disease.—Support provided by the JAWF was instrumental in helping to dispute non-tariff barriers to wheat trade with China and Brazil. USDA used JAWF's extensive weather and climate data base to show that neither China or Brazil have climatic conditions which would support the growth of TCK smut or Karnal bunt. This evidence has weakened the justification by both countries for restricting imports of U.S. wheat.

Drought Initiative.—WAOB continued to play an active role in the Western Drought Coordination Council activities. WAOB collaboration will continue as the Farm Service Agency assumes leadership of a new National Drought Policy Committee.

Grain Transportation Outlook Initiated.—WAOB assembled an interagency committee for the purpose of reviewing and publishing the Department's first Grain Transportation Prospects report. This report addressed the need to provide the transportation industry with timely information on crop supplies in an effort to avoid railcar shortages at the expense of agriculture, and to provide farmers with information on pressures facing the rail industry.

OFFICE OF ENERGY POLICY AND NEW USES—OEPNU

The Office of Energy Policy and New Uses provides leadership, education, coordination, and evaluation for all Departmental energy and energy-related activities. The Office develops a unified presentation of the Department's energy activities to the Administration, Congress, other Federal Agencies, and the public. OEPNU provides analysis and information to support policies aimed at increasing farm income and rural economic growth. OEPNU initiated and coordinated research in electricity deregulation, climate change, biomass, and biodiesel issues.

Electricity Deregulation.—Electricity deregulation that will change power rates in rural America presents the Department with an important policy issue and potential program concerns for the Rural Utilities Service. OEPNU initiated preliminary analysis that enabled the Department to include a rural "place holder" in the Administration's legislation submitted to Congress.

Ethanol Analysis.—OEPNU developed a coordinated research plan with the Department of Energy and Argonne Labs to provide analysis on the net climate benefits of corn ethanol to environmental groups. This research was cited as part of the Administration's successful effort to extend the ethanol excise tax exemption. In addition, OEPNU initiated a research program with Department of Energy and the Environmental Protection Agency to examine opportunities to expand ethanol's market, especially with respect to a proposed low sulfur gasoline program and the reformulated gasoline program.

Biomass Initiative.—OEPNU coordinated and designed a biomass research component of the Climate Change Technology Initiative. To support the initiative, preliminary biomass economic analysis was completed. We have since expanded this work to look at agricultural residues with Iowa State University.

Biodiesel Research.—OEPNU's work on biodiesel has produced a redirection of research resources, several publications, and citations of the work in congressional hearings. Our work influenced significant resource allocation in the joint USDA, the Department of Energy, and the American Soybean Association/United Soybean Board's program toward more coproduct development and the use of biodiesel as an additive. Three publications have been produced by research we used to examine the

feasibility of biodiesel mandated under the Energy Policy Act of 1992. Results from this work were cited at Senate and House hearings to examine the feasibility of biodiesel as an alternative fuel.

OFFICE OF RISK ASSESSMENT AND COST-BENEFIT ANALYSES—ORACBA

The Office of Risk Assessment and Cost-Benefit Analysis exercises the responsibility for reviewing and approving risk analyses for all major USDA regulations. The Office serves as a focal point for Departmental activities related to risk analysis, including interdepartmental activities, risk communication, and education and training for improving risk analyses.

Regulatory and Program Review.—ORACBA reviewed and coordinated interagency review of risk assessments in support of several significant regulatory proposals, programs, and reports. For food safety these include review of the Salmonella enteritidis in eggs risk assessment, the irradiation of beef, and rules evaluating ingesta contamination during processing in chickens.

In the international animal trade arena, ORACBA has been involved in evaluating regionalization for the EU for classical swine fever; regionalization of Mexico for importation of pork and pork products from Yucatan and Sonora, of poultry and poultry products from Sonora and Sinaloa, and easing the restrictions on importation of ruminants and ruminant meat products from certain European countries.

In conservation and plant health, ORACBA reviewed the risk assessments in support of the interim rule on solid wood packing material, the final rule on Karnal bunt, the proposed rule for citrus from Argentina, and the draft final "plant pesticide" rule, so-called for plants containing a natural pesticide gene.

Risk Assessment Education and Training.—ORACBA, in cooperation with the Food and Drug Administration and the USDA Graduate School, has developed a series of courses on risk analysis. These courses are organized into a curriculum for which the USDA Graduate School is developing a certificate program. Courses range from a basic introduction of risk analysis to an advanced quantitative modeling. A course, "Ecological and Environmental Risk Assessment" was piloted and final designs for permanent status of the course in the curriculum are being developed. The courses have serviced individuals from USDA and the Food and Drug Administration, but also from several universities, the private sector and foreign countries.

ORACBA sponsors two work groups, Interagency Food Risk Assessment Group and the Eco-Risk Group, which include scientists from USDA, other government agencies, and the private sector. ORACBA brings in special speakers to provide half-day or one-day workshops to focus on special methodological issues of concern to the groups.

Program Guidance and Consultation.—ORACBA continues to provide guidance and technical support to agencies responsible for USDA conservation programs. This includes a model case-history approach for the Environmental Quality Incentives Program, or EQIP, and a series of small case-histories for the Conservation Reserve Program, or CRP. An interagency team of environmental and ecological risk assessors led by ORACBA has worked closely with the agencies in developing these studies.

ORACBA has worked with the Natural Resources Conservation Service—NRCS—and CRP to develop case-studies to supplement the risk assessment that accompanied the original proposed rules. One case-study for NRCS has matured into a full-fledged research project involving several universities and the Agricultural Research Service. The team is tracking the flow of nutrients and five microbes from dairy cattle to manure storage and into the environment. These studies will be expanded to include swine and poultry operations in the future. The case study for CRP has led to proposing to include native honeybees as wildlife; heretofore, only vertebrate species have been identified as worthy of protection through the CRP.

ORACBA provides representation to the Risk Assessment Consortium—RACof the Food Safety Initiative. The RAC has focused its work on developing a web-based clearinghouse for food safety risk assessment information as well as a risk-based strategic planning project to provide insight in the development of the fiscal year 2001 interagency food safety budget.

ORACBA has continued to provide guidance to the Forest Service regarding the land donation from the Department of Defense to USDA; this work has helped clarify both environmental and legal issues surrounding this land. ORACBA actively provides support and guidance for the Office of Pest Management Policy with respect to the pesticide risk assessments being developed by EPA for the Food Quality Protection Program.

Risk Analysis Coordination and Representation.—ORACBA, working through its auxiliary Interagency Food Risk Assessment Group, coordinated the development of

a farm-to-table model of the E. coli O157:H7 risk assessment subsequently being used by the Food Safety and Inspection Service to complete the risk assessment. ORACBA serves on the Office of Science and Technology Policy and the Council for Environment and Natural Resources Center Subcommittee on Toxics and Risk. ORACBA organized a written summary of rules dealing with animal manure which the Subcommittee issued as a CENR report. ORACBA staff facilitated a planning meeting of Animal and Plant Health Inspection Service managers to develop a strategy to review the entire program of safeguarding American plant resources from alien species.

Risk Communication.—ORACBA continues to improve communication among USDA analysts through the monthly Risk Forum and the quarterly ORACBA Newsletter. The Forum brings together scientists from USDA, other government agencies, universities, and the private sector; the Newsletter has a mailed circulation of over 800 and is available on the USDA/OCE/ORACBA website.

1890 Institutions Partnerships.—ORACBA has worked with several 1890 institutions, providing guest lectures for their students and faculty. ORACBA regularly invites 1890 faculty to attend education and training courses provided through the Graduate School. The participants do not pay any tuition. ORACBA has also facilitated a partnership between Tuskegee University and Harvard University for the BSE Risk Analysis. The results have been significant in the responsibility and funding for Tuskegee.

FISCAL YEAR 2000 BUDGET REQUEST

For fiscal year 2000, OCE is requesting $6,622,000 in direct appropriations. This request represents a net increase of $211,000 over the fiscal year 1999 adjusted base (which includes the transfer of the Office of Energy from the Economic Research Service). The proposed budget includes an increase of $45,000 for the annualization of the fiscal year 1999 pay raise and $166,000 for the anticipated fiscal year 2000 pay raise.

OCE is a small office working under a demanding schedule with little flexibility to absorb pay and other cost increases. Salary and benefits plus required obligations make up 90 percent of OCE's budget with necessary, travel, equipment and contracts making up the remainder. Pay costs are needed to prevent a decline in weather and market analyses, which have been increased and improved as a result of increased appropriations the past two years. Without pay costs, the previous deficiencies in collection and reporting of global weather and economic information would reappear.

OFFICE OF THE CHIEF FINANCIAL OFFICER

PREPARED STATEMENT OF SALLY THOMPSON, CHIEF FINANCIAL OFFICER

Mr. Chairman and members of the Committee, when I appeared before you last year, I had been on the job as the Department's Chief Financial Officer for only three days. At that time, I told you that my top three priorities were: (1) getting an integrated financial management system up and running for all USDA agencies; (2) streamlining reporting functions, improving performance measurements, and increasing accountability; and (3) fulfilling other responsibilities authorized by the CFO Act. I also pledged that all of the systems at the National Finance Center—NFC—in New Orleans would be Year 2000 compliant.

If I may start with the last item, I am pleased to report that the NFC met two self-imposed deadlines, one on June 30, 1998, to make all its systems Year 2000 compliant and another on December 31, 1998, to ensure that all systems were certified as Y2K compliant. The NFC provides payroll/personnel services to 435,000 employees from USDA and 100 other Federal agencies, accounting for one-fifth of the entire Federal workforce. NFC's systems support the Federal Government's Thrift Savings Plan—TSP, which is the $74 billion 401(k) retirement plan with 2.3 million participants. All of us in the Office of the Chief Financial Officer—OCFO—and across USDA are proud of this achievement.

Mr. Chairman, during the past year, I have consulted with OCFO's managers; its customers, both inside and outside USDA, our budget reviewers, members of the Congress, staff from the Office of the Inspector General, the Office of Management and Budget—OMB, and the General Accounting Office—GAO, and our counterparts in other Federal agencies about general and specific financial management problems facing USDA. I have taken seriously the USDA's Inspector General's statement that ". . . a stronger CFO oversight process is needed to assure . . . longstanding problems are resolved on a coordinated department-wide basis." I can assure you and

your colleagues that the Secretary and the Department's senior-level management share my commitment to improving financial management. I would like to thank Secretary Glickman for his support and leadership. I also want to thank you and your colleagues for placing such an emphasis on financial management issues. This budget request reflects Congress' quest for more efficient, effective Government.

OCFO is playing a pivotal role in enhancing the Department's fiscal reputation. We have shouldered a lot of responsibilities in the last few years. As we have managed the Departmentwide implementation of Congressional mandates and executive orders, our budget continued to shrink.

Mr. Chairman, if the Congress approves our request for an increase of $2,005,000 over our fiscal year 1999 appropriation, it will mark the first time since passage of the CFO Act of 1990 that the Department's financial management office has received a program increase in resources. We have done much to position ourselves to improve the financial health of USDA. I ask for this Committee's support for additional resources to fully implement the plans that we have developed.

This budget request will be used to lead, direct, and oversee financial management activities across USDA. This increase in our budget will fund 14 positions to work with the agencies to improve their business practices and to help us accomplish the following objectives:

—Ensure that USDA's information includes accurate, complete, and credible data that are useful and used;

—Provide the Congress and the Administration reliable information when making decisions affecting USDA programs;

—Resolve long outstanding Inspector General's recommendations included in the audit reports;

—Develop a USDA accountability report that complies with new reporting requirements and streamlines existing reports, making it easier for the public and Congress to access information about our financial activities;

—And, perhaps most important, lead USDA to a clean unqualified audit opinion for fiscal year 2000.

In a July 1998 report to the Vice President, we identified the plans of action that we are implementing to correct these deficiencies, which were outlined in the Inspector General's audit of our financial statements. This plan reflects a Departmentwide commitment to putting in place standard business processes that restore our credibility and correct the problems necessary for us to achieve an unqualified audit opinion.

An unqualified audit opinion assures everyone—policymakers, managers, the Congress, program recipients, and the American taxpayer—that USDA's financial management practices produce credible, reliable information that complies with laws, regulations, and accepted authoritative requirements.

These efforts are directly linked to the implementation over the next five years of an integrated financial management system that Congress mandated in the CFO Act. However, while we can get a clean opinion using the system, the system alone, absent changes in financial management practices, will not get USDA a clean audit opinion.

We need these budgeted resources not to do more of the same, Mr. Chairman. We need these staff resources to assist USDA's agencies to ensure that their business practices result in useful, reliable information going into this system.

I place the highest priority on an integrated financial management system for USDA, the cornerstone of which is the Foundation Financial Information System—FFIS. FFIS is funded through the Working Capital Fund—WCF, but I want to make clear that the different funding sources do not separate the interdependence of these efforts. The successful implementation of FFIS rests on good business practices, procedures and a well-trained staff at the agency level. These additional appropriated funds will ensure that this implementation becomes a reality.

In last year's testimony, I made a commitment to you to restructure the FFIS management organization. I am happy to report, Mr. Chairman, that the current FFIS project office is not the FFIS of previous years. With the Secretary's support and guidance, I obtained a waiver in June 1998 from the Office of Personnel Management—OPM to bring an experienced project management team from another Federal agency. This team successfully implemented a system identical to the package that USDA is using and led its agency to an unqualified opinion on its administrative financial statements for fiscal year 1997.

The project director reports directly to me and submits monthly updates to the Secretary's FFIS Executive Oversight Committee. The team, which started July 6, 1998, is putting in place an FFIS implementation plan that includes a schedule for full USDA implementation of FFIS by October 1, 2002.

Since the new project structure's inception, we have conducted numerous meetings with Congressional groups. On September 23, for example, we joined senior-level GAO officials on a panel that briefed staff members from four House committees and two Senate committees on the Department's efforts to implement FFIS in our largest agency, the Forest Service. Both GAO and OMB support this new management structure.

Implementing FFIS will enable USDA to provide useful, consistent, timely, reliable and accurate information to management, achieve conformance with legislative mandates, such as the Chief Financial Officers Act, and meet other Government-wide requirements for financial management systems, processes and internal controls, including the U.S. Standard General Ledger. FFIS will also provide a platform for agencies and NFC to streamline current financial processes and systems. As part of the FFIS effort, we are developing the financial systems architecture and operating models necessary for the integrated financial management information system.

As I said last year, my second priority is to fulfill responsibilities of accountability and performance measurement associated with implementing the Government Performance and Results Act. The Congress gave USDA a low score on its Strategic and Annual Performance plans because your colleagues did not consider USDA's information to be accurate, complete, and credible. We will use these additional resources to establish a staff dedicated to restoring accountability at USDA. We will assist the agencies in linking accountability with program delivery.

WORKING CAPITAL FUND

Mr. Chairman, I would like to conclude my remarks by providing you with a brief update on our Working Capital Fund—WCF, which is entirely funded by fees for services. This Fund supports 20 distinct activity centers across five Department-level organizations. It also supports a number of projects and initiatives to modernize administrative and financial systems.

In WCF, we develop our budgets in partnership with agencies. The Executive Committee comprised of agency representatives advises me on its funding level and use. This arrangement ensures that the Committee's recommendations reflect a "customer" voice in the operation and oversight of WCF activities and finances. Thus, the WCF budget reflects our partnership with our customers.

For the current and next fiscal years, WCF spending consists of three categories: basic services, TSP, and modernization efforts.

In the first category, our customers are paying in fiscal year 1999 the same inflation-adjusted dollars for basic services, such as accounting services, payroll, and computer processing. It is our intent to achieve the same outcome in fiscal year 2000.

In the second category, TSP, the costs of delivering services to TSP shareholders will increase, but the Thrift Investment Board will absorb these costs through investment earnings. Among TSP's enhancements is a new system scheduled to start in April 2000 that will provide daily valuation assessments and allow participants to modify their investments through the Internet.

In the third category, the new FFIS management team's first task was to complete a new implementation plan and timetable for FFIS. This plan calls for full implementation of FFIS for USDA and cross-serviced agencies by October 1, 2002, with a post-implementation and close-out of the current Central Accounting System occurring in fiscal year 2003. Costs through fiscal year 2003 are expected to be $136.1 million, with the bulk of the expenditures occurring during the height of the implementation in fiscal year 2000 and 2001. The fiscal year 1999 budget for FFIS is $23.7 million. The fiscal year 2000 and 2001 budgets are $32.5 million and $32.3 million, respectively. While these one-time implementation costs are straining agencies' budgets because additional funding has not been appropriated for this major project, the Department must continue to implement this new system to be compliant with Federal financial management laws.

Our fiscal year 2000 WCF budget includes $4.2 million to upgrade our payroll/personnel system at NFC for our customers at USDA and in other federal agencies. As I mentioned earlier, NFC provides payroll/personnel cross-servicing to a significant portion of the Federal sector, a practice that reduces overall user costs.

We want to improve on our successes in the payroll arena, which will require us to upgrade or modernize existing systems to meet users' needs and maintain low costs. We must adequately invest in modernization efforts, so we do not jeopardize our service to existing customers or hinder our ability to attract new clients.

This committee has recognized the cost-saving benefits associated with NFC's cross-servicing and has encouraged the expansion of this service at the center. To

expand, however, we must produce a product that can compete in both price and quality of services. We have been investing in this area over the last two to three years and will have products available to our customers this spring.

I pledge to you that, in addition to leading the effort to put USDA's financial house in order, I will give our effort to strengthen NFC's role in human resource systems and infrastructure a priority level equal to that which my office gave to achieving Y2K compliance.

Mr. Chairman, Congress has given us the challenge of improving our performance, accounting for our financial resources, and managing our operations more effectively and efficiently. The budget that I am presenting to you is our commitment to achieving these shared goals.

Thank you, Mr. Chairman. I welcome any questions the Committee might have.

OFFICE OF THE CHIEF INFORMATION OFFICER

PREPARED STATEMENT OF ANNE F. THOMSON REED, CHIEF INFORMATION OFFICER

Mr. Chairman, members of the Subcommittee, I will submit my testimony for the record and also offer a few remarks.

As I stated last year, I am honored to have the opportunity to serve as the Chief Information Officer (CIO) of the United States Department of Agriculture (USDA). I greatly appreciate the opportunity to serve with Secretary Dan Glickman, Deputy Secretary Richard Rominger, my sub cabinet colleagues, and all of the employees of the USDA as we work too more effectively and efficiently deliver USDA's programs, which are vital to the health, safety, and economic prosperity of the American people, as well as people the world over. With the support and cooperation of the Congress, USDA is now stronger, abler, leaner, and more cohesive, and better able to serve our nation. Yet, as we all know, the Department faces significant challenges as we work to achieve the strategic goals which are reflected in the President's fiscal year 2000 Budget. The Department's strategic goals are to: Expand economic and trade opportunities for agricultural producers and other rural residents; Ensure food for the hungry, and a safe, affordable, nutritious, and accessible food supply; and Promote the sensible management of our natural resources.

As you are well aware, the current farm crisis made achieving some of these strategic goals more difficult. The drop in agricultural commodity prices, the Asian economic crisis, and stiffer global competition for the American farmer have all resulted in increased demands on USDA programs. In the face of these demands and another year of tight funding, our challenge is to strategically harness new and existing technologies across USDA to vastly improve service delivery to our customers and help farmers weather the storm.

Implementing IT solutions are complex tasks which all Federal Agencies—including the USDA—have historically had problems accomplishing. However, I believe our progress this past year shows that we are on the right path and, with your support, we can successfully meet the challenges before us. At USDA, our agencies demonstrate daily the cost savings, improved customer service, and other efficiencies to be gained when information technology is effectively utilized. For example, since I met with you last year, three USDA agencies have received Leadership Awards for setting examples of how government agencies get results—for taxpayers and constituents—from technology investment.

—The Agricultural Marketing Service (AMS) now disseminates, via the Internet, information on prices, volume, quality, and other market data on domestic and international farm products within hours of collection.

—The Agricultural Research Service (ARS) allows dairy farmers to pass on $60 million in savings to consumers as a result of improvements in its genetic evaluations of the U.S. milking herd, and the creation of electronic transfer access so breeders can quickly access the data.

—The Farm Service Agency (FSA) instituted a new Electronic Bid Entry System so that bids for some $1.2 billion in food for farm aid can be opened and contracts awarded in two hours. Up to the minute market prices improve competition; the result is that more people can be fed for each dollar in aid.

—Using the Internet, the AMS conducted the first fully electronic rule-making for a major regulation in the history of the federal government. More than one quarter of a million comments for the National Organic Program proposed rule were received by fax, e-mail, and regular mail, and placed online. The ease of submitting comments encouraged more people to participate—you can call it an example of electronic democracy—making the process the most open, publicly accessible rule-making ever.

Mr. Chairman, we are proud of these accomplishments which provide a glimpse into the way our programs and services will be delivered in the future. Information technology today is radically transforming the way we live and work. In our personal lives, the Internet is rapidly changing the way we are accustomed to making transactions—everything from buying stocks, books, cars and homes, to applying for licenses and loans. At the USDA, it is changing the way we collect, analyze, and deliver information, making possible efficiencies that we could not have dreamed of just a few years ago. Yet, we have only begun to transform the way USDA does business.

USDA FISCAL YEAR 2000 INFORMATION TECHNOLOGY BUDGET SUMMARY

The Department's overall budget request for information technology in fiscal year 2000 totals $1.211 billion in budgetary authority. This compares with $1.198 billion in budgetary authority for information technology plus $37,789,000 for Year 2000 emergency supplemental funding in fiscal year 1999. Approximately 30 percent, or $379 million, of the fiscal year 2000 request is for development, modernization, and enhancement of USDA information technology resources, while almost 69 percent, or $832 million, is required for maintaining current systems, including the operation and support of existing information technology systems.

This budget reflects our priority that USDA IT solutions are aligned with program goals. For example:

—By creating a uniform and shared information technology infrastructure with the Service Center Initiative Common Computing Environment (CCE), we are laying the foundation for implementing reengineered programs. In fiscal year 2000, we are proposing a total program level of $90 million for this purpose, including about $16 million from the Commodity Credit Corporation.

—As the Forest Service continues to address changing notions of how to use and protect our public land, Project 615 is integrating the information necessary to manage our National Forests in a more accessible environment. In fiscal year 2000, $102 million is proposed for this effort.

—A significant portion of the Department's IT funding, approximately $280 million or twenty-three percent, is distributed to states to support the information technology resources necessary to run the Food and Nutrition Service Food Stamp Program. This includes $43 million to expand and maintain the use of Electronic Benefits Transfer (EBT) technology.

Over the past year we have improved the Department's ability to properly manage these significant expenditures. However, we still have much work to do before we are managing our IT resources as envisioned by the passage of the Clinger-Cohen Act of 1996.

OFFICE OF THE CHIEF INFORMATION OFFICER FISCAL YEAR 2000 BUDGET REQUEST

The USDA Office of the Chief Information Officer (OCIO) was established pursuant to the Clinger-Cohen Act. We have primary responsibility for supervision and coordination of the design, acquisition, maintenance, use, and disposal of information technology resources by USDA agencies. Our mission is to strategically acquire and use information technology resources to improve the quality, timeliness, and cost effectiveness of USDA's service delivery to its customers, and, increasingly, to ensure the security of the critical information that we manage.

To carry out this mission, we are facilitating the alignment of our information technology investments with USDA's mission goals. We have developed performance measurements to monitor our progress and, more recently, we have begun developing a tactical plan to help us better manage our major initiatives. These initiatives include:

—Overseeing implementation of a single information technology infrastructure and supporting organization for the Farm and Foreign Agricultural Services, the Rural Development agencies, and the Natural Resources Conservation Service;

—Developing policies and procedures to implement the Clinger-Cohen Act through expanding the implementation of our enterprise-wide architecture, strengthening our capital planning process, implementing a formal IT project management training program, and further developing our workforce planning strategies to recruit and retain IT professionals;

—Developing a USDA critical infrastructure assurance plan to secure Department information and IT systems; and protect them against cyber-terrorism and other threats;

—Improving the Department-wide management of telecommunications; and

—Assuring that our mission-critical information systems are Year 2000 compliant; an effort that will leave a lasting imprint on OCIO well beyond January 1, 2000.

We began our Year 2000 effort by enlisting the support of senior executive sponsors and staff in each agency to ensure we moved forward together, as a Department. Leveraging the USDA Information Systems Technology Architecture (ISTA) and the Telecommunications Enterprise Network Program, we jump-started the identification of all USDA mission critical systems—feeding this information back into the ISTA. We then refocused and strengthened our existing IT moratorium and capital planning processes to ensure all IT acquisitions were centered on Year 2000 compliance. And now, we are coordinating our Year 2000 Business Contingency Planning with similar efforts to create a USDA Critical Infrastructure Assurance Plan.

In a moment, I will discuss the initiatives mentioned above in greater detail. However, my office also manages the USDA National Information Technology Center (NITC) headquartered in Kansas City, Missouri. The NITC provides innovative, cost effective, and secure information technology solutions to support the missions of the USDA and its thirty-two agencies, the Federal Aviation Administration, the National Weather Service, and other government clients.

My office oversees implementation of the Paperwork Reduction Act of 1995 to reduce the paperwork burden for the public from the collection of information. Also, we coordinate the Department's records management functions to ensure that USDA's policies and transactions are adequately documented and archived.

Fully implementing the initiatives we have begun will radically transform the way information technology is managed at USDA. To fully implement the Clinger-Cohen Act without unnecessary and costly delay, the USDA Office of the Chief Information Officer requests $7,998,000 for fiscal year 2000, an increase of $2,447,000 and five staff years over the fiscal year 1999 appropriation of $5,551,000.

PAY COSTS

More than eighty percent of the OCIO's fiscal year 1999 obligations are for salaries and benefits. This leaves little flexibility for absorbing increased costs. For the past several years, we have received no added resources for pay cost increases. As a result, critical positions have been left vacant for extended periods. Despite our progress, which I will discuss, the inability to fill critical staff positions has adversely affected our ability to fully implement the Clinger-Cohen requirements and expeditiously achieve the goals we have identified. For these reasons, my office's budget includes a $197,000 increase for pay costs, consisting of $35,000 for annualization of fiscal year 1999 and $162,000 for the anticipated fiscal year 2000 pay raise.

USDA SERVICE CENTER IMPLEMENTATION

I am also pleased to report that, even though significant challenges remain, we are making progress in our efforts to permanently transform the way USDA provides service to farmers and rural America through our Service Center Modernization Initiative (SCMI). At the same time, the current farm crisis makes it clear that we must accelerate our efforts if we expect our reduced staff to respond to cyclical emergency workloads of this type or natural disasters, without disrupting all of our other program delivery.

The goal of reducing the number of county office locations from over 3,700 to under 2,600 is close to realization and should be complete this year. This represents the first step toward true "one stop service" for our customers.

Another critical step is our progress toward creating a shared or Common Computing Environment (CCE) to replace the archaic "stove pipe" information technology systems of the past. The CCE will allow agency computers to talk to one another, utilize the Internet to improve service delivery, and reduce the burden on our customers. In fiscal year 1998, USDA obligated funds for more than 16,500 workstations, at deeply discounted prices. This will allow us to install Y2K compliant computers while also moving forward with limited CCE investments to field already reengineered processes. These workstations will provide a set of common office automation tools; they will also be fully interchangeable: every new field office computer will be loaded with business applications from all of the partner agencies. An additional 5,500 computers will be purchased in fiscal year 1999 to complete the Y2K replacements. The remaining work stations will be addressed in fiscal year 2000 and 2001.

Business Process Reengineering (BPR) is being used to analyze, streamline, and integrate like Service Center processes. The Service Center Modernization Initiative

now has 17 active BPR projects dealing with customer management, program delivery, consolidated administrative processes, lending programs, and other critical processes. Fully 60 percent of the Service Center business processes are in some stage of review. An Interagency Business Integration Center has been established at Beltsville, Maryland, to fully test the reengineered processes in a laboratory environment before sending them to one or more of the nine field pilot sites that were established last year. Early results indicate that the reengineered processes, coupled with enabling technology, are yielding significantly higher benefits than we originally estimated on some processes; staff time savings in excess of 80 percent are being recorded.

The LAN/WAN/Voice Project, which provides integrated voice and telecommunications networks to the Service Centers, is also nearing completion. At the end of fiscal year 1998, nearly 85 percent of the Service Centers were installed with the remainder to be finished in fiscal year 1999. This infrastructure will provide a set of "electronic railroad" tracks for all future technology improvements to run on.

Other technology components will also change the way these agencies do business. The technical infrastructure that has been developed is based on open, interoperable systems that are flexible and able to respond to changing programs, staffing, office and organizational structure. The infrastructure includes network servers to fully connect agencies to the network and provide common e-mail and other support; powerful business applications; public access servers; and Geographic Information System (GIS) servers, which support the business activities of these agencies that are associated with land and water characteristics, capabilities, and ownership. The fiscal year 2000 Budget includes funds to begin acquiring these items. It is anticipated that, depending upon funding levels, the completion of the infrastructure will take place over three years. At that point, the full benefits of the Service Center Modernization Initiative can be achieved.

Administrative Convergence and the creation in the 2000 Budget of a consolidated account for funding the Service Center Modernization Initiative are also essential for success, particularly with the Information Technology (IT) aspects. A consolidated IT staff will be able to take advantage of the efficiencies that a common architecture brings and will ensure that we do not revert to three stove pipes in the future. The consolidated account will facilitate decision making and priority setting on an enterprise basis and will help to improve tracking and accountability.

In addition to the appropriations request, it is estimated that $16.2 million will be transferred from the Commodity Credit Corporation (CCC) to the Support Services Bureau to help support the new shared Common Computing Environment (CCE). These funds will be the remainder available under the current CCC cap for ADP expenses. Legislation is proposed to increase the cap by $105 million, to $293 million for the period through fiscal year 2002. This increase will enable CCC to meet the basic FSA ADP needs while supporting the investment in CCE.

My office provides oversight to ensure that the business processes are appropriately reengineered and drive the technology decisions and that the Service Center technology is consistent with the USDA technical architecture. We have a two-person oversight staff currently financed by reimbursement from the fiscal year 1996 Appropriation to the Secretary for implementation of "InfoShare," which was the predecessor to the SCMI, to carry out this function. We anticipate the reimbursement for this activity to end by fiscal year 2000. Therefore, an increase of $250,000 is requested to continue these positions with appropriated funds and to ensure that the USDA Service Center Modernization Implementation initiative achieves the Secretary's goals of better integrating services and modernizing delivery of programs administered by the Farm Service Agency, the Natural Resources Conservation Service, and the Rural Development mission area.

CLINGER-COHEN COMPLIANCE

Since the creation of OCIO, we have been working to implement both the guidelines and spirit of the Clinger-Cohen Act of 1996. Given the inherent complexity of the task, I am happy to report that we made progress this past year expanding the USDA Information Systems Technology Architecture, improving the Department-wide and Agency Capital Planning Processes, and developing our IT workforce planning initiative. Together these efforts are improving the way the Department acquires and uses IT, and reducing costs while increasing the productivity of USDA programs.

USDA INFORMATION SYSTEMS TECHNOLOGY ARCHITECTURE

USDA actually began designing its ISTA prior to passage of the Clinger-Cohen Act. Our first version of the ISTA was a multi agency collaboration, which served

as an essential guide for the LAN/WAN/Voice and CCE IT investments for the Service Center Modernization Initiative. However, to assure that the Department's overall technical infrastructure is interoperable, efficient, and provides effective support to achieve USDA's business goals, the ISTA requires further development and integration into Department-wide planning processes.

The Service Center agencies' use of the ISTA provides an example of the important role of an information technology architecture in successful project implementation. With varying perspectives on what were the best information technology solutions among the Service Center Agencies, the technical portion of the ISTA provided a framework for the agencies to build on and begin establishing a consensus on what to purchase and implement. The purchase of the 16,500 CCE workstations would have been impossible without the development of the ISTA technical standards. Similarly, the technical architecture has facilitated the CCE consolidation of software licensing, improving our users' ability to share applications and data while reducing costs.

Additionally, my office continues to expand and apply the initial version of the ISTA. Our update of the baseline architecture has focused on Agency business processes, information exchange requirements, the application portfolio, and identification of USDA functions and technology platforms. Thus the ISTA is a dynamic tool, which we are using in the selection phase of the Capital Planning and Investment Control and IT waiver processes to avoid duplication and ensure interoperability of all USDA IT investments.

The ISTA will ultimately modernize and transform the way we all think about delivering programs and services to our customers. With the fiscal year 2000 funding, a web-based repository to house the ISTA combined with inter-agency ISTA training will inform programs and IT staff about existing processes, applications, and standards at the initial stages of a project. Further integration of the ISTA into the Capital Planning and Budget Processes will help guide investment decisions, continue to reduce duplication across agencies, and eventually result in greater interoperability of USDA's IT systems. The fiscal year 2000 funding request includes $500,000 to meet Clinger-Cohen Act of 1996 requirements that Executive Agencies develop an information technology architecture.

CAPITAL PLANNING AND INVESTMENT CONTROL

We have also made progress implementing an Information Technology Capital Planning and Investment Control (CPIC) process, another Clinger-Cohen requirement. We are following OMB and GAO guidelines to ensure that IT investments are made in direct support of business objectives, while maximizing the value and assessing and managing the associated risks. This is not an easy task, as economic, environmental, and policy changes require the Department to find new and flexible solutions which often involve significant investments in information technology. My office requires additional resources to implement the CPIC process consistently across USDA agencies and, most important, to ensure that these investments are properly managed.

I am pleased to report that in 1998, USDA became the first large Federal Department to implement the Information Technology Portfolio System (I-TIPS), a scalable web-based software tool used to track IT projects as investments through the selection, control, and evaluation phases of the Capital Planning and Investment Control Process. Thirteen USDA agencies now use the I-TIPS selection module, exceeding our original performance goal of five. We developed I-TIPS in conjunction with the Department of Energy and the National Performance review. We are proud that in addition to USDA, I-TIPS is now being used in seven other Federal Departments.

The use of I-TIPS as a tool to provide USDA decision-makers with a better picture of our IT investment portfolio is already producing results—allowing the Executive Information Technology Investment Review Board (EITIRB), which is chaired by the Deputy Secretary, to make more informed decisions in its review and approval of the Department's IT investment portfolio.

In addition, my office has produced a USDA CPIC guide for senior decision-makers and agency planning staff. The guide explains the fundamentals of capital planning and how we are integrating the OMB guidelines and GAO model for CPIC into the USDA IT investment process.

Still, the design and implementation of a USDA-wide CPIC program and support system is a multi year effort which requires a permanent, ongoing program management staff. Skilled staff is needed to perform and review cost-benefit, return on investment, and other detailed analyses of IT investments in order to reduce as far as practical the risk of failure in the development, deployment, and operation of USDA information technology systems. The funding we have requested would be

used to train the agencies in the process and the I-TIPS tool to ensure that capital planning is applied consistently throughout our organization.

The benefits of a successful CPIC program are clear: IT investments by USDA agencies that meet their program objectives on time and within cost projections, and which support business objectives. I am requesting $500,000 in fiscal year 2000 to meet the capital planning requirements of the Clinger-Cohen Act of 1996 and the OMB Circular A–11 Part 3 requirement that Federal agencies intensify their review and analysis of information technology systems as capital assets.

PROJECT MANAGEMENT

We are also taking steps to address deficiencies in USDA's management of major information technology projects, an area cited by oversight agencies in recent years. In order to reduce risk in the development, deployment, and operation of information technology systems, my office is creating a formal project management certification program. This program will establish a standardized methodology for project management: projects will be managed consistently, resulting in increased success rates, and avoidance of cost overruns and delays. At the same time, managers will be provided with sound performance measurement tools. This initiative will also help meet the project management requirements of OMB Circular A–11 Part 3, Planning, Budgeting, and Acquisition of Capital Assets, by establishing and providing the means to track cost, schedule, and performance goals. In fiscal year 2000, I am requesting an increase of $300,000 and 2 staff-years to strengthen USDA's project management capacity.

INDEPENDENT VERIFICATION AND VALIDATION

Mr. Chairman, we have also made progress with respect to two other very important management tools which I would like to mention: Independent Validation and Verification (IV&V) and our Acquisition Moratorium.

Independent Validation and Verification (IV&V) is now a standard policy tool that my office uses to manage all large-scale USDA IT investments. At critical points in a project's life-cycle, independent experts review the issues surrounding project design, development, acquisition, and implementation.

For example, this past year an IV&V conducted by my office validated the Service Center Modernization Initiative's Common Computing Environment's cost/benefit analysis and technical alternative plans. This ensured that all appropriate business and technical details were included in the plans before any further steps were taken. Another IV&V on the Department's Foundation Financial Information System refocused the project in a new and sound direction, improving the value of the resources being allocated and the probability of the project's success.

In the coming year, we will continue to apply the lessons learned from previous IV&Vs in order ensure all significant IT investments cost effectively serve USDA program goals.

IT ACQUISITION MORATORIUM

In compliance with our fiscal year 1999 appropriation (Public Law 105–86), my office, together with the Executive Information Technology Investment Review Board, continues to review all USDA information technology investments to ensure new purchases are directed at bringing the Department into Year 2000 compliance. Any Departmental or Agency information technology acquisition over $25,000 requires a waiver from my office. These waivers are granted for emergencies and Year 2000 remediation efforts only.

The USDA IT investment moratorium is a success. Since Deputy Secretary Rominger originally issued the moratorium in November of 1996 to improve the Department's IT management, we have been better able to monitor agencies' use of funds while improving our IT decision-making processes. And, since Secretary Glickman modified the IT acquisition moratorium in August 1997, agencies have redirected a great deal of attention and dollars to Year 2000 compliance.

The IT acquisition moratorium, together with IV&V reviews have greatly improved our ability to ensure that USDA's IT projects meet USDA's business objectives and are effectively and efficiently managed.

INFORMATION TECHNOLOGY WORKFORCE PLANNING AND DEVELOPMENT

My office is also actively working on a professional development strategy to ensure that USDA's IT staffs possess the technology skills necessary to effectively deliver USDA's programs and services. In light of the current worldwide shortage of

IT professionals, there is a clear urgency in our efforts to attract and retain qualified technical staff to support the Department's modernization efforts.

As competition for IT professionals grows more intense, we face the growing challenge of keeping our skilled IT professionals. USDA is experiencing a loss of skilled IT professionals from increased competition with the private sector, and through buyouts and retirements. Since 1994, we have lost more than 11 percent of the IT professionals within the Department.

My office is collaborating with the Office of Human Resources Management and the USDA IT Workforce Planning and Development Working Group, a group composed of HR and IT specialists from several of the Department's agencies, to address this problem by providing USDA managers with recruitment and retention alternatives and flexibilities. IT employees within government know that they will not receive salaries comparable to the private sector; however, we can provide more flexibility in their work schedules, greater opportunities for career development, and management that is more sensitive to all of their work place concerns.

We are also working to implement a set of core competencies for USDA IT professionals which were developed by the CIO Council. In this effort, the Deputy Chief Information Officer, Ira Hobbs, as co-chair of the CIO Council's Education and Training Committee, is playing a leadership role in the adoption of these competencies across government. Together, these efforts support my office's management initiative to implement a professional development strategy to ensure that USDA's program and IT staffs possess the skills necessary to meet the challenges of effectively delivering programs and services with information technology. For fiscal year 2000, I am requesting an increase of $200,000 and 1 staff year to improve USDA's information technology workforce planning and development effort and to expedite the implementation of the component of the Clinger-Cohen Act of 1996 dealing with workforce development.

TELECOMMUNICATIONS

USDA also faces significant challenges with respect to improving the management of our telecommunications infrastructure. This past year, we have made progress analyzing and optimizing our telecommunications network while preparing for the Year 2000 date-change and the upcoming transition to the new GSA FTS2001 telecommunications contract. As the telecommunications industry moves from older voice to more advanced data technologies, it is crucial that the Department continue to put in place a USDA corporate telecommunications network that includes management processes and the infrastructure necessary to efficiently meet the needs of our programs today while planning for the services our customers will demand tomorrow.

The work we have done this past year on the Telecommunications Enterprise Network (TEN) Design and the Telecommunications Ordering, Billing, and Inventory System (TOBI) projects are vital steps to establishing a USDA enterprise-wide network. The TEN Design project captured the current network baseline physical description along with usage, cost, and performance statistics. The TOBI pilot project combines a revised administrative process with an off-the-shelf software application to improve the control and accounting of USDA telecommunications acquisition. These design initiatives together with our recent implementation successes represent the first steps toward a cost effective enterprise network plan.

As I mentioned earlier, the Service Center LAN/WAN/Voice project is providing the shared voice and data telecommunications infrastructure necessary to present one-face to our customers at reduced costs. Similarly, the Washington Metropolitan Area Optimization Project (WMAO) has successfully optimized our headquarters network, generating $1.3 million in cost avoidance since February 1998, allowing agencies to redirect these dollars toward their program activities. In the short-term, the WMAO project is reducing USDA costs in the Washington Metropolitan Area (WMA) while expending minimal expense and time. The long-term objectives are to implement a cost effective and centralized Configuration Management capability and provide enhanced Network Services for all USDA offices in the WMA.

Over the next year, we face significant challenges transitioning to the FTS2001 contract while continuing to reform our telecommunication management process and infrastructure. Through strong management processes we will integrate, optimize, and modernize current services. The FTS2001 transition also provides us a tremendous opportunity to refine and improve the Department-wide telecommunications network design, security, management, and standards development. The challenges associated with administratively managing two networks will be significant while simultaneously managing the implementation, operation, and disconnection of services.

Greater emphasis is being placed on aligning program delivery with appropriate IT solutions. More efficient use of telecommunications personnel, equipment and services will be achieved through institutionalizing structured processes in which IT activity within USDA and its agencies is directed toward building a common information infrastructure for the greater agriculture community of interest.

To meet these challenges, I am happy to report the addition of a new Associate Chief Information Officer of Telecommunications Services and Operations to my senior management team. Filling this position has already significantly enhanced our ability to provide day to day leadership while assuming long term strategic planning responsibilities for the network.

INFORMATION TECHNOLOGY SECURITY

Information technology officials across the Federal government today agree that information security will be the next priority IT issue following Year 2000. Every day, the information that USDA agencies manage affects the financial markets and lives of individuals. We must exercise due diligence in its protection. As we achieve greater ease in the dissemination of information, the Department must walk a fine line between information exchange and information protection: this is especially important in an age of instant access and global exchange. As networks expand and connect, security concerns will expand exponentially.

In May 1998, President Clinton signed Presidential Decision Directives (PDD) 62, "Combating Terrorism," and PDD 63, "Protecting America's Critical Infrastructure." These directives lay out a dramatically new approach to protecting the nation against unconventional threats and assign new responsibilities to agencies for protecting their critical infrastructures, especially their cyber-based systems.

To meet these new requirements, we established a USDA Critical Infrastructure Assurance Task Force, consisting of security and telecommunications specialists. The task force is charged with developing a plan to heighten awareness about risks to our information systems and strategies, and cost-effectively and efficiently protect USDA's critical infrastructure.

Plans, policies, and procedures must also be centrally developed and managed to afford the greatest protection to the Department as a whole. Without them, it is reasonable to assume that unauthorized intrusions will continue and probably increase in both frequency and severity. Currently, my office provides Department-wide guidance and training on information security issues. Departmental policies either issued or currently under review focus on software piracy, e-mail security and privacy, and Internet firewall and network incident responses. My office also participates with leading government security organizations to ensure the Department's security policies and practices are up-to-date.

The additional staff year and funding that I have requested are necessary to thoroughly examine our critical infrastructures, identify vulnerabilities, develop strategies to mitigate unacceptable risk, and fully meet requirements of PDD 62 and PDD 63. The staff-year will serve as the Contracting Officer Technical Representative and administer the contracts required for this initiative and related critical infrastructure protection projects which address continuity of government and disaster recovery requirements.

Current USDA spending on information technology security as a percentage of total IT spending is about ten times below the industry average. Thus, coordination by my office is essential to leverage agency and Departmental Administration resources and ensure USDA's Critical Infrastructure Assurance plan is thorough, effective, and economical. For this purpose, I am requesting an increase of $500,000 and 1 staff-year in fiscal year 2000 to support USDA information security initiatives.

YEAR 2000 STRATEGY

Along with security, our highest priority is to ensure that USDA's programs and services are not adversely affected by the Year 2000 problem. The Department continues to maintain a strong management approach to effectively respond to the challenges of Year 2000 remediation and ensure that our systems and operations are Year 2000 compliant. We have expanded our efforts in several areas since I met with you last year. During the past year USDA has:

—Expanded the responsibility and accountability for Year 2000 remediation to all agency senior executives by establishing a critical element in their performance standards.

—Provided Department-wide guidance in several areas of Year 2000 remediation, including testing, independent validation and verification, and business con-

tinuity and contingency planning. This guidance has followed the General Accounting Office approach.

—Continued to enforce a procurement moratorium requiring CIO approval of any IT acquisition over $25,000

—Requested and received $37,789,000 in supplemental emergency appropriations for Year 2000 conversion, for which I thank you and the Committee members. This money is being applied to remediation efforts in the areas of business continuity and contingency planning, testing and validation, equipment and facilities with embedded chips, hardware and software improvements, outreach and technical assistance.

—Completed the development of mission area business continuity and contingency plans. Each mission area has examined their strategic goals and objectives and identified their core business processes to ensure business continuity for all programs and services.

—Conducted independent validation and verification assessments of Year 2000 remediation in several areas, including systems remediation, buildings and facilities, and program management.

—Took a leadership role on the President's Council on Year 2000 Conversion, including membership on most of the Council's working groups which cover various sectors. These include: benefits payments, building operations, education, emergency services, energy (electric power), finance (banking, guarantee agencies & investments), health care, housing, human services, insurance, international trade, science & technology, small business, telecommunications, transportation, and water & wastewater. USDA chairs the Food Supply Working Group where we are leading assessment and outreach to the food supply sector.

—Expanded the usage of an Internet-based reporting system which allows agencies to input system information, including descriptions, milestones, and current status, and information from contingency plans. The information provides USDA with a "real time" status of Year 2000 remediation which assists managers, oversight organizations and the general public who have an interest in the progress of USDA's Year 2000 efforts.

The most recent quarterly report to the Office of Management and Budget was submitted in February 1999. As of March 1, 1999, we are tracking 353 systems, of which 285 (81 percent) are already compliant. We have designated 52 of those mission-critical systems as Departmental Priority systems, which have major impact regarding Americans' health, safety or finances, or have significant economic impact. Of the 266 mission-critical systems being repaired, 260 (98 percent) are now renovated, 245 (92 percent) are now validated and 234 (88 percent) are now compliant. There are 32 mission-critical systems scheduled for repair which have not completed the entire repair process. All are expected to be implemented by March 31, 1999. There are 30 systems remaining to be replaced. All but six mission critical systems are expected to be implemented by March 31, 1999. Once a system has completed the repair or replacement process, the Agency Executive Sponsor must certify the system as Year 2000 compliant, thereby ensuring the system fulfills its program as well as technical requirements.

Even though we have made significant progress, our work is far from done. During the remainder of this year we will continue to work on our non-mission critical systems. We are redoubling our efforts to assure that our facilities, laboratories, and telecommunications equipment are functional. And we will continue to test all of our systems to assure that the Department is fully prepared well before January 1, 2000. Recognizing that not everything is within our immediate control, we will also focus on business continuity requirements and continue to make contingency plans so that all of our programs will be delivered even if some glitches do occur. We are also continuing to work with all of our partners, state and private, to ensure that food stamps, other nutrition programs, loan and other programs will not be adversely affected.

And we will continue our work with the President's Council on Year 2000 Conversion where USDA heads the Food Supply Working Group and has representation on fourteen other working groups. We will continue to work with the food industry to access the Year 2000 state of readiness of the food supply, and provide the American public accurate information so they can make rational, as opposed to irrational, preparations for January 1, 2000.

CONCLUSION

Mr. Chairman and members of the Committee, let me conclude by saying again that I am privileged to serve as the Chief Information Officer at the USDA.

These are exciting and challenging times. As I have indicated, we are making progress toward meeting all of the challenges before us. However, our work is far from done, and in some respect USDA is still at the very beginning of what will clearly be the most far reaching transformation in its history.

USDA, like all of government and the private sector, is faced with a tremendous opportunity to harness new technologies that are forever changing the way we deliver programs and provide services to the American people, improving our efficiency and our effectiveness. As we do this, we must face the emerging cyber-terrorist threat by protecting our critical information infrastructures. To meet these challenges, we must effectively manage the substantial resources which you have entrusted to us on behalf of taxpayers. During the past year, we have moved forward in implementing some important management tools to help us get the job done. With your help, we will continue to move forward.

I look forward to working with you, and I will respond to any questions you have at this time.

OFFICE OF CIVIL RIGHTS

PREPARED STATEMENT OF ROSALIND D. GRAY, DIRECTOR

Mr. Chairman and Members of the Subcommittee, I am pleased to present the fiscal year 2000 budget request for the Office of Civil Rights. I was appointed Director, Office of Civil Rights, on July 13, 1998, and have full responsibility for civil rights at USDA. Last year the Acting Assistant Secretary for Administration presented the budget statement and reported to you on the first year's progress in implementing the Civil Rights Action Team's—CRAT—recommendations for strengthening civil rights and diversity efforts at the Department of Agriculture—USDA. Today I am reporting on additional progress we have made toward moving USDA to a stronger position and record on civil rights enforcement.

TREAT ALL FAIRLY AND EQUITABLY WITH DIGNITY AND RESPECT

The Department's overall civil rights and diversity goal is to treat every customer and every employee fairly and equitably, and with dignity and respect. We have implemented new policies and procedures to achieve that goal. More than two dozen Departmental regulations and directives have been drafted and issued. Training and assistance is being provided to help the agencies assure that all employees understand and practice the new policies, procedures and guidelines. Also, an accountability system has been put in place to help assure that all employees comply with the intent of our new civil rights effort.

ASSURE ALL HAVE FULL ACCESS TO ALL PROGRAMS AND SERVICES

Another major civil rights goal is to assure that all potential customers have access to all USDA programs and services. All USDA employees have been asked to study and comply with the February 25, 1998, "Equal Opportunity Public Notification Policy"—Departmental Regulation 4300–3, the January 14, 1998, policy on "Communicating with Under-served Customers"—DR 4360–1, and the March 16, 1998, "Civil Rights Policy for the Department of Agriculture"—DR 4300–6. These directives delineate USDA policy and assure that all customers have access to USDA programs and services. In addition, the nondiscrimination statement is displayed in all offices and on all publications, making information about programs and services available to all through concerted efforts using alternative formats for those with sight or hearing impairments or for those who need the information in alternative languages. In partnership with community-based organizations and other groups, we use nontraditional communication channels to reach the hard-to-reach, and make all offices and meeting facilities handicap-accessible.

STAFF REFLECT THE DIVERSITY OF THE COMMUNITY

Another major civil rights and diversity goal of the Department is to eliminate under-representation of minorities, women, and people with disabilities in the workforce by recruiting and employing a highly skilled, competent and diverse workforce. The Department will create a workforce that reflects the diversity of the community. Recruiting efforts are expanding to better reach under-represented candidates. Agencies are required to do workforce climate surveys of their employees each year and exit interviews when employees leave the agency in order to surface employees' issues and assess employees' satisfaction with working conditions. Moreover, agencies are required to assess the reason for complaints and to take the corrective ac-

tion necessary to improve conditions that may cause under-represented employees to prematurely leave the agency. Also, we have created a "USDA Training and Development Consortium," that is responsible for providing the leadership for competency-based training of supervisors and managers. Interactive training will enhance "people skills" and is critical for establishing and maintaining a positive work environment that encourages and supports a diverse workforce.

MOST BACKLOG COMPLAINTS RESOLVED

In 1999, the Department entered a consent decree with the Plaintiffs in the class action lawsuit, Pigford vs. Glickman. The consent decree provides for processing African American farmers' discrimination complaints filed between January 1, 1981, and December 31, 1996.

We have resolved most of the old backlog of complaints that dated back as far as the early 1980's. There were 1,088 program discrimination cases in the backlog. The backlog cases are resolved with the exception of 10 cases where complainants did not accept a resolution offer, 8 assisted cases which require further investigation, and the class member cases. The program discrimination cases in the backlog that were part of the consent decree will generally be processed outside the Department. In addition, more than 1,500 of 2,142 cases that were in the backlog of employment discrimination cases are resolved.

In October 1998, we established the Early Case Resolution Taskforce to prevent or reduce the further delay in the resolution of discrimination complaints that were filed with USDA and, subsequently backlogged, and ensured that cases previously closed were done in accordance with CR policies and regulations. Departmental regulations for processing employment and program discrimination complaints have been approved and procedures for implementation are drafted. The new complaints process is designed to resolve program discrimination complaints in a timely manner—generally within 180 days.

OTHER SPECIFIC ACCOMPLISHMENTS

A new Conflict Resolution Center and new conflict management policies and procedures will lead to early resolution of many conflicts and misunderstandings before they become formal complaints. Early intervention, mediation and alternative dispute resolution will be used throughout the Department.

State Outreach Councils in each State to provide leadership and coordinate efforts to assure that all potential customers have full access to all USDA programs and services. These councils are made up of our top USDA agency heads in the State, key State officials such as the State Commissioners of Agriculture, and elected officials of State, local, and tribal governments.

Every USDA employee is required to have training in civil rights and diversity. Training is also offered to many cooperators, committee members, and volunteers. All who interact with our customers must understand our civil rights policies and regulations.

Special management training is provided to our top and mid-level managers and supervisors because many of the discrimination complaints stem from poor management practices such as simply not communicating well enough with customers and employees so that they understand why certain decisions are made.

Some loan application forms have been simplified so that it is less burdensome and time-consuming to apply for a small loan. In addition, the time required to approve some of our loans has been reduced.

For the first time in USDA history, agency managers are being held accountable—at the Department level—for achieving annual civil rights objectives. In fiscal year 1998, the Assistant Secretary for Administration—ASA—and I, as Director of Civil Rights, rated the agency administrators and staff office directors on their civil rights performance.

In fiscal year 1998, USDA focused on the process and procedures whereby agencies would be accountable for civil rights. The agencies were required to provide monthly reports on their progress in fulfilling the CRAT recommendations. The Office of Civil Rights received the data, assessed it, and the ASA and Civil Rights Director provided feedback to the agencies about whether or not they were fulfilling the intent of the CRAT recommendations and fully implementing the new civil rights policies and procedures.

In fiscal year 1999, we are continuing to hold the agency heads and staff office directors accountable for civil rights. However, this year the focus is more on the achievement of end results.

Special attention is being given to holding agencies accountable for taking documented, positive actions resulting in: disciplining managers and employees who dis-

criminate, complying with settlement agreements, improving workforce diversity, and holding all managers and employees—at headquarters and the field level—responsible and accountable for civil rights.

Agencies are expected to produce concrete results from increased attention to civil rights. For example, we expect agencies to report increases in service to small, minority, and women-owned firms, and other under-served farmers, businesses, and organizations. We also expect agencies to show evidence that their efforts to diversify the workforce—at all grade levels and in all occupations—actually resulted in a more diverse workforce.

OFFICE OF CIVIL RIGHTS BUDGET REQUEST

Within the amount requested for Departmental Administration for fiscal year 2000 is a budget request of $14,868,000 for Civil Rights. This is $2,041,000 over the fiscal year 1999 level of funding for Civil Rights. It includes $802,000 to improve employment complaints processing, and to enhance information system management, and $837,000 to prepare for case increases due to cases that are now eligible for processing under the statute of limitations waiver for program civil rights complaints. Mandatory pay cost increases will require $402,000.

CONCLUSION

Mr. Chairman and members of the Subcommittee, we are making good progress toward our goal of treating all customers and employees fairly and equitably with dignity and respect. I appreciate the very strong support this Subcommittee has given us. I welcome any questions that you may have.

OFFICE OF COMMUNICATIONS

PREPARED STATEMENT OF TOM AMONTREE, DIRECTOR OF COMMUNICATIONS

Mr. Chairman and members of the Subcommittee, I am pleased to discuss the fiscal year 2000 request for the Department of Agriculture's Office of Communications—OC.

As Congress defined in 1862 what would become today's U.S. Department of Agriculture, a major goal of that law was to charge the Agriculture Department with the responsibility to acquire and disseminate to the people of the United States information on subjects connected with agriculture. The communication coordination that fully implements that mandate is directed today by the Office of Communications.

The public learns about USDA's programs, functions and initiatives through a centrally coordinated communications effort led by the Office of Communications. Customers and constituency groups, who depend on the Department, are served directly by communication activities that span all of USDA's seven major mission areas. At the same time, the Office of Communications provides leadership and central services that enhance communications with USDA's employees throughout the Nation.

The Office of Communications is adopting new technologies to meet the increased demands for information. Using the Internet's world wide web, radio, television and teleconference facilities, we are able to ensure that the millions of Americans whose lives are affected by USDA's programs receive the latest and most complete information. The Office of Communications' 5-year strategic goal is:

To support the Department in creating a full awareness among the American public about USDA's major initiatives and services. A complete knowledge by the general public—and specific publics, including USDA employees—about USDA initiatives, policies, and programs is essential to effective customer services and efficient program delivery and should result in more citizensespecially those in underserved communities and geographic areasavailing themselves of USDA services and information that will help them in their daily lives.

The Office of Communications will continue to take an active part in policy and program management discussions, coordinating the public communication of USDA initiatives. OC will continue to provide centralized operations for the production, review, and distribution of USDA messages to its customers and the general public, and OC will monitor and evaluate the results of these communications.

The Office of Communications will continue to acquire and instruct staff in using the most effective and efficient communications technology, methods, and standards in carrying out communications plans.

OC intends to improve communications with USDA employees, especially those away from headquarters. OC will help employees understand USDA's general goals and policy priorities, to become more familiar with USDA programs and services, and to understand initiatives, especially cross-cutting ones, and how they relate to each employee's specific job duties.

Our office is working hard to ensure compliance with Government Performance and Results Act. We will work to update USDA regulations and guidelines for communications; conducting regular training sessions for USDA communications staffs about using communication technologies and processes to enhance public service; fostering accountability for communications management performance throughout USDA; and continuing to work to create a more efficient, effective and centralized Office of Communications.

The Office of Communications will provide equal opportunity for employment and promote an atmosphere that values individual differences. OC will continue to provide equal opportunity for contracting goods and services. OC will increase availability of USDA information to underserved communities and geographic areas to ensure equal opportunity in USDA's outreach efforts, and will continue to develop universally accessible information products.

FISCAL YEAR 2000 BUDGET REQUEST

The Office of Communications is requesting a budget of $9,300,000. This is a net increase of $1,162,000 over our fiscal year 1999 appropriation. The net increase would cover additional personnel costs of $303,000 for pay costs, $588,000 for Electronic Access to Information, $70,000 for an Outreach and Education Program for Underserved Groups, and $201,000 to cover increased costs of critical Department-level communications coordination and dissemination. This effort is directly related to OC's accomplishment of its annual performance goal to improve communication efforts with the public and agricultural industry through live satellite teleconferences, radio, and television special programs.

Without the funding for the Electronic Access to Information initiative, the Office of Communications will be seriously handicapped in providing information in the format and with the timeliness required by USDA clientele and the American public. Specialized computer and digital equipment are required to record, edit and prepare messages acceptable to the media and accessible to the public through the Internet. State-of-the-art computers are needed by the streamlined Office of Communications staff to effectively perform its internal communications coordination function, as well as to promptly and fully respond to this surge of interest to acquire audio, video and print information electronically.

As fiscal year 2000 begins, we will be in the final, critical stages of information dissemination that will assure the American public that food security will not be adversely affected by year 2000 issues. The $201,000 request is essential for us to expand the communications efforts that will let an informed public respond appropriately to this potential crisis. Additionally, we require $70,000 for an expanded outreach and education program for underserved groups. The $303,000 request for pay costs comes at the end of 3 years of straight-lined funding and is needed to maintain an already significantly downsized Office of Communications.

Office of Communications' initiatives are modest, but crucial requests that will place the Office of Communications in the best and most responsive position for meeting communications needs of our customers and the American public in the 21st Century.

This concludes my statement, Mr. Chairman. I will be pleased to respond to any questions.

OFFICE OF THE GENERAL COUNSEL

PREPARED STATEMENT OF CHARLES R. RAWLS, GENERAL COUNSEL

INTRODUCTION

Mr. Chairman and members of the Subcommittee, I am pleased to have this opportunity to present our fiscal year 2000 budget request and to also provide you with an overview of our agency to include some of the current activities and issues facing the Department.

MISSION

The Office of the General Counsel (OGC) is the law office for the Department. As an independent, central agency within the Department, OGC provides all legal serv-

ices necessary to support the programs and activities of USDA. OGC provides legal advice and services to the Secretary of Agriculture and other officials of the Department of Agriculture with respect to all USDA programs and activities.

ORGANIZATION

OGC's services are provided through 12 Divisions in Washington and 18 field locations. The headquarters for OGC is located in Washington, D.C. The Office is directed by a General Counsel, a Deputy General Counsel, a Director for Administration and Resource Management, and six Associate General Counsels. The attorneys located in headquarters are generally grouped in relation to the agency or agencies served. Our field structure consists of five regional offices, each headed by a Regional Attorney, and 13 branch offices. The field offices typically provide legal services to USDA officials in regional, State, or local offices.

Currently, we have on-board, 234 attorneys and 113 support staff, including paralegals, in the Washington, D.C. headquarters and field locations. Approximately half of our personnel are located in the field.

CURRENT ACTIVITIES AND ISSUES

During the past year, OGC has supported the activities of the Foreign Agricultural Service (FAS) in the implementation of a number of major initiatives and we anticipate the need for significant continuing involvement in the coming year. Our involvement in these areas will include assisting the Office of the United States Trade Representative (USTR) and FAS officials with enforcement of the commitments received in the Uruguay Round Agreement on Agriculture and providing assistance in pursuit of additional commitments in future negotiations. We also anticipate extensive involvement in foreign assistance activities as FAS carries out implementation of extensive humanitarian aid initiatives.

OGC will continue to play an instrumental role with respect to the formulation and implementation of international trade-related agreements such as the Mutual Recognition Agreement concerning veterinary biologics and the International Plant Protection Convention, as well as having a role in preparation for the World Trade Organization (WTO) Sanitary-Phytosantiary Committee meeting. OGC has been and will continue to be involved in the preparations for the new round of WTO negotiations to strengthen international trading rules and in addressing specific issues such as credit and credit guarantees and expanded free trade in the Americas.

OGC will continue to be actively involved in the development and application of present international trading rules. The United States has recently invoked the WTO dispute settlement procedures in several agricultural matters with significant OGC involvement. For example, we anticipate continued participation in WTO proceedings challenging the European Union's (EU's) export subsidy on processed cheese, Japanese phytosanitary issues and Canadian dairy export subsidies and access for U.S. products, as well as ensuring EU compliance with the WTO decision striking the ban on imports of meat produced with growth-promoting hormones. OGC has also been active in consultations with South Korea regarding access to its market and in connection with issues involving the Israel Free Trade Agreement.

During the past year, OGC has also been involved in the implementation of major initiatives relating to foreign assistance that will continue to demand attention during the coming year. One of the major OGC accomplishments during this past year was the development of the legal framework for the removal of surplus wheat from the domestic market under the authority of the Commodity Credit Corporation (CCC) Charter Act and the subsequent disposal of these commodities by CCC in support of the "President's Food Aid Initiative." Under this initiative, CCC is exporting a large volume of wheat to meet humanitarian food needs overseas under section 416(b) of the Agricultural Act of 1949. Similarly, OGC provided extensive assistance to FAS officials as they concluded an understanding with the Russian government on key elements of a food assistance package totaling 3.1 million tons of agricultural commodities. The package includes a donation of 1.5 million tons of wheat under section 416(b) as well as concessional sale activity under Public Law 83–480 involving a variety of U.S. agricultural commodities. In addition, OGC reviewed numerous documents relating to the donation of another 100,000 tons of various commodities to private relief organizations conducting operations in Russia.

OGC continues to be actively involved in other FAS and CCC foreign program areas, including export credit, supplier credit, and facilities guarantee programs. We anticipate that there will be significant increases in requests for OGC assistance in fiscal year 2000 due to the upcoming round of negotiations on agriculture in the WTO and the continued efforts of the Department to increase exports in response to the various financial crises around the world.

Attorneys in OGC have continued to provide assistance in the Production Flexibility Contract Program authorized by the Federal Agriculture Improvement and Reform Act of 1996. The sudden decline this past summer in commodity prices for the major grains and oilseeds resulted in a substantial increase in the need for OGC assistance with respect to numerous issues related to marketing assistance loans and loan deficiency payments. Similarly, OGC attorneys have worked closely with officials of the Department, particularly with personnel of the Farm Service Agency (FSA), to implement the various disaster and marketing loss assistance provisions of the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act, 1999. These new authorities involve more than $5.5 billion in expenditures. Furthermore, OGC worked with FSA and other agencies in crafting a means of providing aid to hog producers who have suffered through disastrously low prices during this past year. This included developing a program to make $50 million in payments available to hog producers using authority provided for in section 32 of the Act of August 24, 1935, which had not been utilized since 1961.

OGC continues to provide FSA with needed assistance in connection with conservation programs such as the Conservation Reserve Program, which is in the midst of another successful sign-up. Additionally, during this year, OGC helped FSA draft and finalize new Conservation Reserve Enhancement Program (CREP) agreements with the States of North Carolina, New York, Oregon, and Washington.

The tobacco program and tobacco-related issues have continued to raise difficult legal issues. After a very successful series of criminal prosecutions involving a widespread problem with tobacco marketings that took place in 1990–1992, FSA, with OGC assistance, has now begun to initiate civil actions to collect monies from warehouses where over-quota tobacco may have been marketed. Also, OGC has provided needed advice on issues arising out of the various proposed "national settlements" for tobacco which have come before the agency. OGC attorneys are assisting the Department of Justice in responding to an appeal filed in the United States Court of Appeals for the Fourth Circuit by tobacco warehouse operators challenging administrative penalties imposed upon them.

With respect to USDA's domestic food assistance programs, OGC has been heavily involved in efforts related to the implementation and enforcement of new legislation aimed at welfare reform and other program improvements, as well as the ongoing program integrity and compliance initiatives. We expect the demand for legal services in connection with these activities to remain constant in fiscal years 1999 and 2000.

More specifically, during this past year, OGC attorneys worked closely with the Food and Nutrition Service (FNS) to develop the Administration's proposals for and/or implement the provisions of: the Agricultural Research, Extension, and Education Reform Act of 1998 (AREERA), Public Law 105–185; the William F. Goodling Child Nutrition Reauthorization Act of 1998 (Goodling Act), Public Law 105–336; the Balanced Budget Act of 1997, Public Law 105–33; and the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, Division C of Public Law 104–208. In particular, OGC is providing assistance in connection with the implementation of the food stamp administrative payment reduction provisions of AREERA and the changes to the Child Nutrition programs brought about by the Goodling Act, such as new services for at-risk school children and others up to 19 years of age and revisions to eligibility and reimbursement provisions of the Child and Adult Care Food Program. Challenges have been raised by potential food stamp participants concerning the implementation by some States of certain welfare reform provisions initiated by the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA), Public Law 104–193. These issues concern State food stamp policies with respect to applicant awareness and access to the Food Stamp Program. It is expected that similar "welfare-to-work" issues may be raised as States continue to reform their welfare policies.

The implementation of the alien provisions of the PRWORA continues to generate litigation in several States. OGC is representing USDA's interests in ongoing interagency discussions aimed at providing a uniform and predictable test for determining when the receipt of benefits renders an alien deportable, inadmissable or ineligible for adjustment of alien status as a result of being likely to become a public charge.

In addition, OGC coordinated USDA's legal work in connection with the first suspension action taken against a dairy operation determined by State weights and measures inspectors to have provided under-filled (shortweighted) half pints of milk to schools participating in the National School Lunch Program. The 8 shortweighting results, in some cases, half pint cartons lacked as much as half an ounce of milk, prompted a closely orchestrated effort by State weights and measures offi-

cials, State procurement officials, USDA agency personnel and OGC attorneys to institute corrective and prospective action by the dairy operation.

OGC continued to address numerous issues arising from the nationwide rollout of electronic benefit transfer (EBT) in the Food Stamp Program and demonstrations of the use of EBT in other food assistance programs. Electronic delivery of benefits has shown significant results in terms of reduced costs and improved program integrity, as well as other improvements. For these reasons, the use of EBT systems are a top priority of the Food Stamp Program.

We have provided substantial support to the Department's food safety activities. Last year as you know, the HACCP rule was implemented in the nation's largest meat and poultry plants. In January of this year, HACCP became operational in over 2800 additional plants nationwide. We have worked very hard with the Food Safety and Inspection Service (FSIS) over the last year to ensure successful implementation of these pathogen reduction and HACCP system requirements. We provided daily support to FSIS not only for implementation of HACCP inspection procedures but also on an array of rulemaking initiatives to improve and streamline the food safety and inspection system regulations. These regulatory initiatives have included a proposal to permit the use of ionizing radiation to treat refrigerated and frozen uncooked meat food products to reduce levels of food-borne pathogens in these products; the finalization of rules that would eliminate highly prescriptive sanitation regulations and replace them with performance standards giving plants flexibility to innovate and better ensure good sanitation practices tailored to each establishment; and a proposed rule governing retained water in poultry that would eliminate unnecessary differences between meat and poultry processing requirements.

We also provided legal support for enforcement actions under the meat and poultry inspection laws. We have handled an array of criminal, civil and administrative cases involving violations of those laws and as well as actions for the withdrawal and suspension of inspection services, or termination of the custom exemption, from meat and poultry establishments where compliance was lacking. OGC assisted the Department of Justice (DOJ) in appellate litigation which challenged the Department's application of meat and poultry inspection laws to retail stores that seek to distribute meat and poultry products to kiosks located in shopping malls. We are currently working with DOJ in a lawsuit filed in the U.S. District Court for the District of Columbia by the American Federation of Government Employees, the Community Nutrition Institute and eight FSIS food inspectors, challenging the validity of the Pathogen Reduction/HACCP regulations and FSIS' decision to test new inspection models that we believe will lead to more effective inspection and better use of scarce inspection resources.

In the past year, OGC has provided extensive legal services to the Agricultural Marketing Service (AMS) in various matters and will continue to work closely with AMS on some of these matters as well as new issues that will arise in the year ahead. OGC continues to provide assistance in the reform and consolidation of federal dairy marketing orders. A proposed rule was issued on January 21, 1998, after extensive review and revision by our office. AMS is currently evaluating and considering thousands of comments submitted in response to the proposal. The Department is required by Congress to issue a final decision between February and April 1999, and to implement the final rule on October 1, 1999.

The organic standards rulemaking will continue to be an OGC priority during the coming year. On December 16, 1997, a proposed rule was published that would establish a National Organic Program under the Organic Foods Production Act of 1990. The proposal generated over 275,000 comments. These comments ranged from simple opposition to all or portions of the proposal to more complex and substantive comments, raising a variety of policy and legal issues concerning the proposal and issuance of a final rule. Currently, we are working with the organic program staff on drafting a revised proposed rule that will address concerns raised by the comments.

The Commodity Promotion, Research, and Information Act of 1996 provides general authority for the Secretary to issue orders establishing new research and promotion programs. Prior to enactment of this statute, research and promotion programs were authorized under individual statutory authorities. The 1996 Act provides authority to tailor a program according to the individual needs of an industry. On November 6, 1998, a proposed rule was published in the Federal Register that would provide for an industry funded promotion, research and information program for peanuts, and representatives of the olive oil, dry bean, seafood, asparagus, forestry products, macadamia nuts and sweet corn industries have expressed interest in establishing programs. We will continue to work with AMS as these new research and promotion programs develop.

In 1998, the Supreme Court denied the motion for reconsideration in *Glickman* v. *Wileman,* thus ending the First Amendment constitutional challenge to the tree fruit advertising program. On the basis of the decision in *Wileman,* the United States Court of Appeals for the Ninth Circuit dismissed *Cal-Almond* v. *United States Department of Agriculture* and the Supreme Court subsequently declined to review that dismissal. The challenge to the almond advertising program, and the argument that it is significantly different that the tree fruit program since it allows credit for a handler's branded advertising, also has been rejected. The Supreme Court's rulings in *Wileman* and *Cal-Almond* raised several dormant legal matters. Almost $7,000,000 of assessments held in a trust fund were turned over to the tree fruit administrative committee. An audit was conducted and it was found that approximately $11,000 was still owed by various handlers. The Department is in the process of obtaining a judgment for the remainder and seeking collection. Motions will also be heard in early 1999 to collect the remaining unpaid assessments under the almond marketing order. The handlers are resisting collection with various technical arguments and a significant amount of the funds are held by the *Saulsbury Almond* bankruptcy trustee. Finally, there are on-going challenges to several other advertising and promotion programs which claim to be distinguishable from *Wileman* because these programs were created by free-standing legislation and not by marketing orders. So far the Tenth Circuit Court of Appeals and District Courts in California, Michigan, and Tennessee have rejected these challenges. Despite a complete lack of success by the handlers, it is expected that the challenges will drag-on as appeals are pursued.

We work very closely with Animal and Plant Health Inspection Service (APHIS) in connection with its regulatory activities related to the development of regulations that will allow new commodities to enter U.S. markets while ensuring that America's agricultural resources are not impaired and that plant and animal health in the U.S. are not compromised. These regulations have included requirements for an array of commodities, ranging from fruits and vegetables, to animals and animal products. They include the importation of pork from Yucatan and Sonora, Mexico, importation of ruminants and ruminant products from South Africa, and the importation requirements for animal and animal products from the European Union.

We dedicated significant resources to defending a lawsuit brought by several environmental groups for alleged violations of the National Environmental Policy Act in connection with APHIS regulations governing the importation of logs, lumber, and unmanufactured wood products. In the early phase of the lawsuit, the plaintiffs obtained an injunction that prevented APHIS from issuing permits for the importation of certain wood products until a supplemental environmental impact statement (SEIS) was prepared. Our attorneys assisted APHIS in preparing an exceptionally comprehensive SEIS and ensuring that it was responsive to the Court's order. The SEIS was issued by APHIS in May of 1998. I am pleased to report that the district court accepted and approved the SEIS findings, dissolved the injunction, and dismissed the case.

APHIS' work on the SEIS led to the identification of additional import issues involving wood and wood products that needed to be addressed because of their significant pest risk potential. Principal among these issues was the pest risk posed by solid wood packing material. We assisted in the preparation of an interim rule, promulgated on September 18, 1998, prohibiting solid wood packing materials (SWPM) from China, and with an advance notice of proposed rulemaking published in the Federal Register in January of 1999 dealing with SWPM from all countries.

We also handled a variety of administrative and federal court cases on behalf of APHIS to enforce its regulations. These cases have included prosecutions for violations of the standards for accredited veterinarians, the illegal importation of fruits and vegetables through Canada, and violations of regulations governing the importation of Haas avocados from Mexico into the United States.

We assisted APHIS with the development of a new international agreement permitting the construction of a sterile screwworm production facility in Panama that will help ensure the continued success of the screwworm eradication program.

OGC continues to provide significant legal services to the Animal and Plant Health Inspection Service (APHIS). In 1995 and 1996 APHIS conducted a negotiated rulemaking involving the complete revision of the regulations governing the humane handling, care, treatment, and transportation of marine mammals held in captivity. OGC provided substantial legal services to APHIS throughout the negotiated rulemaking process, and recently, provided substantial drafting and review services to APHIS in preparation for the publication of the proposed rule. Because all of the stakeholders participated in the formulation of the proposed rule, we do not expect that this rulemaking will be as controversial as other animal welfare rulemakings.

We do expect, however, that this rulemaking will require the need for continued legal services in fiscal year 1999.

In 1995 APHIS also published a proposed rule to develop new regulations for marine mammals used in human-dolphin interactive programs. This program is popularly known as Swim-with-the-Dolphin or SWTD. The final rule became effective on October 5, 1998. OGC has provided substantial legal services to APHIS throughout this rulemaking. OGC continues to provide substantial legal assistance to APHIS because of subsequent concerns raised by the marine mammal public display industry regarding the scope of the final rule. APHIS will be publishing in the near future a notice seeking comment from the industry on all aspects of the rule. We anticipate that this process will be very contentious because of the number of interest groups involved, and we expect that APHIS will have to engage in further rulemaking, which will require the need for continued legal services.

In the Trade Practices area, we are continuing to give assistance and counsel to the Secretary on issues of concentration in agriculture and the continuing response of the Department to recommendations of the Advisory Committee on Agricultural Concentration. We prosecuted the nation's largest packer administratively on allegations that the packer gave an undue or unreasonable preference to certain feedlots in the procurement of cattle. The Department's Judicial Officer dismissed the majority of the case, but found one provision of the procurement agreement to be in violation of the Packers and Stockyards Act and issued a cease and desist order. That decision is now before the U.S. Court of Appeals for the 8th Circuit for decision. We are working with agency personnel on a number of investigations into procurement, pricing and competition in areas of production where there are high levels of concentration. We are continuing to prosecute cases involving financial or payment violations and we provide legal services in a number of investigations and enforcement actions involving allegations of false or misleading statements or representations or commercial bribery in the marketing of agricultural products.

OGC also provides legal services to agencies which manage some of America's largest lending portfolios. The ongoing implementation of the Centralized Processing Center (CSC) for Single Family Rural Housing loans continues to require substantial legal resources. OGC continues to be heavily involved in debt collection and foreclosure work with many cases going back to the emergency loan programs of the 1970's and 1980's. Implementation of the Debt Collection Improvement Act of 1996 and the flexibility gradually being made available under the Rural Community Advancement Program of the 1996 Act also requires substantial legal resources. OGC also is providing legal advice concerning the designation of five additional empowerment zones authorized by the Taxpayer Relief Act of 1997 and 20 additional rural enterprise communities authorized by the Agriculture, Rural Development, Food and Drug Administration and Related Agencies Appropriations Act of 1999.

The Secretary is committed to regulatory reform. We continue to work with Department officials to implement the President's regulatory reform package. This is a significant undertaking as we work with agencies throughout USDA to reduce regulatory burdens, eliminate obsolete or unnecessary regulatory requirements, and streamline regulations, particularly in the areas of rural, farm and utility lending. This year we look for a substantial push in this area from the Rural Utilities Service (RUS), Farm Service Agency (FSA), Rural Business-Cooperative Service (RBS), and Rural Housing Service (RHS).

OGC provided considerable assistance to RUS on a range of matters related to the changing electric and telecommunications industries. In particular, the introduction of competition in the electric industry has resulted in increased demand for legal services by RUS on a number of key electric program matters. For example, OGC has provided legal services in connection with the restructuring of borrowers' power supply arrangements through mergers, alliances, and other types of reorganizations and through the renegotiation of borrowers' power supply contracts. OGC has also dedicated substantial resources to the negotiation and drafting of new security arrangements for some large power supply borrowers. These arrangements, patterned after indentures used in the private sector, will provide borrowers with more flexibility in operating in the new competitive environment while facilitating access to private market financing.

As a result of the Telecommunications Act of 1996, which introduced deregulation and competition to the telecommunications industry, the RUS telecommunications program is facing a wide range of issues and concerns requiring legal services. These include issues of loan purposes, loan security and borrower structure as well as the impact of FCC orders implementing the Telecommunications Act on RUS borrowers and program interests. RUS for the first time made distance learning and telemedicine (DLT) loans in addition to its DLT grants. Legal assistance is required both in the promulgation of new regulations implementing the DLT program and

in developing the documents for these loans and grants. One should not underestimate the legal resources which will be required by the movement to deregulate in the rural electric and telecommunications area.

In the natural resources area, we have been involved in a number of extremely significant undertakings concerning national forest management and natural resources conservation programs. We also assisted our clients, the Forest Service and the Natural Resources Conservation Service, daily in legally advancing their program goals.

We have provided assistance nationally to the Natural Resources Conservation Service in implementing a number of conservation programs, including the Environmental Quality Improvement Program (EQIP), the Wildlife Habitat Incentive Program, the Wetlands Reserve Program (WRP), the Farmland Protection Program, the Conservation Farm Option and Emergency Watershed Protection Program. In addition, we have provided legal services in support of the Clean Water Action Plan, including the EPA/USDA Joint Strategy for Animal Feeding Operations and the Watershed Approach for Management of Federal Lands.

Management of our National Forests is a subject of intense debate and litigation, with a great deal of legal work generated by the impact of new scientific information on ongoing Forest Service projects and commitments. Legal questions include interpretation of the nature of forest planning in light of the recent Supreme Court ruling (*Ohio Forestry Association* v. *Sierra Club*), the relationship of the Endangered Species Act to the forest planning process, and revisions and appeals of the second generation of forest plans. OGC provided assistance to the Department of Justice regarding the scope of the government's obligations under the Endangered Species Act. The U.S. Court of Appeals for the 5th Circuit held that federal agencies are required by the Act to implement programs to conserve endangered and threatened species and to consult with the Fish and Wildlife Service as to individual species.

Further, we are defending against numerous timber sale claims arising from contract modifications and suspensions to protect the habitat of endangered species and assisting the Forest Service with new timber sale contracting authority commonly referred to as stewardship contracting. We also successfully defended challenges in several places in the West by local governments and individuals under the so called "County Supremacy" movement disputing federal ownership or jurisdiction over public lands. We are currently involved in appeal of a district court decision involving a land claim of the Pueblo of Sandia to thousands of acres of the Cibolla National Forest north of Albuquerque, New Mexico.

We have also devoted substantial resources to other legislative and regulatory initiatives, such as land exchanges, relicensing of hydro electric projects, grazing reform, reauthorization of the Endangered Species Act, the Safe Drinking Water Act and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). Litigation which raises a question regarding application of a statute of limitations to CERCLA natural resource damages claims by federal trustees is pending before the Court of Appeals for the 9th Circuit. OGC also provided the Forest Service with support in the administration of the National Forest lands as they are affected by the complex statutes related to mineral exploration.

In addition, we regularly provide advice on compliance and litigation arising under the pollution control laws. Most frequently, pollution control issues involve abandoned and inactive mines and landfills on federal lands, the use and storage of agricultural chemicals, and management of hazardous waste at agricultural research facilities. We have worked with other federal resource management agencies on implementation of executive authority under CERCLA to address cleanup of hazardous substances affecting federal resources.

As the Administration and the Congress continue their efforts to re-invent the Federal government, and as the Department takes its own initiatives to make its delivery of services more efficient, streamlined, and customer friendly, we anticipate greater demands on the General Law Division. These range from providing legal services regarding personnel and labor matters; increased legal services in relation to the Freedom of Information Act and the Privacy Act; debt collection initiatives; Year 2000 compliance; and legal support for creative approaches of doing more with less through mechanisms such as partnering.

Among its many responsibilities, the General Law Division provides legal services to the National Appeals Division (NAD). Agency implementation of new administrative offset procedures pursuant to the Debt Collection Improvement Act of 1996 continue to resonate in numerous appeals to NAD, resulting in legal questions regarding the intersection of the offset process and the NAD appeal process.

As NAD determinations begin to be challenged in the district and appellate courts, novel issues have begun to arise regarding exhaustion of administrative rem-

edies, district versus claims court jurisdiction, implementation of NAD determinations, and discovery.

With regard to the procurement of property and services, the Clinger-Cohen Act of 1996 set in motion many changes still in evolution regarding the acquisition, use, and disposal of information technology by the Federal Government. In particular, the General Law Division will continue to devote substantial resources to assist the Chief Information Officer created by the Act in fulfilling her duties both under the Act, and under separate Secretarial mandates, to improve information technology management in the Department.

Also, with regard to procurement, since the 1996 revision of the General Accounting Office protest rules, which in effect requires agency legal representation, the General Law Division has provided an enhanced level of legal representation of USDA agencies in such matters.

As its name implies, the Agricultural Research, Extension, and Education Reform Act of 1998 contained numerous provisions regarding priority-setting, public input, and greater accountability in research, education, and extension programs, both within the Department and among our land-grant partners. Those reform provisions with the greatest impact become effective on October 1, 1999. Considerable resources will be expended in fiscal year 1999 and fiscal year 2000 to ensure that this deadline is met and to ensure a smooth transition to the applicable requirements to research, extension, and education grant funds awarded in fiscal year 2000.

Over the past few years the Department has taken measures to improve the operations of its agencies and improve how its agencies service their customers. In February 1999, USDA took another significant step in that direction by converging the administrative support functions of the Rural Development mission area, the Farm Service Agency, and the Natural Resources Conservation Service into a single entity, the Support Services Bureau ("SSB"). The General Law Division provided legal advice with respect to the formulation of the SSB. It is anticipated that as the SSB is implemented, significant attorney resources will be required to address numerous legal issues involving labor law, personnel law, administrative law, fiscal law, and leasing of office space.

Besides the labor law issues that will be attendant to restructuring and downsizing, changes have occurred in the OGC itself that will require the attorney resources of the General Law Division in the coming year. Last year the American Federation of Government Employees was elected as the exclusive representative under the Federal Service Labor Management Relations Statute ("FSLMR") of both professional and non-professional employees of OGC in field locations. During this process, General Law Division attorneys advised OGC managers regarding issues under the FSLMR. It is anticipated that General Law Division assistance will continue to be required in implementing management responsibilities under the FSLMR and negotiating collective bargaining agreements with the new units.

We continue to provide legislative drafting and related assistance to the Department and Congress on major legislative activities that involve the Department. Extensive assistance was provided to Department policy officials and Congressional staffs in drafting and analyzing various legislative proposals recently considered by Congress, including proposals in connection with the Goodling; AREERA; the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act, 1999 (Pub. L. No. 105–277); and the Plant Protection Act (HR 3766). We are preparing legislation to improve the Department's conservation and trade assistance programs. In addition, we are participating in the preparation of legislation in a number of areas in support of the President's fiscal year 2000 budget request for the Department.

Over the past two years the Department has engaged in massive efforts to reform its civil rights performance. The Secretary wants to ensure that all of our customers and employees are treated with dignity and respect and are afforded equal employment opportunity and equal access to all USDA programs. Critical to the achievement of these goals was the creation of the Civil Rights Division (CRD) within OGC, staffed with attorneys who have specialized expertise in civil rights law, and are charged with providing legal services to the Secretary and all agencies of the Department on civil rights legal issues.

The CRD played a very critical role in the settlement of the *Pigford* and *Brewington* litigation. Both cases are class actions filed by African American farmers who have filed administrative complaints of discrimination with USDA since 1981 alleging race discrimination in Farm Service Agency programs. The consent decree received preliminary approval on January 5, 1999. A fairness hearing on the settlement was held on March 2, 1999. When the consent decree is given final approval by the court, it will provide a framework for the adjudication of claims of African American farmers who believe they suffered discrimination by the Department

in connection with USDA credit and benefit programs during the period January 1, 1981 through December 31, 1996. The settlement will help the Department open a more constructive front in its efforts to be the Federal civil rights leader in the 21st century.

Key to settlement of the *Pigford* and *Brewington* cases was the enactment last year the waiver of various statutes of limitations, that allows farmers with long-standing discrimination complaints to have their claims finally heard. Section 741 of the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act, 1999, enacted in section 101(a), Division A, of the Omnibus Consolidated and Emergency Supplemental Appropriations Act, 1999, Pub. L. No. 105–277. The Associate General Counsel for Civil Rights and the Assistant General Counsel for Legislation worked with Departmental officials, members and staffs of the House and Senate, DOJ officials, and White House officials to bring about enactment of the statute of limitations waiver language in the budget bill. CRD also worked some with GLD and the Associate General Counsel for Legislation, Litigation, and General Law in drafting regulations to implement the new law. 63 Fed. Reg. 67392 et seq. (Dec. 4, 1998) (codified at 7 C.F.R. Part 15f). The success of this work shows the potential when the different divisions work in cooperation. cooperation.

Settlement of the *Pigford* and *Brewington* and any case in which a farmer alleges discrimination can only include damages if the claim alleges credit discrimination and the Department or the courts find that discrimination occurred in our credit programs. The limitation on the Department's ability to award damages in conducted discrimination cases was made clear by the 1994 Opinion of the Office of Legal Counsel (OLC), Department of Justice entitled Authority of USDA to Award Monetary Relief For Discrimination. In its opinion, OLC ruled that, in cases of alleged discrimination in a USDA conducted program, such as FSA farm loan programs, the Secretary has authority to award monetary relief, attorneys' fees, and costs if a court could award such relief in an action by the aggrieved person. However, after examining Title VI of the Civil Rights Act of 1964, the Fair Housing Act, the Rehabilitation Act, and the Equal Credit Opportunity Act (ECOA), OLC concluded that only ECOA waives sovereign immunity with respect to monetary relief, authorizing imposition of compensatory damages by the Department. In light of this opinion, OGC issued memoranda to the Office of Civil Rights that made clear that CR can settle farmer discrimination case for monetary damages only if the case involves credit discrimination and only to the extent a court could award damages given the facts of the case.

With respect to the *Pigford* and *Brewington* settlement, CRD will take the leading role to ensure that USDA meets its commitments under the consent decree, particularly with respect to the production of relevant documents and necessary legal analysis related to each claim filed pursuant to the consent decree. CRD is working with the FSA, the Office of Civil Rights (CR), and the DOJ to develop rapid responses to claims and to help ensure that the Government's responses are timely and appropriate.

With respect to farmer discrimination claims not covered by the *Pigford* and *Brewington* settlement, CRD will work with CR to ensure that all claims, including those filed pursuant to the statute of limitations waiver, receive expeditious and fair consideration, within the bounds set by applicable law.

The number of employment discrimination cases filed against the Department has increased dramatically. CRD and OGC field offices are defending the Department in administrative litigation before the Equal Employment Opportunity Commission (EEOC) and are working with DOJ to ensure the best possible defense in court.

In *Donnelly* v. *Glickman,* C–95–4389 DLJ, a class action filed in Federal district court on behalf of female employees of the Region 5 (California) of the Forest Service, a negotiated settlement is near. In a related matter, the Government is negotiating with the Forest Service Region 5 Regional Hispanic Working Group to negotiate settlement of issues similar to those raised in *Donnelly* before litigation is filed. In both negotiations, CRD attorneys are working with the OGC Regional Attorney, DOJ, and Departmental officials in Washington, chiefly in developing settlement proposals for the negotiations and participating in the negotiations. CRD is performing the Department's goals of addressing legitimate concerns of the plaintiffs and addressing systemic issues that will hopefully prevent future litigation.

Similarly, in *Herron* v. *Glickman,* EEOC No. 100–98–7120X, a class action pending before EEOC in Washington, filed on behalf of African American employees of FSA, alleging that African American employees at the GS 12, 13, and 14 levels were being prevented from obtaining promotions to the GS 13, 14, and 15 levels respectively, CRD has completed several months of discovery and is now discussing litigation and settlement options with the FSA Administrator and the Under Secretary.

To address other employment issues, CRD will intensify its efforts to provide training and technical assistance to OGC field attorneys and to Department officials, civil rights directors, and employee relations specialists. The goal is to identify and address issues before they become litigation. Where issues are identified, CRD will bring the issues to the attention of appropriate Department officials, with legal analysis and recommendations for addressing the issues.

Drafting and reviewing nondiscrimination regulations is part of CRD's mission. In 1998, CRD drafted a proposed published regulation governing nondiscrimination in programs and activities conducted by USDA which will delete 7 C.F.R. Part 15, Subpart B, which deals with programs and activities receiving Federal financial assistance from USDA—and create a new 7 C.F.R. Part 15d that will deal exclusively with conducted programs. CRD is in the process of finalizing the regulation for publication. The new 7 C.F.R. Part 15d would clarify that the regulation applies to all USDA conducted programs and activities; add familial status, marital status and sexual orientation to the protected classes contained in the regulation; add a provision concerning USDA agencies' compliance efforts; add public assistance status as a prohibited basis under authority in the Equal Credit Opportunity Act (ECOA); add a prohibition against reprisal; and reflect Secretary's Memorandum 1010–4 (May 16, 1997), which further delegated to the CR Director the authority to make final determinations on complaints and order corrective actions. The regulation has been published, the comment period has ended and the final regulation will be published soon.

In 1998, CRD worked with CR on a number of nondiscrimination Departmental Regulations (DRs) to further the effort to reform the Department's civil rights enforcement program: DR 1614, Processing EEO Complaints of Discrimination; DR 4330–2, Nondiscrimination in USDA Conducted Programs and Activities; and DR 4330–1, Nondiscrimination in Programs and Activities Receiving Federal Financial Assistance from USDA. The Departmental regulations are near completion.

CRD is assisting more and more agencies in developing proposed regulations that would require recipients of Federal financial assistance to collect certain participation data on "protected classes," such as race, color, religion, national origin, sex, age, and disability. This work is critical to ensuring compliance with Title VI of the Civil Rights Act of 1964 and other statutes that prohibit recipients of Federal financial assistance from discriminating with respect to the programs for which they are receiving Federal financial assistance.

CRD drafted a Secretary's Memoranda and Secretary's Decision Memorandum creating a uniform policy on adverse actions against individuals who have filed complaints of discrimination against USDA. These documents are near completion and will begin the clearance process shortly.

CRD will continue to write memoranda giving advice and legal opinions on a number of civil rights topics. A current project relates to the Department's authority to provide compensatory damages in discrimination cases arising in Federally conducted programs.

CRD's most important work is in assisting agencies and administrators in complying with the letter and spirit of civil rights laws, thereby avoiding unnecessary litigation, in providing training and ongoing advice and other legal service. Training, however, is just one component. The development of ongoing working and collaborative relationships between CRD and agency officials is critical and will be a great part of CRD's work this year.

FISCAL YEAR 2000 BUDGET REQUEST

For fiscal year 2000, OGC is requesting $32,675,000 in direct appropriations. This request represents a significant increase of $3,481,000 over the fiscal year 1999 appropriation. The requested increase is needed to support and maintain current staffing levels to meet the current and projected increased demand in delivering predecisional legal advice, training, appeal and litigation legal services to agencies. The majority of the increase consists of $1,159,000 for pay costs, which OGC does not have any flexibility for absorbing and $1,621,000 to maintain current staff and provide enhanced legal services in specific areas where staffing is insufficient to adequately meet demands for legal services generated by the Department. The remaining $701,000 is necessary for the office to meet processing requirements into the year 2000 and beyond. OGC anticipates migrating fully to Windows 98, replacing and or upgrading 15 file servers along with 50 percent of the personal computers. The requirement to upgrade the hardware will be a continuing process as the technology continues to change.

CLOSING

That concludes my statement, Mr. Chairman. We very much appreciate the support this Subcommittee has given us in the past. Thank you.

OFFICE OF INSPECTOR GENERAL

PREPARED STATEMENT OF ROGER C. VIADERO, INSPECTOR GENERAL

INTRODUCTION AND OVERVIEW

Good afternoon, Mr. Chairman and members of the Committee. I am pleased to have this opportunity to visit with you today to discuss the activities of the Office of Inspector General (OIG) and to provide you with information on our audits and investigations of some of the major programs and operations of the U.S. Department of Agriculture (USDA).

Before I begin, I would like to introduce the members of my staff who are here with me today: Jim Ebbitt, Assistant Inspector General for Audit; Greg Seybold, Assistant Inspector General for Investigations; and Del Thornsbury, Director of our Resources Management Division. I want to thank the Committee for its support during the nearly 4½ years since my appointment as Inspector General. We have tried to work closely with you, and I hope that we have been able to address some of your concerns.

OIG's mission is to perform audits and investigations of the Department's more than 300 programs and operations, recommend policies and actions to promote economy and efficiency, and prevent and detect fraud, waste, and mismanagement in these programs and operations. We keep you and the Secretary informed about problems and deficiencies and report criminal violations to the U.S. Attorney General. We have a diverse staff of auditors, criminal investigators, and other personnel in offices throughout the Nation to carry out these activities.

I am proud to say that in fiscal year 1998, we continued to more than pay our own way. In the audit arena, we issued 220 audit reports and obtained management's agreement on 1,122 recommendations. Our audits resulted in questioned costs of over $112 million. Also, as a result of our audit work, management agreed to recover more than $39 million and put another $128 million to better use. Most importantly, implementation of our recommendations by USDA managers will result in more effective operations of USDA programs. Additionally, our investigative staff completed 815 investigations and obtained 777 indictments, 604 convictions, and 2,780 arrests. Investigations also resulted in $81 million in fines, restitutions, other recoveries, and penalties during the year.

We continued to work closely with agency officials during fiscal year 1998 to address key issues and to expand our cooperation with other Federal, State, and local law enforcement and audit agencies to broaden the impact of our work. Working together, our staffs identified program weaknesses and program violators. Capitalizing on the staffs' respective expertise, we created solutions for positive action.

In fiscal year 1999, we are focusing our efforts primarily on food safety and smuggling of uninspected, unapproved food products carrying unwanted pests and diseases into the United States that affect the wholesomeness of the Nation's food supply. We are also focusing our audit efforts on the Department's financial accounting systems; farm credit programs; the Rural Rental Housing Program; the Food Stamp Program, including its Electronic Benefits Transfer efforts; and the Child and Adult Care Food Program. In addition to investigations and emergency responses to threats to the health and safety of food, our investigative priorities include investigations of sponsors abusing the child and adult care programs; employee integrity issues; and fraud in the Department's loan, regulatory, and benefit programs. Before I discuss some of our specific audit and investigative activities, I would like to update the Committee on the status of our forfeiture authority.

I am pleased to report to you that on the forfeiture front, with this Committee's strong support, we are now authorized to receive proceeds from forfeiture actions arising from our investigations. Our memorandum of understanding was signed with the Department of Justice in May of last year and, since that time, we have been a fully participating agency in the Justice Department's Asset Forfeiture Fund.

Special Health and Safety Initiative

Mr. Chairman, at this time, I would like to discuss our special law enforcement request for fiscal year 2000. This effort will be a major endeavor for the agency, and we ask your support to provide the resources necessary for it.

The quality or wholesomeness of the Nation's food supply, from production to the consumer, is of special concern to OIG. Investigations of any criminal activity that poses a threat to the general health and safety of the public remain our highest priority. Criminal investigations have usually involved the processing and sale of adulterated meat or poultry and egg products; criminal tampering with food products consumed by the public; and product substitution, adulteration, or other misrepresentation of food products which are regulated or purchased by USDA.

Recent and ongoing investigations involving real or alleged threats to food products intended for the public have necessitated the immediate deployment of OIG special agents and auditors to several U.S. cities. These cases have involved real or threatened adulteration or contamination of meat with everything from E. coli bacteria or Listeria to HIV-infected human blood. Some of these products were destined for or actually ended up in the National School Lunch Program or on military bases.

To address these types of emergencies, we are entering into joint activities with other Federal and State agencies to share intelligence and conduct undercover operations. Doing so will help us stem the threat to the food supply from packing plants and other facilities and target criminal enterprise in general.

The increasing threat to the wholesomeness of domestic and exported food requires not only vigilance but also advanced preparedness including preemptive operations. Profit-motivated criminal activity that threatens the food industry can cause economic disruption while victimizing innocent members of the industry. Likewise, threats of criminal adulteration and biological contamination of food products from outside the food industry for extortion or ideological motives can victimize and disrupt the Nation's food production and distribution systems. These threats must be resolved through a vigilant, established emergency law enforcement and health and safety response.

A threat in a Milwaukee, Wisconsin, meat plant is a prime example of these types of dangers. This past December, the plant received a threat of biological contamination using HIV-infected human blood. We immediately deployed 30 OIG special agents (including eight bilingual agents to converse with Spanish-speaking plant employees) and four auditors to the scene to determine the validity of the threat and to identify those responsible. Personnel from the Food Safety and Inspection Service (FSIS) assisted in this investigation, with FSIS staff taking the lead role in ensuring that potential contaminants had not been introduced into the food chain. Our investigative efforts to resolve this bioterrorism threat continue. Approximately 580 interviews have been conducted to date. I am pleased to be able to report that extensive testing of samples taken from the plant has not indicated the presence of human HIV-infected blood.

In another significant case, an OIG Emergency Response Team was dispatched to a Nebraska meat plant to investigate an outbreak of E. coli bacteria when 15 people in Colorado became ill after eating ground beef patties that came from the plant. Two plant officials have been indicted and await trial for misleading FSIS and OIG during our attempts to determine the source of the E. coli bacteria. Some 25 million pounds of ground beef were recalled due to this contamination, which, at that time, was the largest meat recall ever in the Nation.

Additionally, we are currently investigating a significant case involving another meat company alleged to have intentionally adulterated and misbranded beef and pork products, which have also tested positive for E. coli bacteria. Approximately 4.4 million pounds of this company's meat product containing ground pork or ground beef are under voluntary hold at various school districts, prisons, military institutions, and other facilities. In addition, another 1.6 million pounds of this product are being retained or detained at other facilities.

We have also investigated other cases in which the health and safety of the public were at serious risk. In Buffalo, New York, three feed company employees pled guilty to Federal charges and await sentencing for their role in selling canned meat products to the public which were unfit for human consumption. This product was being shipped from a Canadian company to the feed company to be used as animal food but was diverted by these individuals to be sold for human consumption. In a second case in New York, an FSIS inspector pled guilty in Federal court and was sentenced to 6 months in prison for accepting bribes from the owner of a slaughter facility to permit the slaughter of livestock, including 3-D (dead, diseased, or dying) cows, without the benefit of inspection. In Pennsylvania, the owner of a slaughterhouse pled guilty to conspiracy, while three employees pled guilty to violating the Federal Meat Inspection Act. These individuals were caught slaughtering 3-D cows after the FSIS inspector had left the premises and then commingling the unwholesome product with meat that had been inspected.

We have initiated audits of the new food safety procedures for inspecting meat and poultry plants, the Hazard Analysis Critical Control Point system, or HACCP.

Since an increasing number of processing plants are becoming subject to HACCP, the safety and wholesomeness of the Nation's meat and poultry supply are dependent on HACCP being successfully implemented. Meanwhile, our efforts to actively address the problems of food safety, posed by those who put it at jeopardy and who are motivated by profit or ideology, present special concerns for us. OIG needs to be prepared to immediately respond to these emergency situations. To do so, we must be equipped with the specialized equipment, protective clothing, and supplies necessary to ensure the health and safety of our personnel responding to these crises.

We also need to be mindful of the economic impact of closing a major food processing plant. To our knowledge, the Milwaukee plant I mentioned earlier had violated no laws and had been successfully implementing HACCP inspection procedures. Yet, its production line was successfully halted by outside forces, tons of its product were put on hold, and the facility was temporarily shutdown. OIG's rapid response and deployment of considerable staff resources not only helped to protect the health and safety of consumers, but it also allowed the plant to reopen—reemploying approximately 1,500 people with a minimum disruption of production, lost profit, and impact on the local economy as opposed to an indefinite and costly closure.

The costs of rapid responses by OIG such as this are great. In addition to the personnel time and the disruption to other critical OIG work, to date, we have expended approximately $40,000 in unanticipated travel costs in the Wisconsin investigation alone. This figure will continue to rise until the matter is resolved.

Another form of criminal enterprise that poses a significant threat to the Nation's food supply and its economic well-being is smuggling of uninspected, unapproved food products into the United States. A direct result, and a byproduct of smuggling, is the danger that forms of pestilence—whether insects, fungi, bacteria, or viruses—not previously present in the United States could be introduced here. As a result, entire crops of the U.S. agricultural industry—such as citrus, vegetables, trees and other plants, or beef, poultry, and pork products—could be severely damaged, devastating the economy of the local communities producing these products as well as reducing both the quantity and quality of the Nation's food supply.

The Administration has begun a new initiative to counteract the invasion of unwanted and mostly foreign species of plants and animals. By Executive Order, the President has established an Invasive Species Council, which the Secretary of Agriculture will Co-chair, to ensure a safe and wholesome food supply and prevent the spread of unwanted, invasive pests.

OIG has begun an antismuggling campaign to interdict and suppress foreign contraband that is dangerous when consumed by the American population, and potentially catastrophic to the economic stability of certain U.S. agricultural products. Ongoing criminal investigations are targeting smuggled fruits, vegetables, plants, and other commodities or animals that bring high dollars in underground "black market" commerce. This initiative requires significant agent resources dedicated to intelligence collection, undercover operations, and foreign law enforcement cooperative efforts that cross international boundaries. These activities normally require extensive surveillance utilizing high-tech investigative devices and equipment.

The smuggling of infested fruits into the United States is a serious law enforcement problem because the criminal profit is tremendous while the deterrent is grossly inadequate at present. Longans are a good example. Longans are prized Asian fruits. They cost $1 a pound from distributors in Taiwan and are sold illegally in U.S. markets at $7 to $10 per pound. Often they are contaminated with fruit flies. Although banned in the United States, sealed containerized shipments of longans are routinely, and legally, allowed into U.S. ports for transshipment to Canada. Intelligence efforts have documented that semi-trucks, which can carry 40,000 pounds or more of containerized longans, have transported shipments into Canada, where the fruit is not prohibited, only to turn around and smuggle the shipments back into the United States, thus, allowing for pest infestations in this country.

One well-known example of a devastating pest that has been introduced into this country is the Mediterranean fruit fly, commonly called Medfly. One of the world's most destructive agricultural pests, it attacks more than 250 kinds of fruits, nuts, and vegetables, causing major economic losses. Whole States can be beset with severe crop losses and economic problems caused by this and other such pests. In the past 4 years, Florida has been faced with severe outbreaks of oriental fruit fly, citrus leaf miner, brown citrus aphid, citrus canker, African beetle, leather leaf anthracnose, pine short beetle, and sweet potato fly in addition to the Medfly infestations. Animal pests and disease importation are a severe problem in Florida and, due to the favorable climate in most of the southeastern United States, the pests and diseases could easily spread throughout that area. The costs to protect the in-

dustry are staggering. Since 1980, over $256 million in California State and Federal funds has been spent to eradicate Medfly infestations in quarantined areas. In the last 10 years, Florida has spent more than $150 million to eradicate such infestations.

The risk to the agricultural industry, including exports, is clear. The State of California alone produces over $25 billion in fruits, nuts, and vegetables annually—about 55 percent of the Nation's output. About $11.8 billion of these commodities is exported to other countries each year.

In carrying out successful smuggling investigations, OIG must perform extensive travel; procure and maintain the necessary specialized equipment needed to investigate these incidents; provide essential protective supplies and/or equipment to ensure the health and safety of our agents and auditors; and provide specialized training to our staff to prepare them to cover various types of such emergencies. OIG must also provide state-of-the-art Y2K compliant ADP equipment and systems to track data; analyze intelligence-based information; and provide faster, more responsive information to better support this mission work. All of these items are essential to ensure that OIG can adequately address this critical public health and safety issue concerning the quality and wholesomeness of the Nation's food supply.

Mr. Chairman, at this time, I would like to highlight some of our other audit and investigative activities.

AUDIT AND INVESTIGATIONS ACTIVITIES

MARKETING AND REGULATORY PROGRAMS

ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)

We have investigated various types of criminal acts involving APHIS programs. An investigation in San Francisco, California, provides a good example. In this case, two businessmen pled guilty to causing the delivery of misbranded food for introduction into interstate commerce in this case. A joint investigation conducted by OIG, the U.S. Customs Service, and the U.S. Food and Drug Administration disclosed that the businessmen smuggled bird nests, abalone, fish maw, scallops, and dried oysters from Hong Kong by commingling these products with their legitimate imports of frozen shark fins and other food products. The two businessmen received 3 years' probation and were each ordered to pay a $3,000 fine and restitution of $1,500. A third individual is pending trial on similar charges.

In Oregon, six individuals are awaiting sentencing after they pled guilty on Federal charges of theft for their part in a conspiracy to fraudulently acquire and sell over 100 dogs to medical research facilities. The six defendants have also agreed to testify against a former USDA-licensed dog dealer, her husband, and their son, who have all been indicted for conspiracy and mail fraud related to the scheme. Our investigation disclosed that the dealer and her associates either stole dogs or obtained them under false pretenses over a 15-month period. The dealer then falsified APHIS forms in order to conceal her activities. She also forwarded false documents to the Oregon State Department of Agriculture.

AGRICULTURAL MARKETING SERVICE (AMS)

Oversight of the Fluid Milk Promotion Program Needs Strengthening

Our review of the Fluid Milk Promotion Program indicated that AMS and the National Fluid Milk Promotion Board need to improve their oversight and controls over the program's activities to ensure that assessments on fluid milk are used in accordance with the Fluid Milk Promotion Act. Those assessments, from approximately 370 processors, totaled about $169 million from December 1993 through June 1997.

Neither AMS nor the Board provided adequate management or oversight of program activities. AMS left most oversight efforts to the Board. The Board delegated most administrative functions to two contractors and was not actively involved in the day-to-day operations of the program. One contractor, the Milk Industry Foundation, was responsible for performing various management and administrative services. The other contractor, the Board's Administrator, was responsible for collecting assessments, accounting for funds, and performing compliance reviews. These services were provided through contracts with the Administrator's public accounting firm. Altogether, the Board's Administrator, either as an individual or through his firm, had three sole-source contracts with the Board.

Although AMS was responsible for reviewing and approving all contracts, the Board paid over $127 million for contracts, representing 75 percent of the funds collected through the program, without AMS' approval. The Board entered into these

sole-source contracts without any competition to ensure the most cost-effective procurement of services.

The Act requires that the Board obtain title to all assets developed using program funds. In one case, the contract to procure photographs, taken as part of a major milk-marketing campaign, the popular "Milk Mustache" or "Got Milk" advertising campaign, did not include language to secure title to the photographs. Consequently, the program expended almost $130,000 in royalties for the continued use of the photographs. The photographer still has control and possession of the photographs, which were developed using over $2.7 million in program funds.

Overall, neither AMS nor the Board has determined, as required by the Act, whether the program has resulted in increased milk consumption. While this marketing campaign has been highly visible in the marketplace, no independent studies have been performed to determine the campaign's impact on fluid milk consumption.

We recommended that AMS: (1) suspend Board program activities until a plan is developed whereby the Board will take full control of its activities and comply with the Act, including establishing guidelines for awarding contracts to ensure that contracted goods and services are obtained in the most cost-effective manner; (2) require the Board to determine the effectiveness of its research and promotion activities to increase fluid milk consumption; (3) require the Board to obtain AMS approval on all contracts before any funds are obligated or expended and that the Board obtain title and possession of all assets acquired with program funds; and (4) require the Board to assure that audits of its books and records are conducted using generally accepted Government auditing standards. AMS did not agree to suspend the Board's activities. However, it has agreed to institute improvements and is continuing to work with the Fluid Milk Board to strengthen management controls.

FOOD, NUTRITION, AND CONSUMER SERVICES

FOOD AND NUTRITION SERVICE (FNS)

Operation Talon

In previous testimony, I informed you we had initiated "Operation Talon." This special law enforcement initiative, made possible by the passage of Welfare Reform, involves the exchange of information between law enforcement and State social services agencies. Specifically, law enforcement fugitive records are matched with social service agencies' food stamp recipient records, and the information is used by law enforcement officers to locate and apprehend dangerous and violent fugitive felons who may also be illegally receiving food stamp benefits.

Overall, Operation Talon has been the most successful investigative initiative we have yet undertaken. To date, this initiative has resulted in the arrest of over 3,650 fugitive felons. This has included 26 wanted for murder or attempted murder; 11 for rape or attempted rape; 8 for kidnapping; and 1,202 for assault, robbery, or drug offenses. This has also resulted in the arrest of 18 fugitive felons wanted for child molestation. A number of States are removing arrested fugitives from their food stamp rolls, which will result in savings to the Food Stamp Program and allow food stamp benefits to continue to go to the needy for whom they were intended. One particularly rewarding note is that 2 of the 18 fugitives wanted for child molestation have also been charged with violating State "Megan's Law" statutes. In one of these cases, OIG and the Hudson County, New Jersey, Sheriff's Department arrested a convicted child molester for failing to register as a sex offender. The fugitive had moved without notifying appropriate State officials and eluded the authorities until he provided his new address to participate in the Food Stamp Program.

One recent Operation Talon success was in Austin, Texas, where our special agents worked with Texas law enforcement officials in apprehending over 75 fugitive felons. We have additional warrants and anticipate the arrest of numerous other fugitive felons in this highly successful operation. Operation Talon is an ongoing initiative, and, working with local law enforcement agencies, we are planning future arrest operations in many parts of the country.

Food Stamp Program (FSP)—Coupon Trafficking

We are continuing to devote significant investigative resources to combat fraud in the Food Stamp Program. Ever since the program began distributing food stamps to needy Americans, unscrupulous people have been willing to devise methods to unlawfully benefit from this important program. There are basically two types of traffickers—the street traffickers who buy or barter food stamps or EBT card benefits for cash or other nonfood items, and the retailers who purchase or redeem unlawfully obtained food stamps or cards from eligible recipients.

We have conducted several significant food stamp trafficking cases in the last year. Investigations conducted of large-scale fraud operations in New York, Philadel-

phia, and Detroit are good examples of these. In these investigations, we have thus far identified 55 store owners and employees involved in the unlawful acquisition of some $99 million in food stamp benefits. This has resulted in the arrest and conviction of many of these individuals, some of whom have been sentenced to prison terms and ordered to pay millions of dollars in restitution. Our investigations into these matters continue, and we anticipate additional persons will be charged.

Child and Adult Care Food Program (CACFP)

Last year, I testified about a special law enforcement initiative we had undertaken with one of the targeted programs being CACFP. I indicated that we would continue "sweeps" of program sponsors to find those who are abusing the program to remove them from sponsorship, to prosecute them if warranted, and to recover ineligible payments. Since last year, our CACFP initiative has been designated as a Presidential Initiative which we named Operation "Kiddie Care."

Our efforts have been very successful. Currently, we have 29 open CACFP investigations. As of December 1998, 54 sponsors in 23 States were being audited or investigated. We identified 37 sponsors as being seriously deficient, a term used by FNS to designate sponsors who could be terminated from the program unless the deficiencies are addressed promptly. Fourteen sponsors, who had been receiving a total of $24.4 million annually, have been terminated from the program.

In Ohio, seven persons, including the director of the sponsoring organization operating a local child and adult care food program, pled guilty to conspiracy to submit false claims for issuing or receiving reimbursement payments for in-home day care providers who did not exist or did not have children in the home. This ongoing investigation has identified 11 people to date who conspired to set up more than 40 false providers. This conspiracy, which had been ongoing since 1988, resulted in the submission of false claims for reimbursements totaling about $1.1 million. The investigation continues with additional prosecutions anticipated.

In another California case, an executive director of a sponsor retained food reimbursements to cover the salary he claimed to earn in California while he was actually working for another enterprise and living in Wisconsin. He also had a vehicle in Wisconsin for his personal use which was being paid for by the California sponsor. We are currently investigating about $231,000 of program funds paid to this individual.

We will continue with Operation "Kiddie Care" as long as we find evidence that abuses exist. Returning integrity to this important feeding program and protecting the resources of the American taxpayer are high priorities for OIG and FNS.

Special Supplemental Food Program for Women, Infants, and Children (WIC)

One of the primary purposes of the WIC program is to provide funds to pregnant women and families with small children to allow them to purchase certain nutritious food items. In an effort to curb fraud in the WIC program, we are continuing our investigative activities in this area. One such investigation occurred in conjunction with the Columbus, Ohio, Division of Police; the Ohio Department of Taxation; and the Franklin County prosecutor where we conducted a 12-month undercover investigation into trafficking of WIC infant formula and untaxed cigarettes. Investigators determined that store owners and a wholesaler received the formula through the black market, removed its "not for retail sale" marking, and sold it commercially in area stores and to businesses in other States. In two separate "buy-bust" cases, store owners and managers were arrested for illegally purchasing hundreds of cases of WIC formula and hundreds of thousands of cartons of untaxed cigarettes. Both investigations were linked to a Columbus commodity wholesaler at whose warehouses between $500,000 and $1 million in commodities were seized. The owner and the manager of the first "buy-bust" case pled guilty to racketeering and trafficking in WIC benefits and untaxed cigarettes. The owner and manager in the second case pled guilty to trafficking in WIC benefits and untaxed cigarettes. Their corporation pled guilty to racketeering, and the wholesaler is now a fugitive.

FARM AND FOREIGN AGRICULTURAL SERVICES

FARM SERVICE AGENCY (FSA)

OIG and FSA Managers Meet

In a joint effort to further agency cooperation, OIG and FSA senior managers and other policy makers met at a roundtable conference in San Antonio, Texas, the week of December 7, 1998, to explore and embrace new ways of working together. Prior negative experiences brought many participants to the conference with an "us versus them" attitude. In the roundtable, OIG auditors, special agents, and FSA program officials were able to explain obstacles they frequently encountered in ac-

complishing their agencies' missions. Working together as part of a united team, the participants identified several opportunities to improve communications, and all participants left with a new appreciation for the other's needs. We look forward to improved working relationships with FSA's Administrator and his hardworking staff.

Noninsured Crop Disaster Assistance Program (NAP) Overpayments

We reviewed 1996 crop-year program payments in California, Florida, Georgia, and Oklahoma, where $26.9 million in benefits—out of a total of $45.9 million nationwide—were paid as of July 31, 1997. We found hidden or inaccurate reporting of production and the use of incorrect yields to compute payments for 23 of the 98 cases. We found that because the estimates and adjustments used to determine loss could not be verified, the process for determining the actual amount of loss allowed producers to obtain unwarranted program benefits. This was a major problem for seeded wheat forage in Oklahoma. For other crops—strawberries, cherries, and onions—production was based on information reported by the producer which also was not verifiable as actual production. We recommended that FSA collect $411,000 in overpayments. FSA has agreed to review the payments and collect any overpayments to which relief provisions did not apply.

Overpayment of Emergency Assistance to Producers in the Upper Great Plains

In January 1997, FSA implemented two programs to provide assistance to endangered livestock caught in the blizzards and cold weather in North and South Dakota. The Emergency Feed Grain Donation Program (EFGDP) provided 100-percent cost-share assistance to livestock producers for snow removal and to feed their livestock in immediate danger of perishing. The Foundation Livestock Relief Program (FLRP) provided 30-percent cost-share assistance for area producers to enhance the diet of foundation livestock—or breeding stock—weakened by the severe winter weather.

Because the two programs ran concurrently with different cost-share rates, some producers improperly received assistance for supplemental feed purchases under EFGDP instead of FLRP. This allowed the producers to receive 100 percent of the feed cost compared to the 30-percent cost-share. In addition, we found that producers were paid excessive snow removal costs during a 15-day extension period and for snow removal when they already had access to normal feed supplies. FSA improperly authorized $2.5 million of FLRP payments to 23 counties in Iowa, Montana, Nebraska, and Wyoming adjoining the disaster area. We recommended FSA strengthen its oversight role in certain areas to help ensure that future disaster assistance is limited to identified areas and require county offices to act on the cases where excessive EFGDP and FLRP payments were issued. FSA believes its existing controls are generally adequate; but, due to the complexity and difficulty of administering emergency and disaster programs, procedures to improve oversight will be incorporated into future programs. FSA agreed, subject to the finality rule, to recover the overpayments.

Environmental Benefits Index Scores Controls Could Be Improved

Under the Conservation Reserve Program (CRP) producers receive annual payments from FSA to take highly erodible cropland out of production and establish and maintain a vegetative cover on it. During signup, producers designate tracts of land determined to be environmentally sensitive, which are reviewed and scored according to values on the Environmental Benefits Index (EBI). One subpart of the index identifies the environmental benefits of the land, such as providing cover beneficial to wildlife. It also specifies what numerical scores may be given for the different kinds of conservation practices—planting mixed grasses, legumes, etc.—that the producer established to enhance each benefit. Tracts that have been awarded higher scores are regarded as more worthy of conserving and qualify for CRP consideration ahead of tracts with lower scores. Tracts that fall below a minimum score are excluded from the program.

We reported that the Natural Resources Conservation Service's (NRCS) implementation of CRP exhibited significant control weaknesses. These included improperly modified point scores for various environmental ranking factors and subfactors in some States. In addition, producers in some States received high scores for preserving cover beneficial to wildlife or for protecting threatened and endangered species even though the required cover or endangered species were not present on the tract of land. Such inconsistencies can result in greater CRP consideration for cropland in one State, even though its environmental benefits are no greater than those of its neighbors. We identified approximately 2,900 offers nationwide with annual rental payments totaling about $13 million that were at risk of incorrect acceptance

into CRP. NRCS management issued guidance that addressed some scoring problems noted in our review.

FARM SERVICE AGENCY (FSA) INVESTIGATIONS

Historically, one of our primary activities has been the investigation of criminal violations of the various farm loan programs administered by USDA. We continue to conduct such investigations with great success. A good example is a honey producer in Idaho. This individual was sentenced to serve 28 months in prison and ordered to pay USDA over $3 million in restitution after he pled guilty to submitting false statements to FSA in order to obtain over $6 million in loans and subsidy payments.

RURAL DEVELOPMENT

RURAL HOUSING SERVICE (RHS)

OIG and RHS Join Forces to Combat Fraud and Abuse in Rural Rental Housing (RRH) Program

OIG and RHS combined efforts to identify, investigate, and prosecute owners and management agents that had abused or defrauded the RRH program. We targeted owners and management agents who were suspected of abusing the program.

Joint OIG-RHS teams physically inspected 631 apartment complexes and then examined the financial records of apartment complexes operated by 32 owners and management agents in 13 States. The teams identified over $3.5 million in misused funds and uncovered serious physical deterioration of some apartment complexes, including conditions that posed health and safety risks to the tenants. Our work is continuing, and we will issue a summary report later this spring.

An investigation in Washington State centered on a prominent local attorney who was a general partner of multiple limited partnerships which owned federally financed and subsidized low-income housing projects. The attorney had built 65 apartment projects in 20 States under the RRH program. Our investigation disclosed that the partner submitted false and fictitious construction invoices to RHS and to the lending banks which administered RHS loans in order to divert $176,000 in funds from four RHS loans. Our investigation also showed that he received kickbacks from the bank where loan funds were deposited. In order to conceal the kickbacks, he submitted fictitious invoices to the bank for purported legal services rendered. He also failed to disclose $95,000 in income derived from the diverted funds and other sources on his 1995 individual income tax return. He pled guilty to making false statements, receiving unlawful payments, and filing a false Federal income tax return. He was sentenced to 21 months in prison and ordered to pay $300,000 in restitution.

Problems Exist With Electric Program Loan Funds, Borrowers

We evaluated the Rural Utilities Service's (RUS) electric program because of its high dollar value—approximately $32 billion, potential for large losses—writeoffs of more than $1.7 billion and about $8 billion owed by troubled borrowers, and recent changes in legislation and in the industry. We found that the eligibility criteria prescribed by law and regulation for hardship loans and prioritization of applications for municipal rate loans did not take into consideration the applicant's financial strength, loan amounts, or local user rates. Also, the Rural Electrification Act of 1936, as amended, and regulations did not allow RUS to ensure that guaranteed loans benefited only truly rural areas. This could delay funding for improvement of electrical services to the most needy borrowers and in truly rural areas.

We recommended that RUS seek legislative change and amend regulations so that hardship loan funds can be targeted to areas of greatest need by taking into consideration financial condition and local area user rates and by ensuring municipal rate loan funds benefit only truly rural areas. Although agency officials generally agreed with our findings, they did not agree with our recommendations to seek a legislative or regulatory change.

INSURANCE

RISK MANAGEMENT AGENCY (RMA)

Reinsurance Companies' Quality Control Systems Lacking

RMA delivers multiple-peril crop insurance programs through standard reinsurance agreements with private insurance companies. Under the agreements, the companies are required to develop quality control plans consistent with the agency's policies and procedures that safeguard against waste, loss, unauthorized use, and

misappropriation. This past year, we reviewed the quality control processes of reinsured companies operating under agreements made with RMA in 1995. We found that, although the quality control systems generally complied with the terms of the agreement, they did not effectively improve program delivery, ensure program integrity, and adequately measure or report on program performance. The consequences of poorly specified requirements in the reinsurance agreements were insufficient data collection, maintenance, and reporting requirements; ineffective oversight of quality control operations; and insufficient controls against conflicts of interest. As a result, program officials cannot rely on reinsured companies' quality control reviews.

We recommended that RMA, in consultation with crop insurance organizations and experts, adopt appropriate professional standards for quality control and, in particular, controls to deal with conflicting sales and claims adjustment operations that affect the integrity of crop insurance programs. The agency concurred with our recommendations for improved quality control processes but not with our findings and recommendations for improved controls against potential conflicts of interest. We are working with RMA on the disputed recommendations.

Nonirrigated Crop Insurance Yields Set Too High and Practices Not Viable

Prompted by an OIG hotline complaint, we audited RMA's first year, crop-year 1998, extra long staple (ELS) cotton insurance program in the Texas counties of Glasscock, Midland, Reagan, and Upton. We determined that the transitional-yields, or T-yields, and established yields based on historical averages for nonirrigated ELS cotton were set exceptionally high. Also, we questioned whether the growing season and rainfall were sufficient to produce ELS cotton in these four counties. We reported that, as a result of these issues, RMA could incur excessive losses of about $12 million for the 1998 crop-year alone. Similarly, we disclosed that high T-yields for nonirrigated popcorn in the Rio Grande Valley resulted in indemnities totaling about $5.5 million for 1997, and nonirrigated dent corn T-yields for 1998 were sufficiently elevated to result in losses of between $2.2 million and $2.8 million in Tom Green County, Texas.

Officials in the four counties stated that these were not locally accepted practices because more water is required than the counties receive in rainfall and the growing season is too short for ELS cotton to properly mature. Therefore, we concluded that nonirrigated practices were not viable in the cited counties and recommended that, effective for crop-year 1999, RMA discontinue coverage for ELS cotton in the four counties named in the complaint, popcorn in the Rio Grande Valley, and dent corn in Tom Green County. RMA agreed.

RESEARCH, EDUCATION, AND ECONOMICS

COOPERATIVE STATE RESEARCH, EDUCATION, AND EXTENSION SERVICE (CSREES)

Schedule A Extension Appointees' Rights Need Clarification

There are approximately 8,000 Schedule A appointees working nationwide in the State Cooperative Extension System (CES). The appointees receive Federal benefits including participation in the Federal Health Benefits Program and civil service retirement plan. In 1990, the Civil Service Due Process Amendments extended coverage to these appointees. Our review of adverse actions taken against two appointees by one State university CES director disclosed that the universities are not always aware that protections such as counseling and appeals procedures apply. In this case, the university had offered no protections and stated that its own policy allowed the CES to dismiss the appointees without recourse. The Office of General Counsel provided CSREES with an opinion that these positions fall within the due process requirements of the Merit Protection System. USDA's Office of Human Resources Management confirmed that Schedule A appointees are Federal employees for purposes of civil service protections.

On December 9, 1998, the Merit System Protection Board ruled that the individual taking actions against the two employees was within Federal jurisdiction. The case was remanded to an Administrative Judge for further adjudication. OIG has encouraged CSREES to work with the National Association of State Universities and Land Grant Colleges to inform all CES offices of the appointees' current status and assist them in developing suitable personnel procedures for these positions.

Financial Statement Audits

As required by the Chief Financial Officers Act of 1990 and the Government Management Reform Act, we completed seven financial statement audits of the Department's programs. We issued unqualified, or "clean," opinions on the fiscal year 1997 financial statements of the Federal Crop Insurance Corporation, the Commodity Credit Corporation, and the Rural Telephone Bank. Audits of the Rural Development mission area and the Food and Nutrition Service resulted in qualified opinions. Rural Development received a qualified opinion because we were unable to assess the reasonableness of its estimated loan subsidy costs for loans obligated after fiscal year 1991.

In fiscal year 1997, FNS received a qualified opinion because we were unable to assess the reasonableness of its gross, non-Federal accounts receivable for the Food Stamp Program and the related account balances and notes to the financial statements. I am happy to report that on February 1, 1999, we issued an unqualified opinion for the fiscal year 1998 financial statements for FNS.

For fiscal year 1997, we issued a disclaimer of opinion on the Forest Service (FS) and the USDA consolidated statements. FS received a disclaimer due to significant financial system weaknesses which include the lack of an integrated general ledger and supporting subsidiary records. The USDA consolidated statements received a disclaimer of opinion for fiscal year 1997 because the Department could not provide assurance that its financial systems provide information that is relevant, timely, consistently reported, and in conformance with applicable accounting principles. In addition to financial system problems, numerous internal control weaknesses exist that materially impact the Department's ability to report accurate and reliable financial information.

A disclaimer of opinion has been issued to the Department for each of the last 4 years. This means that the Department, as a whole, does not know whether it correctly reported the amount of revenue it received, the cost of its operations, or other meaningful measures of financial performance. The Department and its agencies have recognized the weaknesses and have put considerable effort into improving their financial systems and reporting processes. While plans have been made to fix these problems and actions have been taken to address some of the weaknesses, more must be done. The Department is carrying out its Financial Information System Vision and Strategy project aimed at developing a single integrated financial management system that meets all Treasury and Office of Management and Budget requirements and fulfills the needs of USDA. We continue to assist departmental and agency officials in these efforts.

Information Resources Management

Department Progressing With "Year 2000" Conversion

The Year 2000 issue has the potential to limit the Department's ability to deliver its programs. In April 1997, we began a continuing review and assessment of the Department's Year 2000 conversion efforts. Most recently, we completed a review of the renovation and validation efforts of seven agencies. This review determined whether the agencies had devised a strategy to convert, replace, or eliminate impacted hardware and software; fully tested and certified systems identified as compliant; and adequately assessed data exchanges and communicated with the exchange partners. Overall, we determined that the agencies are progressing in their Year 2000 conversion efforts; however, improvement is needed in some areas.

Our review disclosed that FSA had reported four mission critical systems—the Highly Erodible Land and Wetland Conservation system, the Cotton Rate Offer system, the Daily Terminal Prices System, and the Marketing Assessment System—as Y2K compliant without performing any validation testing. Also, FSA reported that its Warehouse Rates Management System and the Processed Commodities Inventory System would not be implemented until June 1999. The Foreign Agricultural Service reported that its Financial Accounting and Reporting system will be implemented in April 1999. The Animal and Plant Health Inspection Service reported its Information System Upgrade Project would not be implemented until September 1999. In addition, FS reported its data exchange agreements generally consisted of informal verbal agreements which did not fully establish the data conversion responsibilities of each exchange partner.

Due to the time sensitivity of the Year 2000 issue, these findings and others have been provided to the affected agencies in interim reports. The agencies have responded to our recommendations, and an audit report consolidating our findings will be issued later this year. Currently, we are reviewing personal property, facilities, and equipment because of their reliance on embedded microprocessor chips.

EMPLOYEE INTEGRITY

The investigation of serious misconduct by USDA employees remains a high priority of OIG. During fiscal year 1998, OIG issued 55 reports of investigation concerning serious allegations of misconduct by USDA employees. Our investigations resulted in 23 convictions of current and former employees and 80 personnel actions, including reprimands, suspensions, resignations, removals, and alternative discipline.

In July 1994, a tropical storm struck southern Georgia, causing serious flooding and millions of dollars in damage. As a result, NRCS negotiated and funded numerous watershed repair contracts under the Emergency Watershed Protection Program (EWPP). After we received confidential information from a private sector contractor, our 18-month investigation developed evidence showing that two NRCS employees, who were responsible for managing EWPP contracts, accepted cash bribes from a contractor in exchange for special considerations in obtaining EWPP contracts. A third employee arranged for a contractor doing business with NRCS to perform construction work on personally owned land. The cost of this work was then improperly billed to USDA. During July through September 1998, the three employees entered guilty pleas in U.S. District Court to violations resulting from their acceptance of bribes and gratuities. One employee was fined and placed on probation while the other two employees are awaiting sentencing. All three employees resigned from NRCS.

A Louisiana Rural Development county office employee pled guilty in Federal court to embezzling and misapplying over $82,000 in rural housing loan payments she had received in her office. She was sentenced to serve 6 months' imprisonment, to be followed by 4 months' home confinement. She was also fined $10,000 and ordered to pay nearly $24,350 in restitution. The employee resigned soon after we initiated our investigation.

CONCLUSION

This concludes my statement, Mr. Chairman. As you can see, the work of OIG is far-reaching and expansive. I appreciate the opportunity to appear today and present this information, and I hope that my comments have been helpful to you and the Committee. I will be pleased to respond to any questions you may have at this time.

OFFICE OF THE UNDER SECRETARY FOR RESEARCH, EDUCATION, AND ECONOMICS

PREPARED STATEMENT OF DR. I. MILEY GONZALEZ, UNDER SECRETARY

Mr. Chairman, Members of the Committee, I am pleased to appear before you to discuss the fiscal year 2000 budgets for the Research, Education, and Economics (REE) mission area agencies. I am accompanied by Deputy Under Secretary, Dr. Eileen Kennedy, and the Administrators of the four mission area agencies: Dr. Floyd Horn, Administrator of the Agricultural Research Service (ARS); Dr. Colien Hefferan, Acting Administrator of the Cooperative State Research, Education, and Extension Service (CSREES); Dr. Susan Offutt, Administrator of the Economic Research Service (ERS); and Mr. Donald Bay, Administrator of the National Agricultural Statistics Service (NASS). Each Administrator has submitted written testimony for the record.

The REE budget, the first budget submitted since the passage of the Agricultural Research, Extension and Education Reform Act of 1998 (Reform Act), reflects very strong support for the REE programs and a recognition of contributions that research, education, economics and statistics programs of REE can make in solving the pressing challenges facing agriculture and the nation. REE and its agencies have a proud history of finding solutions to the challenges facing agriculture over many decades. Building on the extraordinary possibilities of cutting edge research and biotechnology, REE is more capable than ever of delivering on new challenges in production agriculture, food safety and nutrition, mindful of the need to find environmentally sound solutions. The budget we are discussing today, begins to meet the spirit of the message delivered by the House Committee on Science last fall in its report Unlocking Our Future. To quote the report, "Science . . . must be given the opportunity to thrive, as it is the precursor to new and better understanding, products and processes." I believe this budget affords the Nation's agriculture and food system and all who have an interest in its future, the opportunity to benefit from such a thriving research and education system. As good as our REE programs are today, the size and shape of the increased investment found in this budget is

one in which all would benefit, producers from Maine to Guam and consumers from Alaska to Puerto Rico.

Overall, the President's budget provides $2.1 billion for the four REE agencies, an increase in program level of 7 percent above fiscal year 1999 for the conduct of research, education, and statistical programs. This is the most significant increase in the REE budgets since the early 1990's and moves REE in the direction of the funding increases in the budgets of other major research agencies across the government over the last few years. Meaningful increases are requested for all four agencies to support high priority initiatives and programs addressing critical issues, such as food safety, human nutrition, emerging diseases, pest management, and environmental quality.

The 7 percent increase in the overall program level of funding depends significantly on the inclusion of the Initiative for Future Agriculture and Food Systems under Section 401 of the Reform Act. The program provides an infusion of $120 million in the CSREES budget to competitively award research, education, and extension grants focused on high priority issues outlined in the Reform Act, such as farm efficiency and profitability and natural resource management. In addition, $20 to $40 million will be available for research, extension, and education through the Fund for Rural America when allocation decisions are made after the 2000 Appropriations Act is enacted.

The overall increase in the REE budget reflects the strong support that REE is receiving from the Secretary and the Administration. We have worked diligently with the Secretary to explain the benefits of the research investment and make the results and benefits more broadly known to our stakeholders and the general public. However, I am still concerned that we find ways to balance the research portfolio in helping colleges and universities enhance their future capacity with base funding, so they may strengthen their ability to compete in the new Initiative for Future Agriculture and Food Systems that encourages this competitiveness. We want to work with you in this arena. Minority serving institutions find themselves even more disadvantaged in this growing competitive environment.

As we take some satisfaction in the increase in this budget and the implied recognition of its value and productiveness, I believe we must acknowledge that new times demand new ways of doing business. I have talked with our university partners, and they share this recognition of this need for change as we move into the 21st century. Multi-disciplinary, regional, multi-state, and multi-institutional strategies facilitate both efficient and effective returns on our research, education, and extension dollars. We must continue to listen to our stakeholders and customers and hear their needs. We must shape and describe our programs so, with a good dose of our judgment, the programs are responsive to those same stakeholders and customers. We must tell them in plain English just what we plan to do and what difference it will make for farmers, ranchers, food processors, and others in the food industry, as well as consumers. In other words, we must hold ourselves accountable for the investment made in our programs and understand that agricultural research and education issues transcend national borders and global competitiveness requires international scientific partnerships. We believe we are meeting the outreach, accountability, and coordination requirements of recent legislation efficiently and effectively. We are confident our efforts along these lines will contribute to program effectiveness, and better equip us, and you, to defend budget requests in increasingly competitive arenas.

Often agriculture research and extension hold the keys to effectively addressing acute problems. Our recent response to the wheat and barley scab crisis in the northern Plains is an example of how quick action can make a difference. Similarly, our rapid and effective response to the Avian influenza scare proved to be very valuable in protecting the lives and health of all people.

I believe it is equally important to call on and support the research and education system in government, at universities and at other research institutions in mounting a proactive, long term approach to solving or even avoiding acute problems, such as the ones being experienced by the farm community today. In this regard, I believe the REE education, extension and information technology programs can play a critical role. In our knowledge-based society, getting the right information in an accessible form to the user is the key to empowering farmers, individuals, families, and communities to improve their futures and guard against bad times. If I may quote again from the report Unlocking Our Future, "Not only must we ensure that we continue to produce world-class scientists and engineers, we must also provide every citizen with an adequate grounding in science and math, if we are to give them an opportunity to succeed in the technology-based world of tomorrow." The results of our research and analyses yield information farmers need to effectively manage the many types of risk inherent in operating a farm, including crop selec-

tion, disease, weather, market volatility, and pest control. We have an obligation to ensure that this information gets to the farmers and other producers so they can make informed decisions. They need this to have a complete safety net. I urge you, in your deliberations on the REE budgets, to take full advantage of the potential value of such a long term approach for the new roles and responsibilities of scientific investigation and education in agriculture. We must make substantial funding for these areas the highest priority if we are to prepare for the future.

REE FISCAL YEAR 2000 INITIATIVES

Before turning to the budgets of the four REE agencies, I would like to focus on six high priority initiatives found in the budget: Integrated Pest Management, including implementation of the Food Quality Protection Act (FQPA); Food Safety; Agricultural Genomics; Small Farms; Global Change; and Community Food Security. They all represent critical investments to meet major challenges facing agriculture and the nation.

Effective pest management is a continuing challenge for agricultural producers. The public's increasing concern about the quality of the environment and the safety of our food, reflected in such laws as the FQPA, heighten the challenge. While generally sharing the overall goals, producers find themselves needing new pest control technology that is effective and economically viable, and at the same time responsive to public environmental and food safety concerns.

Under the umbrella of FQPA Implementation and Integrated Pest Management, the REE agency budgets include $29 million in increases focused on providing EPA information and data essential for science-based implementation of FQPA and on advancing efforts to develop and transfer to producers environmentally sound and effective pest management technology. In fiscal year 1998, the Department established the Office of Pest Management Policy, to coordinate the FQPA/IPM activities. That office is effectively serving in that capacity. In particular, it is working closely with EPA to ensure that that agency has the data it needs, when it needs it to make decisions critical to producers on the availability of different pesticides under FQPA.

Under the broader integrated pest management component of this ongoing initiative, significant progress has been made in developing sound pest management technologies and their adoption by producers. However, there is considerable distance to go in the pursuit of promising technologies and in the adoption of practices and technologies that take advantage of the newest discoveries coming out of IPM research. The initiative includes increases to support enhanced research on biocontrol alternatives to pesticides and new control technologies, as well as to support more effective transfer of the new technologies to producers. Both the ARS and the CSREES budgets include funding requests to expand work with producers to test new technologies and practices and facilitate their adoption. These increases to promote adoption of technologies are critical if the Nation is to benefit from the discoveries coming out of laboratories.

Promoting food safety is a second issue in which the Administration and Department have a keen interest, an interest that fiscal year 1999 Appropriations and the Reform Act indicate is shared by Congress. While the U. S. food supply is one of the safest, if not the safest, in the world, millions of Americans become ill each year due to food-borne pathogens. Consumers increasingly express concern about the safety of all food. Episodes of food contamination and the consumer response at the grocery store demonstrate the influence of consumer confidence on the demand for foods.

Over the past few years, the Administration has taken major strides to improve our current food safety system. A "farm to table" approach to food safety has been adopted in which the potential for the introduction, transmission, prevention and/or elimination of contaminants is systematically examined at each step along the path to the consumer's table. Ongoing implementation of Hazard Analysis and Critical Control Point (HACCP), relying heavily on USDA research, is radically changing our meat and poultry inspection system and already showing signs of significantly reducing food contamination levels. Last year, the Administration placed new emphasis on food safety in fruits and vegetables, now an integral part of the Administration's Food Safety Initiative begun in fiscal year 1997. Producers are increasingly being called on to modify their production practices to reduce the potential for pathogen contaminations. In recognition of these new challenges, the food safety program is also placing new emphasis on research to help producers respond to preharvest food safety issues, such as animal waste management.

The REE component of the Food Safety Initiative in the fiscal year 2000 budget provides increases to ARS, CSREES, and ERS, totaling $26 million, including increased funding through the National Research Initiative (NRI). Additional funds

will be provided under the increase for the Initiative for Future Agriculture and Food Systems. The majority of the funds will focus on developing improved pathogen prevention and detection methods and other bioscience research in ARS and CSREES. ERS requests funds to determine the economic burden from unsafe food and to assess the benefits and costs of alternative pathogen control policies. CSREES would also receive funding to expand education efforts for those involved in the food production system from farm to table.

To enhance the effectiveness of the national food safety research effort and the larger Food Safety Initiative, USDA, in collaboration with the Department of Health and Human Services, is providing leadership in establishing a new Joint Institute for Food Safety Research. Created in response to a Presidential directive, the new virtual Institute will promote coordinated planning and priority setting of food safety research across the government and with the private sector, using existing funds. The Institute will also facilitate transfer of research results into new food safety practices.

A third initiative I would like to highlight is agricultural genomics. The promise of biotechnology for producers is well established. Higher yields, improved quality, greater resistance to disease and pests, and reduced stress due to adverse weather conditions are outcomes we can anticipate will help producers individually, and as an industry, to be more competitive in the global market. These same outcomes will help the Nation achieve a safe, abundant, and nutritious food supply and meet the needs of a growing population worldwide. However, such success depends on having an understanding of the genetic make-up of plants and animals on which biotechnology depends.

As a leader in the President's Food Genome Initiative, a government-wide initiative, USDA is making a major contribution to the larger effort, expanding our knowledge of genomes of species of importance to the food and agricultural sector. The REE mission area has chaired the Interagency Working Group on Plant Genomics involving the Office of Science and Technology Policy, the Department of Health and Human Services, the Department of Energy and the National Science Foundation. In this role, REE continues to engage commodity group representatives and leading scientists in discussions about the plant genome research program.

Joint ARS and CSREES programming under the USDA Agriculture Genome Initiative includes research on animals and microbes, as well as plants. This research program is built on the blueprint for future research outlined in a USDA concept paper and follows the Interagency Working Groups's Plant Genome recommendations.

This research, focused on gene structure and function, is expected to have considerable payoff for crop species ranging from rice to corn and animal species ranging from cattle to swine to poultry. Efforts in the USDA food genomics program will initially concentrate on identification of economically important traits that increase yield, quality and disease resistance in plants, minimize the need for pesticides, and protect the environment.

The budget provides ARS and CSREES increased support for genomics research. The CSREES funds would be provided under the NRI and the new Initiative. The Reform Act indicates both agricultural genome and agricultural biotechnology are high priority areas for the purposes of making grants.

The small farms initiative is the fourth initiative I would like to highlight. Small farmers and ranchers make a valuable contribution to agriculture and rural America, often filling market niches and bringing life to rural communities. But many have fallen on hard times with the industrialization of agriculture and are struggling to find a place in an increasingly competitive sector. In 1997 Secretary Glickman established the National Commission on Small Farms to determine the status of small farms in the United States and recommend USDA actions to promote their economic viability and, therefore, their contribution to the agriculture sector and rural America in these new times. This initiative is responsive to the Commission's report, A Time to Act, in providing ERS and CSREES funds to better understand the market information needs of small farmers and the degree to which these needs are being met and to develop programs that help small farmers acquire the critical business skills and develop effective marketing strategies that promote economically viable farms. Increased funding in the NRI will support examination of the economics of small farms and their contribution to local economies, as well as increased funding of research appropriate to this segment of the sector. Data on small and medium-sized farms coming from the Census of Agriculture recently completed by NASS will be valuable in helping ARS and other agencies identify and conduct research responsive to the needs and priorities of such farms.

Climate change is a fifth initiative I would like to highlight. Climate change has extraordinary implications for production agriculture in terms of the impact of cli-

mate change on plants and animals, as well as the potential for new production practices to mitigate these effects on agriculture and on the Nation. In support of the President's Initiative on Global Climate Change, the fiscal year 2000 budget includes funds in the ARS, CSREES, and ERS budgets to support research to gain a better understanding of climate change, its causes and associated consequences for agriculture. The funds will also support complementary research on possible coping or adjustment mechanisms to minimize the adverse effect of climate change on agricultural production. Looking to the potential for agriculture to play a positive role in mitigating the greenhouse effect and associated global warming, other increases would provide new understanding of the greenhouse gas emissions and the potential for carbon sequestration carried out under production agriculture to mitigate such emissions. It is a promising possibility for agriculture that warrants serious investigation.

The final initiative to be highlighted is Community Food Security. Communities across the Nation have been confronting an increasing number of food-related problems including unprecedented demand on the charitable food sector, the decline of local agriculture systems, and poor nutrition. To address these and related problems, the CSREES budget includes $15 million for a Food Recovery and Gleaning grant program as the principal component of the USDA Community Food Security Initiative. The purpose of the grant program is to improve methods of collection, transport and storage of recovered and gleaned food, to enhance the technical assistance and education network to empower communities to establish and administer food recovery programs and to extend understanding of the technical issues in food recovery.

These are the highlights of six initiatives that span the agencies within REE. Fuller discussion of agency components of these initiatives can be found in the agencies' Explanatory Notes.

REE AGENCY FISCAL YEAR 2000 BUDGETS

I would like to turn briefly to the budgets of the four REE agencies. The Agricultural Research Service (ARS) fiscal year 2000 budget requests $837 million in ongoing research and information programs or a net increase of $51 million over fiscal year 1999. The proposed increases will be dedicated to a broad range of the high priority programs, such as food safety, human nutrition, invasive species and integrated pest management. To partially offset these increases the budget also includes redirection of approximately $35 million in current programs to fund higher priority program initiatives of nationwide interest. As the principal intramural biological and physical science research agency in the Department, ARS continues to play a critical role for the Department and the larger agricultural community in conducting mission-driven research. Results from ARS's fundamental research provide the foundation of applied and developmental research carried out in many public and private institutions. Building on its own and other fundamental research, ARS also conducts applied research and technology development to solve specific problems of national and regional importance and to meet the research needs of other USDA agencies.

The ARS fiscal year 2000 budget includes an increase of $20 million in the third year of the Human Nutrition Research Initiative. Research results continue to confirm the critical role of nutritious diets in promoting good health and mitigating diet-related disease. It is hard to overestimate the potential payoff for individuals and society as a whole from the adoption of healthy diets. At the scientific level and the personal level, increasing our understanding of the relationship between diet and health and of the sources of important nutrients will enhance our well-being and reduce our national health care bill.

The fiscal year 2000 increases will emphasize the role of nutrition in bone growth and nutrient requirements for healthy mental function. Also included in the budget are funds to complete the Western Human Nutrition Research Center and the first of two phases of the new Beltsville Human Nutrition Research Center.

In addition to the ARS increases in the highlighted initiatives and nutrition, the ARSbudget includes increases for emerging infectious diseases and invasive species, global change and sustainable ecosystems.

The fiscal year 2000 budget proposes $45 million for the ARS building and facilities program, a decrease of $12 million from fiscal year 1999. As the Subcommittee knows, over the last 18 months the Strategic Planning Task Force on Research Facilities, mandated in the 1996 Farm Bill, has been addressing the multifaceted and complex issues related to agricultural research facilities and their adequacy to support cutting edge research in the 21st Century. We are awaiting the Task Force's recommendations and guidelines in their report to be completed later this year. In

the meantime, we believe we must provide support for several ARS projects in which there are critical and immediate needs.

The $45 million also includes $22 million in funding for five locations, in addition to the two Nutrition Research Centers. This includes $14 million for the Regional Research Centers located in Albany, Peoria, Philadelphia, and New Orleans, which all need major infrastructure replacement and modernization. Another $8.2 million is requested for the Plum Island Animal Disease Center. Current biosafety and biocontainment standards and regulatory issues relating to environmental quality and energy conservation are among many concerns that indicate the facility is in serious need of modernization. The increases for renovations are the product of careful planning over several years and are vital for ARS to continue its high quality and productive research for which it is world renowned.

The President's fiscal year 2000 budget provides $1.1 billion for the Cooperative State Research, Education, and Extension Service. This includes $948 million in the discretionary budget, an increase of $24 million over fiscal year 1999. Within the discretionary budget, an increase of $81 million is provided for the National Research Initiative (NRI). The NRI increases will focus on several high priority areas, including development of integrated production systems, agricultural genomics, global change and food safety.

As indicated above, the budget also includes $120 million in mandatory spending under the Reform Act for fiscal year 2000, and a total of $600 million over 5 years for the Initiative for Future Agriculture and Food Systems under the Reform Act. This competitive research, education and extension program will emphasize a multidisciplinary and multi-institutional approach to addressing high priority issues outlined in the law. The Administration strongly believes that the most appropriate and effective use of taxpayer dollars is through peer-reviewed competitively awarded research grants that focus on national issues and concerns. Programs such as the NRI and the Initiative for the Future Agriculture and Food Systems provide a very effective mechanism for attracting and focusing the highest quality research conducted across the country on high priority issues faced by the agriculture and food system. There is also evidence that a significant portion of competitive grants are awarded to land grant colleges, universities and State extension agencies. The Administration's budget should result in a major infusion of funds to these institutions.

In addition to the NRI increases and the broader Initiative for Future Agriculture and Food Systems, the CSREES budget includes increases to empower less advantaged people and communities so they may improve their own lives and that of their families.

The CSREES budget also includes increases in the Children, Youth and Families At Risk (CYFAR) program and Expanded Food and Nutrition Education Program. The goal of both programs is to help individuals and families gain the skills and create the environment that encourage individuals, families and community leaders to take responsibility for their own lives and that of their communities.

In addition to the increases, the CSREES budget provides for a redirection of fiscal year 1999 funding for the new Integrated Research, Education, and Extension grant authority provided in the Reform Act. Bringing the research and education component together with extension affords the opportunity to integrate programs which draws on the strengths of both activities. The research agenda is more likely to be informed by extension's connection to the customer and extension is more likely to understand research findings coming from the research.

In providing critical funding to the research, education, and extension programs of the Land Grant system and other universities and organizations across the country, CSREES continues to play a central role in helping generate new knowledge and technology and in facilitating the transfer of that knowledge and technology to those who will use it.

The Economic Research Service's budget decreases from $63 million in fiscal year 1999 to $56 million in fiscal year 2000. As the Department's principal intramural economics and social science research agency, ERS conducts research and analysis on the efficiency, efficacy, and equity aspects of issues related to agriculture, food safety and nutrition, the environment, and rural development. The decreased funding level is due to the return of the food program studies to the Food and Nutrition Service. The fiscal year 2000 ERS budget supports new or enhanced research of approximately $2.9 million. In addition to the increases in the initiatives highlighted above, the ERS budget includes $0.9 million to enhance the Agency's program in commodity market analysis. The increase will allow ERS to further strengthen its commodity program to assure the maintenance of sufficient capacity to analyze the structure and peformance of commodity markets, contribute its analytical expertise to related Department activities and enhance the dissemination of analytical market information to customers who rely on its availability. Additional funds of $0.2 mil-

lion will support an examination of the impact of electric utility deregulation on rural areas.

The National Agricultural Statistics Service (NASS) budget declines by $3 million to $101 million due to the cyclical nature of Census of Agriculture funding. The market-oriented policy and the competitive global market in which agriculture exists make NASS's comprehensive, reliable, and timely data on U.S. agricultural commodities more critical than ever to farmers, ranchers, and other agribusinesses needing to make informed production and marketing decisions. The results of the 1997 Census, the first NASS has conducted, were released last month, 10 months ahead of schedule. The survey results show that with careful counting the number of farms was relatively stable over the last 5 years. While the overall NASS budget decreases, the agency's budget includes several increases to enhance and broaden its statistical program. They include $2.5 million to conduct a new fruits and vegetables survey as part of the Food Safety Initiative, $1.6 million to collect pesticide use data for horticulture and greenhouse industries to support a science-based response to the Food Quality Protection Act and $1.8 million to conduct the decennial Agricultural Economics and Land Ownership Survey. An additional increase will allow for establishing a permanent NASS office in Puerto Rico. NASS is the only USDA agency with field offices that do not include Puerto Rico. The increase will facilitate both better statistics and better access to statistics for producers in Puerto Rico.

SUMMARY

In summary, I want to reiterate that I believe that, given a tight budget environment, the REE agencies' budgets reflect a strong commitment to investment in agricultural research, statistics, education, and extension, one stronger than in the recent past. It also reflects an understanding that research and education are the key to solving not only the problems agriculture and its producers are facing today, but those of tomorrow. With continued strong investment we will be ready to meet those future problems. And if we are even smarter and more farsighted, we will employ research and education to mitigate agriculture problems before they overtake us. Thank you. We welcome your questions.

RURAL BUSINESS-COOPERATIVE SERVICE

PREPARED STATEMENT OF DAYTON J. WATKINS, ADMINISTRATOR

Mr. Chairman and members of the Subcommittee, I am pleased to appear before you today to present the Administration's fiscal year 2000 Budget for the Rural Business-Cooperative Service (RBS).

Mr. Chairman, the key to improving the economic conditions of rural areas, and particularly those areas experiencing decades of poverty and stagnant economies, is the creation of more business opportunities and more jobs. But, particularly jobs that pay wages that are sufficient to lift families out of poverty. Presently, service sector jobs are the leading employer in many rural areas, and as important as those jobs are to the local economy, they still do not pay a wage sufficient to support a family of four. Creation of these jobs is best accomplished by the private sector, but as we all know there are a number of rural areas in which private sector capital is not readily available, and it is these areas in which we target the programs of the Rural Business-Cooperative Service. The $1.2 billion requested for the programs in this budget will assist in creating or saving about 100,000 jobs.

BUSINESS AND INDUSTRY GUARANTEED AND DIRECT LOAN PROGRAMS

For the Business and Industry (B&I) Program, the fiscal year 2000 budget includes $31.1 million in budget authority to support $1.0 billion in Guaranteed Loans and $50 million in Direct Loans, Since the streamlined Business and Industry Guaranteed Loan Program regulations were published in December 1996, demand for the program has increased 300 percent. With this level of funding we estimate that these two programs will create or save over 40,000 jobs. But equally as important, under the guaranteed loan program we are able to help the local lender provide financing and this helps build community stability.

Of the $1 billion requested for the guaranteed program we are again proposing to make available $200 million for financing for new cooperative businesses with a particular emphasis on new value-added cooperatives. Priority will be given to projects involving farmer-owned value-added cooperatives. In addition, this financing is available for guarantees of individual farmer's purchase of cooperative stock in a start-up cooperative established for value-added processing of an agricultural

commodity raised by the individual farmer stockholders. We expect this program to be a key tool in capital investment in rural areas and as a means of helping farmers keep more of the income generated by their product.

INTERMEDIARY RELENDING PROGRAM

The fiscal year 2000 budget also includes $22.8 million in budget authority to support $52.5 million in loans under the Intermediary Relending Program. The initial investment of this level of funding will create or save an estimated 13,000 jobs, but because these funds are re-loaned 3 or 4 times by the intermediary, we estimate that over 40,000 jobs will result eventually. In an effort to be of more assistance through this program we revised the regulations in 1998 to expand the $2 million cap on loans to intermediaries to a $15 million cap to any one intermediary in annual increments of $1 million. The regulation is more user-friendly and authorizes the Rural Development State Offices to process applications at the State level, rather than submitting applications to the National Office for processing. This change has speeded up the application process and allows State Offices to work closer with borrowers to provide immediate feedback concerning their applications. Pursuant to Rural Development's mission of prioritizing the most under served communities we are prioritizing the neediest communities, such as those in low-income or under served areas, those with declining populations, or communities faced with economic restructuring or economic disasters. In addition, the eligible purposes for loans to businesses have been expanded. The demand for this program continues to be strong.

RURAL BUSINESS ENTERPRISE GRANTS

For the Rural Business Enterprise Grants Program, the fiscal year 2000 budget includes almost $36 million. We anticipate that this level of funding will provide over 14,000 new jobs. The purpose of this program is to assist small and emerging businesses and the small amount of funds we typically invest in a project, on a dollar-for-dollar basis generates another $2.40 in private capital.

RURAL ECONOMIC DEVELOPMENT LOANS AND GRANTS

The fiscal year 2000 budget requests $15 million in Economic Development Loans and $4 million in grants. These programs represent a unique partnership since they directly involve the Rural Electric and Telecommunication borrowers in community and economic development projects. They are the intermediaries through which these funds are invested locally and each dollar invested through these programs attracts an additional $3 dollars in other capital. The loan program is a zero interest loan to the cooperative which guarantees repayment of the loan to the government. Loans are used primarily for economic development activities while the grant funds can be used for establishing revolving loan funds and for community development projects.

RURAL BUSINESS OPPORTUNITY GRANTS

The fiscal year 2000 budget includes $5 million for Rural Business Opportunity Grants to provide much needed technical assistance and capacity building in rural areas. We have determined through the Empowerment Zone/Enterprise Community process that the most significant non-capital need in most rural areas is the capacity to develop the economic and community development strategies that are necessary to attract private investment capital and Federal and state assistance. The vast majority of rural communities are served by part-time officials who do not have the time or the necessary training to compete with larger communities for funding that may be available to them. The funds requested under this program will aid in providing that invaluable assistance that allow communities to take the first step in assisting themselves.

RURAL COOPERATIVE DEVELOPMENT GRANTS

For Rural Cooperative Development Grants, the fiscal year 2000 budget requests $5 million to provide continued support in the creation of new cooperative forms of business and to fund the existing and new Cooperative Development Centers who directly assist farmers and others in the development of new rural cooperatives, value-added processing, and other rural businesses. We are firmly committed to the philosophy that the development of new opportunities to enhance farmer income and simultaneously create new business and job opportunities for others is critical to the family farmer and to the renewal of many rural areas. While the farm economy does

not produce as many jobs as it once did, it is still the key component of most local economies and must be the base for revitalizing these economies.

COOPERATIVE RESEARCH AGREEMENTS

We are requesting $2 million for needed research on cooperatives. Cooperative Research Agreements are used by RBS to participate with universities and other entities in providing research that relates directly to the needs of rural cooperatives. This includes a diversity of needs, reflecting the many changes that are taking place for cooperatives, such as major expansions into value-added processing. There is a greater interest on the part of small farmers and others in applying the cooperative form of organization to non-agriculturally based enterprises. In the past, funding has been included with RBS' administrative expenses account.

APPROPRIATE TECHNOLOGY TRANSFER FOR RURAL AREAS

The fiscal year 2000 budget also includes $2 million for the Appropriate Technology Transfer for Rural Areas (ATTRA) program that provides producers and agribusiness advisors information on use of the best sustainable production practices. Encouragement of such practices lessens dependence on agricultural chemicals and is more environmentally friendly.

The ATTRA program handled over 18,000 requests this past year and continues to be a major source of information on sustainable agriculture throughout the country through its 800 number and the use of Internet. We are asking for $2 million, an increase of $700,000, for the ATTRA program to accommodate expanding requests for information.

CONCLUSION

Over the past several years, RBS has been provided with increased program resources to use in meeting rural business and economic development needs. We have streamlined our programs, improved consumer focus and developed strategic relationships all to benefit the entire rural America. Each year we have used all of our resources in this new business environment, but still, the need exits for more resources to accommodate the needs of those communities not yet experiencing positive economic impact of America's economic prosperity. Mr. Chairman, this concludes my statement on the fiscal year 2000 Budget. I would be happy to respond to any questions the Subcommittee may have regarding the Business-Cooperative Development programs of the Rural Development Mission Area.

OFFICE OF THE SECRETARY FOR RURAL ECONOMICS AND COMMUNITY DEVELOPMENT

PREPARED STATEMENT OF JILL LONG THOMPSON, UNDER SECRETARY

Mr. Chairman, Members of the Subcommittee, it is a pleasure to present to you the fiscal year 2000 budget request for the Rural Development Mission Area. It is even more pleasurable when I can submit a program budget that is $800 million higher than the level enacted last year, but at a lower cost than last year. The increase reflects the President's strong commitment to rural America. It is also due to the President's strong commitment to balancing the budget, growing the economy and maintaining low interest rates, that we are able to keep our subsidy costs low.

Mr. Chairman, the economic growth that we are enjoying has reached some parts of rural America, but it is not at all widespread geographically or demographically. For the most part rural America is still characterized by sluggish or declining economies, and many parts of the country are still plagued by high rates of poverty and unemployment rates. In fact, many rural areas have poverty rates as high as 20 percent. Among those most vulnerable to the effects of poverty are elderly women and children. Over 3 million children in rural areas live in poverty while almost one quarter of older Americans in rural areas also live in poverty and primarily in areas lacking adequate health care and social services. Many of the rural areas such as the Mississippi Delta, Native American reservations, and the Southwest border region, have endured decades of poverty, and it is these areas to which this Administration has devoted a significant portion of our staff and financial resources. We do so because these areas are also characterized by the lack of capacity to seek out the Federal and other financial assistance that could aid in improving their lives.

Our efforts to improve the capacity of these areas to help themselves has coincided with the need to more effectively utilize administrative resources which we have accomplished through staff reductions and the closure of many of our local offices. We have attempted to compensate for the resulting lack of presence in some

communities by building partnerships with other governmental entities, non-profit organizations, and the private sector. While we are making some progress there remains a large void of such assistance in many areas.

Mr. Chairman, the President's commitment to rural America is deep, he knows the private sector is the key to resolving the many and differing economic problems affecting these areas, but he also knows that the private sector cannot accomplish the task alone. The private sector cannot finance housing for low and very low income families; the private sector cannot finance the thousands of water and waste water systems needed; the private sector cannot extend higher educational opportunities to remote rural areas; and the private sector cannot finance the thousands of fire and rescue projects, relying sometimes on the proceeds from bake sales and fish fries to repay loans, as we do on frequent occasion. Likewise, the Federal government cannot create the thousands of private jobs that are needed to raise the economic hopes of rural areas. But, we are demonstrating that the Federal government in partnership with the private sector and others can do much more than each of us can do alone. The private sector is now participating with us in more and more projects, and the private sector is beginning to realize, as the President recently stated, that these many pockets of poverty and high unemployment represent this country's largest untapped market. I am reminded of Henry Ford's answer to the negative reaction of fellow industrialists when he decided to give each employee a significant weekly raise, "I am doing this so they can buy my cars." We cannot be content with the current, historically low unemployment rate; we must continue our efforts to work with the private sector to create more jobs, so the millions of individuals still mired in poverty can eventually buy the products produced by this economy.

Mr. Chairman, poverty is insidious, and it destroys people's confidence, their desire and their drive. One can see the effects in too many rural areas of this country. Should anyone doubt the benefits of these programs, I challenge him or her to visit some of the areas I have, and see the optimism and joy of families when they move into a home they have built with their own hands; when they enjoy the benefits of clean running water in their homes for the first time, or when they see their children connected to the Internet where they can explore the world. These are just some of the reasons I am proud to present this budget request for your consideration.

RURAL DEVELOPMENT BUDGET REQUEST

The budget request for Rural Development is just under $11 billion for direct loan, loan guarantees, grants and technical assistance. It is an increase of $800 million over the fiscal year 1999 level, but it requires less budget authority than the current fiscal year. The request includes over $4 billion to support the President's National Home-ownership Initiative with an additional 50,000 more opportunities for home-ownership; a 12 percent increase in funding for the water and waste disposal loan and grant programs in support of the Water 2000 Initiative; and $1.2 billion in funding for the business programs which will assist in creating or saving almost 70,000 jobs in rural America.

RURAL HOUSING SERVICE

Mr. Chairman, as I have said on numerous occasions, no single factor contributes more to the vitality and stability of a community than does home-ownership. And no sector of the economy contributes more to the growth of the economy than does home-ownership. Every month the Department of Commerce releases statistics on housing starts and this information is eagerly awaited by all of the financial institutions in our country. The effects on the economy are also evidenced by the policy decisions for annual reductions in Federal income tax revenues of about $94 billion for the deduction of mortgage interest, and other deductions attributable to the housing industry.

Despite the positive economic effects of the housing industry, the budget process of the Federal government and the budget constraints we all must labor under, force our attention and our energy to the discussion of the comparatively meager $728 million in budget authority required to support the $5.9 billion in loans, loan guarantees, and grants needed by the less well off individuals in rural America. The economic value of the investments made by the Rural Housing Service are the same as those made by the private sector lenders, Mr. Chairman, but the societal and familial values can be much greater.

The programs administered by the Rural Housing Service reach the families and individuals that cannot otherwise afford decent, safe, and sanitary housing. They reach families and individuals that the private sector cannot serve. And in many

ways they reach two of the population groups most vulnerable to the effects of poverty elderly women and children.

SINGLE FAMILY HOUSING

The request for single family housing loans totals $4.3 billion, over $300 million more than available for fiscal year 1999 and requiring only $114 million in budget authority. Each new home constructed under this program provides 1.75 years of employment, over $50,000 in wages and generates over $20,000 in taxes for the local economy. In short, each new home generates much more economic value than it costs in budget authority. The average income of a borrower in the direct loan program is $17,000 and the average interest rate paid initially by these borrowers is about 4 percent, even though the interest rate can be subsidized to as low as 1 percent. The Rural Housing Service has been successful in stretching limited funding by generating private sector participation in this program. This effort began in 1996 with 20 partners and has now grown to 78 partners in 36 states. However, as important as stretching limited resources, is the acquaintance of private lenders with rural areas which can generate even more business for the lender. The guaranteed loan program provides loans at the market rate and serves borrowers with more moderate incomes.

MULTI-FAMILY HOUSING

The multi-family housing direct loan program serves those individuals and families least able to afford suitable housing. The average annual income of our tenants is $7,300 and for the most part the tenants are elderly female heads of household living on minimum social security benefits. Yet, it is this program and its related rental assistance that presents the largest dilemma in terms of policy and budget decisions. Because of the tenants it serves, these loans are typically subsidized to 1 percent this contributes to a high subsidy cost. However these tenants have no housing alternatives. There is a tremendous need for this type of housing and while we need to remain cognizant of budget constraints we should not be blind to the most needy in this country. The guaranteed program that was begun just two years ago serves renters with higher incomes. The demand for the program is significant and the program is particularly well received as an effective way to ensure that rural businesses have a well housed work force. It promotes rural economic stability. We are requesting the program be increased from $75 million to $200 million and we are recommending legislation which will eliminate the subsidy cost. Presently, we are required to provide interest subsidies for at least 20 percent of the loan funds and we have determined that this requirement is not necessary to ensure affordable housing is available. The subsidy cost can be redirected to programs serving the more needy.

RENTAL ASSISTANCE

Rental assistance is a subsidy provided to the developers of the direct loan multifamily housing projects in the form of renewable five-year contracts. The contracts make up the difference between the required tenant payment (30 percent of income) and the market rental rate, or the rate required to amortize the loan. Rental Assistance is the single largest component of the cost of administering the rural housing programs. We are requesting $640 million for this program, an increase of $57 million from the fiscal year 1999 level. The largest portion of the funding is needed to renew existing contracts that will expire in 2000. The balance is needed for rehabilitation loans, loan servicing options and for new construction. The request for rental assistance is submitted as a "forward funding" request which calls for $440 million to be available in fiscal year 2000 and $200 million available on the first day of fiscal year 2001. While this represents a change in the budgeting method for this program, it will not delay the provision of rental assistance to our tenants.

MUTUAL AND SELF-HELP HOUSING

Mr. Chairman, this program is one of the most rewarding programs we administer and I encourage every member of this subcommittee to visit one of our sites to see the positive effects provided when families, who would not otherwise have an opportunity to be homeowners, join forces and build their own houses. The house becomes secondary to the benefits of self confidence and self assurance provided throughout the family and community. This pride is evidenced in the fact that the delinquency rate in these homes is less than others we finance and the borrowers move to conventional credit much faster than do other borrowers. We are requesting a slight increase of $4 million for this program bringing the level to $30 million.

These grant funds provide the technical support needed by the families as they construct their homes which are then financed through the single family direct loan program.

FARM LABOR HOUSING

We are requesting a combined increase of $9 million for the Farm Labor Housing loan and grant programs which will allow us to finance the construction and repair of 960 units for migrant and seasonal farm laborers, who with Native Americans are the worst housed populations in America. These programs are the only programs within the Federal government specifically designed to serve this population and the program is one of the few areas over which USDA has the jurisdiction to improve the lives of farm workers who are, in large part, responsible for the low cost other Americans have to pay for food. This program also helps to ensure that the children of farm workers are well cared for while their parents are at work. A substantial number of the projects constructed through this program provide child care facilites which are often administered through Head Start or Migrant Head Start.

COMMUNITY FACILITIES

We are requesting a significant increase in funding for community facilities. This is one of our most popular, but often overlooked programs from which we finance a wide variety of essential community projects, ranging from hospitals, nursing homes, and child care facilities to drainage improvements. For years most of the funds have financed health facilities and fire and safety projects, but a recent priority has been child care facilities which are desperately needed in rural areas and the need is growing as families move from welfare to work and single mothers are filling many of the new jobs created in rural areas. Since the inception of this initiative RHS has provided more than $42 million for 141 new or improved child care centers. In several of the projects RHS has partnered with Rural LISC, a non-profit organization and the Head Start program of the Department of Health and Human Services; we expect the partnership to grow even more in fiscal year 1999 and fiscal year 2000.

For community facilities we are requesting $473 million for loans, loan guarantees and grants, an increase of $86 million. Included in the request for community facilities is $5 million to reinvigorate the effort to install severe weather early warning systems through out rural areas. Although the funding is requested under the community facilities program, the program will be administered by the Rural Utilities Service. This effort began initially in 1994 following widespread destruction and 30 deaths from tornados spawned by one storm in Alabama, Georgia and South Carolina. The Vice President called for 95 percent coverage for rural America with early warning systems triggered by the National Weather Service. And while we had some initial success through voluntary efforts of our Electric and Telecommunication borrowers liability issues soon slowed the effort. The Vice President has renewed the effort and we estimate the total cost will be $50 million. The $5 million requested in this budget will finance the installation of the necessary equipment at 15 to 20 of the highest priority sites. In all cases we will make every effort to use existing towers which will reduce the cost per site by $200,000. This is a very small investment that could save a significant number of lives and help reduce the billions in property loss each year due to these storms.

RURAL UTILITIES SERVICE

Mr. Chairman, the Rural Utilities Service administers programs that have a long and proud history of contributing to the economic growth and stability of rural areas. These programs led to the economic prosperity of rural America and they continue to provide the infrastructure necessary to ensure economic growth in those areas that are still experiencing economic difficulty. While many have argued in prior years that these programs are no longer needed, the reality is that the need has only shifted from initial connectivity to electric and telephone service to maintenance of an aging infrastructure. The current argument from some quarters is that deregulation of the electric and telecommunications industries will drive down the cost of these services and that the service can be provided by the private sector. Mr. Chairman, there is a reason that the Federal government led the way in providing electric and telephone service to rural areas; the profit was not there to induce the private sector to make the initial investment and most rural areas are still not profit centers. And while competitive pricing will reduce prices on a macro level, the situation could be quite different on a micro level, particularly in rural areas. We must maintain our vigilance and ensure that rural areas are fairly treated in this

era of deregulation. Many rural areas are currently having a very difficult time maintaining or attempting to rebuild viable economies. Rural economies are very sensitive to even minor changes and we should be very cautious as we proceed with deregulation.

The budget request for Rural Utilities is $3.4 billion, a slight increase over fiscal year 1999 and the necessary budget authority required to support the request is almost $100 million less than that needed in fiscal year 1999. Due to the growing demand for electric loans we are proposing a new direct loan program. The loans from this new $400 million program would be made at the Treasury rate requiring minimal budget authority. In total, we are requesting $1 billion for electric loans. For telecommunications loans, including the Rural Telephone Bank, we are requesting $645 million. We are again proposing the Rural Telephone Bank begin operating as a performance based organization with the goal of achieving privatization within ten years. We are in the process of finalizing legislation which will be submitted to Congress shortly to effect this transition.

DISTANCE LEARNING/TELEMEDICINE

For Distance Learning/Telemedicine loans and grants, the budget requests a total of $220 million, an increase of $58 million. The demand for this program continues to grow because it makes a real and immediate difference in people's lives, and the potential of the program increases with every improvement in technology. Rural Americans must be connected to the information superhighway, not because of the educational and medical purposes, but also because such access opens limitless opportunities for new business opportunities.

WATER AND WASTE DISPOSAL

We are requesting an increase of $156 million for the water and waste disposal and solid waste loan and grant programs at a cost of almost 50 percent less than required for fiscal year 1999. The total request is just less than $1.5 billion. This level of effort will provide new water service to approximately 650,000 rural residents, improved water service to 1.3 million rural residents and improved waste disposal services to another 600,000. Under the Water 2000 Initiative, RUS will devote a portion of its resources to those families lacking running water in their homes or experiencing serious problems with drinking water. A side benefit of this investment is the creation of over 40,000 jobs, primarily in the construction trades, in rural areas.

Mr. Chairman, the economic problems affecting many rural areas are most easily explained by the fact that 50 percent of all of the jobs in non-metropolitan areas are in the service industry. While these jobs are vital to local economies, they often do not provide enough income to support a family at anything but a subsistence level. More than 60 percent of the rural families with incomes below the poverty level have family members with some type of employment, and 23 percent of the rural poor were either full time workers or were in families with one or more full time workers. Over half of the jobs in rural areas pay less than $17,000 annually and another one quarter pay less than $12,000. In most of these same areas we also find deficiencies in transportation, infrastructure, health care and social services. Increasing the incomes through the creation of employment is the best and most permanent solution to these problems and that is what we do through the efforts of the Rural Business-Cooperative Service.

RURAL BUSINESS-COOPERATIVE SERVICES

The budget request for these programs is $1.2 billion, a slight increase over the level provided for in fiscal year 1999. The request for the business and industry loan guarantee program is $1.0 billion, the same level as last year. Mr. Chairman, a recent report issued by the General Accounting Office demonstrates the commitment of this Administration to improve the stewardship over taxpayer dollars. While the program level has increased from $100 million in fiscal year 1993 to $1 billion, the amount of outstanding principle delinquent has decreased from 22.5 percent to 6.1 percent and the percentage of borrowers delinquent has dropped from just under 14 percent to 5 percent. This is a significant accomplishment and I am very proud of this staff.

The budget also requests $52 million for the Intermediary Relending Program, an increase of $19 million over fiscal year 1999. This level of funding will leverage an additional $197 million in investment capital and create more than 12,000 jobs. These funds are relent 3 or 4 times, which in turn creates more employment opportunities over the life of the original loan. For Rural Business Enterprise grants, we are requesting $36 million, $1 million less than available for fiscal year 1999. We

are also requesting $5 million for Rural Business Opportunity Grants to provide partnership technical assistance planning grants to help rural communities develop comprehensive economic revitalization strategies.

For rural cooperative development grants, we are requesting $7 million, an increase of $3 million. Rural cooperatives are growing both in numbers and in terms of non traditional types of cooperative-businesses. Cooperatives are forming business alliances with private corporations, engaging in value added processing and beginning to enter the retail and export markets. Expanded use of the cooperative form of business is helping retain income in rural areas. The additional funding will aid in providing technical assistance to small farmers and small farm related operations in developing marketing and management skills. We are also requesting $2 million to continue cooperative related research through universities. In the past, this effort has been funded at the same level through the salaries and expense account. To further aid the formation of new cooperative businesses, we are again proposing to utilize up to $200 million in business and industry loan guarantees specifically for new cooperative businesses, including the guarantee of loans to individual members to purchase stock in a new cooperative. The level of funding requested for the Rural Business-Cooperative Services will help create or save about 100,000 jobs throughout rural areas.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

The budget request for the Alternative Agricultural Research and Commercialization Corporation is $10 million, a significant increase over the level provided for fiscal year 1999. This level of funding will aid in bringing six new agriculturally based products to market and create about 1,500 jobs.

Empowerment Zones/Enterprise Communities The budget request also includes $15 million for the second year funding for the five new rural Empowerment Zones and 20 new Enterprise Communities. As you know, the designations were announced in January of this year. The Administration is also proposing legislation which would provide mandatory funding in fiscal year 2000 and the out years for these communities. Our experience with the rural Empowerment Zones/Enterprise Communities is demonstrating that this approach to community revitalization is very successful because it involves the entire community, it empowers local residents to develop their own solutions and time-frames, and it addresses structural problems comprehensively rather than from the perspective of narrowly focused categorical assistance programs.

SALARIES AND EXPENSES

Mr. Chairman, the Rural Development Mission Area is blessed with very capable, dedicated employees and it is only because of them that we have been successful in restructuring our field offices, downsizing the work force, re-engineering some of our business processes and still effectively delivering the programs. The vast majority of our employees are in the field offices and know first hand the value of the programs we administer because they live in rural areas. The number of full time employees has been reduced from over 9,500 to 7,100 since fiscal year 1993, a reduction of 26 percent in a very short time frame. During the same time frame the Rural Development program level has increased from about $7 billion to $10.9 billion, an increase of 56 percent. Also during this same time frame we have asked our employees to take on additional responsibilities. We have reached our streamlining targets, and our employment will not decrease any further, unless we do not receive sufficient funding for salaries and expenses.

The Secretary has recently decided to proceed with the implementation of administrative convergence, which will consolidate many of the headquarters and field administrative functions of the Natural Resource Conservation Service, the Farm Services Agency and Rural Development, as a means to achieve savings through improvements in administrative support. I am a strong supporter of this effort.

The budget request for Salaries and Expenses is $542 million, an increase of $25 million over the level available in fiscal year 1999. There is no fat in this request. We have for too long deferred needed investments in a number of areas, particularly in information technology and accounting systems. Some of these systems are seriously outdated and incompatible with much of the current software that would allow us to work more efficiently. One firm visiting some of our field offices referred to them as museums for computer equipment.

Mr. Chairman, both the Congress and the Administration can take pride in the accomplishments in reinventing and restructuring the federal government. However, we should ensure that we leave as our legacy a more effective and efficient system, not one that cannot function due to the lack of sufficient support. Our employees

take great pride in what they do and they deserve our strong support. I ask for your serious consideration of this request.

This concludes my comments. The Administrators and I are available for any questions the Members of the Subcommittee might have.

RURAL HOUSING SERVICE

PREPARED STATEMENT OF JAN E. SHADBURN, ADMINISTRATOR

Mr. Chairman and members of the Committee, thank you for this opportunity to testify on the President's fiscal year 2000 budget proposal.

As you and the members of the Committee well know, the Asian economic crisis of the past year as well as drought, disease, and numerous other problems have had devastating effects on America's farmers, ranchers, and agricultural communities. Rural manufacturers have felt the effects as well, as they find that foreign markets can no longer absorb their products. The more than $5 billion for farmers and ranchers which you appropriated last year is helping to shore up the economies of rural communities across America. More will need to be done, though, as production agriculture and manufacturing continue to lose jobs to increases in productivity and other factors.[1] Rural communities need help retaining their members, attracting new residents, and providing basic services. Rural Housing Service (RHS) programs meet these needs. Through partnerships that span the private, nonprofit, and public sectors, RHS provides rural American communities with affordable rental housing, homeownership opportunities, child care facilities, schools, and a multitude of services for the elderly. Together, these programs enhance community livability, create jobs, and add to local tax bases, giving rural communities the resources they need to grow and prosper.

RURAL HOUSING SERVICE PROGRAMS HELP LEVEL THE PLAYING FIELD FOR RURAL CHILDREN

Today, rural children are at an economic disadvantage compared with urban children. Twenty-four percent of America's 14 million rural children live in poverty. To show you how insubstantial the resources for these children are, the poverty threshold in 1996 for a family with two adults and two children was $15,911; for a family with one adult and one child, it was $8,163. Children of color bear a tremendous share of this burden: 50 percent of rural African American children live in poverty, as do 46 percent of rural Latino children and 41 percent of rural Native American children. Urban children, by contrast, are better off: they are less likely to live in poverty and more likely to live in middle- and upper-class homes. In 1997, 39 percent of urban children lived in households with incomes higher than 300 percent of poverty, compared to only 25 percent of rural children. Rural children deserve the same opportunities as urban children. By providing affordable and safe rental housing, homeownership opportunities, and essential community facilities such as child care centers and schools, RHS can help rural communities level the playing field.

Rural communities often have difficulty housing their poor citizens for the following reason: poor rural people cannot afford their housing because they lack the necessary income, not because rural housing is very expensive. In fact, almost 60 percent of poor rural households who pay more than 30 percent of their income towards housing and utilities pay less than $500 each month for housing costs. As you know, many families find it difficult these days to make ends meet, even when they work full time. Wages in rural areas are often insufficient to lift families out of poverty.

The RHS Section 521 Rental Assistance program, the Section 515 Rural Rental Housing program, and the Section 514/516 Farm Labor Housing program directly address the problem of housing affordability by filling the income gap. In fact, the average income for tenants in Section 515 and Farm Labor Housing is $7,300. The Rental Assistance program ensures that families living in Section 515 and Farm Labor Housing pay no more than 30 percent of their incomes toward rent and utilities by providing landlords with a grant to make up the difference. Even with Rental Assistance, some families have so little income that they must make choices be-

---

[1] Throughout this testimony, I describe current socioeconomic conditions in rural America. All of the statistics and trends I cite come from the USDA Economic Research Service's (ERS's) 1997 and 1998 Rural Conditions and Trends Socioeconomic Conditions Issues, as well as from 1998 Agricultural Outlook reports. ERS typically reports these data in terms of "non-metropolitan" and "metropolitan". For convenience, I use the term "rural" to refer to non-metropolitan and "urban" to metropolitan.

tween necessities such as medicine and food. The Section 515 and Farm Labor Housing programs decrease the income gap by providing very low interest loans and grants to developers, who in turn are able to provide tenants with below-market rents for safe and comfortable housing. Currently, 225,750 households receive Rental Assistance. About half are young single people and families, and the remainder are elderly. More than 452,000 families are living in the decent, safe, and comfortable housing that the Section 515 and Farm Labor Housing programs provide. Illustrative of the tremendous need for this housing is the fact that 86,000 Section 515 and Farm Labor Housing tenants pay more than 30 percent of their income towards rent, and 29,000 pay more than 50 percent, yet these families remain in RHS housing. Even though they are heavily rent overburdened, these tenants still see RHS housing as their best alternative.

The President's proposed $640 million Rental Assistance budget will enable 41,800 households to remain in either Section 515 or Farm Labor Housing, helping young families to provide a stable environment for their children and affording elderly households the income security they would not otherwise have. The proposed budget will also provide Rental Assistance to new Farm Labor Housing apartments as well as to rehabilitated Section 515 and Farm Labor Housing apartments. In addition, it will provide a limited amount of new construction and emergency servicing Rental Assistance. Emergency servicing Rental Assistance is crucial in disasters such as the recent California citrus freeze, which by destroying citrus crops also devastated the economies of numerous small towns and took away the seasonal jobs of hundreds of agricultural workers. Without the emergency Rental Assistance RHS is providing, those agricultural workers who live in RHS's Section 515 Rural Rental Housing would have not have been able to make their monthly rent payments, jeopardizing not only their own housing security but also the financial viability of their entire Section 515 complex.

The President's budget of $100 million for the Section 515 Rural Rental Housing program will ensure that RHS is able to maintain its 17,000 complexes in good repair and to provide approximately 1,900 new apartments. Funding for the Section 515 program directly benefits the very poorest children, their parents, and elderly people. These are people whom communities struggle to provide with good housing.

The President's $40 million budget for the Farm Labor Housing program will allow RHS to provide farmworkers and their families with approximately 600 new apartments and 350 rehabilitated apartments. Farmworkers are one of the most poorly-housed populations in the country, and, as I have already pointed out, 46 percent of rural Latino children live in poverty. The 113 additional units that the proposed budget increase provides will ensure that at least a few of these children are able to live in the safe, pleasant housing that is so often out of reach for farmworkers.

RHS is working to improve tenants' quality of life and self-sufficiency by promoting on-site services such as computer training, reading programs for children, resume preparation for job seekers, tutoring services for children and adults, health services, Meals on Wheels, and fitness classes. By working together with the Office of the Inspector General (OIG) to find and correct any fraud or abuse, we are also making sure that the most vulnerable in our society are protected. This partnership with the OIG complements our implementation of the reforms you mandated, as well as the over 100 administrative measures we have taken to improve the program.

For those families with low and moderate incomes who wish to rent apartments, RHS has begun providing the Section 538 Rural Rental Housing guaranteed loan program. The average rent for a Section 538 apartment is $455 per month. The President's proposed budget of $200 million for this program will allow RHS to provide almost 5,400 new apartments to rural families. Included in the President's budget is a legislative proposal which would remove the requirement that 20 percent of loans be subsidized, thereby removing the main source of subsidy cost. This legislative change would allow RHS to receive twice as much money and provide twice as many apartments as it would be able to were the subsidy requirement to remain.

I have discussed the rental housing options RHS provides rural American families and their communities. Now I would like to spend a few minutes telling you about how we serve rural families who have demonstrated their ability to repay a loan and wish to own their home. The Section 502 direct loan program, and its companion program, the Mutual Self-Help Housing program, are targeted at people who earn 80 percent or less than the median income in their area. These programs give borrowers and their children the boost they need to move out of poverty. We recently commissioned the USDA Economic Research Service (ERS) to conduct a national survey of borrowers who have received Section 502 direct loans since 1995,

whether for Self-Help or for contractor-built homes. The results were impressive. First, 25 percent of borrowers had at some time received government rental assistance. As a matter of fact, we know that many of the families who participate in the Self-Help program are farmworkers who once lived in RHS-funded farm labor housing. Now these families are paying a mortgage, and by the time they leave the program they are likely to have moved off interest credit and to be paying the note rate on their loans. The ERS survey shows that 83 percent of borrowers were first-time homebuyers. Ninety percent said that they were living in a better home than they were before, and 61 percent said they were living in a better neighborhood than before. To show you what a good investment we have been making over the past four years, Section 502 homes seem to have appreciated in value, with a median purchase price of $64,800 and an estimated current value of $72,000. RHS borrowers are sinking roots into their communities, providing their children with so many benefits: a comfortable and safe home they can be proud of, a better neighborhood, and, eventually, equity against which to borrow for a college education, a business expansion, or even another home.

Let me share with you what a difference the Section 502 direct loan program has made in the life of one Mississippi family. Ms. Ruby Jean Lee is a 48-year-old single parent of three children, ages eleven, thirteen, and seventeen. She is currently employed at Northwest Community College in Senatobia and earns an annual income of $9,300. Until a few days ago, she and her children were living in an overcrowded old wood-frame house with a leaky roof, weak floors, inadequate heat, and nonfunctional plumbing. In July 1998, Ms. Lee applied for a Section 502 direct loan. She was certified eligible, and in October she closed her loan of $65,000. She and her children moved into their new three-bedroom, two-bathroom home in February 1999. Ms. Lee and her children finally have a water-tight roof, good heating system, solid floors, and indoor plumbing that works. The Section 502 direct loan program that is included in the President's budget will allow for 1,730 more such opportunities, for a total of 16,630 families.

The President's budget provides a $4 million increase for the Self-Help Housing Technical Assistance Grant program, bringing the program level to $30 million. This increase will allow RHS to provide approximately 16 new technical assistance grants to Self-Help organizations in underserved communities such as Empowerment Zones and Enterprise Communities, as well as in areas which currently do not have a Self-Help program. It will also allow 1,900 families to build their own homes, an increase of 370.

For low- and moderate-income families, RHS offers the Section 502 Single Family guaranteed loan program. This program eliminates the downpayment barrier that prevents many young families from becoming homeowners by providing financing for the full value of the home. The President's budget of $3.2 billion for the Section 502 guaranteed loan program will finance more than 34,000 homes.

RHS multi- and single-family housing programs provide high quality, affordable housing to rural American families. Communities benefit from these programs not only because they increase their housing stock but also because they realize the jobs, local taxes, and fees generated by construction. Using the National Association of Home Builders' estimates of the economic benefits generated by housing construction, the President's budget for RHS multi-family housing will create and preserve more than 8,000 jobs in construction and construction-related industries, $268 million in wages, and $142 million in combined federal, state, and local revenues and fees. The President's single family housing budget will create and preserve more than 35,000 jobs, $1.1 billion in wages, and $601 million in revenues and fees.

In order to retain and attract young working families, rural communities must offer not only safe and affordable homes but also good day care and schools. Today, rural children under the age of six face higher poverty rates than older children, with children of color bearing a disproportionate burden: young African American children are three times as likely to be poor as white children, and young Latino and Native American children are twice as likely. Research by ERS suggests that the reason young children suffer higher poverty rates than older children is that rural areas lack the child care facilities which enable parents to go to work. Many rural parents face a tough choice: go to work to increase their family's income but worry constantly about whether their children are safe and well cared for, or live in poverty in order to stay at home to take good care of their children. RHS's Farm Labor Housing and Community Facilities programs offer a way out of this dilemma by providing much-needed safe, high quality child care facilities.

Although housing complexes financed through the Farm Labor Housing program are not required to provide child care facilities, these facilities are an eligible loan purpose of the program, and many borrowers have taken advantage of the opportunity to provide them to their tenants. These facilities are critical to farmworker

families, whose economic circumstances are sometimes so dire that they must bring their young children with them into the fields. RHS is continuing to encourage its Farm Labor Housing borrowers to build child care facilities. RHS has also greatly augmented the number of child care facilities it funds through the Community Facilities program, financing 13 centers in 1995, 19 in 1996, 33 in 1997, and 46 in 1998. The facilities financed in 1997 and 1998 alone will serve more than 10,000 children, and we plan to continue this high level of commitment to providing child care facilities.

One of the biggest determinants of success in life is education, and mobile young families often relocate to be near good schools. Because small rural communities have difficulty obtaining funds to build and repair educational facilities, RHS provides these communities with Community Facilities direct loans, guarantees, and grants. RHS has funded schools, including schools for people with mental or physical disabilities, teacher housing, dormitories, and all-purpose college campus buildings. We have also joined a partnership with the American Indian Higher Education Consortium to assist this organization with funding tribal colleges. Since 1993, we have provided $3 million in direct loans and grants to build college facilities in Montana, North Dakota, and Arizona. In addition, Rural Development State Directors with large Native American populations have been expanding their outreach and communication with tribal leaders. As a result of this interaction, we expect in the future to be funding more community facilities and housing for Native Americans.

The President's proposed $473 million budget for the Community Facilities direct loan, guaranteed loan, and grant programs will ensure that we are able to continue these expanded child care and educational services, as well as to continue our commitment to providing high quality health care and emergency services facilities. The increases in the direct loan and grant programs will allow RHS to expand services in the most distressed communities, including Empowerment Zones and Enterprise Communities.

RHS PROGRAMS PROVIDE RURAL AMERICA'S ELDERLY POOR WITH SAFE AND AFFORDABLE HOUSING

In 1996, 9 million of rural America's 54 million people were 60 years old or older. Twenty-nine percent of rural seniors between the ages of 60–74 were poor or near-poor (100–149 percent of the poverty level), as were a staggering 42 percent of people over the age of 74. Poverty among seniors increases with the degree to which their surroundings are rural, with elderly poverty rates being highest in the most remote areas and the lowest in urban centers. Ironically, because the likelihood of poverty among seniors increases with age, those who typically have the greatest need for assistance with the tasks of every day life are the least able to pay for it.

The children of the Great Depression worked all their lives to build the rural economy. Many of them did not work in jobs with retirement plans, and they survive on their monthly social security check, food stamps, and Supplemental Security Income (SSI). Many of them are living in housing worse than what they had during the Depression and to varying degrees are struggling to take care of themselves. Often, their children lack the resources to help them, as do their communities. Every day, through its home repair, rental housing, and community facilities programs, RHS provides modern housing for the first time to elderly people who have been chopping wood for heating or walking to a well for water because their homes are so decrepit.

The Section 504 grant and loan programs directly address the housing rehabilitation needs of very low-income seniors who own their own homes.[2] The median income of beneficiaries of both programs is less than $9,000. Often, our customers have no choice but to remain in the substandard homes in which they have lived for decades, and the programs makes a tremendous difference in their quality of life. The President proposes a budget of $30 million for the grant program and $32.4 million for the loan program. Combined, this funding will allow both of these heavily oversubscribed programs to improve the homes of 11,200 households with basics most Americans take for granted: a roof that does not leak, indoor plumbing, an air conditioner, an electric or gas heating system, a solid floor, or an electrical system that meets the fire code. They will also allow seniors to retrofit their homes to accommodate disabilities, for example by installing low counters, handrails, and ramps for wheel chairs.

---

[2] The Section 504 grant program is limited to rural seniors while the Section 504 loan program is available to any rural person with a very low income. However, 60 percent of loan program beneficiaries are seniors.

The Section 515 program provides a highly valued residential alternative to relatively independent rural seniors who find that they can no longer keep up with the yard work and structural maintenance that homeownership requires. In addition to being virtually maintenance-free, Section 515 apartments for elderly and disabled people are equipped with special amenities such as strategically placed handrails and emergency call buttons or lights with which to signal for help. They are also wheelchair accessible. Managers of these complexes often arrange for services such as transportation, grocery and pharmaceutical delivery, Meals on Wheels, health screenings, and entertainment, and they make sure that the community rooms stay in constant use. In addition, a small percentage of Section 515 complexes offer congregate facilities in which seniors receive at least one meal per day. Many seniors in Section 515 housing receive Rental Assistance, as well, enabling their small incomes to go further to cover costs of prescription drugs, food, and other necessities.

Margaret Bakken is one of the more than 180,000 seniors who is currently benefiting from Section 515 housing. She also receives Rental Assistance. In October 1989, she and her husband Norbert Bakken, who then were 77 and 85 years old respectively, completed an application to live in the Section 515-funded Pine Ridge Apartments in Ridgeland, Wisconsin. Their rural Chetek home was heated only by wood and lacked plumbing and an indoor toilet. Mr. Bakken was physically unable to chop wood and haul water, so Mrs. Bakken had to perform these demanding tasks every day. At the time she and her husband applied to live at Pine Ridge, she could no longer keep up with these chores and with the maintenance of her old house. She was worried about how she and her husband would survive the coming winter. Mr. and Mrs. Bakken were overjoyed and extremely grateful that their application was accepted and that they could move into a warm, comfortable, and secure apartment. Without the aid of the Section 515 program and a monthly Rental Assistance payment of $261, the Bakkens could not have afforded such a nice home on their annual income of $6,960. In December 1995, Mr. Bakken passed away. Mrs. Bakken, now 87 years old, remains a tenant at Pine Ridge Apartments. She tells us she loves her home and enjoys the quiet, safe environment. The assistance she receives through RHS allows her to live a comfortable life, unlike many of her peers.

In addition to providing housing repair loans and grants and subsidized rental housing, RHS also provides elderly rural Americans with numerous community facilities, including assisted living facilities, boarding homes, adult day care centers, intergenerational care centers, retirement homes, and nursing homes. The program also invests heavily in rural health care facilities, from which seniors typically benefit in great measure. In 1997, RHS invested $51 million—23 percent of its total Community Facilities funds for the year—to either build or make improvements to 33 senior facilities. In 1998, we invested $43 million in 40 facilities. We plan to continue our commitment to serving the ever-increasing rural elderly population.

RHS AND ITS PARTNERS LEVERAGE THEIR RESOURCES TO BUILD COMMUNITIES

None of the programs I have described would be successful without the help of our many partners. Without the strong interest and support of our network of 2,000 private lenders, the Section 502 guaranteed loan program would not have been able to help 39,400 families become homeowners last year. These same lenders are also working hard to make our Section 538 guaranteed loan program a success. Our nonprofit technical assistance grantees are at the heart of the Section 523 Mutual Self-Help Housing program, which has made homeownership a reality for thousands of people for whom it seemed impossible. Nonprofit organizations also help package our loans, performing valuable outreach to underserved communities in the process and helping to stretch our limited staff resources. And our nonprofit and government partners in the Rural Home Loan Partnership have played pivotal roles in expanding the reach of the Section 502 direct loan program. Thanks to the combined efforts of the Rural Local Initiatives Support Corporation (Rural LISC), the Federal Home Loan Bank System, the Office of Thrift Supervision, the Federal Deposit Insurance Corporation, and RHS, in 1998 the Partnership made home loans worth $19.8 million ($13 million in Section 502 direct loans, $6.8 million from private and nonprofit lenders) to help 284 families become homeowners. Nonprofit community development corporations provided them with homebuyer education to ensure that they will be successful borrowers.

Finally, let me discuss the contributions of our most important partners, the citizens of rural America. So often we hear of how a town's citizens rally to improve the housing conditions of one of our customers. In an Appalachian community in eastern Ohio, for example, students at the high school build one new home each year for a local family. In a community with an unemployment rate of 10 percent,

their contribution makes a real difference. Recently, one young couple with a four-year-old child received one of these homes, which they financed through a $70,000 Section 502 direct loan. Through this arrangement, the family was able to save $20,000 in labor costs, and the students learned marketable construction skills.

Another fine example of RHS and a community working together to improve the life of a local resident took place in southern New Mexico. An eighty-six-year-old woman, who has been deaf since childhood, has lived her whole life in the home her parents built. When the woman's friends approached the local public works office and the local Rural Development office for assistance, her home lacked a septic system and indoor plumbing, had no kitchen facilities other than a wood stove, and had a leaking roof and a dirt floor. Rural Development was able to provide a Section 504 grant for $7,500. The public works employees began soliciting help from the community to augment this grant. They were able to secure $10,000 in materials and donated labor. Many citizens from the town, as well as Rural Development and public works employees, provided their labor to the renovations. When the renovations were completed, the home had a new roof, floor, kitchen, septic system, and remodeled interior. Because so many people from the city, various businesses, and private individuals donated their time, money, and materials to remodel this home, this Section 504 grant truly turned into a community development project.

Mr. Chairman and members of the Committee, with your continued support, RHS and our thousands of partners around the country will continue to lay the foundations for a strong rural America.

RURAL UTILITIES SERVICE

PREPARED STATEMENT OF WALLY BEYER, ADMINISTRATOR

Mr. Chairman, members of the subcommittee, thank you for the opportunity to submit the President's fiscal year 2000 budget and program proposals for the Rural Utilities Service (RUS). I want to begin by thanking you and the members of the subcommittee for your continued support for the infrastructure programs and policies of rural America. Together, we are helping rural America invest in its communities and its future.

A safe, affordable, modern utility infrastructure is a key component of economic competitiveness. It is also a fundamental building block of economic development. Dramatic regulatory and market changes are occurring in the telecommunications, electric and water utility sectors. Without the help of the RUS, rural communities will have a very difficult time financing their utility investments.

At RUS, we are continuously working to enhance rural utility efficiency by encouraging system mergers, leveraging private capital and forging new partnerships for economic development. We are reforming our program regulations to be more customer friendly, focusing our resources on rural development and loan security.

The nearly $42 billion RUS loan portfolio includes investments in approximately 7,500 small community and rural water and wastewater systems, and 2,000 telecommunications and electric systems, servicing approximately 84 percent of America's 3,096 counties. This 64-year old local/federal partnership is an American success story. It is a partnership providing critical infrastructure to 80 percent of the nation's landmass while enhancing the lives of 25 percent of the nation's population. That infrastructure spurs economic growth, creates jobs, and improves the quality of life in rural America. The vitality of rural communities truly depends on access to modern, reliable, and affordable utilities.

REFORM, REINVENTION AND RESPONSIBILITIES

RUS is not your mother and father's REA! We are working to make RUS pro-active in a rapidly changing utilities market. The success of the public-private partnership between RUS and its borrowers depends on the ability of borrowers to respond quickly to changing conditions. Consistent with the spirit of reinvention, the RUS continues to streamline its policies, offering borrowers more flexibility in financing, while ensuring safe, reliable modern utility service to rural Americans.

Specifically, RUS has reinvented its focus and activities by:

—Targeting scarce Federal grant funds and limited budget authority to those areas of our country that do not have basic utility infrastructure; to those areas with the highest poverty levels and out-migration of human, financial, and economic resources; and to our Native Americans;

—Developing varied and flexible financing programs that result in substantial interest savings to RUS electric borrowers. Since 1993, RUS has refinanced or re-

priced $9 billion of high interest Federal Financing Bank loans, saving rural consumers $227 million;
—Reducing regulatory burdens enabling eligible borrowers and rural communities to more effectively and efficiently participate in RUS programs;
—Eliminating and simplifying RUS loan approval processes, allowing borrowers to respond more quickly to the ever-changing financial and economic markets;
—Automating loan processing functions to provide borrowers faster access to loan and grant funds while reducing the administrative costs incurred by the Federal government. Processing time for RUS loans has been slashed from 9 months to less than 1 month;
—Networking with Federal, State, and local government agencies in an advocacy role for rural citizens;
—Servicing an electric industry in revolution both technically and financially;
—Promoting a paperless society that makes the Federal government more responsive to its customers while decreasing the national paperwork burden; and
—Leading the way to Y2K compliance. Since 1996 RUS has been a leader in the effort to promote Y2K compliance among rural utilities.

THE FEDERAL PARTNERSHIP WITH RURAL AMERICA

A diversified rural economy requires investment in infrastructure, and quality education and health care to foster economic growth. Affordable power creates on farm and off-farm employment. Modern wastewater treatment systems along with clean drinking water improve the rural environment and health. We must provide rural children with educational opportunities that will enable them to compete with the best and brightest from around the world. Our rapidly aging rural population must have affordable access to quality health care. Rural businesses need state-of-the-art communication technologies and affordable power to create new jobs and enhance the quality of life. All Americans should have a healthy environment and safe, clean drinking water and have their commercial and recreational water resources protected from contamination. RUS is helping rural communities in each of these areas.

Our goal is to help provide rural America with the tools and resources necessary to realize the full extent of its potential. We are applying creative thinking, personal commitment, and customer service to program delivery.

TELECOMMUNICATIONS—50 YEARS OF PROGRESS

1999 marks the 50th Anniversary of the RUS Telecommunications Program. In 1949, when the Telecommunications program started, only about 39 percent of U.S. farms were receiving telephone service of any kind. During Congressional hearings, many witnesses testified to both the need and demand for rural telephones, for area coverage, and for a source of long-term financing to change from magneto to dial. A new era for rural telephony began with enactment of the REA telephone loan legislation. Congress ensured that adequate telephone service be made generally available in rural areas and to the widest practicable number of rural users of such service.

Today, 50 years later, the RUS Telecommunications Program and the Rural Telephone Bank (RTB) have developed into successful, forward-focused programs with a continuing, strong demand for investment capital. We are making certain that Rural America succeeds in the digital age.

Advanced telecommunications services are crucial to rural America's economic development. Rural businesses must be able to compete and rural residents need better access to the global economy, quality health care, and quality educational opportunities. The concept of "basic" voice telephone service no longer exists. "Core" services, defined in terms of speed and bandwidth, that evolve with new technologies must be established and delivered to rural America.

Loans made by the RUS Telecommunications Program and RTB affect the lives of many rural residents. Rural telecommunications are providing advanced communications technologies for rural businesses, increased educational opportunities for rural students, and improved health care for rural residents. RUS and the RTB are working hard to assist borrowers in enhancing the standard of living, ensure the quality of life, and bring about economic development to rural America. As we approach the 50th anniversary, RUS has seen an increased demand for its financing.

This year's telecommunications budget proposes $560 thousand in budget authority to support $50 million in direct hardship telecommunications loans and $2.4 million in budget authority to support $300 million in Treasury-rate loans, as well as $3.3 million in budget authority to support $175 million in Rural Telephone Bank (RTB) loans.

The successful implementation of the Telecommunications Act of 1996 is critical for rural consumers. In addition to being a lending agency, RUS continues to be an advocate for rural citizens before federal and state regulators. We firmly believe that the benefits of the digital revolution must be shared by all Americans. Continued capital investments and operational and technical support are critical to maintaining a high level of quality in areas served by RUS borrowers.

The budget also reflects our commitment to privatize the RTB within the next 10 years. By establishing the RTB as a performance based organization (PBO), the RTB can demonstrate that its financial and managerial independence is consistent with privatization goals. The cost of the subsidy budget authority and administrative expenses would be paid from the unobligated RTB liquidating account balance in fiscal year 2000.

DISTANCE LEARNING AND TELEMEDICINE

In the Distance Learning and Telemedicine (DLT) Program, the budget request of $20.7 million in budget authority will support $200 million DLT loans and $20 million in DLT grants.

The Distance Learning and Telemedicine Program provides financial assistance for rural education and health care providers seeking to utilize advanced telecommunications technologies. DLT loans and grants provide needed infrastructure and high technology end-use equipment for rural areas. This program is a powerful complement to the e-rate which provides discounts for monthly services and connections to schools, libraries, and rural health care facilities. The Federal Communications Commission administers the e-rate as part of the Universal Service Support System. The DLT program and the e-rate provide an unparalleled opportunity to use telecommunications to enhance rural education and health care providers.

Vice President Gore said it best when he announced the 1997 DLT awards. He stated: "This country cannot afford a digital divide between those who have access to the benefits of the Information Superhighway and those who do not."

Since 1993, the DLT program has funded 252 projects totaling $68 million in 43 states and two U.S. territories. These projects serve 850 schools and learning centers and 600 hospitals and rural health clinics. The DLT programs provide seed money to leverage almost two times its investment from other private and public sources.

Simply put, rural Americans must be connected to America's Information Superhighway. USDA/RUS is the catalyst for this rural connection.

ELECTRIC PROGRAM

The Electric Program budget proposes $10 million in budget authority to support a program level of $1 billion dollars. The President's Budget requests $450,000 budget authority for a hardship program level of $50 million; $9 million budget authority for a municipal rate program level of $250 million. The budget proposal provides a $300 million funding level for guaranteed loans. The loan guarantees do not require any budget authority.

The RUS Electric Program continues to serve one of the most effective local/public partnerships of the federal government. Today's program ensures that all areas of our nation have access to reliable, reasonably affordable, electric energy. We are also forging new and strengthened relationships with private lenders to offer RUS guarantee loans.

Over the last several years, changes have been made in the electric lending program to reduce the overall federal cost of the program. In an effort to reduce the cost of the electric program and provide yet another financing tool to meet increasing demand, the Administration again proposes a new Treasury Rate Loan Program to complement its existing loan programs. This $400 million loan program can be generated with only $320,000 of budget authority.

Each RUS electric loan dollar leverages an additional three dollars from private sources.

In the coming years, rural distribution and power supply systems will require continued assistance in upgrading and replacing an aging electric infrastructure to support growing electricity demand, new technologies, and a more competitive industry structure. For example, RUS financing will enable rural electric systems to replace aging, inefficient and undersized electric transformers and conductors to enhance the reliability of distribution and transmission systems to meet load growth while cutting line losses, improving energy efficiency, and reducing carbon and other air pollution emissions.

Demand for the RUS Electric Program exceeds available resources; there is currently a $1.3 billion waiting list for RUS electric financing assistance.

FINANCIALLY STRESSED BORROWERS

RUS is also working very closely with electric borrowers facing financial stresses from past nuclear and large base-load generating plant investments and from increasing pressures from wholesale and retail competition. In each instance, RUS is diligent in ensuring that work-out agreements maximize the recovery to the Federal taxpayers. Today, RUS is actively working with six financially stressed borrowers as compared with some 15 borrowers four years ago.

Since its inception, RUS has worked closely with its borrowers to ensure the integrity of its loan portfolio. The financial health of each RUS borrower is of the utmost concern to the Agency and when that health is threatened, RUS immediately undertakes the steps necessary to minimize delinquencies. RUS' loan security goals and debt collection activities maximize the collection of delinquent debts owed to the Federal government by ensuring that collection and correctional activities are promptly pursued.

WATER AND ENVIRONMENTAL PROGRAMS

This budget seeks $503 million in budget authority for Water and Waste Disposal (WWD) grants; $2.746 million in budget authority for solid waste management grants; and $63.9 million in budget authority to support $900 million in WWD direct loans and $75 million in guaranteed loans.

The budget request includes $20 million for Colonias along the U.S. Mexico border, $16.2 million for technical assistance and training grants, $5.3 million for the circuit rider program, $20 million for rural Alaskan villages, and $34.7 million in budget authority for loans and grants in empowerment zones and enterprise communities. Our budget request will also allow third-party grantees (such as rural water circuit riders) to make over 28,000 water systems and 29,000 wastewater system contacts to assist communities with intensive assistance, and through a clearinghouse effort taking 28,000 telephone calls and 11,000 electronic bulletin board and web site contacts.

As a result of the strong technical assistance efforts, both from staff and third-party grantees/contractors, loan delinquency and loan losses will remain low. Currently, 1 percent of borrowers are delinquent and since the inception of the water and waste disposal program less than 0.1 percent of the amount loaned has been written off.

The RUS program improves the quality of life and health of about 1.3 million Americans each year by bringing safe drinking water and environmentally sound wastewater facilities to those rural communities in the greatest need. The program is delivered by a field network of Rural Development employees who provide "hands-on" technical and financial assistance through the Rural Community Advancement Program (RCAP).

In the Water and Environmental Program area, RUS has shown great leadership in using information age technologies to add value and efficiency. A RUS Intranet allows program delivery professionals up to the minute information, the ability to seek advice, share best practices and to store forms, bulletins, regulations and staff instructions online.

WATER 2000 PRESIDENTIAL INITIATIVE

The Water 2000 Initiative has been very successful at investing in the people and places where safe drinking water is needed most. The program has been so successful that demand for funds exceeds supply. Based on the Administration's belief and policy that low income, high unemployment and high poverty areas with water-related public health problems have the greatest needs, we increasingly target drinking water and environmental investments to those areas.

In a state-by-state safe drinking water assessment performed in 1995, RUS found that at least 2.5 million rural Americans had very critical needs for safe, dependable drinking water, including almost one million people who had no water piped into their homes. Approximately 5.6 million more were found to have serious needs under the Safe Drinking Water Act standards. At that time, the costs of meeting rural drinking water needs were estimated at $10 billion.

Under Water 2000 targeting guidelines, over four fiscal years, RUS has committed almost $1.8 billion in loans and grants to over 1,000 of the nation's highest priority safe drinking water projects. Water 2000 projects serve communities with the most limited financial resources and highest poverty rates. Once completed, Water 2000 projects funded as of October 1998 will provide 380,000 Americans water for the first time for the first time from properly constructed, maintained and tested public sources.

Few tell the Water 2000 story as clearly or dramatically as Carole Buckland of Binghamton, New York. "The families of Park Terrace in the town of Binghamton, New York are out of water! Water, the very thing that humans need for survival!" Carole wrote in a letter to President Clinton, asking for help for her community. That letter triggered a series of events that brought Carole Buckland to Washington, D.C. on July 13th 1998 to meet Vice President Gore, who announced that Binghamton would have a Water 2000 project and that the Park Terrace families would have "water, . . . clean, safe water that would bring a quality of life that most of us take for granted."

We are proud of our record of helping rural communities help themselves bring drinking water and wastewater facilities to thousands of Americans—with strong emphasis on those who truly need our services most. As the application backlog illustrates, this is a huge job that directly affects the health and safety and economic well-being of rural America.

THE NEW TELECOMMUNICATIONS & ELECTRIC COMPETITIVE ENVIRONMENTS

To ensure that newly formulated policies address the role of rural utility systems in a deregulated marketplace, RUS has assumed a pro-active role in discussions with the Federal Communications Commission, Federal Energy Regulatory Commission and our partners in the Executive Branch to protect and enhance RUS loan security and improve the lives of rural residents. As this nation grapples with telecommunications and electric industry market reforms, RUS will remain in the forefront of these discussions and will lead the policy debate as it impacts rural Americans. In an ever-changing legislative and regulatory environment, ensuring the security of a $36 billion portfolio of telecommunications and electric loans while providing modern, high quality, reliable, and affordable infrastructure in rural America will present a formidable challenge into the 21st Century.

ELECTRIC RESTRUCTURING LEGISLATION

In 1998, President Clinton submitted legislation on electric retail market restructuring. Similar legislation is being prepared for reintroduction in 1999. I am pleased to report that the RUS made significant contributions to this landmark legislative proposal. No restructuring plan currently before the Congress is as complete or as sensitive to rural issues as the President's bill. The legislation recognized that restructuring will present challenges to rural areas and provide for a rural safety net of about $500 million a year to help mitigate any adverse effects on rural consumers. The USDA has looked very carefully at the effects of retail electric competition on rural communities. The proposal includes a flexible mandate, allowing states to opt out of retail competition. The bill also requires the Federal Energy Regulatory Commission to consider the multi-tiered nature of rural electric cooperatives; the tax exempt status of those cooperatives and the program interests and loan security of USDA in its rate-making authority. The RUS looks forward to working with the Congress to implement restructuring legislation which appropriately considers rural needs.

Y2K OUTREACH AND READINESS

In addition to working within the Rural Development Mission Area to ensure USDA's Y2K compliance, RUS has been a national leader on Y2K industry outreach. RUS featured its first Y2K presentation at its 1996 Telecommunications Engineering Symposium. In 1998, we aggressively brought the issue to the attention of our industry and community partners.

In our telecommunications and electric programs, we have surveyed our borrowers and issued regulations requiring borrowers to provide Y2K compliance statements for new loans and loan advances. We have offered our assistance and will expedite processing of Y2K related loan requests. For our Water and Environmental Programs, which are administered at the state level, RUS has utilized state program managers and circuit riders as well as our national conference to conduct effective Y2K outreach.

The RUS has also been very active in the President's Y2K council serving on the telephone, electric and environmental committees. Deputy Administrator Christopher McLean also serves on the Y2K Task Force of the National Association of Regulatory Commissioners.

RUS takes the Y2K situation very seriously. It is a matter of public health, safety and national security. Even if utility outages are limited and isolated, the consequences of Y2K failures for the communities affected will be no less grave. This problem can not be underestimated.

WEATHER RADIO

Already in 1999, savage winter tornadoes have ripped through the states of Arkansas, Tennessee and Mississippi. When disastrous weather strikes, the difference between survival and the loss of human life can be a matter of minutes. With early warning, families, especially children and the elderly can be afforded sufficient time to protect themselves in the face of oncoming tornadoes, flash floods and hurricanes. The National Oceanic and Atmospheric Administration (NOAA) Early Warning Weather Radio network can help provide that margin of safety. NOAA weather radio provides warnings of dangerous weather conditions to nearly 70 percent of all Americans. The 30 percent of Americans without NOAA weather radio broadcasts are, however, almost entirely in rural areas.

For several years, RUS has participated in this interagency effort to expand the coverage of NOAA Weather Radio and to upgrade the current system to an all hazards network that will also warn against potential terrorist, economic, and environmental dangers. We have already identified unserved areas and tower resources among RUS borrowers where NOAA weather radio transmitters could be installed. While there is much still to do in rural America, there are already several success stories to report from these efforts. The State of Alabama, for example, has achieved near total state-wide coverage.

I am very pleased to report that the President's budget includes a new $5 million grant initiative in the Rural Development Community Facilities program to be administered by RUS that will add approximately 18 new transmitters to the NOAA Radio Network.

RUS estimates that, at current costs, it will take about $50 million to increase NOAA radio coverage from its current 70 percent to 95 percent. The $5 million in the President's Budget is an important commitment and tremendous initial step towards protecting the lives of rural Americans.

NATIVE AMERICAN OUTREACH

The Federal government has a special responsibility to and relationship with America's Native peoples. Since the earliest days of rural electrification, this agency has focused special attention on tribal communities. One of our earliest electric borrowers was the Navajo Nation. In telecommunications, five out of the seven tribally owned telephones companies are RUS borrowers. The significant RUS investments in utilities service in Alaska, provide service to some of the most remote native Alaskan villages. Just this year, the RUS Telecommunications Program made its second loan to Sandwich Isles Communications to provide state of the art telecommunications service to native Hawaiians living on homeland territory. The DLT program has also funded 21 projects serving tribal areas.

RUS investments in drinking water and wastewater projects serving tribal and rural Alaskan communities have increased by nearly 400 percent since fiscal year 1993, and continue to grow. RUS is uniquely dedicated to helping unserved and under-served communities. We expect that in fiscal year 1999, the annual investment in tribes from our Water and Environmental Programs will exceed $25 million. Additionally, we are intensifying coordination of funds with the Indian Health Service and the U.S. Environmental Protection Agency (EPA) at higher levels than ever before.

CONCLUSION

USDA/RUS continues to help rural America build its future. Our ability to succeed in the next century depends, to a large extent, on the investments in productivity enhancing modern infrastructure. No where is that need greater than in rural America. With your continued support, RUS will play a significant role in advancing rural America's quality of life and enhancing its competitiveness in the global marketplace.

Thank you Mr. Chairman and the members of the committee.

SUBMITTED QUESTIONS

DEPARTMENTAL ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR COCHRAN

BRAVO INITIATIVE

Question. What is the BRAVO initiative and when was this initiative first funded?

Answer. Bringing Rural America Venture Opportunities, BRAVO, is a Secretarial business development program designed to assist Tribal entities—Indian Nations—in establishing small start-up information technology companies. BRAVO will create technology-based jobs on Indian Lands and in surrounding economically disadvantaged rural areas. Software development will be the initial services provided to USDA. Employees will be recruited/trained from Indian Reservations and economically disadvantaged individuals from surrounding areas.

BRAVO was officially initiated during fiscal year 1999 with the addition of one GS–15 project manager position to the Office of Small and Disadvantaged Business Utilization's, OSDBU, FTE ceiling. OSDBU absorbed the costs of the position and has requested resources to support the BRAVO project in the fiscal year 2000 budget.

BRAVO OBLIGATIONS

Question. The fiscal year 2000 budget indicates that $65,000 was obligated under other USDA appropriations for the BRAVO initiative in fiscal year 1999; no such obligations are projected for fiscal year 2000. Please explain.

Answer. As no funds were in Departmental Administration's fiscal year 1999 appropriation for BRAVO, OSDBU absorbed the cost. As OSDBU is a very small staff, one USDA program agency participating in BRAVO provided $65,000 toward the cost of this position. No such obligations are projected in fiscal year 2000 because OSDBU has requested funding for BRAVO as part of USDA's fiscal year 2000 budget.

TARGET CENTER

Question. What is the TARGET Center?

Answer. The United States Department of Agriculture, USDA Headquarters Technology Accessible Resources Gives Employment Today—TARGET—Center established in 1992, in Washington, DC, and the Midwest TARGET Center established in 1995 in St. Louis, Missouri, support all USDA employees Nationwide. The Centers' mission is to provide policy, guidance, and support for applying accessible technology solutions within USDA for employees with disabilities. The TARGET Centers ensure compliance with Section 508 of the Rehabilitation Act of 1973, as amended. Furthermore, the TARGET Centers support the Department's workforce diversity and Federal workforce policies.

The TARGET Centers provide a wide range of services to USDA and other Federal agency employees with disabilities, and their supervisors. Employees nationwide are able to request services from the TARGET Centers in order to address computer and telecommunication accessibility issues for employees with disabilities. These services include: evaluations, demonstrations, and assessments of assistive technologies and accommodations; review and analysis of accessible technologies; disability awareness presentations; coordination of training; resource information on accommodations, vendors, and technologies; contracting of accommodations services; technical support; consultations with managers and employees; and information provided in alternative, accessible formats.

The TARGET Centers track Federal, State, local, and private initiatives regarding accessible workplace technologies and accommodations. As a liaison between the Department, the computer industry, schools, public organizations and associations, the TARGET Centers provide crucial information to USDA to ensure that accessibility requirements of employees with disabilities are included in decision making processes.

Having established quality operational infrastructure, the TARGET Centers also support other Federal agencies through cross service agreements. These agencies include the Department of Housing and Urban Development, Department of Defense, Department of Energy, National Institutes of Health, and Food and Drug Administration.

An intricate component of the USDA Accessible Technology Program, the USDA Headquarters TARGET Center was highlighted in December 1998 as one of three Federal government best practices in Re-charting the Course, the first report of the Presidential Task Force on Employment of Adults with Disabilities. This report was presented to Vice President Al Gore on December 14, 1998. In recognizing the success of the Center, USDA seeks to strengthen the impact the TARGET Centers have in creating a fully accessible USDA computer and telecommunication environment.

FUNDING AND STAFFING LEVELS FOR DEPARTMENTAL ADMINISTRATION

Question. Provide a table showing the fiscal year 1997, 1998, 1999, and proposed 2000 funding and full-time equivalent staffing levels for the following Departmental

Administration activities: (1) Office of Civil Rights; (2) Office of Outreach; (3) Office of Procurement and Property Management; (4) BRAVO initiative; (5) Office of Small and Disadvantaged Business Utilization; (6) Office of Human Resources Management; (7) Office of Ethics; (8) Office of Operations; (9) Management Support Staff; and (10) Office of Administrative Law Judges/Judicial Officer.

Answer. The information follows.

FUNDING AND STAFFING LEVELS—FISCAL YEARS 1997, 1998, 1999 AND PROPOSED 2000

[Dollars in thousands]

Activities	1997 Act.		1998 Act.		1999 Est.		2000 Est.	
	Amount	FTE	Amount	FTE	Amount	FTE	Amount	FTE
Civil Rights	[1] $8,517	86	[1] $12,242	129	$13,227	137	$14,868	154
Outreach			750	8	1,433	16	2,825	27
Procurement and Property Management	2,961	33	2,741	32	3,261	35	3,507	35
BRAVO Initiative							[2] 194	1
Small and Disadvantaged Business Utilization	780	10	788	9	1,196	11	1,235	11
Human Resources Management	5,772	78	5,596	81	6,969	84	7,219	84
Ethics					600	5	618	5
Office of Operations	762	11	673	13	987	14	1,014	14
Management Support Staff	2,409	28	2,507	28	2,842	27	2,929	27
Administrative Law Judges/Judicial Officer	1,490	19	1,449	18	1,653	16	1,708	16
Total	22,691	265	26,746	318	32,168	345	36,117	374

[1] Fiscal years 1997 and 1998 reflect a transfer of $2,475,000 for the EEO Counselors.
[2] The Bravo initiative is part of OSDBU's fiscal year 2000 President's Budget of $1,429,000.

Question. How much of the $7 million increase proposed in fiscal year 2000 budget is for investigation and cleanup of Forest Service sites; how much is to continue and accelerate investigative and cleanup activities at ARS sites; how much for cleanup of CCC grain storage bins; and how much for cleanup actions at the sites of other USDA agencies? Please provide a status report of these activities and provide the fiscal year 1999 funding level.

Answer. The proposed increase in fiscal year 2000 for Forest Service is $4,365,000; ARS work $479,000; CCC grain storage bins $1,500,000; and other agencies' work $646,000. The following tables summarize the funding allocation for fiscal year 1999 and the budget for fiscal year 2000 for the use of agency funds and the central hazardous waste management account.

TOTAL USDA HAZARDOUS WASTE MANAGEMENT FUNDS

[Dollars in thousands]

Agency	Fiscal year 1999 HWM central account	Fiscal year 1999 agency funding	Total funding
Commodity Credit Corporation	$3,000	$5,000	$8,000
Forest Service	6,900	9,000	15,900
Agricultural Research Service	3,666	.....	3,666
Farm Service Agency, Farm Credit Programs	.....	[1] 1,000	1,000
Food Safety and Inspection Service	230	.....	230
Rural Housing Service	75	95	170
Office of the General Counsel	1,379	.....	1,379
Program Administration	450	.....	450
Total, USDA HWM Funds	15,700	15,095	30,795

[1] Estimates are roughly between $1 to $2 million.

TOTAL USDA HAZARDOUS WASTE MANAGEMENT FUNDS [1]

[Dollars in thousands]

Agency	Fiscal year 2000 HWM central account	Fiscal year 2000 agency funding	Total funding
Commodity Credit Corporation	$4,500	$5,000	$9,500
Forest Service	11,265	10,272	21,537
Agricultural Research Service	4,145	.....	4,145
Animal & Plant Health Insp. Service	210	160	370
Farm Service Agency, Farm Credit Programs	150	[2] 1,000	1,150
Food Safety and Inspection Service	230	.....	230
Rural Housing Service	60	60	120
Office of the General Counsel	1,569	.....	1,569
Program Administration	571	.....	571
Total, USDA HWM Funds	22,700	16,492	39,192

[1] Central account figures are the amounts planned in the budget request and agency funding figures are amounts agencies have planned in their budget requests for agency funding of the program. These figures are subject to reevaluation and adjustment during the year as new developments occur.

[2] Estimates are roughly between $1 to $2 million.

Question. How much is requested for fiscal year 2000 to support an increased workload in the Office of General Counsel—OGCto continue to provide legal assistance and advice for hazardous waste management? What is the fiscal year 1999 level of funding?

Answer. The fiscal year 1999 funding level for OGC is $1,379,000 and the budget for fiscal year 2000 is $1,569,000 which is an increase of $190,000 in support of the increased workload.

Question. Why isn't legal assistance and advice for hazardous waste management a cost borne by the Office of General Counsel—OGCrather than Hazardous Waste Management?

Answer. The hazardous waste management account has been available for use on CERCLA/RCRA environmental compliance issues USDA-wide, including necessary legal services, since its inception in the fiscal year 1988 Agriculture Appropriations Act. Funding from this account is critical to ensuring that USDA agencies meet the complex requirements contained in hazardous materials laws, including State and local laws made applicable by broad waivers of sovereign immunity.

The assistance provided by legal staff on identifying applicable regulatory requirements is an essential part of achieving environmental compliance at USDA and avoiding civil and criminal liability. The central hazardous waste management account is allocated to all affected USDA agencies by the Secretary based on critical needs in this area. The funds allocated for legal services from this account are based on a determination by the Secretary and USDA agencies that those services are necessary for USDA to support priority environmental projects. Although USDA agencies receive funding that may be used for environmental matters in addition to the central hazardous waste management account funds, this account was created so that priority environmental compliance issues would be funded, including legal services.

It is worth noting that one of the important services provided by the OGC in this area is negotiation of cleanup agreements with parties responsible for contaminating lands and damaging resources under the jurisdiction of USDA. Last year alone, over $100 million in cleanup work on Federal lands was performed by the parties responsible for the harm, through agreements negotiated by the OGC. These cleanups would otherwise have been funded with scarce appropriated dollars or the damage would have continued unabated. Hazardous waste management appropriation funds expended by the OGC may also be recovered from responsible parties and returned to the account. It is based on an evaluation USDA-wide of the needs in this area that a portion of the central hazardous waste management account is allocated to the OGC.

OFFICE OF CHIEF INFORMATION OFFICER

QUESTIONS SUBMITTED BY SENATOR COCHRAN

OVERALL USDA INFORMATION TECHNOLOGY (IT) BUDGET

Question. I understand that USDA's IT budgets will exceed $1 billion in fiscal year 2000. What are USDA's overall planned IT expenditures for fiscal year 2000 broken out by agency and staff offices?

Answer. As reflected in the OMB Exhibit 42 report submitted in January, 1999, USDA has requested budget authority for IT of just over $1.2 billion. A copy of OMB Exhibit 42 is provided for the record, along with a summary of the major USDA IT Systems, specified by Agency.

Question. Of the total planned expenditures, how much does the Department expect to spend for (1) new hardware and software purchases by agency and by computer system, and (2) IT personnel by component agency and by staff office?

Answer. As reflected in the OMB Exhibit 42 report submitted in January, 1999, USDA has requested budget authority for IT of just over $1.2 billion. Specific information on the expenditures for hardware and software are no longer reported. According to the last Exhibit 43 report, prepared in the fall of 1998 for budget year

2000, the estimated expenditures for equipment in fiscal year 2000 are $224 million, and the estimated expenditures for software in fiscal year 2000 are $66 million.

According to the estimate prepared in August of 1998, 4,816 FTEs from all of USDA's agencies and staff offices were to be devoted to information technology activities for fiscal year 2000. The composition, by agency or office, follows:

USDA IT PERSONNEL BY COMPONENT AGENCY AND OFFICE

[Dollars in thousands]

Agency	Personnel	FTE
AMS	$2,951	72.00
ARS	16,127	225.50
APHIS	13,332	202.00

INFORMATION TECHNOLOGY CONTRACTOR ASSISTANCE

Question. To what extent does USDA rely on contractor assistance to carry out its IT responsibilities? Please list all ongoing IT contracts, the amount of the contract award, and the contractor's scope of work.

Answer. During fiscal year 1998, there were 1,191 active contracts for ADP-related support services, as defined by the Office of Federal Procurement Policy. These contracts totaled approximately $259 million. In fiscal year 1999, there are 548 active contracts for ADP-related support services, totaling approximately $117 million.

For a full list of active IT service contracts, please see the attached document "IT support Service Contracts Active in Fiscal Year 1999".

Question. Did USDA's Executive Information Technology Investment Review Board approve the Department's fiscal year 2000 IT budget/IT systems proposals? If so, when and what were the results? (Identify any IT systems proposals that were not approved for funding and their dollar amount).

Answer. The Executive Information Technology Investment Review Board—EITIRB—considered and approved the USDA information technology portfolio of investments for fiscal year 2000 as part of the investment review process in the fiscal year 2000 budget process. The Board focused on the major information technology—IT initiatives within the Department, the totality of the investment, and the strategic issues that derive from this level of investment. USDA major technology initiatives include the Foundation Financial Information System, the Service Center Modernization Initiative, Rural Development's Dedicated Loan Origination System, the Forest Service's Project 615, and the Food and Nutrition Service's Electronic Benefits Transfer program.

In addition to approving the USDA IT portfolio, the EITIRB discussed key IT issues and challenges which affect all agencies including: the Department's Year 2000 compliance efforts, management of the Department's telecommunications network, USDA Continuity of Operations Plans, the increased use of independent verification and validation, and the USDA moratorium on all new IT purchases that do not directly support the Department's Year 2000 compliance work.

Prior to the formulation of the Department's IT portfolio, USDA's Agency IRM Review Boards review IT initiatives and decide whether to continue, modify, or stop a project or system sponsored by the agency. These surviving IT projects or systems then become part of the draft Department IT portfolio where it is reviewed by OCIO staff and approved by the EITIRB.

CLINGER-COHEN ACT

Under the Clinger-Cohen Act of 1996, departments and agencies were to establish a Capital Planning and Investment Control (CPIC) process and an information systems technology architecture to guide IT investment decisions.

USDA CAPITAL PLANNING AND INFORMATION SYSTEMS TECHNOLOGY ARCHITECTURE

Question. Where does the Department of Agriculture stand with respect to fully instituting a CPIC process and implementing an overall information systems tech-

nology architecture? What work remains and what are the time frames and milestones for completing it?

Answer. During fiscal year 1999, the OCIO capital planning performance plan goal was to have 10 agencies using the Capital Planning and Investment Control Process. For fiscal year 2000, the goal stated was 20 agencies using capital planning. We now have 15 agencies using capital planning, and hope that by the fiscal year 2001 budget cycle, which begins in July, all of our agencies and staff offices will be using capital planning to manage their IT investments. Further, USDA plans to use I-TIPS, an information technology capital planning support system, to produce reports for OMB, including Circular A–11 Exhibit 42 and xhibit 300. Additional resources requested in the President's budget would be used to hire and train skilled staff to perform and review benefit-cost, return on investment, and other detailed analyses in order to reduce as far as practical the risk of failure in the development, deployment, and operation of USDA information technology systems.

During fiscal year 2000, integration of the USDA Information Systems Technology Architecture—ISTA—into the capital planning process will continue to ensure the interoperability of future information technology investments across program areas and further breakdown existing "stovepipes" within the Department. We will use the principles and standards of the architecture process to evaluate investments and ensure the best use of our scarce resources.

USDA is revising Version 1 of the Information Systems Technology Architecture. The next version will be published in the summer of 1999. This effort is refocusing the architecture to align with the Federal Architecture Model, which prescribes a segment approach for addressing diverse organizations such as the Federal government and USDA. Major segments represent business areas such as grants, finance, ecosystems management, etc. Organizing by segments allows critical parts of the architecture to be developed individually, while also providing a mechanism for integrating the architecture segments into the larger enterprise architecture. Examples of USDA segments include: the Foundation Financial Information System—with initial implementation of the Department-wide financial system beginning in fiscal year 1999 and ending in fiscal year 2002, the Service Center Initiative's Lan/Wan/Voice and Common Computing Environment—CCE—which are bringing common telecommunications, and network and desktop hardware and software infrastructures, to over 2500 county-based farm service centers. Lan/Wan/Voice deployment is over 85 percent complete, with the remainder to be completed in fiscal year 1999. CCE deployment was initiated in fiscal year 1998 for Year 2000 machine replacements and will continue through fiscal year 2002 to fully complete the system. And, the Procurement Modernization Team is working to provide modern, integrated procurement automation tools and streamlined business processes to the USDA acquisition community—breaking down "stovepipes", reducing the time and cost of processing procurement actions, and better supporting the Department's mission.

Question. To what extent did the Department follow a CPIC process and its current IT architecture to direct and approve the IT investments planned for fiscal year 2000?

Answer. Version One of the USDA Information Systems Technology Architecture, issued in February of 1997, was the foundation for OCIO architectural review during the fiscal year 2000 budget cycle. The Department has also developed a Guide to its Capital Planning and Investment Control process, which was recently approved and it is being printed for distribution to USDA agencies and staff offices. The Guide is a reference manual that provides information about Capital Planning and Investment Control and was developed with significant input of USDA agencies. While the Guide was not published officially at that time, it was available to all agencies as guidance for the fiscal year 2000 budget cycle. The principles within the Guide include criteria for investment selection such as mission, cost, and technical issues including architecture. They formed the basis for OCIO's budget review for fiscal year 2000.

USDA FISCAL YEAR 2000 BUDGET INCREASE

Question. USDA's fiscal year 2000 budget summary shows a budget increase of $2.4 million for the Chief Information Officer (CIO) to continue implementing a plan to strengthen the department's management of information technology across several areas. Based on the various areas cited:

What are the CIO's plans for improving Department-wide management and security of information systems and telecommunications networks?

Answer. In January 1999, the USDA CIO appointed a new Associate CIO for Telecommunications Services and Operations—TSO to provide day-to-day management leadership while also assuming long term strategic planning responsibilities for the

Department's telecommunications network. In this role, the Associate CIO for TSO will ensure the necessary safeguards to protect USDA's telecommunications infrastructure are implemented.

In fiscal year 2000, OCIO will be leading Departmental initiatives to improve and strengthen information security and telecommunications management across the Department. Presidential Decision Directive—PDD—63, which mandates USDA take appropriate steps to protect its critical infrastructure, will form the basis for these activities. The Department will begin by assessing the risk to its information and telecommunication networks. Potential risks include: intrusion by unauthorized individuals, disruption of services due to natural disasters, malicious actions by USDA employees, data corruption, critical system failure propagated from a failure in a connected non-critical system, computer viruses and worms, etc.

The fiscal year 2000 budget request includes funding for the USDA risk assessment and for subsequent actions to address and mitigate identified vulnerabilities to the maximum extent possible. The budget request also includes funding to leverage agency resources in creating a USDA incident response capability, and to ensure the readiness of USDA telecommunications services required to support the Department's Continuity of Government plan.

Training will also be an integral part of USDA's security plans. OCIO is beginning this effort by coordinating a security course for USDA agency IT staff interested in this rapidly expanding and crucial area. By building security expertise inside the Department, USDA respond more quickly and effectively to future security threats.

USDA has also implemented a comprehensive Information Security Policy review and update project to keep up with the rapid pace of change in the information security field. In fiscal year 2000, OCIO will continue focusing on Internet security policies to guide the Department's use of identification and authorization tools, Internet firewalls, encryption and digital signatures and certificate technology, Virtual Private Networks, and other Internet security issues. The policy review will also include the development of new policies and revision of existing policies in such areas as electronic mail privacy and security, incident reporting, software piracy, and security awareness and training.

Further, OCIO is working with USDA Agencies to: 1—respond to existing regulatory requirements as well as PDD 63 requirements; 2—link the IT security planning and budgeting processes; and 3—establish performance indicators for measuring the effectiveness of agency IT security programs. As part of this process, Agency IT security submissions are due to OCIO by June 1, 1999. After an initial request for IT security budgets during late 1998, agencies will be required to submit IT security budget information as a part of the annual A–11 IT budgeting process.

Question. How does the CIO plan to strengthen IT capital planning, review and evaluation processes and refine the Department-wide architecture?

Answer. The Chief Information Officer—CIO plans to strengthen the USDA's IT capital planning process in several ways, as resources allow. OCIO will play a more active role in phases of the life cycle of capital planning by expanding our developed process beyond the selection phase to the control and evaluate phases as well, including improved project management for information technology. OCIO will also make increased use of independent verification and validation, an approach that has proven valuable, to review IT decisions, both from managerial and technical perspectives. The CIO will also expand efforts to bring the understanding and adoption of capital planning, the discipline, to the remainder of USDA agencies and staff offices. Thereby educating and evolving the existing IT investment processes in all USDA agencies to embody the capital planning model, and employ its methods and tools to assist in the management of information technology investments.

In fiscal year 2000, OCIO will focus its architecture efforts on implementation. In working with USDA agency personnel who are building the Department's future financial system, OCIO's will be working to ensure that integral pieces of the project such as common datawarehousing standards—essential to agency financial reporting and a unified loan module—applicable across multiple USDA loan programs—are designed to share information and re-use technology to the maximum extent possible. Similarly, OCIO will help coordinate the Department's use of geospatial information systems and data—a technology heavily used in the Forest Service and an integral piece of the Service Center Modernization Initiative. Further, OCIO architecture coordination will focus on a structured approach to providing secure electronic access options to USDA program participants.

Question. What is the CIO doing to develop a workforce planning capacity to improve the management of the USDA IT infrastructure?

Answer. OCIO is actively involved in strengthening the knowledge, skills and capabilities of USDA's IT staff. During fiscal year 1998 a new member was added to the OCIO staff to work specifically on issues relating to the current national IT

workforce crisis, as well as requirements cited in the Clinger-Cohen Act of 1996. Both the USDA and OCIO Strategic Plans include strategies to implement a professional development program to ensure that program and IT staffs possess the skills necessary to effectively manage and deliver IT programs and services.

During fiscal years 1998 and 1999, OCIO has been collaborating closely with USDA's Office of Human Resources Management—OHRM—in IT workforce planning and development. Early in fiscal year 1999, USDA's Deputy CIO was named co-chair of the Federal CIO Council's Education and Training Committee, and is now working with federal agencies to ensure adoption and implementation of the core competencies for IT professionals approved by the Council.

During fiscal years 1999 and 2000, the OCIO will continue to address IT staffing issues including training, certification, classification consistency, and private/public sector challenges in the area of IT workforce planning and development.

Question. How will the Department/CIO provide oversight for the single IT infrastructure and supporting organization of FSA, RD, and NRCS?

Answer. Departmental oversight of the Service Center Initiative single IT infrastructure and the Support Services Bureau is assigned to the USDA Chief Information Officer—CIO, because of the major technology component. The CIO carries out this responsibility with a Senior Policy Advisor and support position. Activities include providing advice and council to senior USDA policy officials and the NFAC, conducting reviews, studies and analyses of implementation activities, providing Oversight Reports and Issue Papers, working with OMB and Congressional staffs on implementation issues and managing contracts to utilize independent verification and validation contractors to assess technical and management issues. The Oversight Staff will also continue to review all IT waiver requests from Service Center agencies to ensure that to the extent possible, any investments needed to meet emergency needs are made in a way to progress towards the long term objective of single IT structure.

The OCIO Oversight activities have led to improvements in the management of the Service Center initiative, better coordination, improved technical solutions and a better understanding of the initiative both within and outside USDA. It is vital to continue this function as the Service Center initiative moves into the next stage of major acquisitions and deployment of reengineered business processes.

Question. How is the CIO's performance in strengthening departmental IT management being assessed?

Answer. The OCIO Annual Performance Plan serves as a tool to assess the CIO's performance in strengthening the departmental management of information technology. The plan lays out performance measures for OCIO's six critical issue areas, which include: 1) assuring mission critical information systems are Year 2000 compliant, 2) overseeing implementation of a single information technology infrastructure to support the Service Center Agencies, 3) improving department-wide management of telecommunications infrastructure, 4) developing policies and procedures for implementing the Clinger-Cohen Act of 1996.

USDA INFORMATION TECHNOLOGY MORATORIUM

In 1996, USDA established a moratorium on all new IT purchases and required agencies to obtain a waiver.

Question. Does USDA still have this IT moratorium in place, and if so, what are the Department's plans for future use of the moratorium?

Answer. In compliance with our fiscal year 1999 appropriation—Public Law 105–86, the Executive Information Technology Investment Review Board has approved all information technology investments and the Chief Information Officer continues to review all USDA information technology investments to ensure new purchases are consistent with the current architecture and are directed at bringing the Department into Year 2000 compliance. Since August 1997, any Departmental or Agency information technology acquisition over $25,000 requires a waiver from the Chief Information Officer. These waivers are granted for emergencies and Year 2000 remediation efforts only.

There are only two types of information technology acquisitions which do not require a waiver—existing contracts for mission-critical maintenance and leases, and information technology acquisitions by organizations other than USDA agencies that are funded by USDA grants.

Once USDA has achieved its Year 2000 compliance objectives and more fully integrated the USDA Information Systems Technology Architecture into the capital planning process, OCIO will reassess the moratorium on information technology purchases.

Question. How many waivers did agencies request for each fiscal year period since the moratorium was established and what was the dollar amount of the waivers?

Answer. During fiscal year 1997 there were 127 waiver requests submitted for approximately $283.7 million. During fiscal year 1998 there were 246 waiver requests submitted for approximately $379.7 million. Through April 6, 1999, there have been 80 waiver requests processed for approximately $178.2 million.

Question. How many of these waivers were approved for each fiscal year period since the moratorium was established and what was the dollar amount of the approved waivers?

Answer. During fiscal year 1997, 113 waivers requesting expenditures of approximately $210.5 million were approved and 5 were approved for telecommunications items involving no expenditures. During fiscal year 1998, 224 waivers were fully approved and 12 were partially approved. Fiscal year 1998 waiver amounts approved totaled $356.8 million. Through April 6, 1999, 79 waivers were fully approved and one was partially approved. Amounts approved totaled $170.6 million.

Question. How many waivers were denied for each fiscal year period since the moratorium was established and what was that dollar amount?

Answer. During fiscal year 1997, 7 waivers were denied totaling $29.5 million, 2 waivers were exempt from the moratorium totaling $43.7 million. During fiscal year 1998, 7 waivers were denied and 3 waivers were canceled by the requesting agency or OCIO for lack of documentation. Denied amounts totaled $22.9 million. Through April 6, 1999, three waivers were canceled by the requesting agency or OCIO for lack of documentation. Denied amounts from the partially approved waiver total $7.6 million.

SUPPORT SERVICES BUREAU

Question. USDA's budget for fiscal year 2000 proposes a new account, called the Support Services Bureau, to provide consolidated administrative support functions, including information technology with an identified funding level of about $90 million. This includes an appropriation request of $74 million to support this modernization initiative, and another $16 million for this purpose will be made available from CCC.

What specifically will this total funding of $90 million dollars support by service center agency in fiscal year 2000 (in terms of software and hardware acquisitions, FTEs, and contractor support, etc.)?

Answer. Through the end of fiscal year 1999, funding for the activities performed within the Service Center Initiative (SCI) is provided by the participating agencies. The collective agencies determined the budget for each activity and the total amount of their contributions. For fiscal year 2000, a direct appropriation is requested to fund the continuation of the currently agency-funded SCI activities. Since this appropriation is in support of Service Centers and not individual agencies, a breakdown by Service Center agency is not available. The requested direct appropriation will be supplemented by a CCC transfer of $16,231,000.

The following table provides a breakdown by ongoing activities and overall funding source for fiscal year 2000:

[In thousands of dollars]

Activity	*Fiscal Year 2000*
Program/Change Management	2,500
Business Process Reengineering	14,000
Common Computing Environment	48,231
Base Data Acquisition	25,550
TOTAL	90,281

Program/Change Management activities include customer service initiatives, change management training programs in the field and at headquarters, communications, outreach activities and SCI initiative-wide program management functions.

The BPR investment will be employed to complete development and pilot testing of the initial Service Center BPR projects included in the BPR Business Case and several critical agency projects, and complete deployment of the first reengineered applications. In fiscal year 2000, an integrated deployment is planned for the Service Center Organizer (SCO) software, the Integrated Office Information Systems Project, the Common Land Unit Project, the Customer Information Management Project and the initial Geographical Information System (GIS) Project. The Combined Administrative Management System will also be deployed to support administrative convergence of the county-based agencies.

The fiscal year 2000 investment for CCE will build on initial CCE workstation acquisitions that include 16,000 systems in fiscal year 1998, and approximately 6,000 additional systems in fiscal year 1999. In fiscal year 2000, deployment of another 8,000 CCE workstations is planned. In addition, network servers will be provided to USDA offices to allow centralized configuration management of software, real-time help from IT support elements and file sharing by service center employees. If funding permits, the SCI also plans to deploy an initial GIS capability to offices where GIS data is available.

A total of $25.5 million will be invested to continue acquisition of GIS data (orthoimagery and soils data) during fiscal year 2000, in accordance with the GIS Strategy published in August 1998.

Question. Since the new Support Services Bureau is being implemented to consolidate administrative costs, should one expect corresponding reductions in the agencies' budgets of at least the $90 million?

Answer. The fiscal year 2000 budget includes a $74,050,000 direct appropriation and transfer of $16,231,000 in CCC funds for the SCI. A corresponding reduction of $31,050,000 from the Natural Resources Conservation Service has been included by USDA to partially offset this request. The fiscal year 2000 budget also requests additional transfer authority in support of the consolidated administrative functions that will be executed under the Support Services Bureau (SSB). Authority has been requested to transfer fiscal year 2000 funds embedded in the agency budget requests to the SSB in order to support consolidated administrative functions previously performed by the agencies.

Question. How much in administrative support savings will be achieved in fiscal year 2000 and beyond by establishing the Support Services Bureau, and how many FTE positions will be eliminated?

Answer. Secretary Glickman approved the Organizational Structure of the Support Services Bureau (SSB) on February 3, 1999, and directed that the SSB be operational on October 1, 1999. The Secretary asked that the SSB Implementation Team finalize the administrative staffing level relative to the SSB formation. This estimate is scheduled for completion in May 1999, and will outline the level of administrative support needed.

Question. How much is estimated to be transferred from FSA, NRCS, and RD for administrative services for the Support Services Bureau? How will this affect salaries and expense accounts of FSA, NRCS, and RD?

Answer. The Secretary asked that the Implementation Team finalize the administrative budget levels relative to the SSB formation. A team has been formed to make this estimate for fiscal year 2000 expenditures and FTE levels for the SSB. They should complete their work by the end of May 1999 and we will provide these estimates to you. Staffing and resources for direct program delivery will not be converged, but remain specific to each agency.

USDA SERVICE CENTERS

In August 1998, GAO reported on weaknesses in USDA's service center IT modernization effort and provided several recommendations. (USDA SERVICE CENTERS: Multibillion Dollar Effort to Modernize Processes and Technology Faces Significant Risks (GAO/AIMD–98–168, August 31, 1998.).

Question. Why does USDA continue to spend millions of dollars buying new technology for its service centers before it completes business process reengineering and before it finalizes how the Department will provide one-stop-shopping in all of its field offices?

Answer. In the period 1995–1997, USDA did make some moderate investments, primarily to upgrade the FSA system 36 machines, to upgrade the Natural Resources Conservation Service (NRCS) Field Office Computing System (FOCS) platforms, and to provide computers required to implement the Dedicated Loan Origination Servicing System (DLOS) of Rural Development. USDA acquired 16,000 CCE workstations in fiscal year 1998, and plans to acquire 6,000 additional workstations in fiscal year 1999. In fiscal year 1999, USDA is deploying these CCE workstations to satisfy Y2K compliance requirements and meet critical agency business needs. These interim investments have been coordinated and justified separately based on costs and benefits as well as critical program needs. They were recognized as steps needed to support the business of the agencies as we go through the process of reengineering business processes and acquire an interoperable, shared information system for all of the agencies. It should be noted that the Rural Development investment, in fact, was to implement a reengineered process, the DLOS, that will save hundreds of millions of dollars in support and other costs. In 1997, USDA instituted a moratorium on IT investment that was further strengthened in fiscal year 1998.

Exceptions are considered and granted only to meet Year 2000 needs or emerging needs associated with equipment failures, new program or legislative requirements, or major initiatives such as civil rights and Service Center implementation. In the case of the Service Center agencies, exceptions granted generally include conditions such as buying computers that meet the minimum standards set for the Common Computing Environment (CCE) pilot sites.

Planned Service Center investments are directly tied to the business process reengineering (BPR) work that is being done. The planned phasing of future CCE investments is consistent with the BPR process, including the piloting and testing of the reengineered processes and enabling technologies. Phases of technology investments will move forward as they are justified and needed to field new business processes, meet Year 2000 needs, etc. Because the BPR process for current programs and administrative activities will take several years to complete, all investments cannot wait until the full process is completed. We must enable the Service Center staff to take advantage of efficiencies and service improvements as they are ready to be fielded. By using an interoperable and scalable architecture that has flexibility for modifications as required, USDA will be able to transition from the existing to new IT systems in a manageable fashion. The business of the collective agencies is too comprehensive and complex and changes too frequently to suggest that all business should be reengineered before any investments are made. If USDA were to take that approach, some of the agency equipment would be nearly twenty years old, and we would have foregone the chance to reap benefits and efficiencies before replacements were provided, not to mention the issue of Year 2000 failures.

Question. What is the Department's status of addressing the GAO recommendation to ensure that all identified weaknesses are addressed?

Answer. The Department is taking every step necessary to ensure that all material weaknesses are addressed prior to approving IT investments. Service Center IT projects are subjected to the evolving USDA capital investment and control process just as any other investment. The Service Center Business Case for technical solutions that included benefit, cost, and risk information has been completed. The USDA Chief Information Officer (CIO) conducted an independent verification and validation (IV&V) contractor review of this documentation that, while pointing out some shortcomings that need to be addressed, essentially verified that the documentation was properly done. The Executive Information Technology Investment Review Board has devoted considerable effort to examining these activities and monitoring progress. The CIO has established a Senior Executive Position to focus oversight activities for this initiative. IV&V by outside contractors have been used extensively by OCIO to evaluate service center projects and plans. The USDA moratorium and approval authority of the CIO for IT procurements are used as control points to ensure that proper planning and execution is taking place. The CIO has used her authority to suspend projects and stop work when conditions have warranted until problems are resolved. Regular reviews of milestones and performance are conducted.

USDA has established processes for the approval, monitoring, and control processes for this project. In addition, except for the telecommunications initiative that was started in fiscal year 1996 and initial Year 2000 computer replacements, only pre-acquisition activities have approval from the CIO to proceed. These include support for BPR, pilot projects, and technical studies and evaluations. Other than Year 2000 compliant investments, the USDA has not approved the CCE for procurement and deployment, and the CIO has conditioned any such approval on meeting capital investment planning and control requirements and other factors. These activities are still in the development stage and, as GAO recognized, involve issues that must be resolved before USDA will move ahead. These issues have been identified earlier by the internal USDA oversight process and are in the process of being corrected. USDA has no intention of moving forward with CCE acquisition until all of the requisite plans, management and controls are in place to ensure success. The CIO is currently engaged in a review of how the Service Center Initiative has responded to management's concerns raised in the past to ensure that all appropriate corrective actions have taken place.

Question. What is the status of the Department's effort to implement one-stop service, what will this entail, in terms of a concept of operations, and when will this be implemented? (Provide the latest time frames and milestones for all major activities related to this effort).

Answer. We are in the process of updating our implementation plan to reflect recent funding levels that were lower than those requested in fiscal year 1998 and 1999, and the impact that such levels have had on the original plan. USDA developed a Service Center Concept of Operations in 1996 and 1997. The Concept of Operations served as the springboard for the 1997 BPR study, consisting of the four

BPR teams. The USDA October 1997 Business Case documented the results of the BPR Study. USDA is in the process of updating the Concept of Operations and overall plan by the end of July 1999 to reflect the current Service Center Initiative. We will provide a copy of these documents when they are available.

Question. What has the Department identified as its funding needs in fiscal year 1999 and 2000 for making USDA service center agencies' information systems and other technology Year 2000 compliant and for supporting ongoing operations and maintenance of its systems?

Answer: To be provided to the subcommittee.

Question. Has the Department assigned a senior-level official with overall responsibility, authority, and accountability for managing and coordinating the separate service center IT modernization projects, when was this assignment made, and who was assigned?

Answer. The Secretary has approved an organization of the SSB which has a National Board of Directors made up of the Administrator of the Farm Service Agency, The Deputy Under Secretary of Operations and Management of Rural Development, and the Chief of the Natural Resources Conservation Services. An Executive Director who reports to the National Board will lead the SSB. In support of the national structure, each state will have a Board of Directors and a single Administrative Support Unit. In addition to the State units, four unique program units have been identified. These entities will also have a Board of Directors and a single Administrative Support Unit. To ensure a single point of accountability for the SSB, the National Board of Directors will allocate administrative funds and delegate administrative authorities to the SSB Executive Director, which, in turn, will be reallocated to the State Board of Directors. The Executive Director and other senior leaders of the SSB will be fully responsible to the National Board for ensuring that the needs and requirements of the serviced agencies are met. The SSB Deputy Director will also be the Chief Information officer for this group of Agencies, and will manage the IT support for the Service Center Initiative.

The Secretary signed a memorandum on March 3, 1999, approving the organizational structure of the Support Services Bureau and appointing Joseph Leo as the Acting Executive Director for implementing the new organization.

Until the SSB is operational, the ongoing SCI will continue to operate as a joint project for FSA, Rural Development, and NRCS. The Deputy Secretary assigned the responsibility for strategic coordination and management of the SCI to the National Food and Agriculture Council (FAC), with oversight by the USDA OCIO. The National FAC manages the efforts of inter-agency project teams working towards completing the SCI. All Service Center Agency staff working on the SCI is contributed by the agencies without reimbursement.

Question. Why hasn't the Department implemented GAO recommendations calling for the CIO to be held accountable and responsible for managing and implementing the service center IT modernization effort?

Answer. The Department did not agree with the GAO recommendation. Our position is that we will continue to place accountability with the program leaders of the agencies to ensure that the modernization, business process reengineering, change management, and other components of the Service Center initiative are carried out successfully. The USDA CIO will continue to provide a strong oversight role to ensure that the IT modernization is done correctly and is in accordance with the overall IT architecture envisioned for the Department.

Question. GAO also recommended in its report that, until critical weaknesses in the Department's service center IT modernization effort are resolved, USDA should limit IT funding to its service centers to only that necessary to (1) bring mission-critical systems into Year 2000 compliance; (2) implement cost-effective efforts that support ongoing operations and maintenance; and (3) develop and document a concept of operations and the new mission-critical business processes necessary to provide one-stop service at all sites and integrate the service center business process reengineering project with its county-based study.

Why has the Department disregarded this recommendation?

Answer. Not all past and planned USDA IT procurements during reengineering are tied directly to business processes. There are technologies that are universally needed and are available to accomplish basic business activities. These include office automation applications, electronic mail, Internet access, and other similar applications. Also, there is recognition that these common applications can be supported on computer systems sold as basic desktop or laptop business platforms.

Many of USDA's simple business processes can be reengineered to make immediate use of these common tools to deliver services. Most organizations are approaching technology implementation with the recognition that both the business processes and the technology components are not static. If either component is held

constant while the other is refined, the result is an unbalanced solution. Either the business or the technology has changed to the extent that the solution no longer serves the organization. IT experts are advising that there are basic technology components that can be implemented and that business process reengineering can proceed in parallel with these acquisitions. The Common Computing Environment Project implementation plan is structured to acquire these types of technologies within the first phases, with the more business sensitive components delayed until the reengineering is more complete. This approach allows the Service Center implementation to proceed and, at the same time provides the opportunity to better match technology with the business requirements. It also enables the agencies to field current or soon to be available reengineered processes as they are ready to be implemented.

Question. The President's budget shows in its Information Technology Performance Table (Table 22–1) that $90 million was spent in fiscal year 1998 for the Common Computing Environment (for the service centers), and that about $50 million would be spent during fiscal year 1999 and another $90 million spent in fiscal year 2000.

Define what the Common Computing Environment entails (i.e., technology being acquired, number of sites, number of staff, etc.), and describe how the Department is measuring its performance in achieving its Common Computing Environment goals?

Answer. As discussed earlier, $48 of the $90 million will be used for the Common Computing Environment (CCE) Project, with the remaining funds to be used in support of the Program/Change Management, Business Process Reengineering, and Base Data Acquisition projects. CCE is providing the hardware and software for the integrated business systems necessary to make one-stop service a reality and to deploy the reengineered business processes. At the core of this vision is a shared information system that provides service center staff access to customer, program, technical, and administrative information, regardless of the agency they represent. The preliminary CCE technical architecture is complete, and is being tested in service centers sites with BPR pilot projects. More than 16,000 CCE workstations have been acquired to replace agency systems that do not comply with Y2K requirements and provide critical business functionality required for current program delivery. These machines and accompanying software will be delivered in the third quarter of fiscal year 1999. In fiscal year 2000, we plan to acquire 8,000 workstations, initial network and GIS servers, and necessary software to run the reengineered processes. We currently have 17 employees assigned to the CCE project. Full CCE deployment is scheduled for completion by the end of 2002, depending on the availability of funding.

When fully implemented, the Common Computing Environment (CCE) will:

—Provide the enabling technologies to support the successful introduction of reengineered business processes across the core service center agencies (FSA, NRCS and Rural Development).

—Optimize the data, equipment, and people sharing opportunities for service center agencies.

—Overcome the extreme limitations of the current legacy systems.

—Allow the service centers to use commonly available information technology, such as the Internet, to deliver services and conduct business with customers and partners.

—Achieve efficiencies across the agencies and enhance customer service today and into the 21st Century.

The vision is of open systems operating within a common technical architecture sustaining both the program delivery and administrative support needs of the agencies. The business requirements for defining the CCE will come, in large part, from the BPR and Business Process Improvement (BPI) efforts within the Service Center Initiative.

The performance measures for the CCE initiative are based on acquisitions and deployment. However, all these acquisitions and deployment are driven by the BPR, customer service, base data acquisition, and sharing of information in a common technical architecture. All of these activities are dependent upon each other and, accordingly, their performance is measured as a whole, not individually. Performance measures for the entire project are included in our 2000 Annual Performance Plan that was submitted to Congress this year.

Question. What are the current estimated life-cycle costs for the Common Computing Environment, what time period does this cover, and when does the USDA expect to have it completely implemented? (Include all important time frames and milestones).

Answer. The Department is in the process of updating the Common Computing Environment Deployment plan. This plan includes estimated procurement and delivery dates, necessary levels of funding, and the life-cycle costs. The plan should be completed in July 1999. We will provide a copy of this plan when it is completed. Acquisition cost for the CCE as currently estimated at about $360 million.

Question. What was acquired for the USDA Service Center, in terms of the number and cost of computers, software, etc., with the fiscal year 1998 expenditure of $90 million and the estimated $50 million in fiscal year 1999 expenditures for the Common Computing Environment?

Answer. The fiscal year 1998 $90 million expenditure and fiscal year 1999 estimated $50 million expenditure will cover all of the Service Center activities and not only CCE. In fiscal year 1998, more than 16,000 CCE workstations were acquired at a cost of approximately $29.5 million under CCE. A total of about $3.0 million in fiscal year 1998 and $2.4 million in fiscal year 1999 is allocated to technical studies required for defining the CCE Technical Architecture. In fiscal year 1999, nearly $7.0 million will be spent to acquire 6,000 additional CCE workstations and software, and conduct deployment activities.

Program/Change Management activities include customer service initiatives, change management training programs in the field and at headquarters, communications, outreach activities and program management expenses. BPR expenditures include costs of project developments, equipment and preparations for 9 service center pilot sites and 5 State Office pilot sites, training of test personnel, and the conduct of pilot testing activities. LAN/WAN/Voice expenditures include costs to complete installations at approximately 2,200 USDA offices and operate and maintain the infrastructure that has been put in place. Base data funds are used to acquire orthoimagery and soils data required to develop and test our Geographical Information System (GIS).

A table showing the budgets by activity for fiscal years 1998 and 1999 follows:

Activity	Fiscal year—	
	1998	1999
Program/Change Management	2,050	2,500
BPR	9,516	11,388
Common Computing Environment	33,536	9,332
LAN/WAN/Voice	25,275	11,400
Base Data Acquisition	19,750	15,050
TOTAL	90,127	49,670

Question. The explanatory notes indicate that of the $7.5 million for fiscal year 1996 to the Secretary of Agriculture for Service Center Implementation Team, $224,951 were obligated in fiscal year 1998 and $4,465,344 remains. What are your plans for obligation of the remaining amount?

Answer. The unobligated funds remain in the Office of the Secretary account for the use of the Service Center Initiative (SCI). We plan to spend most of the $7,500,000 by the end of fiscal year 1999. The carryover funds will be used to coordinate the SCI activities and to supplement shortcomings of funding from the participating agencies. activities as mandated by Congress.

DELIVERY OF USDA PROGRAMS, SERVICES, AND BENEFITS VIA THE INTERNET

The Internet is being used more and more by companies to conduct business and deliver services and benefits via what is called e-business.

Question. To what extent is USDA presently delivering programs,benefits, or services via e-business and how does the department plan to expand the use of Internet in the future?

Answer. A sample of current and future USDA e-business applications to serve the public via the Internet is provided below:

Farm Service Agency—FSA—consistent with the Federal Acquisition Streamlining Act, the Electronic Bid Entry System (EBES) was developed and implemented January 1998 to automate the bid entry portion of the commodity procurement process. The EBES application received a runner-up award in the "1998 Windows World Open" competition held in Chicago April 20–23, 1998. EBES also received a "Government Technology Leadership Award" December 1, 1998. The Financial Internet Site was developed in February 1999. FSA/CCC began officially using the FSA/Fi-

nancial Internet site to announce the monthly interest rate changes related to price support and marketing assistance loans. This process replaced paper notifications that were mailed to the cotton, peanut and tobacco associations each month.

Participation in FSA programs through Electronic Funds Transfer (EFT) increased from about 14 percent in the 1st Quarter of fiscal year 1998 to 56 percent during the 4th quarter. A total of about 2.5 million payments were disbursed during the 4th quarter of fiscal year 1998, 1.4 million of which were disbursed via EFT. This participation level increased to 71 percent during the 1st quarter of fiscal year 1999. Major payment activity during this time frame included—$2.8 billion in Market Loss Assistance Payments and $4.5 billion in Production Flexibility Contract Payments. FSA is now planning an EFT disbursement process through Treasury for the Farm Loan Programs.

Agriculture Marketing Service (AMS) in a joint project with FSA, will implement an electronic bid entry system to automate the bid entry portion of the Domestic, Dairy, and AMS commodity procurement processes. Vendors will submit bids electronically via an Internet web-based application. Bids will then be forwarded to a database which will be used to analyze the bids and generate contracts. Programming, testing, training and implementation will be completed this fiscal year 1999.

Rural Development (RD) provides prospective sellers electronic access to its business opportunities through the OSDBU page of the USDA Departmental Administration home page. This site provides forecasted opportunities for the current fiscal year for USDA agencies.

Research, Education, and Economics Agency (REE) established a procurement Web-page to provide electronic access to facilitate government and private industry access to REE procurement opportunities, including on-line solicitation documents.

Food and Nutrition Service (FNS) Electronic Benefits Transfer (EBT) is an extension of electronic credit and debit procedures that have been developed as part of the commercial payment systems. EBT systems issue and redeem benefits through the use of an electronic funds transfer network and point-of-sale—POS—technology. FNS is engaged in EBT initiatives to support the Food Stamp Program—FSP and the Women, Infants, and Children (WIC) Program. The use of this technology eliminates the need for paper coupons and cash change in the issuance of benefits. These initiatives feature automated links between FNS, the Federal Reserve, the Department of Treasury's ASAP system and state partners. Currently 33 states and the District of Columbia have operational Food Stamp EBT systems. Two milestones were passed during 1998 when the monthly volume and value of EBT transactions exceeded those for the traditional coupon-based technology. During September of 1998, there were over 1.7 million Food Stamp transactions via EBT, totaling nearly $681 million in benefits. The corresponding statistics for coupon-based benefits were slightly over 1 million coupon transactions, with a value of approximately $613 million.

The Food Stamp EBT initiative expects to achieve implementation in 42 states by the end of fiscal year 2000. The WIC EBT initiative plans to increase the number of state operational pilot systems from one to seven by the end of fiscal year 2000.

Forest Service—National Recreation Reservation Service (NRCS)—In October, 1997, the Forest Service in conjunction with the US Army Corps of Engineers, entered into a service contract with Park.Net, Inc. to allow the general public to make reservations for recreation activities in the national forests and waterways. The system began accepting reservations in October 1998. The Forest Service, through a contractor, sells reservations to the public via a call center, electronically through computers at field location sites, and through an interactive Internet web site.

Office of Procurement and Property Management (OPM) has defined requirements for a USDA-wide procurement system that includes the ability to identify buyers and sellers in a secure environment. OPPM has begun evaluating a commercial procurement system that provides electronic access to buyers and sellers in a secure environment.

Question. What level of expenditures, either IT-related or otherwise, are planned to support or develop e-business for USDA program delivery?

Answer. The Department has not separated future e-business expenditures from Agency IT budgets. However, the Service Center Agencies have begun to study the future infrastructure costs necessary to provide electronic access to America's farmers. And, OCIO will be devoting more time and resources to this issue in the coming year.

COMMODITY CREDIT CORPORATION (CCC) FUNDING CAP

Question. In 1996, the Congress limited CCC's funding for ADP equipment and services during fiscal years 1997 through 2002. What has USDA spent each fiscal

year (from fiscal year 1997 to the present) under the caps and for what purpose were these funds expended?

Answer. CCC funding for investments in automation and servicing of existing automation was limited to $275 million during fiscal years 1997 through 2002 by the Federal Agriculture Improvement and Reform Act of 1996. Within this cap, ongoing maintenance as well as system improvements have to be accommodated. However, since this Act was passed, additional legislation has reduced the originial cap by $87 million to $188 million, a cut of over 30 percent from the originial $275 million. Given the need to meet basic maintenance requirements for current systems, only a portion is available for technology investments.

In fiscal year 1997, total obligations for CCC ADP were $36.1 million. All but $3.5 million was for ongoing system maintenance needs. In fiscal year 1998, total CCC ADP obligations were $80.6 million of which $35.5 million was used for ongoing systems maintenance and the balance of $45.1 million was used for technology investment in service centers. The fiscal year 1999 appropriations act limits spending for CCC ADP to $65 million. It is anticipated that the bulk of this spending will also be for system maintenance. System maintenance spending is critical to ensure the continued operation of existing systems, some of which will eventually be replaced with tecnology being deployed to the Service Centers. Maintenance funding includes support for networks, CCC accounting systems and commodity management systems needed to support CCC programs.

Adequate investment in information technology is critical to the success of the plan to consolidate farm, conservation and rural development program delivery into Servie Centers. The plan called for a reduction in the number of field offices from over 3,700 to about 2,560 Service Centers, and staffing reductions accompanied by major technology investments. To date, the number of field offices has been reduced to about 2,700 and staffing reduction have occurred; however, the corresponding IT investment has not taken place.

Recognizing the need to increase the level of support for IT to begin to fulfill the objectives of the consolidation plan, the fiscal year 2000 President's Budget proposes a new, direct appropriation of $74 million for these investments in a central account, the Support Services Bureau account. In addition, approximately $16 million of the estimated remaining balance under the CCC ADP cap will be transferred to this new account which will then provide a total of $90 million for technology investment in the Service Centers in fiscal year 2000. Only through the necessary technology investment can the goal of providing efficient and effective service to agricultural producers and rural people through "one stop" Service Centers be met.

INTERAGENCY FOOD SAFETY INITIATIVE

Question. How are information systems and other new technologies being used to achieve objectives under the President's interagency Food Safety Initiative and what are the costs? What information systems are involved?

Answer: The President's fiscal year 2000 interagency Food Safety Initiative includes one time funding to implement the Field Automation Information Management (FAIM) project to provide States off-the-shelf inspection automation infrastructure to accommodate HACCP. The State FAIM initiative is not a single application but a collection of systems. FAIM provides inspectors with electronic forms, technical references, office automation tools, electronic mail, and computer based training. The number of applications has and will continue to expand over time, with HACCP inspection scheduling and reporting to be the next significant application added. Taken as a whole, the State FAIM initiative provides the infrastructure to support new inspection technologies such as HACCP, and brings the States and FSIS closer to having a uniform nationwide inspection system.

Question. What performance measures have been established to evaluate success of the Food Safety Initiative and to what extent have these measures been achieved?

Answer: FSIS established performance measures in the Fiscal Years 1999 and 2000 FSIS Annual Performance Plans to evaluate the success of the Food Safety Initiative. These measures, which can be found under "Performance Goal Two" of the plans, include:

[The information follows:]

	Fiscal years—			
	1997	1998	1999	2000
Number of foodborne illness causing pathogens monitored in collaboration with the CDC, FDA and State Public Health Departments through the Foodborne Disease Active Surveillance Network (FoodNet). Fiscal year 2000 estimates include two parasites: Staphylococcus enterotoxin, and Listeria monocytogenes and Listeria species	7	7	7	9
Number of FoodNet Case Studies	2	3	3	3
Number of new formal risk assessments initiated annually to identify and quantify food safety risks	1	1	1	1
Number of cooperative agreements with	N/A	N/A	N/A	5
States for risk assessment	.....	.....	.....	.....
Standard operating procedures established for coordination of foodborne illness outbreaks and other food safety emergencies	(1)	(1)	(1)	(1)
Strategy with HHS and USDA, and private sector groups developed and implemented to expand communications on food safety information to the general public	N/A	(1)	(1)	(1)
Number of people reached with food safety information through media stories, circulation reports, Home Page visits, Hotline calls (in millions)	110	132	158	170
Number of Federal-State joint undertakings in:				
Technical conferences	12	12	12	12
Advisory Committees	3	3	3	3
Other Committees	3	3	3	3

[1] Yes.

The Agency is confident that these activities are on target. However it should be noted that these are long term projects. For example, FoodNet, which is a collaborative effort with HHS, will be the main source of information used to monitor projects in achieving the FSIS stated outcome of a 25 percent reduction in the number of foodborne illnesses associated with meat, poultry, and egg products by the year 2000. Many factors can influence disease incidences on a year-to-year basis, and it will be necessary to collect several years of data to be confident of the stability of trends. These performance measurements will be reassessed once the President's Council on Food Safety finalizes a strategic plan.

USDA RESPONSE TO GAO TELECOMMUNICATIONS MANAGEMENT RECOMMENDATIONS

In 1995, GAO reported that USDA was not effectively managing its telecommunications systems and services USDA Telecommunications: Strong Leadership Needed to Resolve Management Weaknesses, Achieve Savings (GAO.AIMD–98–131, June 30, 1998). Because of this, the GAO indicated that the Department was wasting millions of dollars each year paying for unused, unnecessary, and uneconomical telecommunications services. To its credit, USDA took some steps to begin addressing GAO's recommendations for resolving the telecommunications management problems at the Department—improvements that USDA says could reduce its $200 million-plus reported annual investment in telecommunications by as much as $70 million each year. However, GAO again reported in 1998 that the Department had failed to achieve any significant cost savings and management improvements because its corrective actions were incomplete or inadequate.

Question. What progress has the Department made since GAO's 1998 report to implement GAO's recommendations to:

—ensure that all telecommunications resources are inventoried, properly accounted for, and cost-effectively managed;

—consolidate and optimize telecommunications services to achieve savings where opportunities exist to do so;

—adequately plan integrated networks in support of USDA's information-sharing needs;

—determine the extent to which the Department is at risk nationwide for telephone abuse and fraud and acted to mitigate those risks?

Answer. The USDA Telecommunications Network Stabilization and Migration Program—TNSMP—established in May 1997, clearly defines agency and Depart-

mental telecommunications management roles and responsibilities. As part of the TNSMP, twenty-one major hub cities have been identified for consolidation/optimization. Further, as part of the Department's transition to the new FTS2001 contract, the Department will connect these cities into shared USDA network. Thereby implementing the phase one of the Department's future Enterprise Network.

A Departmental moratorium on the acquisition of all telecommunications resources was established in the fall of 1996 and remains in effect today. The moratorium requires USDA agencies to document the need for each telecommunications acquisition prior to initiating the acquisition process. Waivers have been granted only when clearly demonstrated cases for need could be established. In addition, opportunities for sharing telecommunications services when applicable, were required as a part of moratorium waivers.

As part of the Department's Year 2000 readiness program, USDA has implemented a Department-wide inventory of all telecommunications hardware, software, and services, e.g., data and voice communications circuits. This inventory will be maintained in a centralized database and will be fully operational by the end of April 1999.

Under Departmental Regulation—DR 3300–1, dated March 23, 1999, all USDA agencies and staff offices are required to "seek and actively pursue opportunities for sharing, optimizing, and consolidating of telecommunications resources." Reorganizing USDA's telecommunications network around the twenty-one hub cities identified in the TNSMP, will also facilitate improved telecommunication's management throughout the Department.

DR 3300–1 also provides specific policies regarding telephone abuse and fraud risks, and mitigation of those risks. This policy requires agency personnel to enforce the appropriate business practices and educate USDA personnel in the proper use of office telephones, thereby mitigating the risk of abuse and fraud. Specifically, "Agencies and staff offices shall establish internal procedures to determine the risk of and vulnerability to telephone fraud, waste and abuse of their networks. Agencies shall implement cost-effective actions to minimize their exposure to telephone abuse. Examples to minimize exposure would be to review and verify telephone billing information, block collect and third party calls through the Local Exchange Carrier—LEC and educate employees on acceptable use policies."

In order to better integrate USDA network services, the Department is in the process of developing Part III of USDA's Information Systems Technology Architecture—ISTA—on telecommunications. The Telecommunications Architecture establishes a departmental framework to guide agencies in the delivery and management of new and existing telecommunications services in order to meet the needs of their mission area.

USDA TELECOMMUNICATIONS SAVINGS IN FISCAL YEAR 1999 AND FISCAL YEAR 2000

Question. What total telecommunications savings have been achieved in fiscal year 1999 and how much in telecommunications savings does the Department expect to achieve in fiscal year 2000?

Answer. Total annual savings and cost avoidance across all telecommunications sharing, cost reduction, and consolidation initiatives for fiscal year 1999 will exceed $3 million. USDA currently estimates transitioning to the FTS2001 telecommunications contract and optimizing access arrangements will save the Department an estimated $6 million in fiscal year 2000.

Question. What has the Department done or planned to do with the savings achieved?

Answer. Telecommunications cost savings achieved in fiscal year 2000 will be realized by USDA agencies.

USDA YEAR 2000 PREPARATION

Y2K is just around the corner, and there have been numerous accounts of what could go wrong in the technology arena, from failed information systems to embedded chips.

Question. How many mission critical systems has the Department identified and what is the status of making them Y2K compliant?

Answer. The following table outlines the Y2K status of USDA's mission-critical systems as of April 6, 1999.

[The information follows:]

Total Number of Mission-Critical Systems:	
April 9, 1999	350
Number Compliant	335
Percent	96

Number To Be Replaced	6
Percent	1.7
Number To Be Repaired	4
Percent	1.9
Number To Be Retired	5
Percent	1.4
Total Number of Mission-Critical Systems Originally being Repaired:	
Current Number Complete	266
Assessment Phase	266
Percent	100
Renovation Phase	264
Percent	99.2
Validation Phase	264
Percent	99.2
Implementation Phase	262
Percent	98.5

USDA FISCAL YEAR 2000 EXPENDITURES FOR Y2K REMEDIATION, TESTING, AND IMPLEMENTATION

Question. What is the Department's planned expenditure, broken out by each agency and the department itself, for completing work on Y2K remediation, testing, and implementation of mission critical systems during fiscal year 2000?

Answer. The Department's planned Year 2000 expenditure is provided in the following table.

[The information follows:]

[In thousands of dollars]

Agency	*Fiscal year 2000 expenditures*
Foreign Agricultural Service	70
Farm Service Agency	2,130
Food Safety & Inspection Service	85
Agricultural Marketing Service	30
Animal and Plant Health Inspection Service	2,196
Forest Service	200
Natural Resources Conservation Service	110
Agricultural Research Service	205
Cooperative State Research, Education and Extension Service	280
Economic Research Service	60
National Agricultural Statistics Service	100
Departmental Administration	500
Office of the Chief Financial Officer	1,000
Office of the Chief Information Officer	2,920
Office of Communications	300
Total	10,186

USDA FISCAL YEAR 2000 EXPENDITURES FOR Y2K WORK ON VULNERABLE PROCESSES AND SYSTEMS

Question. For other vulnerable processes and systems, such as telecommunications, facilities, alarm systems, etc., what is the Department's planned expenditure, broken out by each agency and the Department itself, for completing work on Y2K remediation during fiscal year 2000?

Answer. The Department of Agriculture will continue to remediate vulnerable processes and systems throughout fiscal year 2000. Funding for these efforts will come from the agencies' fiscal year 2000 budget, which does not breakout remediation funding for telecommunications, facilities, alarm systems, etc. USDA has requested $6.198 million in supplemental funding for Y2K remediation of Vulnerable Systems (embedded chips in buildings, facilities, scientific and laboratory equipment). Supplemental one and two have been appropriated. These are three year funds (Fiscal year 1999, 2000, 2001).

USDA requested Y2K funding for remediation of vulnerable systems, by Agency, is provided below:

[The information follows:]

[In thousands of dollars]

Agency	Supp 1 12/8/98	Supp 2. 2/3/99	Supp 3 4/2/99	Total
FSIS	400	.....	628	1,028
Forest Service	2,000	.....	.....	2,000
ARS	303	1,840	418	2,561
DA	150	.....	.....	150
OCIO	300	.....	.....	300
APHIS	.....	.....	159	159
TOTAL	3,153	1,840	1,205	6,198

USDA requested funding for Y2K remediation of telecommunications systems, by Agency, is provided below:

[The information follows:]

[In thousands of dollars]

Agency	Supp 1	Total
DA	323	323
OCIO	4,000	4,000
Forest Service	1,750	1,750
ARS	1,143	1,143
FSIS	200	200
Total	7,416	7,416

USDA AGENCY BUSINESS CONTINUITY AND CONTINGENCY PLANS

Question. To what extent has each of the component agencies, staff, and field offices completed and tested business continuity and contingency plans? For those that have not yet completed and fully tested their plans, what are the time frames and milestones for doing so?

Answer. Business Continuity and Contingency Plans—BCCPs—have been received from all mission area, agencies, Departmental Administration, and several staff offices. The majority of these plans have been approved. Final approval from the Under Secretary for one agency plan is pending, and we are working with three staff offices regarding their plans. The target date for completing these plans is May 21, 1999, with USDA's overall plan due to the Office of Management and Budget by June 15, 1999. However, USDA Agency BCCPs will continue to be reviewed, tested, and revised as necessary through September 1999—the date the General Accounting Office has recommended for BCCP completion.

For BCCPs relating to the field/regional offices and service centers, OCIO is providing guidance for developing and implementing Local Contingency Plans. Several agencies have started this process and information is being shared across USDA.

BCCPs are scheduled to be tested from January through October 1999. Several agencies have started testing their BCCP in accordance with the GAO Guidelines. The Y2K Program Office is developing additional guidance for this testing activity which will be provided to agencies by the first week in May 1999. This guidance will give examples of the various tests (desktop, rehearsals and simulations), how to plan and evaluate the process, and steps for process improvement. As part of the review process with agencies, the Y2K Program Office will be working with the Office of Inspector General to develop evaluation criteria for conducting site visits during agency BCCP tests. The testing schedule for the Department and for five agencies or offices who have already submitted schedules is provided below.

[The information follows:]

	Start	Complete
Department-wide Test Schedule—for all mission areas and staff offices.	January 1999	September 1999
Foreign Agricultural Service	.....	September 1999
Forest Service	April 1999	October 1999

	Start	Complete
Food Safety and Inspection Service	February 1999	September 1999
Agricultural Research Service	March 31, 1999	April 30, 1999
National Appeals Division—end-to-end testing through March 1999		May 1999

USDA Y2K EMERGENCY FUNDING—APPROVED AND EXPECTED IN FISCAL YEAR 2000

Question. How much in Y2K emergency funding has OMB approved for the Department, for what specific purpose were these funds requested, and how much additional funding does USDA anticipate having to request from OMB in fiscal year 2000?

Answer. As of April 6, 1999, OMB has approved $46,168,420 in emergency Y2K funding for Year 2000 work planned for fiscal year 1999. These funds are to support remediation activities in our aggressive program to address Year 2000 computer and embedded chip problems and ensure the uninterrupted delivery of USDA programs and services. Supplemental funding requirements include:

—meeting the remediation needs of additional systems;
—conducting end-to-end testing;
—independent verification and validation;
—business continuity—contingency—planning and testing;
—hardware and software system upgrades or replacements;
—embedded and scientific equipment upgrades or replacements; and
—technical assistance.

Current base appropriation estimates for fiscal year 2000 are $10.2 million. USDA does not anticipate requesting additional money from OMB in fiscal year 2000, however in the event of unforseen requirements, USDA will be able to request additional allocation from the fiscal year 1999 Supplemental, which is a three-year appropriation.

PRESIDENTIAL DECISION DIRECTIVE 63—PDD–63

Under Presidential Decision Directive 63 (PDD–63), federal agencies are to ensure the protection of critical infrastructures, which include critical information systems, telecommunications, and other essential services. To carry out this responsibility, agencies were to have developed a critical infrastructure protection plan by February 1, 1999. According to PDD–63, these plans are to be fully implemented by May 22, 2000.

Question. Has the Department completed its critical infrastructure protection plan? If so, what actions must USDA take to implement the plan?

Answer. The USDA Critical Infrastructure Assurance Plan CIAP—has been completed and is now in the final steps of Departmental review.

USDA's CIAP will follow the Vulnerability Framework prepared under contract for the national CIAO. It calls for a four staged analysis and corrective action strategy to identify and mitigate vulnerabilities to USDA's essential cyber infrastructure. In addition, it defines responsibilities for continued security assurance, it addresses the need for an on-going risk management program, and it identifies the basic requirements of a comprehensive Emergency Management Program to ensure the continuity of cyber support for the Department's vital program activities.

USDA is well positioned to implement this plan. The analysis and planning we have done to correct Y2K problems, optimize our telecommunications systems, and develop an information architecture will collectively serve as a solid baseline from which we will assess the broader array of security concerns. The procedures and policies we have in place to support our ongoing information system security program will provide additional detail necessary to assess our cyber infrastructure and determine what corrective actions are necessary to ensure its safety and integrity.

TIME FRAMES FOR IMPLEMENTING USDA'S CRITICAL INFRASTRUCTURE PROTECTION PLAN

Question. What are the time frames and overall costs for implementing USDA's critical infrastructure protection plan?

Answer. USDA's Critical Infrastructure Assurance PlanCIAP follows the Vulnerability Framework prepared under contract for the national Critical Infrastructure Assurance Office—CIAO. Our estimation of the time it will take to fully define all of USDA's essential cyber infrastructure, identify vulnerabilities of the systems, facilities and other assets of that infrastructure, and develop a mitigation strategy that will assure continuous operation is 16 months.

Much of the work called for in the early stages of our infrastructure assurance strategy will have already been accomplished through our efforts to correct Y2K problems, optimize our telecommunications networks, and develop an information architecture. Costs for these efforts will not be attributed to our infrastructure assurance initiative. Other costs will be borne, in large part, by our network of security and telecommunications specialist who work directly for our program agencies. Overall coordination will be provided by existing staff assigned to the Office of the Chief Information Officer.

USDA recognizes that critical infrastructure assurance requires specialized skills not readily available or resident within our technical community. For this reason, the Office of the Chief Information Offices has requested $500,000 in its fiscal year 2000 budget for security measures. These funds will be used to engage contract expertise in the areas of vulnerability assessment, intrusion detection, risk mitigation, and other critical infrastructure assurance plan tasks.

USDA INFORMATION TECHNOLOGY AND TELECOMMUNICATIONS EXPENDITURES FOR PDD–63

Question. How much is being spent to purchase new or upgrade existing information technology and telecommunications systems to comply with PDD–63?

Answer. At this time, it is too early to estimate the cost of the specific measures necessary to assure the security of USDA's critical cyber infrastructure, as required by PDD–63. USDA has developed a very methodical approach to defining its critical cyber assets, identifying existing and expected vulnerabilities and developing a corrective action plan. Much information must be assembled and much analysis must be performed prior to establishing a firm cost for complete USDA infrastructure assurance.

USDA INFORMATION TECHNOLOGY BUDGET

Financial Management Systems

Question. What is the status of USDA's effort to implement its single integrated financial management information system?

Answer. The Foundation Financial Information System—FFIS—is the cornerstone of the effort to implement a single integrated financial system. FFIS will replace the Central Accounting System—CAS—at NFC and will provide a Standard General Ledger for the financial management operations there. FFIS is being implemented in phases. Two agencies and two regions and one research station of the Forest Service are currently up on FFIS. The remainder of the Forest Service and the Food Safety and Inspection Service will be implemented on October 1, 1999. Other USDA agencies will be implemented in phases with the remaining agencies being implemented on October 1, 2002.

In addition, analysis of the use of a data warehouse is in process now. The warehouse will be implemented in phases and will first address FFIS reporting followed by the USDA consolidated financial statements. A full implementation schedule has not been developed for the warehouse pending outcome of the initial analysis task.

The Office of the Chief Financial Officer has reassessed the original Financial Information System Vision and Strategy—FISVIS—and believes that a "single integrated financial system" will be achieved through the sound integration of all financial management systems in the Department. The integrated system will be comprised of a data warehouse fed by multiple general ledger systems. The information contained in those systems used to feed the data warehouse will be used for reporting the more detailed information that is not available in the summarized information contained in the data warehouse. All of the systems involved must meet all applicable authoritative requirements, including the capture of information using standard data definitions and posting rules, and transactions that are traceable to the point of entry.

Question. How many agencies are currently using the single integrated financial management information system, and what are the time frames and milestones for having all USDA agencies use it?

Answer. The Office of the Chief Financial Officer—appropriated funds, Risk Management Agency—RMA—and two regions and one research center of the Forest Service have been implemented on FFIS. The remainder of the Forest Service and the Food Safety and Inspection Service will be implemented on October 1, 1999. Other USDA agencies will be implemented in phases with the remaining agencies being implemented on October 1, 2002.

Question. What does USDA plan to spend on developing and operating its integrated financial management information system in fiscal years 1999 and 2000?

Answer. The fiscal year 1999 estimate included in the President's budget is $26.9 million; the estimate for fiscal year 2000 is $32.9 million. As we proceed with the execution this year, we are finding that the fiscal year 1999 estimate can be reduced somewhat to $23.8 million. Further, we have adjusted the fiscal year 2000 estimate downward to $32.5 million. These new fiscal year 1999 and fiscal year 2000 costs are reflected in the project plan developed by the new project management team. The estimates do no include any costs the agencies will bare internally.

Question. What are USDA's latest life-cycle costs and time frames and milestones for fully implementing its single integrated financial management information system?

Answer. The new 5-year project plan covering fiscal year 1999 to fiscal year 2003 includes estimated project costs for that time period of $136.1 million. This covers full implementation of all USDA agencies by October 1, 2002, post-implementation requirements, as well as shutdown activities associated with the Central Accounting System—CAS.

NATIONAL AGRICULTURAL STATISTICS SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

PUERTO RICO

Question. The budget proposes the addition of a NASS office in Puerto Rico and describes this establishment as a cooperative agreement. Please provide the amount of funds that the Puerto Rico Department of Agriculture will contribute to this cooperative agreement.

Answer. The Puerto Rico contribution to the cooperative program would exceed 50 percent of the total cost of the joint agricultural statistics program. The Puerto Rico Department of Agriculture would supply the office facilities and the majority of professional, clerical, and field staff. However, the Puerto Rico Department of Agriculture would not transfer direct funding to USDA.

The Government of Puerto Rico has requested that NASS establish a cooperative program with the Puerto Rico Department of Agriculture which would allow NASS to establish a joint Puerto Rico/USDA agricultural statistics office in San Juan. This partnership, which would operate similar to others that NASS maintains with State cooperators throughout the United States, would enhance Puerto Rico's current agricultural statistics program by combining the present Puerto Rico Department of Agriculture's Office of Statistics staff with staff assigned from NASS.

A partnership between the Puerto Rico Department of Agriculture and NASS would help to bring consistency and comparability between Puerto Rico agricultural data and the agricultural statistics collected and published for the 50 States. In addition, this office would plan and conduct the 2003 and future Censuses of Agriculture in Puerto Rico.

Question. Will this cooperative agreement obligate USDA for additional expenses associated with the census of agriculture?

Answer. Under this cooperative agreement, NASS would provide some data processing equipment as well as Federal personnel, including two agricultural statisticians and a data processor, but would not contribute direct funding.

FOOD SAFETY AND PESTICIDE USE SURVEYS

Question. The budget proposes an increase of $2,500,000 for a fruit and vegetable food safety survey and an increase of $1,600,000 for pesticide use data for the horticulture and greenhouse industries. Are other federal agencies contributing funds to fund these surveys? How do these programs differ from the Pesticide Data Program, which is not funded by NASS?

Answer. NASS does not anticipate receiving funding from other federal agencies in support of these survey efforts.

NASS currently collects survey data in support of the Pesticide Data Program. Pesticide use data are collected for field crops, fruit and vegetable crops (in alternate years), livestock, and general farm use, along with information on postharvest chemical applications on selected commodities. Related information is also gathered on Integrated Pest Management practices. The importance of these data collection efforts have been elevated due to the requirements of the Food Quality Protection Act (FQPA).

The $1.6 million requested for fiscal year 2000 would be used both to fill data gaps for additional commodities not covered under NASS's current program and to provide data important to scientists and researchers addressing issues related to

FQPA implementation. This initiative would enable NASS to conduct a pesticide use survey of the nursery and greenhouse industries, which are rapidly growing segments of agriculture, and would also allow for a significant expansion of current field crop, fruit, and vegetable programs to fulfill data needs of FQPA. This would be accomplished through a yearly survey rotation program. The increasing importance of pesticide use data has been reinforced through the refinement of risk assessments with the availability of "real world" data, as opposed to the use of assumptions of maximum usage of pesticides on all acres of commodities.

In alternating years, NASS would collect and publish comprehensive nursery and greenhouse pesticide use statistics at the State level for major States where nurseries and greenhouses are located. Pesticide use data are needed for these industries in order to fill the void in information about what pesticide products and quantities are used for producing various nursery and greenhouse plants. In addition, NASS would expand pesticide use data collection coverage for field crops such as dry beans and peas, canola, flaxseed, hops, lentils, mint, rice, rye, safflower, sorghum, sweet potatoes, artichokes, beets, brussel sprouts, garlic, kale, collards, mustard greens, okra, pumpkins, radishes, squash, and turnip greens. Included in the commodity expansion would be collection of additional data relative to target pests and preharvest intervals for pesticide applications. Through partnering with Michigan State University, the Environmental Protection Agency, and other end users, NASS has strived to address these emerging data needs as the chemical risk assessment process has matured.

The $2.5 million would be used to fund a survey of fresh fruit and vegetable growers and packers to establish a baseline of agricultural practices as they relate to food safety. These data would be used to address issues related to the President's Food Safety Initiative. The survey will be conducted in 14 States representing nearly 85 percent of the Nation's fresh fruit and vegetable acreage and will consist of core questions covering water, manure management, facility sanitation and hygiene, and transportation practices.

QUESTION SUBMITTED BY SENATOR BURNS

DATA FOR CROP INSURANCE PROGRAMS

Question. The estimated budget for fiscal year 2000 is cut by $8.4 million for the National Agricultural Statistics Service. This is an important service for ensuring accurate data is available for crop insurance purposes. In the past, not enough time or resources has been spent on the gathering or distribution of this data. How will USDA restore and increase this funding to provide assurance that a reliable data base is available?

Answer. The $8.4 million decline for fiscal year 2000 reflects the decrease in activity due to the cyclical nature of the census of agriculture program and does not reflect reductions to NASS base programs.

NASS supports the USDA crop insurance program through a cooperative agreement with the Risk Management Agency (RMA). Through this cooperative agreement, NASS provides county estimates for 21 crops which RMA requests annually in support of USDA's crop insurance programs. RMA utilizes NASS data in the administration of the Group Risk Plan. In addition, NASS data are used to formulate premium rates and transitional yields for determining insurance guarantees when little or no actual production history data are available from the producer. To the extent available, RMA also uses NASS data in the development of new crop programs and/or plans of insurance.

ECONOMIC RESEARCH SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FOOD ASSISTANCE PROGRAM STUDIES AND EVALUATIONS

Question. The Economic Research Service was given responsibility in fiscal year 1998 and again in fiscal year 1999 to manage the research program for the nation's food assistance programs. What was the underlying rational you used to guide setting up the program?

Answer. The first item on our agenda was to develop a set of guiding principles for program development and implementation. First, we wanted a program that addresses the research and information needs of clients—program managers, program participants, Congress, USDA, and the public. We believe integrated research in the

broader context of the current and future economic and social environment is critical. We also believe that a broad array of public and private entities should be directly involved in the research, evaluation, and review efforts and that integration of ERS staff expertise in the development, implementation, and accomplishment of research projects will add a new dimension to the program. As scientists, our approach is that all studies and evaluations should be rigorous and have verifiable and unbiased results. ERS standards demand rigorous internal and external review of results. It is an ERS policy that all data collected, to the extent possible, are publicly assessable and widely distributed—putting high quality information in the hands of everyone can only result in better decisions. Finally, the program would move toward the development and maintenance of continuous data sets. The latter will allow us to address issues in a more timely, accurate, and cost effective manner than relying on very tailored surveys designed to address a particular topic.

Question. Could you explain the process you used to identify research priority areas?

Answer. ERS has sought input from a broad constituency of policy officials, researchers, practitioners, advocates, industry groups, and service providers to identify and develop our research priorities. In January 1999, ERS convened a roundtable discussion with over 60 distinguished experts representing these various groups to obtain their individual opinions and perspectives. Participants included Julie Paradis, Deputy Under Secretary for Food and Consumer Services; Dr. Rebecca Blank from the President's Council of Economic Advisors; Dr. Pat Ruggles, Deputy Assistant Secretary for Human Policy Research at DHHS; Melinda Newport, the President of the National Association of WIC Directors; Barry Sackin, of the National Association of School Food Service Providers; Larry Goolsby, the American Public Human Services Association; and others.

Question. How has the Economic Research Service involved the Food and Nutrition Service, both this year and last year, in the determination of research priorities?

Answer. To ensure that the ERS program meets the policy information and research needs of the Department, ERS is working closely with Food and Nutrition Service (FNS) program and research leaders to identify needs and priorities. FNS has also been extensively involved in the development of contract requirements and the evaluation of deliverables. They have a capable and knowledgeable staff that has been helpful in our program implementation. Representatives from FNS have helped us refine our research agenda, served on technical review panels, and assisted with ongoing projects. Their assistance, advice, and knowledge of the programs certainly have helped us develop what we believe is a program for which everyone can be proud and take credit.

Question. What are the research priorities for fiscal year 1999?

Answer. We have identified 6 research themes for fiscal year 1999 as follows:

(1) WIC Program Research
(2) The Food Stamp Program as a Safety Net
(3) Better Serving the Working Poor
(4) Child Nutrition Programs
(5) Outcome-Based Performance Measures
(6) Research Innovation, Infrastructure, and Outreach

Highlights of the proposed program include research to stem the rising obesity in poor children served by the food programs, and research to understand why Food Stamp Program caseloads have declined more than expected. Other highlights include research on the role of the food assistance programs in establishing dietary patterns, analysis and measurement of food security, and research on nutrition and health outcomes associated with food programs.

Question. What staffing adjustments has the Economic Research Service made to run the research and evaluation program?

Answer. The food assistance research program has been given priority in ERS. Some of the most senior and capable staff have been assigned to manage and direct the program, many of whom have extensive experience in the food assistance research area. Staffing has been accomplished largely through reallocation of existing personnel. A small research office has been established in an ERS division to direct and coordinate the activities of more than 30 research scientists involved to various degrees in this research program. Two capable and knowledgeable senior researchers have been assigned to help direct the food stamp and child nutrition research agenda.

Question. Has ERS used any of the funds to support farm or other nonfood assistance research?

Answer. No. All funds appropriated for food assistance research and evaluation have been used to support food assistance and nutrition research. In fiscal year

1998, less than $100,000 was used to support program administration. The balance was used to support extramural research and data collections.

Question. What is your response to those who believe the ERS program is too academic?

Answer. The ERS research program is driven by policy issues and concerns of a critical nature to the nation. Our research outputs are designed to inform decisions by members of both the private and public-sectors. If decisionmakers are to be well-informed, then the information base must be credible. Credibility stems from a strong science base, which means meeting disciplinary standards for analytical rigor and reaching out to the best economists wherever they might be found. When appropriate, ERS and ERS-supported research is published in academic journals, a process that both helps ensure analytical rigor and that builds the Agency's reputation with the scholars and universities that produce the next generation of ERS researchers.

Question. Why did you start a small grants program?

Answer. A small grants program was created to stimulate new and innovative research on food assistance programs and to broaden the participation of social science scholars in food assistance research. Five academic institutions and affiliated research institutes administer the program. Each institute focuses on a particular facet of food assistance, such as, diet and health outcomes, relationships to poverty and well-being, rural issues, and special at-risk population groups. The expected completion date for fiscal 1998 projects is September, 1999. Research projects include:

The Institute for Research on Poverty at the University of Wisconsin is looking for proposals that address the effects of food assistance on individual and family well-being and food security. They were awarded $234,843.

The Joint Center for Poverty Research, University of Chicago and Northwestern University invites proposals on interactions between food assistance and other welfare programs, and linkages between the macroeconomy and food assistance. They were awarded $262,740.

The Southern Rural Development Center at Mississippi State University will focus food assistance research on rural people, families and communities in the South. The Center also proposes to initiate a dialogue among scholars through the establishment of a Rural South Food Assistance Research Task Force, with the purpose of further articulating research priorities on food assistance-related issues. They were awarded $220,000.

The University of Arizona American Indian Studies Program will work with scholars at tribal colleges and elsewhere to support research addressing the unique position and problems of Native Americans with respect to food assistance. Their small grants program will focus on the relationship between food assistance programs on reservations and family poverty. They were awarded $246,224.

The University of California-Davis Department of Nutrition will award small grants for research on the impact of food assistance programs on nutritional risk indicators (anthropometric, biochemical, clinical and dietary), food purchasing practices and food insecurity. This program will seek to encourage examinations of multiple indicators of nutrition impact, and interdisciplinary approaches integrating epidemiology, economics or anthropology with nutrition. They were awarded $225,024.

Question. What research is ERS conducting on Able Bodied Adults Without Dependents (ABAWDS) and Immigrants, two groups whose Food Stamp Program eligibility status were heavily impacted by welfare reform?

Answer. ERS has two studies underway that are focused on these groups. First, we have partnered with several agencies within the Department of Health and Human Services to fund a study of how the immigrant population is fairing under welfare reform. The project is being conducted by the Urban Institute. They are conducting a very thoughtful and thorough investigation of the immigrant populations in Los Angeles and New York City. The study is well underway.

Second, we have extensive studies underway on the status of people leaving the Food Stamp Program in Arizona, Illinois, Iowa, and South Carolina. These studies are looking not only at the ABAWDS, but also at the larger number of other people who are leaving the Food Stamp Program. We believe this approach will provide a more complete analysis and an improved understanding of the issues for decision makers.

Question. Why has the Economic Research Service placed more emphasis on the collection of continuous data sets?

Answer. ERS is committed to investing in broad-based, program and policy relevant data that addresses not only today's needs but also future unforeseen needs. These data tend to have less detail on any particular program but cover more programs and also tend to follow people for a number of years. In this way, we can

examine such issues as gaps in program coverage, performance measures of outcomes, multiple program participation, impacts on diets over one or more days, and how households utilize programs over an extended period of time.

We believe that one of the most cost-effective ways to achieve these research objectives is to partner with other federal data collection efforts and add important food assistance components. This includes support for expanding the low-income samples in the USDA Continuing Survey of Food Intake by Individuals, the DHHS Nutrition and Health Examination Survey (NHANES), and special supplements targeted to food assistance issues in the Panel Study of Income Dynamics and the Survey of Program Dynamics.

We also have a strong research interest in understanding the role of child nutrition programs in cognitive development. Consequently, we have added a food assistance module in the Department of Education's Early Childhood Longitudinal Survey-Kindergarten Cohort (ECLS-K) which follows children from kindergarten through fifth grade. These data will allow us to examine the relationship between program participation, cognitive development, school performance, and children's physical activities.

Question. The fiscal year 1999 Appropriations Act requires the Economic Research Service to transfer $2 million of the funds provided to it for studies of the food stamp, WIC, and child nutrition programs to the Food and Nutrition Service to enable it to conduct programmatic evaluations and analyses. Have those funds been transferred?

Answer. Yes. The Department sent an SF–1151, Nonexpenditure Transfer Authorization, to the U.S. Treasury in December 1998 to transfer the appropriated funds from ERS to the Food and Nutrition Service. The document was processed by the Treasury Department on January 18, 1999.

Question. For fiscal year 1999, the Economic Research Service was given responsibility for several Congressionally-mandated studies in the food assistance area. What is the status of each of those studies? Please indicate who is doing the study, the framework established for the study, when the study will be completed, costs, etc.

Answer. ERS was given responsibility this year for two legislatively mandated studies on the WIC program. One study is on the appropriate amounts of sugar and fiber in the diets of the WIC population and the impact on diets of the sugar limit in dried cereals. The other study is to assess the cost containment practices used by states (other than for infant formula) on access to the food items by participants, WIC voucher redemption, program participation, health outcomes, and program costs. As with all congressionally mandated studies, we have given these projects top priority.

ERS was directed to enlist the National Academy of Sciences to conduct the first study. We have been in contact with NAS, but they will not undertake this particular study. They said it is neither an issue of national significance nor does it require their unique capabilities. We are currently in discussions with the Under Secretary's office to develop a mutually acceptable alternative.

In reference to the cost containment study, we have met with representatives from the Private Label Manufacturers Association, General Mills, the National Association of WIC directors, and FNS. We are in the process of developing a competitive procurement to conduct the study. We expect the project to cost no more than $1.1 million in fiscal year 1999 funds for data collection and $400,000 in fiscal year 2000 for analysis and reporting. We expect the project to be completed within three years of contract award.

In early versions of the agriculture appropriation, ERS was directed to do a plate waste study for the National School Lunch Program. After it was learned that GAO had just completed such a study, the conference report language was changed to have the Secretary prepare a report on recommendations to reduce plate waste. FNS will prepare this report since it deals with program implementation.

FOOD SAFETY

Question. Funding of $453,000 was provided to ERS for fiscal year 1999 to provide economic analysis in food safety risk assessment. Has ERS begun this work with the funds available? What work is underway and what additional work will be undertaken with the additional $453,000 requested for fiscal year 2000?

Answer. ERS is continuing research on the costs associated with illnesses associated with seven pathogens in food. Starting with the estimated numbers of illnesses, and examining the nature and severity of the illness, ERS analysts have calculated the medical costs, based on the typical treatment needed for each type of illness. When the illness implied long-term disability or long-term care, the cost of that

long-term care, lost wages, and reduced productivity were also included. Estimates also take the age and gender distributions of each illness into account and for each pathogen both the short-term and long-term medical costs. The total annual costs for the seven pathogens is between $6.7 and $36 billion annually.

ERS is participating with other Federal agencies in both the National Food Safety Initiative and the President's Food Safety Initiative for Fresh Fruits and Vegetables. Under the National Food Safety Initiative, ERS is collaborating with the Agricultural Research Service, the Food Safety and Inspection Service (FSIS), Office of Risk Assessment and Cost/Benefit Analysis, and the Centers for Disease Control and Prevention (CDC). ERS is a member of the Risk Assessment Consortium established under the Initiative and this collaboration supports risk assessment activities relating to food safety policies. In collaborating with CDC and FSIS, ERS is using the "FoodNet" site surveillance data developed under the Initiative to develop better and more comprehensive estimates of the costs of foodborne disease and the benefits of pathogen reduction.

ERS is planning a three-year research program to improve our estimates of the benefits of food safety using the appropriation of $453,000 for fiscal year 1999. This research will be funded under a competitive grants process, where one or more research programs will be funded over three years to apply state-of-the-art economic analysis to estimate the benefits of making the U.S. food supply safer. We anticipate a final report will be completed in fiscal year 2002. ERS will also be updating and revising our existing estimates of the benefits of food safety in collaboration with the Food and Drug Administration and the Centers for Disease Control and Prevention through our collaborative research program established under the National Food Safety Initiative.

ERS is collaborating with several USDA and other Federal agencies on food safety economics research. We are collaborating with the Centers for Disease Control and Prevention on a study they are conducting on measuring food safety benefits. Our two agencies are working together to ensure that the joint research programs are complementary and do not result in duplicated effort. ERS is also collaborating with staff of USDA's Office of Risk Assessment and Cost/Benefit Analysis, the Food and Drug Administration, and the Environmental Protection Agency on joint research on measuring the benefits of safer food. We will be inviting scientists from collaborating agencies to provide scientific peer-review of the project proposals during the selection process, and will also seek input from them during the implementation of the research project.

In fiscal year 2000, we will continue our research program to estimate the benefits and costs of food safety policies and programs. The additional funding of $453,000 for fiscal year 2000 will support economic analysis in risk assessment activities. We will work with the Risk Assessment Consortium established under the National Food Safety Initiative to develop priorities for food safety risk reduction based on economic criteria. We will expand our knowledge of food safety benefits by studying the costs of foodborne disease linked to additional microbial pathogens using the FoodNet surveillance data. We will also be collaborating with FDA to evaluate the benefits and costs of production practices recommended by FDA under the Produce and Imported Food Safety Initiative.

OFFICE OF ENERGY POLICY AND NEW USES

Question. What work will not be performed by the ERS now that the Office of Energy has been transferred to the USDA Office of the Chief Economist?

Answer. With respect to electric utility deregulation research, ERS will not duplicate work underway or planned by the Office of Energy Policy and New Uses. As a result, if further work in this area is funded, we will rely heavily on the Office of Energy for policy analysis and expertise on electric utilities. ERS will continue to provide modeling and research expertise, and will increase its capacity to analyze the financing and delivery of electricity in rural America, but will not be the primary source of policy analysis on electric utility deregulation issues, those will fall to the Office of the Chief Economist.

ELECTRIC UTILITY DEREGULATION

Question. I understand that the Office of Energy, under the auspices of the Office of the Chief Economist, has done an internal study on electric utility deregulation at the request of USDA's Rural Utilities Service (RUS). Increased funding of $200,000 is requested for ERS for fiscal year 2000 for an interagency activity to expand the Department's capacity to assess the potential impacts of electric utility deregulation.

How much is ERS currently spending on assessments of the potential impacts of electric utility deregulation?

What research/economic analysis has ERS produced?

Why is additional research necessary if the Office of Energy has already done an internal study on the impacts of electric utility deregulation at the request of RUS?

Who will do this work at ERS? What involvement will the Office of Energy have? What involvement will RUS have?

What role will the Department of Energy have? Is the Department of Energy contributing financially to this effort?

Answer. At the request of USDA Rural Utility Service (RUS), and with their financial assistance, ERS undertook a preliminary assessment of the rural impacts of electric utility deregulation in fiscal year 1997. This work was led by the Office of Energy, which at the time was part of ERS. The research did involve other ERS researchers as well as data supplied by RUS and the Department of Energy. This initial effort has resulted in research that is currently being conducted for use by the Department to examine some of the potential impacts of deregulation at the national level. Recognizing that the electric utility deregulation process at the State, and possibly Federal, level will unfold over a number of years, ERS requested additional funds to help support a long-term research effort on the full range of issues surrounding deregulation. We view this as a collaborative effort, drawing on the modeling and analytic strengths of ERS, the policy expertise of the Office of Energy Policy and New Uses, now housed in the Office of the Chief Economist (OCE), and the program expertise of RUS. As a result, the work could also be funded through the OCE account, but we believe that long-term research on this issue is very important as policy makers at the State and Federal level contend with the complex issues involved. Answers to your specific questions follow:

With the creation and relocation of the Office of Energy Policy and New Uses, ERS reduced the number of staff working on energy-related issues. In fiscal year 1999, we expect to spend between $100 and $200 thousand on energy-related issues largely focusing on electric utility deregulation and biomass fuel.

Much of our work on electric utility deregulation has been in support of the research underway under the auspices of the OCE. In particular, the regional economic impacts of anticipated changes in electric rates were estimated using a model developed by ERS staff. In addition, a forthcoming issue of Rural Conditions and Trends, published by the agency, includes a short article on what electric utility deregulation could mean for rural America.

Work underway appears to raise legitimate concerns about the distributional impacts of electric utility deregulation, but it is only a first step. As State deregulation efforts have demonstrated, there are many ways of structuring the deregulation process, each with its own set of pricing and competitive impacts. The Department's preliminary research, which is not yet complete, only examines some of the potential impacts of one scenario for deregulating electric utilities. If the Department is to craft programs and policies which ensure that rural Americans have access to affordable, reliable, and safe electric power as the electric utility sector restructures in coming years, it will need a continuing flow of information and analysis. Given the sizeable loan programs the Department operates in support of rural electric cooperatives, it has an obligation to minimize potential loan losses as these key rural electric service providers are affected by, and react to, State and Federal deregulation efforts.

This research effort will continue to require the full cooperation of ERS, OCE, and RUS. None of these agencies, by itself, has the resources and expertise needed to study the full range of issues deregulation involves for rural households, businesses, and governments; investor-owned, municipal, and cooperative electric service providers; and USDA. Within ERS, staff with expertise on regional economic modeling, business finance, and industrial location will help assess the distributional impacts of electric rate changes on the rural economy. RUS will provide expertise and data on rural electric cooperatives and the USDA programs serving them. The Office of Energy Policy and New Uses within OCE will continue to provide policy analysis and spearhead the Department's electric utility deregulation work.

To date, USDA's research on electric utilities has relied upon the Department of Energy's (DOE) aggregate models. We will continue to rely on DOE's data and models as the starting point for our research on rural distributional impacts. DOE has not provided any financial support for USDA's electric utility deregulation research thus far, and none is anticipated in the future.

NATIONAL ASSESSMENT OF CLIMATE CHANGE AND VARIABILITY

Question. The fiscal year 2000 budget requests an increase of $300,000 for U.S. Global Change Research Program National Assessment Activities. Does $300,000 represent the total cost of these assessment activities?

Answer. The $300,000 requested by ERS for National Assessment activities is part of an $800,000 total budget request by USDA for fiscal year 2000, with the difference split between ARS and NRCS. The funding will be used to conduct economic analyses pertaining to the potential impacts of climate change and variability on agricultural production. These analyses were not undertaken in the first National Assessment due to time and financial constraints.

Assessments play an integrative role across the U.S. Global Change Research Program (USGCRP) program by assembling and synthesizing scientific results, increasing interaction among scientists and the public, and identifying gaps in knowledge. Assessments are also an important vehicle for disseminating information to public policy and decision making communities. The current National Assessment of the Consequences of Climate Variability and Change satisfies the mandate of the Global Change Research Act of 1990 to prepare and submit to the President and the Congress "an assessment which integrates, evaluates, and interprets the findings of the Program . . ." This Assessment is demonstrating a new public-private partnership that links research to the needs of stakeholders by providing managers, policy-makers, and the public with information needed to increase resilience to climate variability and cope with climate change. The current National Assessment is providing valuable information on the ability of agricultural and forestry systems to adapt to climate change. Fiscal year 2000 assessment activities will focus on continued efforts to involve USDA stakeholders in helping to identify risks, opportunities, research and information needs associated with increased climate variability, and climate change.

Question. Will Global Change Research Program National Assessment Activities related to USDA programs be carried out by ERS or is ERS requesting funding for government-wide assessment activities?

Answer. The funding requested by ERS will be used to sponsor USDA research activities pertaining to the impact of climate change and variability on agricultural production. ERS will coordinate its efforts with the USDA Global Change Program Office and other USDA agencies. While the research sponsored by ERS will be related to the goals of the National Assessment program, the funding request is intended to support the mission of ERS as it relates to global change activities.

OUTLOOK REPORTS

Question. How has ERS responded to the language in the reports accompanying the fiscal year 1999 Appropriations Act regarding the frequency of situation and outlook reports?

Answer. Beginning in January, 1999, ERS resumed publication of field crop and livestock reports on a monthly schedule. This is the same frequency as in 1996. There are 3 published reports in each of the specialty crop series—Fruit and Tree Nuts, Sugar, Tobacco, and Vegetables—compared to 4 in 1996. However, ERS is preparing electronic briefing rooms for these commodities that will provide a vehicle for more frequent release of data and analysis.

QUESTIONS SUBMITTED BY SENATOR COCHRAN

RURAL HOUSING

Question. A total of $500 million has been cut from rural housing direct loan subsidies over the last five years. The President's fiscal year 2000 budget cuts an additional $240 million in budget authority for the cost of these loans as well as rental assistance. The fiscal year 2000 budget request proposes an additional 10 percent increase, $2.5 billion, in HUD funding. If this amount is appropriated, HUD will have received a 2 year increase totaling approximately $6 billion. While some HUD resources make their way to rural areas, they are not adequate to meet the need for improved housing in rural America. Where is the $240 million in budget authority being spent in the fiscal year 2000 proposed budget?

Answer. I think it is important to put the reductions in budget authority for rural housing programs in the proper context. A large portion of the reduction in budget authority over the time period you referenced is due to the need for less budget authority as a result of lower interest rates. Another significant factor was the Congressional reduction of the funding for the rural rental housing program. The fiscal

year 2000 Budget requests $640 million for rental assistance with $200 million being available and, therefore, reflected as budget authority in fiscal year 2001. This was necessary to remain within the budget caps agreed to by the Administration and the Congress. In developing the President's fiscal year 2000 Budget, rural housing programs were not reduced in order to fund other specific programs.

Question. At a time when the HUD budget is increasing by 10 percent a year and there is an increased need for rural housing assistance, why isn't the Administration investing more in rural housing programs?

Answer. I think of the increases in HUD funding as an effort to recover from the disastrous cuts in these programs made during the Reagan Administration. The Administration would very much like to invest more in rural housing programs, but as I have said previously the primary objective is to continue efforts to ensure the budget is balanced and continue to meet the highest priority needs. This is a delicate balancing act, but one that is necessary because of the need to put our fiscal house in order. The Administration has, however, been able to provide substantially more guaranteed loan assistance for rural housing, which contributes to the amount of housing being built in rural America at very little government cost.

Question. There is a tremendous need of additional housing for migrant and seasonal farmworkers. What is the backlog for farmworker housing loans and grants?

Answer. We presently have on hand applications for loans and grants totaling $25.1 million. These applications are from the states of Pennsylvania, Texas, California, Washington, North Carolina, Florida and Oregon. However, we believe that this does not reflect the true demand because when we changed from allocating the funds to States and began nationwide competition borrowers ceased filing applications with States. When we announce the availability of funds in April, I think we will have a better idea of the true demand.

EARLY WARNING SYSTEMS

Question. Ms. Thompson's testimony indicates that $5 million of the funding for community facilities is earmarked to install severe weather early warning systems throughout rural areas. The total estimated cost is $50 million for all sites. The $5 million will finance the installation of the necessary equipment at 15 to 20 of the highest priority sites. Where are the "highest priority sites" located? How many sites have existing towers that can be used? Who will maintain these sites once the towers are in working order and what is their life span? What is the total number of sites that need service? What is the agencies goal for these sites in order to fulfill the Vice President's wish for 95 percent coverage of rural areas?

Answer. The highest priority sites tend to be located in the Southeast, Southwest, Great Plains, and Mid-Western states. The priority systems is designated by the National Weather Service (NWS), based on a number of variables such as population density, and severe weather occurrences. The Rural Utilities Service is in the process of helping identify existing towers owned by RUS borrowers or others in areas targeted by NWS for a transmitter. The number of tower sites is not yet known, and constantly increases due to the construction of new telecommunications, cellular, paging and other telecommunications services. RUS will target its borrowers with towers in the needed areas in order to maximize program monies and the number of sites funded. However, there will be some targeted areas in which towers do not exist.

Maintenance and liability of these transmitters and constructed towers will be assumed by the NWS, and supported through that appropriation. Customarily, an existing tower owner retains ownership of the tower space, but allows the NWS use for its transmitter. We envision a grant recipient (tower owner) purchasing and installing the transmitter, and donating the transmitter to NWS. This releases the tower owner from maintenance and liability.

Approximately 170 sites are needed to reach 95 percent coverage. RUS believes by utilizing its relationship with its borrowers and using grant monies to leverage donation of tower space, we can achieve this goal.

RURAL ELECTRIFICATION AND TELEPHONE PROGRAMS

Question. Ms. Thompson's testimony states that in the rural utilities area, a shift has occurred resulting in a move from initial connectivity to electric and telephone service to maintenance of an aging infrastructure. How many loans lent in RUS are for maintenance vs. initial connectivity?

Answer. Mr. Chairman, the point I was attempting to make in my statement is that even though the vast majority of rural residents today have access to electrical and telecommunications services, the programs we administer are just as needed now as they were in the 1930s and 1940s. The primary purposes of the loans today

are to maintain an infrastructure, upgrade the systems, and connect new customers. About 45 percent of the electric loans made to distribution borrowers are for maintenance and upgrades and the remainder are for connecting new customers. For the telecommunications programs the percentage of the funds used for new subscribers is about 27 percent.

Question. The fiscal year 2000 budget request proposes a new Treasury Rate Electric loan program. Has this legislation been sent to the authorizing Committees? If this new loan program is not authorized, how will this affect the budget authority request for other electric loans programs? Are the agency's customers demanding a new program such as the proposed Treasury rate program? Does the agency have any indication that its customers will use this new program?

Answer. The legislation is in clearance at the Office of Management and Budget and will be submitted to Congress in the near future. There will be no effect on the budget authority for other electric programs if this proposal is not enacted. Agency customers have expressed desire to move from the municipal rate program to avoid the long queue for loan approval to the guaranteed program, but have also expressed anxiety about dealing with the Federal Financing Bank because of the bad experiences of the generation and transmission borrowers with the FFB during the 1980's. They have also expressed anxiety about having to deal with two Federal bureaucracies, RUS and the FFB. We have absolutely no doubts the borrowers would use the new program.

RURAL TELEPHONE BANK

Question. The fiscal year 2000 budget request proposes privatization of the Rural Telephone Bank (RTB) over a ten year period. This authorization must be acted on by the Agriculture Committee, not the Appropriations Committee. Should this legislation not be enacted into law, how will this affect the budget authority for the RTB for fiscal year 2000?

Answer. This should have no effect on the budget authority for the fiscal year 2000 budget since the language appropriates the funds from the unobligated balances of the RTB liquidating account.

BUSINESS AND INDUSTRY LOANS

Question. The agency should be commended for its efforts in reducing the amount of outstanding principal delinquent and the percentage of borrowers delinquent within the business and industry loan guarantee program. What has contributed to this successful reduction?

Answer. The staff in the field offices realize that this program is important to rural America only if we make successful loans and because of that the staff works very closely with the borrowers and lenders to ensure the loans are successful. This attitude in turn leads to better loan underwriting which has been improved through more intensive training. I am very proud of the staff, and I agree, they are to be commended.

COOPERATIVE DEVELOPMENT GRANTS

Question. For rural cooperative development grants, the fiscal year 2000 budget request is $7 million, an increase of $3 million. How much of this additional funding will enhance technical assistance of small farmers and small farm operations in developing marketing and management skills? Is this assistance not available from the Extension Service?

Answer. I cannot give a precise answer as to how much of the funds will be made available for developing marketing assistance and management skills. This is going to be one of my highest priorities and applicants for the grants will be so notified of that priority through the Federal Register. This is a very important area because the most glaring weakness in small business start-ups is in marketing their products and I am convinced it will be the same for cooperatives. The Cooperative Research Educational Extension Service (CREES) does offer some assistance to producers and we will continue to use the capacity of CREES where appropriate as we develop new research products.

PARTNERSHIP TECHNICAL ASSISTANCE GRANTS

Question. Please discuss the need for a new earmark of up to $5 million from the rural business and cooperative development programs for partnership technical assistance grants to rural communities.

Answer. The majority of rural communities are dependent on part time public officials and voluntary help and they do not have the technical capacity to compete for

Federal and State assistance that might be available to them. They consistently lose in the competition for such assistance even though their need may be greater. Our staff provides as much assistance as possible, but the need is far greater than we can meet. In order to get these communities to the front of the queue for such assistance we need to have available a source of funds through which we can help these communities develop the capacity to compete more successfully. I think we have demonstrated through the Empowerment Zone/Enterprise Community that once this capacity is available, the traditionally under served communities compete very well.

COOPERATIVE RESEARCH AGREEMENTS

Question. How much funding is being used from the Salaries and Expense account in fiscal year 1998 and 1999 for cooperative related research through universities and other entities? Which universities and other entities are receiving this funding and how much is provided to each? When does the agency expect the research to be completed? How are the universities and other entities selected to conduct the research?

Answer. I will submit a list of the research agreements awarded in fiscal year 1998 for the record. The amount used for cooperative agreements in 1998 was $1.9 million and approximately $1.3 million will be used in 1999. Most of this research at universities will be completed within 3 years from initiation of the project. The normal procedure used for executing these projects is that an announcement is posted in the Federal Register and applicants submit projects based on the areas suggested. Proposals are rated by the agency according to established criteria in the announcement and are awarded competitively according to ratings received. Universities and other entities receiving funding under the Research on Rural Cooperative Opportunities and Problems program in fiscal year 1998 were as follows:

State	Institution	Title	Amount
NJ	Rutgers University	A Cooperative Approach to the Development, Production, and Marketing of a Value Added Blueberry Product.	$94,445
IA	Iowa State University	Agricultural Development in the 21st Century: The Changing Role of Cooperatives.	57,342

SUPPORT SERVICES BUREAU

Question. With the implementation of administrative convergence how much will Rural Development be expected to contribute to the Support Services Bureau? How will this affect each agency's salaries and expense budget?

Answer. Mr. Chairman, preliminary estimates are that the Rural Development Mission Area would transfer about 1,070 staff in headquarters, St. Louis, and the States and the cost would be in the neighborhood of $73 million. Following reorganization of the Department and the creation of the Rural Development Mission Area, we consolidated the administrative functions and placed those functions under the umbrella of the Rural Housing Service with sources being provide to all three agencies. Hence the effect on the salaries and expense budget of the other two agencies should be minimal since the monies for administrative personnel and functions are currently transferred to the Rural Housing Service under the policy oversight of the Deputy Under Secretary for Operations and Management and day to day operational oversight of the Deputy Administrator for Operations and Management.

SALARIES AND EXPENSES

Question. The fiscal year 2000 budget request proposes an increase of $25 million for the salaries and expenses account. How will this increase be used?

Answer. The requested increase is for three items: one totaling $14 million is pay cost increases composed of the annualization of the fiscal year 1999 pay increase and the increase anticipated for fiscal year 2000; another totaling $8 million is for improvements to our financial systems; and the third item is $2 million for a Housing Data Warehousing Initiative, the purpose of which is to improve loan origination, loan servicing, and loss mitigation by sharing information on loan portfolio management among the Federal Housing Administration, the Veterans Administration,, and the Government National Mortgage Association.

Regarding the first item, I would like to note that since my tenure as Under Secretary, we have tightened our belt continually on items such as travel, training, and information technology to ensure we had sufficient funds to maintain our staffing level and not be forced into adverse actions such as reductions-in-force and furloughs. In doing so we reduced training to a very low level, and disrupted several financial management improvement projects. The increases requested must be provided to avoid reductions in force.

WATER AND WASTE

Question. What is the backlog of applications for the Water 2000 initiative?

Answer. We do not maintain a separate backlog of applications for the Water 2000 initiative, those applications are part of the total backlog for water and waste disposal loans and grants which total about $4 billion combined.

RCAP UNOBLIGATED BALANCES

Question. Please list the amount of obligated and unobligated balances from prior year appropriations for the rural utilities assistance program. Why will the unobligated balances not be available for future obligation for the Rural Community Advancement Program (RCAP)?

Answer. Appropriations made to this account are made available until expended and any unobligated balance or future cancellation of obligated balances, other than those made appropriated for disaster recovery, are available for obligation for water

and waste disposal loans or grants. Appropriations to the Rural Utilities Assistance program began in fiscal year 1996 and as of the end of fiscal year 1998 the unobligated balances totaled $543,841 and the obligated balance totaled over $528 million. The totals for fiscal year 1997 for unobligated and obligated are $1,062,359 and $593,313,440, respectively. The totals for fiscal year 1997 include a small amount of funds made available for disaster assistance.

ELECTRIC AND TELECOMMUNICATION PROGRAMS

Question. Why is the Department requesting greater flexibility to manage electric and telecommunication loan programs by allowing the budget authority to be interchangeable for those programs?

Answer. Mr. Chairman, the demand for the loan programs, particularly the electric loan programs is increasing significantly, but it is not consistent from year to year for each of the programs. Having one source of budget authority for the electric programs, as opposed to three would enable the Administrator to adjust to demand annually and ensure the funds are used more effectively.

Question. The budget justification notes that the fiscal year 2000 requested lending levels for electric and telecommunication loans are justified to meet the Administration's goal to stimulate economic development and fulfill the variety of Administrative initiatives. What is the variety of Administration initiatives?

Answer. Mr. Chairman, the infrastructure provided through these programs is a vital key to economic stability and economic development in rural areas. Infrastructure investment provides the foundation for new economic activity and economic stimulation is the basis for the enactment of the programs we administer.

RURAL ECONOMIC DEVELOPMENT GRANTS

Question. The fiscal year 2000 budget proposes a decrease of $7 million for rural economic development grants. At the proposed level, how many grants will be available? What will be the average grant amount?

Answer. Mr. Chairman, the decrease results from the lack of funds in the "Cushion of Credit" account from which these grants are made. At the $7 million level requested, there would be as few as 20 grants made at an estimated average of $350,000 each.

QUESTIONS SUBMITTED BY SENATOR BURNS

RURAL ELECTRIC AND TELEPHONE PROGRAMS

Question. The funding for the Rural Utilities Service was cut by over $247 million, and within that agency, funding for telecommunications was cut by over $25 million. I have been a huge proponent of telecommunications in my home state of Montana. The Burns Telco center serves a large sector of the population of Montana. A cut like this can hurt telecommunications efforts immensely. How does USDA plan to restore funding to Rural Utilities?

Answer. Senator Burns, I think there must be some confusion in the budget numbers that I hope I can clarify. You are correct that the funding requested for telecommunications loans is $25 million less than fiscal year 1999, but there is an increase in Rural Telephone Bank loans of $18 million so the net effect is about $7 million less for telecommunication loans. Such reductions are necessary if we are to remain within the budget caps agreed to in 1997 by the Congress and the Administration. The reduction in electric and telecommunication loans totals only $67 million, and for the Rural Utilities Service the budget request is $142 million higher than fiscal year 1999.

EZ/EC GRANTS

Question. EZ/EC grants to states were cut by $15 million. These Rural Enterprise Zones and Rural Empowerment Communities are part of Vice-President Gore's empowerment zones. They are represented largely by Native Americans and enhance community development. How can the USDA justify this budget cut?

Answer. Senator, again I think there may be some confusion caused by the manner in which the budget material is presented. In fiscal year 1999, the $15 million for the rural Empowerment Zones and Enterprise Communities was part of the Agricultural Appropriations Act. However, for fiscal year 2000 the Administration is requesting $15 million in funding through the Social Security Block grant program, just as the first round of EZ/EC communities was funded. Our presentation of the

budget reflects only that the funding will not be available through the Agriculture Appropriations Committees.

RURAL BUSINESS-COOPERATIVE SERVICE

Question. Rural Business-Cooperative Service was cut by $4.6 million. How can the USDA justify this type of cut when Americans living in rural areas are currently in such a huge economic crisis?

Answer. Senator, the budget request for the Rural Business-Cooperative Service is an increase of $20 million in program level.

RURAL HOUSING SERVICE

Question. Rural Housing Service also suffered a huge budget cut. A decrease of $1.2 billion is proposed for fiscal year 2000. Again, people in rural areas cannot afford to have this important funding decreased. Montana is already at a disadvantage as the money is allocated to states based on a factor, which is based on population. Thus, those states with a low population, such as Montana, are not allocated nearly enough funding for the needs of their rural population. How will USDA replace funding for Rural Housing?

Answer. Senator, again I do not know what is causing the confusion with the budget material, but the budget requested for rural housing is over $600 million higher than the amount appropriated for fiscal year 1999. Regarding the allocation issue, the percent of rural population of a State is one of the factors used in allocating funds, and that factor is provided by the latest census information. We will be happy to look at the allocation formula to see if there is some adjustment that would be appropriate.

ALTERNATIVE AGRICULTURAL RESEARCH AND COMMERCIALIZATION CORPORATION

Question. In last year's testimony it was projected that the Alternative Agricultural Research and Commercialization Corporation (AARCC) would recover $300,000 in repayments but in actuality received over $450,000, well ahead of the projected return on investment. For fiscal year 1999 it is projected that payments will total $1.7 million. How much money has been recovered to date? Do you expect the payments to surpass the projections again this year?

Answer. The figures you state are correct, but are cumulative figures through the end of the fiscal year; i.e., the accumulated amount across all fiscal years since AARCC started operation in 1992. To date, repayments to the revolving fund total $840,120. Half way through this fiscal year, AARCC has received $389,204 in repayments and is on target to exceed its 1999 repayment plan of $800,000.

Question. With a lower appropriation level than anticipated in the past and a higher return last year, how does this affect the business plan that has been laid out over the next five or six years?

Answer. Long-term return on investment (ROI) has been affected. The ROI AARCC realizes today is generated by investments made five or six years ago. Future ROI will be affected by the deals done today. ROI in the outyears is expected to be less than anticipated in AARCC's business plan because reduced appropriations provided us with fewer funds to invest.

Question. In your 10-year business plan and your 10-year strategic plan you do not anticipate appropriations after fiscal year 2002. Have the plans changed?

Answer. No, AARCC anticipates no longer requiring appropriations beyond fiscal year 2002, provided we have sufficient ROI and appropriated income to continue to operate until then.

Question. In the fiscal year 2000 budget request of $10 million, Secretary Thompson indicated that six new agriculturally based products will be created. Can you tell me what new products are to be brought to market, the location of the new industries, and the number of jobs associated with each industry?

Answer. The job creation targets in AARCC's strategic and annual performance plans are projections based on past experience. AARCC data show that in the six years since inception, an average of one new job has been created for each $5,000 invested by AARCC. These new jobs are only possible because of the leveraging effect of AARCC investment capital, which has generated roughly $3.00 of private investment capital for every dollar invested by AARCC. Thus, it really takes a total investment of between $15,000–$20,000 to create one new job. With an appropriation of $10 million in fiscal year 2000, AARCC could anticipate helping to create 486 new jobs. The nature and location of the industries in which these jobs might appear depends on which proposals are approved for funding by AARCC's Board of Directors. If past trends continue, the demand for AARCC assistance will far out-

strip the corporation's investment resources. In fiscal year 1998, AARCC project funding totaled $5.2 million; requests exceeded $27 million.

Question. If the fiscal year 2000 budget request of $10 million is not appropriated, how would this affect the marketing of these new products?

Answer. Existing portfolio companies would receive no additional assistance from AARCC in bringing new products to market, or in expanding their presence in the marketplace. In most cases, help from AARCC is the only outside assistance these companies can count on since traditional sources of credit are unavailable to them as start-up or development-stage companies seeking to commercialize new and unfamiliar products.

Question. It has come to my attention that there tends to be three or four core companies that seem to be the most profitable. Please provide more about the companies that have the greatest return on investment.

Answer. It is usually the case in venture capital funds that three or four key investments generate most of a portfolio's ROI. But this is judging ROI in strictly financial terms. Because AARCC has a broader mandate than private sector venture capital firms, the AARC Corporation's strategy considers much more than profit. In pursuing AARCC's investment strategy, no one variable—ROI, job creation, or agricultural material used—has priority. Investment decisions are made after weighing these three factors in order to maintain a balance in the portfolio. In judging AARCC's portfolio investments against these three factors, six companies appear to have made the greatest strides toward commercial levels of production. An overview of these six companies follows:

Automotive Lubricants from Vegetable Oil

This company, in partnership with a Michigan oil seed growers cooperative and Michigan State University, recently formed a limited liability company (LLC) to begin the licensed production and sale of soy-based engine oil. A processing plant is tentatively scheduled to begin operation in 2–4 months.

The engine oil is currently undergoing a battery of tests as part of certification program. Testing is being conducted according to American Petroleum Institute (API) standards and should be completed by the end of the year. Concurrently, the product is being tested as part of a motor pool fleet trial sponsored by the State of Michigan.

The U.S. Navy has just completed the initial round of two-phased evaluation of the engine oil. The Phase I evaluation involved a year-long cost comparison of the company's product, petroleum oil, and synthetic lubricants. Preliminary results from life cycle cost analyses show an annual cost savings of 10–15 percent versus petroleum-based motor oil. Cost savings compared to synthetic lubricants was considerably smaller, however. The Phase II evaluation will test product performance for environmental, safety, and health benefits as compared to petroleum based and synthetic products. Once both phases of the evaluation are complete, and provided satisfactory results are obtained, an implementation plan will be developed for service-wide adoption of the product in military motor pools.

Nutraceuticals from Corn Syrup

Late last year this Minnesota-based company arranged with a contract fermentation company to toll-manufacture a dietary supplement product made from corn syrup. Two fermentations have been successfully completed following the company's patented purification process. Final product is ready for packaging and distribution.

The company has signed and exclusive U.S. sales and distribution agreement with a major branded food products company and in January fulfilled its first substantial purchase order under the contract. A second purchase order has been received and is being filled.

A marketing and public relations program is being developed to promote the benefits of the company's product to the neutraceutical industry. Additionally, a market research and consulting firm has been retained to consult on product positioning within the marketplace.

By mid-summer, the company expects to officially introduce its dietary supplement product to the European market. For several months, the company has been in negotiations with a large food and nutraceutical ingredient manufacturer in The Netherlands over an exclusive sales and distribution agreement for Europe. Concurrently, the company has retained a Dutch regulatory consulting firm to manage its regulatory affairs in Europe. Documentation for European regulatory approval has been submitted and approval is expected by early summer.

Ethanol from Wood Waste and Energy Crops

AARCC's first two rounds of investment helped this Arkansas company prove its biomass-to-ethanol conversion technology and helped fund the construction and ini-

tial operation of its Phase I pilot plant. The pilot plant demonstration was completed in September, using wood waste as the biomass feedstock. Processing costs have proven to be competitive with gasoline on a per gallon basis.

Having demonstrated quantifiable production volume and costs, the company is now ready to pursue Phase II of its strategic plan—the construction of a semi-commercial production facility. AARCC's most recent round of investment provided the funds to complete a financing package (through USDA's Business & Industry Loan Guaranty program) and engineering feasibility study for the new facility, and to secure ethanol purchase agreements.

Commercial Applications for Milkweed (Syriaca) Floss

For the first time in its eleven year history, this Nebraska company reported a positive net income in 1998. The company has built its business in two areas—Syriaca (Milkweed) processing, and milkweed floss comforters and pillows.

1998 was a year of continued sales growth (12 percent) for the company. Comforters and pillows are sold primarily through catalog companies, however distribution has expanded recently to include mainstream retailers. The hypoallergenic properties of ground syriaca clusters have captured the interest of a cosmetics manufacturer, whose director of research & development recently visited the company to assess its capability to produce ground syriaca is sufficient quantities to meet its needs. Applications for syriaca oil are also being explored.

Citrus-based Household Cleaners and Solvents

This Connecticut company manufactures cleaners and solvents derived from citrus peal and other natural materials. The company experienced a 10 percent increase in sales in 1998 and is the only AARCC-funded company to receive a GSA contract following the USDA sponsored National Marketplace for the Environment trade show held in Washington in November 1997. The company is in the process of obtaining a Federal stock number.

Last year, the company retained a New York City advertising agency to develop a new branded image and advertising campaign for its products. Focus groups were organized to obtain consumer feedback about product effectiveness and packaging. Changes are now being incorporated into the product line as a result. A series of infomercials are being developed for the Home Shopping Network and similar cable-access, and internet-based retailing operations.

Fiberboard furniture and flooring panels from soy straw

Construction of this company's new, commercial scale fiberboard manufacturing facility in Mankato, Minnesota, is nearly complete. The company is scheduled to begin manufacturing operations on May 3 of this year. Upon start-up, the Mankato facility will be the lowest capital cost fiberboard plant operating in North America, with a cost per square foot of output that is almost half the industry average. The facility will be the only one of its kind capable of using multiple fiber sources with multiple resins to create a variety of panelized products. Of the plant's annual capacity of 45 million board feet, the company has received letters of intent from customers expressing an interest in purchasing an initial 48 million board feet.

The company is being considered for a multi-million dollar investment by a group of investors interested in building an identical facility in California's rice-producing Sacramento Valley.

Question. Are procedures in place to determine that investees use AARCC funds as they are intended and, if so, what are they? Have these procedures been delayed?

Answer. AARCC is in the process of refining its internal control procedures with the help of an outside CPA firm. An updated set of internal control procedures is expected to be available by mid-summer.

Question. It is required by the AARCC agreements and the investees that audited financial statements are to be submitted. Are there any policies or procedures for performing credit checks, background investigations, or gathering references concerning the investees?

Answer. In its March 27–28, 1996, meeting, the AARCC Board of Directors made changes in the reporting requirements of companies receiving AARCC funds. The Board voted to require project update reports and financial reports to be submitted on an annual, instead of semi-annual basis. Also, the Board voted to require projects to have, as directed by the Board, a CPA audit to be conducted annually or an unaudited, signed financial statement prepared in accordance with Generally Accepted Accounting Principles (GAAP) and supplemented by corporate tax returns. AARCC has initiated a process of credit and background investigations on new and renewal applicants. This process relies on on-line credit information obtained through Dunn & Bradstreet business information reports and Experian credit reports.

Question. Do you require disclosures by AARCC investees that may also do business with other companies that are affiliated with AARCC?

Answer. AARCC's Board of Directors has approved a procedure as part of a recent investment approval, to assign responsibility back to the Board of Directors of AARCC-funded companies to annually review and certify that any non-arms-length transactions occurring among or between parent and/or subsidiary company(ies) are made at prices that do not disadvantage the company AARCC is invested in. These certifications must identify any non-arms-length transactions by type and amount, and the services rendered through the transaction. They must also identify the cost of those same services in an actual arms-length transaction so as to demonstrate that such costs would have been equal or greater and that, consequently, the AARCC-funded company was not disadvantaged by the transaction.

Question. Does AARCC have adequate control to assure that the Government receives the royalties and repayments that it is due? Please explain.

Answer. In its March 27–28, 1996, meeting, the AARCC Board of Directors made changes in the reporting requirements of companies receiving AARCC funds. The Board voted to require projects to have, as directed by the Board, a CPA audit to be conducted annually or an unaudited, signed financial statement prepared in accordance with Generally Accepted Accounting Principles (GAAP) and supplemented by corporate tax returns. These documents are used to verify sales reports that are the basis for calculating royalties due to AARCC.

During monitoring visits or phone calls, AARCC personnel try to obtain as much information as possible about the accounting and technical aspects of an investment. Information is gathered on how much AARCC money has been spent to date and what tasks from the company's own business plan have been accomplished with that money. Regarding the technical aspects of an investment, information is gathered about what is needed to make the project successful, what obstacles to success have arisen, what alternative approaches might be pursued, and what help AARCC might provide to move the project forward.

Question. Is a security interest required on assets that are purchased with AARCC loan funds? Please explain.

Answer. AARCC funds are typically used to make equity investments. AARCC purchases shares of stock in the companies it invests in. These companies in turn use the proceeds of the AARCC investment to purchase equipment that is then collateralized for working capital loans. This is exactly what AARCC intends for these companies to do. The value of AARCC's shares in the company is increased when AARCC funds are used to leverage additional working capital for the company.

Question. Are there any instances that a project received more funds than requested? If so, why?

Answer. Yes, there have been cases in which a project was funded at a level higher than that which was requested. This happens if AARCC's Board of Directors feels that an entrepreneur has underestimated that amount of capital required to commercialize his or her technology or product line. Given the broader experience of the Board members, they are often able to identify potential shortfalls in projected capital requirements. Most entrepreneurs are conservative in preparing their business plans, and it is our experience that they underestimate future expenses.

Question. Do all grants that are submitted have to go through a competitive bidding process?

Answer. Yes, as a rule grants must be competitively bid, but there are a few exceptions. Some grants have been awarded under AARCC's authority to support educational activities which promote the biobased economy. Occasionally, AARCC has provided grants to companies to enable their participation in trade shows or similar activities that enhance the profile of the company's products. In other instances, after an investment proposal has been reviewed and approved, a grant has been made to finance feasibility testing for a given product or technology on the condition that if the product or technology proves viable and can be successfully commercialized, the grant funds convert to a recoverable investment later on. In all cases, grant proposals are reviewed by the Due Diligence Committee of the AARCC Board of Directors.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

STERILE FRUIT FLY RELEASE PROGRAM

The fiscal year 2000 budget request proposes a $2.2 million increase for the fruit fly exclusion and detection program. Dr. Reed's statement indicates this money will be used to strengthened detection and control trapping activities in Florida and California.

Question. How much funding has each state, Florida and California, received for the sterile medfly release program in fiscal year 1999?

Answer. APHIS and the California Department of Food Agriculture (CDFA) operate a sterile Medfly Preventive Release Program (PRP) over a 2,155-square mile area of Los Angeles, Orange, Riverside, and San Bernadino Counties. The PRP is designed to prevent the development of Medfly infestations and to limit the geographic size of any infestations that may manage to start. The PRP releases a minimum of 125,000 sterile Medflies per square mile per week over the PRP zone. An additional 125,000 sterile Medflies per square mile per week is released over a high-risk area in central Los Angeles. Total program costs for fiscal year 1999 are estimated at $14.6 million which is shared equally between APHIS and the CDFA. APHIS' contribution of $7.3 million is funded from annual appropriations in the fruit fly exclusion and detection line item.

APHIS and the State of Florida are currently conducting an area-wide sterile release program as part of the emergency eradication effort in Florida. The Florida sterile release program covers a 700-square mile area that includes portions of Manatee, Sarasota, Hillsborough, and Dade Counties. APHIS' program costs are estimated to be $7 million in fiscal year 1999. The Agency has $5.1 million available from CCC emergency funds for fiscal year 1999 program costs.

Question. How much do they get in the proposed fiscal year 2000 budget for sterile medfly release programs?

Answer. The proposed fiscal year 2000 budget includes $7.3 million to continue the ongoing PRP in California.

Question. How successful has the release of sterile medflies been in addressing the outbreaks in California?

Answer. Prior to the 1994 implementation of an area-wide sterile release program as part of a Medfly eradication program, the Los Angeles area experienced annual Medfly outbreaks. Since 1994, however, only 1 Medfly outbreak has occurred within the PRP boundaries which encompass 2,155-square miles in the Los Angeles basin area of California. Despite this outbreak, APHIS considers the PRP a very effective program for several reasons. First, the constant layer of sterile flies provided through the PRP helps limit the size and spread of any potential outbreak. Second, smaller scale outbreaks that do occur can be addressed using less intrusive control methods such as limited Malathion bait applications and increased sterile fly releases. The current California medfly outbreaks are located outside the PRP boundaries in Orange, San Diego, and Riverside Counties.

Question. How much money is earmarked for trapping of the fruit fly in Florida and in California in the fiscal year 2000 budget request?

Answer. The majority of the proposed $2.2 million increase—approximately $1.9 million—is earmarked for the cooperative trapping program in Florida while approximately $334,000 of the increase would be used to enhance the cooperative trapping program in California.

MALATHION AERIAL SPRAYING

The Environmental Protection Agency (EPA) has told APHIS that the use of Malathion must be minimized.

Question. Does EPA indicate how much Malathion the agency can use, if any? Should the agency not receive this additional funding, how will the agency reduce the use of Malathion?

Answer. EPA has indicated that they would like the Agency to use Malathion only as a "last resort" especially aerial applications over urban areas. In October 1998, APHIS submitted to EPA an application for a quarantine exemption for the use of Malathion in certain fruit fly emergency situations. The application is pending.

The additional funding would be used primarily to increase survey activities to national fruit fly trapping protocol levels. Early detection of outbreaks allows APHIS and cooperators more options in the selection of control actions, often eliminating the need for aerial applications of pesticides. Without an effective early detection

system, APHIS and cooperators will not likely be able to reduce use of aerially-applied pesticides like Malathion.

Question. What progress has been made to eliminate Malathion aerial sprays to control Medflies and other exotic fruit flies?

Answer. APHIS in cooperation with Agricultural Research Service (ARS) and State scientists are developing alternatives to Malathion aerial sprays including more environmentally-acceptable chemicals. In April 1999, APHIS applied for a quarantine exemption for Spinosad, a "natural" pesticide, which research indicates may achieve eradication when used in conjunction with sterile releases. Suredye, another more environmentally-acceptable pesticide, also shows promise and is being field tested in Guatemala and Hawaii.

The public, however, will likely have concerns about aerial applications of any pesticide in urban areas. To address this concern, APHIS and cooperators continue to enhance the sterile insect release technology. New, more efficient male-only genetic strains were used in eradication programs for the first time in 1997 in Florida and in 1998 in California. There have been positive preliminary results of tests of biocontrol agents in combination with sterile Medflies for Medfly control in Guatemala. However, additional development is needed before this technology is ready for program use. Also, APHIS is planning to modify and enhance our Waimanalo rearing facility to produce new genetic strains of Medfly and incorporate current and future advances in genetic transformations to control Medfly.

FRUIT FLY EXCLUSION AND DETECTION—SUREDYE

Question. It is my understanding that USDA has evaluated a product called "SureDye" for use in Medfly Control. What is the status of these evaluations? Has the product been approved?

Answer. USDA has evaluated several photoactive dyes for control of Medfly and other fruit flies. Various formulations of two of these dyes, phloxine B and uranine, have been sold under the trade name SureDye by PhotoDye International. These dyes are a promising potential alternative to Malathion for fruit fly control, but they have not yet been approved by the EPA which is responsible for pesticide registration.

Question. Has the ARS evaluated this product?

Answer. Yes. The Agricultural Research Service is very active in the development and evaluation of photoactive dyes for fruit fly control.

Question. How would you describe APHIS' relationship with the manufacturer of "SureDye," PhotoDye International?

Answer. APHIS has been a client of PhotoDye International since 1995 and has purchased SureDye for use in field trials.

Question. Please compare the safety of "SureDye" versus other control methods. Is "SureDye" essentially the same product used as a food additive?

Answer. Phloxine B and uranine, sold by PhotoDye International under the trade name SureDye, are available as dyes approved by the Food and Drug Administration (FDA) for cosmetics and pharmaceuticals. However, FDA approval does not imply that these products are safe for use as pesticides. The EPA is responsible for evaluating the risks of pesticides. EPA has not yet registered SureDye.

Question. It is my understanding that APHIS conducted a very small test of the "SureDye" bait last fall. Please provide a brief summary of the test size, protocols used, and test results.

Answer. In November 1998, APHIS conducted two tests in Guatemala using field cages. ARS developed the procedures for these tests to evaluate the efficacy of photoactive dyes under field conditions.

The first test compared SureDye against Malathion and a nontoxic control. Each test consisted of 100 insects in a field cage with 30 ml of SureDye on a coffee bush. No additional food or water was provided for the test insects. Exposure to the SureDye began at 9 a.m. and mortality was measured every 2 hours until 4 p.m. and then again the next morning at 9 a.m. The test ran six replicates. The SureDye showed low percent kill when compared to Malathion and was only marginally better than the nontoxic control.

A second test, using the same protocol, was conducted to compare the SureDye with previous formulations of photoactive dyes tested in Guatemala. This test confirmed the relative efficacy of the previous photoactive dye formulations and the lack of efficacy of the SureDye provided by PhotoDye International.

Question. Describe the difference between an "8-hour test protocol" used by APHIS and a "72-hour test protocol" preferred by the makers of "SureDye." Given the toxicity of Malathion, why is one test protocol preferred over the other?

Answer. APHIS does not use an "8-hour test protocol." In laboratory tests of photoactive dyes, the test insects are placed in small Plexiglas cages, provided food and water, exposed to measured amounts of photoactive dyes or other test pesticides, and observed for up to 72 hours. Photoactive dyes, unlike normal pesticides, can take much longer to kill the test insects. In the November 1998 tests, APHIS used a 24-hour field cage test developed by ARS to evaluate the efficacy of photoactive dyes in field conditions. Although observations in these cages were limited to the daytime periods between 8 a.m. and 4 p.m., when light conditions are optimal, observations were made over a 24 hour period. Observations did not extend beyond 24 hours due to the lack of alternative food or water for the test insects.

KARNAL BUNT

Question. Dr. Reed's statement indicates that over $33 million has been provided to mitigate producer and handler losses from Karnal bunt since the program began in March 1996. How much of this money has been distributed to Arizona wheat producers for their economic loss for the 1997–1998 crop due to Karnal bunt? Have rules been published regarding the economic compensation of these farmers? If not, when do you expect them to be published? Why has the agency not submitted a plan for deregulation of Karnal bunt in Arizona as the Conference Report accompanying the fiscal year 1999 Appropriation Act directs?

Answer. The $33 million figure does not include any payments for losses for the 1997–98 crop due to Karnal Bunt. The final rule will make compensation available to these farmers for the 1997–98 crop season and we expect this final rule to be published soon. Concerning deregulation, we submitted our initial plan on November 15, 1998, and continue to meet regularly with representatives of the Arizona wheat industry and Arizona regulatory agencies. For the 1999 harvest season, we have published a proposal in the Federal Register in which we would greatly reduce the size of the existing regulated areas and allow the planting of wheat in plowdown, traceback, and bunted kernel fields. We intend for a final rule based on that proposal to be published in time to provide relief for the crop that will be harvested in May, June, and July.

ACCELERATED PSEUDORABIES ERADICATION PLAN

Question. It has been reported that by mid-January, USDA's accelerated pseudorabies eradication plan has had only 65 hog producers enroll totaling nearly 104,000 hogs. In mid-January, USDA reported that 1.9 million head of hogs are infected with pseudorabies. Why has there been little enrollment in this eradication program? When do you expect that the sign-up for this program will be finished?

Answer. As of April 9, 1999, 344 herds have been depopulated, involving 412,803 hogs. APHIS expects approximately 50 more producers to participate. Some producers chose not to enroll in the accelerated program because they are under contract with slaughtering plants to provide a certain number of hogs in a certain time period. Legislation in some States requires that their facilities be kept inactive for a period of 30 days following cleanup and disinfection. This requirement could interfere with their ability to fulfill their contract. These producers feel that breaking their current contracts may jeopardize their ability to secure such contracts in the future. Other producers' herds are close to pseudorabies-free because of the mandatory testing and removal standards developed by the cooperative APHIS/State/industry pseudorabies program. If only finishing hogs (which go to slaughter) and not breeding hogs are infected, they are reluctant to lose their investment in the genetics of their herds by participating in the accelerated eradication. They feel that their herds will soon be pseudorabies free without participation. Also, hog prices have risen since the original crisis, reducing the economic incentive for producers to participate in the voluntary program. Despite these obstacles, the accelerated program continues to reduce the number of known pseudorabies infected herds.

Producers will be able to sign up for the accelerated eradication program until July 15, 1999. APHIS expects that the vast majority of producers who decide to participate will sign up by the end of April 1999.

U.S.-PANAMA SCREWWORM COMMISSION

Question. How is the Joint U.S.-Panama Commission for the Eradication of Screwworm funded?

Answer. Eighty-five percent of the Joint Commission's funding comes from contributions made by the United States Government. The remaining 15 percent is supported by contributions made by the government of Panama. In 1994, USDA signed an agreement with the Panama's Ministry of Agriculture and Livestock Develop-

ment to create the Commission, to initiate operations in Panama, and to construct and operate a sterile fly facility to maintain a permanent biological barrier.

Question. Will the U.S. cooperative share be funded through the APHIS budget?

Answer. Yes. The U.S. share is funded through the APHIS screwworm line item.

NATIONAL FARM ANIMAL IDENTIFICATION AND RECORDS PROJECT

Question. What is the cost of each fiscal years 1999 and 2000 of the National Farm Animal Identification and Records (FAIR) pilot project? Which industry groups are working with APHIS on this pilot program? How were the States participating in this program chosen?

Answer. APHIS is contributing $500,000 in fiscal year 1999 for the F.A.I.R. pilot project. A similar amount is projected for fiscal year 2000. APHIS is working with the Holstein Association, the Dairy Herd Improvement Association, and the National Association of Animal Breeders on this pilot project. The project also has the support of the United States Animal Health Association and the Livestock Conservation Institute. The States of California, New York, Pennsylvania, and Wisconsin were chosen because of the significant dairy industries in these states and the ability of the states to control animal movements (through the use of limited slaughter markets and establishments).

BRUCELLOSIS

Question. How much additional funding is USDA and the Department of Interior (DOI) using to develop a safe and effective brucellosis vaccine for wildlife?

Answer. For fiscal year 1999, APHIS expects to fund one brucella vaccine research study for $20,000. The study involves RB51 field trials in feral swine in South Carolina. APHIS is also aware of several ongoing ARS brucella vaccine research studies. The USDA and DOI are scheduled to meet in the last half of fiscal year 1999 to establish a consolidated approach to prioritizing and funding brucella vaccine research needs. In addition, ARS has included an increase of $1,000,000 in the fiscal year 2000 President's budget to develop a vaccine for brucellosis in wildlife.

Question. Please update the Committee regarding the construction and operation of the bison quarantine facility.

Answer. Discussions are currently taking place between the State of Montana and APHIS regarding the location of the bison quarantine facility in Yellowstone. A final decision on the location is pending the outcome of the Environmental Impact Statement (EIS). The EIS includes seven separate alternatives for managing bison in the park. The National Park Service (NPS) is expected to make a final decision on the EIS in June 2000.

WILDLIFE SERVICES

Question. Dr. Reed's statement indicates that the gray wolf recovery program has succeeded beyond expectations. Is there a possibility of overpopulation? If yes, how is the agency addressing this problem?

Answer. Gray wolf populations in the United States continue to expand. In August 1974, the Eastern Gray Wolf was classified as an endangered species. At the time, the Minnesota wolf population was estimated at 500–1,000 animals and occupied a range of approximately 19,000 square miles. The Minnesota wolf population is increasing at an annual rate of 3 to 5 percent and expanding its range considerably. By 1996, the population reached an estimated 2,200–2,300 wolves which had expanded their range to more than 39,000 square miles. APHIS' Wildlife Services (WS) verified 145 incidents of wolf predation on domestic animals in Minnesota in fiscal year 1998 and captured 166 wolves. Presently, the wolf population in Minnesota has reached such proportions that the U.S. Fish and Wildlife Service (FWS) is considering removing the wolf from the endangered species list.

In Wisconsin, FWS may also remove the gray wolf from the endangered species list because the population is increasing to the point where the State Wildlife Agency is preparing management plans. WS investigated 32 complaints of wolf depredations in fiscal year 1998, an increase of almost 100 percent from fiscal year 1997, and captured 3 animals.

Gray wolves began moving back into northwestern Montana from Canada in the mid-1980s. This naturally occurring population of wolves is well established and its size has approached 100 animals at various times. Some wolves have been removed from the population after they repeatedly killed livestock. The population currently consists of about 45 animals. In addition to this naturally occurring population, the FWS captured 29 wolves in Canada in 1995, 37 wolves in 1996, and released them into Yellowstone National Park and central Idaho. These wolves are considered nonessential experimental populations, and both are increasing. There are now well

over 100 wolves in each area. In the next few years, the wolf population in the Northern Rockies area may also reach population levels that will warrant FWS consideration for removal from the endangered species list.

Formal rules and plans direct that WS will deal with wolves that damage livestock. WS verifies wolf damage to livestock, captures depredating wolves as directed by the FWS, mediates conflicts between agencies and resource owners, disseminates information to the livestock community and the general public, and provides training to people who work with wolves that damage livestock.

Wolf recovery in Montana and reintroduction into Idaho and Wyoming have impacted WS' ability to conduct routine livestock protection activities. Restrictions on the use of traditional methods of control where wolves may exist have hampered APHIS' ability to manage coyote damage to livestock. There has been a significant increase in work to verify potential cases of wolf predation and to deal with instances of confirmed wolf damage. The fiscal year 1999 Congressional directive of $175,000 did not include new money.

In addition to this $175,000, another $72,000 is expected to be needed in fiscal year 1999 due to the increasing wolf populations in Montana, Idaho, and Wyoming, and related dispersal activities. A wolf from Idaho recently dispersed into Oregon, and its presence impacted WS ability to conduct routine wildlife damage management activities in that State. WS biologists expect more wolves to disperse from both the Idaho and Yellowstone recovery areas later this spring. Oregon livestock producers are concerned about their ability to protect their livestock. WS expects a significant increase in work load in Wyoming, Montana, Idaho, and Oregon associated with these dispersals.

The presence of naturally occurring populations and introduced experimental populations in the same general area with the potential for intermixing also creates difficulty for livestock owners and WS field personnel. The damage management control for each of these populations is governed by different regulatory requirements; the inability for WS personnel to distinguish between these two populations may make it difficult to provide services to ranchers and farmers in the area.

In Minnesota, where wolf control work is conducted solely with APHIS funding of about $250,000 per year, APHIS spent an additional $30,000 in fiscal year 1998, and total costs in this State are expected to be $380,000 in fiscal year 1999. In addition, wolf expansion into Wisconsin is projected to cost approximately $15,000 in fiscal year 1999 due to increasing populations.

ANIMAL WELFARE

Question. Please breakdown all costs associated with the implementation of the Animal Welfare Act. Please indicate shortfalls in this area?

[The information follows:]

AWA Implementation Costs

[Fiscal year 1999 estimated]

Inspection Activities (Includes Travel Expenses)	
Dealer Inspections	$3,394,291
Research Inspections	1,523,968
Exhibitor Inspections	1,731,781
Carrier/Handler Inspections	277,085
Subtotal	6,927,125
Licensing/Record Keeping	619,313
Other Activities:	
Enforcement Action	203,570
Search Unlicensed/Unregistered	77,357
Educational Services	1,347,635
Subtotal	1,628,562
Total	9,175,000

Since 1992, the Animal Welfare Act (AWA) appropriation has remained constant. Inspections to ensure minimal standards of care has declined from 17,764 in 1992 to 10,709 in 1998, without any reduction in the number of animals or number of animal sites (approximately 10,400) requiring inspection oversight.

Every facility needs at least one annual inspection to ensure minimal standards are met and to remind the licensee/registrants of their responsibilities under the AWA. Past history suggests that over 45 percent of the facilities will have some degree of noncompliance observed during an inspection, with some of these needing reinspection to ensure correction of problems that have, or are likely to have, a detrimental effect on the well-being of the animals. Several of the problem facilities may require up to 4 inspections per year just to ensure correction of life threatening situations. With 10,400 sites (7,773 facilities) to inspect, it is estimated that AC needs to conduct at least 17,120 inspections per year to ensure minimal standards of care.

Sites requiring one inspection	10,400
45 percent of the 10,400 sites will have violations and require at least 1 more inspection. 10 percent of the 10,400 sites will require 2 or more inspections	6,720
Total number of inspections that should be conducted	17,120

With a current short fall of 6,411 inspections at an approximate cost of $551 per inspection, Animal Care needs an additional $3.5 million to ensure minimal levels of animal well-being at the facilities currently regulated under the AWA.

Question. How many inspectors are currently conducting inspections in fiscal year 1999?

Answer. There are 69 inspectors in fiscal year 1999.

Question. How many facilities are they inspecting per year?

Answer. In fiscal year 1998, there were approximately 10,709 compliance inspections and 1,579 pre-license inspections conducted at 7,773 facilities.

Question. How many facilities should be inspected at least annually?

Answer. There are 7,773 facilities that APHIS should be conducting 16,000 compliance inspections and 1,600 to 2,000 pre-license inspections per year. For maximum compliance, each facility should average two inspections per year. Facilities with greater number of violations need up to four inspections per year while those with no violations can be inspected every other year.

Question. How many field inspectors are supported by the fiscal year 2000 proposed budget?

Answer. The proposed fiscal year 2000 budget supports 69 field inspectors.

Question. Should the agency rule that rats and mice bred for use in research and birds be treated like other animals, will more inspectors be needed to enforce the ruling?

Answer. Yes, it is estimated that APHIS will need to hire an additional 34 veterinarians and 16 animal health technicians, to conduct inspections of facilities that deal with rats, mice, and birds.

SWIM WITH THE DOLPHINS

Question. When does the agency expect to fully implement the provisions of the final rule regarding the swim-with-the-dolphin regulations?

Answer. As a result of the continuing concerns expressed by several regulated parties over multiple components of the final rule to regulate human dolphin interactive programs, including wading programs, the Agency has initiated the process to suspend enforcement of the rule and solicit additional public comment prior to moving ahead with any new rulemaking for these programs.

HORSE PROTECTION

Question. Please explain the modifications made to the current Horse Protection Strategic Plan after working with the six Horse Industry Officials.

Answer. The Horse Protection Act (HPA) Operating Plan for the 1999 Horse Show Season (Operating Plan) was issued on February 12, 1999, to expand on the procedures outlined in the Horse Protection Strategic Plan. The Operating Plan is organized into nine components and covers items such as APHIS and HIO responsibilities; certification of HIO designated qualified person (DQP) programs; inspections; compliance with 9 CFR 11.3 (the scar rule); HIO sanctions for HPA violations; conflict resolution; and regulatory changes.

APHIS through the Strategic Plan transferred the initial enforcement responsibility to the various DQP programs. However in doing so, APHIS has not relinquished its authority for enforcing the HPA. APHIS will conduct inspections at HIO sanctioned events to determine whether or not the DQP's are successfully detecting sore horses and other violations of the Horse Protection Regulations. The HIO's will be responsible for demonstrating that the DQP programs are properly identifying

these violations and applying appropriate penalties. APHIS will review, evaluate, and certify the DQP programs. Because confusion has arisen between the DQP programs and APHIS regarding the proper detection of violations of HPA based on 9 CFR 11.3 (the scar rule), APHIS has also included procedures in the operating plan for the detection of noncompliance with the scar rule.

Violations of the HPA and the regulations are under the jurisdiction of the Hearing Committee of each HIO. The Hearing Committee will enforce the schedule of penalties in the operation plan for violations. APHIS will encourage employees to resolve conflicts with DQPs at the local level. Disagreements that cannot be resolved at the local or regional level will be elevated to the HIO Chair or President and the APHIS Deputy Administrator for Animal Care. APHIS will provide a final decision to the HIO within 60 days.

APHIS has asked each HIO to develop reasonable plans for eliminating scarring. If this cannot be accomplished, APHIS may consider proposing an amendment to 9 CFR 11.3 that would provide that any horse exhibiting active, visible bilateral evidence of abuse on any foot area above the hoof shall be deemed to be "sore" under the HPA. In this scenario, APHIS would exempt all horses born before 1998 that exhibit old scar tissue.

NATIONAL MONITORING AND RESIDUE ANALYSIS LABORATORY

Question. Please list the other USDA agencies and entities with which the (National Monitoring and Residue Analysis Laboratory (NMRAL) in Gulfport, Mississippi does reimbursable work. Please list the reimbursements received by each. Will any other agency programs be located at this facility in Gulfport? If not, what will be done with the additional space available since relocation of agency employees to North Carolina has occurred? What amount of funding is proposed for fiscal year 2000 for NMRAL?

Answer. This year at NMRAL, we expect to receive approximately $50,000 from the Boll Weevil Eradication Foundations for analyzing environmental samples for insecticides used in the eradication program. In addition, we expect to receive approximately $100,000 from the Farm Service Agency for analyzing samples from a variety of commodities and approximately $8,500 from the Agricultural Marketing Service for analyzing soybean samples. Our imported fire ant methods development program is conducted at the Gulfport facility as well. Also, we are currently evaluating the feasibility of increasing staffing in the methods development unit to perform work on agricultural quarantine inspection technology. Approximately $1.6 million is proposed for fiscal year 2000 for NMRAL.

APHIS Y2K SYSTEMS

Question. At the first of January APHIS reported that 2 systems, the Licensing of the Registration Information System and the Integrated Systems Upgrade Project, are behind in the Y2K government-wide goals. Please provide an update of the agency's activities to prepare these two systems for the year 2000.

Answer. The Licensing and Registration Information System has been remediated, tested, and implemented in the three Regional Offices of the Animal Care Program. APHIS certified the system as Y2K compliant on March 31, 1999. The Integrated Systems Upgrade Project was certified as Y2K compliant on April 29, 1999. After reporting that these systems were falling behind schedule, the Agency allocated additional in-house and contractor resources to both efforts to accelerate progress.

SAFETY OF APHIS PERSONNEL

Question. In the 2000 budget request, how does the agency address the safety of personnel at state and field offices?

Answer. APHIS has taken and continues to undertake a wide range of activities to address and ensure the safety of personnel at State and field offices. Safety is a serious matter for APHIS, in light of the event that occurred in Oklahoma City in 1985, in which APHIS lost seven employees, as well as several other incidents including fire bombings in Washington State, and office break-ins and takeovers in New Mexico and Arizona. In accordance with the Department of Justice (DOJ) report, Vulnerability Assessment of Federal Facilities, the APHIS National Security Program (NSP) team is surveying all APHIS offices to ascertain vulnerability risks, and to determine appropriate security measures for each existing location as well as future ones. To date, over 250 APHIS field offices have responded to the self-assessment survey which are being evaluated by the NSP team. The APHIS-NSP team is currently involved in several major agency wide projects including assisting in the development of an emergency management preparedness plan; an emergency

management operations center; a workplace violence prevention program; an Agency-appointed bioterrorism coordinator, and an Agency-wide Continuity of Operations plan.

AGRICULTURAL QUARANTINE INSPECTION USER FEES

Question. What is the current balance of the Agricultural Quarantine Inspection user fee reserve program?

Answer. The fiscal year 1999 beginning-of-year total balance of the Agricultural Quarantine Inspection user fee reserve account was $30.5 million. Of this total, $14.7 million was unencumbered. However, current projections estimate an end-of-year unencumbered balance of $3.9 million for fiscal year 1999.

CONTINGENCY FUND

Question. What is the current balance of the Contingency Fund?

Answer. As of April 9, 1999, the balance of the Contingency Fund is $3,710,306.

JOHNE'S DISEASE

Question. What threat is Johne's Disease to the U.S. dairy cattle industry? How much funding in the fiscal year 2000 budget request is proposed for the establishment of a certification and control program for Johne's?

Answer. Johne's disease is a contagious bacterial disease of the intestinal tract. The disease occurs in a wide variety of animals but most often in ruminants, especially dairy cattle. The risk to dairy cattle is high because the transmission of the disease favors the close quarters of the animals. Cattle infected with this disease usually develop diarrhea, rapid weight loss, and a loss in milk production. Johne's disease is estimated to cost dairy farmers $1.5 billion annually in reduced milk production. In northern States such as Minnesota, Michigan, New York, Ohio, Pennsylvania, and Wisconsin, it has been estimated that 30 percent of the dairy cattle herds are infected with this disease. The fiscal year 2000 President's budget includes $1.5 million for a Johne's disease certification and control program.

NATIONAL ANIMAL HEALTH EMERGENCY MANAGEMENT SYSTEM

Question. Please outline the agency's proposal to create the national animal health emergency management system program and provide a breakdown of the fiscal year 2000 budget request of $1.2 million for this program.

Answer. The proposed program is designed to enhance USDA's primary responsibility to protect the Nation's food supply and animal populations from disease events, both accidental or intentional, that could negatively impact the economic status of the food supply and/or the livestock and poultry industries.

APHIS is requesting $1.2 million to develop an infrastructure to better position APHIS to provide the public and animal industry with a counter-terrorism force; developing disease detection and reporting systems; and promoting and strengthening partnerships with other Federal and State Agencies including the Federal Bureau of Investigation and the Federal Emergency Management Agency. Approximately $500,000 will be used to support 6 program positions. Another $300,000 will be used for systems development, software, and computer equipment. The remaining $400,000 will be used to conduct training courses on biological warfare and decontamination procedures and to provide funds for cooperative research efforts.

ASIAN LONG-HORNED BEETLE

Question. Will the fiscal year 2000 budget request of $2.1 million for the eradication program of the Asian Long-horned Beetle (ALB) be sufficient to meet the needs of the program in Chicago and New York? If this requested amount is not sufficient, how much additional funding is required?

Answer. The $2.1 million request will certainly help us control this devastating pest and prevent its further spread. We expect to remove all known infected trees by May 1999. If no additional infected trees are found, this amount is likely to be sufficient.

INVASIVE ALIEN PLANTS

Question. What need is there for a new national rapid assessment and response system for invasive alien plants in the U.S. and how will the fiscal year 2000 budget request of $1.7 million be used to create this system?

Answer. The development of a national early warning and rapid response system would be a critical component in our efforts to minimize the economic and ecological

impacts of introduced invasive plants under the new presidential executive order on invasive species. In addition, it would be crucial to the establishment of an effective noxious weeds prevention and control strategy for the United States. We will use the $1.7 million increase to begin establishing a Federal Interagency Rapid Response Weed Team; an APHIS Regional Weed Team team to determine Agency priorities regarding weed prevention and eradication; State-level Interagency invasive species councils to establish invasive plant prevention, eradication, and management priorities in each State, as part of an overall State strategy for invasive species; and State Weed Detection and Reporting Networks in association with the State Councils. The extent to which the national early warning and rapid response system will be implemented in fiscal year 2000 will be based in large part on State cooperation in developing local, State, and Regional partnerships to facilitate interagency action on invasive species.

Question. The Committee has consistently expressed concern about the growing problem associated with fish-eating birds which cause economic damages to farm-raising catfish operations. Please provide a detailed summary of the extent and scope of this problem, including the progress that is being made toward addressing the issues identified. Has the agency identified additional needs which are not currently being addressed, in terms of confronting bird depredation problems in the farm-raised catfish industry?

Answer. Aquaculturists report that fish-eating birds cause significant economic losses, with some operations reporting one year losses in excess of $200,000. In the lower Mississippi Valley, cormorants cause losses of more than $17 million to catfish operations each year. With cormorant populations increasing throughout their range at the rate of approximately 8 percent per year, these losses can be expected to increase. Cormorants have also been found nesting in the lower Mississippi Valley, adding to the potential impacts to aquaculture operations.

APHIS' Wildlife Services (WS) provides assistance to aquaculture producers in Alabama, Florida, and Mississippi. WS biologists conduct on-site evaluations to assess damage and make control equipment available to producers. If exclusionary and scaring techniques fail to reduce losses, producers may now take limited numbers of birds by lethal means under authority of a cormorant depredation order, developed by the Fish and Wildlife Service with WS cooperation. WS was an active participant in the roost dispersal program conducted to move roosting sites from producing areas to sites along the Mississippi River. Last year's efforts resulted in the dispersal of 70 percent of cormorants from catfish producing ponds.

WS is aware of the need for increased wildlife damage assistance for catfish farmers in the southern United States and has a research field station in Starkville, Mississippi, which conducts studies to improve current control methods and develop new ones. Catfish production areas in southern Georgia and northern Florida are experiencing increased levels of depredation by fish-eating birds, including herons and egrets. Many of these production facilities are small farms and are unable to sustain heavy operating losses due to wildlife damage. Additional WS personnel are needed to establish an active presence and to provide on-site technical assistance and develop cormorant damage management plans.

Question. The Committee believes that interagency coordination should increase between USFWS and APHIS. How can these two agencies address bird problems in a more orderly, effective, and ecologically responsible manner?

Answer. A major step in the coordination between APHIS and FWS was the effort to develop and implement a cormorant depredation order, which provides a more effective and efficient method of allowing producers to implement control actions. Both Agencies cooperate on research studies on the ecology, behavior, food habits, and migratory patterns of various fish-eating birds, which includes ongoing surveys to determine population status and trends on fish-eating birds migrating and nesting in the Mississippi River valley. Further progress can be made by cooperating in the development and implementation of a cormorant management plan that includes cormorant population dynamics from the upper Great Lakes to the Gulf of Mexico and the relationship to cormorant population status and trends in the Northeast. APHIS will work with FWS in the northeast to identify areas that experience difficulties with fish-eating birds. A review of activities in the northeast should include a consideration of the possibility of expanding the current cormorant depredation order to include states beyond the Southeast.

In addition, APHIS continues to provide technical and on-the-ground support to the public under the constraints imposed by the Migratory Bird Treaty Act. APHIS is currently working with FWS to streamline the resident Canada goose permitting process to assist our customers in receiving more efficient and cost effective support from FWS, which is the permitting Agency. APHIS provided FWS with information on damage caused by resident geese. FWS developed an environmental assessment

and asked for public comment on a special purpose, resident Canada goose permit. Based on the results of this environmental analysis, FWS proposed a modification of permit regulations to allow a more liberal approach by State wildlife agencies for controlling resident goose damage. In the absence of a migratory bird permitting process for Federal agencies, APHIS continues to consult with FWS before implementing wildlife damage management control activities for resident Canada geese. In addition, APHIS continues to work with FWS on the development of a long-term, flyway based strategic plan for resident goose management which will address resident goose damage nationwide.

BRUCELLOSIS

Question. Last year the Department anticipated that all 50 states would reach a brucellosis Class "Free" status by the end of 1998. Have all 50 states achieved this status? Which states have not achieved this status? How have the bison carrying brucellosis which wander beyond the boundaries of the Yellowstone affected this goal?

Answer. The established program goal was to have no affected herds and all states qualifying for Class Free status by the end of 1998. APHIS nearly reached this goal with only four affected cattle herds and one affected bison herd. In addition, 43 states had achieved Class Free status and 4 States (Florida, Kansas, Louisiana, and Oklahoma) were in the qualifying stage for Class Free status. The remaining three States, Missouri, South Dakota and Texas, were expected to be in the qualifying stage for Class Free status by the end of fiscal year 1999. Due to a newly affected herd being discovered in March 1999, the State of Oklahoma must reenter the qualifying stage and be disease free for one full year before they can reach Class Free status. The YNP bison have not affected this goal.

NATIONAL POULTRY IMPROVEMENT PROGRAM

Question. How much does the fiscal year 2000 budget propose for the National Poultry Improvement Program? How does this compare to the fiscal year 1999 appropriated level?

Answer. The budget request contains approximately $260,000 for the National Poultry Improvement Program. Funding for fiscal year 1999 is at a similar level.

BIOTECHNOLOGY

Question. How much is proposed in the fiscal year 2000 budget for the Biotechnology Products Regulatory Division of APHIS? Is this amount adequate to fulfill the unit's statutory responsibilities? How many new crop variety approvals did the agency approve in 1998? How many applications are estimated for approval in 1999?

Answer. Our fiscal year 2000 budget request includes approximately $5 million for biotechnology regulatory activities. Although this amount should be adequate to fulfill our statutory responsibilities, an ever-increasing demand for our services will create significant challenges for us as we struggle to keep pace with the projected continuous, rapid growth of biotechnology in agriculture. In fiscal year 1998, we regulated the field testing of two new crop plant varieties and expect to regulate the introduction of four new varieties this year. The addition of four new plant varieties will bring the total number of different genetically modified varieties of plants field tested in the U.S. to 56. Of greater importance, though, is that we made 1,799 regulatory decisions on genetically engineered crops. Included in this figure is 1,073 release notifications and permits that we issued at over 5,000 sites nationwide. These release notifications and permits represent over 25 percent of all field releases ever made. Also in fiscal year 1998, we processed several more petitions for determination of regulatory status than in fiscal year 1997. Processing these petitions is the last USDA regulatory step for the commercialization of genetically modified crop plants. Adding to this increased workload is the "determination extension process", which will significantly increase the document handling workload by fiscal year 2000. This streamlined petitioning process involves deregulating an organism which is similar to but not identical to an organism that has previously been deregulated. To help fund our costs associated with the expected workload increase, we have proposed user fees in the amount of $5.36 million. This proposal is designed to achieve full cost recovery for our biotechnology activities associated with the permitting process, field inspections, and the increase proposed for the biotechnology permits unit. Since service being provided by this activity benefits a limited and clearly defined group of people, it is appropriate that they rather than the general taxpayer pay for these services through a user fee.

MANAGEMENT AND OVERHEAD EXPENSES

Question. APHIS does not receive a separate appropriation for its management and overhead expenses. How are these costs funded? Please provide an accounting of management and overhead expenses for fiscal year 1998.

Answer. Because APHIS does not receive a separate appropriation for management and overhead expenses, funding for these costs are allocated to the various line items available to the agency, including appropriations, user fees, reimbursements, and trust fund receipts. As shown in the following table, management and overhead expenses totaled $77.7 million in fiscal year 1998, with total availability from all sources of approximately $613 million. APHIS' support costs fall into two categories: Agency support and program support. Agency support includes budget, finance, personnel, procurement, contracting, Congressional relations, public information, rulemaking, planning, policy development, program evaluation, civil rights enforcement and compliance, equal employment opportunity counseling, and Central Services which include National Safety and Health Council, headquarters security, labor, and copier maintenance services. Agency support costs are assessed to each budget line item on a proportional basis, except for the Information Systems Acquisition Project, the contingency fund, emergency transfers, and the Buildings and Facilities appropriation, which are exempted. Program support costs are funded by each individual unit from within its available funds, and may include regional offices in the field and an office of the Deputy Administrator and Resource Management Support at headquarters.

MANAGEMENT AND OVERHEAD COSTS—FISCAL YEAR 1998

[In thousands of dollars]

Cost Center	Agency Support	Program Support	Total funding
Plant health programs	.....	17,881	17,881
Animal health programs	.....	13,252	13,252
Wildlife Services	.....	4,553	4,553
International Services	.....	3,635	3,635
Animal Care	.....	1,574	1,574
Investigative and Enforcement Services	.....	783	783
Office of the Administrator Staff	2,181	.....	2,181
Civil rights Enforcement and Compliance	1,138	.....	1,138
Equal Opportunity Employment Counseling	527	.....	527
Information technology support	167	.....	167
Congressional relations and public information	3,445	.....	3,445
Budget, finance, personnel, procurement, and contracting	16,678	.....	16,678
Employee development and training	3,795	1,400	5,195
Policy, program planning and evaluation, regulatory support	5,510	.....	5,510
Headquarters Central Services	1,148	.....	1,148
Total, APHIS	34,589	43,078	77,667

Note: Excludes approximately $7.2 million in available funds and support costs performed for Agricultural Marketing Service and Grain Inspection and Packers and Stockyears Administration on a reimbursable basis.

PINK BOLLWORM

The National Cotton Council, along with growers in Arizona, are proposing an eradication program for the pink bollworm to begin in 2000 and complete in 2004. They are requesting an increase for APHIS of $5 million over the fiscal year 1999 level to facilitate increased production of sterile moths at the Phoenix facility and to allow APHIS to provide important technical oversight of the program.

Question. Why does the fiscal year 2000 President's budget not propose an increase to instigate a pink bollworm eradication program?

Answer. Current budget constraints and more pressing program needs prevented us from doing so. However, we remain confident that this type of program can succeed, particularly with the increased use of Bt cotton, and may consider it again along with other program priorities.

Question. Is this increase adequate to support the work that the National Cotton Council has proposed?

Answer. A $5 million increase, together with contributions from cotton growers, would be adequate to support this work. Our contribution would represent 30 percent of the total projected first year costs and the growers' contribution would represent 70 percent.

Question. Is it possible to eradicate the pink bollworm as they have proposed in their plan?

Answer. Yes, it is. This strategy has yielded extremely promising results in smaller scale projects; we would expect similar results from an area-wide program.

QUESTIONS SUBMITTED BY SENATOR BURNS

BRUCELLOSIS

Question. The APHIS budget was cut by $9 million in the fiscal year 2000 budget. APHIS is responsible for numerous important projects to the State of Montana. Funding for the brucellosis vaccine research is among those projects. Brucellosis remains a threat to the health and well-being of livestock in the bordering Yellowstone National Park (YNP). YNP will continue to serve as a reservoir for brucellosis unless it can be adequately managed or appropriate measures are taken. Considering that over 1.5 million people visit YNP annually and come into close proximity to wildlife and wildlife secretions, brucellosis poses an obvious threat not only to livestock and bison, but is also an issue of human biosafety. How does USDA expect to solve this problem when the APHIS budget is cut?

Answer. One of APHIS' greatest achievements has been the success of the brucellosis program. Through cooperative efforts between Federal and State governments and industry and careful herd management, the last pockets of infection are being eliminated from domestic livestock. At the end of fiscal year 1998, only 8 herds remained under quarantine. As a result of this success, the Agency will be able to reduce disease management activities in domestic cattle in fiscal year 2000 including tracebacks, investigations, vaccinations, and depopulation. The reduction in the brucellosis management program should not impact the Agency's activities in YNP.

As long as wildlife in YNP continues to serve as a reservoir for brucellosis, there will always be concern that the disease could be reintroduced in the country's livestock population. For this reason, APHIS will continue to conduct monitoring and surveillance activities from the Agency's animal health monitoring and surveillance program. This continued surveillance and testing will allow APHIS to detect and quickly eliminate the disease should it spread into the livestock population.

Public health issues, including educating Park visitors to the threat of brucellosis, have been addressed in the Environmental Impact Statement (EIS). The EIS includes seven separate alternatives that could be implemented by the National Park Service (NPS) in the management of bison in YNP. Until a final decision is made on the EIS, APHIS' long-term role in managing brucellosis in YNP will remain undetermined.

WILDLIFE SERVICES

Question. APHIS also serves as the agency for Wildlife Services which is extremely important to livestock producers in the state of Montana. $175,000, which was earmarked for the purchase of a new helicopter for Wildlife Services, was cut out of the APHIS budget. How will USDA restore this valuable funding to Montana livestock producers depending on it for the welfare of their animals?

Answer. The fiscal year 1999 Congressional directive of $175,000 for wolf control in Montana was not accompanied with additional appropriated funds. APHIS is addressing the directive through a contingency fund release.

AGRICULTURAL MARKETING SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

PESTICIDE DATA PROGRAM

Question. The budget proposes an increase of $911,000 for the development of a program that monitors pesticide residues in meat, poultry, eggs and drinking water. Is this data collection currently conducted by any other federal agency? What jurisdiction or responsibility does USDA have to monitor drinking water? Why is this

not done by the EPA? How does this program differ from the pesticide data program?

Answer. The USDA's Food Safety and Inspection Service (FSIS) has regulatory authority over meat, poultry, and egg products. FSIS' compliance program is oriented towards enforcement of tolerances (maximum allowable pesticide residues in or on foods); therefore, their data, although appropriate for enforcement, have limited usefulness in population-based evaluations. FSIS' data are not statistically representative of the overall residue situation for a given slaughter class, pesticide, or region. Sampling for compliance programs is usually biased to take into account factors such as commodities or places of product origin with a history of violations. FSIS uses mostly multi-residue methods and no verification of findings is required unless a tolerance violation is suspected. These methods can detect pesticides at tolerance levels which in some cases are too high to be useful for accurate pesticide risk assessment.

EPA requested monitoring data for drinking water. These data will be obtained by the Agricultural Marketing Service (AMS), under authority of the Agricultural Marketing Act of 1946, using the Pesticide Data Program (PDP). Currently available drinking water data are very limited and are collected through the EPA's Public Water System Supervision Program by delegated States and tribes. Limitations of these data include lack of consistency in sampling and testing protocols, and an extensive array of data reporting formats which make it difficult to compile or derive national estimates. The U.S. Geological Survey (USGS) collects data for ground and surface water but does not sample drinking water. USGS monitors vulnerable bodies of water in areas of intense agricultural production, such as the corn belt region. Both the EPA and USGS programs focus on monitoring for compliance with Maximum Contaminant Levels of various chemicals, including selected pesticides. These programs do not provide data for all pesticides needed by EPA's Office of Pesticide Programs to meet Food Quality Protection Act (FQPA) requirements that exposures through drinking water be included in dietary risk assessments. AMS is working with EPA to develop a sampling and testing program for drinking water on a national scale.

If EPA does not have reliable residue values for food and water, they use assumptions or models which tend to overstate risk. PDP data have been of great value in providing sound data to EPA. This proposal would extend the PDP program to meat and water—important components of children's diets. Because FQPA requires EPA to consider all non-occupational exposure in the establishment of tolerances, assumed high-end exposures from meat, poultry, eggs, and drinking water can fill the "risk cup" and leave little or no room for critical agricultural pesticide needs. Sound data and realistic assessments of exposure are critical for maintaining critical agricultural use of some pesticides.

Because of the PDP experience, partnership with States, and existing infrastructure, adding to the scope of the current program is the most cost-effective way to generate the data needed to support agricultural pesticide needs.

In contrast to existing data sources for drinking water, PDP uses statistically-reliable, unbiased random sampling procedures to provide objective and comprehensive residue data to produce national estimates of pesticide residues. PDP collects samples as close to point of consumption as possible. For water, samples would be collected at water treatment facilities. State population figures are used to assign the number of samples collected per month. This number is constant for each commodity if the commodity is available in the marketplace. Generally, at least 600 samples of a commodity are obtained in a year. PDP uses refined multi-residue methods capable of detecting levels much lower than tolerances. These methods are resource-intensive and require various steps to allow for detection of residues at trace levels and verification of positive results. All PDP data are supported by rigorous quality assurance (QA) and quality control (QC) procedures. Approximately 30 percent of the analytical resources are in the QA/QC system to provide data integrity and uniformity. PDP uses a uniform reporting system and requires strict adherence to data reporting procedures. PDP's database allows for remote data entry and electronic transmission of data, and can be queried to provide customized reports for EPA.

AMS will modify PDP methods to incorporate meat, poultry, eggs, and drinking water, beginning with poultry. Analysis of these foods requires acquisition of equipment and new technologies, and reengineering of PDP's data system for processing of these data. These data will be provided to EPA and FSIS. EPA will use the data for FQPA risk assessments, and FSIS for mitigation and risk management activities. For the poultry program, AMS staff are working with FSIS personnel to develop procedures for sampling based on statistically-reliable protocols, with FSIS assuming responsibility for the sampling, handling, and shipping portion of the pro-

gram. The National Agricultural Statistics Service is providing the statistical consultation for this endeavor. Poultry was selected as the first of these products to monitor in fiscal year 2000. Meat and egg products will be introduced into the program in subsequent years.

For the drinking water testing program, PDP is working with EPA to develop sampling and testing protocols to collect drinking water data on a national scale. Additional funds will be needed to begin sampling and analysis of drinking water. The estimated cost to accomplish this work is $2.0 million.

MICROBIOLOGICAL DATA PROGRAM

Question. The budget proposes an increase of $6,185,000 to initiate a microbiological data program for food-borne pathogens. Is this data collection currently conducted by any other federal agency? How is this program to be coordinated with other agencies involved in this program, especially the Food and Drug Administration? Are other agencies contributing to the cost of this program?

Answer. Data collection of this magnitude and with statistical validity has not been conducted by any other Federal agency. At present, the Food and Drug Administration (FDA) is doing a survey of 10 imported products, with the purpose of detecting those levels of contamination that might result from a failure to follow adequate Good Agricultural Practices and Food Manufacturing Practices. The purpose of the Microbiological Data Program is to perform a statistically valid assessment of the contamination level of raw produce available to the American consumer. The FDA will be informed of test results and has assigned a research supervisor to act as liaison to work with AMS on this project. The Centers for Disease Control and Prevention will also be informed of MDP's test results. The National Agricultural Statistics Service will contribute directly to the program by providing the statistically-reliable sampling plans and associated laboratory testing quality control measures. The Agricultural Research Service has expressed a desire to receive isolated cultures which can be tested for antibiotic resistance, and arrangements will be made with Federal or university laboratories to perform serotyping. No funds will be received from any other agency for the execution of this project.

SUMMARY OF FEES BY ACTIVITY

Question. Dr. Figueroa's testimony indicates that 75 percent of AMS funding is derived from fees charged for services provided. Please provide an estimate of fees collected and disbursements by activity for fiscal years 1999 and 2000.

Answer. AMS funding is approximately 72 percent user fee funded in fiscal year 1999. If the budget requests are approved, the percentage in fiscal year 2000 will be 68 percent. The following is a table reflecting the summary of fees by activity.

SUMMARY OF FEES BY ACTIVITY

[Dollars in thousands]

	Fiscal year 1999 unobligated beginning balance	Earned revenue	Percent	Program Obligations	Fiscal year 200 unobligated beginning balance	Earned revenue	Percent	Program Obligations	Fiscal year 2000 unobligated ending balance
User Fee	$42,473	$60,730	25	$60,730	$42,473	$60,730	23	$60,730	$42,473
Trust Fund	20,860	106,122	43	106,122	20,860	106,122	41	106,122	20,860
PACA [1]	6,347	6,783	3	8,607	4,523	6,894	3	8,718	2,699

[1] PACA = Perishable Agricultural Commodities Act Program.

Note: This table does not include reimbursements to appropriations of approximately $3.7 million which represents approximately 1 percent in both fiscal year 1999 and fiscal year 2000.

ORGANIC CERTIFICATION PROGRAM

Question. Dr. Figueroa's testimony also indicates that $770,000 is requested for final implementation of the National Organic Standards program. When will the final regulation be published? When will it become effective? What will the additional staff position be used to do? Will the completion of the final rule not allow shifting of staff responsibilities to accomplish these tasks?

Answer. AMS staff has reviewed and analyzed the nearly 300,000 comments which were submitted in response to the proposed rule and subsequent issue papers. Based on this input, a revised rule is being prepared. Development of a final rule will commence after the comments have been received and thoroughly analyzed. Once the final rule is published there is an 18-month period during which full implementation will occur.

The additional position being requested is needed to augment existing staff. Functions which will be performed include assistance in developing international standards, accrediting both private and State certifying agents, determining equivalency of foreign programs, obtaining and disseminating relevant export data, monitoring State programs for compliance, developing a system to prevent fraudulent labeling, and extensive outreach efforts. While completion of the final rule will enable staff to shift responsibilities, it will not preclude the need for this additional staff position.

QUESTION SUBMITTED BY SENATOR BURNS

EXPORT FUNDING AND PRODUCER EDUCATION

Question. I am pleased that the Agricultural Marketing Service budget was increased by nearly $12 million. With the increase in funding for this important program, how will USDA utilize these funds for increases in exports and producer education for marketing?

Answer. Some of the additional funding for Marketing Services will be used by the Microbiological Data Program to facilitate the global marketing of domestically produced fruits and vegetables. This program will provide information on the contamination level of fresh fruits and vegetables for domestic risk assessment which can be used by exporters to market these commodities.

The Market News Program will use some of the additional funding to expand the number of foreign countries currently reported and to develop new reports on international trade and exports. Improving market awareness of conditions in the world market will increase export opportunities.

The additional funding requested for Wholesale Market Development will enable a number of direct marketing initiatives to be implemented for small producers, including educational outreach efforts on issues such as improving product quality, diversifying products, expanding markets, and developing market strategies.

GRAIN INSPECTION, PACKERS, AND STOCKYARD ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR COCHRAN

Question. Mr. Secretary, over the last few years we have heard a lot about the prices livestock producers have been receiving for their cattle and hogs. Many people have explained this situation as normal economic cycles in livestock production. Others have pointed to industry consolidation as the problem. Still others have claimed that country of origin labeling for meat and poultry products and mandatory price reporting of boxed beef would have provided relief. This committee has funded numerous GIPSA investigations into the meat packing industry. Can you share with the committee what the results of these investigations have yielded? Would mandatory country of origin labeling or mandatory price reporting have prevented these fluctuations in prices? Do you have additional studies underway? If so, please describe their focus and cost.

Answer. In addition to the Concentration study, GIPSA has used additional funds provided by this committee to fund a cooperative agreement with prominent economists from the University of Nebraska and Iowa State University to complete an econometric study of the data obtained in the Texas panhandle investigation. That study, as well as the investigation itself is currently undergoing professional peer review. Funds have also been used to recruit and hire additional economists for the regional offices and hire investigators with legal expertise, to undertake more complex investigations. These hiring efforts have allowed GIPSA to respond quickly to

complaints of anticompetitive behavior, such as a recently completed investigation of a feedyard boycott that is likely to result in further action, as well as a complaint issued by GIPSA against Excel Corporation alleging unfair and deceptive pricing practices in the procurement of carcass merit hogs. GIPSA will continue to investigate and monitor all aspects of the livestock industry. Current efforts underway include follow up work from the Texas Panhandle investigation for cattle as well as a plant closing investigation and a comprehensive review of current procurement contracts for hogs. Additionally, the Department is conducting a study on mandatory country of origin labeling and has a legislative proposal on mandatory price reporting and will be reporting on both issues to Congress.

Question. Can you provide the committee with the status of the GIPSA price reporting investigation of the meat packing industry mandated by Public Law 105–277?

Answer. A framework for conducting the Congressionally mandated price reporting pilot investigation has been developed by GIPSA. Project options that can be completed with the available funding have been identified. The anticipated date for commencing with the information collection is May 1, 1999.

Question. Public Law 105–277 also directed the Department to conduct a study on the effects of mandatory country of origin labeling for meat and poultry products. Can you share with the Committee the status of that study? Who in the department is conducting the study and when can we anticipate seeing the final report?

Answer. The Conference Report of the Omnibus Appropriations Bill directed the Secretary to conduct a comprehensive study on the potential effects of mandatory country of origin labeling of imported fresh muscle cuts of beef and lamb. The Food Safety and Inspection Service (FSIS) of USDA is preparing this report. The report is expected to address the impact of such requirements on imports, exports, livestock producers, consumers, processors, packers, distributors, and grocers. The report is also to address any additional costs to the federal government which would be incurred as a result of mandatory country of origin labeling of imported fresh muscle cuts of beef and lamb.

Question. Recommendation B. 15 of USDA's Advisory Committee on Agricultural Concentration calls for the reporting of more timely and accurate trade data. Public Law 105–277 provided clear direction to the Department to move forward and develop an electronic export certification reporting system. It is believed that such a system would provide important trade information to producers within a matter of one or two weeks instead of the current three-month delay. Can you share with the committee the development status of this electronic export certificate program.

Answer. Public Law 105–277 provides for a pilot investigation of a "streamlined eletronic system for collecting export data, in the least intrusive manner possible" for meat products. We understand that representatives of the U.S. meat industry are working to clarify their needs regarding price and export data reporting. Once these consultations between the producers and packers have concluded and we have their recommendations, we will reevaluate our work to ensure we develop systems compatible with the guidance provided by Congress.

Question. Farmers across the South were plagued with significant infestation of aflatoxin in the 1998 corn crop. What testing capability does GIPSA have for aflatoxin? Farmers were also plagued with inconsistent testing. Does GIPSA set standards for aflatoxin testing? Does GIPSA have the authority to do so? What funds are included in the budget request or would be required to establish such a program?

Answer. GIPSA provides aflatoxin testing service as official criteria for corn, sorghum, wheat, and soybeans, as official criteria under the Unites States Grain Standards Act (USGSA). Testing is also provided for rice, popcorn, corn meal, corn gluten meal, corn/soy blend, and other processed products governed by the Agricultural Marketing Act (AMA). Additionally, all corn exported from the United States is required to be tested for aflatoxin. Aflatoxin testing services are available nationwide, upon request and for a fee, as either a qualitative (screening above or below a threshold determined by the customer) or as a quantitative (actual results in parts per billion) service using several different types of test kits approved by GIPSA. The GIPSA approved test kits use enzyme linked immunosorbent assay (ELISA), monoclonal antibody affinity chromatography, or fluorescence technology. To further assist the grain industry, GIPSA also provides, on a limited basis, a complex chemical testing method, High Pressure Liquid Chromatography (HPLC) testing for aflatoxin. All official aflatoxin testing is performed as prescribed in the GIPSA directive by authorized employees of GIPSA or licensed delegated/designated agency personnel.

GIPSA has established sampling and testing procedures for GIPSA and official agency personnel to follow for aflatoxin testing. Official personnel receive extensive

training on the official procedures and must be authorized or licensed by GIPSA to perform aflatoxin testing. Other inspection laboratories and commercial businesses that measure aflatoxin levels in corn may or may not follow GIPSA procedures.

In addition to the official mycotoxin training and testing program, GIPSA has a program in place to evaluate equipment used in the official system. Test kits used in the official system must meet certain GIPSA specifications and pass a rigorous testing program. Test kits sold for commercial use in the United States are not regulated by USDA, therefore do not require GIPSA approval. Commercial businesses may or may not use GIPSA approved test kits.

GIPSA has the authority to set standards for aflatoxin testing only in the official inspection system.

Aflatoxin testing represents a user fee service under the Inspection and Weighing Program. In essence, revenue for this service is generated from fees charged by GIPSA and no additional funds are required to be appropriated.

Question. Please distinguish between the roles of GIPSA and the Justice Department in investigating competitive practices.

Answer. GIPSA has responsibility for enforcing the Packers & Stockyards (P&S) Act, including investigating competitive practices, trade practices and ensuring financial protection for producers in the livestock industry. The Justice Department, along with the Federal Trade Commission, has primary responsibility for enforcing the antitrust statutes, including the Sherman Act and the Clayton Act. GIPSA has a close working relationship with both of these agencies on matters of mutual interest and expects that relationship will continue. During the course of a GIPSA investigation, if it is determined that the conduct being investigated may be criminally prosecuted, the investigation is referred to the Justice Department, with GIPSA providing information and assistance, as required.

The Department of Justice has primary responsibility for mergers and acquisitions but has generally looked to GIPSA for broad industry information and concentration ratios. GIPSA has generally investigated most complaints alleging anticompetitive practices in the meat packing industry.

Question. Increased funding has been provided to GIPSA over the past few fiscal years to carry out recommendations of the Agricultural Concentration Committee. Please provide a detailed accounting for each of fiscal years 1997, 1998, and 1999 on the use of these funds. How will the increased funding requested for fiscal year 2000 be used?

Answer. For fiscal year 1997, GIPSA received $800,000 of additional funding to increase investigations of deceptive and fraudulent practices that affect the movement and price of meat animals and their products, and for increased analysis of industry structure and performance to monitor the competitive implications of behavioral practices in the meat packing industry and to support legal actions that require complex economic and statistical analysis.

During that year, GIPSA completed a comprehensive investigation of the procurement of slaughter cows in the Northwest region of the country and began a broad investigation of fed cattle procurement in the Texas panhandle. It also began conducting an investigation of slaughter hog procurement in the Central United States, and began an investigation involving slaughter lamb procurement in the Western United States. GIPSA also entered into cooperative research agreements to examine the effects of meat packing concentration on prices paid for fed cattle.

During fiscal year 1997, GIPSA began planning the restructuring of its P&S program areas to strengthen its ability to investigate industry structure and competitive practice issues, and to provide greater flexibility and efficiency in enforcing the trade practice and payment provisions of the P&S Act.

For fiscal year 1998, GIPSA received $800,000 of additional funds to recruit and integrate more economic, statistical, and legal expertise into investigative units that will conduct investigations involving anticompetitive practices. It also requested additional funding to increase its poultry compliance activities but none were appropriated.

During fiscal year 1998, GIPSA began the reorganization of P&S by consolidating and strengthening its field offices and by reorganizing its headquarters staff. P&S hired new economists and legal specialists for its Denver and Des Moines field offices and additional economists for its headquarters staff. It established a toll-free complaint hot line for producers and the public to file complaints and report market abuse. GIPSA began planning a peer review process for major investigations that will evaluate whether GIPSA asked the right questions, collected the right data, and conducted sound analyses using appropriate models. The Agency also completed or continued the investigations begun in fiscal year 1997 into procurement practices in the fed steer and heifer, cow, hog, and lamb markets, and conducted numerous investigations of live poultry dealers.

For fiscal year 1999, GIPSA received $397,000 of increased funding to increase staffing to pursue more aggressively and more comprehensively investigations into anticompetitive practices related to industry concentration without this work coming at the expense of its programs designed to protect individual producers from unfair practices and provide financial protection. In addition, GIPSA received $2.5 million to complete the restructuring of the P&S program.

During fiscal year 1999, GIPSA has continued to hire economists and legal specialists for its field offices and headquarters staff. It has also initiated the investigation peer review process, and the peer review panel is examining the investigations of fed cattle procurement in the Texas panhandle conducted by GIPSA staff and by cooperative university researchers. The funds received for reorganization are being used to relocate employees who are being displaced as a result of the reorganization. The increased funding and personnel are also being used to continue major investigations of potential anticompetitive procurement practices and detailed analyses of the slaughter steer and heifer, slaughter cow, slaughter hog, and slaughter lamb markets.

The requested budget increase of $1,386,000 for fiscal year 2000 is critical in expanding the Agency's capability to monitor and investigate the competitive implications of structural changes and behavioral practices in the meat packing and poultry industries. The Advisory Committee on Concentration recommended increased monitoring and enforcement of antitrust and regulatory policy and, specifically the antitrust enforcement of current regulations under the Packers and Stockyards Act be stepped up.

Question. Fiscal year 1999 funding of $2.5 million has been made available for one-time relocation costs associated with the restructuring the Packers and Stockyards Administration. Please give the Committee an update on the restructuring of the Administration and the use of these funds.

Answer. The three new regional offices have been established at Denver, Colorado; Des Moines, Iowa; and Atlanta Georgia, and all field employees now report to one of these offices. We are still in the process of relocating employees to the new regional offices and are positioning resident agents in outlying locations where they will conduct compliance investigations and provide routine services from home-based offices or one of three suboffices. The funds are being used for employee relocation; outplacement services; severance pay; equipment transfer and office setup; and to hire additional economists and other staff to conduct investigations of potential anticompetitive behavior in the cattle and hog industries. We expect our restructuring to be completed by June 1999.

QUESTION SUBMITTED BY SENATOR BURNS

Question. The budget cut for funding of GIPSA was cut by nearly $18.5 million. Currently, four packers control nearly 80 percent of the meat market. Livestock producers have no transparency in the market and not enough avenues to market their commodity. The grain industry is also highly consolidated and the effects of this concentration is hurting farmers immeasurably. Mergers and concentration within the agricultural industry play a huge role in the demise of farmers and ranchers. At a time when the agricultural economy is at a 30 year low, How does USDA justify cutting the budget of GIPSA, the agency responsible for monitoring the actions of packing and grain companies?

Answer. The President has requested authority for GIPSA to collect licensing fees to recover the cost of administering the P&S Act and for Standardization Activities under the United States Grain Standards Act in lieu of appropriated funding. The proposal would amend the P&S Act to provide authority to collect license fees to cover the cost of the program. It would also provide authority to initiate user fees for standardization activities including the developing, reviewing, and maintaining of official U. S. Grain standards used by the entire grain industry. Converting to license and user fees is consistent with the Administration's overall effort to shift funding for programs to the beneficiaries of such programs.

QUESTIONS SUBMITTED BY SENATOR COCHRAN

Question. The fiscal year 1999 Senate report indicates that the Committee expects the Secretary to use his authority to collect, assimilate, and make available information regarding the boll weevil eradication program to agencies and entities that use this information concerning acreage planted to cotton. Has the Secretary made this information available? If not, why?

Answer. We are aware of the Senate language. However, OMB has not approved the collection of land use information for FSA. Because the collection information for bollweevil eradication and other areawide pest control programs is not legislatively mandated, OMB considers this is a voluntary submission by producers.

Question. The fiscal year 1999 appropriations act blocks the availability of the $60 million available for the Fund for Rural America for fiscal year 1999. Since these funds are available for two years, the fiscal year 2000 budget restores these fiscal year 1999 funds and then proposed to block their availability in fiscal year 2000 but to restore $60 million in annual increments beginning in fiscal year 2001.

Since the Administration did not support the action taken by Congress to block the availability of fiscal year 1999 funding for the Fund for Rural America, is the budget proposal to block these funds the second year and restore them in increments in the outyears simple one to offset discretionary spending.

Answer. The proposal to make fiscal year 1999 funding for the Fund for Rural American available in the years after fiscal year 2000 was one of several budget proposals used to ensure that the Department met its tight discretionary budget target for fiscal year 2000.

Question. Of the fiscal year 1997 funding for the Fund for Rural America, the budget indicates that $26.1 million was allocated for the "core initiative," $7.8 million for the secretary's initiative and $2.2 million for Telecommunications Infrastructure Research. For each of these categories, please provide a description of each project/grant funded, the amount of funds allocated to it, a brief description of the project, who carried out the work, and an evaluation of benefits of the work undertaken.

Answer. A description of the project funded by the Fund for Rural American of CSREES is provided to the subcommittee. Because the grants were made in the past 12–18 months, and the nature of the projects involved, it is too soon to provide an evaluation of the benefits of the work undertaken. It is expected that CSREES will be able to initiate assessment of impacts at the end of fiscal year 2000. Some assessment may occur prior to that time from annual reports that are submitted for each project, and the first set of annual reports was just recently received.

[The information follows:]

Fund For Rural America

Core Initiative	$22,659,800
Secretary's Initiative	5,471,000
Agriculture Telecommunications	2,112,000
Planning Grants	886,900
Center Grant	1,585,026
Subtotal, Grants Awarded	33,714,726
Federal Administration	1,444,000
Small Business Innovation Research	453,600
Peer Panels	487,674
Total	36,100,000

SECRETARY'S FARMWORKER INITIATIVE

Question. What is the "Secretary's Farmworker Initiative?"

Answer. The Secretary's Farmworker Initiative is to establish a Farmer/Rancher Coordinator position to develop policy, establish relationships with community-based farm work organizations, and develop and participate in the development of initiatives with other Federal agencies and non-Government organizations. Recent examples of improving conditions for farmworkers have been to (a) partnership with the Department of Labor (DOL), Migrant and Seasonal Labor, (b) exchange models for DOL ONE STOP and USDA Service Centers for purpose of including farm workers in programs or services which are going to be provided by both Federal Agencies, (c) partnership with Health and Human Services (HHS) to explore health service for migrant workers through the USDA Rural Housing Service program, (d) meet with Farm Worker organizations in the Northeast corridor from New Jersey to Florida to identify program needs of the farm workers, and (e) creating working relations with the National Farm Worker unions UAW and FLOC.

Question. Please list, by USDA agency and appropriations account/activity, the funds available for fiscal year 1999 and requested in the fiscal year 2000 budget to implement the following: (1) the Civil Rights Action Team (CRAT) report; (2) the National Commission on Small Farms Report, (3) the Secretary's Farmworker Initiative; (4) the Global Change Research Program; (5) the Clean Water Action Plan; (6) the Debt for Nature initiative; and (7) the Climate Change Technology Initiative.

Question. Please explain the reason for the increase from the fiscal year 1999 level proposed in the Office of the Secretary "Other Services" object class.

Answer. The Office of the Secretary requested an increase for the Biobased Products Coordination Council in fiscal year 2000. The Council is chaired by the Under Secretary for Research, Education and Economics. Among the major activities that would be started or carried out in fiscal year 2000 by the Under Secretary are the development, publication and maintenance of a biobased products list as directed in Executive Order 13101, education activities, such as training and conferences to inform the public and Government agencies about biobased products, demonstration projects to create awareness of and demand for biobased construction materials, support for the Office of the Environmental Executive, support for technology transfer activities through our research agencies, and outreach to land-grant universities involved in biobased research, education and extension. The amount for this requested increase of over $1 million is reflected in Other Services.

AGRICULTURAL RESEARCH SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FISCAL YEAR 1999 APPROPRIATIONS

Question. Please provide a status report on the execution of each of the following funding increases provided to ARS for fiscal year 1999:

—Emerging Plant Diseases, Albany, CA, $250,000;
—Emerging Plant Diseases, Beltsville, MD, $250,000;
—Emerging Plant Diseases, Frederick, MD, $250,000;
—Emerging Plant Diseases, College Station, TX, $250,000;
—Emerging Plant Diseases, Montpellier, France, $250,000;
—Emerging Plant Diseases, Logan, Utah, $200,000;
—Fusarium Head Blight (consortium of 12 land grant universities), $3,000,000;
—Exotic Infectious Animal Diseases, Athens, GA, $500,000;
—Exotic Infectious Animal Diseases, Ames, IA (NADC), —$1,000,000;
—Exotic Infectious Animal Diseases, Beltsville, MD, $500,000;
—Exotic Infectious Animal Diseases, Pullman, WA, $600,000;
—Exotic Infectious Animal Diseases, Laramie, WY, $500,000;
—Environmental Quality/Natural Resources, Bioactive compounds, Gainsville, FL, $250,000;
—Environmental Quality/Natural Resources, IPM/Areawide, Beltsville, MD, $250,000;
—Environmental Quality/Natural Resources, IPM/Areawide, Columbia, MO, $400,000;
—Environmental Quality/Natural Resources, IPM/Areawide, Stoneville, MS, $250,000;
—Environmental Quality/Natural Resources, IPM/Areawide, College Station, TX, $250,000;
—Environmental Quality/Natural Resources, Livestock management systems, $1,000,000;
—Everglades Initiative, Canal Point, FL, $250,000;
—Everglades Initiative, Miami, FL, $250,000;
—Everglades Initiative, Ft. Lauderdale, FL, $250,000;
—Food Safety, Preharvest, Athens, GA, $250,000;
—Food Safety, Preharvest, Ames, IA, $250,000;
—Food Safety, Preharvest, West Lafayette, IN, $250,000;
—Food Safety, Preharvest, Beltsville, MD, $250,000;
—Food Safety, Preharvest, Clay Center, NE, $600,000;
—Food Safety, Preharvest, College Station, TX, $250,000;
—Food Safety, Postharvest, Safety/Quality of Fruits/Vegetables, $1,000,000;
—Food Safety, Postharvest, Food Safety Engineering, Purdue Univ., $1,000,000;
—Genetic Resources, Palmer, AK, $100,000;
—Genetic Resources, Columbia, MO, $700,000;
—Genetic Resources, Leetown, WV, $1,000,000;
—Human Nutrition, Little Rock, AR, $750,000;
—Human Nutrition, San Francisco, CA, $250,000;
—Human Nutrition, Boston, MA, $250,000;
—Human Nutrition, Beltsville, MD, $250,000;
—Human Nutrition, Grand Forks, ND, $250,000;
—Human Nutrition, Houston, TX, $500,000;

—Pfiesteria, $719,000;
—Alternative Fish Feed, Aberdeen, ID, $250,000;
—Appalachian Fruit Research Station, Kearneysville, WV, $250,000;
—Aquaculture research, AK, $1,100,000;
—Biological control of Western weeds, Albany, CA, $300,000;
—Biomedical materials in plants, $500,000;
—Cereal crops research, Madison, WI, $250,000;
—Cotton ginning, Stoneville, MS, $250,000;
—Endophyte research, $200,000;
—Fish diseases, Auburn, AL, $750,000;
—Fish Farming Experiment Laboratory, Stuttgart, AR, $750,000;
—Floriculture and nursery crop research, $1,000,000;
—Horticulture, Ft. Pierce, FL, $500,000;
—Forage crops, Woodward, OK, $250,000;
—Garden Unit, National Arboretum, Washington, DC, $250,000;
—Golden Nematode, Ithaca, NY, $150,000;
—Grape Rootstock, Geneva, NY, $300,000;
—Grasshopper research, AK, $750,000;
—Grazinglands research, El Reno, OK, $250,000;
—Honeybee research, Baton Rouge, LA, $300,000;
—Lettuce geneticist/breeding, Salinas, CA, $250,000;
—Lyme disease (Tick Control Project), Beltsville, MD, $200,000;
—Manure handling and disposal, Starkville, MS, $500,000;
—Meadowfoam research, Peoria, IL, $200,000;
—Mycoplasma research, Starkville, MS, $250,000;
—National Warmwater Aquaculture Center, Stoneville, MS, $1,100,000;
—National Agriculture Library, $250,000;
—Natural products research, MS, $750,000;
—New England Plant, Soil and Water Lab, Orono, ME, $250,000;
—Non-chemical control of pecan insect pests, Byron, GA, $250,000;
—Peach varieties research, Byron, GA, $150,000;
—Peanut quality research, Dawson GA/Raleigh, NC, $1,000,000;
—Pear Thrips, Ithaca, NY, $100,000;
—Potato Breeder, Aberdeen, ID, $150,000;
—Range research, Burns, OR, $250,000;
—Rice research, Stuttgart, AR, $1,400,000;
—Rice research, Davis, CA, $250,000;
—Rice research, Beaumont, TX, $200,000;
—Root diseases of wheat and barley, Pullman, WA, $500,000;
—Small fruits research, Poplarville, MS, $250,000;
— Small fruits research, Corvallis, OR, $250,000;
—Soil tilth research, Ames, IA, $500,000;
—Soybean and corn research, Stoneville, MS, $750,000;
—Subtropical Animal Research Station, Brooksville, FL, $500,000;
—Subtropical Horticultural Research Station, Miami, FL, $300,000;
—Sugarbeet research, Ft. Collins, CO, $200,000;
—U.S. Plant Stress and Water Conservation Laboratory, Lubbock, TX, $500,000;
—Vegetable research, East Lansing, MI, $200,000;
—Wild rice research, St. Paul, MN, $100,000;
—Wind erosion research, Manhattan, KS, $250,000.

Answer. ARS is in the process of releasing each of these program increases added by Congress in fiscal year 1999 in the amounts and for the purposes authorized in accordance with the fiscal year 1999 Appropriations Act. A detailed listing of the distribution of these increases will be provided for the record.

[The information follows:]

AGRICULTURAL RESEARCH SERVICE IMPLEMENTATION OF FISCAL YEAR 1999 PROGRAM INCREASES

Funding research	Amount	Research location	Status/purpose	Status of New Scientist(s) Position(s)
Emerging Plant Diseases	$250,000	Albany, CA	Funds have been released and work in underway on new and emerging invasive weeds in the Western U.S.	New scientist position not required.
	250,000	Beltsville, MD	Funds have been released and work is underway on taxonomy of bunt and smut of fungi.	Recruitment actions are underway to hire a Botanist.
	250,000	Frederick, MD	Funds have been released and work is underway for research on karnal bunt.	New scientist position not required.
	250,000	College Sta., TX	Funds have been released and work is underway for research on sorghum ergot.	Recruitment actions are underway to hire a Plant Pathologist.
	250,000	Montpellier, FR	Funds have been released and work is underway to develop exotic microbial biological control agents in eurasia.	Recruitment actions are underway to hire a Plant Pathologist.
	200,000	Logan, LT	Funds have been released and work is underway on research on poisoning of livestock by larkspur.	Recruitment actions are underway for a Veterinarian Pharmacologist.
Fusarium Head Blight	3,000,000	Headquarters	Negotiations have been completed and specific cooperative agreements are being entered into with the 12 State Consortium.	Not Applicable.
Exotic Infectious Animal Diseases	500,000	Athens, GA	Funds have been released and work is underway on highly pathogenic avian influenza and exotic newcastle disease.	Recruitment actions are underway for a Veterinary Medical Officer.
	1,000,000	Ames, IA	Funds have been released and research is underway on Johne's disease, bovine tuberculosis and emerging enteric diseases of swine.	Recruitment actions are underway for a Veterinary Medical Officer.
	500,000	Beltsville, MD	Funds have been released and research is underway on parasitic immunology.	Recruitment actions are underway to hire an Immunologist and and Animal Microbiologist.

	600,000	Pullman, WA	Funds have been released and research is underway on prion diseases and anaplasmosis.	Recruitment actions are underway to hire a Molecular Biologist and an Entomogist.
	500,000	Laramie, WY	Funds have been released and research is underway on vesicular stomatitis an arthropod-borne disease of livestock.	Recruitment actions are underway to hire a Entomologist/Microbiologist.
Environmental Quality/Natural Resources	250,000	Gainesville, FL	Funds have been released and research is underway for the development of bioactive compounds that attract natural enemies of insect pests.	Recruitment actions are underway actions are underway to hire a Chemist.
	250,000	Beltsville, MD	Funds have been released and Recruitment research is underway to develop technologies for management of gypsy moth with entomophaga maimaiga.	Recruitment action is underway to hire an Molecular Biologist/Botanist/Entomologist
	400,000	Columbia, MO	Funds have been released and research is underway to develop methods of in vitro proagation of beneficial insects for biological control.	Recruitment actions are underway to hire an Entomologist.
	250,000	Stoneville, MS	Funds have been released and research is underway to develop mass propagation technologies for beneficial insects (lygus bugs/leafy spurge).	Recruitment actions are underway to hire an Engomologist.
	250,000	College Sta., TX	Funds have been released andresearch is underway to developnew and improved areawide IPM technology in support of the boll weevil eradication program.	Recruitment actions are underway to hire an Entomologist.
Livestock Mgt	1,000,000	Ames, IA	Funds have been released to establish a program at the National Swine Research Center on livestock management.	Recruitment actions are underway to hire the Research Leader. Recruitment actions are underway for three animal scientists.
Everglades Initiative	250,000	Canal Point, FL	Funds have been released and research is underway on soil microbiology as it relatees to water quality.	Recruitment actions are underway to hire a Soil Microbiologist.

AGRICULTURAL RESEARCH SERVICE IMPLEMENTATION OF FISCAL YEAR 1999 PROGRAM INCREASES—Continued

Funding research	Amount	Research location	Status/purpose	Status of New Scientist(s) Position(s)
	250,000	Miami, FL	Funds have been released an research is underway to develop a computer model on the impact of the Everglades Nat'l Park Restoration Plan on the sustainability of agriculture in south Florida.	Recruitment actions are underway to hire an Agronomist.
	250,000	Ft. Lauderdale, FL	Funds have been released an research is underway for the development of melaleuca biological control..	A selection is pending to hire an Entomologist.
Food Safety, Preharvest	300,000	Athens, GA	Funds have been released and research is underway for treatment of poultry manure to prevent pathogen transmission.	Recruitment actions are underway for a Microbiologist.
	300,000	Ames, IA	Funds have been released and research is underway to prevent pathogen contamination in animals particularly swine.	Recruitment actions are underway to hire a Microbiologist.
	300,000	West Lafayette, IN	Funds have been released and research is underway to prevent pathogen contamination in animals particularly swine.	Recruitment action is underway to hire an Animal Scientist.
	600,000	Beltsville, MD	Funds have been released and research is underway for animal waste handling systems to prevent pathogen transmission.	Recruitment actions are underway to hire a Microbiologists and an Animal Scientist.
	300,000	Clay Center, NE	Funds have been released and research is underway to prevent zoonotic pathogen transmission in cattle.	Recruitment actions are underway to a hire a Microbiologist.
	600,000	College Stn., TX	Funds have been released research is underway to prevent antibiotic resistance.	Recruitment actions are underway to hire two Microbiologists.
Food Safety, Postharvest	1,200,000	Albanay, CA	Funds have been released and research is underway to develop knowledge pathogens on various fruits and vegetables.	Recruitment actions are underway to hire two Microbiologists. One Microbiologist has been hired.

	1,000,000	Purdue Univ	Funds have been released and a specific cooperative agreement has been executed with Purdue Univ.	Not Applicable.
(Note: Final distribution of Food Safety increases by location is different from those listed in question.)				
Genetic Resources	100,000	Palmer, AK	Funds have been released and research is underway on arctic plant germplasm storage, regeneration, evaluation and documentation at Palmer, AK.	Recruitment actions are underway to hire a Curator.
	700,000	Columbia, MO	Funds have been released and research is underway on soybean and genomic research.	Recruitment actions are underway to hire a Research Geneticist and a Molecular Biologist.
	1,000,000	Leetown, WV	Funds have been released and research is underway on trout genome at the National Center for Cool and Cold Water Aquaculture.	Recruitment actions are underway actions are underway for two Trout/Animal Scientists.
Human Nutrition	750,000	Little Rock, AR	Funds have been released and research is underway on nutrient-gene interactions.	New scientist position not required.
	250,000	San Francisco, CA	Funds have been released and research is underway on nutrient-gene interactions.	Recruitment actions are underway to hire a Human Nutritionist.
	250,000	Boston, MA	Funds have been released and research is underway on diet and degenerative diseases in the aging.	New scientist position not required.
	250,000	Beltsville, MD	Funds have been released and research is underway on diet and flavonoid function.	Recruitment actions are underway to hire a Human Nutritionist.
	250,000	Grand Forks, ND	Funds have been released and research is underway on the role of trace minerals in gene expression.	Recruitment actions are underway to hire a Immunologist/Chemist.
	500,000	Houston, TX	Funds have been released and research is underway on nutrition and child development.	New scientist position not required.

AGRICULTURAL RESEARCH SERVICE IMPLEMENTATION OF FISCAL YEAR 1999 PROGRAM INCREASES—Continued

Funding research	Amount	Research location	Status/purpose	Status of New Scientist(s) Position(s)
Pfiesteria ($719,000)	300,000	Beltsville, MD	Funds have been released and research is underway on the relationship between agricultural practices and pfiesteria in the Chesapeake Bay and its tributaries.	Recruitment actions are underway to hire a Soil Scientist.
	100,000	Auburn, AL	Funds have been released and research is underway on pfiesteria.	New scientist position not required.
	250,000	New Orleans, LA	Funds have been released and research is underway on pfiesteria.	Recruitment actions are underway to hire a Plan Physiologist.
	69,000	Florence, SC	Funds have been released and research is underway to protect water quality through effective mgt. of agricultural nutrients.	New scientist position not required.
Alternative Fish Feed	250,000	Aberdeen, ID	Funds have been released and research is underway on cereal grains and fish.	Recruitment actions are underway to hire a fish geneticist.
Appalachian Fruit Research Station	250,000	Kearneysville, WV	Funds have been released and research is underway on diseases of apples and pears.	New scientist position not required.
Aquaculture Res. in Alaska	1,100,000	Albany, CA (Fairbanks, AK).	Funds have been released and research is underway on aquaculture research in Alaska. Research is being conducted in cooperation with the Univ. of Alaska.	Recruitment actions are underway to hire a Chemical Engineer/Food Technologist.
Biological Control of Western Weeds	300,000	Albany, CA	Funds have been released and research is underway on biocontrol of yhellow starthistle and other non-indigeneous plant pests in the western U.S.	Recruitment actions are underway to hire a Research Entomologist.
Biomedical Materials in Plants	500,000	Beltsville, MD	Funds have been released and research is underway. A specific cooperative agreement ($300,000) has been executed with the Biomedical Foundation, Inc.	Not Applicable.
Cereal Crops Research	250,000	Madison, WI	Funds have been released and research is underway on barley and oak quality.	New scientist position not required.

Cotton Ginning	250,000	Stoneville, MS	Funds have been released and research is underway on cotton ginning.	Recruitment actions are underway to hire an Engineer.
Endophyte Research	200,000	Booneville, AR	Funds have been released and negotiations are underway with the Universities of AR, MO and Oregon State Univ.	No Applicable.
Fish Diseases	750,000	Auburn, AL	Funds have been released and research is underway on fish health.	Recruitment actions are underway to hire a Aquatic Pathologist. Selection has been made to hire a new Microbiologist.
Fish Farming Experiment LAB	750,000	Stuttgart, AR	Funds have been released and research is underway on aquaculture production systems, therapeutics evaluation and chemical registration.	Recruitment actions are underway to hire a Physiologist and a Fishery Biologist.
Floriculture and Nursery Crop Research ($1,000,000).	600,000	Headquarters	Funds have been released and negotiations are underway for specific cooperative agreements..	Not Applicable
	400,000	Wash., D.C. (Arboretum).	Funds have been released and research is underway on floriculture and nursery crops.	Recruitment actions are underway for a Plant Pathologist.
Horticulture	500,000	Ft. Pierce, FL	Funds have been released and research is underway on vegetable virology and irrigation management.	Recruitment actions are underway to hire a Plant Pathologist and a Horticulturalist.
Forage Crops	250,000	Woodward, OK	Funds have been released and research is underway to accelerate forage improvement.	Recruitment actions are underway to hire an Agronomist.
Garden Unit, Natl. Arboretum	250,000	Washington, DC	Funds have been released for increased staffing for the Gardens Unit at the National Arboretum.	New scientist position not required.
Golden Nematode	150,000	Ithaca, NY	Funds have been released and research is underway on golden nematode.	New scientist position not required.
Grape Rootstock	300,000	Geneva, NY (w/s Ithaca).	Funds have been released and research is underway on grape rootstock evaluation of pest, disease resistance and stress tolerance.	Recruitment actions are underway to hire a Geneticists.

AGRICULTURAL RESEARCH SERVICE IMPLEMENTATION OF FISCAL YEAR 1999 PROGRAM INCREASES—Continued

Funding research	Amount	Research location	Status/purpose	Status of New Scientist(s) Position(s)
Grasshopper Research	750,000	Sidney, MT (Alaska)	Funds have been released and research is underway on IPM for grasshopper control in the Delta Junction region of Alaska.	Recruitment actions are underway to hire two Entomologist.
Grazinglands Research	250,000	El Reno, OK	Funds have been released and research is underway for the development of pasture management systems that enhance productivity and water quality in the Southern Great Plains.	Recruitment actions are underway to hire an Agronomist that will be stationed at Langston Univ.
Honeybee Research	300,000	Baton Rouge, LA	Funds have been released and research is underway for the control of parasitic bee mites.	Recruitment actions are underway to hire an Entomologist.
Lettuce/Geneticist Breeding	250,000	Salinas, CA	Funds have been released and research is underway for the control to develop new lettuce varieties and improved product quality.	Recruitment actions are underway to hire a Geneticist/Breeder.
Lyme Disease	200,000	Beltsville, MD	Funds have been released to support the NE Regional Lyme Tick Project.	Not applicable.
Manure Handling and Disposal	500,000	Ms State (Starkville), MS.	Funds have been released and research is underway on procedures for poultry manure and disposal with emphasis on reducing the amounts of phosphorus in litter and the environment.	Recruitment actions are underway to hire an Engineer.
Meadowfoam Research	200,000	Peoria, IL	Funds have been released and research on meadowfoam is underway.	New scientist position not required.
Mycoplasma Research	250,000	MS State, (Starkville) MS.	Funds have been released and research is underway on mycoplasma gallisepticum.	Recruitment actions are underway to hire a Molecular Biologist.

Nat'1 Warmwater Aquaculture Ctr.	1,100,000	Stoneville, MS	Funds have been released and research is underway on warmwater aquaculture. Half of these funds will be added to the existing specific cooperative agreement with Mississippi Agricultural and Forestry Experiment Station (MAFES).	Recruitment actions are underway to hire a Molecular Biologist and a Microbiologist.
Nat'1 Agriculture Library	250,000	Beltsville, MD	Funds have been released and will be used to purchase periodicals, enhance preservation efforts, and improve electronic retrieval capacity, including the information centers.	Final selection of a Librarian/Technical Information Specialist is in process.
Natural Products Research	$750,000	Oxford, MS	Funds have been released and research is underway on natural products. Half of these funds will be added to the existing specific cooperative agreement with the University of Mississippi.	Recruitment actions are underway to hire a Molecular Biologist.
New England Plant, Soil, and Water Lab	250,000	Orono, ME	Funds have been released and research is underway on nutritient management in NE cropping systems.	Recruitment actions are underway to hire a Soil Biochemist/Microbiologist.
Non-chemical Control of Pecan Insect Pests	250,000	Byron, GA	Funds have been released and research is underway on nonchemical alternatives to the use of chemical pesticides to control fruit and foliar pests of pecans.	Recruitment actions are underway to hire an Entomologist.
Peach Varieties Research	150,000	Byron, GA	Funds have been released and research is underway on new peach varieties.	New scientist position not required.
Peanut Quality	1,000,000	Dawson, GA/Raleigh, NC.	Funds have been released and on peanut quality. A fpecific cooperative agreement is being negotiated with Auburn University.	Recruitment actions are underway to hire a Systems Engineer/Economist.
Pear Thrips	100,000	Ithaca, NY	Funds have been released to support a specific cooperative agreement with the Univ. of VT.	Not Applicable.

AGRICULTURAL RESEARCH SERVICE IMPLEMENTATION OF FISCAL YEAR 1999 PROGRAM INCREASES—Continued

Funding research	Amount	Research location	Status/purpose	Status of New Scientist(s) Position(s)
Potato Breeder	150,000	Aberdeen, ID	Funds have been released and research is underway to develop new potato germplasm with improve processing & fresh market qual. with resistance to pests/diseases.	Recruitment actions are underway to hire a Geneticist/Breeder.
Range Research	250,000	Burns, OR	Funds have been released and research is underway to develop new grazing management approaches that have positive effects on rangeland plant communities.	A selection has been made to hire Rangeland Scientist.
Rice Research	1,400,000	Stuttgart, AR	Funds have been released and research is underway on the genetic improvement of rice.	Recruitment actions are underway to hire a Plant Pathologist, Plant Physiologist and Molecular Biologist. Selection of a new Cytogeneticist has been made.
Rice Research	250,000	Davis, CA	Funds have been released and research is underway on the rice germplasm.	New scientist position not required.
Rice Research	200,000	Beaumont, TX	Funds have been released and research is underway on the rice germplasm improvement.	New scientist position not required.
Root Diseases of Wheat and Barley	500,000	Pullman, WA	Funds have been released and research is underway on the root diseases of wheat and barley.	Recruitment actions are underway to hire a Plant Pathologist.
Small Fruits Research	250,000	Poplarville, MS	Funds have been released and research is underway on the root diseases of what and barley.	Recruitment actions are underway to hire a Plant Pathologist.
Small Fruits Research	250,000	Corvallis, OR	Funds have been released and research is underway. Specific cooperative agreements are being negotiated ($160,000 for pest and diseases control and the development of agricultural systems for northwest small fruits productions.	New scientist position not required.

Soil Tilth Research	500,000	Ames, IA	Funds have been released and research is underway on effective soil and water management practices.	Recruitment actions are underway to hire to Agronomists.
Soybean and Corn Research	750,000	Stoneville, MS	Funds have been released and research is underway to increase farm profits through the use of corn and soybeans in rotation with cotton and to expand research on plant molecular genetics.	Recruitment actions are underway to hire a Plant Geneticists, Plans Physiologist and Plant Molecular Biologist/Geneticists.
Subtropical Animal Research	500,000	Brooksville, FL	Funds have been released and research is underway on beef cattle.	Recruitment actions are underway to hire a Nutritionist/Biological Systems and a Geneticists.
Subtropical Horticultural Research Station	300,000	Miami, FL	Funds have been released and research is underway on subtropical/tropical ornamental plant germplasm.	Recruitment actions are underway to hire a Geneticist/Curator.
Sugarbeet Research	200,000	Ft. Collins, CO	Funds have been released and research is underway on diseases of sugarbeet.	Recruitment actions are underway to hire a Plant Pathologist.
U.S. Plant Stress and Water Conservation Lab	500,000	Lubbock, TX	Funds have been released and research is underway on plant required stress factors in the High Plains region.	New scientist position not required.
Vegetable Research	200,000	Lansing, MI	Funds have been released and research is underway on vegetable crops.	New scientist position not required.
Wild Rice Research	100,000	St. Paul, MN	Funds have been released and added to the existing specific cooperative agreement with North Central Ag. Expt. Station.	Not Applicable.
Wind Erosion	250,000	Manhattan, KS	Funds have been released and research is underway on wind erosion in Manhattan, KS.	Recruitment actions are underway for a Soil Scientist/Agricultural Engineer.

Question. The fiscal year 2000 budget proposes an increase of $76.4 million for new and expanded research programs and an increase of $9.9 million for pay costs, partially offset by a proposed decrease of $35 million for ongoing research projects. As the Department's materials indicate, many of the projects proposed for termination have contributed to solving important agricultural problems. While the budget indicates that this research is proposed for termination because it has been deemed less critical than the higher priority research the Administration proposes, it is also apparent that the proposed terminations include only research the Congress initiated or has continued to support. Please tell the Committee how the Administration determined that each of these research projects was "less critical" than those the President's fiscal year 2000 budget proposes increased funding to support.

Answer. The President's fiscal year 2000 budget for the Agricultural Research Service is $836,868,000. This recommendation recognizes the importance of the Department's in-house science program and its capacity to solve a multitude of problems affecting production agriculture, the environment, human health and safety, utilization research, trade, and rural development. This budget provides an increase for new and expanded research programs of $51.4 million as well $9.9 million for authorized pay raises. Additionally, the Agency is requesting $44.5 million for ongoing laboratory modernization and construction projects.

These increase recommendations are made under the very tight funding limitations established for the fiscal year 2000 budget. This Administration has proposed and continues to support a number of critical initiatives, such as food safety, global climate change, and human nutrition. Given the spending constraints of the fiscal year 2000 budget, and the urgency this Administration places on the research initiatives proposed, it was necessary again to request the termination of a number of ongoing research projects. Some of these projects were identified in prior budgets as less critical to the overriding issues of national importance, such as food safety for all Americans. While important, such projects as wild rice breeding, turf grass evaluation, development of feeds for aquaculture, floriculture research, Hops genetics research, etc. were deemed to be of lesser priority than the initiatives advanced in this budget. All the projects are evaluated within the ARS research portfolio. Decisions are based on the following criteria: the relevance of the research project, the availability of sufficient resources to conduct the research, and the overall impact of research on American agriculture.

The overall reduction and redirection requested represents four percent of the total research program authorized and funded by the Congress. The $35 million would essentially be reallocated to these national research priorities. These initiatives are supported by the Congress, agricultural stakeholders and others who have interests in food, nutrition, and environmental programs. Infectious and zoonotic diseases of livestock, wheat and barley scab, bioinformatics, genetic engineering in major crops, invasive weeds, pathogen control in slaughtering, nutrition and chronic diseases, IPM, understanding the carbon cycle in global change—these are some of the new projects requested and are considered to be of greater critical importance to the Congress and the Nation than those projects recommended for termination.

Question. Please prioritize the research program and operational increases requested for fiscal year 2000.

Answer. ARS' program and operational increases proposed for fiscal year 2000 listed in order of priority will be provided for the record.

[The information follows:]

Agricultural Research Service

[Proposed Increases Listed in Priority Order]

Pay Costs	$9,930,000
Emerging Diseases and Exotic Pests of Plants and Animals	8,133,000
Food Safety	11,720,000
Human Nutrition Initiative	20,250,000
Food Quality and Protection Act Implementation	3,167,000
Sustainable Ecosystems	11,100,000
Agricultural Genome	2,750,000
Global Climate Change	15,300,000
Air Quality	2,000,000
Agricultural Information	2,000,000
Total	86,350,000

Question. For each of the research program increases proposed for fiscal year 2000, please provide the current (base) level of funding available to support the research, a brief description of the research work and where the research will be conducted.

Answer. The current base level funding, a brief description of the research work and location for fiscal year 2000 increases will be provided for the record.

[The information follows:]

AGRICULTURAL RESEARCH SERVICE FISCAL YEAR 2000 PROPOSED INCREASES

SUSTAINABLE ECOSYSTEMS—$11,100,000 ($112,074,000 AVAILABLE IN FISCAL YEAR 1999)

Implement the CENR (Committee on Environment and Natural Resources) Research and Monitoring Framework—$600,000

Tucson, AZ, $300,000.—Expand Semi-Arid Land-Surface-Atmosphere (SALSA) project in the Southwest.

Miami, FL, $300,000.—Expand projects on integrated crop and animal production systems in the Southeast.

Advance Ecological Science for Sustainable Livestock Management Systems—$900,000

Ames, IA, $300,000.—Develop improved storage, handling, and treatment systems for swine manure.

Brooksville, FL, $300,000.—Develop best management practices for effective use of manure nutrients from cattle.

University Park, PA $300,000.—Initiate a national effort to develop Park, PA the relationship between soil phosphorus and movement of phosphorus to surface waters in major soils of the U.S.

Predict Impacts and Restore the Viability of Damaged Riparian Zones and Coastal Habitats.—$1,100,000

Tifton, GA $300,000.—Develop management practices to maximize the ability of riparian zones to protect water quality in the Coastal Plains.

Oxford, MS, $300,000.—Develop methods to protect water quality in the Mississippi Delta.

Florence, SC, $250,000.—Determine the effectiveness of removal of nutrients and pathogens from liquid animal waste.

Baton Rouge, LA $250,000.—Develop guidelines and procedures to protect water quality in the Louisiana Bayous.

Conduct Integrated Ecosystem Risk Assessments—$600,000

Ft. Collins, $300,000.—Develop models and decision support CO tools to assess stresses and effects of Great Plains farming practices.

Temple, TX, $300,000.—Develop models to forecast ecosystem responses to multiple stresses related to agricultural production practices and systems.

Prevent and Control Invasive Weed Species for Ecosystem Management—$600,000

Prosser, WA $300,000.—Develop and implement weed IPM, with a focus on weeds of irrigated crops for ecosystem management.

Albany, CA, $300,000.—Conduct foreign exploration for new weed biological control agents for ecosystem management.

Develop and Implement Biologically-Based Integrated Pest Management Systems for Invasive Weeds and Other Pests—$2,700,000.

Davis, CA, $300,000.—Develop biologically-based weed management with emphasis on integration of biological control agents.

Logan, UT $300,000.—Develop biologically-based weed IPM with emphasis on invasive weeds.

Morris, MN, $300,000.—Develop biologically-based weed IPM with emphasis on crop weeds.

Frederick, $300,000.—Conduct foreign exploration MD for new pathogens of exotic weeds.

Ft. Lauderdale, FL, $300,000.—Conduct foreign exploration for new FLbiological control agents of exotic weeds.

Newark, DE, $300,000.—Conduct foreign exploration for new insect natural enemies of horticultural crop pests.

Stuttgart, AR, $300,000.—Develop and implement biological controls to manage invasive weed and problematic algal species.

Beltsville, MD $300,000.—Develop attractants for invasive pest species such as Asian Longhorned Beetle.

Kearneysville, WV $300,000.—Develop and implement non-chemical pest management of tree fruits and small fruits.

Prevent and Control Eutrophication, Harmful Algal Blooms, and Hypoxia—$4,100,000

Oxford, MS, $300,000.—Develop alternative practices and systems to reduce storm water runoff and runoff of manure and fertilizer nutrients in coastal waterways.

Lincoln, NE, $300,000.—Develop guidelines and decisionmaking tools that establish sound levels of manure and fertilizer nutrients in the Midwest and the hypoxia problem in the Gulf of Mexico.

Ames, IA, $300,000.—Establish a center for hypoxia research in the Midwest.

Beltsville, MD, $300,000.—Expand projects for improved soil, water, and air quality in the Chesapeake Bay.

Stoneville, MS, $500,000.—Develop techniques to better monitor and manage water quality, off-flavor components, and wastes in aquaculture production systems.

University Park, PA, $300,000.—Develop guidelines and decisionmaking tools on sound levels of phosphorus and other animal manure nutrients to reduce eutrophication and toxic algal blooms in the Mid-Atlantic region.

Columbus, OH, $300,000.—Expand projects to capture, treat, and recycle drainage water in the Midwest.

Watkinsville, GA, $300,000.—Expand projects for improved soil, water, and air quality in the Southeast.

Tifton, GA, $300,000.—Expand projects to enhance the use of wetlands and riparian zones for fish and wildlife habitat.

Bushland, TX, $300,000.—Expand projects for improved soil, water, and air quality on the High Plains of the Southwest.

Kimberly, ID, $300,000.—Expand projects for improved soil, water, and air quality in the Northwest.

Ames, IA, $300,000.—Determine processes controlling the effectiveness of biofilters in Midwest agricultural drainage areas.

Florence, SC, $300,000.—Develop best management practices for effective use of swine manure nutrients.

Predict Ecological Impacts of Extreme Natural Events—$500,000

Lubbock, TX, $250,000.—Develop technology for seasonal and interannual weather predictions based upon El Nino forecasting to decisionmaking by dryland farmers.

El Reno, OK, $250,000.—Develop weather forecasting capabilities to climate variability and forecasts in time scales relevant to agricultural operations.

AIR QUALITY—$2,000,000 ($4,923,000 AVAILABLE IN FISCAL YEAR 1999)

Research on Particulate (PM) Emissions and Controls—$1,500,000

Fresno, CA, $800,000.—Understand processes of agricultural PM emissions during field operations (equipment usage and burning).

Lubbock, TX, $400,000.—Understand processes of PM emissions by cattle feed yards, and swine facilities.

Pullman, WA $300,000.—Develop understanding of emission of PM by agriculture (emphasis on high wind-induced emissions, but also with attention to burning).

Research on Emission and Control of Odors—$250,000

Clay Center, NE, $250,000.—Determine the influence of cattle diet on the formation of odor-causing compounds.

Research on Protection of Agricultural Crops from the Effects of Tropospheric Ozone—$250,000

Raleigh, NC, $250,000.—Develop understanding of the biophysical processes by which ozone causes crop damage.

GLOBAL CHANGE RESEARCH—$15,300,000 ($25,806,000 AVAILABLE IN FISCAL YEAR 1999)

U.S. Global Change Research Program, Carbon Cycle Research Initiative—$5,000,000

Ft. Collins, CO, $600,000.—Develop a balance sheet approach to the modeling and prediction of agricultural emissions and sequestrations of greenhouse gases at the national scale.

Auburn, AL, $600,000.—Determine the extent of sequestration of greenhouse gases in cropland soils associated with tillage systems.

Cheyenne, WY, $600,000.—Determine the rate, sources, fate, seasonal timing, and depths of deposition of organic carbon in cropland and grazingland soils.

El Reno, OK, $600,000.—Develop methods and establish long-term monitoring of changes in the carbon balance of various forage production systems.

Temple, TX, $600,000.—Document rates of storage of atmospheric greenhouse gases in clay soils.

Athens, GA, $500,000.—Develop and apply new technology for monitoring methane emissions from cattle, livestock waste lagoons, and other agricultural sources.

Mandan, ND, $300,000.—Develop data bases suitable for modification and validation of models which quantify rates of carbon storage in grazinglands soils.

Pendleton, OR, $300,000.—Develop simple, easily-used models which accurately predict rates of change in organic carbon content of cropland soils.

Morris, MN, $300,000.—Document the effects of tillage and other management options for cold, wet soils with carbon storage.

St. Paul, MN, $300,000.—Develop new technology for accurately measuring fluxes of carbon dioxide above crops and cropland soils.

Ames, IA, $300,000.—Determine which of the many kinds of microbes present in cropland soils are most important in altering soil carbon content.

Mitigating Climate Change Impacts on Food Availability—$2,000,000

Phoenix, AZ, $600,000.—Determine how the availability of water and plant nutrients interact with rising temperatures and atmospheric carbon dioxide levels.

Gainesville, FL, $600,000.—Identify the physiological, biochemical, and genetic mechanisms by which rising temperatures reduce seed yield and quality of sensitive crops.

Beltsville, MD, $500,000.—Identify germplasm of major crops that is tolerant of high temperatures, limited availability of water or nutrients, and elevated atmospheric carbon dioxide levels.

Temple, TX, $300,000.—Determine how the effects of rising atmospheric carbon dioxide levels will alter the productivity and water relations of rangelands.

Impacts of Atmospheric and Climate Change on Alaskan Agro-Ecosystems—$1,000,000

Fairbanks, AK, $1,000,000.—Initiate research on the effects of a changing climate and rising atmospheric carbon dioxide levels on Alaskan agriculture.

U.S. Global Change Research Program National Assessment Activities—$300,000

Headquarters, $300,000.—Participate in developing integrated assessment of global change impacts on agriculture, food and water availability, and other relevant resources and sectors of the U.S. economy, as required by the Global Change Act of 1990.

New Technology for Predicting and Adapting to Global Change Impacts—$4,000,000

Tucson, AZ, $600,000.—Develop basin-scale simulation models of soil- vegetation-atmospheric fluxes of water and energy suitable for prediction of climate change impacts.

Beltsville, MD, $600,000.—Develop models to predict and assess impacts of weather variation and a changing climate on soil water availability.

Burns, OR, $600,000.—Develop data bases documenting long term effects of greenhouse-induced changes in amounts and patterns of precipitation on the productivity and species composition of rangeland vegetation.

El Reno, OK, $600,000.—Develop and apply new genetic improvement of forage cultivars tolerant to elevated temperatures, limited availability of water, and other extreme environmental conditions.

Boise, ID, $600,000.—Develop and refine simulation models which accurately predict effects of climate change on the availability of water from snowmelt in the West.

Raleigh, NC, $600,000.—Develop data bases to describe effects of rising atmospheric carbon dioxide on population dynamics and damage inflicted on major crops by insect pests.

Urbana, IL, $400,000.—Develop the molecular technology required in understanding the "sucrose transporter gene".

New Technologies for Improving and Expanding Biomass for Energy—$3,000,000

Lincoln, NE, $600,000.—Develop improved varieties and management practices for producing switchgrass and other promising grass species.

Madison, WI $600,000.—Develop processes and machinery for harvesting, transporting, and storage of crop residues and dedicated energy crops, for biomass separation.

St. Paul, MN, $600,000.—Develop improved varieties and management practices for producing alfalfa and other promising legume species.

Tifton, GA, $600,000.—Develop more productive varieties and improved management practices for switchgrass and other grasses.

Miss. State, MS, $600,000.—Develop persistent and productive legume/grass mixtures for biofuel production.

AGRICULTURAL GENOMES—$2,750,000 ($44,936,000 AVAILABLE IN FISCAL YEAR 1999)

Genomic Approaches for Improving Economically Important Traits in Livestock, Poultry, and Fish that Affect Animal Health and Economic Yield—$300,000

Beltsville, MD, $300,000.—Identify genetic basis for mammary gland resistance to mastitis and productivity.

Bioinformatic Tools, Biological Databases, and Information Management Technology—$1,100,000

Clay Center, NE, $500,000.—Develop methods to compare and analyze large numbers of DNA sequences for livestock genes, affecting production traits.

Beltsville, MD, $300,000.—Enhance the interconnection and interoperability of the GRIN and genome databases.

Columbia, MO, $300,000.—Develop software to improve the statistical precision of mapping genes and locating QTLs.

Genomic Approaches to Characterizing and Improving the Productivity of Microbes of Industrial or Medicinal Importance—$650,000

Peoria, IL, $350,000.—Apply genomic tools to discover genotypes of fungi, bacteria, actinomycete used to produce medicine or industrial products by fermentation and other biochemical processes.

Beltsville, MD, $300,000.—Develop knowledge of the genomes of the plant pest nematode, soybean cyst nematode, and of the swine pest nematode, Ascaris.

Characterize Genome of Insects which are Pollinators, Either Beneficial or Pests of Crops—$300,000

Baton Rouge, LA, $300,000.—Apply genomic tools to develop bees with resistance to mites and disease.

Functional Genomic Approaches to Manipulating the Function of Important Genes in Crops—$400,000

Albany, CA, $400,000.—Investigate the congruence of patterns in gene expression (as measured by mRNA occurrence).

FOOD QUALITY PROTECTION ACT IMPLEMENTATION—$3,167,000 ($90,992,000 AVAILABLE IN FISCAL YEAR 1999)

Areawide IPM Programs Demonstrating Alternatives to At-Risk Pesticides—$1,000,000

Headquarters, $1,000,000.—Develop increased areawide IPM programs focused on replacements for at-risk pesticides.

Support for USDA Office of Pest Management Policy—$1,500,000

Headquarters, $1,500,000.—Support for the USDA Office of Pest Management and Policy (OPMP).

Develop IPM Component Technology for Fruits and Vegetables Treated with Organophosphates and Carbamates and for Pests Under Large-Scale Action Agency Eradication or Control Programs—$667,000

Ft. Pierce, FL, $300,000.—Manage vegetable disease by control of vectors and disease transmission.

College Station, TX, $367,000.—Develop IPM technologies to replace malathion for boll weevil control and eradication.

EMERGING AND EXOTIC DISEASES, AND PESTS OF CROPS—$8,133,000 ($127,702,000 AVAILABLE IN FISCAL YEAR 1999)

Wheat and Barley Scab—$900,000

St. Paul, MN, $300,000.—Conduct research on spring wheat genetics for resistance to wheat scab.

Fargo, ND, $300,000.—Conduct research on durham wheat and barley for resistance to Fusarium head blight.

Peoria, IL, $100,000.—Conduct research on control of vomitoxin and biocontrol of wheat scab.

Madison, WI, $75,000.—Conduct research on the molecular biology of wheat transformation.

Albany, CA, $50,000.—Conduct research on wheat genetics for resistance to wheat scab.

Raleigh, NC $75,000.—Conduct research on wheat scab epidemiology in the Southeastern U.S.

New Emerging and Exotic Diseases—$600,000

Charleston, SC, $300,000.—Develop biologically-based control measures for management of nematodes and insects of vegetable crops.

Fort Pierce, FL, $300,000.—Develop improved methods for detection, identification, and control of whitefly-transmitted plant viruses.

Emerging and Exotic Weeds/Plant Pests—$2,033,000

Headquarters, $733,000.—Support scale-up pilot tests for areawide IPM implementation.

Montpellier, FR, $300,000.—Plant ecology and molecular taxomony-based foreign studies on the biology, genetics, and natural control of insect and weed pests in sites of origin.

Sidney, MT, $700,000.—Develop biologically-based weed IPM with emphasis on using plant pathogen agents for rangeland and crop weeds.

Miami, FL, $300,000.—Conduct biological control research in support of APHIS' exotic pest control programs in the Caribbean Basin.

Systematics of Invasive Weeds and Other Pests—$500,000

Beltsville, MD, $500,000.—Develop the systematics and taxonomy of key invading pest species and biological control agents for weed pests.

Rapid Identification, Prevention, and Control of Emerging Exotic Infectious Diseases of Livestock and Aquaculture—$1,300,000

Orient Point, NY, $1,300,000.—Compare the pathogenesis of new variants of classical swine fever (hog cholera) viruses from recent Western hemisphere and European outbreaks.

Rapid Identification, Prevention, and Control of Emerging Domestic Infectious and Zoonotic Diseases of Livestock—$900,000

East Lansing, MI, $300,000.—Develop DNA sequence databases and the needed diagnostic tools for investigations of the genetic diversity of the retrovirus, avian leukosis subgroup J.

Ames, IA, $300,000.—Determine how chronic wasting disease is transmitted through environmental contamination or animal contact on the range.

Beltsville, MD, $300,000.—Investigate mechanisms of drug resistance in coccidia in poultry.

Develop Vaccines for Brucellosis in Wildlife—$1,000,000

Ames, IA, $1,000,000.—Develop vaccines for brucellosis of wildlife.

Livestock Pests—$900,000

Lincoln, NE, $300,000.—Determine larval breeding sites, and IPM strategies to control stable flies.

Gainesville, FL, $300,000.—Develop wide area projects to control fire ants.

Weslaco, TX, $300,000.—Develop methods to control the small hive beetle.

FOOD SAFETY—$11,720,000 ($69,868,000 AVAILABLE IN FISCAL YEAR 1999)

Pathogen Control in Fruits and Vegetables—$2,100,000

Beltsville, MD, $600,000.—Investigate the ecology of foodborne pathogens on fresh cut produce to optimize varieties of fruits and vegetables.

Wyndmoor, PA, $900,000.—Develop methods of inhibiting pathogens on whole and fresh-cut fruits and vegetables, using irradiation, and steam pasteurization.

Albany, CA, $600,000.—Quantify effects of phytochemicals and environmental conditions on growth and survival of E. coli O157:H7, salmonella and campylobacter on the surface of fruits and vegetables.

Pathogen Control During Slaughter and Processing—$700,000

Athens, GA, $700,000.—Develop system for on-line detection of unwholesome poultry in slaughter plants.

Investigate Antimicrobial Resistance—$1,620,000

Wyndmoor, PA, $900,000.—Develop molecular characterization methods to facilitate identification of the resistant pathogens detected in food.

Peoria, IL, $720,000.—Establish culture collections of resistant and nonresistant bacterial and fungal pathogens.

Manure Handling and Distribution—$2,500,000

Miss. State, MS, $600,000.—Develop practical and economical pathogen reduction process methods to handle and treat manure in poultry production operations.

Ames, IA, $400,000.—Develop practical and economical pathogen reduction process methods to handle and treat manure in swine production operations.

Clay Center, NE, $300,000.—Develop practical and economical pathogen reduction process methods to handle and treat manure in swine production operations.

Lincoln, NE, $300,000.—Develop practical and economical pathogen reduction process methods to handle and treat manure in swine production operations.

Bushland, TX, $600,000.—Develop practical and economical pathogen reduction process methods to handle and treat manure in cattle production operations.

Phoenix, AZ, $300,000.—Determine the identity and amounts of viable, bacterial, and parasitic, and zoonotic pathogens associated with the use of municipal wastewater when used in irrigation of crops.

Antibiotic Resistance—$1,800,000

Athens, GA, $600,000.—Determine factors favoring the acquisition and dissemination of resistance genes among pathogens and nonpathogens, particularly for poultry.

Ames, IA, $600,000.—Determine the factors or conditions favoring the acquisition and dissemination of resistance genes among pathogens and nonpathogens, particularly in relation to cattle and swine.

College Station, TX, $600,000.—Develop basic information, using chemostat model systems, on the time and dose dependency of various antibiotics.

Risk Assessment—$2,400,000

Athens, GA, $600,000.—Develope data for use in assessing risk on the contamination of poultry presented for slaughter.

West Lafayette, IN, $600,000.—Assess the risk of various swine production practices, and transportation systems on contamination of the animals as they are presented for slaughter.

Clay Center, NE, $600,000.—Develop data for use in assessing risk on the contamination of cattle as they are presented for slaughter.

Beltsville, MD, $600,000.—Develop predictive models for the risk of transmission of zoonotic parasites through farm management systems, animal manure and water runoff.

Reduce Fungal Toxins—$300,000

Athens, GA, $300,000.—Develop methods to prevent the occurrence of endophytic fungi in corn and grasses, in particular those fungi producing the fumonisins and ergot alkaloids.

Reduce Zoonotic Disease Risk—$300,000

Fayetteville, AR, $300,000.—Develop knowledge of diseases in chickens and turkeys to prevent the serious manifestations of osteoporosis, anoxia, and ascites.

HUMAN NUTRITION—$20,250,000 ($69,121,000 AVAILABLE IN FISCAL YEAR 1999)

PHASE 3 OF THE PRESIDENT'S HUMAN NUTRITION RESEARCH INITIATIVE—$20,250,000

Update the National Nutrient Database—$2,200,000

Beltsville, MD, $2,200,000.—Analyze the nutrient content of those key foods that supply the bulk of the important nutrients in the American diet.

Development of Food Composition Methods—$1,200,000

Beltsville, MD, $1,200,000.—Develop robust analytical methods to determine the concentration of nutrients in foods.

Determination of Healthy Body Weight—$2,500,000

Beltsville, MD, $600,000.—Investigate energy restriction and physical activity as they relate to tissue metabolic activity and body composition.

Houston, TX, $600,000.—Identify the alterations in biochemical and neuropsychological regulators of energy intake, energy expenditure and appetite that relate to childhood obesity.

San Francisco, CA, $700,000.—Assess detrimental energy effects including reduced immune response, diminished short term memory and reduced energy needs.

Little Rock, AR, $600,000.—Study the interaction of diet with the long term physical and cognitive indicators of health in older children.

Role of Nutrition in Bone Growth and Maintenance—$3,600,000

Boston, MA, $1,200,000.—Assess the requirements for nutrients critical to bone health and the prevention of osteoporosis in aging adults.

Houston, TX, $1,200,000.—Determine factors that affect the ability of rapidly growing children to absorb and utilize minerals from animal and vegetable sources for the formation of bone.

Grand Forks, ND, $600,000.—Assess the role of mineral elements and their interactions relative to bone growth.

Little Rock, AR, $600,000.—Determine the effects of early dietary factors on long-term consequences of bone growth.

Development of Biomarkers of Nutritional Status—$3,500,000

Beltsville, MD, $700,000.—Study the relationship between immune competence and diet.

Houston, TX, $600,000.—Study the effects of colostrum and other dietary factors on skeletal muscle protein in the rapidly growing neonate.

San Francisco, CA, $1,200,000.—Identify sensitive biomarkers that are indicative of health promotion.

Grand Forks, ND, $1,000,000.—Identify the regulatory genes of importance that are responsive to trace minerals in the diet.

Cognition and Brain Function—$3,450,000

Boston, MA, $500,000.—Assess dietary factors that alter vascular reactivity and brain function in the elderly.

Grand Forks, ND, $600,000.—Study the relationship between mineral nutriture and cognitive function including reasoning, memory and visual perception.

Little Rock, AR, $1,700,000.—Study cognitive and social development of growth delayed in malnourished infants and children.

Little Rock, AR, $650,000.—Determine the precise relationship between nutrients in the diet and the development of cognition in children.

Diet and Immune Function—$2,100,000

San Francisco, CA, $900,000.—Define the relationship between nutrition and the induction of the synthesis of immunoglobulins.

Boston, MA, $300,000.—Determine changes in the immune response that occur throughout the aging process.

Beltsville, MD, $500,000.—Expand studies of the effect of nutritional status of a host on viral pathogen.

Little Rock, AR, $400,000.—Determine foods in the diets of young children that have a positive effect on growth and development.

Role of Nutrition Throughout the Life-Cycle—$1,300,000

Houston, TX, $800,000.—Define the relationship of nutritional status at various stages of childhood.

Boston, MA, $500,000.—Develop measures which help delineate the relationship between diet and the development of vascular dementia in the elderly, and between diet and the rate of physical form and function in the elderly.

Enhanced Dietary Survey Methodology—$400,000

Beltsville, MD, $400,000.—Continue development of telephone technology for use in dietary surveys with the aim of reducing cost and improving accuracy.

AGRICULTURAL INFORMATION—$2,000,000 ($19,948,000 AVAILABLE IN FISCAL YEAR 1999)

Information Services for Rural America—$2,000,000

NAL, $2,000,000.—Develop enhanced methods to communicate critical agricultural information to rural America.

TOTAL ALL PROGRAM INCREASES: $76,420,000

Question. An increase of $8.1 million is proposed for fiscal year 2000 for research on emerging diseases and exotic pests. Provide a summary of total ARS funding for emerging diseases and exotic pests for each of fiscal years 1998 and 1999 and that requested for fiscal year 2000, along with a brief description of the project and where the research is currently being conducted, or is proposed to be conducted.

Answer. The Agricultural Research Service devoted $109,772,700 in fiscal year 1998, $127,701,500 in fiscal year 1999, and proposes $148,273,000 in fiscal year

2000 for research on emerging diseases and exotic pests. A description of the current research and the locations where the research is being conducted is provided for the record.

[The information follows:]

Location/Research Description	*Fiscal year 1999 funds*
Auburn, AL (Aquaculture diseases, diagnosis and prevention)	$1,913,700
Fayetteville, AR (Food safety/pathogen reduction in poultry)	293,800
Albany, CA (Food safety/pathogen reduction in fruits and vegetables/yellowstar thistle/salt cedar)	6,180,900
Davis, CA (Control of diseases of perennial crops)	70,600
Fresno, CA (Alternatives to Methyl Bromide)	762,300
Funds Riverside, CA (Food safety/pathogen reduction in fruits, vegetables, beef and poultry/animal manure/alternatives to Methyl Bromide)	734,100
I89 Salinas, CA (Alternatives to Methyl Bromide)	428,700
Fort Collins, CO (Diseases of sugar beets)	242,100
Washington, DC (Control of diseases of ornamentals/alternatives to Methyl Bromide)	952,600
Newark, DE (Quarantine clearance, biology and ecology)	1,018,300
Canal Point, FL (Control of sugarcane diseases)	123,400
Fort Lauderdale, FL (Control of wetland and aquatic weeds)	749,700
Gainesville, FL (Control of arthropod pests of livestock and humans)	5,633,400
Orlando (Ft. Pierce, FL) (Alternatives to Methyl Bromide)	939,900
Athens, GA (Food safety/pathogen reduction in poultry)	10,058,400
Byron, GA (Control of nematodes and diseases of peaches)	209,700
Griffin, GA (Quarantine clearance/disease identification)	82,800
Tifton, GA (Integrated nematode management on irrigated crops and control of diseases of forage and turf)	633,000
Ames, IA (Zoonotic diseases such as brucellosis, leptospirosis, tuberculosis and infectious diseases of cattle and swine/food safety/pathogen reduction in cattle and swine)	20,570,100
Peoria, IL (Infectious diseases of livestock/biological control of root and tuber diseases)	1,238,900
Urbana, IL (Control of Soybean Cyst Nematode)	112,000
West Lafayette, IL (Food safety/pathogen reduction in swine)	296,400
New Orleans, LA (Control of diseases and insects in sugarcane)	219,300
Beltsville, MD (Systematics, biology, ecology and management of plant diseases and pests/parasitic diseases/mastitis/food safety/pathogen reduction in swine, fruits and vegetables)	18,852,900
Frederick (Ft. Detrick, MD) (Pathogen quarantine clearance, biology and ecology)	1,414,400
East Lansing, MI (Tumorigenic viruses of poultry)	2,088,600
St. Paul, MN (Control of forage disease)	52,900
Columbia, MO (Stress in pigs)	617,600
Mississippi State, MS (Control of mycoplasmosis in poultry)	544,900
Oxford, MS (Biological control of pests and diseases)	277,700
Funds Stoneville, MS (Application technology and bioherbicides/control of Soybean Cyst Nematode)	248,600
Sidney, MT (Control of rangeland weeds)	694,900
Raleigh, NC (Control of diseases in wheat)	146,100
Fargo, ND (Food safety/toxins/leafy spurge)	296,400
Clay Center, NE (Herd health/food safety/pathogen reduction in cattle)	5,191,600
Lincoln, NE (Control of livestock pests)	1,031,200
Ithaca, NY (Control of potato nematodes and diseases/small grain viruses/grape rootstocks	1,496,100)
Orient Point, NY (Highly infectious exotic animal diseases)	9,678,300
Wooster, OH (Pesticide application technology/control of corn virus diseases)	271,600
Stillwater, OK (Control of Russian Wheat Aphid)	196,600
Corvallis, OR (Control of diseases in nursery crops, ornamentals and small fruits)	1,448,600
Wyndmoor, PA (Food safety/pathogen reduction in animal products, fruits and vegetables)	8,692,900
Charleston, SC (Control of nematodes and diseases of vegetables)	486,600

Location/Research Description	*Fiscal year 1999 funds*
College Station, TX (Food safety/pathogen reduction in poultry, swine and cattle/application technology/control of cotton diseases)	4,407,500
Kerrville, TX (Integrated pest management of ticks and biting flies)	4,338,500
Lubbock, TX (Food safety/pathogen reduction of cattle)	281,600
Temple, TX (Biological control of salt cedar and musk thistle)	147,200
Weslaco, TX (Integrated production systems)	594,600
Logan, UT (Food safety/poisonous plants effect on livestock)	63,600
Prosser, WA (Potato variety improvement)	384,200
Pullman, WA (Control of smut diseases of grains/tickborne diseases/transmissible spongiform encephalopathy)	3,277,600
Wenatchee, WA (Control of diseases of tree fruits)	344,000
Kearneysville, WV (Fruit production and disease control)	677,200
Laramie, WY (Vector-borne diseases of livestock)	3,454,700
Buenos Aires, Argentina (Foreign exploration, biology, ecology, testing, and shipment)	507,000
Montpellier, France (Foreign exploration, biology, ecology, testing and shipment)	1,051,000
Panama City, Panama (Screwworm eradication)	980,200
Total	127,701,500

A description of the proposed research and the locations where the research is being proposed to be conducted which is included in the fiscal year 2000 Emerging Diseases and Exotic Pests increase is provided for the record.

[The information follows:]

Emerging diseases and exotic pests

Emerging exotic infectious diseases of livestock: Orient Point, NY—Hog cholera pathogenesis and vaccines	$1,300,000
Emerging domestic infectious and zoonotic diseases of livestock:	
E. Lansing, MI—Avian Leukosis J virus diagnosis and vaccines	300,000
Ames, IA—chronic wasting disease control	300,000
Beltsville, MD—drug resistance in coccidia of poultry	300,000
Subtotal	900,000
Vaccines for brucellosis in wildlife: Ames, IA—brucellosis vaccines for wildlife	1,000,000
Livestock pests:	
Lincoln, NE—integrated pest management of stable flies on cattle	300,000
Gainesville, FL—fire ants control	300,000
Weslaco, TX—control of small hivebeetle (pest of bees)	300,000
Subtotal	900,000
Emerging and exotic plant pests/weeds:	
Headquarters—areawide IPM implementation	733,000
Montpellier, FR—plant ecology and molecular taxonomy	300,000
Sidney, MT—biologically-based weed IPM	700,000
Miami, FL—biological control of pests in Caribbean Basin	300,000
Subtotal	2,033,000
New emerging and exotic plant diseases:	
Charleston, SC—biological control of nematodes and insects	300,000
Fort Pierce, FL—whitefly-transmitted plant viruses	300,000
Subtotal	600,000
Wheat and barley scab:	
St. Paul, MN—spring wheat genetics for wheat scab	300,000
Fargo, ND—fusarium head blight	300,000

Emerging diseases and exotic pests—Continued

Peoria, IL—vomitoxin and biocontrol of wheat scab	100,000
Madison, WI—molecular biology of wheat transformation	75,000
Albany, CA—wheat genetics	50,000
Raleigh, NC—wheat scab epidemiology	75,000
Subtotal	900,000
Systematics of invasive weeds/pests: Beltsville, MD—systematics and taxonomy	500,000
Total	8,133,000

Question. What has been accomplished through research on emerging and exotic pests?

Answer. Key accomplishments of ARS research on emerging and exotic pests and weeds include establishment of nine biological control agents against leafy spurge, a major weed that costs ND, SD, MT and WY alone $144.4 million/year. Biological control with co-evolved natural enemies is the only option for affordable, sustainable, and environmentally compatible leafy spurge management. For example, the introduced flea beetles (Aphthona spp.) cause 80 percent reduction of leafy spurge at release sites. A TEAM Leafy Spurge group has been formed to manage ARS' newest areawide pest management program (AWPM), against leafy spurge. Biological, chemical and cultural control of leafy spurge is managed as part of the ARS-funded ($4.5 million over five years) TEAM Leafy Spurge project, which involves other Federal agencies and States.

Another major accomplishment is the establishment of a weevil against the Australian plant melaleuca, a major wetlands invasive exotic weed in the Florida Everglades. Early damage on melaleuca by the weevil is significant. Melaleuca has changed the drainage in a large part of southern Florida: it spreads at the rate of 50 acres/day, and occupies 500,000 acres of native wetlands. Biological control is the only option for long-term, affordable, environmentally compatible management of melaleuca, and several other natural enemies are slated for release over the next several years.

Waterhyacinth, an invasive floating aquatic weed from South America, has been managed by the introduction of two weevil species, saving the southeastern U.S. millions of dollars, and reducing pressure on native aquatic and wetlands plants. This technology has been transferred to other countries (e.g., Australia and Africa) to help manage waterhyacinth.

Many other invasive weed species infest large portions of the U.S., causing loss of productivity and biological diversity, displacement of native vegetation, and job loss. There are annual losses of $13 billion from weeds in the U.S.

Pests such as codling moth, corn rootworm, stored grain insects, corn earworm/tobacco budworm, Russian wheat aphid, Colorado potato beetle, boll weevil, sweetpotato whitefly, and fruit flies are targets of the successful ARS AWPM programs. As with the leafy spurge AWPM program, these projects are funded at about $1 million/year for five years, about half of which funds work by partners in other Federal agencies and States. As examples of accomplishments of the ARS AWPM program, details of two of these projects follow.

Codling moth is a serious pest of apples and pears in the U.S. In 1994, before the AWPM program was initiated, only 11,000 acres were treated with mating disruption technology in Washington State. By 1998, there were more than 44,000 acres using the technology throughout Washington, Oregon, and California. A result of the diminished use of hard pesticides has been a resurgence in the natural enemy populations that have exerted almost complete control of secondary pests, and further reduced the costs of insect control on apples and pears in this three-state area. Populations of codling moth were reduced to almost undetectable levels at some of the 17 project sites. The cost of the control was less in the mating disruption treated orchards than in orchards treated with conventional organo-phosphate pesticides.

Corn rootworm populations can be reduced by 85 to 95 percent with less than 10 percent of the chemicals used in current corn rootworm control regimes by using adult attracticide baits developed by ARS and now marketed by industry. This technology is the basis for the AWPM program on corn rootworm in the midwestern U.S. and Texas, which includes more than 25,000 acres in the research demonstration project.

The ARS research on invasive pests has led to a better understanding of the ways that these pests are introduced into the U.S. (leading to better exclusion techniques), eradication of incipient populations before they become pests, and manage-

ment of established populations through biologically based integrated pest management. ARS plans and implements management of invasive species by closely working with customers and partners such as the USDA-Forest Service, USDA-Animal and Plant Health Inspection Service, universities and State departments.

Question. What new threats of plant and animal diseases and pests has the agency identified and what new and expanded research initiatives are proposed to address these problems?

Answer. *Plant Pests.*—New invasive species are discovered every month in the U.S. ARS has proposed several new initiatives to control these threats as they occur. Recently, for example, giant salvinia was discovered in Louisiana and Texas. This invasive floating weed from Brazil was successfully managed in Australia, Papua New Guinea and Africa by introduction of a small weevil in a biological control program. A USDA-State team is in the process of developing an integrated weed management program for the U.S.

The Asian gypsy moth, a close relative of the gypsy moth, is periodically discovered in the U.S. This species could further devastate trees in the U.S. However, rapid detection and eradication by USDA and States has prevented its establishment.

Programs are developed in advance of threats of invasion by key pest species. For example, ARS and APHIS, together with international colleagues, implemented a biological control program for the pink hibiscus mealybug in the Caribbean that resulted in management of this pest. Should the mealybug arrive in the U.S., the biological control technology is already available to quickly manage the pest.

New threats from other invasive weeds such as salt cedar, mile-a-minute weed, kudzu, Chinese tallow, tropical soda apple and other related species, and miconia, and insects such as the Asian longhorned beetle, giant whitefly, etc., continue to invade the U.S. Research initiatives concentrating on learning more about the basic biology, systematics, and ecology of these invasive species, leading to implementation of biologically based integrated pest management programs have been proposed for each region of the country.

ARS has approximately 70 projects at 29 locations conducting basic and applied research directly related to integrated pest management (IPM). Current and planned future IPM studies in support of the Department's IPM goal are tailored to each pest and designed to be sustainable over time.

Animal Diseases.—Changes in animal production practices, climate change, and increased international trade and travel are creating new opportunities for the reemergence and spread of infectious diseases and pests. Control of diseases is needed in both domestic and wild animals, as the latter are reservoirs of disease. Emerging threats have been identified from avian leukosis, chronic wasting disease of cervids, drug-resistant coccidiosis, wildlife brucellosis, and stable flies.

New and expanded program thrusts include:

Research to develop a new generation of biochemical and DNA based diagnostic tools for sensitive and rapid detection of exotic pathogens and to develop new vaccines.

Identification, prevention, and control of emerging domestic infectious and zoonotic diseases of livestock and aquaculture, including avian leukosis, chronic wasting disease, and coccidiosis.

Development of vaccines for brucellosis in wildlife.

Control of livestock pest flies through biologically based IPM strategies.

PAY COSTS

Question. ARS is requesting $9,930,000 to finance pay costs for fiscal year 2000. Is this the total required to meet the cost of mandatory pay requirements? If not, what additional amount would be required to meet these costs? If the full amount is not being provided, what will the impact of absorbing these mandatory pay requirements?

Answer. The $9,930,000 represents half of the total required to meet the cost of the mandatory, pay requirements in fiscal year 2000. An additional $8,768,000 is required to fully finance pay cost needs of $18,698,000. These funds are critical to support an effective and responsive USDA in-house research capability. Absorption of the pay costs will result in further erosion of the Agency's capacity to maintain viable research programs. To cover these anticipated pay increases, resources will have to be shifted from other research requirements such as: travel, equipment, supplies, contracts, etc., thereby impacting the productivity of many ARS locations. Continuing absorption of these costs consequently reduces the number of scientists and support personnel who can be supported with ARS funds. These individuals are needed to carry out the USDA in-house research mission and objectives.

Question. Provide a table showing historical data for each fiscal year from 1992 to 2000: (1) ARS pay cost requirements; (2) the funding requested in the President's budget to meet these requirements; and (3) the amount appropriated to meet these costs.

Answer. The information you requested is provided for the record.

[The information follows:]

AGRICULTURAL RESEARCH SERVICE

[Pay cost history]

Years	Agency Requirements	President's Budget Request	Appropriated
2000	$18,698,000	$9,930,000	.....
1999	14,805,000	12,201,000	.....
1998	17,021,000	6,407,000	.....
1997	11,745,000	6,576,000	.....
1996	9,703,000	9,091,000	.....
1995	11,119,000	4,201,000	$4,202,000
1994	19,705,000	8,628,000	.....
1993	17,328,000	7,387,000	.....
1992	16,281,000	16,042,000	16,042,000

Question. Provide a short explanation for each of fiscal years 1995 to 1999 of how pay costs were absorbed by the agency and the consequences of absorption of these costs on agency operations and activities, including research productivity and the hiring of scientists.

Answer. As indicated in the preceding table, ARS has absorbed some $60 million of costs associated with mandatory Federal pay raises from 1995 through 1999. These costs were absorbed by every ARS research laboratory throughout the Agency. Each laboratory was required to finance the costs of increased salaries and benefits within its operating budget. Financial plans for each year reflected reductions in other important research expenditures to accommodate these increased costs. Expenditures pursuant to research—travel, scientific equipment, cooperative agreements, research supplies, hiring of full-time and temporary personnel, and post-doctoral support—have been reduced to pay the higher personnel compensation due to pay raises. Research productivity is seriously eroded under these circumstances.

Because program increases are generally directed to specific locations, most ARS locations and research units do not benefit from annual appropriation increases and are facing tight financial situations.

In order to hire replacement scientists ARS must have the assurance that the funding will be available to fully support scientist needs required in attaining their research mission. Because of these absorptions, many research units have not been able to fill scientific and technical positions. Research units cannot effectively hire scientists and provide the adequate funding necessary for essential laboratory and operating costs. Research is curtailed; productivity at the bench is diminished; and benefits postponed.

ARS ROLE IN COUNTER-NARCOTICS/ANTI-BIOTERRORISM RESEARCH

Question. For fiscal year 1999, $23 million in emergency supplemental appropriations, along with an additional $4.5 million transfer of funds from the Office of National Drug Control Policy (ONDCP) has been made available to the ARS for counter-narcotics research. Provide a detailed description of the research work this funding is being used to support, the amount of funds allocated to each project, and who will conduct this work. Please show the allocation of the $4.5 million transferred from the Office of National Drug Control Policy separately from the allocation of the $23 million emergency appropriations.

Answer. Of the allocation of $23 million, $10 million was earmarked for an external contract for the biological control of coca, opium and cannabis; $5 million to ARS for herbicidal and biological control research; $5 million to ARS for alternative crop research; and, $3 million to ARS for research on illicit narcotic plant chemistry, remote sensing and illicit crop estimation.

Specific allocations are as follows:

Herbicidal and Biological Control of Narcotics, $5,000,000

Frederick, MD: $2,000,000 to investigate augmentative biological control of poppy

Stoneville, MS: $1,000,000 to investigate augmentative biological control of coca and cannabis

Albany, CA: $1,000,000 to investigate classical biological control of poppy, coca and cannabis

Headquarters: $1,000,000 for cooperative agreements on foreign exploration, host specificity testing, and mass rearing of biological control agents for narcotic plants

Alternative Crop Research, $5,000,000

Beltsville, MD: $500,000 to determine Phytopthora resistance in potato and cacao

Miami, FL: $300,000 to develop DNA markers of cacao resistance to Crinipellis, Phytopthora and Moniliopthora

Ft. Pierce, FL: $300,000 to develop disease resistance in tropical tree fruit crops

Mayaguez, PR: $500,000 for breeding resistance in tree crops, including cacao and banana, mango, mangosteen and papaya

Starkville, MS: $300,000 to develop coffee berry borer artificial diet for biological control purposes

Organization of American States: $666,667 for field trials in Peru for the biological control of cacao pests

USDA/APHIS: $100,000 for assistance in tropical crop export promotion in Peru

University of Mississippi: $194,444 for biocontrol of cannabis

CABI Biosciences, U.K.: $888,889 to conduct cacao breeding, resistance field trials and biological control assessments

University of Maryland: $1,250,000 to develop predictive models of the epidemiology of tropical crop diseases in Colombia

Narcotic Plant Biochemistry and Identification, $3,000,000

Beltsville, MD: $500,000 to develop test models for relating opium gum yield to capsule size for worldwide opium production estimates

Beltsville, MD: $1,500,000 to develop molecular markers that characterize coca, opium poppy and cannabis populations, species and cultivars in their different native and introduced areas

Beltsville, MD: $1,000,000 to test and refine yield models of narcotic crops, gather data to enhance model performance, combine models with weather and topographic data for predictive data, examine multispectral data for remote sensing of narcotic crops

Biological Control Contract, $10,000,000

Contract: $10,000,000 for a contract for product development, environmental testing, registration, production, aerial distribution, evaluation of product effectiveness and modification of biological control agents of coca, opium poppy and cannabis.

The allocation of $4.5 million was provided through the ONDCP to ARS by means of an interagency transfer of funds. Specific allocations are as follows:

Beltsville, MD: $2,337,000 for construction and instrumentation of containment greenhouse facilities

Beltsville, MD: $166,000 for equipment associated with containment greenhouse operations and a research field site at the University of Hawaii, Kauai

Beltsville, MD: $166,000 for postdoctoral position to work on mycoherbicides and alternative crops

Stoneville, MS: $222,000 for a cooperative agreement with University of Mississippi on the use of fungi to control cannabis production

Starkville, MS: $333,000 for a cooperative agreement with Mississippi State to work with Colombian counterparts on coffee berry borer parasatoids as biological control agents for coffee pests

Miami, FL: $166,000 for cooperative agreement with University of Florida to identify genetic markers for resistance to crinipellis in cocoa

Centro Internationale Agropecuria Tropicale, Colombiam: $277,000 to evaluate market growth potential for cocoa, oil palm, and field trials for temperate and tropical tree fruit crops

U.S. Department of State, Bureau of International Narcotics: $500,000 for a cooperative agreement with the United Nations Drug Control Program for monitoring biological control tests overseas

Bozeman, MT: $333,000 for cooperative agreement with Montana State University to enhance the efficiency, yields, alkaloid extraction and processing capability of the licit opium industry in Turkey

Question. Because the fiscal year 1999 funding made available to the ARS for counter-narcotics research is one year emergency funding, what is ARS doing to make sure that this funding does not increase the agency's base requirements for fiscal year 2000?

Answer. Without an increase in base funds, we will not implement the program with an increase in permanent staff. Of the $23 million, Congress earmarked $10 million for a biological control contract. Once awarded, the contract will be self-sustaining and will not increase ARS base resource requirements. The balance of the funds ($13 million) is earmarked for $5 million in alternative crop research, $5 million in illicit crop eradication research and $3 million for narcotic plant chemistry, remote sensing, illicit crop detection and worldwide illicit crop estimates. In addition to some purchases for equipment, the research will primarily be carried out through extramural agreements and limited-term, in-house, post-doctoral appointments. Extramural agreements will run for a period of five years and then expire; post-doctoral appointments for two years.

Question. Does the Department believe the Agricultural Research Service should be involved in counter-narcotics research? If so, what should be its role?

Answer. ARS should be involved in counter-narcotics research. The agency serves in a research support role to federal and international action agencies. ARS has unique expertise which makes the agency well-qualified to work in the plant sciences, which includes narcotic crops. For example, our expertise in plant pathology allows us to support programs in the development of biological control technologies for narcotic crops and research into diseases which affect tropical agriculture, specifically, alternatives to narcotic crop cultivation. Similarly, plant genetics are applied to improving varieties of coffee, cocoa and tropical tree crops, essential to developing the economies of many Andean and Central American economies. The agency has significant experience in spectral imaging of vegetation in mixed environments, as well as crop modeling, which is directly applicable to illicit crop estimation and detection. Our experience in weed science and herbicide application technology has direct impact upon the eradication programs for coca and opium, currently being implemented in Colombia.

ARS has a long history in narcotic plant research beginning with assisting the United Nations and Drug Enforcement Administration in evaluating strategies for the eradication of illicit narcotic crops and developing alternative crops, primarily in Thailand. Currently, our mission continues to be one of support of U.S. and international action and policy agencies, including the Office of National Drug Control Policy, the Department of State, United Nations Drug Control Program, and the U.S. intelligence community.

Question. Is the Agricultural Research Service involved in the Administration's bioterrorism initiative? If so, what is the role?

Answer. While ARS has no specific line item appropriation in support of the Administration's bioterrorism initiative, the Agency is actively involved in this program. The agricultural sector must play an integral part in the development of a coordinated, comprehensive national strategy to protect the security of the nation's food supplies in the event of a bioterrorism emergency. To this end, ARS has worked vigorously to have food and agriculture recognized as a critical infrastructure. In this regard, the Agency is posturing itself to engage this issue more directly, both internally and externally in terms of program and infrastructure requirements.

Naturally occurring pathogens and pests which could be used as biological agents against agriculture are widely available in foreign countries. Also, technologies, expertise, and delivery platforms related to many types of biological and chemical weapons are commonly employed in normal commercial agricultural practice world wide.

ARS' ongoing mission is highly relevant to the Administration's bioterrorism initiative. The research to protect crops and livestock from the farm gate to the consumer's table is a priority concern. ARS research on emerging exotic diseases of livestock carried out at the Plum Island Animal Disease Center and the National Animal Disease Center are central to this effort. Research carried out at other ARS laboratories on wheat scab, for example, is pertinent to the bioterrorism concern. Invasive species of agricultural crops is also central to this issue. The ARS infrastructure is of critical importance in assessing vulnerabilities to bioterrorism. The upgrade and modernization of ARS laboratories is also essential to this program. In fact, biocontainment capabilities at a number of ARS research locations—including the Plum Island Animal Disease Center to the National Animal Disease Center—can serve as the primary means for supporting the characterization of biological weapons-related pathogens in the event of a bioterrorism incident.

MANAGEMENT

Question. ARS does not receive separate appropriations for its management and overhead expenses. How are these costs funded?

Answer. ARS program and administrative management activities include the Administrator's Office; National Program Staff; Civil Rights Staff; Information Staff; Office of Technology Transfer; Budget and Program Management Staff; Eight Area Directors' and Administrative support; Human Resources Management; Information Technology Division; Procurement and Property Division; Extramural Agreements Division; Financial Management Division and Facilities Division. In addition to support of these internal management organizations, ARS finances its share of departmental assessments for such operations as the National Finance Center, computer centers, central supply, telephone services, security, etc. ARS, like a number of other agencies in the Department of Agriculture, does not have a line item or direct appropriations to finance costs associated with the program and administrative management activities necessary to support the Agency's mission. Historically, management costs in ARS have been financed through the assessment of research programs carried out by the agency. Costs associated with the support of program and administrative activities represents about 10 percent of the Agency's annual appropriated funds.

Question. Please provide an accounting of management and overhead expenses for fiscal year 1998.

Answer. The information you requested is provided for the record.

[The information follows:]

Program and Administrative Management Costs

Organization/Functions	*Fiscal Year 1988 Obligations*
Office of the Administrator (Immediate Office, Office of Technology Transfer, Civil Rights Staff, Budget and Program Management Staff)	$5,276,250
Information Staff	3,211,598
National Program Staff	7,356,599
Administrative and Financial Management (Office of Deputy Administrator, Human Resource Management, Financial Management, Facilities Division, Contracts and Extramural Agreements, Information Technology, and Procurement and Property Administration)	18,805,349
Area Program and Administrative Management (Area Directors, Associated Administrative Staffs)	16,396,600
USDA Central Charges (NFC, Computer Center, Central Supplies, Telephone Service, Security, etc.)	9,871,968
Total	60,918,364

Question. How does the ARS cover indirect research costs? Please show an accounting of these costs for fiscal year 1998.

Answer. ARS indirect research assessment provides for program and management of ARS's national and international research mission. These costs represents approximately 10 percent of the Agency's appropriations. The ARS program and management costs are reviewed annually and the indirect support rate represents a viable assessment needed to administer the ARS mission. An accounting of these costs is reflected in the previous response.

Question. How much money budgeted for positions was due to "lapse" at the end of each of fiscal years 1997 and 1998?

Answer. Fiscal year 1997 and 1998 lapsed salaries totaled $7,850,700 and $11,791,100, respectively. This represents 60 percent of the total lapse salary accrual which was managed from ARS Headquarters. The 40 percent balance of the accrued lapsed salaries were retained and used by local managers.

Question. How were the funds projected to "lapse" spent in each of fiscal years 1997 and 1998? Please provide a list of items funded and the amount provided for each, by fiscal year and location.

Answer. The fiscal year 1997 lapsed salaries were spent as follows:

Use of Funds	*Funds*
Research Equipment:	
Akron, CO	$75,000
Ames, IA	296,800
Auburn, AL	70,000
Beltsville, MD	570,000
Boston, MA	20,000
Brookings, SD	35,000

Use of Funds	*Funds*
Brooksville, GA	75,000
Clemson, SC	40,000
College Station, TX	44,500
Columbia, MO	96,100
Columbus, OH	9,300
Coshocton, OH	15,500
Davis, CA	70,000
Dawson, GA	41,300
E. Lansing, MI	17,000
Fargo, ND	172,000
Ft. Collins, CO	91,000
Grand Forks, ND	30,000
Ithaca, NY	50,300
Lincoln, NE	56,000
Lubbock, TX	97,600
Madison, WI	74,500
Miles City, MT	29,500
New Orleans, LA	178,000
Orient Pt., NY	74,300
Oxford, MS	60,000
Peoria, IL	332,200
Raleigh, NC	30,000
Stillwater, NC	46,600
St. Paul, MN	44,000
Temple, TX	6,500
Tifton, GA	178,000
Tucson, AZ	150,000
Urbana, IL	8,000
Weslaco, TX	69,000
Wooster, OH	84,100
W. Lafayette, IN	80,000
Total Research Equipment	3,417,100
Facilities Repair & Maintenance/Upkeep:	
Beckley, WV	85,000
Brookings, SD	25,000
College Station, TX	12,000
Columbia, MO	43,000
Durant, OK	46,500
Fargo, ND	158,000
Ithaca, NY	72,000
Manhattan, KS	30,000
Greenport, NY	1,142,300
Peoria, IL	51,000
Pullman, WA	35,000
Riverside, CA	138,000
Yakima, WA	221,000
National Agricultural Library	75,000
Total Facilities Repair & Maintenance/Upkeep	2,133,800
Operating Expenses:	
Ames, IA	35,000
Athens, GA	377,200
Auburn, AL	15,000

National Agricultural Library	265,500

Use of Funds	*Funds*
Headquarters	1,082,500
Total Operating Expenses	3,691,300
Total Fiscal Year 1998 Use of Salary Lapse	[1]11,618,200

[1] This represents 60 percent of the total lapse salary accrual which was managed from ARS Headquarters. The 40 percent balance of the accrued lapsed salaries were retained and used by local managers to directly support research programs and operating needs. The primary uses of these funds were for research equipment, employee relocations, facilities repair and maintenance, safety and health improvements, and unanticipated operating needs.

AQUACULTURE

Question. Aquaculture continues to be one of the fastest-growing sectors of U.S. agriculture. What level of funding is included in the fiscal year 2000 request for research to support this growth industry? How does this compare with the fiscal year 1997, 1998, and 1999 levels?

Answer. The funding levels are provided for the record.

Fiscal year 1997 funds	$10,184,800
Fiscal year 1998 funds	11,686,400
Fiscal year 1999 funds	17,330,300
Fiscal year 2000 funds	14,071,000

Question. Please list those locations involved in aquaculture research, their specific programs and mission, and current funding and staffing levels. Please list future funding and staffing requirements, by location.

Answer. The fiscal year 1999 aquaculture research funding, programs and mission, and staffing levels, by location, as well as future funding and staffing requirements, are as follows:

Location	Program and mission	Fiscal year 1999 funds	Fiscal year 1999 scientists	Total funds required	Total scientists required
Auburn, AL	Diagnosis and control of diseases and parasites of cultured fish	$1,913,700	7.0	$1,913,700	7.0
Pine Bluff, AR	Aquaculture production and processing technology	531,400	2.0	531,400	2.0
Stuttgart, AR	Research on therapeutics evaluation and culture systems for farm-raised fish.	2,448,600	9.0	3,590,000	11.0
Albany, CA (Fairbanks, AK worksite)	Processing technology to convert fishery byproducts into feed	1,086,800	1.0	1,086,800	1.0
Albany, CA (Hilo, HI) Oceanic Institute	Tropical aquaculture feeds and culture technology development	1,583,800	.....	1,583,800	.....
Aberdeen, ID	Development of alternative, grain-based diets for aquaculture species using genetic enhancement of grains and aquaculture species.	123,500	1.0	373,500	2.0
New Orleans, LA	Improve flavor quality of farm-raised catfish	745,900	2.4	1,005,100	3.4
Beltsville, MD	Detection Methods for Cryptosporidium	29,600	.....	29,600	.....
Beltsville, MD (NAL)	Aquaculture Information Program provides the public with information on all aspects of aquaculture.	34,000	.....	250,000	.....
Oxford, MS	Catfish off-flavors	277,800	1.0	277,800	1.0
Stoneville, MS	Improve production efficiency, including breeding, genetics, nutrition, health, harvesting, and product quality of catfish.	4,681,900	8.0	5,298,600	8.0
Wyndmoor, PA (Dover, DE, Worksite)	Food safety of farm-raised shellfish	541,900	2.0	541,900	2.0
College Station, TX	Food safety of catfish	358,800	.....	358,800	.....
Kearneysville, WV	Water Quality control and intensive culture of fish	1,737,600	1.4	1,737,600	1.4
Leetown, WV	Cool and cold water aquaculture research	1,235,000	4.0	4,000,000	12.0
Total	.....	17,330,300	38.8	22,578,600	50.8

The fiscal year 2000 budget includes a proposed increase of $180,000 at Stoneville, MS for research related to harmful algal blooms, eutrophication, and hypoxia. In addition, reductions totaling $3,439,300 are proposed at Auburn, AL; Stuttgart, AR; Albany, CA (Hilo, HI); Aberdeen, ID; Stoneville, MS; and Leetown, WV.

LOWER MISSISSIPPI DELTA NUTRITION INTERVENTION RESEARCH INITIATIVE

Question. Please provide the Committee with an update on the status of the Lower Mississippi Delta Nutrition Intervention Research Initiative.

Answer. The Lower Mississippi Delta Nutrition Intervention Research Initiative (NIRI) is conducted by a consortium of seven partners: Alcorn State University, Arkansas Children's Hospital Research Institute, Pennington Biomedical Research Center, Southern University and A&M College, University of Arkansas at Pine Bluff, University of Southern Mississippi, ARS, and a Coordinating Center at Westat. Each partner participates in attaining the objectives of the Initiative by representation of the Steering and Research Committees. Research proposals and protocols are developed by the Research Committee utilizing expertise from each of the partners in specific Working Groups.

Question. What progress has been made to date?

Answer. The Delta NIRI Consortium has completed two major research projects: the Key Informant Survey (to determine the perceptions of community leaders in 36 counties in AR, LA, and MS relative to food, nutrition and health related problems and interventions) and the Foods of Our Delta Study (FOODS). The latter was a validation and pilot study conducted in three counties, one each in AR, LA, and MS. The validation study was to determine if the telephone methodology could be used for collection of food and nutrition survey data. The consortium has published in the Scientific literature and published a monograph, Nutrition and Health Status in the Lower Mississippi Delta of Arkansas, Louisiana, and Mississippi: A Review of Existing Data. Capacity has been built in each partner through the employment of additional scientists and workshops on statistical sampling, nutritional epidemiology, intervention strategies, and evaluation of nutritional status.

Question. What activities are planned for each of fiscal years 1999 and 2000?

Answer. In fiscal year 1999, the partners propose: the first phase of a comprehensive nutritional assessment survey (collection of dietary, food security, and health perceptions data) will be completed in the thirty-six counties in AR, LA, and MS delta area; planning for the second phase of the survey which will include biochemical, anthropometric, and dietary data, and partner institutions will complete and begin to implement their strategic plans for continuing the research activities of the Initiative. Extensive field surveys will be based on the results of preliminary assessments in 1998. The partnership will focus on data collection and analysis. Extensive collaborative field work will be required. Post fiscal year 1999, research will depend on prior outcomes but will include initial planning, implementation, and validation of targeted nutritional interventions. In fiscal year 2000 the data collection of the above studies will be completed and data analyses will be completed. Protocols for the assessment of community food security will be piloted; protocols for nutrition interventions will be finalized; additional research will be planned based on results of data analyses, especially in the area of food security. Individual partners will assume responsibility for specific research proposals of the initiative (for example: through the development of telephone survey centers, dietary data analyses, overall data analysis, and community outreach).

Question. What is the current level of funding for this initiative and what is the fiscal year 2000 request?

Answer. A total of $3,147,700 is the current level of funding for the Lower Mississippi Delta Nutrition Intervention Project. A total of $3,147,700 is budgeted for fiscal year 2000.

Question. Will fiscal year 2000 funding continue to be split equally among the seven partners of the consortium conducting this initiative?

Answer. The funding of $3,147,700 for fiscal year 2000 will continue to be shared equally among the seven partners.

GINNING RESEARCH

Question. Please provide the level of resources available in each of fiscal years 1998 and 1999, and included in the fiscal year 2000 request for the ginning labs at Mesilla Park, NM; Stoneville, MS; and Lubbock, TX.

Answer. Resources for each of fiscal years 1998, 1999, and 2000 for ginning research is provided for the record.

[The information follows:]

Location	Fiscal year 1998 Estimated	Fiscal year 1999 Estimated	Fiscal year 2000 Estimated
Stoneville, MS	$1,190,900	$1,423,400	$1,423,400
Las Cruces, NM	1,062,800	1,049,900	1,049,900
Lubbock, TX	1,262,000	1,246,700	752,700
Total	3,515,700	3,720,000	3,226,000

Question. Please describe the importance of the work being carried out by ARS at each of these locations and whether there are presently any unfunded facility or program requirements.

Answer. Cotton ginning remains an important area for improving the efficiency and profitability of the industry. The process of separating fiber from seed, removing trash, and drying often degrades the quality of the lint, making it less valuable and reducing the return to producers. With cotton prices very low, the cotton industry has called for research to improve profitability by 10 cents per pound of lint produced. Much of this shortfall can be captured by improved ginning efficiency, which both decreases costs and improves the quality and the price of the product.

Some recent important advances from these ARS laboratories include computerized process control for improved lint quality and better profitability; technology for reduced dust emissions from gins to improve air quality; online moisture sensors and control systems for improved drying efficiency, energy conservation, and decreased lint damage; seed coatings that reduce the need for delinting with dangerous acids; technology that reduces seed coat fragmentation and nep (fiber entanglements) formation during ginning; and combined drying and ginning operations to improve efficiency.

Equipment at all three laboratories is aging and some of it is outdated, with an estimated cost of up to $500,000 per laboratory for upgrading. Facility repair and upgrading is required to support ongoing research as well as to allow transition to new program initiatives. New program needs not currently being addressed include improved harvesting and processing equipment for ultra narrow- row production; technology to reduce use of defoliants and other harvest aid chemicals; value-added products from gin waste; and integration of gin management with production management and with the changing needs of the textile industry. At Lubbock, ARS has a good cooperative relationship with Texas Tech University and is in a position to develop the linkage to textile manufacturing, in part through collaboration with the University's International Textile Center, and with collaborative contributions from the other ginning laboratories and ARS laboratories in New Orleans and Clemson, and in partnership with State institutions.

Question. What are the unique capabilities of each of these labs and how does ARS ensure there is no duplication of effort among them?

Answer. The ginning laboratories are a unique resource in the United States, with no other facilities serving a similar purpose. The three laboratories have complementary roles. They are located in different cotton-producing regions of the U.S., each with greatly different cotton production systems and therefore with differing cotton processing and ginning needs. In part, the mission of each laboratory is to address problems of cotton harvesting, processing, and ginning that are specific to its region. These functions are, by their very nature, not duplicative. In Stoneville, ginning research addresses the needs of upland cotton producers in a humid production zone. In Lubbock, the research is focused on harvesting and ginning needs of short-season stripper-harvested cotton. The laboratory in Mesilla Park concentrates on high-quality long and extra-long staple cottons produced in the Irrigated West, which require different equipment and methods to preserve the inherent quality.

ARS provides national oversight and management of research through its National Program Staff, which determines priorities through interactions with customers and stakeholders; allocates funding to different research objectives consistent with the intent of the Congress and the needs of ARS customers; and coordinates activities among laboratories. Much of this management occurs through 23 recently established National Programs. The three ginning laboratories all participate in the same National Program (New Uses, Quality, and Marketability of Plant Products), which provides a venue for the scientific staff to plan, carry out, and report cooperative, coordinated, research. Because of this coordination, the existence of three different labs with complementary activities actually strengthens cotton ginning re-

search, because it serves customers in all regions without wasteful duplication and without gaps.

Question. The National Cotton Council has asked the Committee to instruct the ARS not to reprogram fiscal year 1998 funds provided to the Lubbock lab. Is the Administration contemplating such a reprogramming request? Are there any unused fiscal year 1998 funds available?

Answer. The fiscal year 2000 budget request includes the reduction of $494,000 appropriated for the Lubbock ginning laboratory. The funds, which were first added by Congress in 1998, are proposed to be redirected into areas of highest national priority, such as food safety, emerging and exotic diseases and pests, agricultural plant genomes, impact of FQPA implementation, and sustainable ecosystems. A total of $35 million in proposed reductions and terminations are being used to finance these proposed, high priority increase. Prior to the proposed redirection, the funds were used to hire two engineers who have already joined the staff of the laboratory in Lubbock. There are no unused fiscal year 1998 funds available, but ARS is committed to providing alternative employment opportunities to its scientific staff displaced by redirection of funds.

AFLATOXIN

Question. The Committee is aware of extensive problems which occurred during 1998 in southern corn production. In particular, aflatoxin in corn has adversely impacted the prices received by farmers and the markets for southern corn production. What steps are being taken to enhance and expand research to address this problem? Is there adequate focus being placed on this problem, especially in view of the fact that current farm policy has resulted in the rapid growth of southern corn production?

Answer. The ARS has taken steps to enhance and expand research to address the aflatoxin problem in southern corn. The Southern Regional Research Center (SRRC) of the ARS sponsored an "ARS Workshop on Aflatoxin Prevention in Southern Corn", January 27, 1999 in New Orleans, LA. There were 67 attendees comprising ARS and university aflatoxin researchers, corn growers and corn industry representatives with an intense interest in research aimed at eliminating aflatoxin. The workshop provided a forum by which corn industry representatives could discuss the conditions under which contamination occurred in 1998, and the state-of-the-art technology being developed by researchers to control aflatoxin contamination.

The workshop developed a plan to further focus and enhance resources aimed at the elimination of aflatoxin in corn before harvest using the extensive input from researchers and workshop participants. The goals of the plan are to:

Identify additional sources of resistant corn germplasm. Use marker assisted breeding to combine resistance traits for prevention of fungal infection, aflatoxin contamination, and insect injury in corn;

Elucidate the effects of drought on biochemistry, physiology, aflatoxin accumulation and fungal pathology in kernels of resistant corn genotypes;

Transform corn with "up-regulated' versions of disease and/or drought resistant genes;

Continue investigation on cultural practices and crop management techniques that may minimize aflatoxin contamination before harvest; and

Develop a toxigenic *A. flavus* technology for aflatoxin control on corn grown in the southern U.S. (Research experience has demonstrated that this technology is effective in preventing aflatoxin in cotton grown in Arizona.)

ARS has extensive resources devoted to solving the southern corn aflatoxin problem at several locations throughout the southern U.S., including Mississippi State, MS; New Orleans, LA; and Tifton, GA. Because of their research we have made significant advances in understanding how aflatoxin is produced and potential effective strategies for reduction. These research advances are as follows:

Delineated the effects of cultural practices and pest management on the accumulation of aflatoxins in corn.—ARS research has elucidated both the "life cycle" of A. flavus, the preharvest process by which aflatoxin contamination occurs, and the effects of cultural conditions and insects pests on aflatoxin contamination. Several factors can be manipulated which can affect the level of aflatoxin contamination—the corn hybrid utilized and its adaptability to the geographic region, choice of fields, soil fertility, planting and harvest dates, planting density, irrigation, harvest methodology, tillage and crop rotation and management of insect pests (for example, with the advent of new Bt transformed lines of corn resistant to insects). Generally, optimization of cultural and management practices in the particular growing region to produce healthy corn partially alleviates (or at least does not exacerbate) aflatoxin contamination.

Genetic and Biochemical Resistance Factors Identified in Corn.—ARS research has produced four germplasm releases (one release occurring in 1999) with useful levels of aflatoxin resistance, thus showing substantial progress in developing a genetic based resistance. Markers which could be useful in marker assisted breeding and/or genetic engineering of corn have been putatively identified in corn. Selection for these genetic and biochemical factors/traits could further help increase resistance in certain corn varieties to A. flavus, aflatoxin and insect attack (which can predispose corn to fungal infection).

Several putative resistance factors were characterized at the protein level and shown to comprise fungitoxic proteins, enzymes, enzyme inhibitors and peptides. Also identified were kernel pericarp properties (wax thickness and antifungal properties) in a resistant corn genotype that may either prevent the physical entry of A. flavus into kernel tissues or kill the fungus directly. Corn genotypes will be selected to maintain production of these resistance compounds even under suboptimal conditions for kernel health and development (such as drought stress or insect injury).

Identification and Successful Deployment of a Biocontrol Agent in Large Scale Cotton Field Trials.—A biological control formulation was invented by ARS scientists for use in aflatoxin prevention in cottonseed grown in the Yuma Valley, Arizona. The formulation is made from non-toxic strains of A. flavus previously discovered in Arizona cotton fields. When applied to cotton fields in large scale trials, the formulation reduced aflatoxin below the FDA mandated level of 20 ppb in cottonseed. In parallel work by ARS scientists, non-toxic strains of A. flavus/parasiticus were used in biocontrol of aflatoxin in peanut. This technology may also be effective for large area control of aflatoxin in corn grown in the southern US, however EPA approval is needed for each individual type of application.

Genetic Engineering of Plants with Resistance Genes Encoding Proteins Inhibitory to A. flavus.—Using genetic engineering resistance genes from corn and other sources, encoding antifungal proteins (effective against A. flavus) have been moved into tobacco plants and cotton callus where they showed high in vitro expression of antifungal activities. With the development of new efficient corn transformation protocols and identification of potent antifungal genes, the potential for genetically engineering corn for resistance to A. flavus becomes very feasible.

Molecular Basis for Aflatoxin Biosynthesis Elucidated.—A cluster of genes was found which encodes enzymes catalyzing aflatoxin formation in Aspergillus flavus and A. parasiticus. Previously, a "master switch" gene was discovered which could be targeted essentially to switch off aflatoxin production. Reporter genes consisting of portions of aflatoxin gene regulatory DNA or growth related genes linked to the GUS reporter gene were engineered into A. flavus. These reporter genes could help identify plant factors affecting levels of aflatoxin, which in turn could be used as selectable markers in breeding for resistance.

Question. The Department recently announced that ARS researchers have created a new corn line which is highly resistant to aflatoxin and could be an important step toward the long-term goal of commercial hybrids with strong aflatoxin resistance. Would you please tell us more about this major research advancement.

Answer. Agricultural Research Service (ARS) scientists at Mississippi State, Mississippi, have recently developed and released corn germplasm which is highly resistant to Aspergillus flavus, the fungus that infects grain and produces the toxic substance, aflatoxin.

Because corn hybrid seeds are all developed and marketed by the private sector, incorporating the A. flavus resistance into commercially available hybrids requires that ARS transfer the technology to hybrid seed corn companies. To do so, Cooperative Research and Development Agreements (CRADAs) have been established with two such companies.

Question. What is the current level of funding and staffing levels for aflatoxin research and at which ARS locations is this work conducted?

Answer. The current level of funding and staffing levels for aflatoxin research, including ARS locations at which this work is conducted are as follows:

[Fiscal Year 1999]

Location	Funds	Scientists
Albany, CA	$1,788,900	6.7
Dawson, GA	745,600	2.9
Tifton, GA	544,200	1.5
Peoria, IL	827,300	2.9
New Orleans, LA	2,832,700	10.9

[Fiscal Year 1999]

Location	Funds	Scientists
Miss. State, MS	669,100	2.8
Headquarters	861,200	0.0
Total	8,269,000	27.7

Question. What additional funds are required for aflatoxin research to expand projects implementing the biocontrol management technology and increasing funds for grants to translate our best knowledge into practical systems to help farmers?

Answer. The fiscal year 2000 budget does not request additional funds for aflatoxin research. ARS continues to meet with stakeholders and customers to ascertain their important research needs, including implementing biocontrol management technology and increasing the translation of our best research knowledge into practical systems to help farmers. The additional priorities for aflatoxin research will be met by redirection, or by future agency budget requests.

COTTON NEMATODE

Question. The Committee is concerned that cotton yields have been stagnant and even declined in some cases over the past decade in the Midsouth area. Among other problems affecting this situation, I understand that scientists at the Midsouth Research Center have detected a contributing factor to be the growing problem of cotton nematodes. In view of the rising cost of production for cotton farmers and the statistical plateau in Midsouth cotton yields, what is USDA doing to aggressively seek solutions to problems such as the cotton nematode. Are research needs being met to provide an adequate level of scientific support for solving cotton nematode problems?

Answer. The origins of the cotton "yield plateau" are complex, with a major source being the narrow genetic base of commercial cotton varieties. In the Mississippi Delta region and in some other areas, there is also a growing problem with nematodes. These pests are forcing many growers to look for the first time to rotation crops that are non-hosts for nematodes. Corn and rice have proved to be good rotation crops for soybeans and cotton in the Mississippi Delta.

ARS maintains a strong national research program that is focused on controlling or managing nematodes with environmentally friendly methods. In Beltsville, MD, ARS studies the fundamental biology of these pests and uses that information to develop new avenues to disrupt their life cycles and protect crops. Elsewhere, ARS research is targeted specifically at nematodes that affect specific crops. Cotton nematode work is carried out at College Station, TX (improved management, biological control, and host plant resistance); Stoneville, MS (cotton production systems that minimize pest damage from nematodes); and Mississippi State, MS (identification of new genes for nematode resistance, and using them to breed resistant cotton germplasm). ARS research has resulted in the development and release of nematode-resistant germplasm for use in breeding programs, including a variety which has been widely used in the Lower Rio Grande Valley of Texas.

The current ARS program has effectively targeted the most feasible ways to bring cotton nematodes under control. Promising approaches include genetic host plant resistance and biological control using fungi. Additional funding would allow a broader approach to nematodes and could intensify the ARS effort in selected areas where the pest pressure is increasing, such as the Mississippi Delta.

BASE FUNDING FOR COTTON NEMATODES

	Fiscal year 1998	Fiscal year 1999
College Station	$370,700	$370,700
Stoneville	45,100	45,100
Mississippi State	610,100	610,100
Total	1,025,900	1,025,900

RED IMPORTED FIRE ANT

Question. Where is the site of ancestral origin for the red imported fire ant, and how did it enter the United States?

Answer. Red imported fire ants originated from the Paraguay river drainage basin in Argentina, Paraguay and Brazil. The mode of entry into Mobile, Alabama, in the mid 1930s is unknown but probably was the result of contaminated ship ballast or agricultural products associated with soil arriving from Argentina or Brazil.

Question. What is the present and projected geographic range of the red imported fire ant in the United States?

Answer. Presently, this pest is distributed in about 310 million acres in Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Tennessee, Mississippi, Louisiana, Arkansas, Texas, Oklahoma and Puerto Rico. Recently it has been detected in limited areas of New Mexico, Arizona, California, but appears to be established in all but Arizona. Projected distributions, based on temperature limits, would allow expansion into the tidewater area of Virginia, the eastern shore of Maryland, and most or all of Oklahoma, Arkansas, Tennessee and North Carolina. Conditions also are favorable in the irrigated urban and agricultural regions of the western states including most of California (80 percent), and sections of Arizona (70 percent), Nevada (10 percent) and New Mexico (30 percent). Coastal regions in particular are vulnerable throughout California, in Oregon, and possibly Washington.

Question. What is unique about the red imported fire ant that allows it to be an urban, agricultural, wildlife, and industrial pest?

Answer. The red imported fire ant is virtually ubiquitous in the southeast and is characterized typically by 75–100 colonies (mounds) per acre with each colony containing half a million stinging ants. Thus, there can be 40–50 million imported fire ants per acre. The imported fire ants out-compete and replace native ants (including native fire ants) which reach about 1000 in number per colony and 1–2 million per acre. Fire ants are far more aggressive than the native ants and readily sting animals and humans when disturbed. Unlike native ants which move away from the disturbed areas, the red imported fire ants explore and thrive in disturbed habitats caused by human activities that include agricultural operations, urbanization, transportation infrastructures (roads, sidewalks, airports) and utilities. They produce hundreds of thousands of winged queens per acre that may disperse several miles and establish new colonies that mature within months, and release additional winged queens. In comparison, native ants produce up to 1,000 queens and do not spread as well. The red imported fire ant is inadvertently moved in agricultural and horticultural products in soils, and easily becomes established at final destinations.

Question. What is the economic impact of the red imported fire ant to the nation?

Answer. Nationally, imported fire ants are estimated to cause 0.5 billion to several billion dollars in damage every year. Exact figures are difficult to determine because economic impact is so diverse and widespread. Losses are incurred in agriculture, human health, damage to infrastructure, damage to wildlife and farm animals, and in the costs to manage this pest. This excludes the pain and aggravation associated with fire ant stings, or the environmental damages to biodiversity and the ecosystem. Fire ants kill newly hatched offsprings and reduce the populations of several wildlife species, including bob white quail, other ground-nesting birds, and others with few defenses, such as tortoises, tree snails, marsh hares, amphibians, and reptiles.

Question. What is the economic impact of the red imported fire ant to Mississippi?

Answer. The economic impact of the red imported fire ants to Mississippi is, according to the Mississippi Department of Agriculture, somewhere between 75 million and 200 million dollars per year.

Question. Describe the damage caused by the red imported fire ant in urban areas by stinging; in agricultural areas where livestock are attacked, plants damaged, and crop care and harvest interfered with; in wildlife areas where other invertebrates and ants are displaced and recreational activities interfered with; and in industrial areas where the ant causes malfunctions by tunneling and nesting near electrical conduits and communication systems.

Answer. The red imported fire ants are a major medical concern to approximately 0.5 million people who are severely allergic to even a single fire ant sting (1 percent of the population), and to millions of young children who are repeatedly stung by hundreds of fire ants when they accidentally step onto the mounds. People who are allergic or very sensitive to fire ant stings often need to limit outdoor activities because fire ants are found virtually everywhere except in dense forests.

Fire ants cause a wide variety of agricultural problems. They lower soybean harvests by 10–30 percent by killing seedlings, and from the need to raise the Combine cutting bar to avoid mounds. They frequently girdle and kill young citrus trees.

They attack and kill corn and sorghum seedlings. They can damage a wide variety of vegetables from okra and potatoes to watermelon and strawberries. They inhibit harvesting of many nuts, fruits, and vegetables that are picked by hand, or when the crop is shaken to the ground for subsequent collection. Their mounds mechanically jam or damage harvesting equipment. Fire ants also injure or kill young livestock and poultry. Foraging activity of fire ants commonly short circuits outdoor electrical equipment such as air conditioners, power transformers, and telephone boxes. Their tunneling and mounding activities loosen or removes soil from beneath roadways, causing these to collapse under weight of vehicles.

Fire ants are also a major environmental concern because they substantially reduce the biodiversity of native ants and other ground-dwelling arthropods. They also reduce populations of many native vertebrates such as quail, lizards, water birds, mice, and even deer. A number of rare and endangered animals such as gopher tortoises, sea turtles, alligators, butterflies, tree snails, grasshopper sparrows, and the least tern may also be negatively affected by fire ants.

Question. Why have U.S. federal, state, and private sector researchers failed in their efforts to develop technologies for stopping the spread of the red imported fire ant?

Answer. ARS was instrumental in the development of a chemical, mirex which provided 99 percent control level. In the early 1960s, large-area eradication tests with toxic baits (mirex) were conducted in several states, including northeastern Mississippi (256,000 acres), Tampa, Florida (626,000 acres), and Savannah, Georgia (2.13 million acres). Although mirex was very effective in controlling fire ants (99 percent control), it subsequently was removed from the market, because of the environmental and economic concerns. Consequently, in the late 1960s these field tests with mirex were terminated. Alternative materials that replaced mirex were less environmentally damaging, but not as effective in area-wide control, and provided only temporary relief.

To develop new and improved fire ant control technologies, the ARS laboratory in Gainesville, Florida focused on developing poison baits for controlling fire ants in small but high public-usage and livestock production areas, such as yards, parks, schools, hospitals, and feedlots. These newer bait materials, such as AMDRO and LOGIC are very effective, but give only temporary control in such areas that ultimately become reinfected. Consequently, since 1995, ARS has focused its research on the development and evaluation of an integrated long-term methods, including the release of classical biocontrol agents that have the potential of permanently reducing fire ant populations over large portions of their range. The goal is to help slow or stop the expansion of imported fire ants into uninfested areas. Small-scale field test releases have been initiated in 1998 in one-quarter acre plots in several states. Given the necessary resources, ARS plans to conduct research on mass propagation of selected biocontrol agents, and conduct large-area field evaluation and demonstration tests.

Currently, additional technologies may be needed to halt the expansion of fire ant populations. The biology of this pest is such that natural spread is difficult to prevent without a concerted, coordinated large-scale application of multiple control measures. Because it is so widespread environmentally (not limited to specific crops or plant types), and exists underground (largely unexposed), it is neither environmentally nor economically feasible to use toxic pesticides.

Question. What plans does ARS have for research to: (1) stop the spread of the red imported fire ant; (2) suppress it in infested areas; and (3) eradicate the fire ant at the local level, statewide (including in Mississippi), and nationwide?

Answer. The ARS laboratory in Gainesville, Florida has ongoing cooperative projects with states to evaluate its biologically-based approach, including: (1) cooperative projects between ARS and APHIS to stop the spread of fire ants through nursery stock. A new attractant has been developed and patented to assist in rapid assessment of infested material while still in nursery facilities; (2) current ARS research on suppression in infested areas is focused on the development and field evaluation of an integrated long-term approach. This approach relies on the use of biologically-based technologies to reduce overall population levels, combined with blanket applications of emerging bait formulations that are followed by precision-targeted treatments of high risk local areas (schools, health care facilities, parks, tourism, and recreation) with emerging bait technologies; and (3) two of the three biological control agents developed by the ARS laboratory in Gainesville, Florida are being evaluated in several pilot tests. In this effort, ARS is partnering with the National Fire Ant Task Force of the Southern Legislative Conference (SLC) of the Council of State Governments to develop proposals for pilot tests in several states. For example, ARS is proactively involved in developing a cooperative research project with the Mississippi State University and APHIS (Gulfport) to test inte-

grated control measures for a 300-acre health care facility in Mississippi. In addition, ARS is conducting cooperative projects with APHIS at field sites near Gulfport, and with the Mississippi National Guard/Nature Conservancy on managing fire ants at Camp Shelby. That effort is specifically addressing the issue of fire ant impact on gopher tortoises. Other pilot test sites in partnership with SLC include, Arkansas, Oklahoma, Texas, Virginia and Tennessee have been selected. However, current constraints in state and federal resources preclude large-scale field evaluation and implementation of the integrated approach.

Question. Which ARS locations have been directed to conduct research on the red imported fire ant and in each case what is the level of effort in terms of dollars and scientists? Is there any research on the fire ant being conducted in Mississippi?

Answer. ARS research on imported fire ants is conducted at the Center for Medical, Agricultural, and Veterinary Entomology in Gainesville, Florida ($1,311,800/5.9 SYs), with cooperative projects at the South America Biocontrol Laboratory at Hurlingham, Argentina ($101,400/.2 SYs). ARS research in Mississippi consists of cooperative projects with APHIS at field sites near Gulfport, and in a cooperative project with the Mississippi National Guard/Nature Conservancy on managing fire ants at Camp Shelby. That effort is specifically addressing the issue of fire ant impact on gopher tortoises.

Question. What is the level of Federal funding currently obligated by ARS, CSREES, and APHIS for research, education, and regulatory activities? How much funding is contributed by State and private organizations?

Answer. The level of Federal funding currently obligated for research, education, and regulatory activities for red imported fire ants is $1,413,200 for ARS; $76,300 for CSREES; and $1,330,000 for APHIS. Funding contributed by State and private organizations includes non-federal funds of $742,000 for CSREES and $1,139,959 for APHIS. ARS receives no funding from State and private organizations for red imported fire ant research.

NATIONAL PLANT GERMPLASM SYSTEM (NPGS)

Question. Are there materials in the National Plant Germplasm System (NPGS) that are at risk for loss and that will remain at risk under the Administration's budget request?

Answer. Duplicate germplasm samples and duplicate copies of databases maintained in at least two physically-separate locations represent perhaps the most effective safeguards against the risk of catastrophic loss from weather- related causes, other natural phenomena, equipment failure, and human activity, be it intentional or unintentional.

The Germplasm Resources Information Network (GRIN) in Beltsville, MD, which maintains key data associated with NPGS germplasm, is duplicated by mirroring, i.e., there are two copies of the database on disk. One weekly duplicate copy of the database is maintained off-site locally on tape and one duplicate is sent monthly to National Seed Storage Laboratory, (NSSL) Ft. Collins, CO. The Administration's budget requests an increase of $600,000 for additional data safeguards, such as incorporating into GRIN evaluation and characterization data that are still on local databases, and continual hardware and software upgrades to help safeguard database integrity.

At present, ca. 104,000 (ca. 26 percent of total) seed samples and 32,000 (ca. 85 percent of total) clonally-propagated samples in the NPGS are not duplicated, and consequently are at a higher risk of catastrophic loss than are the duplicated samples. Some of the samples that are not duplicated within the NPGS are duplicated in other nations or at International Agricultural Research Centers (IARCs). But, with fiscal shortfalls at other institutions, the NPGS cannot assume that duplicates of "lost" germplasm can be readily obtained elsewhere. As the preceding data indicate, the risk is greatest for clonally-propagated germplasm. With many clonal crops, long-term "backup" methods (e.g., cryopreservation) do not exist; more funds are needed for NPGS researchers to develop this technology.

Germplasm may also be at risk from slower, more insidious processes such as gradual loss of viability, loss of genetic integrity, infectious disease, etc., that deteriorate the quality of germplasm and associated data. The following list illustrates some NPGS germplasm potentially at risk:

(1) Griffin, GA: At least 20 percent (17,000 + accessions) of the seed samples at Griffin are greater than 20 years old, or are original seed lots with few seeds. With the few funds available for operations (ca. 6 percent of total fiscal year 1999 location budget), relatively few accessions can be regenerated at present.

(2) Ithaca, NY (Geneva, NY worksite): About 30 percent (ca. 4,000 accessions) of the seed-propagated germplasm accessions are at risk because of low or unknown

viability, or low seed numbers. With the few funds available for operations (ca. 10 percent of total fiscal year 1999 location budget), relatively few accessions can be regenerated at present.

(3) Mayaguez, PR: Without additional funds for clonal propagation and virus eradication, 30 percent of the plantain and banana clones at this site may die of virus infection.

(4) Ft. Collins, CO: More than 20 percent of the duplicate seed accessions in long-term storage at NSSL have not been tested recently for their viability, and consequently may be at risk. No funds are available to hire more technical staff to conduct germination tests.

(5) College Station, TX (Brownwood, TX worksite): Approximately 60 percent of the pecan accessions there are represented by only one tree, and none of the accessions are backed-up at another site. No funds are currently available to improve this situation.

(6) Ames, IA: Approximately 4,500 seed-propagated accessions with low seed number, and low germination percentages (9.5 percent of the total) are at risk because there are no funds to regenerate them. Funds are also unavailable to conduct applied research to regenerate and monitor seeds of species for which standard management protocols have never been developed.

(7) Corvallis, OR: Under the Administration's fiscal year 2000 budget request, $27,400 of the base funding for the Corvallis genebank will be eliminated. Those funds support the hop (a key ingredient for brewing) germplasm maintenance, regeneration, and viral eradication program. If the preceding funds are not reinstated, this site will be unable to maintain and distribute the collection in pathogen-negative (virus, fungus, and bacteria-free) status.

Question. With current resources, is the agency able to manage the materials that are in the quarantine centers in a manner that successfully fulfills the demands of the users? Have materials died in quarantine centers? Are the materials made available to the requesters in a timely manner?

Answer. In general, the Plant Germplasm Quarantine Office/National Plant Germplasm Quarantine Center (PGQO) in Beltsville, MD can manage the plant germplasm in quarantine successfully, provided the amount of germplasm in the PGQO does not exceed current capacity, which is determined primarily by the funding available for personnel, operations, and facilities. To ensure that its capacity is not exceeded by demand, the PGQO is establishing annual quotas for each type of germplasm. These will be communicated to germplasm users in May 1999 and put into effect for fiscal year 2000. The quotas will vary somewhat over years based on factors such as the germplasm in the quarantine testing "pipeline" at the beginning of the year, changes in testing protocols, and changes in program goals.

No significant germplasm losses have occurred in the potato, sweet potato, rice, or sugarcane held by the PGQO. In the past, fruit tree accessions in the PGQO orchards were lost because of inadequate care, and insufficient attention to matching the work load with the resources available to tend to this germplasm. These problems were addressed and loss has been minimal during the last three years of orchard testing. Some replicates of accessions have been lost to herbicide injury but, in these cases, a sufficient amount of backup material was available to repeat the tests as necessary. Occasionally, replicate samples of blackberry, raspberry, or currant perish from winter damage in the screenhouses. But, these samples are "backed up" so the accession is not lost, but its release from quarantine is delayed because the tests must be repeated. Losses from winter kill have been minor during the past two years because of mild weather, and improved horticultural care.

The stone fruit (cherry, peach) quarantine program is conducted entirely in greenhouses and screenhouses, where germplasm loss is relatively rare, but does occur occasionally because of several factors that are not unique to PGQO: (1) the inherent difficulty of maintaining trees in pots for years; (2) cherry and peach accessions received by PGQO as budwood are often difficult to propagate, especially after days in international transit, and may die before they are established.

Germplasm is made available ("released") from quarantine as rapidly as quarantine regulations and/or "pathogen clean up" permit. The only crop with a backlog of accessions awaiting quarantine testing is rice, with a 4,000 accession backlog:

(1) Pome fruits (apples, pears, quince) are now released "provisionally" within one year if the first round of testing is negative and if the propagative material is available. Under the "provisional release policy," germplasm users can propagate and evaluate the germplasm prior to its final release from quarantine. This policy has been very popular with germplasm users, and is feasible because of the polymerase chain reaction (PCR) test for phytoplasmas. Final release still requires at least 3–5 years because test trees must produce fruit for evaluation of symptoms: there is no technological substitute for the fruit evaluation.

(2) Stone fruits (cherry, peach) are also provisionally released after one year, but full release requires at least 3–5 years for germplasm imported as budwood. But germplasm imported as seed can be released sooner (12–18 months) because less testing is required.

(3) Sugarcane imported from other nations requires 18–24 months in quarantine, whereas sugarcane shipped interstate (e.g. Louisiana to Florida) requires 12–18 months. Current molecular technology will probably not accelerate the release time, although the former may improve the accuracy of test results.

(4) Rice cannot be released from quarantine until it sets seed, which can require 100 to 240 days, depending on the specific germplasm. Notably, quarantine testing could be conducted entirely from in vitro tissue culture and germplasm released in 30 days but, because it would be distributed in the form of tissue-cultured plantlets, rather than true seed, the user community has not been interested in this method.

(5) The quarantine process for potatoes and sweet potatoes requires 18–24 months; tests require one year and are repeated. The testing required for true potato seed is substantially less than for potato tubers.

(6) The quarantine process for currants and gooseberries requires 3–5 years, necessitated by waiting for plants to fruit so they can be evaluated for the reversion virus. There is a PCR-based test for the reversion virus but APHIS has not accepted it, although Agriculture Canada has done so. The PCR test could enable provisional release after one year, if the propagative material is available.

(7) The quarantine process for raspberries requires about 3 years.

Question. With current resources, are you able to take advantage of modern molecular techniques to accelerate the rate of quarantine testing for crops such as rice, apples, cherries, sweet potatoes, and others?

Answer. Molecular diagnostic techniques alone may not accelerate the finalrelease of germplasm from quarantine but they may accelerate the provisional release of germplasm, as described above for pome and stone fruits. The tests will detect target pathogens that have been thoroughly characterized genetically, but not other "exotic" pathogens which are often essentially unknown scientifically, except for symptoms on the plant or fruit. Thus, molecular diagnostic tests will not completely replace the time-consuming visual observations of plants currently required by APHIS regulations. Consequently, the speed of the entire quarantine process may be more closely related to principles of scientific risk assessment and/or the field and greenhouse capacity, rather than to modern molecular technology.

Despite the preceding factors, the current resources at the Plant Germplasm Quarantine Office (PGQO) do not enable the staff to take full advantage of molecular diagnostic techniques. Additional resources in the form of a senior technical assistant and additional supplies could hasten the implementation of molecular technology which would facilitate provisional germplasm releases. Additional resources are needed to hire additional technical staff to fully utilize the new greenhouse and screenhouse space at the PGQO, and accelerate the rate whereby germplasm can be released from quarantine.

(1) Pome (apple, pear) and stone fruits (cherry, plum, peach): The PCR-based test for phytoplasmas and molecular hybridization assays for viroids have enabled provisional quarantine release within one year, providing adequate budwood is available. Half-time technical assistance is needed to fully utilize new greenhouse and screenhouse space, implement more fully this molecular testing program, and further accelerate the quarantine process.

(2) Stone fruits: Implementation of a PCR-based test for sharka (plum pox) could supplement to plant graft testing on indicator species, but would require an additional resources for implementation, and half-time technical assistance to fully utilize new greenhouse and screenhouse space.

(3) Sugarcane: Current quarantine testing relies on observations of symptoms on greenhouse-grown plants, which is not ideal for sugarcane. Molecular tests for Fiji virus (Oceania) and sugarcane mosaic gemini virus (Africa) are under development at PGQO. Implementing these tests, which might result in provisional quarantine release, will require additional resources for the PGQO.

(4) Rice: Molecular techniques are not required to accelerate pathogen diagnostic testing with rice, because the key pathogens are readily culturable bacteria. Half-time technical assistance is needed to fully utilize new greenhouse and screenhouse space for the rice quarantine program.

(5) Currants and gooseberries: A PCR-based assay for the reversion virus in these plants should be implemented, but this will require APHIS approval and additional resources for PGQO.

(6) Potatoes and sweet potatoes: A PCR-based test for phytoplama should be implemented to improve the accuracy and reliability of the potato/sweet potato pathogen detection, but would not necessarily accelerate the rate whereby germplasm is

released from quarantine. Half-time technical assistance is needed to fully utilize new greenhouse and screenhouse space and to bolster this molecular testing program.

Question. Have the germplasm materials at the Griffin, GA, and Pullman, WA, facilities been tested for viability?

Answer. 18,781 (28 percent) of the 67,394 germplasm accessions at Pullman, WA have undergone germination testing at Pullman during the 10-year period of 1989–1998. Most of the germination tests (15,481/18,781, or 82 percent of the total tested) were conducted during the last 5 years (1994–1998).

During the last 10 years, 331 (.04 percent) of the more than 78,000 seed-propagated accessions at Griffin, GA have undergone germination testing. There are 1,100 clonally-propagated sweet potato accessions at Griffin that are regularly checked visually for health and vigor.

Duplicate samples of 72 percent of the seed-propagated accessions from Griffin and 85 percent of the accessions from Pullman have been deposited at the National Seed Storage Laboratory, Ft. Collins, CO. The viabilities of many, but not all, of these duplicate samples were tested by NSSL before being deposited in long-term storage and the germination information made available to curators at Griffin and Pullman.

Question. What percentage of the NPGS collection requires timely regeneration to maintain its genetic integrity?

Answer. In our response, we assume that 1) "timely" means "during the next 2–5 years" (consistent with the 1997 GAO study of the NPGS), and 2) "regeneration" is relevant for the 400,000 + seed- propagated NPGS germplasm accessions. Because of the variable quality and quantity of data available, the accuracy and precision of the following percentages vary. Across the NPGS, the median percentage of collections that require regeneration during the next 2–5 years seems to be about 30 percent.

Estimated Percentage Requiring Refeneration During the Next 2–5 Years

Selected NPGS collections	*Percentage*
Tomato genetic stock (Davis)	20–50
Soybean (Urbana)	55
Cotton (College Station)	50–60
Seed-propagated fruits and nuts (Corvallis)	50
Seed propagated accessions at Ames	20
Seed propagated accessions at Griffin	31
Seed propagated accessions at Geneva	30
Small grains (Aberdeen)	10
Seed propagated accessions at Mayaquez	10–50
Seed propagated accessions at Pullman	10–25
National Seed Storage Laboratory (Ft. Collins)	30

Question. With current resources, and at the current rate of regenerating accessions, how long would it take ARS to regenerate those accessions?

Answer. Regeneration rate is determined not only by fiscal resources available for that activity, but also strongly by the biological properties of each crop (breeding system, genetic constitution, growth rate, duration, etc.). Therefore, information for representative individual seed-propagated crops is presented. Because of the variable quality and quantity of data available, the accuracy and precision of the following figures vary. Across the NPGS, the median period required to regenerate these accessions seems to be more or less 10 years. But, importantly, for a substantial proportion of these accessions, especially of wild species (e.g., tomato, potato), research and development will be required to first develop methods for successful regeneration. Selected NPGS collections

Estimated Years Required to Regenerate Accessions

Selected NPGS collections	*Years*
Tomato genetic stock (Davis)	2–5
Soybean (Urbana)	5
Cotton (College Station)	10–15
Seed-propagated fruits and nuts (Corvallis)	(1)
Seed propagated accessions at Ames	10–23
Seed propagated accessions at Griffin	12–15
Seed propagated accessions at Geneva	1–32
Small grains (Aberdeen)	5–10
Seed propagated accessions at Mayaquez	10
Seed propagated accessions at Pullman	7–10

Selected NPGS collections	*Years*
National Seed Storage Laboratory (Ft. Collins)	(2)

[1] No resources are currently available for regenerating those accessions.
[2] Regeneration of base collection is conducted at active sites.

Question. What percentage of NPGS germplasm is not in long-term, back-up storage?

Answer. At present, ca. 104,000 (ca. 26 percent of total) seed samples and 26,000 (ca. 93 percent of total) clonally-propagated samples in the NPGS are not in long-term, backup storage at the National Seed Storage Laboratory, Ft. Collins, CO. Some of the samples that are not duplicated within the NPGS are duplicated in non-NPGS germplasm collections in the U.S., or in collections in other nations, or at International Agricultural Research Centers (IARCs). But, with budgetary cuts at universities, the IARCs and in developing nations, the increasing complications to international germplasm exchange associated with the Convention for Biological Diversity and other international germplasm legislation, the NPGS cannot assume that specific germplasm samples can always be secured on demand from international sources.

Question. If germplasm is lost due to the lack of regeneration, is it always possible to replace it?

Answer. No, it is not always possible to replace germplasm samples that are lost due to lack of regeneration when they are not duplicated within the NPGS, obtainable from other germplasm collections or genebanks within the U. S. or internationally, currently grown by farmers or produced by seed companies or nurseries, or if they are extinct in nature, as is the case with some wild species. Some of the genetic components of the "lost samples" may be conserved in other, genetically closely-related samples. But the degree of genetic redundancy between genetically closely-related samples may be quite variable and unpredictable. Consequently, germplasm managers in general do not assume that genetically closely-related samples necessarily contain precisely the same genetic components of the "lost samples," some of which may be key to current and future genetic improvement of crops.

Question. What percentage of the NPGS budget is spent on maintenance and regeneration?

Answer. Of the total $22.7 million allocated to the NPGS about 65 percent ($15 million) is devoted to germplasm conservation and preservation, which includes the activities of maintenance and regeneration. The remainder of the NPGS budget is allocated to germplasm acquisition, characterization, and agronomic assessment. At specific NPGS sites (e.g., plant introduction stations, crop- specific collections of grains, oilseeds, etc.) that both maintain and regenerate germplasm, the budgetary percentage devoted to maintenance and regeneration is often 75 percent or higher.

Question. If there is not a substantial increase (on the order of $20 million) in the NPGS budget within the next couple of years, what are some of the forecast ramifications?

Answer. The ramifications of a static NPGS budget for fiscal year 2000- fiscal year 2004 can be forecast from both a fiscal and a programmatic standpoint. From a fiscal standpoint, consider the current budget of $22.7 million, and assume the following: 1) inflation reduces purchasing power at a rate of 3.3 percent per year (a ten-year mean of the non-pay/inflation factor used by USDA for planning); and 2) personnel costs increase by 3.2 percent per year (a ten-year mean of the pay factor used by USDA for planning). Given the preceding figures, and a static budget, during fiscal year 2000–2004, the purchasing power of the NPGS budget would decrease by 18 percent from inflation. During the same period, the current percentage (13 percent) of the NPGS budget devoted to non-salary items (equipment, operations, travel) would decrease by 17 percent to 11 percent. Adjusted for inflation, the non-salary budget would effectively be reduced to less than 10 percent of the total NPGS budget. And, at certain NPGS sites, that percentage would be substantially less than 10 percent.

A static budget during fiscal year 2000-fiscal year 2004 would have severe programmatic ramifications throughout the NPGS. Funding at many sites would be insufficient not only for salaries of temporary employees, but also of some permanent curatorial staff. At many sites, no funds would be available for utilities, travel, operations, facility repairs or expansion, supplies, or equipment. Position vacancies would be abolished to provide funds for operations.

With a static budget during fiscal year 2000–2004, the NPGS would by necessity focus nearly exclusively on providing security for databases and for germplasm stored in coldrooms, greenhouses, and field plantings. Acquisition of endangered germplasm would slow or cease, as would evaluation of germplasm for agronomically or horticulturally valuable traits. The rate of duplicating (backing-up)

germplasm and testing it for health, viability, or genetic integrity would slow or cease. Germplasm would move through the quarantine process more slowly, or not at all. Germplasm currently at risk would perhaps be endangered further, whereas additional germplasm might also be endangered. As the funds available for maintaining each accession shrank, the supply of germplasm would shrink, which would limit germplasm distribution, and impede the progress of important research and breeding programs. Should additional funds become available in later years, they would initially be devoted to restoring the NPGS to its state in fiscal year 1999, rather than to progress on new initiatives.

A static budget would preclude the NPGS from exploiting the new tools of genomics and biotechnology to develop more effective and efficient means of maintaining and regenerating germplasm. The ramifications would be especially severe for clonally-propagated crops, many of which cannot now be preserved by long-term tissue culture or cryopreservation.

Lastly, there is currently more public interest in conserving genetic diversity and in exploiting it for crop improvement than at anytime in the past. For example, soybean farmers through the United Soybean Board and state checkoffs have been and still are investing millions to exploit soybean germplasm. Researchers are already finding new genes for improved levels of disease resistance and yield. Genomic technology is identifying loci important for yield, seed composition, disease resistance and other economical important traits in soybean and other crops. The major funding increases for plant genomic research at NSF will generate many new specialized genetic stocks for the NPGS to manage. For example, NSF-funded research will generate at least 50,000 new maize (corn) genetic stocks, which would more than double the size of the NPGS maize stock center. Just when researchers can use germplasm more effectively and efficiently than ever before, just when its clientele is demanding more from the NPGS, and just when the NPGS, if sufficiently funded, could deliver more than ever before to its customers, the NPGS will struggle just to maintain staff, facilities, and germplasm.

BIOLOGY AND MANAGEMENT OF TEMPERATE FRUIT FLIES

Question. The United States cherry and apple industry has brought to the Committee's attention the pressing need to develop effective pest control strategies for temperate fruit flies that minimize the use of chemical insecticides while adequately addressing the quarantine concerns of our industry's current and potential export markets. Do you agree that there is an unmet research need in this area and that the addition of a full-time entomologist at the Yakima, WA, research laboratory is required to conduct research on the biology and management of temperate fruit flies?

Answer. The most promising controls for temperate fruit flies, including the cherry fruit fly and the apple maggot, in the United States is by the use of Integrated Pest Control (IPM) programs. However, an important component of the IPM program is pesticides that have an uncertain future resulting from provisions of the recently passed Food Quality Protection Act (FQPA). The registrations for some of the most useful of these pesticides may be dropped for horticultural crops including apples and cherries. This could result in greatly increased fruit fly problems including invasion of the apple maggot into areas currently declared free of apple maggot. This would not only present a problem for production of high quality cherries and apples but would also raise quarantine issues for apples and cherries that could halt their export to states and countries where these fruit flies do not occur. ARS assigns high priority to research to study the biology and management of temperate fruit flies. Additional funding for an entomologist would be an important boost for this research.

POTATO RESEARCH

Question. Is the ARS working with the National Potato Council on how funds available for potato research can best be used to address research priorities?

Answer. Yes, ARS works closely with the leaders of the potato industry and the National Potato Council in developing research priorities and allocating funds.

Question. Does the ARS agree that there is a need to continue research on site-specific management and to focus on the biology of potato production and that the addition of an agronomist to supplement the soil science and pathology research would greatly strengthen the potato program in Orono, Maine?

Answer. Yes, potato production in northern Maine has shown a significant decline in recent years. This trend will, however, be reversed with the construction of a new potato processing facility in Maine by McCain Foods. It is estimated that 15,000 acres will be returned to potato production. The current ARS research program has

included a search for alternative crops that could be used in a potato rotation. Potatoes are grown in three-year rotations with soybean, canola, green bean, sweet corn, and barley/clover. An interdisciplinary team of two scientists is evaluating cropping system impacts on soil nutrient dynamics and soilborne pathogen ecology. A third scientist is being recruited to assess crop management system interactions with potato late blight. The addition of an agronomist to supplement the soil science and pathology research will greatly strengthen the potato program in Maine. Estimated cost is $300,000/year.

Question. Do you agree that an agronomist position (in addition to the weed and soil scientist for which recruitments are currently in process) to integrate the soil, weed, pathology and entomology information on potato production into a more effective system and achieve better quality as well as improved yield is needed at Prosser, WA, to continue research on site-specific management and to focus on the biology of potato production?

Answer. Yes, the site-specific management research team at Prosser, WA is in the process of rebuilding after the loss of several scientists. A new soil scientist has been selected and will be on-board soon. Recruitment is underway for a new weed scientist. The objective of this team is to develop site-specific management strategies based on knowledge of the biology of the potato crop and its interactions with pests, pathogens, and the aboveground and below-ground environment. The resulting management systems will be more efficient in the use of resources, improve yield and quality of the crop, and reduce the risk of negative impacts on groundwater quality. To accomplish these goals, an agronomist to lead the research on potato biology and water management should be added to the Prosser group. Just as the plant integrates biological, chemical, and physical factors to determine yield and quality, the agronomist will be the point of integration for knowledge of potato biology, pathology, entomology, soil science, and weed science into an effective management system that is acceptable to growers. The estimated cost is $300,000/year.

PASTURE-BASED BEEF SYSTEMS FOR APPALACHIA INITIATIVE

Question. Please describe the cooperative agreement between the USDA ARS station in Beaver, WV; the Virginia Polytechnic Institute and State University; and West Virginia University for support of the Pasture-Based Beef Systems for Appalachia initiative.

Answer. A cooperative agreement between the USDA ARS in Beaver, the Virginia Polytechnic Institute and State University, and West Virginia University does not formally exist. The three institutions have actively collaborated in the development of a cooperative research initiative for a Pasture-Based Beef System for Appalachia that capitalizes upon the complementary capabilities of the three institutions. This initiative will develop innovative concepts/practices to enhance the efficiency, profitability and sustainability of pasture-based beef production systems in Appalachia. Systems for each of the different phases of cattle production and marketing will be compared. The initiative will be a long- term, multi-disciplinary/multi-institutional regional effort that will impact and benefit small farms. The net result will be increased economic viability of small livestock producers, enhanced economic development of Appalachia and enhancement of the environment.

Question. What level of effort, both in terms of dollars and scientific support, is ARS currently provided for this initiative and what increase is required to provide full ARS support for the initiative?

Answer. At the present time, the initiative is unfunded though some effort at each institution is relevant to the objectives of the initiative. An increase of $2.5 million will be needed to effectively implement this project. Of this, $1.5 million annually would be shared equally between the three institutions to provide the critical mass of disciplines and infrastructure needed to sustain the program. The remaining $1 million will be used to meet special disciplinary/resources requirements of the project to be distributed on a competitive basis among the three institutions. The annual request for proposals will be developed by consensus of the member institutions and will be based on the particular needs and stage of the project.

FUSARIUM HEAD BLIGHT (WHEAT/BARLEY SCAB) RESEARCH

Question. The fiscal year 1999 Appropriations Act provides increased funding for fusarium head blight research. Please describe the current level effort, both in terms of dollars and scientists, for the ARS base program and the ARS consortium with 12 land-grant universities, as compared with that in fiscal year 1998, and summarize research accomplishments to date.

Answer. The current efforts for fiscal year 1998 and fiscal year 1999 are as follows:

	Fiscal Year 1998		Fiscal Year 1999	
	Scientists	Dollars	Scientists	Dollars
In-House	3.0 (SY)	$773,500	4.7 (SY)	$1,188,400
Consortium	.....	500,000	.....	3,500,000

Recent accomplishments within ARS include: the identification and maintenance of resistance genes from wild wheat relatives into wheat germplasm, the development of molecular markers for resistance genes, release of a scab- tolerant wheat variety for the upper Midwest, identification and isolation of genes that inactivate the toxin produced by the head blight fungus and incorporation of these genes into wheat and barley, and identification of anti- fungal genes that appear to inhibit the fungus.

Question. Please describe the budget proposal for fiscal year 2000 funding to address fusarium head blight or scab. What research enhancements are proposed for ARS? Is any increase in funding requested to support the consortium?

Answer. The fiscal year 2000 budget proposes a $900,000 increase to fund fusarium blight research at St. Paul, Minnesota; Fargo, North Dakota; Peoria, Illinois; Madison, Wisconsin; Albany, California; and Raleigh, North Carolina. Research topics to be addressed include: genetics of resistance in spring and durum wheat, transformation of wheat and barley for fungus resistance and control of vomitoxin, biological control of the fungus, and disease epidemiology. The fiscal year 2000 budget does not request additional funding to support the consortium.

Question. Describe the Wheat and Barley Scab Initiative. What parts of the plan have been implemented with the funding provided to date? What additional funding will be required to fully implement the research plan?

Answer. The U.S. Wheat and Barley Scab Initiative is a consortium of representatives of the wheat and barley industries and university, ARS, and private researchers. Activities include research on all aspects of the disease, especially enhancement of genetic resistance to head blight in wheat and barley, disease epidemiology, and disease management strategies. The funding plan developed called for $5,125,000 per year for 5 years, and the Wheat and Barley Protection Act of 1997 authorized $5.2 million per year for a partnership between land grant universities and the federal government to address scab in wheat and barley. In fiscal year 1999, $3.5 million was appropriated to partially address each of the objectives. Full funding would require an additional $1.7 million per year.

Question. The Committee has been asked "to limit to no more than 5 percent, the overhead charges" deducted from ARS grants to land grant universities for the Scab Initiative. Please explain what percentage is taken from each of these grants and why it is taken.

Answer. Universities typically charge an "overhead" or "indirect" cost to extramural grants to partially defray in-house infrastructure costs of conducting the research. The percentages taken by the land grant universities for the grants in fiscal year 1999 were:

University	*Percent*
North Dakota State University	.....
University of Minnesota	5
Michigan State University	14
South Dakota State University	10
Ohio State University	5.5
University of Illinois	10
Purdue University	.....
University of Missouri	5
Kansas State University	.....
University of Nebraska	.....
North Carolina State University	.....
University of Maryland	.....
Cornell University	.....
University of Kentucky	.....
University of Arkansas	.....
Virginia Tech	.....
University of Georgia	10
Louisiana State University	.....
Washington State University	14

Question. The Committee has learned that despite the fact that the Upper Midwest has been devastated by several serious plant disease epidemics over the past ten years caused by stem rust and fusarium head blight, there are currently no ARS scientists working on fungal diseases of barley in the region. Is this true? If so, does the ARS agree that federal support in combating serious disease in the region is desirable? What level of effort, in terms of dollars and scientists, would be required to do this?

Answer. It is not true. Currently, ARS researchers in Madison, Fargo, and St. Paul are conducting research on fungal diseases of barley, including fusarium head blight, stem rust, and powdery mildew. Research areas include genetics of host plant resistance, genetic variability of pathogens, host- pathogen interactions, and enhancing host-plant resistance through conventional and biotechnological means.

TURKEY RESEARCH

Question. Please provide the Committee with a status report on ARS Poult Enteritis Mortality Syndrome (PEMS) research.

Answer. During fiscal year 1999, the following has been accomplished:

—Initial studies showed that turkey poults exposed to PEMS-infected tissues exhibited immunosuppression prior to the enteritis and this had a direct impact on the immune system, specifically the thymus gland.

—Turkeys exposed to thymus gland tissue from infected birds developed a PEMS-like disease with mortality, severe growth depression, enteritis, immunosuppression, and tissue atrophy.

—A new virus has been isolated from the thymus of PEMS-infected birds—a "Small Round Virus" (SRV). A culture system was developed to grow and purify the virus. Initial experiments indicated SRV can cause disease in turkey poults similar to PEMS in the field. The virus is not identified by diagnostic tests for common turkey enteritis viruses.

Question. How soon will a diagnostic test be available for the rapid identification of the likely presence of the PEMS virus?

Answer. Current studies are in progress to produce experimental antisera for development of diagnostic tests for use in the field. The antisera will be available for initial tests in 3–4 months. The ARS Southeast Poultry Research Laboratory (SEPRL) has committed to providing the antisera for initial testing at North Carolina State University, College of Veterinary Medicine and Purdue University Diagnostic Laboratory. Development and release of a commercial diagnostic kit is 12–18 months to the future.

Question. Based on the fiscal year 2000 request for ARS funding for PEMS research, when do you estimate a vaccine will be developed? Would the hiring of a post-doctoral fellow to concentrate solely on PEMS vaccines and other therapeutic treatments reduce the time necessary to develop a vaccine? By how much would this additional research support reduce the time needed to develop a vaccine?

Answer. Estimates based on current personnel and financial resources suggest a vaccine would be available within 3–5 years. Although the hiring of a post- doctoral fellow would allow a full-time person to work on the vaccine development alone, the prospect for an effective vaccine would be greater with the recruitment of a permanent scientist. This would require an additional $300,000 in permanent funds. This additional person would free the current personnel to work on the identification of the Small Round Virus, define its role in production of PEMS and development of the diagnostic tests. This could reduce the estimated time to vaccine development from the current 3–5 years to a 1–3 years.

Question. Avian pneumovirus is a new disease posing a potential serious threat to the turkey industry. The industry and the State of Minnesota have allocated more than $500,000 to pneumovirus research in the past year and are seeking a federal contribution to efforts to further refine diagnostic tests, improve disease containment procedures, and accelerate vaccine development. Is ARS currently involved in the University of Minnesota project? Is ARS performing any research related to this disease? What level of participation in the University of Minnesota project would be appropriate if resources were made available to the ARS to participate in this research effort?

Answer. No direct or indirect involvement has been requested by the Minnesota Turkey Federation or the University of Minnesota. ARS has offered to assist in the Minnesota research effort, but such offers have not been accepted. Recently, several Minnesota pneumoviruses were sent to SEPRL for molecular analysis. This was the first occurrence of cooperation between ARS and the Minnesota state research effort on pneumoviruses.

In fiscal year 1998, the National Veterinary Service Laboratory, Animal and Plant Health Inspection Service, USDA, requested assistance from SEPRL, ARS, in avian pneumovirus research, especially in analysis of the Colorado virus. In fiscal year 1999, pneumovirus research was incorporated into existing research efforts at SEPRL.

ARS has conducted molecular epidemiologic evaluation of the initial avian pneumovirus from Colorado, making appropriate comparisons to the avian pneumoviruses Subtypes A and B of Europe and Africa. The findings indicated that the U.S. Colorado pneumovirus was a new subtype of pneumovirus distantly related to the European viruses and most likely not introduced from Europe or Africa. Other studies in progress include development of DNA-based tests for diagnostics, determining the reservoir and original source of the pneumoviruses in North America and understanding the disease and its control, including vaccines.

ARS could assist in poultry experimental studies to determine the role of individual viruses in the field disease. Currently, APHIS has limited in vivo experiments to biological containment facilities which are lacking in Minnesota. SEPRL could provide additional assistance and coordination in molecular analysis and vaccine development.

EURASIAN AVIAN INFLUENZA

Question. The Senate report accompanying the fiscal year 1999 appropriations Act encourages ARS scientists at Athens, GA, to provide technical assistance and to collaborate with other leading virologists and ornithologists to develop and assess baseline data on Eurasian birds as an influenza reservoir and their migration habits between Southeast Asia and North America and their breeding grounds in Alaska. Have ARS scientists assisted in this effort to assess the threat viruses from Eurasian birds migrating to the United States?

Answer. The Southeast Poultry Research Laboratory (SEPRL), Athens, Georgia, has provided technical assistance, in the form of virus isolation, identification and characterization, to the University of Alaska since the summer, 1998. Additional assistance has been provided to the Department of Agriculture and Fisheries in Hong Kong on Asian Influenza. Currently, SEPRL has two Specific Cooperative Agreements with universities for establishing baseline data on Eurasian birds as influenza reservoir and their migration habits between Asia and Western North American (Cooperator: University of Alaska) and between Europe and Eastern North America (Cooperator: University of Georgia).

Question. Do findings from surveillance efforts to date call for an increase in this screening effort? How many Eurasian avian influenza positives were found as a result of surveillance efforts last year?

Answer. The findings to date cover only fall 1998 and winter 1999 sampling and such data represents only 6 months of effort. Patterns of influenza ecology and identification of reservoirs can only be established from sampling over multiple years in wide geographic areas.

Four avian influenza viruses were obtained from the 700 samples tested from Alaskan birds and 34 influenza viruses from 400 samples from the Midwest and Eastern US wild birds. The infected samples are being evaluated in studies to determine the genetic origin and relationships to Asian, European and North American avian influenza viruses. However, additional isolates need to be obtained from both locations in order to make the epidemiologic study viable by multi-year sampling.

Question. What additional funding would be required for the Athens ARS laboratory to collaborate with the University of Alaska and the University of Georgia to further develop and assess these baseline data, specifically to increase the number and diversity of wild bird samples obtained and analyzed.

Answer. The SEPRL will provide the virologic and molecular biologic components of both collaborative research projects. An additional $100,000 would allow the hiring of a post-doctoral research associate and the purchase of reagents to be used in the isolation and identification of the influenza viruses from a greater number of more diverse samples. Both university cooperators will provide the ornithologic expertise and obtain the diagnostic samples from wild birds in the field, and in the case of the University of Georgia, the initial virologic isolations from the Midwest and Eastern USA. The cooperators would need an additional $100,000 each to continue and enhance their field sampling activities. The total required funds would be $300,000.

NATIONAL SEDIMENTATION LABORATORY

Question. Please provide the fiscal year 1998, 1999 and proposed 2000 funding levels for the National Sedimentation Laboratory.

Answer. The fiscal year 1998, 1999 and proposed 2000 funding levels for the National Sedimentation Laboratory are respectively; $5,424,000, $5,424,000, and $5,964,000.

Question. What level of funding is available for the Laboratory to conduct research on sources and causes of water impairment in the Yazoo River Basin and to seek economically feasible Best Management Practices for attaining new water quality goals (Total Maximum Daily Loads) at field, farm, watershed, and basin levels?

Answer. In fiscal year 1999, the Laboratory will have $3,297,200 available to conduct research on the sources and causes of water impairment in the Yazoo River Basin, and to develop economically feasible Best Management Practices for attaining new water quality goals in the Yazoo River Basin and Mississippi Delta. This does not include the $1,246,900 in financial support that the National Sedimentation Laboratory currently provides the University of Mississippi's Center for Computational Hydroscience and Engineering and National Center for Physical Acoustics. The fiscal year 2000 budget will provide the Laboratory with an additional $540,000 that will be used to expand the current research effort on water quality in the Yazoo River Basin, and to assess the performance and reliability of a broad spectrum of farming and resource management practices for attaining new water quality goals at farm, field, watershed, and basin levels.

GENOME RESEARCH

Question. Please describe the animal and plant genome research programs being carried out by ARS and the importance of that research.

Answer. Plant Genome Research. The ARS' Plant Genome Research Program began in fiscal year 1990, and now has several major components: 1) development, enhancement, and maintenance of a genome database system for managing gene mapping and sequence information, and integrating the former information with knowledge of biological function and other attributes within and among crop species; 2) research that elucidates crop genome structure and organization, and that interrelates the preceding information to biological function so as to facilitate the manipulation of genomes to improve crops; 3) development of research tools, such as DNA libraries, molecular probes, and primers; and 4) development of bioinformatics software tools for characterizing and integrating complicated plant genome data. To date, this program has stressed the development of individual genome databases for several major crops (e.g., maize, wheat, soybeans) and software development and database management.

ARS is currently allocating $3.9 million to plant genomic research for several major crops. New crop genome research and database support positions have been established at Ithaca, NY, in association with Cornell University, and at the Western Regional Research Center, Albany, CA. The ARS-Cornell partnership has been strengthened by establishing a joint center for comparative genomics and bioinformatics.

The VA-HUD Bill (Public Law 105–65) in fiscal year 1998 approved $40 million to be allocated by the National Science Foundation (NSF) to a National Plant Genome Initiative focused on "economically significant plants." In the first competition for these funds, nine ARS scientists were Principal Investigators or co-Principal Investigators on proposals that were funded. ARS is striving to ensure that its institutional genome research and database development efforts are coordinated with and effectively complement research funded by the new NSF program, and other crop genome initiatives.

Importantly, the USDA/ARS Plant Genome Research program contributes to solving many of USDA/ARS's priority research problems. It addresses environmental deterioration (e.g., global change, water quality), promotes sustainability and profitability of crop production, improves the quality of food, fiber, feed, ornamentals, and industrial products by facilitating the development of new crops and crop varieties. These new crops and crop variants will use inputs more efficiently, and yield products with higher quality and higher value. This research program will also contribute to the optimal conservation and utilization of crop genetic resources.

Animal Genome Research.—ARS initiated a program on animal genome mapping in 1988. In 1994, ARS scientists published the first genetic linkage maps in the world for livestock and was a key participant in the first genetic linkage map for poultry. Second generation linkage maps in cattle, swine, poultry and sheep were published in 1997. They are the most complete genetic maps for this livestock species available in the world. ARS scientists have established cooperative efforts in genome mapping and databases with scientists in State Agriculture Experiment Stations, other countries, and agribusiness companies.

The USDA/ARS is currently allocating $9.1 million to animal genome research. ARS has programs on the identification of genes of importance for animal production, gene mapping, and gene characterization in cattle, sheep, swine, poultry, and fish at the U.S. Meat Animal Research Center, Clay Center, NE, Avian Disease and Oncology Laboratory, East Lansing, MI, Animal Physiology Research Unit, Athens, GA, National Animal Disease Center, Ames, IA, Beltsville Area Research Center, Beltsville, MD, and the Cool and Cold Water Aquaculture Research Unit, Leetown, WV. The improved genetic linkage maps permit ARS to direct research efforts to identify genes that regulate growth, lactation, reproduction, carcass traits and disease resistance. These efforts will improve production efficiency, resistance to diseases and parasites, and quality and safety of products, and keep U.S. agriculture competitive in international markets.

Question. How will the increased funding requested for fiscal year 2000 enhance this research effort?

Answer. The Administration's budget for fiscal year 2000 requests an increase of $800,000 for animal genome research and $700,000 for plant genome research. The new funding for animal genome research will enable the Agency to augment its efforts to: 1) identify the genetic basis for productivity in dairy cattle and mammary gland resistance to mastitis (Beltsville, MD; $300,000); and 2) develop high throughput methods for comparing, analyzing, and storing large numbers of DNA sequences and gene variants (polymorphisms) so as to identify economically important genes in cattle and swine (Clay Center, NE; $500,000). The new funding for plant genome research will enable the Agency to augment its efforts to: 1) apply new genomic approaches to manipulating agriculturally important genes in crops (Albany, CA; $400,000); and 2) develop new bioinformatic tools, biological databases, and information management technology to generate, store, locate, arrange, interrelate, analyze and communicate the voluminous data produced by plant genomic sequencing, mapping, and other genomic research (Columbia, MO; $300,000).

HUMAN NUTRITION RESEARCH

Question. Two years ago, the Administration proposed an ARS Human Nutrition Research Initiative. Please distinguish research performed as a result of this initiative from the agency's ongoing nutrition education and research program at each of the Human Nutrition laboratories?

Answer. The research performed as a result of the Human Nutrition Research Initiative can be distinguished from the agency's ongoing nutrition education and research program at each of the Human Nutrition Center's will be provided for the record.

The ARS Human Nutrition Research Centers do not have a nutrition education program. However, Children's Nutrition Research Center at Baylor College of Medicine has a nutrition specialist person that is employed by USDA's Cooperative Research, Education, and Extension Service.

The Initiative strengthens ARS' integrated, multi-disciplinary human nutrition research program by using new approaches to elucidate the fundamental interrelationships between diet, genetics, and health, and by applying and validating strategies to stimulate healthy food, nutrition, and lifestyle behaviors. Specifically, it has allowed the ARS Human Nutrition Research Centers to focus on the following five vital concerns: food, phytonutrients and health; healthy body weight to avoid diabetes and other diseases; brain function and resistance to mental decline; bone growth and protection from osteoporosis; and foods and nutrients' roles in preventing infectious disease. This funding has allowed the Grand Forks Human Nutrition Research Center to examine the role of trace minerals in gene expression; the Human Nutrition Research Center on Aging was able to examine the influences of diet on loss of immunocompetence and other functions during aging, including examining the relationship between diet, adult-onset Type 2 diabetes, functional disabilities, and food security in a Hispanic population; the Children's Nutrition Research Center at Baylor has examined how fetal nutriture affects later human development and functioning, specifically how in-utero nutrition may alter the course of human development and produce permanent consequences for the child after birth; the Western Human Nutrition Research Center has examined the molecular links between gene expression, dietary intakes, individual nutrient requirements, and risk of disease; the Arkansas Children's Nutrition Center has examined the molecular basis for nutrient effects on cognitive development of children, in addition, they are examining phytonutrient compounds extracted from soybean (components part of soy-based infant formulas) and how they might reduce the risk of various cancers; and the Beltsville Human Nutrition Research Center was able to establish a new ARS project for research on diet and flavonoid (a major constituent of fruits

and vegetables) function, which is to determine the bioavailability of flavonoids and their role as biomarkers of health status.

Question. What has been accomplished to date from increased funding made available for the Human Nutrition Research Initiative?

Answer. Some of the accomplishments to date will be provided for the record.

Jean Mayer USDA Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts

Dietary Antioxidants and Aging.—High dietary intakes of antioxidant vitamins and phytochemicals are associated with better maintenance of physiologic function and a lower prevalence of many degenerative conditions in older adults. Understanding how antioxidants reduce oxidative stress and impact the pathogenesis of chronic disease present opportunities for health promotion. There is a compelling body of scientific evidence that suggests that free radical pathology is associated with many of the chronic diseases that are common among older adults, e.g., cancer, heart disease, and degenerative eye disorders. It has been found that the food matrix in which carotenoids are found affects their bioavailability. Chicken eggs may serve as a rich dietary source of bioavailable lutein and zeaxanthin, two common carotenoids, possibly due to the lipid matrix of the yolk in which they are located. Antioxidant status as assessed by measuring plasma antioxidant capacity can be with increased consumption of fruits and vegetables. This is the first time anyone has demonstrated that antioxidant status can be altered with increased fruit and vegetable consumption.

Nutrition, Aging and the Immune Response.—The long recovery period and pathology associated with infectious disease has a debilitating effect on functionality and quality of life in elderly; and infectious diseases are among the leading causes of death in this age group. Nutrients play an important role in regulation of the immune response and host defense against infectious diseases. Understanding the mechanism of nutrient modulation of the immune response during aging will help in designing effective interventions. Consumption of up to 800 IU/day for six months of vitamin E had no adverse effect in healthy elderly and significantly improved their immune response. One of the mechanisms by which vitamin E contributes to the reduction of risk of atherosclerosis and cancer is through modulation of immune and endothelial cell interaction, production of several chemokines, pro-inflammatory cytokine and modulation of angiogenesis. Green tea flavonoids showed similar but more potent inhibitory effects on angiogenesis compared to that observed with vitamin E.

Bone Health in the Elderly.—The current RDA does not appear to support optimal functioning of vitamin K-dependent proteins in bone. These observations are of concern because vitamin K has recently been identified as a potentially important nutrient that can affect bone mineral density and the risk of hip fracture. A sub-clinical deficiency of vitamin K showed significant increases in abnormal forms of vitamin K-dependent proteins. These investigations showed a direct evidence that dietary depletion of vitamin K has a detrimental impact on bone metabolism in humans. Repletion of vitamin K restored function of vitamin K-dependent proteins, and bone resorption levels returned to baseline.

Grand Forks Human Nutrition Research Center, Grand Forks, North Dakota

Micronutrients.—Copper deficiency can lead to anemia, low white blood cell count, bone loss, poor growth, and some forms of heart disease. ARS researchers have identified a link between copper deficiency during pregnancy and neurological defects in the offspring of laboratory animals. Mice fed diets lacking adequate copper throughout pregnancy and for a few weeks after delivery; had altered observed enzyme levels in the brains of pups and changes in protein kinase C, an enzyme involved in the development of the nervous system. These findings may have implications for human mothers by showing the importance of an adequate copper intake during pregnancy.

The major signs of copper deficiency found in depleted men and women resemble the most common characteristics that can predict risk of ischemic heart disease in people. Although official recommendations about desirable amounts of dietary copper have been made, no Recommended Dietary Allowance has been assigned. In addition to the link of low dietary copper to ischemic heart disease there has been a recently identified link between heart disease and osteoporosis. Adequate dietary copper is required for health of both hearts and bones. Mice deficient in copper had fragile bones.

Strong evidence was found supporting the view that glycation, the undesirable binding of sugar to proteins, is enhanced in dietary copper deficiency. Because glycation is a process that is increased in diabetes and aging, the present finding

suggests that reduced copper intake may worsen the consequences of these two conditions.

Zinc is essential for growth and early development, but the relationship between zinc and cognition in later development is largely unknown. ARS scientists determined that short-term supplementation with zinc combined with other micronutrients may improve some aspects of cognitive function of school-aged Mexican-American children, who are at increased risk for zinc deficiency primarily because of high intakes of dietary phytate.

Beltsville Human Nutrition Research Center, Beltsville, Maryland

Bioavailability, Transport and Antioxidant Activity.—ARS scientists have been able to demonstrate that lesser known carotenoids in tomato, phytofluene and phytoene, are much more bioavailable from tomato juice than is the dominant tomato carotenoid lycopene. The mechanism of protection of tomato products dies not appear to be related to immune function as judged from a T-lymphocyte proliferation assay. ARS plant scientists and nutritionists have developed a variety of tomato that is rich in phytofluene and phytoene. They have shown that the carotenoid content of colon cells is markedly increased in humans consuming carotenoid-rich vegetables, thus relevance to colonic cell mutagenesis is likely.

Diet and Infectious Disease.—Nutritional interactions may play a significant role in the etiology of several chronic degenerative or acute infectious diseases. ARS scientists have shown that dietary oxidative stress increases viral virulence apparently by changing the genetic nature of the virus as it replicates with the host. Nutritional status of an individual, especially in vitamin E and selenium, appears to affect virulence and genetic structure of the virus.

Children's Nutrition Research Center, Baylor College of Medicine, Houston, Texas

Calcium Intakes in Girls.—Most of the calcium found in the body is in teeth and bone. The remaining small percent plays a role in mediating vascular constriction and vasodilation, muscle contraction, nerve transmission and glandular secretion. Calcium reference intake values must be set at levels associated with maximum retention of body calcium. ARS scientists showed that girls must increase their calcium intakes at the earliest onset of puberty, rather than previously accepted ages, since peak mineral accumulation occurs at an early age.

Body Composition.—Obesity affects 20–30 percent of the U.S. population. Obesity is an increasing problem in children. Children and adolescents expend less energy and become more sedentary as the social encounters revolve around electronic devices. Dieting has not been successful for the long-term control of obesity. Consequently, a thorough knowledge of the metabolic and endocrine factors controlling fat deposition is needed in order to rationally modify the current trends. A complete body composition profile has been obtained in children ages 3–18 representing white, black and Hispanic populations. Preliminary analyses indicate that new standards are needed and that these must be ethnic and gender specific.

Growth and Neurodevelopment.—Breastfeeding optimizes brain development and reduces infections and allergy. Understanding how milk is made, and understanding what controls how much milk is made, will tell us what we need to know to improve milk quantity and composition and promote breastfeeding. ARS scientists were able to identify the possibility of genetic factors related to calcium absorption and utilization. They showed that GLUT1 glucose transporter is responsible for transferring glucose, the major sugar in the mother's blood, to the place where milk sugar is made in breast cells. This is significant because the amount of milk sugar the breast cells make determine how much milk is produced.

Western Human Nutrition Research Center, San Francisco, California

Diet, Antioxidants, and Optimal Health.—Studies have shown that vegetables rich in beta-carotene protect against heart disease and cancer. The amount of beta-carotene that it takes to prevent chronic disease is not known. In well-controlled carotenoid depletion studies ARS scientists examined the effective range of beta-carotene in the antioxidant defense system of healthy women. They found that maximal protection occurred at low, physiological concentrations of beta-carotene. They are identifying groups of people that have low beta-carotene status and might need targeted nutritional guidance on beta-carotene.

Healthy Body Weight: Influences of Nutritional, Biological and Environmental Factors.—The conditions of overweight and obesity are leading nutritional problems in the U.S. National surveys indicate that 97 million American adults or 55 percent of the population are overweight or obese, and the prevalence is escalating. Thus, achieving and maintaining a healthy body weight is a concern of many Americans. ARS scientists demonstrated that during a prolonged period of dietary energy restriction in women, the levels of plasma leptin, a protein, were predictive of sensa-

tions of hunger. This is the first report linking leptin to long-term appetite regulation in humans. Iron status declined in about half of the women subjects during the energy restriction. The inability to sustain attention may be an early cognitive indicator of developing iron insufficiency in these women. Bone mineral content of obese women did not decline after a 3-month period of energy restriction. However, in premenopausal women, those who chronically restrained their dietary intake for the purpose of weight control had significantly lower bone mineral density.

Arkansas Children's Human Nutrition Research Center, Little Rock, Arkansas

Soy-based Infant Formulas.—The same protein extracted from soybeans and used as the exclusive protein source for over 95 percent of the world's soy-based infant formulas will reduce the risk of various cancers when fed to animals. In addition, the factors associated with these proteins circulating in the human body after consumption are being examined.

Question. Please describe the nutrition education and research program at each of the ARS Human Nutrition labs. Provide the fiscal year 1998 and 1999 levels of funding and staffing (FTE) for each lab.

Answer. The ARS Human Nutrition Research Centers do not have a nutrition education program. However, Children's Nutrition Research Center at Baylor College of Medicine has a nutrition extension specialist that is employed by USDA's Cooperative Research, Education, and Extension Service. The research carried out by each of the ARS Human Nutrition Research Centers will be provided for the record.

Beltsville Human Nutrition Research Center, Beltsville, Maryland.—defines the role of food and its components in optimizing health and reducing the risk of nutritionally related disorders in the diverse American population. To accomplish this mission, the Center develops new methods of food analysis; determines the role of nutrients and their interactions in maintaining health; monitors nutritional intakes and maintains the database of the nutrient content of foods; studies the expenditure of energy by using direct and indirect calorimetry; and investigates the consequences of altered nutrient intakes in free-living humans.

Jean Mayer USDA Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts.—defines safe and adequate nutrient intakes and identifies factors that may contribute to degenerative processes associated with aging. To accomplish this mission, the Center determines factors related to prevention of age-related loss of bone density leading to osteoporosis and fracture, and the preservation of muscle strength; identifies dietary factors critical in slowing or preventing cataract development; determines the relation of antioxidant food components to heart disease and immune function; and explores relationships between vitamins and brain function, stroke, and dementia.

Grand Forks Human Nutrition Research Center, Grand Forks, North Dakota.—determines nutrient needs for humans with an emphasis on mineral element requirements that prevent disease and promote health and optimal function throughout life. To accomplish this mission, the Center determines the importance of mineral elements at the molecular level with an emphasis on chronic disease; identifies detrimental functional changes, especially in bone, brain, cardiovascular and reproductive systems, that occur in the U.S. population because of improper mineral element nutriture; identifies and validates biochemical and physiological status assessment indicators for use in the study of populations at risk from inadequate mineral element nutrition; and defines the impact of environmental, dietary, physiological and psychological stressors on specific mineral requirements.

Children's Nutrition Research Center at Baylor College of Medicine, Houston, Texas.—defines the nutritional needs of pregnant and lactating women and of their infants and children from conception through adolescence. To accomplish this mission, the Center establishes nutrient requirements to prevent low birth weight babies, particularly in pregnant adolescents; elucidates nutrient-gene interactions that regulate metabolism and disposition of nutrients; determines nutrient requirements for growth and development of school-aged and adolescent children; and establishes nutritional relationships to acute and chronic childhood diseases.

Western Human Nutrition Research Center, San Francisco, California.—determines the impacts of dietary, environmental, behavioral, and genetic factors on nutrient requirements and functions. To accomplish this mission, the Center establishes markers of nutritional status in relation to maintenance of healthy body weight, nutrition, infection and immune disorders; and protective factors in foods.

Arkansas Children's Nutrition Research Center, Little Rock, Arkansas.—determines the role of nutrition in cognitive and behavioral function, and the health consequences of infant consumption of dietary factors (phytochemicals) such as

phytoestrogens on endocrine and metabolic development and prevention of chronic diseases.

The funding and staffing for the ARS Human Nutrition Research Centers and related programs for fiscal years 1998, and 1999 will be provided below for the record.

Question. Is ARS conducting any nutrition education and research outside of the Human Nutrition labs? If so, please describe the education and research being conducted and where it is being conducted.

Answer. The nutrition education and research conducted outside of the ARS Human Nutrition Research Centers will be provided for the record.

ARS does not conduct nutrition education at any of the nutrition laboratories outside the ARS Human Nutrition Research Centers.

The Lower Mississippi Delta Nutrition Intervention Research Initiative (NIRI) is conducted by a consortium of seven partners: Alcorn State University, Arkansas Children's Hospital Research Institute, Pennington Biomedical Research Center, Southern University and A&M College, University of Arkansas at Pine Bluff, University of Southern Mississippi, and ARS. The mission of the Delta NIRI is to evaluate the nutritional health in the Lower Delta, to identify nutritionally responsive problems, and to design and evaluate interventions which may be sustained at the community level and implemented on a larger scale in similar areas of the United States.

The research conducted by the U.S. Plant, Soil and Nutrition Laboratory, Ithaca, New York, has a human nutrition component that examines the absorption and utilization of organic and mineral constituents of plant foods. ARS scientists are identifying and depicting dietary and physiological factors that interact to affect absorption, distribution and utilization of organic and inorganic constituents in plant foods.

Human nutrition research conducted at the ARS National Center for Agricultural Utilization Research, Peoria, Illinois has examined the effect of triglyceride structure and dietary fat composition on fatty acid and lipid metabolism in humans.

INTEGRATED PEST MANAGEMENT

Question. How has ARS research to date contributed to progress made toward the Administration's goal of implementing integrated pest management (IPM) programs on 75 percent of the Nation's crop acreage by the year 2000?

Answer. During the past 15 years, USDA agencies, including ARS, have developed research, education, and extension programs to support the policy of implementing IPM programs on 75 percent of the Nation's crop acreage by the year 2000. Of

course, strong interagency coordination and cooperation with the Departmental Agencies, including CSREES, AMS, ERS, and NASS and other public and private sector organizations is vital if IPM is to be implemented in the United States and the year 2000 goal is to be achieved. The USDA has developed a Strategic Plan, completed in 1993, for implementation of USDA's Integrated Pest Management Initiative. Under the plan, specific strategies to attempt to meet the year 2000 goal have been formulated for each Agency. ARS currently carries out a program, using base funding, that conducts research to meet the needs of the policy. ARS has approximately 70 projects at 29 locations conducting basic and applied research directly related to IPM. Current and planned future IPM studies in support of the Department's IPM goal are tailored to each pest and designed to be sustainable over time.

Emphasis of the ARS IPM program is placed on biological, cultural, and other biorational technologies. In addition, special programs are underway to facilitate the transfer of new IPM technologies from small-scale research studies to producers, which typically require large-scale tests. An area-wide IPM program initiative has been developed by ARS in collaboration with other federal and state agencies, as well as private entities. An area-wide pest management pilot study using mating disruption for codling moth on tree fruits in the Pacific Northwest was fully implemented in fiscal year 1995, followed by full implementation of another area-wide program using an adult attracticide against the corn rootworm in the midwestern United States in fiscal year 1997. A third area-wide IPM program was initiated by ARS in 1997 and is directed at the leafy spurge weed in Montana, North and South Dakota, and Wyoming, using primarily a natural insect predator. The numerous other ARS IPM research projects in support of the Department's IPM initiative emphasize traditional biological control, host-plant resistance, behavior-modifying chemicals (e.g. pheromone mating disruptors), resistance management, cultural practices, improved pesticide application technologies, and other related control technologies. Target pests include a multitude of insects, mites and ticks, plant pathogens and nematodes, and weeds.

The Agency's IPM and area-wide programs are involved with the development of potential substitutes to the 95 organophosphate and carbamate pesticides currently on the EPA priority list of pesticides to be reviewed and possibly terminated for grower use under FQPA. For example, pheromone mating disruption of codling moth in apples and pears will substitute for azinphos-methyl. A semio- chemical attracticide bait will substitute for methyl parathion and carbaryl in the control of corn rootworms; the leafy spurge predatory insect, Apthona, will substitute for certain herbicides on the EPA list; kaolin clays could substitute for methylchlorpyrifos, methyl parathion and other chemical insecticides in the control of orchard pests; and photoactive compounds in a bait matrix could substitute for chlorpyrifos and diazinon for imported fire ant control. These examples are only a small sampling of substitutes of the more than 90 technologies that ARS has in the developmental pipeline currently to help address the impact of FQPA.

Much progress has been made by ARS in generating pest management technologies for use in the Nation's IPM systems to meet the year 2000 goal, and only a select few are mentioned here:

As a result of the area-wide codling moth management program, mating disruption technology is being used widely in the apple and pear growing areas of the western U.S. In 1994, before the area-wide program was initiated, only 11,000 acres were treated with mating disruption technology in Washington State. During 1997, more than 30,000 acres were treated with mating disruption technology, almost tripling the usage in 3 years. There were more than 44,000 acres using the technology throughout Washington, Oregon, and California in 1997 and 1998. A result of the diminished use of hard pesticides has been a resurgence in the natural enemy populations that have exerted almost complete control of secondary pests. This has further reduced the costs of insect control on apples and pears in this three-state area. Populations of codling moth were reduced to almost undetectable levels at some of the 17 project sites. The cost of the control was less in the mating disruption treated orchards than in orchards treated with conventional organo-phosphate pesticides. The number of pesticides sprays were reduced in all orchards under the area-wide program and were entirely eliminated at most of the project sites. Because of the overwhelming success of the program, thus far, numerous other growers in these states have indicated their desire to be included in this large-scale IPM program.

Corn rootworm populations can be reduced by 85 to 95 percent with less than 10 percent of the chemicals used in current corn rootworm control regimes by using adult attracticide baits developed by ARS and now marketed by industry. This technology is the basis for the area-wide IPM program on corn rootworm in the midwestern U.S. and Texas. More than 25,000 acres are included in the research dem-

onstration project. This technology could ultimately become the treatment of choice on the 20 million acres of U.S. cropland currently treated with corn rootworm insecticide, in combination with transgenic corn.

ARS scientists imported and developed a black flea beetle for control of the weed, leafy spurge, in the Midwest during 1988. By 1995, leafy spurge was virtually eliminated at the release sites in North Dakota and Montana. This technology is one of the major strategies being used in the area-wide program on leafy spurge in the northern plains of the U.S., which includes the States of Montana, Wyoming, and North and South Dakota.

This past year, extensive fundamental, ecological, biological, and IPM research on the silverleaf whitefly and its natural enemies produced strategies for an ecologically-based management system. Some crop management and community- oriented farm decision-based practices, such as water-use patterns, and proximity of alternate host crops; and spatial considerations have been implemented in an effort to provide overall silverleaf whitefly population reductions. Area-wide, community-based IPM approaches covering infested crops were implemented across the southern tier of the U.S., and growers now have available cotton cultivars, which are less susceptible and have reduced losses from whiteflies. New commercial safer pesticides have been tested and made available, and new biological control agents have become available on the market, such as a natural fungus agent that was discovered and developed by ARS, and a number of parasites.

ARS developed a nematode biological control agent, Steinernema riobravis, for control of pink bollworm, corn earworm, and fall armyworm, among others. Biosys, Inc. started selling the nematode-based product commercially in 1994–95 for use in IPM systems. Photodyes have been developed for use in fruit fly IPM systems for control and for possible use in eradication of these pests from Hawaii and the mainland. ARS scientists have found that releasing large numbers of the boll weevil parasite, Catolaccus grandis, on infested cotton can kill up to 95 percent of the weevils. This biocontrol agent has great potential when used in an IPM system or eradication scheme for boll weevils.

A new pear variety has been developed by ARS that resists fire blight disease and will reduce chemical pesticide use and improve export markets. Sugarbeet cultivars have also been developed and released with resistance to leafspot and root and crown rot.

Other projects that contribute to the overall IPM program include a community-based field trial study for control of the deer tick and lyme disease in the northwestern United States, the management of Colorado potato beetles and aphids with biological control systems and cultural practices to lessen the need for chemical insecticides, and the management of cotton plant bugs in post-boll weevil eradication zones.

The anticipated outcome of these projects will be the adoption of the component technologies by end-users into IPM and sustainable agriculture system with a concomitant reduction; in chemical pesticide use and increased worker and food safety. Most of these projects are using alternative technologies that will substitute for at-risk chemical pesticides and which could be lost as a result of the Food Quality Protection Act. The ARS, the Animal and Plant Health Inspection Service (APHIS), and the Cooperative State Research, Education, and Extension Service (CSREES), in cooperation with other USDA agencies and local and regional organizations and producers will continue to cooperatively implement IPM research, education, and proactive technology transfer programs to help growers to adopt new IPM practices.

Question. An increase of $3.17 million is requested for fiscal year 2000 for the Food Quality Protection Act (FQPA) research initiative. Please describe this initiative more fully. What resources is ARS currently committing to this initiative and where is the research being conducted?

Answer. Department policy places high priority on funding, development, and testing of safe substitute technology for currently used pesticides at risk of being phased out after review by EPA under FQPA, including the development of area-wide pest management programs using biointensive IPM approaches, biological control agents, and other IPM components technology.

Research funded by the proposed increase will allow ARS to expand support for its area-wide IPM research demonstration programs based on the use of biorational and biologically-based strategies for control of key pests where organophosphate and carbamate pesticides are used primarily as management agents. New projects selected for implementation will be chosen through a scientific review process with a major criteria tied to replacement technology for at-risk pesticides. ARS also needs to expand its IPM component research for pests of fruits and vegetables treated with organophosphates and carbamates, as well as for pests under large-scale action agency eradication or control programs, such as boll weevil and the silverleaf

whitefly, a vector of crop diseases. These programs will specifically help U.S. agriculture adjust to changes resulting from implementation of FQPA and the cost of chemicals currently used against these pests.

Finally, the increase in funds will be used to support the USDA Office of Pest Management and Policy (OPMP). The Office functions to improve USDA's ability to address FQPA by improving integration and coordination of pest management and pesticide data programs and by strengthening communications with the existing network of grower organizations and crop specialists at land-grant institutions. The activities coordinated by OPMP will help increase USDA's responsiveness to the pest management needs of the agricultural community. Overall, OPMP has been designated as USDA's lead office on pest management policy and will coordinate USDA's interface with EPA, FDA, growers, and interested groups on pest management and pesticide-related issues. OPMP will be directly responsible for developing and implementing the Department's overall pest management strategy to adequately meet the needs of growers throughout the FQPA implementation process.

The current location and funding for the Food Quality Protection Act research initiative for fiscal year 1999, as addressed by the Agency's IPM research programs, will be provided for the record.

Question. Why is USDA's Office of Pest Management Policy being funded by the ARS? What is the role of this office and when was it established? Please provide the level of resources, in terms of dollars and full-time equivalent staff years, allocated for this office for each fiscal year.

Answer. Because of the central role of ARS laboratories and field research facilities in crop production and pest management research, housing the Office in ARS provides the Office of Pest Management Policy (OPMP)with ready access to a large existing network of scientific resources and expertise. These resources are fundamental to the OPMP mission of better informing EPA's decision processes and, when necessary, leading efforts to develop strategies to transition to lower risk pest management tactics. OPMP has assumed the responsibilities of the NAPIAP program and it is reasonable to maintain funding in ARS and follow the NAPIAP model of drawing upon other Departmental resources as necessary. OPMP works cooperatively with CSREES to maintain and fully utilize the network of crop production in the land grant system.

The OPMP was created in response to the demands of the Food Quality Protection Act (FQPA) for the Department to better integrate and coordinate numerous programs related to pesticides and pest management. In addition, OPMP serves as the primary contact point for EPA and agricultural producers on pesticide matters. Deputy Secretary Rominger announced the Office in September of 1997 and it became effective in February, 1998.

The resource level has remained constant and equal to the former ARS-NAPIAP budget of $1.192 million in 1998 and $1.089 million in 1999. This level of funding supports approximately ten full time equivalent staff members. Additional funding is sought in fiscal year 2000 to meet the demands of the FQPA and to develop strategies allowing agricultural producers to transition away from pest management chemicals that have been targeted by the EPA risk assessment process.

FOOD SAFETY

Question. What food safety research will ARS conduct in fiscal year 1999, and what is proposed for fiscal year 2000? Provide a brief description of each research project.

Answer. In fiscal year 1999, ARS is undertaking $69,867,600 food safety research specifically in the areas of detection and prevention/control of foodborne hazards; antimicrobial/antibiotic resistance; risk assessment; and food handling, distribution and storage, consisting of: 40 projects ($14.2 million) in detection of foodborne pathogens; 70 projects ($37.9 million) in prevention and control of pathogens; 7 projects ($2.2 million) in anti-microbial/antibiotic resistance; 9 projects ($4.9 million) in risk assessment; and 18 projects ($10.6 million) in food handling, distribution and storage.

In fiscal year 2000, ARS plans to undertake $11,720,000 in additional food safety research to expand work on the following: detection of foodborne pathogens ($700,000); prevention and control of pathogens ($4,750,000); antimicrobial/antibiotic resistance ($3,420,000); risk assessment ($2,400,000); and food handling, distribution and storage ($450,000).

A listing of the fiscal year 1999 projects is provided for the record.

A listing of the proposed fiscal year 2000 projects is provided for the record.
[The information follows:]

PREHARVEST

Manure handling and distribution ($2,500,000)

—Ames, IA, $400,000—pathogen reduction

—Miss. State, MS, $600,000—pathogen reduction
—Clay Center, NE, $300,000—pathogen reduction
—Lincoln, NE, $300,000—pathogen reduction
—Bushland, TX, $600,000—pathogen reduction
—Phoenix, AZ, $300,000—identify pathogens associated with water

Risk assessment ($2,400,000)

—Athens, GA, $600,000—poultry contamination
—West Lafayette, IN, $600,000—swine production practices
—Clay Center, NE, $600,000—microbiological models in cattle
—Beltsville, MD, $600,000—zoonotic parasites

Antibiotic resistance ($1,800,000)

—Athens, GA, $600,000—gene resistance for poultry
—Ames, IA, $600,000—gene resistance for cattle and swine
—College Station,TX, $600,000—antibiotics for organisms in food animals

Fungal toxins ($300,000)

—Athens, GA, $300,000—prevention of endophytic fungi in corn and grasses

Zoonotic disease risk ($300,000)

—Fayetteville, AR, $300,000—metabolic diseases in chickens and turkeys

POSTHARVEST

Pathogen control during slaughter/processing ($700,000)

—Athens, GA, $700,000—on-line detection of unwholesome poultry

Pathogen control in fruits/vegetables ($2,100,000)

—Beltsville, MD, $600,000—ecology of foodborne pathogens, development of handling procedures
—Wyndmoor, PA, $900,000—intervention strategies for pathogens on vegetables
—Albany, CA, $600,000—growth and survival of pathogens inbiofilms

Antimicrobial resistance ($1,620,000)

—Wyndmoor, PA, $900,000—molecular characterization methods
—Peoria, IL, $720,000—culture collections of fungal pathogens

Question. Please indicate how ARS' food safety research agenda for each of fiscal years 1998 and 1999 was tailored to meet the needs of the participant agencies in the President's Food Safety Initiative. What process was used to determine research needs and priorities?

Answer. The following process was used to tailor the ARS' food safety research agenda for each of fiscal years 1998 and 1999 to meet the needs of the participant agencies in the President's Food Safety Initiative, and to determine research needs and priorities:

There was continual dialogue between the agencies conducting food safety research via meetings between the Chief Scientist at the Center for Food Safety and Applied Nutrition and his staff at the Food and Drug Administration, the Deputy Administrator for Public Health and Science and her staff of the Food Safety Inspection Service, and ARS Food Safety National Program Leaders. The ARS and the FSIS hold a joint Program Planning Workshop each year where research progress is reviewed and additional research needs are discussed. Representatives from the FDA are invited to participate in the workshop, and are often requested to review specific programs of research. In addition, there was a comparison of research agendas from each of the agencies conducting food safety research, that is ARS, CSREES and FDA, and a delineation of activities in order to eliminate any duplication of effort. These activities were formalized through an inventory of all food safety research performed by USDA and DHHS. This document is under preparation for the Office of the Under Secretary of Research, Education and Economics. There is continual interaction between agencies on projects or issues of national importance when required.

ALTERNATIVES TO METHYL BROMIDE

Question. Please give us an update on the status of the agency's research efforts to find alternatives to the use of methyl bromide.

Answer. ARS continues to conduct an aggressive research program to identify and develop effective, practical and cost effective alternatives to methyl bromide for use by U.S. farmers, postharvest commodity handlers and processors, exporters, and others impacted by the 2005 ban.

The ARS methyl bromide alternatives research program encompasses a wide range of approaches. For soil fumigation they include: alternative chemicals, new technology for pesticide application, resistant plant varieties, biological control, and cultural practices such as soil amendments. For postharvest they include: new chemicals, heat and cold treatments, controlled atmospheres, inert dusts, radiation, systems approaches and combinations of these.

Research to develop alternatives to methyl bromide to control pests of stored commodities produced in the western United States is conducted at ARS laboratories in Fresno, California, and Yakima, Washington. Commodities being studied include nectarines, cherries, apples, raisins and other dried fruits, citrus, tree nuts, cotton, and hay. Also, methyl bromide is currently used to control pests of many of these crops during storage. Many of these commodities cannot currently be exported without methyl bromide treatment to eliminate quarantine pests. Research approaches include alternative fumigants, heat and cold, modified atmospheres, and combinations of treatments.

At Weslaco, Texas, and at Orlando and Miami, Florida, ARS is developing alternative quarantine treatments for citrus, vegetables, and subtropical fruits, as well as studying ways to minimize phytotoxic effects of these treatments. Emphasis is placed on pest-free zones, irradiation, heat and cold treatments, and advanced quarantine pest detection systems.

At the Hilo/Honolulu, Hawaii, ARS laboratory, alternatives are being developed for tropical fruit infested with fruit flies, especially Mediterranean and oriental fruit flies, to allow export of Hawaii-grown fruit to foreign markets and mainland United States, and to protect mainland United States from introduction of pests present in Hawaii. This research focuses on irradiation, heat and cold commodity treatments and on techniques to eradicate fruit flies.

At Manhattan, Kansas, ARS is developing alternatives to use of methyl bromide to fumigate flour mills, food processing plants, and other structures for insect infestations. Building heat-ups alone and in combination with other treatments such as diatomaceous earth are the approaches being researched.

Research to develop alternatives to soil fumigation with methyl bromide to control pathogens and weeds is conducted at 15 ARS locations. Methyl bromide is used to some extent on more than 100 crops, although nearly 80 percent of all the preplant methyl bromide soil fumigation is used on just four crops—strawberries, tomatoes, ornamentals/nursery crops, and peppers. Alternatives to methyl bromide soil fumigation include host plant resistance, biological control, alternative chemicals, and different cultural practices, either alone or in combination.

At Washington, D.C., biological control and alternative, naturally-occurring chemicals are being evaluated as alternatives to methyl bromide for control of soilborne diseases of ornamentals.

At Beltsville, Maryland, biological control agents are being identified and their mode of action determined to improve control of diseases of vegetables.

At Kearneysville, West Virginia, natural plant volatiles are being evaluated as alternative fumigants and compost and other cultural methods identified for disease and weed control.

At Fresno, California, integrated strategies are being tested that involve host plant resistance, biological control and alternative chemicals for control of disease, nematodes and insects of strawberries, grapes, tree fruits, and vegetables. The application of alternative chemicals using irrigation systems is being tested.

At Riverside, California, research is under way to reduce methyl bromide emission in strawberry and vegetable production and to track the movement and degradation of methyl bromide and alternative fumigants.

At Davis, California, work is directed at using host plant resistance and cultural modifications to manage diseases in tree fruits and nuts.

At Salinas, California, research is aimed at finding biological and cultural control methods to manage strawberry and vegetable diseases, and to characterize the ecology of soilborne pathogens.

At Wenatchee, Washington, disease problems in tree fruit production are being identified, and strategies for their control are being sought.

At Corvallis, Oregon, biological controls are being investigated for diseases of ornamentals and nursery crops, and the role of beneficial microorganisms in disease and weed management is being explored.

At Stoneville, Mississippi, biological control agents to control weeds in vegetables are being identified and characterized.

At Tifton, Georgia, the emphasis is on finding cultural methods and alternative chemical treatments and integrated strategies for control of nematodes and diseases on vegetables, and on identifying alternative herbicides for control of weeds.

At Byron, Georgia, research is aimed at improving cultural practices and host resistance to manage nematodes and diseases in peaches and other tree fruits.

At Gainesville, Florida, work is under way to find alternative soil treatments, such as solarization, flooding, or heating, to control pests, weeds, and pathogens in vegetables.

At Orlando, Florida, integrated methods involving biological control, cultural practices, and alternative chemicals are being developed for control of weeds, nematodes and diseases in tomatoes, peppers, and other vegetables.

At Charleston, South Carolina, alternative fumigants, host-plant resistance, and cultural practices are being explored as alternative disease management strategies in vegetables and fruits. The survival and spread of soilborne pathogens as influenced by other microorganisms and the environment is being determined.

In addition, field-scale validation projects that were begun in fiscal year 1996 were continued in Fresno, California, and Orlando, Florida, to determine if the most promising experimental alternatives were effective, economically feasible, and adaptable to commercial production systems of strawberries, vegetables and perennial crops.

ARS conducted a review of the Florida methyl bromide alternatives research program in December 1998. Participants included growers and other commodity representatives and university and ARS scientists. The objective of that meeting was to get grower input on research needs. A major outcome of that meeting was a refocusing of the ARS research effort in Florida to include more research on pesticides such as Telone as methyl bromide alternatives. A similar meeting is planned for California in April 1999 to get input from growers and others impacted by the loss of methyl bromide.

Question. How much is included in the fiscal year 2000 request for this work and where will this research be conducted?

Answer. Resources and locations for each of fiscal years 1998, 1999, and 2000 for methyl bromide research is provided for the record.

[The information follows:]

Location	Fiscal year 1998 estimated	Fiscal year 1999 estimated	Fiscal year 2000 estimated
Davis, CA	$228,800	$226,000	$226,000
Fresno, CA	3,542,400	3,485,400	3,485,400
Riverside, CA	128,200	126,600	126,600
Salinas, CA	542,500	535,900	535,900
Washington, DC	244,100	241,200	241,200
Gainesville, FL	215,600	213,000	213,000
Miami, FL	1,234,300	1,219,300	1,219,300
Orlando, FL	1,616,800	1,597,100	1,597,100
Byron, GA	984,900	83,900	83,900
Tifton, GA	467,800	462,200	462,200
Hilo, HI	1,705,500	1,684,700	1,684,700
Manhattan, KS	71,700	70,800	70,800
Beltsville, MD	1,061,100	1,048,200	1,048,200
Stoneville, MS	184,500	182,200	182,200
Corvallis, OR	493,900	487,400	487,400
Charleston, SC	334,600	330,600	330,600
Weslaco, TX	1,501,100	1,482,900	1,482,900
Wenatchee, WA	211,800	209,200	209,200
Yakima, WA	261,200	258,000	258,000
Kearneysville, WV	440,400	435,000	435,000
TOTAL	14,571,200	14,379,600	14,379,600

Question. Are the agency's research findings being transferred to producers and others?

Answer. To demonstrate promising methyl bromide alternatives and provide opportunity for grower involvement of alternatives testing, ARS conducts numerous tests collaboratively with growers in grower fields. In addition, ARS provides approximately $500,000 each year from base funds to university scientists, primarily in California and Florida, to fund demonstration projects of the most promising methyl bromide alternatives in grower fields. The USDA co-sponsors the Inter-

national Methyl Bromide Alternatives Research Conference each year where scientists, extension agents, growers, exporters and other members of the impacted agricultural community discuss the latest methyl bromide alternatives technology. In addition, ARS scientists work closely with grower organizations and key farmers to ensure that technology is transferred in a timely manner.

For example, in California, ARS has methyl bromide alternative experiments on six commercial growers' land, covering the north to south (Watsonville to Oxnard) strawberry growing regions, both to validate the feasibility of possible alternative fumigants and to allow the growers input and experience in using them in commercial settings. The growers work collaboratively with ARS scientists and do the land preparation, planting, and harvesting themselves. ARS then uses grower observations and field data in planning subsequent trials. Similar validations have been conducted in Florida on tomatoes and peppers on six to eight locations from the northern part of the state (Quincy) to the southern (Homestead).

ENVIRONMENTAL INITIATIVES

Question. Increased funding is proposed for fiscal year 2000 for ARS on sustainable ecosystems and air quality. Please describe the agency's current research programs in each of these areas; what has been accomplished to date; and the level of resources, both in terms of dollars and scientists, allocated to these programs.

Answer. *Sustainable Ecosystems*.—The proposed funding increase on sustainable ecosystems is in direct response to the National Science and Technology Council, Committee on Environment and Natural Resources (CENR), Integrated Science for Ecological Challenges (ISEC) Initiative. ISEC was initiated by the CENR member agencies in 1998, and a detailed strategic plan has been completed where key actions have been proposed for natural resource and environmental challenges in fiscal year 2000 and beyond. The seven areas included in sustainable ecosystems and ARS involvement are as follows:

—*Implement the CENR Research and Monitoring Framework*.—ARS is currently involved in the implementation of the CENR Mid-Atlantic Pilot, which is an interagency effort that will lead to improved monitoring and understanding for water quality and environmental issues in the Delaware River Basin and the Chesapeake Bay. The Mid-Atlantic Pilot has been used to establish environmental data comparability as Federal agencies increase collaboration; and ARS proposes to expand research and monitoring for the South Florida Ecosystem Restoration Initiative in fiscal year 2000. ARS currently provides $4,848,100 in funding and 15 SYs that are contributing towards Mid- Atlantic Pilot.

—*Prevent and Control Eutrophication, Harmful Algal Blooms, and Hypoxia*.—ARS became involved in eutrophication, harmful algal blooms, and hypoxia research with a funding increase in fiscal year 1999 for Pfiesteria research. The Pfiesteria research has begun to determine the effects of harmful algal blooms in aquaculture and preliminary results show that land-based agricultural management practices can protect water quality and prevent future outbreaks. ARS has $801,600 and 2 SYs currently for Pfiesteria research. In terms of hypoxia research, ARS currently has no funding that will provide direct solutions at the farm and watershed-scale to the problem of increased nutrient loadings into the Gulf of Mexico.

—*Predict Impacts and Restore the Viability of Damaged Riparian Zones and Coastal Habitats*.—ARS has been the primary agency involved in determining the effectiveness of conservation buffers for the removal of nutrients, pesticides and other pollutants. The Clean Water Action Plan calls for farmers to create two million miles of biofilters adjacent to waterways by year 2002, construct 100,000 acres of wetlands by 2005 and restore 25,000 miles of stream corridors by 2005 without knowing the capabilities of these practices in agricultural areas throughout the United States. ARS has shown that conservation buffers can remove sediments and contaminants generated by agricultural activities before they reach surface waters, but limited data are available on the long-term effectiveness of conservation buffers for the removal of nutrients, pesticides, pathogens, and other pollutants. ARS has $1,558,800 and 6 SYs involved in wetlands and conservation buffers research.

—*Predict Ecological Impacts of Extreme Natural Events. ARS currently conducts weather and climate research at several locations*.—The major thrust of this research is to obtain more reliable information on the spatial and temporal distributions of precipitation and temperature for several major physiographic regions of the country. ARS has developed weather generators that can assist food and fiber producers and resource managers in developing strategies for coping with weather variability and climatic extremes. The funds requested in the

budget for fiscal year 2000 will be used to improve our current ability to predict the ecological impacts of extreme climatic events through the development of new and improved techniques for determining trends in climate and the impacts of oceanic anomalies, such as the El Nino, on the frequency and severity of extreme climatic events, such as floods and droughts, at watershed and river basin scales. ARS has funding of $14,876,800 and 54 SYs involved in weather and climate research.

—*Advance Ecological Science for Sustainable Livestock Management Systems*.—ARS has recently refocused its manure and byproduct research to reduce nutrient enrichment of soil and water, to decrease release of odor causing compounds and greenhouse gases to the atmosphere, and control pathogens in manure for public and animal health. The current research has resulted in information and findings on the extent of manure problems and new methods for manure handling, storage, and treatment. Additional research is being conducted to protect surface waters from build up of excess phosphorous in soils, and future research is planned on reducing pathogens from animal feeding operations. ARS has funding of $7,195,400 and 21 SYs involved in manure and byproduct utilization research.

—*Conduct Integrated Ecosystem Risk Assessments*.—ARS currently conducts research on understanding the mechanisms by which agricultural operations affect natural resources, on control measures to ameliorate these impacts, and develops models and decision support systems for comparing different crop and livestock management systems in terms of effects on natural resources. ARS has developed models for predicting soil erosion, water quality impacts at the farm- and watershed-scales, and crop and livestock response based on different levels of inputs. However, action and regulatory agencies are currently being required to conduct risk assessments before and after conservation management practices are placed on the land. ARS has funding of $850,100 and 3 SYs involved in the development of integrated natural resource, crop, and livestock models.

—*Prevent and Control Invasive Weed Species for Ecosystem Management*.—ARS has an extensive weed research program that addresses conventional weed problems on natural areas, waterways, croplands, rangelands, and pasture lands; and ARS is currently conducting some research on a number of invasive weed species, including the control of invasive weed species such as melaleuca, leafy spurge, salt cedar, and yellow starthistle. ARS has shown that integrated pest management (IPM) systems that include biological control, cultivation, other cultural approaches, and appropriate herbicide management practices can be used to prevent and control weed species; however, prevention and control of invasive weed species is needed for many agricultural ecosystems. ARS currently provides $10,137,300 in funding and 34 SYs for invasive weed species research.

Air Quality.—The Agricultural Research Service conducts air quality research on issues associated with agricultural emissions of particulate matter (as dusts or as such volatilized particulate precursors as ammonia and pesticides) and odors. Research goals are to understand the physics and chemistry of these emissions, to develop approaches to reducing emissions, and to develop simulation models to use in evaluating alternative emission-reduction strategies. Research is also conducted regarding physiological mechanisms of ozone damage to crops and the development of measures to reduce crop damage by ozone. The Agency has developed a technique for analyzing dust particles to determine sources of origin, the level of differentiation being sufficient at this time to distinguish between roads, crop lands, and rangelands. A computer-based predictive model for particulate matter (PM–10) has been developed for the Columbia Plateau region of Washington. Co-composting of dairy manure with municipal refuse compost reduced volatile loss of nitrogen by 90 percent compared with composting dairy manure alone. The Agency has provided some of the first evidence that plants' antioxidants (like ascorbic acid or vitamin C) help protect them from the oxidative damage caused by ozone. The Agency played a significant role in research and reporting that led to publication of "Farming with the Wind—Best Management Practices for Controlling Wind Erosion and Air Quality on Columbia Plateau Croplands". The Agricultural Research Service currently allocates $4.9 million and 18 scientist years to the air quality research initiative, not counting the odors research. The latter, which is currently carried out at the $1.3 million level with 5 scientist years, is reported under an animal wastes research initiative.

ENVIRONMENTAL INITIATIVES

Question. The fiscal year 2000 budget proposes increased ARS funding for the Administration's global change initiative. Please describe the agency's current research effort in this area, what is being accomplished, and the importance of this research to agriculture in the United States.

Answer. For the past several years, ARS's global change research has focused on determining the likely effects of global change on: (1) Ecosystem dynamics, i.e. how will the increasing atmospheric CO_2 concentration and any accompanying climate change affect the productivity and water requirements of agricultural crops in the future; (2) Biogeochemical dynamics, i.e. what are the amounts of greenhouse gases (carbon dioxide, methane, nitrous oxide) being emitted and stored by agriculture and how are these amounts likely to change in the future; and (3) Hydrologic processes, i.e. how to improve predictions of water and energy flows to, within, and from managed ecosystems and how they will change in the future.

ARS research has determined the rates of storage and emission of carbon dioxide from soils under various tillage systems and from the undisturbed soils of rangelands. The emissions of methane and nitrous oxide from soils and livestock waste lagoons have also been measured. The responses of several of the most important crops, especially soybean, rice, cotton, and wheat, to elevated levels of carbon dioxide and its interactions with other environmental variables have been observed. Our understanding of the effects on specific plant physiological processes, such as photosynthesis, has been increased. From monitoring of experimental watersheds, long-term hydrologic, climatic, and vegetation databases have been developed that are useful for documenting change and developing an understanding of hydrologic processes and climatic effects on crop and livestock production.

One accomplishment from the past year is especially noteworthy. ARS scientists along with colleagues from Ohio State University and from the Natural Resources Conservation Service published a keystone book on *The Potential of U.S. Cropland to Sequester Carbon and Mitigate the Greenhouse Effect.* Refinements are needed, but nevertheless, this book is a major accomplishment that is being used by nearly everyone in and outside of government who is looking for guidance on the soil carbon sequestration issue. The authors' calculations suggest there is a huge potential for sequestering carbon in soils if conservation management practices are adopted, practices which would additionally reduce erosion and improve soil tilth.

The importance of global change, and of the research needed to prepare for it, is very high for agriculture. Agriculture is more sensitive to weather than any other economic sector, and climate is the primary determinant of agricultural productivity. Climate change is expected to influence crop and livestock production, hydrologic balances, and input supplies. For example, crop and livestock yields are directly affected by changes in temperature, precipitation, and the frequency of droughts, floods, and wind storms. Climate change may also change the types, frequencies, and intensities of various pests, the availability and timing of irrigation water supplies, and the severity of soil erosion. Trying to cope with the vagaries of weather is not new for agriculture. However, the increased carbon dioxide concentration in the atmosphere adds a new dimension to the issue because it is an essential plant nutrient for photosynthesis, and higher concentrations have the potential to actually enhance productivity of agricultural systems.

Global change research in agriculture is also important for devising ways to mitigate the increases in greenhouse gas concentrations in the atmosphere. As already mentioned, with improved management practices on the hundreds of millions of acres of agricultural land, significant quantities of carbon could potentially be stored in soils, and methane and nitrous oxide emissions could also be reduced. Agriculture could potentially also provide biomass as a alternative to burning fossil fuels.

CENTERS OF EXCELLENCE

Question. Please list the Centers of Excellence receiving ARS funding for each of fiscal years 1998 and 1999, and the funds proposed for each Center in the fiscal year 2000 budget request. Please list the institution, the amount of funding, and describe the research program funded.

Answer. The location, funding and staffing levels of the ARS Centers of Excellence for fiscal years 1998, 1999 and proposed for 2000 are as follows:

Location	Fiscal year 1998		Fiscal year 1999		Fiscal year 2000	
	Funds	Scientists	Funds	Scientists	Funds	Scientists
University of Arkansas Pine Bluff, AR	537,900	2.0	$531,400	2.0	$531,400	2.0
Delaware State University Dover, DE	248,500	1.0	241,400	1.0	241,400	1.0

Location	Fiscal year 1998		Fiscal year 1999		Fiscal year 2000	
	Funds	Scientists	Funds	Scientists	Funds	Scientists
University of Maryland Princess Anne, MD	244,400	1.0	541,900	1.0	541,900	1.0
Alcorn State University Lorman, MS	164,700	1.0	162,700	1.0	162,700	1.0
Langston University Langston, OK	199,000	.....	444,600	1.0	444,600	1.0
Tennessee State University McMinnville, TN	488,400	2.0	482,500	2.0	482,500	2.0
Total	1,882,900	7.0	2,404,500	8.0	2,404,500	8.0

The research programs at each of the Centers will be provided for the record.

Swine Production at Alcorn State University.—The objective of the program is to develop an efficient system for the production of meat type hogs in the Southern United States. The research includes the evaluation of breeds of swine suitable for production in Southern climates, the use of local feeds, and development of feeding systems to obtain efficient production of pork.

Aquaculture Products at Delaware State University.—This program will develop rapid detection and monitoring methods for pathogens and spoilage microorganisms in aquaculture processes and products and improving the efficiency of purging contaminants in order to prevent human illnesses.

Grazing Lands at Langston University, Oklahoma.—The objective of this program is to determine impact of pasture design and grazing animals on quality of water emerging from watersheds, and develop pasture management systems that will optimize water quality and productivity in the semi-arid U.S.

Horticulture at Tennessee State University, McMinnville.—The objective of the program is to develop new and improved ornamental trees and shrubs for the U.S. nursery industry. The research includes development of basic genetic and physiological information related to nursery crop species; reduce pesticide use and fertilizer runoff during nursery crop production; develop improved nursery crop propagation methods; and evaluate existing germplasm or ornamental trees and shrubs for pest resistance, tolerance of environmental stress, and superior ornamental value.

Aquaculture at University of Arkansas at Pine Bluff.—The ARS Aquaculture Systems Research Unit develops and evaluates new or alternative aquaculture production systems, particularly small scale systems, and develops new components of these systems to improve the efficiency of fresh water fish farming. Research also addresses improvement of cultivation and processing methods to enhance the quality of farm-raised fish and their products.

Critical Control Points in Model Systems at University of Maryland Eastern Shore (UMES).—The program seeks to determine the natural prevalence of bacterial pathogens in poultry grow-out houses, processing plants, and in distribution channels; to conduct challenge studies on critical control points in model systems to provide data for predictive model development; and to develop risk assessment models for use in hazard management systems. In particular, the laboratory is developing risk assessment and predictive models to provide the scientific basis for Hazard Analysis Critical Control Point (HACCP) systems in poultry production, processing, and distribution. ARS research is conducted in close collaboration with the USDA Food Safety & Inspection Service (FSIS), providing critical research to support their regulatory mission.

NATIONAL AGRICULTURAL LIBRARY

Question. Please describe in greater detail the $2 million research initiative the National Agricultural Library (NAL) proposes to improve information services for rural America, including how information currently is made available by the library to farmers and rural communities; how this initiative will improve that information flow; specifically how the $2 million requested will be spent, and which universities and "Centers of Excellence" will be involved in this initiative.

Answer. The increase of $2,000,000 is for an Initiative on Digital Libraries for Rural America. This is a natural extension of current services provided by the National Agricultural Library (NAL) to the entire U.S. population. General information services provided by NAL include reference, online searching, interlibrary loan, and information products. In addition, NAL provides leadership for the Agriculture Network Information Center (AgNIC), a collaborative effort of twenty-three institutions (mostly land-grant universities) to organize and provide universal access to quality Internet information resources on agriculture and related sciences. NAL currently provides information to farmers and rural communities on such topics as: sustainable agriculture, nutrition, and rural economic development.

NAL recognizes that there is much more information that would be beneficial to rural communities, but not all that information is available in electronic format. This initiative will improve information flow by developing specific electronic information resources of use to rural America. This new funding will enable NAL, in partnership with the land-grant community, to assess the information needs of rural citizens, ensure that needed information is made available, and facilitate the use of that information by rural citizens and others involved in rural development.

The $2,000,000 requested will be used to improve the electronic delivery infrastructure available to rural communities and to add significant subject content. A portion of the funding will be used at NAL to enhance delivery infrastructure. The remainder of the funding will be made available to land-grant universities and other institutions to augment subject content, features, and services for rural America. NAL will establish criteria for selecting organizations to do that work, publicize the subject work to be done, and invite proposals. Funding will be provided to the institutions best able to do the work needed.

It is too early to know which universities and "Centers of Excellence" will be involved in this initiative. Over the past decade, NAL has worked closely with a number of land-grant universities including, but not limited to, Cornell University, Iowa State University, Michigan State University, New Mexico State University, North Carolina State University, Pennsylvania State University, Ohio State University, the University of Arizona, and the University of Wisconsin.

Question. The Committee is aware that the NAL serves as a storehouse for numerous art collections of major historical and botanical significance to horticulturists, historians, artists, and publishers from around the world. Please provide a list of the collections maintained by NAL and describe the importance of each collection. Also, how much does it cost NAL each year to maintain these collections, including the cost of making them accessible to historians and researchers around the world?

Answer. The Special Collections Section of the National Agricultural Library serves as a storehouse for, and provides access to, numerous rare and historical collections of artistic interest, including 15,000 rare books and more than 300 collections of watercolors, posters, nursery catalogs, photographs, and historic papers. These collections are consulted by users from throughout the world who conduct subject-specific research in all fields of agriculture. A representative list of important collections unique to NAL includes the following treasures:

—The USDA Pomological Watercolor Collection (1887–1937). This collection includes hand-painted, detailed, scientifically-accurate watercolors of fruit and nut species and varieties. It is the historical record of early research.

—The Nursery and Seed Trade Catalog Collection (1731–1999). This is one of the largest collections of nursery catalogs in the world, including some of the earliest U.S. catalogs. It is the historical record of the U.S. seed industry.

—The Horace J. McFarland Collection (ca. 1900–1940). The papers of this conservationist and publisher include one-of-a-kind glass plates documenting the history of landscape architecture and horticulture, as well as American rose introductions.

—The Forest Service Historical Photograph Collection (1898–1974). This collection includes 60,000 black and white photographs documenting rural life in America, forestry practices, and fire-fighting techniques.

—The Beverly T. Galloway Papers (1891–1933). The papers of the first Chief of the USDA Bureau of Plant Industry trace the history of plant pathology, plant exploration, and USDA cooperation with state universities.

—The Charles Valentine Riley Papers and Memorabilia. The papers of the Father of Biological Control document early USDA entomological research and the beginning of biological control.

—The Smokey Bear Campaign Collection (1902–1994). This collection documents one of the most successful public awareness campaigns and includes early Smokey posters, illustrations, and memorabilia.

NAL has an annual budget of approximately $70,000 to provide limited maintenance of and access to these materials. This level of funding is clearly inadequate to take proper care of the materials or to provide the access these collections deserve; it is not even enough to prevent deterioration of these items. An initial appropriation of $1 million is needed to begin to conserve and provide permanent public access to rare and irreplaceable materials.

In order to enhance NAL's ability to maintain and provide access to these special collections, NAL would use approximately 65 percent of the requested funds to provide access via the Internet and 35 percent of the requested funds to support initial maintenance and conservation activities. The seven collections described above represent NAL's top priorities. Funded activities would include:

Access ($650,000):

—Prepare materials for electronic access. Scan materials into electronic form.
—Make items available via the World Wide Web (WWW).
—Link full-text and images to AGRICOLA, NAL's database now available via the Internet.

Collection, Maintenance, and Conservation ($350,000):
—Rehouse materials into preservation quality media.
—Conduct a thorough survey of collections to determine appropriate conservation treatments and then to perform such activities that will retard further deterioration.
—Convert extremely fragile paper and photographic materials to longer lasting media such as acid free paper, slides, etc.
—Improve the storage environment to consistently meet national standards for temperature, humidity, and security, etc. to ensure their longevity.

Funding such an integrated program will enable us to enhance NAL's digital library with a unique and historically significant collections for use by researchers, students, and the general public.

BUILDINGS AND FACILITIES

Question. The explanatory notes indicate that the design of the Beltsville Human Nutrition Research Center is scheduled for completion in the second quarter of fiscal year 2000. Why are construction funds requested for Phase I of the facility for fiscal year 2000 rather than fiscal year 2001?

Answer. The design of the Beltsville Human Nutrition Research Center will be completed in the second quarter of fiscal year 2000. Construction funds are needed for Phase 1 in fiscal year 2000 in order to advertise and award a construction contract by the third quarter. If funds are not received until fiscal year 2001, the construction process will be delayed and the estimated construction cost will increase due to inflation.

Question. How many phases are proposed for construction of the new Human Nutrition Research Center? What funding is required for each phase of this project?

Answer. Two phases are proposed. Phase I requires $11.4 million in fiscal year 2000, and Phase II requires $10.8 million in fiscal year 2001.

Question. The fiscal year 2000 request proposes an increase of $4.4 million for modernization of the Eastern Regional Research Center in Philadelphia, PA. Will this funding be sufficient to complete the sixth phase of the Chemical Wing Laboratory? Please describe the nine phases of this project and the additional funding that will be required to complete this work.

Answer. The funds required to complete the sixth phase of the Chemical Wing Modernization are $4.4 million.

Phases 1 and 2 of the ERRC modernization renovates the Engineering Research Laboratory of the Pilot Plant and Service Buildings. The Chemical Wing construction consists of Phases 3 through 7. Once Phase 7 is accomplished, the Chemical Wing renovation will be complete. Phase 8 includes an addition to the Service Building (Power Plant) to allow for the higher load of steam and chilled water required for the expanded laboratory functions. Phase 9 consists of renovation of the Pilot Plant Wing Engineering Laboratories.

An additional $13 million will be required for Phases 7, 8, and 9.

Question. Provide the proposed schedule for modernization of each of the other ARS facilities for which funding is requested in the fiscal year 2000 budget. Include planned project phases, the funding provided to date, and the additional funding needed to complete the work scheduled.

Answer.

Western Regional Research Center Chemical Wing

Funding to Date (Chemical Wing):	
1990—Design (R&M)	$1,938,830
1990—Construction Phases I & II (R&M)	5,900,000
1991—Construction Phase III (R&M)	3,400,000
1993—Construction Phase IV (R&M)	3,000,000
1994—Construction Phase V (R&M)	4,900,000
1994—Construction Phase VI (R&M)	4,400,000
1994—Construction Phase VII (B&F)	1,161,000
1995—Construction Phase VII (B&F)	919,000

Western Regional Research Center Chemical Wing—Continued

1997—Construction Phase VII (B&F)	4,000,000
Total	29,618,830
Additional Funding Needs:	
2000—Design Research & Development Facility (RDF), all phases	2,600,000
2001—Construct RDF—all phases	19,600,000
Total	22,200,000

National Center for Agricultural Utilization Research

Funding to Date:	
1989—Study (R&M)	170,000
1990—Phasing Study (R&M)	56,000
1990—Design Phase I (Infrastructure Upgrade)	330,000
1991—Construction Phase I (R&M)	2,404,000
1992—Design Phase II, Pilot Plant (B&F) ($1.7 Allocated)	1,825,000
1993—Design Phase III Chemical Wing (B&F) (Redirected to Pilot Plant)	1,545,000
1996—Construction Phase II—Segment 1 Pilot Plant (B&F)	3,900,000
1997—Construction Phase II—Segment 1 Pilot Plant (B&F)	1,500,000
1998—Modernization Phase II—Segment 2 Pilot Plant (B&F)	8,000,000
1999—Modernization Phase II—Segment 3 Pilot Plant (B&F)	8,200,000
Total	27,930,000
Additional Funding Needs:	
Funding to Date:	
2000—Design Chemical Wing—all phases	1,800,000
2002—Construct Chemical Wing—Phase 1	5,900,000
2004—Construct Chemical Wing—Phase 2	7,400,000
2006—Construct Chemical Wing—Phase 3	8,000,000
Future—Design and construct South Wing and Administration Wing—All phases	30,900,000
Total	54,000,000

Southern Regional Research Center

Funding to Date (Chemical Wing):	
1990—Design (R&M)	884,000
1991—Construct Phase I (R&M)	1,400,000
1992—Construct Phase II (R&M)	2,400,000
1992—Construct Phase III, IV (R&M)	3,050,000
1992—Construct Phase V (B&F)	1,950,000
1993—Design/Construct Site Repairs (B&F)	1,651,000
1994—Construct Phase VI (B&F)	2,667,000
1995—Construct Phase VII (B&F)	2,934,000
1996—Construct Site Repairs, Phase II (B&F)	900,000
Total	17,836,000
Funding to Date (Industrial Wing):	
1998—Design (B&F) All phases	1,100,000
1999—Construct Phase 1 (B&F)	6,000,000
Total	7,100,000
Additional Funding Needs:	
2000—Construct Phase 2—Industrial Wing	5,500,000
2003—Construct Phase 3—Industrial Wing	14,000,000

Southern Regional Research Center—Continued

2005—Construct Phase 4—Industrial Wing	5,500,000
Total	15,000,000

Plum Island Animal Disease Center

Funding to Date:	
1992—Design (Redirected to Consolidation)	(2,000,000)
1993—Modernization	2,540,000
1993—APHIS Transfer	1,183,000
1994—Modernization	1,475,000
1994—APHIS Transfer	516,250
1995—Modernization	1,168,000
1995—APHIS Transfer	747,000
1996—Modernization	5,000,000
1996—APHIS Transfer	3,200,000
1997—Modernization	5,000,000
1997—APHIS Transfer	3,200,000
1998—Modernization	2,000,000
1998— APHIS Transfer	3,200,000
1999—Modernization	3,500,000
1999—APHIS Transfer	3,200,000
Total	35,929,250
Additional Funding Needs:	
2000—Modernization	8,200,000
Future	45,871,000
Total	54,071,000

Beltsville Agricultural Research Center (BARC)

Funding to Date:	
Fiscal year 1988:	
Renovate Building 007	2,000,000
Design Building 003	660,859
Renovate Abattoir, Building 204	57,446
Renovate Building 303	506,877
Modify HVAC, Building 306	372,270
Water Lines	1,402,195
Miscellaneous Projects, BARC (under $100,000)	374,234
Repair Building 307	88,064
Repair Building 467	10,835
Repair Building 264	5,480
Small Animal Facility Contingency	271,740
Total	5,750,000
Fiscal year 1989:	
U.S. National Arboretum Roof Repairs	300,852
U.S. National Arboretum Greenhouse Electrical Repairs	273,200
Steam Lines, Phase IV	1,100,000
Oil to Gas Conversion	328,237
Renovate Building 203 (Boar Facility)	529,026
U.S. National Arboretum, Relocate Service Road	87,643
Hazardous Waste Marshaling Facilities	79,662
Waste Water Treatment Study	194,864
Renovate Building 204	354,335
Beltsville Area Security	91,806
Pesticide Handling Facilities	441,793
Swing Space	274,100

Contingencies	531,000
Total	13,547,000
Fiscal year 1994:	
Modernize Building 001	9,700,000
Modernize East Potable Water System	7,400,000
Design New Animal Building	530,000
Upgrade West Electrical System	1,500,000
Design to Modernize Building 004	450,000
Contingencies	120,000
Total	19,700,000
Fiscal year 1995: Modernize Building 004	3,960,000
Fiscal year 1996:	
Construct Controlled Environment Facility	4,700,000
Design/Construct Infrastructure in 300 Area	2,000,000
Contingencies	60,000
New Animal Building Design	615,000
Cooling Tower for Building 004	375,000
Renovate Building 001	250,000
Total	8,000,000
Fiscal year 1997:	
Design New BHNRC Building	1,700,000
Infrastructure BARC—East	1,400,000
Fiber Optic Backbone Cabling	700,000
Contingencies	700,000
Total	4,500,000
Fiscal year 1998:	
Construct New Feed Center	1,970,000
Fiber Optic Backbone Cable	850,000
Contingencies	380,000
Total	3,200,000
Fiscal year 1999:	
Design/Construct New Poultry Barn	2,200,000
Demolish Facilities	100,000
Contingencies/Miscellaneous Small Projects	200,000
Total	2,500,000
Proposed fiscal year 2000:	
Construct BHNRC	11,400,000
Contingencies/Miscellaneous Small Projects	1,600,000
Total	13,000,000

The balance of funds needed beyond fiscal year 2000 is in excess of $83.7 million. Due to uncertainty regarding future funding levels, and potential changes to priority projects, the Agency has not developed a firm phasing plan beyond fiscal year 2000.

Question. What temporary space arrangements has ARS made to relocate its staff from the Army research laboratory at Presidio, due to the expiration of the lease at the end of April 1999?

Answer. On February 2, 1999, ARS executed a short-term lease agreement with the University of California, Davis, for laboratory and office space on campus for the temporary relocation of personnel and programs from ARS' space at the Army research laboratory at the Presidio, San Francisco. This lease is effective through March 31, 2003, and is renewable on a monthly basis.

Question. When will the agency conduct and complete the further review of the most cost-efficient size and capacity of the replacement facility for the water conservation and cotton research program, as directed by Congress last year? If complete, please provide the results/findings to the Committee.

Answer. ARS has conducted a review of the needs of its U.S. Water Conservation Laboratory and Western Cotton Research Laboratory in Phoenix and reevaluated the space requirements of a replacement facility. ARS' report is being reviewed by the Secretary's Office and should be submitted to Congress shortly.

Question. Provide the Committee with a status report on the urgency of facilities' improvements at the Avian Disease Oncology Laboratory in East Lansing, Michigan. Has ARS done a cost-benefit analysis on this facilities modernization project, in terms of the cost of constructing new facilities versus relocation of the research program? Please provide the results of that analysis to the Committee.

Answer. Building system components have exceeded their normal life expectancy and the existing facilities are in need of repair. Deficiencies include safety and health needs, such as fume hood upgrades, and ventilation issues in labs; accessibility issues; and building code compliance issues. These conditions have resulted in a facility that is costly to maintain and inadequate for present research programs. A four-phase program involving renovation, new construction, and demolition is underway. The total appropriations to date for planning and design are $2.262 million. The remaining need for construction, construction management, and contingency is estimated to be $17.2 million.

ARS is presently conducting an analysis of ARS' poultry health and related facility needs. Results of this study will be provided to the Committee when completed. The agency is moving forward with the design for the modernization of this facility which performs research on domestic diseases of chickens. The design project is expected to be completed by June, 2000.

Question. When will planning and design work funded over the last two fiscal years for the Poisonous Plant Laboratory, UT; Biocontrol and Insect Rearing Laboratory, MS; and Pest Quarantine and Integrated Pest Management Facility, MT be completed? Why isn't funding to begin construction of each of these facilities proposed for fiscal year 2000?

Answer. The Poisonous Plant Research Laboratory design will be awarded in the third quarter of fiscal year 1999 and will be completed in the first quarter of fiscal year 2001. Construction funding will be required in fiscal year 2001.

The name of the Biocontrol and Insect Rearing Laboratory has been changed to the National Biological Control Laboratory. The site design will be completed in fiscal year 1999, with full design of the facility completed in April 2000. Fiscal year 1998 funding of $900,000 for planning and design was rescinded by line item veto. The Agency did not anticipate that this would be reversed. Therefore, no construction funds were requested for fiscal year 2000. If fiscal year 2000 construction funding is available in the amount of $13.4 million, site work can be awarded in January 2000, with full laboratory construction awarded by August 2000.

The Pest Quarantine and Integrated Pest Management Facility design will be completed in the fourth quarter of fiscal year 1999. The necessary construction funds in the amount of $7.3 million were appropriated in fiscal year 1999. No further funding is required.

Question. Provide a report on each of the ARS projects for which funds were provided for fiscal years 1998 and 1999, indicating the current status of the work funded, and what additional funds will be required, if any, to complete the project.

Answer.

[The information follows:]

[Millions of dollars]

Project Location	Appropriated	Additional needed	Status
MAC, Mariocpa, AZ	1999—$0.5	$23.1	Project is on hold pending determination by the Agency of the most cost-effective size for the facility.
HWMRL, Parlier, CA	1998—$23.4	None	Construction will be completed in the Second Quarter of fiscal year 2000.
WHNRC, Davis, CA	1998—$5.2 1999—$6.15	9.0	Design will be complete Davis, in the Fourth Quarter of fiscal year 2000.
EBCL, Montpellier, France	1998—$3.4	None	Construction will be complete in the Fourth Quarter of fiscal year 1999.
PBRC, Hilo, HI	1999—$4.5	51.0	Design will be completed in the Fourth Quarter of fiscal year 2000.
NCAUR, Peoria, IL	1998—$8.0 1999—$8.2	54.0	Phase II, Segment 2, Pilot Plant construction will be complete in the Third Quarter of fiscal year 2000. Segment 3 design will be complete in the Fourth Quarter of fiscal year 1999 and construction will be awarded in the Fourth Quarter of fiscal year 2000.
NADC, Modernization, Ames, IA.	1999—$2.957 1999—$1.943 [1]	328.0	Waste Water Treatment Plant modernization design will be awarded in the Fourth Quarter of fiscal year 1999.
GRL, Manhattan, KS	1999—$1.4 1998—$1.1	8.25	Construction of Phases 1 and 2 will be awarded by the Third Quarter of fiscal year 1999.
SRRC, New Orleans, LA	1998—$1.1 1999—$6.0	15.0	Phase I (Industrial Wing) Design will be completed LA in the Second Quarter of fiscal year 1999. Construction will be awarded in the Third Quarter of fiscal year 1999.
BARC, Beltsville, MD	1998—$3.2 1999—$2.5	96.7	Feed Center design will be completed in the Second Quarter of fiscal year 1999. Poultry Production design will be awarded in the Third Quarter of fiscal year 1999. BHNRC design will be complete in the Second Quarter of fiscal year 2000.
NAL, Beltsville, MD	1998—$2.5 1999—$1.2	26.3	Construction of Phase I will be complete in the First Quarter of fiscal year 2000.
E. Lansing, MI	1998—$1.8	17.2	Design will be completed in the Second Quarter of fiscal year 2000.
Stoneville, MS	1998—$0.9 1999—$0.2	13.4	Design will be completed in the Third Quarter of fiscal year 2000.
Sidney, MT	1998—$0.606 1999—$7.3	None	Design will be completed in the Fourth Quarter of fiscal year 1999. Construction will be awarded in the First Quarter of fiscal year 2000.
Las Cruces, NM	1998—$0.7 1999—$6.7	None	Design will be completed in the Fourth Quarter of fiscal year 1999. Construction will be awarded in the First Quarter of fiscal year 2000.
PIADC, Greenport, NY	1998—$2.0 1999—$3.5	57.0+	Electrical modernization construction to be completed in the Third Quarter of fiscal year 1999. Sewage Decontamination Plant design will be awarded in the Third Quarter of fiscal year 1999. Boiler Plant Replacement design will be completed in the Third Quarter of fiscal year 1999.
Grand Forks, ND	1998—$4.40	None	Construction to be completed by the Third Quarter of fiscal year 1999.
ERRC, Wyndmoor, PA	1998—$5.0 1999—$3.3	17.4	Phase 3 and 4, construction will be completed in the First Quarter of fiscal year 2000. Phase 5 construction will be awarded in the First Quarter of fiscal year 2001.
Charleston, SC	1998—$4.824	14.6	Construction of Phase I will be completed in the Third Quarter of fiscal year 2001.
Logan, UT	1998—$0.6 1999—$0.030	8.6	Design will be awarded in the Third Quarter of fiscal year 1999.
Leetown, WV	1998—$6 1999—$2	None	Construction will be awarded in the Fourth Quarter of fiscal year 1999 with construction completion by the Fourth Quarter of fiscal year 2000.

[1] Reprogrammed.

Question. Does the Administration have any plans to close the Tucson laboratory which is conducting honeybee research?

Answer. ARS is considering its options for providing support to the honey bee industry through its honey bee laboratories. ARS has four honey bee laboratories that have some overlap in program assignment. ARS has a partially occupied new facility for honey bee research at Weslaco, Texas. ARS believes that it would realize increased operational efficiency through program consolidation that would strengthen honey bee research. ARS has consulted with the bee industry and with the University of Arizona on relocation of the program at Tucson to Weslaco. ARS will not propose a reduction in the number of scientists or funding for honey bee research.

Question. Please provide a list, by ARS project, of any available unobligated funds remaining from prior year appropriations.

Answer. The following is a list of available unobligated funds remaining from prior year appropriations as of 2/28/99:

[In thousands]

Project	*Unobligated Balances*
Albany, CA: Western Regional Research Center	$632
Athens, GA: Poultry Disease Laboratory	1,005
Charleston, SC: Vegetable Laboratory	762
Davis, CA: Western Human Nutrition Research Center	5,200
E. Lansing, MI: Avian Disease & Oncology Laboratory	655
Ft. Pierce, FL: Horticulture Laboratory	1,495
Grand Forks, ND: Human Nutrition Center	652
Greenport, NY: Plum Island Animal Disease Center	3,822
Las Cruces, NM: Jornada Range Research Center	602
Logan, UT: Poisonous Plant Research Laboratory	600
Lubbock, TX: Plant Stress Laboratory	647
Manhattan, KS:	
Grain Marketing Research Laboratory	13
Water Conservation Laboratory	396
Montpellier, France: European Biological Control Laboratory	335
New Orleans, LA: Southern Regional Research Center	232
Oxford, MS: National Center for Natural Products	7,000
Parlier, CA: Horticulture Crop Research Laboratory	6,604
Peoria, IL: National Center for Agricultural Utilization	Research
Philadelphia, PA: Eastern Regional Research Center	1,707
Riverside, CA: Salinity Laboratory	125
Sidney, MT: Pest Quarantine & Integrated Pest Management	495
Stoneville, MS: National Center for Warmwater Aquaculture	900
Stuttgart, AR: Rice Research Center	479
Weslaco, TX:	
Bee Laboratory	76
Subtropical Agricultural Research Laboratory	3,141
Leetown, WV: National Center for Cool & Cold Water Aquaculture	11,801
Beltsville, MD:	
Beltsville Agricultural Research Center	5,094
National Agricultural Library	94
Hurricane (Andrew/Iniki) Funds	11,177
Total	67,274

Question. Provide a list of the facilities' maintenance and repair work, by project and location, funded in each of fiscal years 1997, 1998, and 1999 and planned for fiscal year 2000, showing the cost of each.

Answer. The fiscal year 1997 repair and maintenance budget was $18.262 million. This amount includes $14.246 million in Agency funds, $900,000 for the National Agricultural Library, $740,000 for the USNA, and $2.376 million in BARC Renaissance 1993 funds. Some of the types of repair and maintenance projects funded in fiscal year 1997 include: roof repair, HVAC repair, plumbing repairs, upgrade to sewage lines, electrical repairs, fencing replacement, painting, pavement repair, asbestos and lead abatement, accessability projects, and replacement of fire alarm systems.

[The information follows:]

State/Location/Project	*Amount*
AL, Auburn: Install New Roof Bldg 3	$50,575
AR, Booneville: Replace Chill Water Air Conditioning System Bldg 1	54,880
AR, Stuttgart: Rehabilitate Levies at 27 Acre Reservoir	18,720

State/Location/Project	*Amount*
CA, Albany:	
Renovate Greenhouse Control & Ridge Vent Systems	222,840
Fire Alarms	24,825
CA, Davis: Resurface Access Road & Driveway	71,100
CO, Akron: Concrete Drive & Parking Area	151,650
CO, Ft. Collins: Area Energy Audits	7,228
DC, U.S. National Arboretum:	
Exterior Lighting	250,000
Paths, Irrigation, Drainage and Lighting	300,000
Bonsai Courtyard	35,000

PR, Mayaguez: Replace Vehicle Maintenance Building	15,000
TX, College Stn.:	
Comprehensive Facility Assessment	30,000
Repair Storm Damage to Greenhouses	293,500
Refurbish Interior Building 3	280,000
TX, Lubbock: Renovate Building 8	328,200
WA, Pullman: Upgrade Computer Controls in Greenhouse	29,760
WY, Cheyenne: Replace Roofs	31,000
WY, Laramie:	
Install Cooling System	45,000
Incinerator	100,000
Uncommitted at this time	3,071,391
Total	18,262,000

The fiscal year 2000 repair and maintenance budget is anticipated to be $18.262 million in Agency funds. Some of the types of repair and maintenance projects anticipated are: roof repairs, HVAC repairs, plumbing repairs, electrical repairs, water system repairs, sewage system repairs, road repairs, greenhouse repairs and reglazing, fencing replacements, telephone system repairs, painting, accessability projects, replacement of fire alarm systems, and Y2K upgrades.

Question. Please describe the agency's activities and funding obligations in each of fiscal years 1997 and 1998 under the provisions limiting construction, alteration, repair and improvements of buildings in the ARS appropriations language specifying (1) that the cost of constructing any one building shall not exceed $250,000; (2) head houses and greenhouses shall be limited to $1,000,000; and (3) no more than ten buildings can be constructed or improved at a cost not to exceed $500,000 each.

Answer. The agency's funding obligations in fiscal years 1997 and 1998 under the specified provisions are as follows:

Buildings not exceeding $250,000:	
1997 New Storage Building (Pacific West Area)	$207,000
1997 New Screenhouse Building (Pacific West Area)	113,000
1997 New Barn (Midwest Area)	90,000
1998 New Storage Building (Pacific West Area)	137,000
1998 New Shop Building (North Atlantic Area)	160,000
1998 New Residence (Beltsville Area)	115,000
Head house/Greenhouse not exceeding $1,000,000:	
1997 New Greenhouse, Riverside, CA	183,000
1998	[1]
Ten Small Buildings not exceeding $500,000:	
1997 Administrative Building (Southern Plains Area)	455,000
1997 Building A (Southern Plains Area)	205,000
1997 Building B (Southern Plains Area)	205,000
1998	[1]

[1] None.

RESEARCH ACTIVITIES

QUESTIONS SUBMITTED BY SENATOR COCHRAN

IMPLEMENTATION OF THE AGRICULTURAL RESEARCH, EXTENSION, AND EDUCATION REFORM ACT OF 1998

Question. The Agricultural Research, Extension and Education Reauthorization Act of 1998 amends the Competitive, Special, and Facilities Research Grant Act (1) to require grantees to arrange for scientific peer review of their proposed research and merit review of their proposed extension and education activities prior to award; and (2) an annual report of the results of the research, extension, or education activity and the merit of the results. How are these new statutory requirements being carried out? Will the new requirements for scientific peer review of re-

search grants and merit review of proposed extension and education activities delay the award of funds provided for fiscal year 1999?

Answer. Prior to the award of a grant by the Cooperative State Research, Education, and Extension Service, grantees are required to arrange for scientific peer review of their proposed research activities and merit review of their proposed extension and education activities. The review arranged by the grantee must provide a credible and independent assessment of the proposed project. A credible review is one that provides an appraisal of technical quality and relevance sufficient for an organizational representative to make an informed judgment as to whether the proposal is appropriate for submission for Federal support. To provide for an independent review, such review may include USDA employees, but should not be conducted solely by USDA employees. A notice of completion of the review must be conveyed in writing to the Cooperative State Research, Education, and Extension Service either as part of the submitted proposal or prior to the issuance of an award. The written notice constitutes certification by the applicant that a review has occurred. Annually, within 30 days of the anniversary date of each award, the recipient must submit a report describing the results of the research, extension or education activity and the merit of the results.

Regulations to implement these requirements were published as a proposed rule in the Federal Register on March 24, 1999. A 30-day period is provided for submission of public comments to be considered in the development of the final rule. To meet the statutory requirements, the Cooperative State Research, Education, and Extension Service cannot award fiscal year 1999 Special Grants until the final rule is published and recipients have certified that they have conducted reviews in accordance with the provisions of the final rule. It is anticipated that the final rule will be published in May. Therefore, the earliest date that Special Grants could be awarded is June 1999. However, while the rule making process is taking place, the Cooperative State Research, Education, and Extension Service is proceeding with the internal review of proposals and the preparation of grants for signature to minimize delays in making awards.

THOMAS JEFFERSON INITIATIVE

Question. The Agricultural Research, Extension, and Education Reauthorization Act of 1998 authorizes the Thomas Jefferson Initiative for Crop Diversification. The fiscal year 2000 budget proposes no funding for this program. Does the Administration support the program?

Answer. The Administration does support the Thomas Jefferson Initiative for Crop Diversification. The Initiative is funded directly through a Cooperative State Research, Education and Extension Fund for Rural America grant entitled "Diversifying Cropping Systems to Enhance Rural Development." The Center for Crop Diversification brings together a critical mass of partners and expertise to catalyze change in cropping systems and farming communities. The Center works with locally-led teams to develop new oilseeds, grains, fiber crops, and horticultural alternatives for targeted areas in the Midwest, Great Plains, and Pacific Northwest. Partners in this Center include farmers, non-profit organizations, and land-grant universities including the University of Missouri, Jefferson Institute, Purdue University, Iowa State University, University of Nebraska, Colorado State University, and Oregon State University.

This project proposes to help farmers return to the constructive practices of diversification. Over a 4-year period the Center will accomplish several objectives spanning on-farm research, economic analysis and marketing, and comprehensive education programs. Activities to enhance rural development include developing teams of farmers conducting on-farm research on new crop options; supporting the farmer teams with technical, management, and marketing assistance; and building local support through workshops, on-farm tours, information exchange, and leadership development. Additional objectives include: providing facilities; serving as a central information resource; and reducing institutional barriers to diversification.

Question. What funding would be needed for fiscal year 2000 to carry out the Thomas Jefferson Initiative for Crop Diversification?

Answer. No additional funds are needed. The current grant awarded under the Fund for Rural America program runs through year 2002.

U.S. GLOBAL CHANGE

Question. Please provide the Committee with an update on USDA's Global Change/UVB Monitoring Program. What is the importance of this program to U.S. agriculture?

Answer. The Cooperative State Research, Education and Extension Service, CSREES, is in the process of establishing a network for monitoring surface UV-B radiation which will meet the needs of the science community of the United States, and which will be compatible with similar networks being developed throughout the world. The fiscal year 1998 grant supports work through September, 1999.

This grant is part of a government-wide initiative. The research is closely coordinated with other Federal agencies involved in the U. S. Global Change Research Program Inter-agency UV-Monitoring Network Plan.

The principal researcher believes destruction of the stratospheric ozone layer, our shield from the full intensity of solar radiation, continues to increase. This creates a high priority need for information to document not only the levels of UV-B radiation reaching the earth's surface, but the climatology of that radiation. The United States, and the rest of the world, needs to know the strength of the UV-B radiation reaching the earth and the potential impact on all forms of life, especially animal and plant life of agriculturally-important species. The principal researcher believes this research to be of national as well as regional and local importance.

The USDA UV-B Network is to provide accurate, geographically-dispersed data on UV-B radiation reaching the surface of the earth and to detect trends over time in this type of radiation. A primary problem which had to be overcome in order to reach this goal is the development of instrumentation adequate to make the measurements required for the monitoring network.

Colorado State University is managing the operating network, which when completed will include all regions of the country. At least 30 sites are planned for the climatological network including sites in Hawaii, Alaska, and Puerto Rico in order to provide broad geographic coverage. Ten sites have been operational with broad band instruments for up to five years and 26 sites are now operational with new generation instruments. The research level network began with the first instrument installed at the Table Mountain, Colorado instrument intercomparison site and the second to be installed at the Department of Agriculture Plant Stress Laboratory at Beltsville, Maryland. Negotiations are underway with the Department of Energy Solar Radiation site near Ponca City, Oklahoma as part of the Atmospheric Radiation Measurements field network as a potential site for the third instrument to be deployed later in 1999.

As with other weather and climate observations, this network will be an ongoing need for the predictable future. These measurements will provide information on the nature and seriousness of UV-B radiation in the United States and will provide ground truth validation to other predictions of UV-B irradiance. The project has now met it's first objective of the establishment of a climatological network to monitor UV-B radiation at the surface of the earth. Years of operation will be required to measure trends in UV-B radiation and to develop models to predict the climatology of UV-B radiation.

SUSTAINABLE AGRICULTURE

Question. Provide a list of the Sustainable Agriculture Research and Education (SARE) research grants awarded for fiscal year 1998, including a description of the project, who conducted the research, and the amount of the award.

Answer. The list of the Sustainable Agriculture Research and Education (SARE) research grants awarded for fiscal year 1998 are as follows. Projects starting with E are Extension funds.

[The information follows:]

SUSTAINABLE AGRICULTURE RESEARCH AND EDUCATION (SARE) RESEARCH GRANTS AWARDED FOR FISCAL YEAR 1998

Project number	Project title	Project Coordinator	SARE
ENC98–028	Alternative Information Networking to Support Sustainable Agriculture on Small Farms.	John Ikerd	$32,950
ENC98–029	Michigan Field Crop Ecology: Training and Field Demonstration.	Natalie Bement-Rector ..	47,677
ENC98–030	Marketplace '99	Thomas Hanson	12,600
ENC98–031	Revitalizing Community Development in the Dakotas.	Thomas Hanson	64,700
ENC98–032	Planning Sustainable Grazing Systems	Mark Boswell	45,740

SUSTAINABLE AGRICULTURE RESEARCH AND EDUCATION (SARE) RESEARCH GRANTS AWARDED FOR FISCAL YEAR 1998—Continued

Project number	Project title	Project Coordinator	SARE
ENC98–033	Developing Advanced Grazing Educational Materials and Schools on Sustainable and Profitable Grazing Systems for the North Central Region.	Henry Bartholomew	60,000
ENC98–034	Introduction to Management Intensive Grazing Systems Workshops and Resource Manual for Educators.	Deborah Cavanaugh-Grant.	32,308
ENC98–035	Workshops on Land Use and Farmland Policy ...	Kevin Schmidt	48,247
ENC98–036.1	Educate the Agricultural Educators and Bankers on Profitability, Lifestyle and Environmental Benefits of MIG for the Livestock Farmers of Central Wisconsin.	Paul Daigle	12,500
ENC98–037.1	Outreach Education for Permaculture as Native Science.	Ann Krush	36,450
ENE98–037	How to Keep Agriculture Sustainable: Training Trainers on Conserving Farmland & Resolving Land Use Conflicts in the Delmarva Peninsula.	Julia Freedgood	77,282
ENE98–038	Organic Grain Production Another Way	John Hall	90,100
ENE98–039	Northeast Training @ Support Network for Agriculture Development.	Judy Green	132,392
ENE98–040	Diagnostic Team Approach to Enhancing Dairy Farm Sustainability, Phase II.	William Heald	50,000
ENE98–041	Increasing Producer Adoption of Pasture of a Whole Farm System.	Edward Harwood	30,393
ENE98–042	Feeding Our Cities: Establishing a Strong Urban/Sustainable Agriculture Interface in Southern New England.	Michael T. Keilty	6,500
ENE98–043	Nutrient management Education: Development and Implementation of Training Modules on Basic Principles, Current State of Knowledge and Advances in Research.	Karen L. Gartley	6,500
ENE98–044	Locally Led Farmer Groups for Sustainable Agriculture: The Study Circle.	Jim Hanson	6,500
ENE98–045	Re-Inventing the Appalachian Shephard	Tom McConnel	6,500
ENE98–046	Conducting On-Farm Research: Enabling Farmers to Implement Sustainable Change in Agriculture.	Kathryne L. Everts	50,000
ES98–037	Oklahoma Master Woodland Owners Program ...	William G. Ross	23,640
ES98–038	Motivating Teams for Enterprise Facilitation	James V. Worstell	96,000
ES98–039	Multi Disciplinary Training on Pasture-Based Dairy System—A Sustainable Alternative for the Region.	Steve Washburn	52,578
ES98–040	Grazing Management Training to Enhance the Sustainability of Pasture-Based Beef Production Systems.	Jim Green	31,745
ES98–041	Training in Sustainable Systems Approach to Production, Harvesting, Processing and Marketing of Value Added Syrup Crops in MS and Surround States.	William Patton	99,912
ES98–042	Training in Agriculture Program (TAP)	Dorothy Barker	17,890

SUSTAINABLE AGRICULTURE RESEARCH AND EDUCATION (SARE) RESEARCH GRANTS AWARDED FOR FISCAL YEAR 1998—Continued

Project number	Project title	Project Coordinator	SARE
EW98–001	Broadening the Audience: Providing Sustainable Agriculture Education for Pest Control Advisors and Agricultural Consultants in California and Oregon through Multiple Information Delivery Systems.	David Chaney	80,100
EW98–004	Agroforestry Handbooks for Pacific Islands	Craig Elevitch	57,685
EW98–007	Navajo Noxious Weed Training Program	Wallace Tsosie	52,542
EW98–008	Organic Food Production and Marketing—Educational Resource Development.	Miles MeEvoy	19,100
EW98–009	Alternative Crop for Dryland Agriculture in the Intermountain Pacific Northwest.	Edward Adams	67,500
EW98–011	Portable Extension Office for Program Literature Exchange (PEOPLE).	Bob Barber	41,360
EW98–012	Covering New Ground: Tropical Cover Crops for Improving Soil Quality.	Richard Bowen	85,400
	TOTAL, EXTENSION		1,574,791
LNC98–125	Feasibility of Agroforestry System using Management Intensive Grazing in Eastern Black Walnut Plantation.	Sandra Hodge	48,487
LNC98–126	Marketing Sustainable and/or Organic Products in Small Metro Areas.	David Watt	41,355
LNC98–127	County Fair Tomato Cooperative: Developing an Organic Tomato Processing Cooperative.	Dan Nagengast	67,800
LNC98–128	Congregationally Supported Agriculture	Marvin Freiborg	38,900
LNC98–129	Strengthening Farms on the Edge: Developing Rural/Urban Partnerships.	Rebecca Cline	29,450
LNC98–130	Educating Consumers About Local, Sustainable Produced Meat.	Margaret Krome	23,200
LNC98–131	Travelling Food Processing/Educational Trailer.	Susan Houghton	41,138
LNC98–132	Producer-Owned Cooperative to Process and Market Sustainably Produced Pork.	Aaron Heley	23,590
LNC98–133	Strengthening Links Between Meat Producers, Processors, and Consumers.	Jenifer Buckley	6,000
LNC98–134	Perennial Legumes for Sustainable Pasture Systems.	Craig Sheaffer	99,800
LNC98–135	Annual Forages for Integrated Crop and Livestock Systems.	Burt Weichenthal	52,000
LNC98–136	Addressing Agricultural Practices and Water Quality Issues through Youth-Developed Decision Cases.	Marla Reicks	41,498
LNC98–137	Nutrient and Pesticide Loads in Subsurface Drainage from Organic and Conventional Cropping Practices.	Gregory McIsaac	78,902
LNC98–138	Soil Fertility Paradigms Evaluated through Collaboration On-Farm and On-Station.	Derrick Exner	59,027
LNC98–139	Innovative Tart Cherry Orchard Systems: Design, Evaluation, and Demonstration.	Charles Edson	75,000
LNC98–140	Soil Quality Improvement with Cover Crop Mixtures.	Eileen Kladivko	93,256
LNC98–141	Biological Control of Bacterial Diseases of Vegetable Crops.	Sally Miller	103,580
LNC98–142	Heartland Sustainable Agriculture Network	Jerry Jost	64,000

SW98–071	Annual Legumes in Fallow as an Integrated Crop/Livestock Alternative in the Central Great Plains.	James M. Krall	173,979
	TOTAL, RESEARCH		5,314,586

Question. Provide a list of the SARE producer grants awarded for Fiscal Year 1998.

Answer. In fiscal year 1998, 131 producer grants were awarded.

[The information follows:]

PRODUCER GRANTS GRANTS AWARDED FOR FISCAL YEAR 1998

Project number	Project title	Project Coordinator	SARE
FNC98–201	Wolf's Native Garden Project	Charlie Smoke	$4,160
FNC98–202	Expanding Partnerships Between Southern Michigan Cash Crop Farmers and Northern Michigan Livestock Farmers.	Henry Miller	5,000
FNC98–203	Southwestern Michigan Marketing Plan for Locally-Grown Produce.	Phillip Prillwitz	10,000
FNC98–204	On-Farm Market for High Quality, Locally Grown Products and an Experience for School Age Children.	Pamela Bosserd	4,490
FNC98–205	Deer Damage Abatement Research Project	Gary Mensinger	3,627
FNC98–206	Alternative Use for Small Tobacco Acreage in Southeastern Indian.	Denise Dailey	3,270

FORMULA FUNDS

Question. What is the rationale for the reductions proposed in formula grant funding? Why doesn't the Administration consider these programs a priority?

Answer. As you know, the Administration supports a balanced portfolio of funding for university-based agricultural research including formula programs, competitive grants, special grants and projects, and other programs such as Smith-Lever 3(d).

In fiscal year 1999, formula programs received approximately $540 million, almost five times the funding for competitive grants funded through the NRI. The Administration believes that the fiscal year 2000 budget proposals, which reduces this imbalance, actually results in increased funding for formula institutions.

This is because redirecting funds to competitive grant programs does not have to be at the expense of our land grant partners. In fiscal year 1998, land grant colleges and universities received approximately 75 percent of the funds awarded under CSREES competitive grant programs. If past percentages hold true, the proposed $81 million increase in the National Research Initiative in fiscal year 2000 may result in $61 million in additional research to land grant colleges and universities more than offsetting the proposed decrease in formula funds and ensuring that federal research, extension and education programs meet national priorities. The Administration also believes focusing on competitive programs will allow USDA to leverage research dollars from other agencies such as NSF, Environment Protection Agency, and National Institutes of Health to agricultural problems, thereby increasing the funding opportunities for land grant partners. A broadly competitive grant program will also ensure that scientific expertise from outside the land grant system will be brought to bear on agricultural problems, thereby increasing the potential return to taxpayers. Through this approach to research funding, the Administration believes more resources can be devoted to agricultural problems and we can continue to provide our farmers, ranchers and consumers with world-class cutting edge research to meet the ever increasing array of production, processing and nutritional challenges that face them.

Competitive grants are an important mechanism for achieving accountability to taxpayers. The Agricultural Research, Extension and Education Reform Act of 1998 sets specific standards for federally funded agricultural research activities, including activities resulting from formula funding programs. Section 101 (a) requires that agricultural research, extension or education activities address priority concerns that are of national, multi-state or regional in significance. The legislation also requires the Secretary of Agriculture set research priorities after consulting with persons who conduct or use agricultural, research, extension or education and that entities

receiving formula funds also develop a procedure for receiving such input into program development. Competitive grant programs provide an opportunity for the Administration to meet that statutory obligation to taxpayers. Following extensive consultation with stakeholders including the National Research, Extension and Education Advisory Board, the land grant university system, and producer representatives, the Administration develops a list of national agricultural research priorities for fiscal year 2000, including food safety, methyl bromide alternatives, small farms, Food Quality Protection Act implementation and water quality. Through the competitive grants process, the Cooperative State Research, Education, and Extension Service (CSREES) can ensure that scarce federal resources are used to address these high priority concerns. States and localities may still choose to invest the funds they receive through formula programs or other sources to address issues of immediate state and local concern as identified through their own stakeholder input process. Since they are free to use those funds, as well as the funds they receive from formula programs in the manner they choose, the impact of the proposed fiscal year 2000 budget will vary from state to state.

Question. How is the increased funding provided for fiscal year 1999 for each formula program being used?

Answer. The laws authorizing Federal formula programs enable the States to determine how to use their formula allocations for specific projects or programs to address critical issues facing agriculture in their States, region, and the Nation. Generally, the areas of research supported with Hatch Act funding include forest and natural resources; crop resources; animal resources; people, communities and institutions; competitions trade, adjustment, price, and income policy; and food science and human nutrition. The areas of research supported with McIntire-Stennis funding include timber production; forest land management; wood utilization; the associated development of new products and distribution systems; and wildlife, recreation, water, range, and environmental quality. Evans-Allen funding supports research emphasizing small-scale agriculture; human nutrition; rural development and quality of living; crop resources; and animal resources. Animal Health and Disease funding is dedicated to improving the health and productivity of animals; protecting human health through control of animal diseases transmissible to humans; minimizing livestock and poultry losses resulting from transportation and handling; and facilitating the effective treatment and prevention of animal diseases.

Funds provided to the States under the Smith-Lever 3(b) and (c) formula program support base extension programs in Nutrition, Diet and Health; Natural Resources and Environmental Management; 4-H and Youth Development; Leadership and Volunteer Development. The base programs are the foundation of the extension mission, but there are special emphasis areas that are periodically targeted as National Initiatives by the Cooperative Extension System. Currently, the National Initiatives include Food Safety and Quality; Children, Youth, and Families at Risk; Managing Change in Agriculture; Workforce Preparation; Healthy People/Healthy Communities; Animal Waste; and Child Care. Formula funds provided to the 1890 Institutions for extension activities are used to address the needs of small-scale and minority agricultural producers and other limited-resource audiences.

MANAGEMENT

Question. How does CSREES cover its overhead and management costs? Please provide an accounting of these costs for fiscal year 1998.

Answer. Funds to administer CSREES' programs are obtained in primarily two ways: from a percentage set-aside of a program's total appropriation or from funds appropriated specifically for Federal administration. An accounting of these costs for fiscal year 1998 are as follows:

Fiscal Year 1998 CSREES Management Costs

Personnel Compensation:	
Total personnel compensation	$20,336,340
Personnel benefits	5,016,930
Benefits for former personnel	728
Total Personnel Comp. & Benefits	25,353,998
Other Costs:	
Travel	1,647,529
Transportation of things	82,222
Communications, utilities, and misc. charges	907,585
Printing and reproduction	988,641

Advisory and assistance services	148,716
Other services	1,149,181
Purchases of goods and services from Government Accounts	1,041,678
Supplies and materials	460,279
Equipment	285,972
Interest for prompt payment	414
Total Other Costs	7,712,217
Total Fiscal Year 1998 Management Costs	33,066,215

Question. How does CSREES cover the indirect costs of research? Please provide an accounting of these costs for fiscal year 1998.

Answer. The indirect costs of research conducted by land-grant universities and other recipients of CSREES funding are realized in two ways. First, a percentage of funds may be charged by recipients against competitively-awarded research grants to pay indirect costs. The percentage of funds that can be used to pay indirect costs is subject to the recipient's Federally-negotiated indirect cost rate and any statutory limitations on indirect cost recovery. For example, Section 711 of the General Provisions of the fiscal year 1999 appropriations act, Public Law 105–277, limits the recovery of indirect costs under research grants awarded by CSREES to 14 percent.

Second, indirect costs of research are borne by land-grant universities and other recipients under certain situations. For example, a recipient may elect to waive all or part of the indirect costs to which they are entitled so that all, or a larger portion of, the Federal funds provided under an award are used to support the direct costs of the research. In cases where indirect costs are statutorily limited, the recipient must use other resources to offset differences between allowed and actual indirect costs. There also are some CSREES programs under which no indirect cost recovery is allowed, such as earmarked Special Research Grants, and the recipient must bear all indirect costs of the research being conducted.

The fiscal year 1998 funds awarded and indirect costs charged in those research programs allowing indirect costs are shown below:

Program	Total Funds Awarded	Indirect Costs Charged
Federal Administration	$7,833,643	$875,173
Higher Education	4,330,108	342,708
National Research Initiative	50,622,574	6,493,936
Special Research Grants (competitively-awarded)	5,857,333	617,603
Totals	68,643,658	8,329,420

COMPETITIVE GRANTS

Question. The President's fiscal year 2000 budget for the Cooperative State Research, Education, and Extension Service indicates a shift in funding from formula and special research grants to competitive research. What evidence is there to support that the competitive process selects higher priority agriculture research of greater benefit to agricultural producers than research funded through formula or special grants?

Answer. The Administration believes that the highest possible rate of return to funds allocated for agricultural research is through a balanced portfolio of funding for university-based agricultural research including formula programs, competitive grants, special grants and projects, and other programs such as Smith-Lever 3(d).

The Administration, under the Agricultural Research, Extension, and Education Reform Act of 1998 has a statutory mandate to ensure that agricultural research, extension, and education activities address national, multi-state, or regional priorities. The Administration sets these priorities through on-going consultation with the National Research, Extension, and Education Advisory Board, the land grant research and extension system, and producer organizations. This stakeholder input process ensures that competitive grant programs meet national, multistate, or regional priorities. Competitive grants can also be a tool to address national issues which have a narrower regional focus. For instance, the fiscal year 2000 budget contains a request for $5 million to support competitive grants for Methyl Bromide alternatives. This program will benefit producers in very specific areas of the country

while addressing a pressing national need. Also, while competitive grant program areas address broad national priorities, the individual proposals which are submitted and funded may represent issues of particular local concern.

The Administration also believes that competitive grant programs, open to a broad array of scientists, will attract the best scientific talent to the solution of high priority agricultural problems. In fact, much of the best talent lies within the land grant college and university system. In fiscal year 1998, approximately 75 percent of grants funded under CSREES' National Research Initiative—NRI—went to institutions in the land grant system. Through competitive programs, such as the NRI, land grant colleges and universities receive research support, and taxpayers are assured that scarce funds are addressing problems of the highest national priority. States and localities may, of course, use formula fund resources, state funds, and private support to address the local priorities of their stakeholders, as allowed under the authorizing statutes for these programs.

Question. For each of fiscal years 1997 and 1998, show who received funding awards through the National Research Initiative, e.g., the percent of funds awarded to land-grant colleges and universities, to the Agricultural Research Service, to other federal agencies, to state extension agencies, etc.

Answer.

[The information follows:]

NATIONAL RESEARCH INITIATIVE COMPETITIVE GRANTS PROGRAM GRANTS AWARDED FROM FISCAL YEARS 1997 APPROPRIATION

Performing organization	Grants awarded in fiscal year 1997	Dollars awarded in fiscal year 1997	Percentage of funds awarded in fiscal year 1997	Grants awarded in fiscal year 1998	Dollars awarded in fiscal year 1998	Percentage of funds awarded in fiscal year 1998

NATIONAL RESEARCH INITIATIVE

Question. The fiscal year 2000 budget justification indicates a $43,407,663 carryover into fiscal year 1999 of funds available for the National Research Initiative. No carryover into fiscal year 2000 is estimated. What is the reason for the $43,407,663 carryover?

Answer. The no year funding authority for the National Research Initiative has allowed greater flexibility in awarding grants with start dates that best suit the needs of the research area. Carryover funds largely represent grants that were reviewed in the previous fiscal year, but that have start dates after September 30th. Most of these grants will start sometime in the fall or early winter of the following fiscal year. Starting grants later allows investigators who do field work to start their investigations as necessary to take advantage of a summer growing season. In addition, being able to carryover funds from one fiscal year to the next distributes the work load required to administer awards more uniformly during any given 12-month period. Without carryover, work load was concentrated during a short time period at the end of each fiscal year which became unmanageable under the heavy workload CSREES sustains (over 2000 awards each year). Carryover funding also provides CSREES with greater flexibility in funding programs and taking advantage of new research opportunities by offering new programs and by combining small amounts of funds from successive years into meaningful programs.

FOOD SAFETY INITIATIVE

Question. The conferees on the fiscal year 1999 Appropriations Act directed USDA to consult with the Food and Drug Administration (FDA) regarding food safety objectives and recommended that $5 million of the food safety component of the National Research Initiative be used to meet those needs. What consultations with FDA occurred and what food safety objectives were identified? Is $5 million of the NRI food safety funds being reserved for this research?

Answer. The Conference report of Oct 2, 1998, directed USDA to consult with the Food and Drug Administration—FDA—regarding food safety research objectives of that agency and recommended that $5.0 million of the funds provided for the food safety component of the National Research Initiative—NRI—be used to meet those needs. In meeting this directive, the NRI program staff developed from stakeholder meetings and the National Food Safety Conference a list of research areas that addressed the President's Food Safety Initiative and supported the public health mission of Federal regulatory agencies. These food safety research areas were provided to, and a joint meeting held with, representatives from the FDA's Center for Food Safety and Applied Nutrition, as well as from agencies within USDA, including the Food Safety and Inspection Service, the Agriculture Marketing Service, the Office of Risk Assessment and Cost-Benefit Analysis, the Economic Research Service, and the Agricultural Research Service. As a result, a supplemental NRI program titled, Epidemiological Approaches for Food Safety, was developed. The program will support research in the following areas:(a) identification of sources and reservoirs of pathogenic organisms and their toxins in food, animal feed, and the environment; (b) determination of the levels of microbial contamination in finished food products; (c) identification of farm-based production practices that contribute to increased prevalence of foodborne pathogens; and (d) identification of potential sites of contamination in the processing, transportation, retail setting, and consumer use of food products. Proposals are encouraged that use collaborations and partnerships among institutions and bring a multidisciplinary approach to derive innovative approaches to solve problems. Proposals are to describe how research outcomes will be transferred for implementation. It is anticipated that some awards will be granted up to $1 million in fiscal year 2000. The deadline for submission of proposals was April 5, 1999. This research will provide a better understanding of the multiple factors involved in food safety and provide science-based information for those who establish public health policy. The information from this research will help to better identify the sources, incidence, and control of disease-causing microorganisms in meats, poultry, seafood, fruits and vegetables, and other food products.

NATIONAL RESEARCH INITIATIVE

Question. The prepared testimony submitted to the Committee indicates that the increase requested for the National Research Initiative (NRI) will "enable the NRI to attract more of the best scientists." How will a funding increase do this?

Answer. The National Research Initiative is the largest competitive research grants program in the USDA and is unique because all scientists throughout the country, regardless of where they work, are eligible to compete for funds. However,

at current funding levels, the NRI is not positioned to take full advantage of the potential scientific expertise because inadequate funding discourages many excellent scientists from participating in USDA programs. Agriculture needs to attract the best scientists, regardless of where they work, to address key research problems. This is best done by competitive programs at adequate levels of funding. Increased funding for the NRI also means that additional funds would be available for agricultural research at small and midsized institutions and in states that typically are less successful in the competitive grants arena. These funds are provided through the NRI Strengthening Program which targets 10 percent of total NRI funding towards small and midsized institutions and institutions in USDA EPSCoR states. As funds for the NRI increase, so do funds for the Strengthening program. Finally, substantial funding increases would attract beginning investigators into scientific fields that would benefit the agricultural system by increasing available funds for postdoctoral fellows and new investigators grants.

EXTENSION ACTIVITIES

Expanded Food and Nutrition Education Program (EFNEP)

Question. Why is the Administration proposing a $2.348 million increase in funding for the Smith-Lever 3(d) Food and Nutrition Education Program for fiscal year 2000 when it proposed to cut the program by this same amount last year?

Answer. In fiscal year 1999, EFNEP and other CSREES programs were reduced to provide the funding necessary to support Department and Presidential initiatives and to help eliminate the Federal deficit. In fiscal year 2000, the budget once again focuses on high priority research, education, and extension programs including the Expanded Food and Nutrition Education Program. EFNEP has been and continues to be very effective in providing low-income families information to increase nutritional knowledge and improve nutritional practices. The delivery and use of dietary information is critical to meeting the needs of the undernourished portion of the population, especially children. This multi-faceted program addresses many USDA and national goals and initiatives, including the President's Initiatives on Food Safety and Child Care.

FARM SAFETY AND AGRABILITY

Question. Why does the Administration propose to discontinue funding for the Smith-Lever 3(d) farm safety and AgrAbility programs?

Answer. The U.S. Department of Agriculture has determined that alternative funds from formula programs, State and local governments, and private sources could be used to support aspects of this program deemed to be of a high priority at State and/or local levels.

RURAL HEALTH

Question. Please give the Committee an update on the Louisiana and Mississippi rural health projects funded for the last several years.

Answer. The focus of the Nurse Managed Family Health Care Center project being conducted by Southern University and A&M College in Baton Rouge, Louisiana is health promotion and disease prevention for at-risk populations residing in rural and inner city neighborhoods in south Louisiana. Quality, cost-effective, community-based primary health care services are being offered where graduate nurse faculty, nursing students, and physicians located in community health outreach centers assist women, children, and the elderly in understanding and utilizing self-care health practices.

More than 1,300 rural and urban citizens have been served by Nurse Managed Clinics and the Jag Mobile, a mobile health clinic equipped with a laboratory, patient processing areas, pharmacy, nurse's station, examination rooms, and a conference room for teaching. The clients include senior citizens, homeless individuals and families, refugees, battered women, and those seeking substance abuse treatment. In addition, 540 children enrolled in Head Start have received health services.

Services include: physical examinations; childhood vaccinations; and height and weight, blood pressure, and vision screenings. Health education is provided to participants to enhance health promotion and disease prevention by increasing self-care capabilities. Health education topics include nutrition, safety, breast self-examination, dental health, hypertension, and diabetes.

During fiscal year 1997, more than 200 nursing students from Southern University and A&M College and 44 nursing students from Southeastern in Hammond utilized the Jag Mobile as a clinical experience. Eight nutrition education students from Southern University and A&M College were also assigned to the mobile unit

for a clinical rotation. The Louisiana State Board of Nursing has granted approval for the Nurse Managed Clinic and the mobile unit to serve as training facilities for nursing students.

The Mississippi Rural Health Corps is a collaborative effort of the states' 15 community and junior colleges and Mississippi State University Extension Service to increase the number of health care professionals in rural practice. Since Fiscal Year 1993, the project has provided student loans to nursing and allied health students who are willing to commit to a period of service in rural Mississippi upon graduation.

Since the inception of the program, 1,499 students have graduated from the program. A total of 561 have completed their service obligation and 580 are currently completing their obligation by working in rural areas. In fiscal year 1998, 559 Rural Health Corp loans were awarded to nursing and allied health professional students enrolled in the community college system and 9 loans were granted to community college nursing faculty members to pursue advanced degrees.

In addition, statewide health education is provided by Mississippi State University Extension Service. In fiscal year 1998, the major focus was on increasing the understanding of medical self-care, breast cancer prevention, tobacco avoidance, and teen postponement of sexual involvement. One hundred thousand women were reached with breast self exam training, 20,000 individuals were taught medical self-care techniques, and a self-care Web site was created to provide health education throughout the state.

Mississippi State University Extension Service personnel form community based healthcare coalitions to expand the health education outreach. Currently, there are 18 active coalitions. During fiscal year 1998, the coalitions conducted 52 health-related events such as health fairs, health screenings, and a variety of seminars and workshops.

Last year for the first time, the Rural Medical Scholars program was started to interest high school students in serving as physicians in rural Mississippi. Twenty-eight students participated in a 5-week residential experience at Mississippi State University. The students completed two pre-med courses, "shadowed" physicians, and attended a lecture series for aspiring physicians. In fiscal year 1999, an additional week of training will be added. Thirty students will be selected for this program in fiscal year 1999.

In fiscal year 1999, the Scholars program will also be expanded to include a Rural Health Explorers component for high school students with a more general interest in health care careers. The Explorers will take one course, either anatomy or physiology, tour hospitals, interact with health care professionals, and talk with community college representatives about academic requirements for health care careers. The goal is to have thirty students complete the Rural Health Explorers program in fiscal year 1999.

1890 FACILITIES

Question. What is the current demand for 1890's facilities funding? Is the fiscal year 1999 funding sufficient to meet project requests from the 1890 institutions approved by the agency?

Answer. The availability of adequate agricultural research and education facilities at the 1890 Institutions currently lags far behind that of the 1862 institutions. There is a significant need to renovate buildings and to construct and equip new facilities at the 1890 Institutions to ensure high quality training for future scientists and educators, the recruitment and retention of faculty, and the needed infrastructure for the generation and dissemination of agricultural research and extension knowledge.

The fiscal year 1999 appropriation for Section 1447 is not sufficient to meet the project needs of the 17 institutions. The fiscal year 1999 funding allows an average award of less than $475,000 to each school. Usually a school stockpiles the funds over a period of several years until they have a critical mass of capital to enter into subcontracts for renovation or construction or to purchase equipment. Unfortunately, in situations such as this, the buying power of the funds are diminished by inflation. In addition, even after five years of funding at this level many schools are able to address only a portion of their needs.

Question. Provide a list, by 1890 institutions, of the renovation and construction projects funded in each of fiscal year 1997 and 1998.

Answer. As mentioned in the above response, projects completed in any one year may be funded by the accumulation of prior year funds. The 1890 facilities follows.

1980 FACILITIES PROGRAM SUMMARY OF PROGRESS

[Fiscal Years 1997 and 1998]

Institution	1997	1998
Alabama A&M University, Normal, Alabama ...	—Complete initial structural assessments and architectural renderings for the Research Extension Conference Center and the Food Science and Nutrition Laboratories —The Distance Learning Center is operative —The bid materials have been completed for the purchase of equipment for the farm, plant, food and animal biotechnology laboratories —Bids have been completed for replacement windows in the James I. Dawson Extension Building.	—Obtain modern lab equipment and other instructional resources to support traditional and non-traditional learning opportunities —Renovate and construct teaching and research training facilities for all program areas —Purchase state-of-the-art research and training equipment for food and agricultural sciences programs —Improve the coordination among extension, research and academic programs by enhancing extension facilities and equipment, including computer networking and distance education.
Tuskegee University, Tuskegee, Alabama	—A schematic drawing and plan of work was developed and presented to the University Administration for the renovation of the Woodruff Food Processing Laboratories —The asbestos survey was completed and a report was submitted to the University —The decision was made to renovate the Vocational Education Building for extension work —The construction of the Caprine Research Facility has been completed —The roof for Campbell Hall has been replaced These facilities will provide updated extension, research and education initiatives in food technology and processing laboratories to conduct hands-on demonstration for youth, family and community life experiences, interdisciplinary research on ruminants, agro-forestry, food processing, food safety and quality, and environmental quality and waste management.	—Renovate and upgrade Milbank Hall for research —Upgrade the Vocation Building as an Extension Activity Center —Upgrade gutters and repair Morrison-Mayberry Hall for extension activity.

1980 FACILITIES PROGRAM SUMMARY OF PROGRESS—Continued

[Fiscal Years 1997 and 1998]

Institution	1997	1998
University of Arkansas, Pine Bluff, Arkansas	—Purchase data processing equipment —Partially construct, furnish and equip the Extension complex —Purchase farm and laboratory supplies and equipment —Renovate farm structures —Partially construct a demonstration fish processing facility —Partially construct a sheep facility.	—Improve and further develop two farm sites to enhance the quality of research and outreach —Purchase equipment to support research, extension and instruction —Renovate Woodard Hall, which houses the departments of Agriculture and Aquaculture —Expand the child development laboratory and playground in Adair-Greenhouse Hall —Renovate farm structures including the S. J. Parker Research Center, and a fish hatchery.
Delaware State University, Dover, Delaware ...	—Complete the construction of the greenhouse —Begin construction of School of Agriculture herbarium —Construct ponds —Convert dairy barn to a small animal lab.	—Construct an animal handling, holding and teaching facility —Construct an office, laboratory and classroom building to support the research, extension and academic programs and centralize the location of two academic departments of the School of Agriculture, Natural Resources, Family and Consumer Sciences.

Florida A&M University, Tallahassee, Florida ..	—Complete construction of a facility to house research, teaching and extension demonstration animals —Complete construction of teleconference centers on campus and at the University farm site in Quincy, Florida —Purchase furniture and equipment for distance education programs —Develop feasibility proposal for multi purpose research and extension facility —Purchase equipment for a water quality lab and a plant biotechnology lab —Install irrigation wells for animal and vegetable research and demonstration projects —Initiate plans for construction of farm shop and an equipment shed at farm site —Repair a dam and construct a dock at a two acre pond for acquaculture and environmental studies —Renovate an entomology lab for research programs.	—Acquire land to construct a facility for research, teaching and extension aquaculture —Develop program plans and specifications for a multi-purpose research, teaching and extension facility —Monitor program plans for the construction of the agriculture multi-purpose research, teaching, and extension facility —Construct an outreach facility for youth development programs at the farm site —Develop environmental science programs for workshops, seminars, conferences, and distance learning programs for rural and urban youth and families.
Fort Valley State University, Fort Valley, Georgia.	Funds for fiscal years 1996 and 1997 have not been awarded pending the submission of proposals by the University. However, the objectives of the grant for the fiscal years 1993-1995 were for construction of a small ruminant research and extension center; a research, extension education support center; and a research, extension human development and family life center.	—Construction of a family development center —Acquisition of laboratory and demonstration equipment.
Kentucky State University, Frankfort, Kentucky.	—Repair roof, replace boiler, and complete the horticulture and entomology labs in the Atwood Research Facility —Purchase and install telecommunication and interactive video conferencing equipment in the extension building —Complete parking lot —Complete plumbing and electrical upgrades for the greenhouse —Initiate pond repair.	—Design, develop, and select a site for a research, extension and teaching aquaculture field station to expand the aquaculture program.

1980 FACILITIES PROGRAM SUMMARY OF PROGRESS—Continued

[Fiscal Years 1997 and 1998]

Institution	1997	1998
Southern University and A&M College, Baton Rouge, Louisiana.	—Purchase and install equipment including animal pens, electronic timers, portable bleachers, portable panels, poultry coops —Purchase a small vehicle —Purchase fire and sound evacuation, security and monitoring systems for the Multi-purpose Livestock Show Arena.	—Upgrade equipment in Fisher Hall to establish a state-of-the-art computer-assisted and multimedia instruction facility —Equip a Small Farm Family Resource Development Center —Complete the Multi-purpose Livestock Show Arena.
University of Maryland Eastern Shore, Princess Anne, Maryland.	—Design, plan, and construct the Food Science and Technology Research and Extension Center —Renovate the Lifespan Human Development Center.	—Site planning and design of the Plant Science Teaching and Research Center and an Ag Tech Center —Renovate the interactive teaching lab for the early childhood education program —Purchase equipment for research and teaching programs.
Alcorn State University, Lorman, MS	—Construct multi-purpose building —Renovate research facilities.	University is preparing a proposal for fiscal year 1998 funds.
Lincoln University, Jefferson City, Missouri	—Completed Phase 11 construction of Allen and Foster Halls for extension and research —Review plans and specifications for the beef cattle/sheep handling facilities, storage facility, vehicle storage facility, greenhouse and irrigation unit, and multi-purpose building.	—Construct greenhouse/propagation facility for research and teaching programs —Construct farm equipment/hay storage facility and mobile residence for research, teaching, and extension programs
North Carolina A&T State University, Greensboro, North Carolina.	—Continue renovation and construction on Coltrane Hall for extension —Initiate planning and construction of the Extension/Research Office Building —Initiate planning for renovation/conversion of Farm Barn —Renovate Ward Hall for research —Renovate Analytical and Food/Nutrition Labs —Purchase scientific equipment.	—Wire and connect offices and classrooms for teaching to fiber optic network in Benbow Hall, Carver Hall, C. H. Moore Ag Research Facility, Webb Hall, and Coltrane Hall —Upgrade equipment for School of Ag-IV Studio —Upgrade computer network equipment and purchase computers for Benbow Hall for research —Purchase scientific equipment for Analytical Services Laboratory for research —Purchase teleconferencing equipment for Coltrane Hall for extension

Langston University, Langston, Oklahoma	—Construct/renovate Extension/Research Complex.	—Construct/renovate Research/Extension Building —Construct/renovate greenhouse —Construct new facility to house teaching, research and extension programs
South Carolina State University, Orangeburg, South Carolina.	—Continue renovation/repair on residential youth camp —Continue construction on Distant Learning —Purchase equipment for Extension Office Complex.	—Complete construction on Extension Office Complex —Construct/Renovate Commercial Foodservice Management Laboratory Renovate R. L. Hurst Research Center Renovate Staley Hall for teaching
Tennessee State University Nashville, Tennessee.	—Construct a research and extension facility.	—Develop a comprehensive distance learning studio —Renovate/construct teaching learning center
Prairie View A&M University, Prairie View, Texas.	—Purchased some of the equipment needed for the Cooperative Agricultural Research Center (CARC) —Construct/renovate H.S. Estelle 4-H and Youth Camp —Renovate dairy goat center, creamery laboratory, meat laboratory, greenhouse, swine center, feed mill, poultry center, and human nutrition/food science laboratories.	—Continue to purchase equipment and vehicles for the CARC —Continue to construct H.S. Estelle 4-H and Youth Camp —Purchase equipment for Communications Network —Continue renovations for dairy goat center, creamery laboratory, meat laboratory, greenhouse, swine center, feed mill, poultry center, human nutrition/food science laboratories —Renovate Carden-Waller Extension Building —Renovate Jesse H. & Mary Gibbs Jones Building, calf/hay barn, and farm operations for research —Renovate teaching labs —Plan and construct Family Development Research/Extension Center —Construction addition to Cooperative Extension Office and Training Facility; multi purpose pavilion; and Animal Systems Building —Install access gates to Extension parking lots —Construct greenhouse for research

1980 FACILITIES PROGRAM SUMMARY OF PROGRESS—Continued

[Fiscal Years 1997 and 1998]

Institution	1997	1998
Virginia State University, Petersburg, Virginia.	—Purchase equipment for plant science and aquaculture research labs —Purchase equipment for distant education capability in new extension building —Construct/renovate Poultry Building —Construct/renovate Pole Barn Building —Construct greenhouse (Phase 1) —Construct service building on Randolph Farm.	—Complete purchase of equipment for Desktop Publishing and Reference Center —Complete renovations on Animal Science Teaching Laboratory —Renovate former sheep facility to office and storage facility

1994 INSTITUTIONS FUNDING

Question. Is there a need for facilities funding for the 1994 institutions? How does the fiscal year 2000 budget address this need?

Answer. There is a significant need for facilities funding for the thirty 1994 land grant institutions. Current facilities do not place these institutions in a strong position to address broad research, education and extension issues related to the food and agricultural sciences which are important to the communities and students served by these institutions. Of critical need is funding for research facilities. Such funding would enhance the utilization of funds currently appropriated through the U.S. Department of Agriculture, Cooperative State Research, Education, and Extension Service for higher education and cooperative extension programs, and anticipated research program funding proposed in the President's fiscal year 2000 budget. Facilities grants to these institutions would be useful to assist in the purchase of equipment and land, and the planning, construction, alteration or renovation of buildings to strengthen their capacity to conduct research in the food and agricultural sciences and the delivery of relevant research-based information through cooperative extension programs. In the fiscal year 2000 budget there are no funds to address facilities funding for the 1994 institutions.

EXTENSION INDIAN RESERVATION

Question. The fiscal year 2000 request proposes an increase of $3,286,000 for the Extension Indian Reservation Program. Which Indian reservations currently have an extension agent, and which Indian Reservations will receive an agent if the budget request is approved?

Answer. We currently have Extension agents on 25 reservations in 15 states. These include Alaska—Tanana Chiefs' Conference; Arizona—Navajo Reservation, Ship Rock and Window Rock, San Carlos Apache Reservation, Colorado River Indian Tribes Reservation, and Hopi Reservation; Florida—Seminole Reservation; Idaho—Fort Hall Reservation; Mississippi—Choctaw Reservation; Montana—Flathead Reservation, Northern Cheyenne Reservation, Blackfeet Reservation, and the Fort Belknap Reservation; North Carolina—Cherokee Reservation; North Dakota—Fort Berthold Reservation; New Mexico—Jicarilla Apache Reservation and the Zuni Reservation; Nevada—Nevada Indian Reservations; Oklahoma—Muscogee (Creek) Nation; Oregon—Warm Springs Reservation; South Dakota—Pine Ridge Reservation and the Rosebud Reservation; Washington—Chehalis Reservation and the Colville Reservation; and Wyoming—Wind River Reservation.

We also have previously submitted applications from Alaska—Kenaitze Nation; Arizona—Navajo Reservation at Crown Point, Tuba City, Chin Le, and Kayenta; and the Hualapai and Havasupai Reservations; Colorado—the Southern Ute Reservation and the Ute Mountain Reservation; Idaho—the Fort Hall Reservation; Kansas—the Kickapoo Nation; Montana—the Crow Reservation and the Rocky Boy's Reservation; North Dakota—the Fort Totten Reservation, the Standing Rock Reservation, and the Turtle Mountain Reservation; New York—the St. Regis Mohawk Reservation; Rhode Island—the Narragansett Nation; and South Dakota—the Cheyenne River Reservation. These have not been funded, nor have they been recently updated. We anticipate new applications from each of these, should the increase be provided.

We have had recent inquiries from the Menominee Nation—Wisconsin; the Cherokee Nation—Oklahoma; the Tohono O'odham, Gila River, and White Mountain Apache Reservations—Arizona; and the Couer D'Alene Reservation— Idaho.

If the increase is enacted, we expect to receive applications, or new applications, from most of the locations listed above and from more Reservations in Idaho, New Mexico, Texas, Utah, Wisconsin, and Washington.

INTEGRATED ACTIVITIES

Question. The Administration proposes first-time funding of $73 million for an integrated research, education, and extension competitive grants program, as authorized by the Agricultural Research, Extension, and Education Reform Act of 1998. Does the authorization require that a separate appropriations account be created for these integrated activities?

Answer. Section 406 of the Agricultural Research, Extension, and Education Reform Act of 1998 authorizes an integrated research, education, and extension competitive grants program, but it does not require that a separate appropriations account be created. The account implements authorizing legislation to break down the artificial barrier between research and education and extension, as well as to include initiatives. The Administration is proposing that the new account be created

to enable the agency to more efficiently manage existing parallel research and extension programs authorized and administered under separate legislative authorities and separate appropriation accounts, as well as new programs that promote integrated approaches to problem-solving. This is not the first year that some of the programs in this account have been funded. Water quality, food safety, and pesticide impact assessment were funded under the Special Research grants and Smith Lever 3(d) programs in previous years. Fiscal year 1999 level was $30 million.

Question. Is the Department providing fiscal year 1999 funding for integrated activities? If so, please explain.

Answer. The integrated research, education, and extension competitive grants program is not being implemented in fiscal year 1999. However, as it has for the past several years, CSREES will manage the fiscal year 1999 Special Research Grants and Smith-Lever 3(d) funding for the National Pesticide Impact Assessment Program so that single proposals addressing research and extension issues are submitted by the States to the agency for review and award. This approach has significantly streamlined the submission, review, and award process. Because of the separate authorizations and appropriations accounts, we have continued to track obligations separately.

Question. How has the Department determined which programs should be funded under a new integrated authorities account?

Answer. CSREES, which resulted from the 1994 merger of the former Cooperative State Research Service and the former Extension Service, has previously administered parallel research and extension programs in several areas, including the Water Quality, National Agricultural Pesticide Impact Assessment, and Food Safety programs. These programs were administered under the separate legislative authorities for Special Research Grants and Smith-Lever 3(d), and the use of funds awarded under these programs was limited to only research activities or only extension activities. The agency determined that it would be appropriate to include these parallel programs, as well as new programs promoting integrated approaches to problem-solving, in the new account so that research, extension, and education activities can be fully integrated without the artificial barriers resulting from separate legislative authorities. The integrated authorities account will enable the agency to more efficiently manage these programs by streamlining the proposal submission, review, and award processes.

FARM*A*SYST

Question. Please give us a status report on the Farm*A*Syst funded through the Water Quality grant program and the level of funding provided for this program for each of fiscal years 1997, 1998, and 1999.

Answer. Farm*A*Syst has now spread to 47 states, plus Puerto Rico and the Virgin Islands. More than 80,000 assessments have been conducted since the program began. Nineteen of these states raised a total of over $1.1 million in matching funds. An additional $55 million in private citizen funding has been invested in pollution prevention measures due to Farm*A*Syst findings. One study in Nebraska showed that farmers spent an average of $5,400 each in renovations to protect water supplies. In addition to general farm assessments, the program is evolving into commodity-specific assessments such as new pilot assessments in cotton, potatoes, dairy, and beef. In Mississippi, more than 2,000 properties have been assessed; and over 10,000 youth have been trained in simple assessments. The Delta Council FARM group uses materials in their environmental stewardship program. California has certified over 900 dairy farms to date with this program. In Michigan, farmers receive a 20 percent insurance premium reduction for implementing assessment and prevention measures. Several states used trained volunteers to deliver the program.

For rural homeowners without major agriculture, the Home-A-Syst program was developed. This program addresses issues such as rural well and septic maintenance and hazardous waste. This program is now in 31 states; and booklets are in the third printing after distribution of 26,000 copies. Half of these states have raised a total of $510,000 in matching funds.

Funding for fiscal year 1997 was $197,977; fiscal year 1998 was $148,483; and fiscal year 1999 is planned for $111,362 to the national coordinating staff in Wisconsin. An additional $497,000 is available in fiscal year 1999 for competitive grants to states to strengthen their programs.

FOOD QUALITY PROTECTION ACT RISK MITIGATION AND CROPS AT RISK

Question. Please explain how the proposed Food Quality Protection Act (FQPA) Risk Mitigation and Crops at Risk programs will help producers meet requirements of FQPA. Which FQPA requirements? Who would be eligible for these programs?

Provide some specific examples of the activities to be carried out through these programs.

Answer. The new Crops At Risk (CAR) from FQPA Implementation program is requesting $5.0 million for fiscal year 2000. Many crops and cropping systems face potentially severe economic constraints as a result of the impending loss of certain pesticides through implementation of the Food Quality Protection Act (FQPA). In the short term, these are mainly small-acreage fruit and vegetable crops due to the current elimination or restrictions on organophosphate and carbamate pesticides. However, slightly further down the road, many more crops, including the large-acreage grain, forage and fiber crops will be impacted as well. The Crops At Risk (CAR) program is an intermediate-term research and implementation program designed to keep the crop or cropping system as the focal point. The goal of this program is to design and promote the development of new Integrated Pest Management (IPM) strategies to assist producers transition to new technologies necessitated by FQPA implementation. Crop Profiles, which are being developed through the leadership of the Office of Pest Management Policy (OPMP) will be used to prioritize a list of crops potentially at risk within each state as a result of FQPA implementation. State priorities will then be assessed at the regional level to identify crosscutting challenges and opportunities for multi-state and multi-regional cooperation. The resulting reports will serve as the basis for priority setting for this competitive research grants program to be coordinated through CSREES in consultation with OPMP.

The funding mechanism, for the Crops at Risk program, will involve the awarding of competitive grants whose merit has been determined following a relevancy and scientific peer review process. The request for proposals will be developed to attract innovative applications for projects that demonstrate integrated research, education and extension activities.

FOOD RECOVERY AND GLEANING

Question. A new Food Recovery and Gleaning Community Infrastructure Grants Program is proposed to be funded for fiscal year 2000 as an integrated activity. The budget justification indicates that $10 million is proposed to be awarded to support infrastructure projects; $2,850,000 in Smith-Lever 3(d) funding is to be awarded to establish a technical assistance and education network to help coordinate gleaning activities, establish local hunger programs, and administer food recovery programs; and $2,150,000 is to establish a competitive food recovery and gleaning competitive grants program. For fiscal year 1999, the President proposed that a Food Recovery and Gleaning program be managed and overseen by USDA's Food and Nutrition Service. Why is the President now proposing that this be a CSREES activity?

Answer. The Secretary has determined that CSREES should be the lead USDA agency on food recovery and gleaning grants for a number of reasons:

—CSREES is the USDA agency with the most significant previous hands-on experience giving grants to food recovery and gleaning and related activities (through the Fund for Rural America), as well as the USDA agency with the greatest expertise overall in giving grants to grass-roots activities.

—There are numerous CSREES-related food recovery and gleaning projects sponsored by state and local extension services which have proven track records of success in efficiently feeding hungry people, utilizing volunteers, and empowering communities.

—The CSREES-affiliated Cooperative Extension System has a unique ability to help serve isolated rural areas, which are currently under served by nonprofit feeding groups.

—Tying such grants to the Cooperative Extension System will help the effort fully utilize the expertise of universities and county offices, as well as increase hunger-related volunteer activities through the 4-H Program.

—It is desirable to better integrate food recovery and gleaning projects with Community Food Projects grants, which are currently awarded by CSREES, as well as to place the Food Recovery and Gleaning Initiative in the same overall USDA mission area as the overall Community Food Security Initiative.

Question. Please explain the need for a separate food recovery and gleaning competitive grants program, and why such grants can't be funded through the Department's other competitive research programs?

Answer. The food recovery and gleaning grants would go mostly to infrastructure improvements and extension activities that directly feed people and help people better utilize the food provided. Most of these activities would not qualify as research activities that could be funded under research programs.

In previous years USDA had limited ability to provide small grants for food recovery and gleaning activities through both the AmeriCorps National Service Program and the Fund for Rural America (FRA). Because the USDA AmeriCorps program has been eliminated and the fiscal year 1999 Agriculture Appropriations Act prevents USDA from using funds to administer the FRA, USDA can no longer use those avenues to fund such efforts. The Department has been able, over the last few years, to provide some publicity and technical assistance to food recovery and gleaning projects, but USDA currently lacks the ability to provide significant financial resources to help local efforts to directly expand their infrastructure to recover, glean, and distribute excess foods. The $15 million grant program would provide significant aid to hard-pressed nonprofit feeding organizations throughout the country, many of whom now report that they are unable to keep up with large-scale, recent increases in demand for supplemental and emergency food.

A 1998 study by the Second Harvest Food Bank Network indicated that over 21 million Americans obtain supplemental and emergency food from food pantries and hot meal programs, most of which are run by faith-based nonprofit groups. Most of these groups have recently reported that they have experienced dramatic increases in demand for food—especially from families with children and/or families in which one or more adults are working. These groups have also reported that they have been generally unable to collect enough additional food to meet the rising need of their clients.

Existing USDA food recovery and gleaning efforts have certainly been helpful. However, we know that—because local efforts often lack the appropriate equipment and processes for collecting, transporting, heating, refrigerating, packaging, processing, and distributing the food, nonprofit groups and other local entities are often unable to fully utilize USDA technical assistance and publicity to expand their efforts. Such groups and entities repeatedly inform USDA that they need monetary assistance to buy those pieces of equipment and build those processes.

Due to this lack of local infrastructure—even though food can be safely recovered from farms, ranches, orchards, manufacturing and processing plants, wholesale and retail markets, restaurants and food service operations—an estimated 96 billion pounds of the 356 billion pounds of food produced for human consumption in America continues to be wasted. By providing limited Federal funds to leverage community-based efforts to recover, glean, and distribute such food, hundreds of millions of pounds of additional, wholesome food can be distributed to hungry Americans each year.

It is clear that community organizations (including faith-based organizations) are willing to bring significant resources of their own to aid food recovery and gleaning efforts and community volunteers are able and willing to provide free labor to such efforts. Yet these organizations still require some help from the Federal government—as well as from state and local governments, foundations, and private businesses. Federal assistance is needed to provide seed money and leverage other resources.

Question. Please distinguish between activities eligible for funding through the Department's Commodity Assistance Program and those which would be undertaken this through this new grant.

Answer. Most of the funds ($45 million) currently available to states for the administration of the Emergency Food Assistance Program (TEFAP) are used to transport and otherwise handle USDA commodities distributed through TEFAP. The remainder of the funding is usually used by states to support the transport and handling of donated food already moving through the emergency feeding system. Thus, states have very limited ability to use such funds to help non-profit and often community-based, faith-based organizations substantially improve their infrastructure to obtain and use new sources of food.

Furthermore, food banks and their member agencies throughout the country are currently reporting that they are facing dramatic increases in request for food—particularly from working poor families—and that they are frequently unable to provide the additional food needed to meet the additional demand. In addition, food banks and their member agencies are facing great difficulty making up the 10 percent cut in fiscal year 1999 in TEFAP appropriations. For this reason, the Administration has proposed returning funding for TEFAP food purchases to the fiscal year 1998 level of $100 million, as well as proposing an additional $15 million in funding to help such agencies develop and support the channels necessary to obtain and distribute large-scale new sources of donated food.

Question. What types of nonprofit organizations will be eligible for the $10 million "infrastructure" component of this program and please give examples of the types of "infrastructure" projects which would be eligible for funding and the need to provide federal support for these projects.

Answer. Any non-profit organization, including faith-based, community-based, as described in section 501(c) (3) of title 26, United States Code; state governments; local government agencies (including school districts), and Indian tribal governments would be eligible to receive the grants.

The following of some of the "infrastructure" items that could be funded by the grants:

—equipment and supplies to harvest, collect, sort, process, store, dehydrate, preserve, transport, and distribute recovered and gleaned food;

—infrastructure additions needed to start or expand programs that combine food recovery with job training.

—preparation and distribution of handbooks, resource guides, and instructional materials (including materials to help persons use recovered food safely, nutritiously, and cost effectively);

—equipment, programs, and systems (including integrated transportation systems) to improve operations and integration of food recovery and gleaning efforts;

Funds provided through the grants would only be used to start new activities or expand or improve existing activities; funds would not replace funding for existing activities. Federal assistance would be used in conjunction with private, non-profit, and State funds to empower community-based food recovery and gleaning efforts and encourage community volunteerism, as well as to increase ties to broader community food security activities.

Preferences would be given to applicants based on the following criteria:

—the offer of non-Federal matching funds in excess of the match required; the cost-effectiveness of the project; the effectiveness of similar projects operated by the eligible grantee;

—the socio-economic composition of the population to be served by the project;

—the extent to which the project promotes the self-sufficiency of communities and food recipients, utilizes sweat equity to help individuals collect their own food, increases the dignity of food recipients, and helps individuals train for eventual paid employment;

—the extent to which the project includes partnerships with other private or public entities involved with other community food security activities; and

—the extent to which the project will directly affect an area that is designed as an empowerment zone or enterprise community.

FARM*A*SYST

Question. Will the Administration's proposal to provide water quality funding through the integrated activities program affect the Farm*A*Syst program?

Answer. It is anticipated that the Farm*A*Syst program will not be affected by the Administration's proposal to provide water quality funding through the integrated activities program. The integrated activities program is expected to maintain and strengthen existing National initiatives, such as the Farm*A*Syst program, by ensuring that the knowledge and technology generated by research is delivered to the end-users, including producers, communities, and consumers.

METHYL BROMIDE

Question. The fiscal year 2000 budget proposes $5 million under the integrated activities program for a Methyl Bromide Transitions Program. The budget justification indicates that the ARS is focusing on long-term methyl bromide replacement strategies, this program will focus on short-and intermediate-term solutions. How much of the funding proposed for this program will be for research? Why not expand or reorient the ARS program rather than begin a new research program?

Answer. The new funding in the proposed Methyl Bromide Transitions Program would be available to research projects, research and extension combined projects, and extension projects through a competitive grants program that would be made available to land-grant and other universities, extension programs, and other research facilities that normally compete through the USDA-CSREES competitive grants programs. Each category—research , research and extension, and extension-would receive approximately one-third of the funding. Much of the pre-plant methyl bromide alternative research in ARS has focused on fresh market tomato and strawberries. The CSREES competitive grants program would focus on integrated approaches that include: 1) increased support for minor use chemicals on commodities, such as lettuce, pepper, other vegetables; 2) increased integrated research and extension activities on alternatives for ornamentals; 3) increase opportunities for field testing of integrated approaches for strawberry and fresh market tomato; 4) extension activities on implementation of alternatives; and 5) increased technology trans-

fer of results to growers through education programs. The use of the competitive process would assure that new research activities were complementary to ARS and met the needs of industry.

Question. The budget justification indicates that technology transfer of research into practical management alternatives for methyl bromide will be done through cooperative extension activities. How much of the request $5 million is for these activities? What research findings will be transferred to users?

Answer. Cooperative Extension and Education activities would receive approximately one-third of the proposed funding. These activities would more rapidly promote technology transfer from ARS and support new alternative programs by expanding field testing of integrated approaches, implementation of successful alternatives now available, and provide more demonstration of alternatives to growers. This would include tomato and strawberry but focus on other vegetables and ornamentals that are dependent on methyl bromide. ARS sponsors field-scale validations of the most promising alternatives identified in experimental plots. Parallel programs are proceeding in Florida and California ($250,000 each annually) with emphasis on tomatoes in Florida and strawberries in California. Research teams that include ARS and university scientists, extension personnel, and grower representatives meet periodically to evaluate research results and plan future trails. To help transfer the technology to growers, many of the field-scale validations are done with active grower participation on commercial farms. Such alternatives are being tested at seven strawberry sites in California, scattered from just north of San Diego to Watsonsville and with one site in the Central Valley, to test alternatives under a range of growing conditions. There are five sites devoted to perennials, in Florida, there are five sites each for tomatoes and strawberries. $50,000 of the Florida funds supports extension efforts to facilitate adoption of alternatives.

SMALL FARMS

Question. Please explain in more detail the need for the small farms programs proposed in the budget and why these needs aren't being met through the Department's existing rural development; natural resources and environment; farm assistance programs; and research, education and extension programs.

Answer. The National Commission on Smalls 1998 Report, A Time to Act, provides an excellent description of the plight of the Nation's small farmers and makes a compelling case for immediate, effective action on the part of USDA, its Land Grant partners, and other public and private sector organizations and groups who work with farmers. There are many reasons why the Cooperative State Research, Education, and Extension Service (CSREES) and its Land Grant partners need to develop and deliver programs that will stop the erosion of the Nation's small farms. A few of the most important are: (1) Small farms often lead the way in new product development, (2) Small farms enhance the quality of life for all Americans and protect natural resources for the entire Nation, (3) Small farms also enhance the quality of life for urban communities, and (4) Small farms protect resources that serve all Americans.

Small farmers also have special and varied needs and the National Small Farm Program must address those needs. Small farms are highly varied in size, mix of animal and plant enterprises, gate receipts and gender and cultural background of the farm operator. A few examples will illustrate the complexity of the small farm population and its needs.

Small farms produce an enormous range of products and many of them are products for which the existing research base is not well developed. Organic production provides one example. Relatively little research-based information is available for organic producers.

Small farms are not unsuccessful large farms. Small farmers are resourceful entrepreneurs who produce valuable agricultural products using more limited fiscal, human and land resources that their larger scale neighbors. They have special research, education and extension needs because they have fewer resources available to them than larger farms.

Small farms differ widely from state to state and even within the same state. Small farmers include many different cultural and social groups. For example, language can be a barrier for some, and these groups need information available to them in their own languages. Some small farmers have limited educational backgrounds. They also have special information needs. Education and extension programs must address these multiple groups of clients.

In general, the special and varied needs of small farmers have not been met because the majority of resources of the Nation's agricultural system have for several decades been increasingly devoted to research, development, assistance, and edu-

cation/extension programs which have led to greater industrialization of the agricultural sector. While industrialization has certainly resulted in enormous gains and benefits for our food and fiber system, the small farmers, now representing 94 percent of all farms and receiving 41 percent of all agricultural receipts, contribute immensely to our Nation's food production and are the foundation of our Nation.

Question. The budget justification indicates that the $4 million requested for the small farms program will enable CSREES to reach the three goals of the National Small Farm Program "much more rapidly". Please explain how these goals are currently being met by CSREES and how the proposed farm program will expedite the agency's ability to meet these goals.

Answer. There are three principal goals for the National Small Farm Program. They are based on the goals for the CSREES National Plan for Small Farms and reflect many of the primary concerns raised in the National Commission on Small Farms report, A Time to Act.

The goals are to enhance the economic viability of small farms, to improve the contribution of small farms to environmental quality, and to enrich the quality of life for small farm families. These goals are currently being addressed through CSREES National Small Farm Program, a program which currently relies on formula funding and programs at the 1862 and 1890 Land Grant Institutions. Programs at these institutions tend to be quite small, usually supporting professionals part-time to meet the needs of the small farmer communities.

The Small Farms Initiative proposed for fiscal year 2000 will substantially improve education and outreach for small farmers. The priority programs that need to be developed are: appropriate production practices, marketing strategies, consumer awareness, entrepreneurial skills, communication and information networks, and helping beginning farmers establish viable farm operations and enterprises.

QUESTIONS SUBMITTED BY SENATOR BURNS

FISCAL YEAR 2000 BUDGET

Question. Funding for Research and Education Activities are vitally important to enhance university curriculums and to increase opportunities for agricultural producers on new cropping methods, marketing methods, new information in the industry and ways to increase efficiency. How will USDA restore the $2.5 million cut in order to give agricultural producers an extra edge with today's depressed prices?

Answer. Following extensive consultation with stakeholders, including the National Agricultural Research, Education, Extension, and Economics Advisory Board, the land-grant university system, and producer representatives, the Administration developed a portfolio of national agricultural research, extension, and education priorities for fiscal year 2000, including food safety, methyl bromide alternatives, small farms, Food Quality Protection Act implementation, and water quality. States and localities may still choose to address issues of immediate state and local concern as identified through their own stakeholder input process. Since States are free to use formula funds in the manner they choose, the impact of the reduction in the CSREES Research and Education Activities account will vary from state to state. Overall, the Administration is proposing an increase of 2.6 percent in the CSREES discretionary budget, and an additional $152,500,000 in mandatory funding, for high priority research, education, and extension programs that will significantly expand and strengthen the knowledge of agriculture in the United States.

Question. Funding for Extension Activities is vitally important for rural areas. Extension agents and programs provided by county extension of flee provide support and education to farming and ranching communities. How will USDA restore the $16.2 million cut from the budget?

Answer. Following extensive consultation with stakeholders, including the National Agricultural Research, Education, Extension, and Economics Advisory Board, the land-grant university system, and producer representatives, the Administration developed a portfolio of national agricultural research, extension, and education priorities for fiscal year 2000, including food safety, methyl bromide alternatives, small farms, Food Quality Protection Act implementation, and water quality. States and localities may still choose to address issues of immediate state and local concern as identified through their own stakeholder input process. Since States are free to use formula funds in the manner they choose, the impact of the reduction in the CSREES Extension Activities account will vary from state to state. Overall, the Administration is proposing an increase of 2.6 percent in the CSREES discretionary budget, and an additional $152,500,000 in mandatory funding, for high priority re-

search, education, and extension programs that will significantly expand and strengthen the knowledge of agriculture in the United States.

FARM CREDIT ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR COCHRAN

COMPETITION

Question. The Philosophy Statement on Intra-System Competition adopted by the Board last July affirms the Board's belief that competition within the System is beneficial for the customer. Will all of the institutions be able to lend across geographic boundaries on both short-term loans and long-term loans or will there be any regulations from one lending institution to another where the institutions will not be equal in all aspects?

Answer. The Farm Credit Administration (FCA or Agency) Board's philosophy statement expresses support for:

—Farm Credit System (FCS or System) customers being able to choose the System lender with which they want to do business. We call this "customer choice."

—Each System direct lender being able to offer all financial services authorized by the Farm Credit Act (Act). We call this "cross-title lending."

—Each association being able to choose the System bank from which it will be funded. We call this "funding choice."

In November of last year, we published the proposed Customer Choice Rule, which would allow all institutions to lend across geographic boundaries. If the Board adopts that rule substantially as proposed, every association would be able to make a loan to any customer at the customer's choice. In this respect, all associations would be treated the same.

This proposed rule would not change the types of loans an association can make. Federal Land Bank Associations (FLBAs) and Federal Land Credit Associations (FLCAs) could still make only long-term mortgage loans under title I of the Act. Production Credit Associations (PCAs) could still make only short- and intermediate-term loans under title II of the Act. A customer seeking a long-term mortgage loan, for example, could apply to any Agricultural Credit Association (ACA), FLBA, or FLCA. A customer seeking short- or intermediate-term credit could apply to any ACA or PCA.

FCA faces a statutory obstacle to giving customers the opportunity to obtain any type of loan from any association. The FCA Board would have to amend or issue new charters to associations that now have only title I or title II lending authority. The 1992 amendments to the Act prohibit this for FLBAs and PCAs in Louisiana, Mississippi, Alabama, and New Mexico [1]. These same FLBAs and PCAs under existing law could make both long-term and short-term loans if the following actions were taken:

—They merge with the unlike association(s) in their territory; or

—They get permission from each association that now provides the type of credit that they wish to provide in that association's territory. These limits on FCA's chartering authority for associations do not exist elsewhere in the country.

EQUITY-BASED LENDING

Question. Some of the lending banks are now reverting to the 1980's "equity based" lending because crop and livestock projections do not justify writing a loan. Do you see farm credit borrowers significantly hurting from the same actions that took place a decade ago?

Answer. We have found that System institutions learned from the mistakes of the mid 1980's crisis and, as a result, no longer emphasize collateral based lending practices that were referred to as "equity lending" in the 1980s. System institutions shifted to a repayment based lending philosophy, which was further strengthened with a disciplined approach to credit extension, using underwriting standards tailored to the types of commodities financed. In addition, FCA revised regulations addressing System underwriting standards to ensure "an applicant has the oper-

[1] Section 5.17(a)(2) and (C) applies to the associations in the three southern states in the former Jackson district. FCA cannot overcharter existing associations without the consent of the affected FLBA or PCA and the respective funding bank. Sections 5.17 (a)(13) and (14) contain similar consent requirements before overchartering associations that reaffiliated under section 433 of the Agricultural Credit Act of 1987. Today, these provisions apply only to the associations located in New Mexico.

ational, financial, and management resources necessary to repay the debt from cashflow."

When the agricultural economy is experiencing stress, however, FCS institutions have considerable flexibility under existing regulations to provide appropriate relief. Such relief efforts may include, but are not necessarily limited to, extending the terms of loan repayment or restructuring a borrower's debt obligations. A System institution may consider easing some loan documentation or credit-extension terms for new loans to certain borrowers or requesting FCA to grant relief from specific regulatory requirements. When conducted in a reasonable and prudent manner, the FCA will consider FCS efforts to work with distressed borrowers as consistent with safe and sound business practices.

Over the past 10 years, the majority of FCS institutions have increased substantially the level of capital they maintain. In fact, the level of risk funds (which includes permanent capital and the allowance for losses on loans and other property owned) in relation to loans outstanding and other property owned increased from 10.9 percent at yearend 1989 to 21.1 percent at yearend 1998. The total capital of the System grew from $3.8 billion at the end of 1989 to $12.5 billion at the end of 1998. This indicates that System borrowers contributed substantially to rebuilding the financial strength of their cooperative associations and banks so that the institutions would be better able to withstand a downturn in the agriculture environment should it occur and be better positioned to work with their stockholder borrowers if necessary.

COMPETITIVE INTEREST RATES

Question. Does the Farm Credit Act prohibit Farm Credit institutions from offering interest rates that are below their competitors' rates? If yes, why?

Answer. The Act does not expressly prohibit FCS institutions from offering interest rates that are below their competitors' rates. The Act provides that "it shall be the objective" of System lenders to set interest rates and other charges "at the lowest reasonable cost on a sound business basis," taking into consideration the lender's cost of funds, necessary reserves, and the cost of providing services to its members.

Under Section 1.1(c) of the Act, only System institutions that use regulatory accounting practices (RAP), as provided in the Farm Credit Act Amendments of 1986 and part 624 of FCA regulations, are prohibited from pricing their loans below competitive market rates. Currently, there are no FCS institutions using RAP. For FCS institutions not using RAP, neither the statute nor regulations specifically prohibit them from pricing their loans below their competitors.

Question. There have been a lot of complaints directed towards Farm Credit Services of the Midlands because of special loan programs. Has this issue been taken care of and what actions have been taken to keep these special programs from offering below market rates?

Answer. In early 1998, the FCA did receive several complaints from commercial banks regarding the loan pricing practices of the Farm Credit Services of the Midlands (now the FCS of America). The complaints were directed toward a special loan program promoting 5-year fixed-rate term loans for capital purchases (such as equipment purchases); and 15-year fixed-rate real estate loans. Both had a rate of 7.75 percent with no limit on loan size, no prepayment penalty, and no origination fee. At the time of the complaints, there were numerous advertised rates in the association's four-state trade territory from equipment and farm supply dealers that were similar to the rate offered by the association for similar loan products.

Based on our examination of the association and our review and analysis of its loan pricing practices, including the above noted special program, we found no evidence that the FCS of America was offering interest rates that did not recover costs and earn a profit, or were significantly different than those rates currently offered under its differential pricing program. Further, we found no evidence that the institution's pricing program resulted in any violations of applicable law and regulations or was an unsafe or unsound practice.

In our examinations of System institutions, the FCA evaluates an institution's earnings, including whether the institution obtains and uses competitor rate information in the pricing of its loan portfolio. The documents we reviewed indicated that the association obtained surveys of loan rates offered by banks and non-bank lenders in its territory. Also, the association's advertised loan rates were within the ranges of the rates offered by its competitors.

We issued an informational memorandum to all System institutions on February 11, 1999, restating the statutory and regulatory requirements related to loan pricing, as well as how the FCA examines an institution's loan pricing practices. The memorandum stated that, consistent with the law, regulations, and sound business

practices, System institutions should price loans at a level sufficient to cover all costs, fund provisions to the allowance accounts, and accumulate capital. Specific consideration should be given to the cost of funds, the cost of servicing loans, other costs of operations, interest rate risks, profit and marketing objectives, and the competitive environment. FCA examiners evaluate whether interest rates charged are consistent with established policies and are sufficient to cover costs and adequately capitalize the institution, while maintaining safety and soundness and remaining competitive in the marketplace.

Question. Have there been any other cases of below market pricing in the past four years and what action was taken if there was?

Answer. Over the past four years, our reviews of unfair or below market loan pricing have found no instances where an institution's loan pricing program resulted in below market pricing or was outside of the range of rates offered by competitors.

Question. How does the FCA determine the competitive rate? Are Farm Credit Institutions required to do surveys of their competitors' prices? If yes, how often and why?

Answer. As the System's regulator, FCA does not determine the competitive rate. The rate varies by location, type of lender, type of credit, qualifications of the borrower, and other loan terms. It is difficult to obtain exact information about actual loan rates and terms on loan pricing practices of institutions that are competitors of FCS institutions. While advertised rates provide useful information, the rates charged in individual transactions are often higher or lower than quoted rates. Generally, appropriate loan rates for System institutions are those that are sufficient to cover all costs, including credit risk, and earn a profit to be able to accumulate capital in consideration of the law, regulations, sound business practices and the competitive environment.

No provision of the Act or FCA regulations expressly requires System institutions to conduct market surveys of competitors' loan rates. However, we believe that obtaining timely information of what an institution's competitors are charging for equivalent products is a sound and essential business practice and should be a part of the loan pricing policies and interest rate programs that System banks and associations are required to establish. We have strongly encouraged FCS institutions to conduct competitor interest rate surveys periodically to ensure their pricing practices are comparable to the market.

Competitors now include more than commercial banks and other traditional lenders. There are many non-traditional lenders, such as John Deere and Pioneer Hi-Bred, also competing for agricultural loans. If there are instances of loan pricing by FCS institutions that appear to be outside of prevailing market interest rates, they would be scrutinized closely by our examiners.

GOVERNMENT PERFORMANCE AND RESULTS ACT

Question. What specific steps have you taken as the head of the agency to achieve performance-based management within your agency, as required by the Government Performance and Results Act?

Answer. I, along with my fellow Board members, developed the FCA's vision statement, which serves as the basis for our Strategic Plan. As the CEO, I established performance-based management, through FCA's Leadership Team, focusing on accountability and regular reporting to the FCA Board on goal achievements. We have already begun gathering information to prepare our performance report to Congress and the public for the year ending September 30, 1999, which is due in March 2000.

Question. How are your agency's senior executives and other key managers being held accountable for achieving results?

Answer. Our performance expectations are reflected in the individual merit performance plans of each of our managers and supervisors. Each executive has a performance plan for the Agency performance measures for which they are responsible, individually and collectively. These same performance expectations are the backbone of the quarterly report the FCA Board receives from management. This report describes the progress toward accomplishing our goals and objectives.

Question. How is performance information being used to manage the agency?

Answer. We use Agency plans and performance measures to develop direction, manage expenses, and provide objective feedback on success in meeting our goals. We focus on performance results and initiatives that support our goals and objectives. We are also critiquing activities that do not add value to accomplishing our stated goals. FCA's planning process is driven by customer and mission requirements. These include developing direct input and analysis of markets, identifying emerging needs and risks that dictate internal changes for FCA, and then shifting resources and priorities to meet these needs.

Question. How did program performance factor into decisions about funding requests for fiscal year 2000? Please provide examples.

Answer. We developed office budgets for fiscal year 2000 based on resources needed to accomplish Strategic Plan initiatives that were tied directly to our performance indicators. We also identified initiatives to further enhance our goal of ensuring the continued safety and soundness of the System. These initiatives were included in the performance plans supporting staff requirements and salaries to fund the planned work.

Question. What specific program changes has the agency made to improve performance and achieve the goals established in the strategic and annual plans?

Answer. As a financial regulator, the objectives of our strategic and operating plans focus on ensuring the FCS operates safely and soundly, meets the requirements of the statute and regulations, and benefits farmers, ranchers, agricultural cooperatives, and rural America as Congress intended. To further our success in meeting these goals, we have expanded our outreach and communication efforts to our customer base through a series of meetings and symposiums on topics of mutual interest. Also, our recent Philosophy Statement supports actions that will ensure a relevant FCS for the future. The introduction of a "Best People, Best Products, Best Practices" initiative within the Agency has resulted in a clearer focus on what is important.

Question. How does the agency budget structure link resource amounts to performance goals?

Answer. The cost accounting system within our Financial Management System links expenses by goals and functions. The system was modified in October of this fiscal year to ensure the linkage between these systems.

Question. What, if any, changes to the account and activity structure in the budget justification are needed to improve this linkage?

Answer. Budget justifications to Congress are driven by object classes, such as salaries. Performance is tied to strategies and related activities designed to achieve results. In addition, the budget uses a 2-year horizon, while many worthwhile outcomes take much longer. We are developing 5-year human resource and financial plans to estimate and plan resources through the life cycle and significant milestones of major strategies. It is also clear that plans will necessarily change in order to stay relevant and reflect changes in assumptions. We expect to update plans as we learn from our experiences and sharpen performance measures.

Question. Does the agency fiscal year 2000 Results Act performance plan include performance measures for which reliable data are not likely to be available in time for the first performance report in March 2000? If so, what steps are planned to improve the reliability of these measures?

Answer. Yes. We have reliable data, and the databases are in place for reporting 17 of 20 measures included in our annual performance plan. The databases for two of the measures will be ready in time for the March 2000 report. The final measure includes a new customer survey that will not be completed until after the initial report is prepared.

Question. How will future funding requests take into consideration actual performance compared to expected or target performance?

Answer. Future funding requests will consider actual performance compared to target performance by addressing these outcomes in the budget development and justification process. We are now developing a 5-year financial plan to support the FCA 5-year Strategic Plan. Requests will continue to demand cost-effective performance and direct resources to higher value activities for public and mission goals. One of our performance measures uses the cost of the FCA budget to the customers of FCS institutions to determine customer value.

Question. To what extent do the dollars associated with specific agency performance goals reflect the full costs of all associated activities performed in support of that goal? For example, are overhead costs fully allocated to goals?

Answer. We allocate the full costs of activities in support of a performance goal to that goal, including associated overhead costs.

RESEARCH, EDUCATION, AND ECONOMICS

QUESTIONS SUBMITTED BY SENATOR COCHRAN

STRATEGIC PLANNING TASK FORCE

Question. Please give us a report on the progress being made by the Strategic Planning Task Force on Research Facilities mandated by the Farm Bill.

Answer. The Strategic Planning Task Force on Research Facilities has completed its review of agricultural research facilities and has prepared a draft report which has been widely circulated for review. The task force will meet in early summer to finalize the report in light of the comments that have been received.

Question. Is the report of the Strategic Planning Task Force still scheduled to be released in April of 1999?

Answer. It is anticipated that the final report will be printed and distributed this summer.

Question. Are any of the Strategic Planning Task Force's forthcoming recommendations reflected in the President's fiscal year 2000 Budget?

Answer. Recommendations of the task force are not included in the President's fiscal year 2000 budget.

BIOBASED COORDINATING COUNCIL

An increase of $1,500,000 is proposed for fiscal year 2000 in funding for the Under Secretary for Research, Education and Economics, as Chair of the Biobased Coordinating Council, to develop a list of biobased products. The budget justification indicates that the funds would be used to promote acquisition of biobased products and to help develop a biobased products list, including the development of standards, as well as for facilitating technology transfer to new products and for other purposes.

Question. Under what authority was the Biobased Coordinating Council established? What is the composition and purpose of the Council?

Answer. The Biobased Products Coordination Council (BPCC) was originally created as the New Uses Coordinating Council by Secretary Glickman in a decision memorandum dated September 13, 1995. The council's name was changed in 1996 to be more descriptive of and consistent with current terminology. The BPCC's purpose is to provide strategic planning and policy input on the development of biobased products from agricultural materials, including forestry materials, for commercial and industrial purposes. The BPCC garners input from its USDA members and actively collects economic, product and marketing information from other Federal agencies and non-Federal groups. A major accomplishment of the BPCC was planning and hosting a government-wide conference on the acquisition of value added products from agricultural materials. The conference, the National Marketplace for the Environment, was held in November 1997 in Washington, D.C. The BPCC will continue to be a part of other conferences and forums to further the government's and public's knowledge of biobased products.

The Council's purpose was further strengthened by the Agricultural Research, Extension, and Education Reform Act of 1998 (AREERA). For example, one section of this law authorizes the Secretary of Agriculture to "coordinate the research, technical expertise, economic information, and market information resources and activities of the Department to develop, commercialize, and promote the use of biobased products." Another section of the law identifies new and alternative uses and production of agricultural commodities and products as a priority mission area. The BPCC is carrying out these types of coordination activities on behalf of the Department.

The BPCC is chaired by the Under Secretary for Research, Education and Economics and is composed of representatives from each interested USDA agency and office. Ex officio members include representatives from the Environmental Protection Agency, the Department of Energy, and the Office of the Federal Environmental Executive.

Question. Describe in more detail how the $1,500,000 requested to develop a list of biobased products will be allocated, e.g., for promotion, development of a list, and technology transfer.

Answer. The funds will be allocated to those activities supported in the BPCC strategic plan. Among the major activities that would be carried out or started in fiscal year 2000 are: the development, publication and maintenance of a biobased products list as directed in Executive Order 13101; educational activities, such as training and conferences, to inform the public and government agencies about biobased products; demonstration projects to create awareness of and demand for biobased materials; development of Internet-based information systems to promote biobased products; support for the Office of the Environmental Executive; and support for technology transfer activities through our research agencies with involvement of the private sector and industry partners.

Question. Give examples of the activities which will be undertaken both to promote the acquisition of biobased products and to facilitate the transfer of technology to new products.

Answer. Two activities have been accomplished which are the building blocks for future activities. The National Marketplace for the Environment conference in November, 1997, brought to Washington D.C. a huge showcase for biobased products, processes, and partnerships. Biobased products are a foundation piece for environmentally preferable purchasing by government agencies as directed in Executive Order 13101, Greening the Government Through Waste Prevention, Recycling, and Federal Acquisition. The publication of a Biobased Products List will be a major tool to promote acquisition of biobased products.

Agriculture's leadership and innovation are essential in the development of biobased products. Research conducted under Cooperative Research and Development Agreements (CRADAs) will allow for the transfer of new technology to the private sector and industry. This pathway to technology transfer will be used in the development of biobased products.

Another example that will promote acquisition of biobased products is the "Federal Track" (sponsored by the Office of the Federal Environmental Executive) in the annual National Recycling Coalition's Congress and Exposition. In this event Federal, State, and local governments join with educational institutions and commercial businesses to share information, success stories, and challenges on efforts to reach the goals of the Resource Conservation and Recovery Act of 1976 and related environmental activities.

STAKEHOLDERS

Question. How do the Department's research, education and extension agencies communicate with its stakeholders and customers on a regular basis? Please give specific examples.

Answer. The main method of communication between the REE mission area and its stakeholders is through the National Research, Extension, Education and Economics Advisory Board. This board was established in the 1996 Federal Agricultural Improvement and Reform Act of 1996. The Advisory Board's role is to provide consultation to the Secretary and land grant colleges and universities on long-term and short-term national policies and priorities for agricultural research, extension, education and economics. In fiscal year 1998, for example the board held three public meetings in Washington DC, including the Second National Stakeholder Symposium, to solicit input and comment from those who conduct and use agricultural research, extension, education and economics. The board also held a regional listening session in Utah to hear the specific concerns of stakeholders in the Western region. The board held the Third annual Stakeholder Symposium on March 18 of this year.

The REE agencies also use a variety of other venues, such as meetings, conferences, workshops, and public hearings to discuss with stakeholders and customers specific issues of particular importance to them. While the nature and focus of these activities varies, they are all important in helping the agencies and mission area to understand and therefore be responsive to stakeholders and customers needs.

The Agricultural Research Service (ARS) has a long history of meaningful interactions with its customers and stakeholders. ARS' research scientists know who their customers and stakeholders are and they interact with them, formally and informally, throughout the life of the project. Customer input is important in helping to set the research direction for each project and customers help to evaluate the products and outcomes of that research. Each of ARS' eight Area Offices also conduct aggressive outreach efforts with State and regional customers and stakeholders of ARS research. At the National level ARS senior managers and National Program Leaders are in almost constant contact with the major organizations, associations, and a wide variety of Federal action and regulatory agencies that either use ARS developed knowledge and technology or have a keen interest in the work of the Agency. In developing its new Strategic Plan 1997–2002, ARS solicited customer input by printing the draft plan in the Federal Register and mailing copies to 1,400 customers and stakeholders.

In the early stages of the development of the new National Program structure, the National Program Staff sent copies of various draft program statements to approximately 1,400 customers and stakeholders inviting their review and comments. A critical step in the implementation of the 23 National Programs is a series of planning workshops that bring together customers, stakeholders, partners, and ARS scientists. These workshops help identify specific customer needs, problems, and concerns that feed into the Agency's planning process. By this approach ARS is able to keep its research focused on solving specific problems confronting American agriculture.

The following list of planning workshops (completed and upcoming) demonstrates the comprehensive outreach effort being made by ARS to ensure the relevancy of its research:

—Animal Genomes, Germplasm, Reproduction, and Development, February, 2000
—Animal Production Systems, February, 2000
—Animal Health, September, 1999
—Arthropod Pests of Animals and Humans, May, 1999
—Animal Well-Being & Stress Control Systems, April, 1999
—Aquaculture, September, 2000
—Human Nutrition Requirements, Food Composition, & Intake, March, 2000
—Food Safety (animal & plant products), February, 1999
—Water Quality & Management, December, 1998
—Soil Resource Management, October, 1998
—Air Quality, May, 1999
—Global Change, October, 1999
—Grazing lands Management, February, 1999
—Manure & Byproduct Utilization. April, 1998
—Integrated Farming Systems, November, 1999
—Plant, Microbial & Insect Germplasm Conservation & Development, July, 1999
—Plant Biological & Molecular Processes, February, 1999
—Plant Diseases, August, 1999
—Crop Protection & Quarantine, September, 1999
—Crop Production, September, 1999
—New Uses, Quality, & Marketability of Plant & Animal Products, May, 1999
—Bioenergy & Energy Alternatives, April, 1999
—Methyl Bromide Alternatives, November, 1998

As part of its on-going commitment to be responsive to stakeholders, the Cooperative State Research, Education, and Extension Service coordinated a public forum, "The USDA Solicitation of Input from Stakeholders regarding the Initiative for Future Agriculture and Food Systems" in July 1998. The purpose of this forum was to foster dialogue between USDA and stakeholders on the implementation of the mandatory spending program authorized in Section 401 of Agricultural Research, Extension, and Education Reform Act of 1998 for competitive grants to address critical emerging agricultural issues. CSREES also coordinated a public meeting in December 1998 to solicit input from stakeholders regarding the role of the USDA/HHS Joint Institute for Food Safety Research. Agency personnel are using the input to develop plans for the Institute, which was created to (1) develop a strategic plan for conducting food safety research activities consistent with the President's Food Safety Initiative and (2) efficiently coordinate all Federal food safety research, including research conducted with the private sector and academia, to ultimately reduce the incidence of foodborne illness to the greatest extent feasible.

CSREES has recently published in the Federal Register a proposed rule on stakeholder input requirements for recipients of agricultural research, education and extension formula funds. This proposed rule will implement section 102(c) of the Agricultural Research, Extension and Education Reform Act of 1996, and will require land grant and extension partners to report annually on the actions taken to encourage stakeholder input, and a brief statement of the process used by a recipient institution to identify individuals or groups as stakeholders and to collect input from them. The Department believes that these formal channels, as well as our continuing involvement with land grant and extension policy committees and farmer representatives will ensure that USDA's research, extension and education portfolio addresses the highest priority needs of American agriculture.

ERS uses conferences, workshops, and briefings to seek stakeholder input on proposed studies. These activities are developed in conjunction with the scientific associations, cooperating universities, and other organizations concerned with research on agriculture. Recent examples include:

—A workshop on economic analysis of long-term field trials of organic farming systems in Washington, DC, in April 1999. The workshop brought together economists associated with the long-term projects, the Organic Farming Research Foundation, the Rodale Institute, the Wallace Institute for Alternative Agriculture, the Leopold Center, and representatives of USDA extension and research programs.
—Two workshops on the issue of phasing out methyl bromide in Gainesville, Florida in March, 1998, and in Sacramento, California in June 1998. The participants included growers, environmentalists, researchers, input suppliers, and State and Federal administrators. Input from these meetings formed the basis for an inventory of methyl bromide alternatives and the information was used

to produce economic models of the potential impact of the methyl bromide phaseout.

—A March 1999 workshop that brought together representatives of the private sector, universities, the National Research Council, the Congressional Research Service, and other USDA and federal agencies to discuss economic research needs on transportation issues and their impact on U.S. agricultural export performance.

—A Fall 1998 conference of experts on the economic and public health consequences of achieving USDA's dietary guidelines, and a follow-up conference in the spring of 1998 on the impacts of possible changes to those guidelines.

ERS also regularly attends industry meetings attended by its stakeholders. For example, its researchers attend the Fertilizer Institute's Economics and Information Committee meeting each Spring, the International Poultry Waste Management Conference, the International Conference on Methyl Bromide Alternatives, and numerous annual conferences sponsored by commodity groups. ERS also meets directly with specific stakeholders and customers to discuss issues of particular importance to them to obtain their individual opinions and perspectives. For example, ERS leadership met with seven organizations in the fresh produce industry to discuss their desire to see more research on concentration in their industry. The Agency plans to expand its repertoire of communication channels by developing a series of round tables with a broad range of commodity and industry groups. The first of these round tables is being planned for mid-1999.

One of the primary ways that NASS regularly communicates with its stakeholders, customers, and data providers is through the grassroots contacts maintained by the 45 field offices. These State offices work directly with State cooperators, usually State departments of agriculture, and keep in touch with the agricultural leaders in farm organizations and producers across their States. All NASS field offices have toll-free numbers. Each field office has a Home Page in addition to NASS's main Home Page. NASS Headquarters staff also attend a number of national agricultural commodity meetings, exhibitions, conferences, and meetings of the National Association of State Departments of Agriculture. In addition, NASS hosts many visitors each year for its crop and livestock report "lock-up" briefings.

Another major source of feedback for NASS are data users meetings held at least twice per year. Input gathered at these meetings help NASS keep its statistical program responsive to the current needs of the agricultural sector.

RESPONSE TO STAKEHOLDER CONCERNS

Question. Name changes that have been made in the Department's research program over the past year to respond to the concerns and needs of its stakeholders and customers?

Answer. The REE agencies regularly make adjustments in its programs in response to stakeholder and customer concerns and needs. Many are adjustments within programs based on new understandings of stakeholders problems or concerns.

At the laboratory, Area Office, and headquarters levels, ARS maintains continual contact with a wide range of customers and stakeholders. The purpose of this dialogue is to keep our research program relevant to its mission of solving critical national problems that confront American agriculture. In the last 18 months, ARS has made a number of changes in its research activities in response to customer and stakeholder input.

One of the most important changes to occur is the initial implementation of the aggregation of 1100+ research projects into 23 National Programs. This process has had active input from ARS' customers, stakeholders, and partners since its inception. Draft program statements were submitted to our customers for review and comment. Planning workshops have been or will be held for each program or major program components. These workshops bring together customers, stakeholders, partners, and ARS scientists to help focus the Agency's research program on meeting the highest priority needs of American agriculture. ARS is also strengthening it peer review processes to ensure the quality of research programs. By mid-summer, the National Program Staff will make an Annual Report on each of the 23 National Programs available to its customers, stakeholders, and partners on the ARS home page. The Agency intends to send a notice to all interested parties when these reports are available, inviting their review and comments.

In response to stakeholder input, in fiscal year 1999 CSREES added the following National Research Initiative programs: Epidemiological Approaches for Food Safety; and The United States Rice Genome Sequencing Project.

ERS continually appraises and adjusts research plans to address stakeholder and customer needs. As an example, a new research project was formulated based on perceived concerns about the role of agriculture in emerging water quality problems of coastal areas. Initial plans for the project have been based on a host of specific situations, such as the hypoxia problem in the northern Gulf of Mexico, pfiesteria piscida eruptions in North Carolina's Albemarle Sound and the Chesapeake Bay, red tides in Florida, and salinity and nutrient problems in the San Francisco Delta and Puget Sound, all characterized as harmful algal blooms attributed to excessive nutrient enrichment of coastal waters.

Other priority studies designed to respond to issues presented to it by key stakeholder and customers include: An ERS-wide study of concentration in the food system; an analysis of the changing global meat market and its implications for US trade; a multi-division research activity on the economic impacts of biotechnology; a major initiative on risk management; and analyzing the impact of the financial crisis on US agricultural exports. In addition, the Agency has responded to stakeholder and customer requests by reinstating a full complement of its commodity analysis reports, and making them available in concise form on the Internet. Following a meeting with seven representatives of the fresh product industry, ERS initiated a study of retail trade practices and market structure in the produce industry.

On an on-going basis, NASS modifies and enhances the content and access to the vast array of data it provides customers. For example, the Advanced Very High Resolution Radiometer (AVHRR) instrument contained on the NOAA–14 weather satellite continues to be used to monitor changing vegetative conditions throughout the growing season. The NASS Internet web page allows Agency and external users to reference the following 1995–1999 map products on a real time basis: vegetative index maps, ratio comparisons to the previous year, within-year thumbnail time series, and frost danger. In response to customer requests, a new product was created to compare the current period's data to that of a 4-year median (1995–1998). In addition to GIF (Graphic Interchange Format) images, ftp (file transfer protocal) users now have access to postscript files allowing high resolution printing of the AVHRR products from the web.

Research also produces Landsat images categorized by specific crops, which is helping to meet the demand for spatial information on crops. A new initiative has been launched to develop external partnerships that will increase remote sensing capabilities for State Statistical Offices.

Research into the graphical display of data, which will allow users a better understanding of inherent patterns and structure, and a better ability to visualize and analyze data, has begun. The long-term goal of this research is to allow the users to dynamically generate graphical displays through the web. Historically, access to the data have been in tabular form only.

RESEARCH PORTFOLIO

Question. Dr. Gonzalez, you indicate in the testimony you have submitted to the Committee that "we must find ways to balance the research portfolio in helping colleges and universities enhance their future capacity with base funding" to strengthen their ability to compete successfully for research funding. Would you please describe the imbalances which have been identified by the Department and what the Administration is doing to correct these problems.

Answer. When I refer to balances in the research portfolio, I am thinking mainly of imbalances between the various categories of land grant colleges and universities that we have across the nation. Specifically, I refer to the vast differences in funding between our 1862 land grants and our minority-serving institutions, namely the 1890's and the 1994's and some Hispanic Serving Institutions. For these institutions to compete for funds in a competitive environment, the system must identify ways for these institutions to use their formula funds to leverage additional capacity building resources. Very soon, the Cooperative State Research, Education and Extension Service will publish in the Federal Register a proposed rule to implement Section 226 of the Agricultural Research, Extension and Education Reform Act of 1998 which requires increased non-federal matching funds for 1890 institutions. The Reform Act also allows the 1994 institutions to conduct research and extension programs under cooperative agreements with other land grant institutions. Both of these provisions will allow these institutions to use their existing formula fund resources to improve their research capacity, make them more competitive for state and private sector resources, and add diversity in approach to the solution of agricultural problems.

INTEGRATED PEST MANAGEMENT

Question. Will the Administration achieve its goal for the adoption of Integrated Pest Management (IPM) practices on 75 percent of U.S. cropland by the year 2000? Where are you currently in meeting this goal?

Answer. Consensus has emerged that Integrated Pest Management—IPM—systems should be measured along a continuum, ranging from no integration of management tactics to high levels of IPM adoption. The Department's 1994 report, Adoption of Integrated Pest Management in the United States, measured adoption along a continuum, and this approach was refined by Consumers Union in its 1996 report, Pest Management at the Crossroads. This report estimates that in the year 1996, 70 percent of crop acreage was managed with pest management systems at the low end of the IPM continuum. Our goal is to develop and help growers implement IPM strategies that will enable them to move from the low to the high end of the continuum. This will involve incrementally-enhancing biologically-based IPM systems within each production system.

The overall percentage of U.S. crop acres under IPM in 1998 remains at the 70 percent level, and will likely remain constant in 1999. However, we remain convinced that the increased investments proposed in the President's budget request for fiscal year 2000 will permit us to reach the 75 percent adoption goal by 2000. More importantly, we believe that these investments will accelerate the adoption of IPM systems at the medium and high end of the continuum. We believe that increased adoption of pest management systems at the high end of the IPM continuum will benefit all Americans by increasing profitability, protecting water quality and farm worker safety, and enhancing the wholesome quality of our Nation's food supply. We believe that an accelerated effort is warranted to develop IPM strategies and to assist growers to implement pest management strategies through educational programs that will help them reduce reliance on high-risk pesticides and enhance sustainability of their operations.

AGRICULTURAL PROBLEMS

Question. Please describe the Department's response to acute agricultural problems, such as the wheat and barley scab crisis and to the avian influenza.

Answer. The U. S. Department of Agriculture (USDA) recognizes the seriousness of acute agricultural problems, such as wheat and barley scab, and avian influenza.

The USDA-Agricultural Research Service (ARS) is expanding its research program on Fusarium Head Blight, and is working closely with the U.S. Wheat and Barley Scab Initiative to increase collaboration between Federal and State laboratories. The Cereal Rust Laboratory and the wheat genetic improvement project at St. Paul, Minnesota, have focused efforts on improved varieties with enhanced resistance to scab. In fact, a wheat line with significant resistance has been released from that program. In Peoria, Illinois, emphasis has been on the importance of the toxin in virulence and upon biocontrol approaches. $1,000,000 was appropriated to ARS for scab research in Minnesota in fiscal year 98. In fiscal year 99, Congress appropriated an additional $3,000,000 for cooperative research between ARS and the U.S. Wheat and Barley Scab Initiative. ARS is allocating the $3,000,000 to in-house research and grants to scientists in 20 States participating in the Initiative.

The Southeast Poultry Research Laboratory (SEPRL) located in Athens, Georgia, has been intimately involved in the eradication, control, and prevention of the highly infectious and lethal avian influenza virus. The research program will assist the U.S. poultry industry and other countries in influenza control. Assisting other countries with information and collaborative research is an effective strategy to prevent highly pathogenic Avian Influenza from being introduced into the U.S.

SEPRL has been particularly active in research on H5N1 avian influenza, which occurred in Hong Kong in 1997. The H5N1 outbreak began as a problem in chickens and spread to infect at least 18 people. SEPRL has collaborated with the Agriculture and Fisheries Department in Hong Kong and the Hong Kong Zoo on the agricultural aspects of the disease outbreak. This includes providing expert advice and research collaboration on currently available and new serologic tests to detect the virus and diagnose the disease and delivery of a new vaccine to protect poultry. SEPRL collaborated with the Centers for Disease Control (CDC) in Atlanta, Georgia, on the characterization of isolates of the H5N1 viruses. The CDC conducts, as required by law, all aspects on diagnosis of the H5N1 influenza in humans and handles all human clinical specimens. The SEPRL provided collaborative research support on molecular epidemiology of the viruses and testing the human isolates for ability to infect and cause disease in poultry and other bird species.

INFORMATION TO FARMERS AND PRODUCERS

Question. How does the Department currently ensure that information for the Department's research and analyses reaches farmers and producers? What improvements are being proposed for 2000?

Answer. The Department uses a variety of avenues to ensure that information and technology from its research and analysis program reaches farmers.

ARS scientists work directly with farmers and producers by involving them in field trials, research workshops, and other informal and formal outreach. For example, the Area-Wide Integrated Pest Management Project in the Pacific Northwest directly involves dozens of farmers. Once results began to be analyzed, the program also became a demonstration to inform many other growers of ways to reduce their use of chemical pesticides.

ARS produces a number of technical and semi-technical publications that provide important research results and analyses to small and large farmers and producers. For example, ARS recently published a series of manuals for crop residue management to reduce erosion and improve soil quality for farmers bringing their land out of the Conservation Reserve Program. ARS also publishes information such as the Cotton Ginner's Handbook, which provides new research information to the industry. ARS also distributes research information written for broad public audiences including farmers and producers through such Agency publications as Agricultural Research Magazine and the Quarterly Report of Research Results.

In order to make efficient use of resources, ARS disseminates research results through information multipliers such as commodity and trade associations, farm and general media, and educational and service organizations and agencies such as Cooperative Extension offices and State Agricultural Experiment Stations. ARS also distributes information through appropriate USDA farm service and regulatory agencies. For example, ARS supplied extensive amounts of research information for the Grasshopper IPM User Handbook, which is available to farmers through USDA Animal and Plant Health Inspection Service.

Tremendous amounts of ARS information are being made accessible through the Internet. All technical and semi-technical publications are now also published electronically, providing wider access to the information. Individual labs as well as Agency programs maintain web sites that include new research results and analyses. ARS maintains a searchable web site that provides extensive resources to farmers and other stakeholders at http://www.ars.usda.gov. Information about ARS's research initiatives in 23 National Programs and ongoing workshops is available at this site and also at http://www.nps.ars.usda.gov.

The many resources of the National Agricultural Library (NAL) are also Web-accessible. From the home page at http://www.nal.usda.gov farmers and producers can search the bibliographic database, AGRICOLA, with more than 3,500,000 citations to the literature of agriculture, a significant portion of which are USDA publications. Specific Information Centers at NAL support such diverse communities as small farms (Sustainable Agriculture Information Center), mayors and rural communities (Rural Information Center), and those concerned about water quality (Water Quality Information Center). The Food and Nutrition Information Center covers the range of nutrition interests of farmers and producers and provides information relevant to the school lunch program, WIC program participants, dieticians and the general public.

ARS improvements proposed for 2000:

—A systematic effort will be made to provide direct access to ARS research publications in electronic form on the Web.

—Continuation of outreach to farmers and producers through National Program workshops and reviews across the country.

The Cooperative Extension Service is the premier system for disseminating information from Federal and land grant research programs to farmers and producers. The Agricultural Research, Extension and Education Reform Act of 1996 gives the Cooperative State Research, Education, and Extension Service new authority to link research, extension and education programs in Section 406. The fiscal year 2000 budget takes full advantage of this new authority by proposing integrated research projects in the areas of FQPA Implementation, Methyl Bromide Transitions, Food Safety and Water Quality, among others. These topics represent immediate concerns where research results must be translated to on-the ground impacts as soon as possible. The Department believes that linking research and extension from the beginning will ensure the most efficient transfer of new knowledge to farmers and ranchers.

ERS has a comprehensive dissemination program to ensure that its information, research and analyses reach the widest possible audience. This program includes

(with no charge to users): electronic copies of all agency reports on the Internet; e-mail subscriptions for time-sensitive crop, livestock, and agricultural trade reports; and documents available through a fax-on-demand system. It also includes wide distribution of printed reports and summaries to the news media and other information services, to State cooperative extension programs, and to farmer and producer groups for use in their communications. Additionally, all ERS reports are available (for the cost of distribution) from the USDA Order Desk, 1–800–999–6779, which is a service operated by the National Technical Information Service of the Department of Commerce.

In addition to the release of each research and market analysis report, a broader publication program has been designed to generate articles and features in ERS and USDA periodicals, and in popular, widely-read outlets such as Choices, and the Journal of Soil and Water Conservation, and peer-reviewed journals. ERS regularly publishes a variety of monographs targeting a diverse clientele and stakeholder constituency, and designed to communicate complex issues and research findings in a straightforward and useful manner:

—Agricultural Outlook is the Agency's main outlet for summarizing the situation and outlook for agricultural commodities, and for communicating in an easily readable manner the findings of analyses and research on a broad range of commodity market, trade, and natural resource policy issues.

—Rural Development Perspectives publishes the results of new research on rural economic and social changes. Articles are especially targeted toward areas with policy relevance.

—Rural Conditions and Trends provides yearly updates of current economic, social, and policy developments affecting rural America.

—Food Review, ERS' magazine of food economics, provides public and private decision makers with data and analyses of the economic issues surrounding domestic and foreign food consumption, food prices, export opportunities, food safety, nutrition, marketing, and the impacts of Federal food regulations and policy reforms.

ERS has recently made a number of investments in improved electronic information dissemination which will continue in 2000. Through these investments ERS has improved its capacity to access information from the U.S. trade database and share it more easily with other users. The Agency is now developing a prototype of a web-based interactive data base, which would make our data directly and easily accessible to policy makers and the general public. The Agency is also reviewing our system for disseminating printed information to assure that we are reaching key individuals and groups, including organizations which can further disseminate our work to farmers and producers. ERS has developed new products—country, commodity and issue briefing rooms—which are updated regularly. These provide users with focused and timely information from both our data bases and published work.

Annually NASS publishes over 400 national reports which cover more than 120 crop and 45 livestock items. These basic and unbiased data are necessary to maintain an orderly association between the consumption, supply, marketing, and input sectors of agriculture. The popularity of accessing NASS information through Internet continues to grow. During a recent month, the USDA Web Server was accessed an average of 1,600,000 times a week, of which inquiries to NASS accounted for nearly 254,000. The NASS crops and livestock reports were first in popularity among USDA agencies, with 11,000 to 14,300 hits per week. E-mail subscriptions to NASS reports increased over 30 percent in the last year and electronic subscriptions for all reports total nearly 13,000. NASS continues to work with ERS, WAOB, and Cornell University to enhance the USDA Economics and Statistics System Internet site at Cornell University. The Mann Library at Cornell University archives reports and provides an e-mail subscription service for NASS, ERS, and WAOB under a cooperative agreement. The new USDA Economics and Statistics System Home Page improves navigation from any page. The e-mail subscription process was upgraded to enable customers to click on the desired reports in order to subscribe.

Federal Administration and Special Research Grants

Questions Submitted by Senator Cochran

aflatoxin research, illinois

Question. Please provide a description of the research that has been conducted under the Aflatoxin Research, Illinois grant.

Answer. This research is focused on development of strains of corn which will be highly resistant to infection with Aspergillus flavus and the production of aflatoxin under field conditions. After identification of resistant strains through field testing, transfer of genetic material into usable corn inbred strains will be performed.

Question. According to the research proposal, or the principal researcher, what is the national, regional, or local need for the research?

Answer. There is much national concern about the role of aflatoxins as carcinogens in the human population. The aflatoxin material is also toxic to animals and humans. The presence of the fungus in corn results in a lower value for the crop and the possible rejection of the corn. Aflatoxin contamination continues to be a serious problem in the southern and southeastern United States, although outbreaks can and have occurred during severe drought conditions in the upper mid-west and other areas during the past few years.

Question. What was the original goal of this research and what has been accomplished to date?

Answer. The original goal of the research was the reduction of infestation of corn with Aspergillus flavus and the consequent reduction of aflatoxin in the corn produced. The researchers have produced strains with resistance genes for both prevention of infection with A. flavus as well as the production of the aflatoxin itself. Field trials have been in progress to determine effectiveness of these resistance factors under normal growing conditions when exposed to the fungus.

Question. How long has this work been underway and how much has been appropriated by fiscal year through fiscal year 1999?

Answer. Grants have been awarded from funds appropriated as follows: fiscal year 1990, $87,000; fiscal year 1991, $131,000; fiscal years 1992–1993, $134,000 per year; fiscal year 1994, $126,000; and fiscal years 1995 through 1999, $113,000 per year. A total of $1,177,000 has been appropriated.

Question. What is the source and amount of non-federal funds by fiscal year?

Answer. The non-federal funds have been from state appropriated dollars in the form of principal investigator and technical salaries, equipment usage, and experimental plot expenses. These have been at the level of $130,000 for fiscal years 1997 and 1998.

Question. Where is this work being carried out?

Answer. The research is being performed in the Department of Crop Sciences at the University of Illinois.

Question. What was the anticipated completion date for the original objectives of the project? Have those objectives been met? What is the anticipated completion date of additional or related objectives?

Answer. The anticipated completion date for the original objectives was 1995, but the project was revised last year to continue to fiscal year 2002. The primary reason for the extension of the work is that there appear to be multiple resistance genes which are necessary to prevent both the infection with the fungus and the synthesis of the aflatoxin compound. The investigators are very optimistic about the future success of this approach and this work will be discussed at a meeting of Multi-State Research Project NC–129 on January 25–26, in New Orleans.

Question. When was the last agency evaluation of this project? Provide a summary of the last evaluation conducted.

Answer. The last evaluation by the agency was in 1996 at which time the project was considered to be progressing well and had a high probability of success in meeting its original objectives. The project also receives a form of peer review as it is discussed each year during the annual meeting of NC–129, a project focused on mycotoxin production and toxicity of the toxins in animals and humans.

AG-BASED INDUSTRIAL LUBRICANTS RESEARCH PROGRAM, IOWA

Question. Please provide a description of the research that has been funded under the Ag-Based Industrial Lubricants Research Program grant.
