PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

THURSDAY, FEBRUARY 27, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:05 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Specter, Bumpers, Kohl, Byrd, and Leahy.

DEPARTMENT OF AGRICULTURE

OFFICE OF THE SECRETARY

STATEMENT OF DAN GLICKMAN, SECRETARY OF AGRICULTURE

ACCOMPANIED BY:

RICHARD ROMINGER, DEPUTY SECRETARY

KEITH COLLINS, CHIEF ECONOMIST

STEPHEN B. DEWHURST, BUDGET OFFICER

OPENING REMARKS

Senator COCHRAN. The meeting of our agriculture appropriations subcommittee will come to order.

Today we are pleased to begin the first in a series of hearings to review the President's proposed budget for the Department of Agriculture and related agencies for fiscal year 1998. We are very pleased to begin our hearings with the distinguished Secretary of Agriculture, the Honorable Dan Glickman. We appreciate your presence this morning and we also appreciate the presence of your colleagues, the Deputy Secretary of Agriculture, Richard Rominger; the economist for the Department, Keith Collins; along with Stephen Dewhurst, Budget Officer for the Department.

As we all realize, this subcommittee has jurisdiction over the activities and programs of the Department of Agriculture, with the exception of the Forest Service. The President's budget request for the activities under the jurisdiction of this committee totals \$51 billion for this next fiscal year. This is a net decrease of \$1 billion from the fiscal 1997 enacted level of funding.

Three-fourths of this request is for mandatory programs, so-called because the law directs that payments be made by the Department of Agriculture to beneficiaries of programs and for pro-

PART 1

2

gram activities. This year's level of mandatory spending is \$1.7 billion less than it was for fiscal year 1997.

The President's proposed total discretionary appropriations request for the Department of Agriculture is \$13.2 billion, which is an increase of about \$640 million above the enacted level for fiscal year 1997.

Mr. Secretary, we appreciate your being here to further describe and explain the President's budget request for this next fiscal year. We know that you have prepared a statement for the hearing, and we encourage you to proceed to summarize that. We will make it a part of the record in full, so we will have an opportunity to ask you questions about it.

You may proceed.

STATEMENT OF SECRETARY GLICKMAN

Secretary GLICKMAN. Thank you very much, Senator, Senator Kohl, Senator Byrd. It is an honor for me to be here.

You did introduce my partner, Deputy Secretary Rominger, who is well-skilled in budget and management issues. I have two of the finest career employees in Government with me as well, Steve Dewhurst, our Budget Officer, who has probably been before here more times than he would like to acknowledge, but for many, many years, and Keith Collins, our Chief Economist, who has also been at the Department many, many years. And they are here to bail me out when I cannot answer your questions very well, but they also have a good historical understanding of our operations.

I will summarize my statement, and have my complete statement submitted for the record.

This budget was developed under tight constraints. There are four priorities in this budget, and I thought I would list those and talk a little bit about them. One is expanding economic and trade opportunities. Two is ensuring a healthy, safe, and affordable food supply. Three is managing our natural resources in a sensible way, recognizing that part of that budget is within the confines of another subcommittee because of the Forest Service. And four is reinventing Government and saving taxpayer money.

As part of this budget, we have had to make some difficult decisions. Some of you are probably hearing about some of those decisions in terms of closing offices out in the country. In some cases, those discussions are premature. But, the fact of the matter is that we are an agency in a steep reduction mode. And I will talk about that.

At the same time, we are also an agency in which the laws have been changed which changed our jobs. The farm bill reduced budgetary exposure by providing payments to farmers, which are set by law over a 7-year period. We do not propose changing that at all. However, that changes a lot of our job responsibilities. In addition, implementation of the USDA portion of welfare reform is projected to save nearly \$3.5 billion this next fiscal year, and \$21 billion over 5 years.

BALANCED BUDGET AMENDMENT

I would point out, and I mentioned this at the House hearing yesterday, that while we are clearly doing our part, in terms of

PART 1

3

budget reduction and staff reduction, I will indicate some concerns about the potentially adverse effect on the Department's clientele of an inflexible approach as part of the balanced budget amendment. My concern is natural disasters, which occur every year. We had them in California, we had them in the Dakotas, and they require a great deal of expendable resources.

I am also concerned that the amendment could result in reductions in farm program payments under the 1996 farm bill, as well as the Conservation Reserve Program [CRP] payments. Another concern of mine is the rural constituency is much smaller than the urban constituency, and that rural programs could be particularly vulnerable when those kind of priority decisions have to be made.

DISCRETIONARY BUDGET

The current request before this committee for discretionary budget is about \$13.2 billion. It is about one-half of a billion above the level for 1997. We are also proposing legislation which would increase user fees and limit reimbursements to private insurance companies. With the effect of this legislation, the discretionary budget is pretty flat, about \$12.7 billion.

I would also note that the total number of employee staff-years associated with the budget are down substantially. We are projecting staff-years of about 110,000 for 1998. That compares to nearly 130,000 staff-years in 1993. We are down 20,000 staff-years in 5 years. That is as large a reduction, I believe, as any Federal Government agency has taken. And we are looking, based on the budget numbers, at further staff-year reductions projected for the year 2002. And I will talk a little bit more about that later.

1997 WIC SUPPLEMENTAL

Also associated with this budget, we are requesting a 1997 supplemental of \$100 million for the Women, Infants, and Children [WIC] Program, to prevent a large drop in participation and to ensure a smooth transition between 1997 and 1998.

Let me start with the major priority areas, in terms of economic and trade opportunity. The new farm bill brings new challenges to American agriculture. The legislation provides farmers the flexibility to plant for the market rather than Government programs. This is for the major row crops. To deal with the added risk of farming brought about by this legislation—and there will be added risks as we have increased price volatility already occurring in major commodities—we are expanding crop insurance tools as part of our commitment to maintain a safety net for producers.

REVENUE INSURANCE PILOT PROGRAM

Last year we worked with the private insurance industry in developing a pilot program for revenue insurance, which protects farmers against price declines as well as production losses. Right now, insurance, to the extent that it works, deals with catastrophes, acts of God. We are proposing expanding this to include price/revenue insurance. We are proposing that this program be offered nationwide this next year.

PART 1

4

This will be a budget-neutral proposal and provide for a comprehensive set of improvements in the crop insurance programs. My statement talks a little bit about the improvements in administration of it. But of particular interest to the Appropriations Committee, is the proposal would change both the amount of discretionary funds needed to operate the program and the range of expenses that would be paid with such funds.

SAFETY NET

As part of our safety net proposals, the committee should be aware that we are requesting the authorizing committees to give us authority to extend commodity loans beyond their 9-month levels, in certain circumstances where there is great price volatility, allowing for managed haying and grazing of CRP acreage, increased planting flexibility, and providing for flexibility in the timing of production flexibility contract services. We are also proposing changes in the farm credit area.

Also, to help farmers deal with the added risks of farming, we are requesting appropriated funds to expand the collection and dissemination of weather data for agricultural areas. We are concerned that we need more accurate weather forecasting, which would help producers mitigate the adverse impacts of weather-related events.

The most recent one was the freeze in south Florida, where, what we are seeing is that the agriculture component of the National Weather Service is basically being reduced in terms of the separate reporting stations and operations. We think that we need to augment some of those in our budget as well.

On the area of farm credit, we continue to provide essential financial support for those who cannot obtain credit elsewhere. We are proposing these programs be funded at about a level of \$2.8 billion in loans and guarantees. Portions of both direct and guaranteed farm operating and farm ownership loans will be targeted to beginning and socially disadvantaged farmers.

SOCIALLY DISADVANTAGED FARMERS

We are also requesting that \$5 million be appropriated for fiscal year 1998 to continue the outreach program for socially disadvantaged farmers. Only \$1 million was appropriated in 1997. We have allocated a little bit extra from our fund for rural America, but we believe it is very important to ensure that members of these groups receive the training and management assistance necessary to remain in farming.

In the area of trade we have had some great success. Last year we had a record level of nearly \$60 billion in exports that we achieved. We believe trade is the ultimate safety net. One of every two acres of production in America goes for products that go overseas. It is critical that we continue our trade expansion efforts.

U.S. EXPORTS

Changes in the domestic farm programs have made America's farmers and ranchers more dependent than ever on exports. In addition, although many tariffs and trade barriers have been lowered,

PART 1

5

we continually face new challenges in our efforts to access new markets, such as phony sanitary or phytosanitary measures that are not based on sound science, as well as, concerns about genetically engineered products. Competition remains keen.

Our budget proposals continue our strong commitment to export promotion and growth. They provide a total program level of just under \$7.7 billion for the Department's international programs. Funding for most of these programs is either maintained at the current levels or increased.

In the case of the Export Enhancement Program, the budget provides funding at the maximum level permitted by the 1996 farm bill.

In the area of rural development, portions of rural America continue to face persistent poverty, lack of basic amenities, and limited economic opportunity.

EMPOWERMENT ZONES/ENTERPRISE INITIATIVE

The budget provides funding for several key administration initiatives to address these problems, including the empowerment zone/enterprise initiative, the water 2000 initiative, the President's national homeowner initiative, and the administration's national information superhighway initiative.

The budget provides for about \$9.1 billion in loans and grants under our rural development programs, which is about \$1 billion more than can be supported with the 1997 appropriation. This includes \$1 billion for single family housing direct loans.

Further, we are proposing that \$689 million of the budget authority for rural development, which is enough to support about \$2.5 billion in loans and grants, be provided under the Rural Community Advancement Program [RCAP] authorized by the new farm bill. That will give greater flexibility for the States to set priorities and allow some limited block granting as well.

FUND FOR RURAL AMERICA

As most of you know, we have a Fund for Rural America, which was established in the farm bill, which provided up to \$100 million a year in additional funding for critical rural development and high-priority research. We are proposing a technical correction in that bill, which we will be glad to talk about later.

In the area of research, we are proposing \$1.8 billion for research, education, and extension. I will not go into that in great detail, other than to say, that the priorities in that area, including promotion of development of sustainable farming systems, long-term global competitiveness, and new and improved products, are all the things that will be part of that. Also, Congress will have to reauthorize the research title of the farm bill this year.

In 1998, we will also conduct a census of agriculture for the first time, and thereby expand significantly its role as an information provider. Although we were appropriated funding for the census in 1997, the authorization legislation to transfer the function from Commerce to USDA has not been passed. I urge you to see if you can do that.

PART 1

6

MARKETING AND INSPECTION

In the marketing and inspection area, we are making excellent progress in combating many plant and animal pests and diseases, such as brucellosis. The 1998 budget also provides funds for pest detection activities, such as Karnal bunt, a wheat fungus, and agricultural quarantine inspection along the borders.

In addition, we have several proposals regarding packer market competition and poultry industry competition and compliance recommended by the Advisory Committee on Agricultural Concentration. We believe very strongly that the increased concentration in agriculture, particularly in the livestock industry, is a threat to family farm operations. This is an area that we are looking at very closely.

So that covers the area of economic opportunity.

Quickly, I would like to turn to the area of healthy, safe, and affordable food supplies. Obviously, the main part of that is completing our implementation of the Hazard Analysis and Critical Control Point [HACCP] System, which is a performance-based system to inspect meat and poultry. We are requesting a current law budget of \$591.2 million in that area, to inspect meat and poultry. That is a \$17.2 million increase over the 1997 level, to maintain inspection and continue making investments in technology, training, and science.

USER FEE PROPOSAL

Legislation will be proposed, I should reinforce this because it is very controversial, to recover the direct cost of providing inspection to slaughter plants. In-plant inspection we are asking this to be provided for by user fees which is estimated at \$390 million in 1998. This user fee proposal assures that the resources will be available to provide the level of inspection necessary to meet the demand for such services without being subject to annual budget pressures. This action will also reduce the pressure to trade off investment and improving inspection with the need to meet legislative requirements for providing information.

I might also mention this little side note. Livestock is one-half of the gross sales of American agriculture. Fifty percent of everything we sell in American agriculture, from farmer to rancher, through value added, is in livestock. It is billions of dollars a year. Half of that, by the way, is in the cattle industry.

Our point is that we have to continue to convince the American consumers, which we have successfully done, that their meat and poultry is safe. One outbreak of a problem causes a great reflection of fear on the part of the consumer. We have been lucky that we have not had the problems nor the resistance to good science, as we have seen in other parts of the world, particularly with Western Europe, where we saw meat consumption in Germany fall 50 percent the month after the BSE or mad cow incident came up, and there was not one reported case of BSE in Germany.

We do not have it in this country. We have safe meat and poultry. The public is convinced that we do. And we have to make sure that we continue to fund this meat and poultry inspection operation to continue that consumer confidence.

PART 1

7

We worry that there may not be enough funds in the budget without some form of user fee, but I recognize the controversial nature of this particular proposal.

RESEARCH

As part of the President's recently announced food safety initiative, we are also requesting \$9.1 million for research, education, and improved inspection systems, working with cooperative research land-grant universities, tracing foodborne illnesses. We are requesting an increase of \$10.2 million be made available to the Agricultural Marketing Service [AMS] to administer the pesticide data program. We believe that funding for this program within USDA is preferable to the current funding arrangement through the Environmental Protection Agency [EPA], because we are largely the ones involved in the issue of application of pesticides.

FOOD AND NUTRITION

In the area of food and in the area of nutrition programs, we are proud to say that WIC has grown to full participation, achieving a longstanding bipartisan goal. A budget request of \$4.1 billion is proposed for 1998, to provide adequate resources to support full funding for WIC at 7.5 million participants. We will continue to work with the States to improve caseload management and to operate the program within available funds.

We have also requested \$7.8 billion for the School Lunch and Child Nutrition Programs, and we have stepped up our nutrition education activities, designed to help schools serve more nutritious meals and to teach children healthier eating habits. We are also requesting \$12 million for a new human nutrition initiative in 1998, with increases each year until the initiative reaches \$53 million in the year 2002.

Virtually all the human nutrition research in Government is conducted by the Department of Agriculture. The main centers you may have heard of are at Tufts and at the Texas Medical Center in Houston. But we have centers at the University of Arkansas, where we do a lot of human nutrition research. And we believe this is important to understand better the relationship between diet, cognitive development, and health, particularly for infants and children.

In the area of nutrition assistance, we are working actively with the States to implement welfare reform. We plan to offer modest legislative changes to the authorizing committees to moderate the harsher aspects of welfare reform, to provide a softer landing and extend a helping hand to anyone able to and willing to work but unable to find a job. This legislation would add some money to the budget, and it is something you may want to ask me about later.

FOOD RESCUE

I also want to call your attention to a nonbudget item, but USDA, in the last few years, has adopted a major initiative in the area of food rescue and gleaning. Congress passed the Bill Emerson Good Samaritan Act this past summer, which relieves people of liability in most cases for donating surplus food.

PART 1

8

We estimate that, institutionally in this country, we throw away 15 million meals a day of perfectly healthy food. And we are trying to facilitate, through food banks and through community operations, of not wasting good food. USDA happens to have the only cafeteria in Government which routinely donates our surplus food to the D.C. Central Food Kitchen.

As a result of this bill, several American companies now donate several hundred thousand sandwiches a month into the community food bank operation that was otherwise being thrown away. And this is an area where Government can be a facilitator, without costing any money. It is something that we think is part of the community spirit of this country. The Bill Emerson law had a lot to do with that.

CONSERVATION

The third priority is sensible management of natural resources. The 1996 farm bill extended the Department's conservation responsibilities by creating new programs. Actually, if one were to look at the 1996 farm bill, you would say it was largely a conservation farm bill. It included a lot of new programs.

We face a critical year in deciding the fate of 21 million acres that are coming out of existing CRP contracts. The revised CRP will target only our most environmentally sensitive lands, so that we get the maximum environmental benefit for each dollar spent. Less environmentally sensitive land, better suited for planting crops, will be returned to production.

Using Commodity Credit Corporation [CCC] funds, our goal is to reach and then maintain the 36 million-acre maximum enrollment established by Congress. Although it will take us some time to get there, this is probably the most significant part, conservationwise, of the last farm bill.

In addition, in association with CRP, CCC funds will be used to enroll an additional 212,000 acres into the Wetlands Reserve Program [WRP], which would bring total enrollment to about 655,000 acres in 1998, and reaching a goal of nearly 1 million acres by the year 2002.

Finally, we are requesting appropriated funds of \$821 million for our Natural Resources Conservation Service [NRCS] to carry out its work.

REINVENTION

The final area is reinvention and saving money. USDA continues to implement the reorganization which was authorized by Congress in 1994. We have already consolidated agencies and restructured the headquarters field offices. Our initial streamlining efforts have resulted in substantial reductions in employment, and indicate a savings of more than \$4 billion by the year 1999, and nearly \$8 billion by the year 2002.

We are continuing to close and collate field offices to streamline operations, to provide more efficient services. Further streamlining and downsizing, as well as better management of technology services across the Department is underway.

USDA's total Federal and county employment in 1996 was over 16,000 below its 1993 levels. And by the year 2002, it will be more

PART 1

than 26,000 below the 1993 levels. USDA's employment today is lower than it has been at any time in the last 30 years.

When we were asked to streamline and downsize, and this of course started before I got into this job, we are doing just that. I also want to point out something that many of you have told me individually. There are a lot of rumors out there about further closings of offices. Kentucky is one State that I have heard from a lot of folks out there. I sent a letter out, saying that I have not approved any additional plans to close field offices beyond the level of 2,500 field offices that we had agreed to as part of the reorganization. We are about 2,650 now, down from about 4,300.

Senator COCHRAN. Mr. Secretary, since you specifically mentioned Kentucky, I know Senator McConnell has the obligation to chair an appropriations subcommittee at 10:30. If you would permit me, I am going to yield time for him to ask you a question on that.

Secretary GLICKMAN. That is why I referred specifically to you. Because I knew you would have an interest in this.

Senator COCHRAN. Senator McConnell.

FSA FIELD OFFICE CLOSINGS

Senator MCCONNELL. Thank you so much, Senator Cochran. I really appreciate this. I will not take but a moment.

As you know, because we talked about this, the State executive director in Kentucky is running around saying that 50 offices are going to be closed. You had told me and told Senator Ford previously that this was a work in progress.

Secretary GLICKMAN. That is correct.

Senator MCCONNELL. That nobody was to make announcements yet.

Secretary GLICKMAN. That is correct.

Senator MCCONNELL. This fellow seems to me to be totally out of control. I mean Senator Ford, who is obviously not of my party, said to the Farm Bureau just this week that he has told you all you ought to either shut him up or fire him. And my concern is this fellow is sort of running amok across our State. Does he have the authority to do that?

Secretary GLICKMAN. Let me speak to this in a little more generic way, without talking about any individual. I have talked to this particular gentleman, because he is not totally out of line. He got information from the national office to prepare projections of closings based upon a hypothetical plan. Let me just explain it briefly.

Our goal was to get down to 2,500 offices, service centers. These would be combined with USDA offices throughout the country. We are close to that. The President's budget, as proposed, has dollar numbers within the USDA request that would require us to get down to 2,000. That is presuming that you all adopt an appropriations bill that is compatible with his total budget, which you may or may not do.

There was some discussion by some State executive directors [SED] around the country, and I was aware of it, which assumed that if we were going to go get down to 2,000 offices, that would mean some field offices with fewer people. Therefore, you would have to lay off more people in the process, because you would have

PART 1

10

these offices with fewer people. So some of them, I suppose you could call it a rump group of which I was aware, decided to come up with an option by which we would reduce down to a level where we could keep much more of our staff functioning, helping people, but we would not have as many offices. So that was the option that surfaced from the rump group.

Now, what happened inside the Department is that the directive went out to some of the SED's to determine how they would handle this, "option" of going down to 1,500, which, by the way, is 500 more than is proposed in the President's budget. Once I heard about it I sent out a letter last week to all of you which basically said there is no plan on paper to close further offices. I happened to see a wire story about Kentucky concerning something that the State executive director had said. Just let me say, it has happened in other States as well, Senator, besides Kentucky.

Senator MCCONNELL. Mr. Secretary, I do not want to belabor this, and I really thank Senator Cochran for giving me a couple of minutes here. I got your letter. The point is he is still doing that. I strongly recommend that if he does not have the authority to be saying what he is saying, you, as his boss, ought to tell him to quit saying it. We understand that some offices are going to be closed. You are not going to get a wholesale complaint from me about that. I understand the budgetary needs. But he has been just bouncing off the walls, running around the State. We have a turmoil, a general turmoil, down there on this. And I really think you ought to shut him up until you finish your work.

Secretary GLICKMAN. Message heard.

Senator MCCONNELL. Thank you very much, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

Secretary GLICKMAN. Thank you.

Senator COCHRAN. Mr. Secretary, you may complete your testimony.

ELECTRONIC BENEFIT TRANSFER CARD

Secretary GLICKMAN. Besides talking about that issue, I want to talk a little bit about efforts in the reinvention area to combat fraud and reinvent administrative processes. We are working to complete the Electronic Benefit Transfer [EBT] Program in food stamps. The debit card, we believe, will significantly save taxpayer dollars and reduce fraud. This program is operational in 18 States, and in development in all other States. We are also stepping up our management and integrity efforts in child nutrition and WIC.

In the area of single direct family housing, we have moved to a program called dedicated loans, origination and servicing [DLOS], which is a centralized servicing system of housing. We expect that to save \$400 million over the next 5 years, while providing better service to our borrowers and reducing delinquencies.

I have talked to you a little bit about the potential impact of the budget on USDA service center locations. I know that this creates some hardship in certain places in the country. There is no question we are going to have to probably continue to reduce, but I assure you that we will create no plans on further reductions without notifying you and having you participate in that process.

PART 1

11

I do think, in this era of computers, fax machines, and electronic communications, that we do not need the same field office structure we needed in 1935. We have begun the process of reducing it. But, above all, we have to always keep in mind that how we serve farmers and ranchers, how we serve the people who need our programs, is the key point in terms of that field office structure.

CIVIL RIGHTS

Finally, Mr. Chairman, I want to mention civil rights. Your committee, last year, helped to provide some additional money to strengthen staff resources in the area. We have many activities underway now to reduce the embarrassing backlog of equal employment opportunity and program discrimination complaint cases in USDA. A few months ago, I created a civil rights action team to do a thorough audit of USDA civil rights issues and provide me with recommendations for improvements.

We held a series of listening sessions around the country, to hear from employees and program participants. Deputy Secretary Rominger and I attended most of them. I have received a copy of this report, which we will get to you. Tomorrow I will announce some steps that I am going to take to try to make it clear that our Department ought to be viewed in a positive way, not a negative way, in terms of how we treat our employees and how we treat our customers.

In addition, I have directed the agencies that serve farmers to establish special outreach offices in the field. I am committed to making positive changes to USDA to ensure that both our employees and our customers are treated fairly and with dignity.

Finally, let me just thank you for your help. It is no secret that our committee's budget was one of the few that passed on time, the USDA's budget. And in some cases, we were the only agency in Government operating when there were shutdowns. And I would like to think it was because of the cooperative help with which we have worked together, as well as the bipartisan spirit in agricultural programs.

So I thank you very much, and look forward to your questions.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Mr. Secretary. We appreciate very much your cooperation with the committee and your helpful description of this budget request. We have your complete statement, and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF DAN GLICKMAN

Mr. Chairman, Members of the Committee, it is a privilege to appear before you to discuss the 1998 budget for the Department of Agriculture (USDA).

I would first like to express my appreciation for the hard work of this Committee last year that resulted in the timely enactment of the 1997 Agriculture Appropriations Act. We are grateful for your efforts.

The budget again this year was developed under very tight funding constraints. It includes savings that are required to meet the President's objective of balancing the budget by the year 2002 while positively addressing strategic goals for programs that meet the needs of people and protect the Nation's natural resources. There are four fundamental priorities that we focused on in developing our budget proposals for 1998. These include: expanding economic and trade opportunities; ensuring a

PART 1

12

healthy, safe, affordable food supply; managing our natural resources in a sensible way; and reinventing government and saving taxpayer money.

In order to meet our budget priorities, it was necessary to make hard decisions to restrain, reduce, and redirect spending in a number of areas; to include some new user fee proposals; to require employment cuts in many of our major agencies; to absorb part of the increased pay and inflation costs; and to change the way we do business. I should also point out that through recent changes in legislation, USDA also contributes to balancing the budget through reductions in mandatory spending. The Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act) reduces budgetary exposure by providing fixed and generally declining market transition payments over a 7-year period. Also, implementation of the USDA portion of welfare reform is projected to save \$3.4 billion in 1998 and a total of about \$21 billion over 5 years.

The President's budget proposes \$60.3 billion in budget authority for 1998 for the Department of Agriculture compared to a current estimate of \$60.6 billion for 1997. The staff year level associated with the proposed budget is also worthy of mention. USDA is ahead of schedule in reducing employment based on the original reorganization and streamlining plan. By the end of 1996, we reduced our total staff years including Federal and non-Federal to 113,000—a reduction of 8,000 below our original estimate and more than 16,000 below the 1993 level of 130,000. Those reductions were primarily achieved through normal attrition and the use of early outs and buyouts.

I would like to mention also that, while the Department and its clientele will make the necessary sacrifices to meet the needs to balance the budget, we believe the economy will benefit in the long run. However, I would like to register some concern about the potentially adverse effects on the Department's clientele of the inflexible approach pursued in the balanced budget amendment, which could limit our ability to respond to natural disasters, reduce food stamp benefits in times when the need is greatest, and create intense pressures to reduce valuable programs for our farm and rural clientele.

The request before this Committee for discretionary budget authority is \$13.2 billion. However, the budget proposed legislation in several areas of the Department that if enacted would reduce discretionary budget authority to \$12.7 billion, the same level as 1997. The legislation includes new user fees for the Food Safety and Inspection Service, the Agricultural Marketing Service, and the Grain Inspection, Packers and Stockyards Administration; and legislation to limit reimbursements paid to private insurance companies in the crop insurance program.

Also associated with the 1998 budget, we are requesting a 1997 supplemental of \$100 million for the WIC program to prevent a large drop in participation and to ensure a smooth transition between 1997 and 1998. We are also requesting a \$6.2 million supplemental for the Nutrition Education and Training (NET) program to restore funds lost when the Welfare Reform Act removed the direct funding mechanism of this program, leaving it with no funds. NET provides State level technical assistance for nutrition education throughout the Child Nutrition Programs. The Administration's supplemental proposals are fully offset including a rescission of \$50 million in budget authority for the Public Law 480 Title I program.

FARM AND FOREIGN AGRICULTURAL SERVICES

A fundamental goal of the Farm and Foreign Agricultural Services mission area is the expansion of economic and trade opportunities to further income growth and development throughout rural America. How we accomplish our mission will in large part be determined by the new policies set in place by the 1996 Act, and one of our primary tasks this past year has been to implement the policy and program changes provided for in the 1996 Act. As a result of our efforts, nearly 99 percent of eligible producers entered into production flexibility contracts.

Although the 1996 Act has provided much greater flexibility to our farmers in their production and marketing decisions, it has also increased the risks inherent in farming by reducing the Government's role in supporting incomes and managing supply and demand. As a consequence, we remain concerned about the adequacy of the safety net for our producers and have been working diligently to expand and improve programs which help producers manage their risk.

In this regard the Committee should be aware that we will be proposing legislation to the authorizing committees to improve the safety net for farmers. Our legislation provides discretionary authority to extend commodity loans, allows managed haying and grazing of Conservation Reserve Program acreage, increases planting flexibility and provides for flexibility in timing of production flexibility contract payments. Legislation will also be proposed to expand revenue insurance coverage na-

PART 1

tionwide, improve farm credit services, and make other technical adjustments to improve farm programs.

At the same time, we will continue in our efforts to reduce expenses, improve efficiency, and provide improved service to our customers. A major focus of these efforts is the establishment of Field Office Service Centers and associated steps to enhance services in the field.

Farm Service Agency

The Farm Service Agency (FSA) administers the farm credit programs, commodity programs, several conservation programs, and activities of the Commodity Credit Corporation (CCC). The consolidation of staffs and county offices under FSA continues to be a major focus of our streamlining efforts.

FSA staffing has changed dramatically as a result of these streamlining efforts. FSA Federal and county staffing is projected to be down from 19,008 staff years at the end of 1996 to 17,875 staff years at the end of 1997 as a result of buyouts, RIF's, and attrition. The 1998 budget for FSA salaries and expenses proposes a program level of \$954.1 million, estimated to support a ceiling of 15,756 staff years, suggesting further separations in 1998 of approximately 2,119 staff years.

Farm Credit Programs

The farm credit programs administered by FSA continue to serve as a vital source of credit for our Nation's farmers and ranchers. Over the last two decades or more, these programs have changed significantly. Guarantees of loans made by private lenders now comprise the bulk of activity. A portion of the direct loans are targeted to beginning and socially disadvantaged farmers and ranchers, and far more attention than in prior years is being paid to repayment ability and adequate security.

The 1998 budget provides for a total of about \$2.8 billion in farm credit program loans and guarantees, which is about \$300 million less than the amount supported by the 1997 appropriation. Of the reduction, approximately \$200 million is related to the guarantee portion of the farm ownership loan program. The \$400 million guaranteed farm ownership program provided for in the 1998 budget reflects the actual demand for the program in recent years. The remaining farm ownership and operating programs are generally funded at the 1997 supportable levels with a modest increase for the credit sales program. In addition, the 1998 budget proposes to maintain the emergency disaster loan program at \$25 million.

Commodity Credit Corporation

The Commodity Credit Corporation (CCC) programs are carried out by a number of agencies. It is the source of funding for most of the conservation programs administered by FSA and the Natural Resources Conservation Service (NRCS), commodity programs administered by FSA, and most of the export programs administered by the Foreign Agricultural Service (FAS). The CCC is also the source of funding for certain administrative support services associated with delivery of these programs.

Provisions of the 1996 Act limit CCC expenditures for computer equipment and cap reimbursements to agencies for administrative support services at 1995 levels. These provisions impose significant restrictions on the availability of CCC funds for transfers and reimbursable agreements used to fund conservation technical assistance and other support services for the conservation, commodity, and export programs.

The request for 1998 appropriations to reimburse CCC for net realized losses will cover the amount of the loss incurred 2 years earlier which has not been previously reimbursed. The 1998 budget requests \$0.8 billion for the balance of 1996 losses not reimbursed through appropriations in 1996 and 1997. Appropriations to reimburse CCC for net realized losses incurred in 1997 will be requested in the 1999 budget.

Reflecting the pattern of outlays for the commodity programs, total CCC outlays have declined from a peak of \$26 billion in 1986 to less than \$5 billion in 1996. Including conservation programs and other programs for which CCC funding was authorized by the 1996 Act, CCC outlays are projected to total \$7.8 billion in 1997 and \$9.9 billion in 1998, and decline to about \$7.6 billion by 2002.

Conservation Programs

The Conservation Reserve Program (CRP) is the major conservation program administered by FSA. The 1996 Act reauthorized the CRP, switched financing for the program from appropriated funds to CCC, and set maximum enrollment at 36.4 million acres. The 1998 budget assumes a competitive bid process will be used to enroll nearly 19 million acres of new and expiring acres in 1997. Enrollments in subsequent years are assumed to gradually increase total enrollment to 36.4 million acres by 2002.

PART 1

The budget also reflects provisions of the 1996 Act authorizing CCC funding for a number of new conservation programs most of which will be administered by the NRCS in cooperation with FSA.

The Agricultural Conservation Program, the Colorado River Basin Salinity Control Program, the Water Quality Incentives Program, and the Great Plains Conservation Program were replaced by the Environmental Quality Incentives Program. The Flood Risk Reduction Program provides incentives to move farming operations from frequently flooded land, and the Conservation Farm Option gives producers incentives to create comprehensive farm plans. The Wildlife Habitat Incentives Program provides cost-share assistance to landowners to implement management practices improving wildlife habitat. The Farmland Protection Program provides for the purchase of easements limiting nonagricultural uses on prime and unique farmland.

The 1998 budget does not include a request for funding the Emergency Conservation Program (ECP). Under this program, the Department has shared the cost of carrying out practices to assist and encourage farmers to rehabilitate farmland damaged by natural disasters. ECP received emergency funds of \$25 million in 1997. The President's Budget, however, proposes the establishment of a new \$5.8 billion contingent reserve for emergency funding requirements for various disaster assistance needs. This fund would be available to the President for disaster relief purposes including use in the Department's emergency conservation activities.

CCC outlays for CRP and other conservation programs are projected in the 1998 budget to increase from negligible levels in 1996, when rental payments were funded through appropriations, to \$1.9 billion in 1997 and to \$2.2 billion in 1998.

Commodity Programs

The 1998 budget projects CCC outlays for commodity price and income support programs administered by FSA will increase from about \$5.0 billion in 1997 to \$6.2 billion in 1998, and then decline again to about \$4.0 billion by 2002. These projections largely reflect the pattern of expenditures established in the 1996 Act, with payments for production flexibility contracts increasing between 1997 and 1998 and declining thereafter.

The 1996 Act fundamentally restructured income support programs and discontinued supply management programs for producers of feed grains, wheat, upland cotton, and rice. The income support programs were changed by replacing the deficiency payment program, which was tied to market prices and was in place since the early 1970's, with a new program of payments that generally are not related to current plantings or to market prices. The 1996 Act also expands planting flexibility and suspends the authority for the Secretary to require farmers to idle a certain percentage of their cropland in order to be eligible for income support payments.

Dairy policy also is changed under the 1996 Act with phaseout of price support and consolidation of milk marketing orders. The new law also alters the sugar and peanut programs.

These changes have diminished the traditional role of the farm programs as a buffer against fluctuations in production and commodity prices. Our greatest challenge from the 1996 Act is to find new ways to help farmers thrive in an increasingly risky environment, and yet not be involved in the micromanagement of agricultural decisions. That is why risk management has become a top priority, and why the President and the Department attach such importance to enactment of legislation designed to improve the programs that help farmers better manage production and market risk.

Risk Management Agency

The 1998 budget provides funding for the crop insurance program administered by the Risk Management Agency (RMA) under both current law and new legislation to be submitted to the authorizing committees to improve the safety net for farmers by establishing a nationwide program for revenue insurance. Revenue insurance protects producers' income against shortfalls due to either price or yield fluctuations. Our legislative proposal is budget neutral overall. However, it provides for a reduction in the discretionary spending portion of program expenses, which is likely to be of particular interest to the Appropriations Committees.

Under current law, funding for sales commissions, which have been treated as mandatory spending, shift to discretionary spending in 1998. The budget provides \$203 million for this expense. Further, it provides \$68 million in discretionary spending for Risk Management Agency's (RMA) own administrative expenses. All other expenses of RMA are treated as mandatory, although subject to appropriation, for which the budget provides "such sums as may be necessary." The 1996 Act created RMA to administer the crop insurance program and to carry out other risk

PART 1

management functions. Previously, the crop insurance program was administered by FSA, which retains responsibility for the Noninsured Assistance Program (NAP).

The Administration's proposal to establish a nationwide program for revenue insurance reflects the strong demand among producers that we have seen for new revenue insurance products such as Crop Revenue Coverage (CRC), Income Protection (IP) and Revenue Assurance (RA). Current law, however, limits RMA's authorities in the revenue insurance area to pilot programs. In implementing the revenue insurance programs, no additional premium subsidy has been paid, and the expected 1996 loss ratio experience is within the statutory limits and comparable to RMA's standard multi-peril production risk coverage. The only additional cost to the Government has been a modest increase in delivery expenses, including underwriting gain paid to the insurance companies.

To offset the additional delivery expenses and the expected growth in market penetration involved in expanding revenue insurance nationwide, the Administration's proposal provides for a change in the administrative (delivery) expense reimbursements paid to private insurance companies, as well as an incremental reduction in the loss ratio. The Administration is proposing that the reimbursement rate for delivery expenses be reduced from 28 percent under current law to 24.5 percent of the premium for multi-peril coverage. This reduction is based on extensive analysis conducted by RMA and the General Accounting Office. It will reduce discretionary spending for delivery expenses from \$203 million under current law to \$149 million under the proposal. Further, our proposal would make a portion of the overall reimbursement rate discretionary and subject to appropriation whereas current law treats only the sales commissions portion of the reimbursement as discretionary. We believe this change offers insurance companies more flexibility for adjusting to the reduced reimbursement rate.

Finally, the legislative proposal will provide more flexibility for determining subsidy amounts and establishing pilot programs. It will also require a processing fee for RMA's review and approval of industry requests for new insurance products, and make certain changes in program compliance requirements. None of these changes is expected to have a budgetary impact.

International Trade and Export Programs

Exports of U.S. farm and food products achieved a second straight year of robust growth in 1996 and set another record at just under \$60 billion. With the strong, back-to-back gains of the last 2 years, U.S. agricultural exports have increased by nearly \$22 billion or over 50 percent since 1991. As a result, agriculture led all U.S. trade categories as the most significant contributor to the U.S. balance of trade and supported one million jobs both on and off the farm, one-third of which were in our rural areas.

These strong export gains provide convincing evidence that American agriculture is reaping the benefits of the North American Free Trade Agreement, the Uruguay Round Agreement on Agriculture, and the more than 200 other trade agreements the Administration has successfully negotiated. As a result of these agreements, we now have the most open world market of this century and enormous opportunities for additional export growth.

Further progress on the trade front is crucial to American farmers and ranchers. Changes in the domestic farm programs made by the 1996 Act have made U.S. producers more dependent than ever on exports to maintain and expand their income. It is critical, therefore, that we continue our aggressive trade promotion efforts to help U.S. producers and exporters take full advantage of emerging export opportunities. At the same time, we must continue to adapt and improve these efforts to meet today's challenges and keep pace with the competition.

The 1998 budget continues the Administration's commitment to export promotion and growth by providing a total program level of just under \$7.7 billion for the Department's international programs and activities.

For the CCC export credit guarantee programs, the budget provides a total program level of \$5.7 billion, an increase of \$200 million above the 1997 level. The increase consists of export credit guarantees which will be made available to emerging markets for U.S. agricultural products. This complies with provisions of the 1996 Act which require that \$1.0 billion of export credit guarantees be made available to emerging agricultural markets during the 1996 to 2002 period; these guarantees will be made available in annual installments of \$200 million beginning in 1998.

The budget also continues two other export credit initiatives. Included within the overall program level for CCC export credit guarantees are \$350 million of supplier credit guarantees, an increase of \$100 million above the 1997 level. These guarantees, which were first made available in late 1996, allow exporters of U.S. agricultural products to obtain CCC guarantees for short-term credit extended directly to

PART 1

16

foreign buyers. Supplier credit guarantees are expected to be particularly useful in facilitating sales of processed and high value products.

The budget also includes \$100 million of facilities financing guarantees, unchanged from the current estimate for 1997. Under this initiative, CCC will provide guarantees to encourage the establishment or improvement of agricultural related facilities and/or services to address infrastructure barriers to increasing sales of U.S. agricultural products in overseas markets.

The budget provides higher program levels for our two export subsidy programs in 1998, the Export Enhancement Program (EEP) and Dairy Export Incentive Program (DEIP). In the case of EEP, we propose to make available \$500 million, the maximum level permitted by provisions of the 1996 Act and a \$400 million increase over 1997. As you are probably aware, EEP and DEIP program activity was reduced in 1996 as a result of world commodity supply and competitive conditions. The higher program levels established for 1998 will allow for increased sales under the programs in response to changed market conditions.

For the Market Access Program (MAP), formerly the Market Promotion Program, the budget continues funding at its maximum authorized level of \$90 million. During the past year, changes have been made in MAP to make it more targeted and more friendly to small businesses. In 1996, 56 percent of the funds for promotion of branded products was made available to small entities, up from 41 percent in 1994, and another 20 percent was made available to farmer cooperatives. Additional program improvements have recently been made which are designed to broaden participation, clarify program participation criteria, strengthen evaluation and accountability, and simplify program requirements for participants.

For the Public Law 480 foreign food assistance programs, the budget proposes a total program level of \$990 million. This is expected to provide for approximately 3.2 million metric tons of commodity assistance, unchanged from the level currently estimated for 1997.

I would like to highlight one component of our Public Law 480 budget proposals in particular. It transfers the budget and expenditures for the Title I concessional sales program from the international affairs function to the agriculture function of the Federal budget. This proposal is an outgrowth of recent changes in the Title I statutory authorities which have placed a much greater emphasis on the program's market development objectives. With these changes, the role and importance of the Title I program in the Department's overall long-term market development strategy has increased. Shifting Title I to the agriculture function will allow the program to be managed and budgeted as part of a consistent package of agricultural export programs; all of our other export programs are presently included in the agriculture function. I urge your favorable consideration of this proposal.

For the Foreign Agricultural Service, which administers the Department's important trade, export, and international cooperation activities, the budget provides appropriated funding of \$151 million, an increase of \$15 million above the 1997 level. Most of the proposed increase will be used to help meet the costs of several FAS activities which are currently supported with CCC funds made available to FAS through reimbursable agreements. The budget proposes that future funding of these activities will be included in the FAS appropriation; with this change their funding will no longer be subject to the annual limitation on CCC reimbursable agreements established by the 1996 Act. These activities include the Emerging Markets Program, under which technical assistance and training are provided to promising, overseas growth markets where there is potential to increase U.S. exports significantly over the long term. They also include the operating costs of the CCC Computer Facility, which serves as the Department's collection point for international production intelligence and crop estimates, and for other, related FAS Information Resources Management costs.

The budget also includes two innovative proposals to assist FAS address variability in the annual operating costs of its overseas offices. This variability can result from a number of factors, including exchange rate fluctuations. The FAS budget provides an advance appropriation of \$3 million for 1999 to offset wage and price increases that occur at its overseas posts in 1998 and that the agency is able to document. In addition, the budget includes language that will allow funds appropriated to FAS to be obligated over 2 years rather than 1 year; this will allow savings that may be realized in the cost of overseas operations to carry over for use in the following year. These savings generally result from exchange rate gains.

RURAL DEVELOPMENT

Overall, the 1998 budget reflects the Administration's strong support for ensuring that rural Americans have the ability to take advantage of the same opportunities

PART 1

for economic growth that exist in urban areas. It supports the Administration's Water 2000 initiative which targets resources to the estimated 2.5 million rural residents who have some of the Nation's most serious drinking water availability, dependability, and quality problems. It continues support for direct and guaranteed loans to help meet the Administration's National Homeownership initiative. It provides additional support for the Administration's National Information Super-highway initiative. It also targets resources to those rural residents and communities most in need of assistance through the Empowerment Zones and Enterprise Communities (EZ/EC) initiative.

The 1998 budget provides \$175 million more budget authority for Rural Development than was provided by the 1997 appropriation. The increase is expected to support \$1 billion more in loans and grants than is currently estimated for 1997.

The 1996 Act authorized the delivery of the Department's rural development programs under provisions of the Rural Community Advancement Program (RCAP). RCAP allows the Department to manage a portion of its current array of rural development programs through an integrated initiative that: (1) increases flexibility to more effectively meet local needs; (2) reinvents program implementation and increases reliance on performance measures; (3) ensures participation in the development of State strategic plans from State and local officials, the non-profit and private sectors, the State Rural Development Councils, and others involved in the rural development process; and (4) targets a portion of the rural development funding to Native Americans. The 1998 budget fully implements RCAP, including the creation of block grants to the States for the administration of program activities similar to those conducted under the Department's ongoing rural development programs.

The 1996 Act also authorized the Fund for Rural America, which made \$100 million available for rural development and research in 1997. We are proposing a technical correction to this Act to correct a drafting error in order to move up the release date making another \$100 million available in 1998.

Rural Utilities Service

Without the Department's rural utilities programs, much of rural America would have been unable to obtain, at reasonable prices, basic infrastructure such as electricity, telephone, and water and waste disposal services. In earlier times, progress was measured in terms of the number of farms and rural households receiving any level of services. Today, the primary need is to assure quality infrastructure and service at a reasonable price so that rural America can keep pace with modern technology and clean water requirements.

The 1998 budget provides for \$1.5 billion in electric and telecommunications loans, approximately the same level as 1997. Within the total, the 1998 budget provides for an increase of about \$56 million for 5 percent electric loans, and for reductions of \$56 million in direct municipal and \$35 million for 5 percent telecommunications loans. Electric and telecommunications loans made through the Federal Financing Bank and Treasury rate telecommunications loans would be funded at their 1997 levels.

There would be \$175 million in loans made by the Rural Telephone Bank (RTB), the same as the 1997 level. The Administration continues to work with the industry towards the goal of privatizing the bank on a reasonable schedule. The equity of RTB continues to grow and by the end of 1998 we estimate sufficient funds would be available to retire the Government-owned stock in the bank and, thus, achieve privatization under current law. The Administration is in the process of developing proposed legislation to facilitate privatization.

With regard to the distance learning and medical link program, the 1998 budget includes about \$21 million for grants and \$150 million in loans at the Treasury rate, which requires budget authority of \$21 million for both programs. In 1997, Congress provided budget authority of \$9 million which the Department converted into a grant program of about \$7.5 million and a loan program of \$150 million at the Treasury rate. This program encompasses two of the most useful applications of modern telecommunications—education and medical services. Applications for this program are well in excess of current funding. The increase in grant funding will provide vitally needed assistance to some of rural America's most remote and poorest communities.

The water and waste disposal program is one of the Administration's highest priorities. A program level of \$809 million in loans and \$484 million in grants will allow the Department to continue making significant progress towards meeting the goals of the Administration's Water 2000 initiative. Water 2000 targets resources to the estimated 2.5 million rural residents who have some of the Nation's most serious drinking water availability, dependability, and quality problems—including

PART 1

18

the estimated 400,000 rural households lacking such basic amenities as complete plumbing.

Rural Housing Service

For rural housing, the 1998 budget supports almost 120,000 housing units in rural America, compared to about 104,000 in 1997. It provides for about \$3.0 billion in guaranteed single family housing loans, and \$1.0 billion in direct single family housing loans. Interest rate adjustments in 1997 reduced the direct loan program to \$585 million. Restoring the \$1.0 billion program level in 1998 will require \$45 million in additional budget authority. These loans go to low and very low income families. Families with higher incomes are served through unsubsidized guarantees of loans made by private lenders. To further the President's National Homeownership initiative, which seeks to increase the rate of homeownership in the U.S. to an all-time high, the budget provides for \$3.0 billion for unsubsidized guarantees of loans made by private lenders, \$300 million more than the 1997 level. The budget includes an additional \$100 million to be set aside for current direct loan borrowers who can afford to obtain private credit for refinancing. The budget also provides for \$25 million in direct loans for the sale of inventory property.

The rural rental housing program would be maintained at the 1997 level of about \$150 million, and the budget request reflects proposed legislation to shorten the loan terms from 50 to 30 years while amortizing the loan over 50 years. Rental assistance payments, most of which is needed for the renewal of expiring contracts, would be increased from \$524 million to \$593 million. This amount includes \$52.5 million in funding to replace expiring HUD Section 8 rental assistance contracts with less costly RHS rental assistance. The HUD budget request has been reduced by a corresponding amount, reflecting this transfer of responsibilities to USDA.

Rural Business-Cooperative Service

Jobs are the cornerstone of all economic development—rural as well as urban. The Department's role in creating jobs and improving the infrastructure in rural areas is both financial and supportive. Despite budgetary pressures, it is important that the job creation and retention programs of rural development remain adequately funded.

The business and industry loan program has been expanded over several years from a relatively modest \$100 million level to about \$700 million in guaranteed loans in 1997. In 1997, Congress provided for a \$50 million direct loan program to augment the guaranteed loan program. The 1998 budget maintains the direct loan program at \$50 million, the guaranteed loan program would be funded at \$611 million.

The Alternative Agricultural Research and Commercialization program would be increased from \$7 million in 1997 to \$10 million in 1998. This program is particularly useful in meeting the needs for capital to commercialize innovative value-added products from agricultural and forestry materials and animal by-products.

The budget also proposes a change in the method of funding for the rural economic development loan and grant program. This program provides financial assistance to Rural Utilities Service (RUS) borrowers who use the funds to provide financing for business and community development projects. In 1997, the Department used interest generated from the voluntary cushion of credit account of RUS borrowers to fund a \$20 million grant program, and Congress appropriated funding for a \$12.8 million loan program. In 1998, the budget proposes to use the cushion of credit account to fund both the loan and grant programs.

The budget also proposes a \$2 million increase in the level of funding for research on rural cooperatives. This increase is provided within the salaries and expense account to fund cooperative agreements.

Finally, I would mention that about \$135 million of the rural development program funding would be targeted to EZ/EC. The EZ/EC initiative reaches communities with the most persistent poverty and other economic adversity, which have developed strategic plans for development.

FOOD, NUTRITION AND CONSUMER SERVICES

While USDA farm and food safety programs help ensure a safe and affordable food supply, the nutrition programs help to ensure that food supply is available and affordable to low-income families. The Food Stamp, Child Nutrition, and WIC Programs are the Department's primary vehicles for carrying out this Nation's food assistance policy. Our goal is to help ensure that no low-income child goes to bed hungry. We also seek funding to provide nutrition information and dietary guidance to all Americans in our continued long-term efforts to reduce the risk of diet-related health problems.

PART 1

19

The Food Stamp Program is estimated to cost \$25.1 billion in 1998 under current law. In addition, we are proposing a \$2.5 billion contingency fund to cover unforeseen needs. We project that some 23.4 million people will still need food stamps to maintain or improve their nutritional status during 1998. Although this number is still high, it is down substantially from the peak of 28 million food stamp participants reached in March of 1994, thanks to an improving economy.

The budget also includes several proposed legislative changes to permanent food stamp law that would add an additional \$0.8 billion to this estimate in 1998, and \$3.3 billion over 5 years. We believe these changes are necessary to moderate the harsh effects last year's Welfare Reform Act are having on some food stamp eligibles.

The Administration's proposal would extend the time limits on unemployed adults with no dependents from 3 months out of every 3 years to 6 months out of every year. At the same time, stronger penalties are proposed for individuals who refuse to accept employment, or fail to comply with work requirements. The proposal also would provide relief to households with high shelter costs by increasing the amount they may deduct from their income when applying for food stamps; and it would delay implementation of the ban on aid to legal immigrants for up to 5 months while these individuals seek naturalization. Meanwhile, we remain committed to working with the Congress and the States to implement the new welfare reform provisions. We are also committed to modernizing benefit delivery via nationwide use of Electronic Benefit Transfer; and we are continuing our efforts to root out food stamp fraud by cracking down on retailer and participant abuses, as well as reducing program errors causing overpayments.

For the Child Nutrition Programs, including the National School Lunch, Breakfast, Child and Adult Care Food Program, Summer Food Service, and Special Milk Programs, we are requesting \$7.8 billion, about \$0.9 billion less than the 1997 appropriations. Our request assumes continued full funding for all of these programs, as well as better targeting of funds in the family day care program as required by welfare reform. Within this budget, the funds requested to support Team Nutrition are very important because the National School Lunch Program touches almost all school children during the year. This program works with schools to help them serve meals that meet the 1995 Dietary Guidelines for Americans and to help schools teach children about nutrition. This is a critical component of the Department's commitment to improve the health and welfare of children by promoting food choices for a healthy diet.

Our WIC request for 1998 of \$4.1 billion, an increase of \$0.4 billion above the 1997 appropriation fulfills the President's commitment to fully fund WIC. As indicated, the Administration is also proposing a supplemental of \$100 million for WIC in 1997. Without the supplemental many States will have to cut participation significantly in 1997. With several new initiatives to improve program management, as well as careful food and formula cost containment, the 1998 request should be adequate to support all eligibles who choose to participate. WIC eligibility is based on household income and individual nutritional risk. With this now mature program, we will work with the States to improve program management and operate the program within available funds.

The budget proposes increases in several of the commodity assistance programs. Increases for Food Distribution on Indian Reservations and the Commodity Supplemental Food Program are necessary to maintain program levels. Because of the large increase in mandatory and discretionary funding for TEFAP in 1997, we believe discretionary funding can be brought down by \$45 million leaving a program that will still total \$145 million.

For the Center on Nutrition Policy and Promotion, our budget proposes \$2.5 million, an increase of \$281,000 over 1997. This will enable the Center to continue to help all Americans reduce their risk of nutrition-related disease.

Finally, let me say just a few words about the Administration's commitment to food recovery and our efforts to expand food recovery through volunteerism. Food recovery allows us to share, at virtually no cost to the taxpayer, part of the immense food resources that Americans otherwise allow to go to waste. As the recently enacted Good Samaritan Act demonstrates, there is widespread, bipartisan support for food recovery. No one wants to see food go to waste. The hard part is how to get organized to avoid the waste. Since the food is available for the giving, new governmental organizations are not needed. Volunteerism needs to be encouraged to identify donors, organizations that can adequately store and transport recovered food, and organizations that can distribute the food to needy people. While our budget does not propose any new spending on food recovery, we are working within the Administration on a proposal to promote food recovery through creation of a non-governmental, charitable foundation. You will hear more about this proposal shortly.

PART 1

20

FOOD SAFETY

Last July we reached a milestone in our strategy for making significant gains in improving the safety of America's food supply. We published the final rule for Pathogen Reduction and Hazard Analysis and Critical Control Point (HACCP) Systems for meat and poultry products. This rule modernizes a 90-year-old inspection system and lays out the Administration's commitment to ensure a healthy, safe, and affordable food supply.

On January 27, 1997, we reached our first implementation date. All meat and poultry establishments now have in place standard operating procedures for sanitation to ensure they are meeting their responsibility for maintaining sanitary conditions, thereby reducing the potential for contamination. In addition, slaughter establishments have begun testing carcasses for generic *E. coli* to ensure their processes are under control with respect to prevention of fecal contamination. Next January 26 the largest establishments will be required to have the HACCP systems in place. The largest slaughter establishments and those producing ground product will have to meet *Salmonella* performance standards, thereby implementing a major portion of the science-based inspection system. By January 25, 2000, all the provisions of the rule will be implemented.

The final rule sets an important framework for change, but by no means is it the culmination of our strategy. Much more needs to be done to ensure that we can meet today's and tomorrow's food safety challenges.

The 1998 budget proposes an increase of \$17.2 million under current law to maintain inspection and to continue making investments in technology, training, and science. It is expected that the implementation of the HACCP rule will generate the efficiencies necessary to maintain the level of inspection necessary to ensure the safety of the growing supply of meat and poultry products with the current level of inspectors. Our 1998 budget request builds on the 1997 budget approved by Congress, which maintains a frontline workforce capable of providing rigorous science-based inspection. Furthermore, our budget request reflects a 1997 budget decision by the Administration and Congress to reallocate inspection resources from traditional in-plant settings to high risk food safety areas beyond the confines of the plant.

As part of the President's Food Safety initiative, we are proposing to provide HACCP training to State and local food regulatory officers to ensure proper handling of meat and poultry products after they leave official establishments and make their way to consumers. Under the initiative we are also proposing to expand our work with the Centers for Disease Control and Prevention and other public health agencies to identify sources of foodborne illness attributable to *Campylobacter*. This pathogen has been identified as a growing threat to the safety of our food supply.

Legislation will be proposed to recover the direct cost of providing inspection to all meat, poultry, and egg products establishments. Under this proposal the industry will be asked to pay for only the cost of inspection personnel. We estimate that this proposal would generate approximately \$390 million in new revenues. Approximately \$201 million in appropriated funding would be sought for administering the program, including critical food safety initiatives, such as establishing inspection methodology and standards, microbiological testing, technology development, animal production food safety, and epidemiology and emergency response functions. States administering their own inspection programs would continue to be reimbursed by the Federal government for up to 50 percent of the cost of administering their programs.

This user fee proposal assures that the resources will be available to provide the level of in-plant inspection necessary to meet the demand for such services without being subject to annual budget pressures. This action will also reduce the pressure to trade-off investment in improving inspection with the need to meet legislative requirements for providing inspection. As a greater share of agency resources have been allocated to keep pace with the growing demand for inspectors, investment in new inspection systems designed to increase safety and productivity has been hampered. Separating the cost of in-plant inspection from the cost for administering the program will permit the agency to focus more on the investment in science and technology to improve the effectiveness of the program. This proposal has the benefit of providing establishments requiring an intensified inspection presence the added incentive to improve operations in order to avoid higher inspection fees. The proposal is expected to add less than a half a cent per pound to the cost of meat, poultry, and egg products.

PART 1

NATURAL RESOURCES AND ENVIRONMENT

The 1996 Act provides the necessary tools that will enable the Department to play a major role in meeting the President's commitment to protecting our natural resources as well as to helping foster a more common sense approach to their overall management. The 1996 Act not only established several new incentive-based programs including the Environmental Quality Incentives Program (EQIP), the Wildlife Habitat Incentive Program, and the Farmland Protection Program but it also reauthorized and refocused two of our most successful conservation programs ever: the Conservation Reserve Program (CRP) and the Wetlands Reserve Program (WRP).

The funding request for the Natural Resources Conservation Service in 1998 totals \$821 million which includes \$549 million for conservation technical assistance. These funds are needed by NRCS to maintain the viability of its base program which are those activities that support locally led, voluntary conservation through the agency's partnership with conservation districts. It is this base program that also provides the foundation upon which the agency will carry out the important new mandates called for in the 1996 Act. However, while these new programs are now funded through CCC and are therefore considered mandatory, their technical support is not and will impose an especially heavy new workload on NRCS that can only be addressed with appropriated funds. To counter the effects of this new workload and to strengthen the agency's base program, the budget includes a \$15 million increase for geographic information systems and related technology to help in further modernizing USDA field service centers and a \$4 million increase for training in rangeland conservation and improving conservation district skills.

In addition to the new demands imposed by the 1996 Act, the Department's reorganization authorized by Congress in 1994 led to significant changes in how NRCS delivers its conservation services to the field. The agency is now able to provide higher levels and more valuable technical assistance to farmers and other clients with proportionately fewer management and support staff. Field staff are moving to service centers where farmers and government officials can conduct their business more efficiently. Decision-making responsibilities previously centralized in Washington are now assigned to regional and State level officials who are in closer contact with agency clientele. Maintaining our technical assistance workforce in the upcoming years becomes even more critical as farmers take advantage of increased global demand and the new program flexibility that will allow them to farm more land more intensively.

Another high priority activity supported by this budget is the need to target adequate levels of assistance to small and minority producers who need help in maintaining their financial viability. A total of \$5 million is being requested for the Outreach for Socially Disadvantaged Farmers program, a program recently transferred to NRCS from FSA. This request is \$4 million over the level appropriated for this activity in 1997. To support the program in 1997, the Department has apportioned an additional \$4.5 million in funding from the Fund for Rural America. These funds will help support our cooperative agreements with 28 entities, including 1890 land grant institutions and Native American community colleges, through which we provide training and management assistance to small or minority farmers and ranchers.

In the watershed planning and construction area, the Department will continue efforts to make the best use of limited resources. Only the most cost effective and environmentally beneficial projects will be funded with an emphasis on non-structural management systems. We will also continue to closely examine approved watershed plans and de-authorize infeasible projects in order to reduce the backlog of unfunded work. Beginning in 1998, technical support for NRCS' watershed planning and construction activities will come from the agency's conservation operations program which will improve overall administrative efficiency. Also, we will try and help sponsors with implementation costs by allowing up to \$15 million to be used to subsidize rates of municipal loans administered by the Rural Utilities Service.

Finally, the Department's 1998 budget continues its support of the 289 authorized Resource Conservation and Development (RC&D) areas. In addition, an increase of \$18 million is requested to fund local, non-Federal watershed coordinators to assist in watershed planning for a wide range of environmental purposes such as the salmon recovery efforts in the Pacific Northwest.

RESEARCH, EDUCATION, AND ECONOMICS

The budget recommendations for the programs administered by the Research, Education, and Economics (REE) mission area agencies reflect the importance of investments in scientific, technological, and economic knowledge for future performance of the agricultural sector in the U.S. economy. Driven by publicly funded re-

PART 1

search, agricultural productivity has grown at an annual average rate of 1.8 percent over the past 45 years. There is a critical need to maintain the overall level of scientific and technological expertise to support key Departmental objectives related to expanding agricultural-based economic and trade opportunities; ensuring a healthy, safe, and affordable food supply; and protecting public and private natural resources for the benefit of current and future generations.

The ability of U.S. agriculture to meet the growing worldwide demand for food will require that the research pipeline continue to provide knowledge which will maintain productivity growth, protect the natural resource base, create a safer food supply, and address critical human nutrition needs. Continued support for research and education also will lead to a better understanding of how agricultural production impacts the environment and how effective management practices can be applied to avoid or mitigate harmful effects. Federal support for research conducted in universities and private laboratories encourages these institutions to invest in technology at levels beyond what they would invest on their own. Publicly supported research provides the scientific foundation for and complements much of the work carried out in the private sector.

Current research activities will be further strengthened through the Fund for Rural America. On January 17, 1997, the Department announced plans to allocate \$46.1 million of the \$100 million fund for research, education, and extension activities. Of this \$46.1 million, \$33.3 million will fund projects that address international competitiveness, environmental stewardship, and/or rural community enhancement, and \$12.8 million will be used to address key priorities including livestock concentration, food safety, nutrition, food recovery, and telecommunications. Grants will be awarded on a competitive basis for multi-disciplinary projects.

Total funding requested for REE agencies in 1998 is \$1.8 billion, which is about the same as the 1997 appropriation. Within this total, the Agricultural Research Service (ARS) would receive an increase of \$10 million, about 1.4 percent above the 1997 appropriation. The agency would redirect \$23 million from ongoing research projects to support programs of high national priority.

The budget includes an increase of \$12 million for a new Human Nutrition initiative. Half of the total would support activities carried out at ARS human nutrition research centers which examine the impact of nutrition on health of individuals representing diverse population groups in terms of age and ethnic background. The remainder would fund surveys to collect data on food intake by infants and children which will, in turn, be used by the Department and the Environmental Protection Agency to assess pesticide residue levels and establish tolerances in accordance with the Food Quality Protection Act of 1996. The budget also includes a \$5 million increase for Emerging Diseases and Exotic Pests to control the spread of non-native diseases and pests.

Both ARS and the Cooperative State Research, Education, and Extension Service (CSREES) have important roles in the Administration's food safety initiative. The ARS budget includes an increase of \$4.1 million for pre-harvest food safety research to develop new technologies for detection and control of pathogens and for post-harvest intervention strategies needed to support the HACCP approach used by the Food Safety and Inspection Service.

The CSREES components of the food safety initiative consist of: (1) a \$2 million increase for research focusing on pre-harvest issues related to detection and control of pathogens, and post-harvest issues related to production, processing and handling practices, and (2) an additional \$2 million for education programs related to HACCP implementation, including compliance education, quality assurance, and State food handler certification.

An increase of \$4 million is proposed for ARS pest management research, including support for large scale Integrated Pest Management (IPM) projects, host-plant resistance, and for biological control of plant pests. Other increases are proposed for preservation of plant and microbial genetic resource collections and for development of methods for more efficient management of grazing lands.

ARS also plays an important role in the Administration's initiative to restore the South Florida Everglades ecosystem. The budget includes a \$2 million increase to develop mechanisms to control the spread of invasive *Melaleuca* trees and to conduct research on ways to reduce the environmental impact of agricultural production in the Everglades. An increase of \$4 million for construction of a quarantine facility to house the study of biological control agents is also proposed. Construction of this facility was designated by the Administration's South Florida Ecosystem Task Force as a top priority to ensure prompt restoration of the Everglades National Park and other fragile ecosystems in South Florida.

The budget also includes \$59.3 million for facility construction and modernization projects. An increase of \$23.4 million is proposed for a replacement laboratory in

PART 1

Parlier, California, used to conduct horticultural, irrigation, and post-harvest research. Funding in the amount of \$3.2 million is proposed for continued modernization of the agricultural research center at Beltsville, Maryland. Other increases provide support for Federal regional centers, including \$8 million for research carried out by the National Center for Agricultural Utilization Research at Peoria, Illinois, and a total of \$6.3 million for modernization of the Eastern and Southern Regional Research Centers located in Philadelphia, Pennsylvania, and New Orleans, Louisiana. Funds are also recommended for modernization of the National Agricultural Library at Beltsville and for the foreign animal disease facility at Plum Island, New York. An increase is also proposed for construction of new facilities for the European Biological Control Laboratory at Montpellier, France. The mission of this laboratory is to discover, research, and introduce natural enemies of domestic insect pests and weeds.

The budget request for CSREES calls for a reduction of about \$69 million, about 7.6 percent below the 1997 appropriation. Funding for formula programs is held constant at the 1997 appropriated level. An increase of \$36 million is proposed for the National Research Initiative (NRI), the competitive grants program which funds merit-reviewed proposals open to participation by Federal laboratories, public and private universities, and other research entities and individuals. It is especially important that the Federal government support this meritorious program which supports both fundamental and mission-linked research. Estimated returns on research funded through the NRI are among the highest in the portfolio of programs and this work provides technology used by other public and private sector researchers. The budget continues to reflect the Administration's view that the Federal government should not be financing research projects and facility construction activities on university campuses through the Congressional earmarking process. Proposed reductions in these two program areas total over \$100 million.

The budget includes increases for CSREES and other participating agencies to move forward on the IPM initiative. This initiative has the ambitious goal of increasing the adoption of IPM practices to 75 percent of the Nation's crop acreage by the year 2000. Strategies for IPM implementation are based on input from growers, scientists, and other stakeholders who serve on regional and State teams and are involved in program planning and implementation. A proposed increase of about \$13.2 million above the 1997 appropriation for IPM research and education programs will allow us to: (1) support regional IPM development and implementation projects, (2) fund a special grants program devoted to pest management alternatives to replace pest control technologies under consideration for regulatory action by the Environmental Protection Agency (EPA), and (3) fund additional area-wide projects by ARS. We are also requesting a \$5 million increase to support data collection activities for registration of minor-use crop pesticides.

CSREES conducts several relatively small, but important higher education programs to encourage both graduate and undergraduate students to pursue careers in agricultural and food sciences. We are seeking a small increase in support for the highly successful Institution Challenge Grants program and continued funding for the Graduate Fellowships Grants program. Both programs focus on recruiting diverse and talented students and enhancing the quality of education necessary to strengthen the Nation's scientific and professional workforce.

Efforts are made through these programs to reach out to population groups who are under-represented in many agriculture-related fields to enable all young Americans to have opportunities for successful careers in agriculture. The 1890 Capacity Building Grants program, which is funded at the 1997 level, is the cornerstone of the Department's successful partnership with 1890 land grant universities. In the 7 years from 1990 through 1996, over \$60 million has been awarded for 305 research and training projects, each of which features an active, cooperative relationship with one or more USDA agencies. The agency plans to continue supporting construction, renovation, and upgrade of facilities projects at 1890 universities. We have encouraged Departmental agencies to build on partnership relationships with 1890 institutions to establish centers of excellence which are on-campus entities devoted to addressing specific USDA agency tasks. The budget also includes proposals for continued support of Hispanic-serving institutions, and the 1994 Native American institutions.

Finally, CSREES continues to support ongoing extension projects of high national priority and carries out education and technology transfer activities in the areas of food nutrition and education, water quality, and sustainable agriculture. The budget includes an increase for the Children, Youth and Families at Risk program with a specific amount designated for use by the 1890 institutions. A reduction of about \$19 million below the 1997 appropriated level is proposed for several extension pro-

PART 1

grams which could potentially be supported with formula funds and State and regional resources.

The Economic Research Service (ERS) is an important source of analytical information on food and agricultural related issues, and the economic and social science research conducted by ERS supports better decisionmaking in both the public and private sector. The budget request for ERS is \$54 million, which includes a modest increase to conduct analysis focusing on the costs and benefits of resource conserving production practices, such as IPM and conservation tillage. This initiative supports our goal of improved harmony between agriculture and the environment. This research would provide information which would help producers make profitable and environmentally conscious choices and help policymakers direct resources to the most cost-effective conservation programs.

Like ERS, the National Agricultural Statistics Service (NASS) is also an important source of information. The estimates and forecasts that NASS produces are used by all participants in the agricultural economy, and NASS has earned and maintained an unmatched reputation for accurate, unbiased, and timely information. In addition, the implementation of the 1996 Act has made reliable and timely information about production, supply and prices even more critical. Within the total budget request of \$120 million for NASS, an increase of \$18.5 million is requested for conducting the Census of Agriculture. The 1998 costs of the Census are higher than any year in the 5-year Census cycle, because it is the year the Census is scheduled to be conducted. Last year, the Census of Agriculture was transferred from the Department of Commerce to USDA. Although USDA received funding through appropriations for the Census in 1997, the authorization legislation to transfer the function has not yet been passed. I urge you to support the swift passage of this legislation.

The Census is the main source of local level data about American agriculture, the only complete enumeration of farmers, and an important benchmark for USDA's current program which uses statistical analysis to produce national and State estimates. The Census of Agriculture is taken every 5 years, and in 1998, USDA will conduct the Census for the first time, expanding significantly its role as an information provider. By changing the way the data are processed, NASS plans to complete the collection and processing of the approximately 2.5 million census report forms in 25 percent less time than the previous agricultural census.

MARKETING AND REGULATORY PROGRAMS

The Marketing and Regulatory Programs contribute to increased domestic and international marketing of U.S. agricultural products by: (1) reducing international trade barriers and assuring that all sanitary and phytosanitary requirements are based on sound science; (2) protecting domestic producers from animal and plant pests and diseases; (3) monitoring markets to assure fair trading practices; (4) promoting competition and efficient marketing; (5) reducing the effects of destructive wildlife; and (6) assuring the well-being of research, exhibition and pet animals. Consumers as well as the agricultural sector benefit from these activities.

Beneficiaries of these services already pay a large percentage of the program costs through user fees. And, we are proposing legislation to recover over \$38 million in new user fees from those who directly benefit from USDA services. New license fees are requested to recover the entire cost of administering the Packers and Stockyards Act. Expanded user fees are requested for developing grain standards, for certain animal and plant inspection activities, and for Federal administrative costs for operating marketing orders and agreements.

The budget includes an increase of \$11 million for the Agricultural Marketing Service (AMS). The 1998 budget includes modest increases for expanding foreign market news reporting and expanded reporting of livestock and poultry markets in accordance with recommendations set forth by the Advisory Committee on Agricultural Concentration. We expect to have a proposed rule to implement the Organic Foods Production Act issued this year. In order to implement the program we are requesting additional funds to accredit organic certifiers. We plan to recover the full cost of the program through user fees. For 1997, the Pesticide Data Program (PDP) was funded through EPA. The Administration believes that funding for PDP within AMS is preferable to funding the program within EPA. AMS is in a unique position to conduct the program in cooperation with State departments of agriculture. It has the agricultural marketing expertise to develop a statistically reliable testing system.

For the Animal and Plant Health Inspection Service (APHIS), the current law budget contains a \$6 million reduction below the 1997 current estimate. This reduction reflects program successes in many pest and disease management programs

PART 1

such as the eradication of brucellosis. It assumes increased cost sharing from beneficiaries of Animal Damage Control activities and from cotton producers for eradicating boll weevil. It maintains funding for our important data gathering and risk analysis used in negotiations concerning sanitary and phytosanitary trade barriers and restrictions on genetically engineered products entering world markets. Funding increases are provided for Pest Detection activities such as Karnal bunt and Agricultural Quarantine Inspection at the borders. Finally, this budget proposes to fund architectural and engineering work for a sterile screwworm rearing facility to be built in Panama.

The current law budget proposes \$2.6 million of increased funding to strengthen the Packers and Stockyards programs of the Grain Inspection, Packers and Stockyards Administration (GIPSA). The increased funding will enable GIPSA to address more of the recommendations of the Advisory Committee on Agricultural Concentration. Specifically the agency would: (1) hire additional staff to monitor and analyze packer market competition and implications of structural changes and behavioral practices in the meat packing industry; (2) expand poultry compliance activities; and (3) install electronic filing equipment to reduce financial reporting costs for stockyard owners and packing house operators. Legislation is proposed to authorize a dealer trust similar to that of the existing packer trust. Dealers would be required to establish a trust covering the value of livestock inventory and accounts receivable due from the sale of livestock. This proposed trust would be a valuable tool in assisting the recovery of payments for unpaid sellers.

DEPARTMENTAL MANAGEMENT ACTIVITIES

Reinventing government and reducing costs is one of my major goals for the Department. A great deal has been accomplished already. The Department's reorganization reduced the number of agencies from 43 to 30 and over 13,500 staff years have been eliminated. As a result of these changes and further downsizing, savings of more than \$4.0 billion are projected by 1999 and \$8.0 billion by 2002. Further streamlining and downsizing as well as technological, financial, and administrative improvements are underway and will continue.

Also currently underway in the Department is the implementation of the Government Performance and Results Act of 1993 (GPRA). The agencies and mission areas are in the process of preparing 5-year strategic plans, and a Departmentwide strategic plan is currently in draft form. USDA plans to begin consultations with Congress after the Departmentwide plan is completed and reviewed by OMB. In addition, the explanatory notes for the fiscal year 1998 budget include the mission statements and goals for each agency, as well as performance measures. Currently we are working to refine these performance measures and to develop annual performance plans for next year's budget. A great deal of time and effort has been spent on implementing GPRA, and the process is helping us improve program effectiveness, service quality, and customer satisfaction. We look forward to working with Congress to fully implement GPRA.

In light of existing and proposed reductions of staff and funding for the Farm Service Agency and other county-based agencies we have an urgent need to determine ways to increase efficiency and improve coordination. Therefore, the Department will study the administrative and other functions of the county-based agencies and will re-examine our plans for county office based service centers to identify and examine opportunities for further streamlining of program delivery and administrative support for these agencies.

Several offices are responsible for Departmental management activities. These offices provide leadership and administrative support to USDA agencies and coordinate many of the reinvention efforts in the Department. The 1998 budget provides the resources necessary for these offices to enhance their leadership, coordination, and support activities and as a result, improve the overall delivery of the Department's programs and services.

One of my priorities is to reduce the existing backlog of equal employment opportunity and program discrimination complaint cases in the Department and to improve the systems in place to ensure that the same situation does not recur in the future. In 1997, the Congress increased funding in this area to enable the Department to reduce the backlog and we are working to accomplish that goal. This funding level is maintained in the 1998 budget request to continue these activities. In addition, I have created a civil rights action team to do a thorough audit of USDA civil rights issues and provide me with recommendations for improvement, directed agencies that serve farmers to establish special outreach offices in the field, and personally attended a number of listening sessions across the country to hear the concerns of employees and program participants. I am committed to making positive

PART 1

26

changes at USDA to ensure that both our employees and customers are treated fairly and with dignity.

As required by the Clinger-Cohen Act of 1996, USDA has established an Office of the Chief Information Officer (CIO) to oversee the management of the Department's information technology (IT) resources. This request includes an increase to fully fund the CIO's immediate office. We are funding these activities within available resources this year. However, in order to provide adequate resources to improve the planning, acquisition and management of USDA's IT resources, we believe these funds are necessary to strengthen the CIO's office.

This request includes funds to continue the implementation of the Strategic Space Plan for the Washington Metropolitan area. This plan has been tailored to meet the needs of USDA based on the projected reductions in staff at the Washington Headquarters and to provide a safe efficient work place for our employees. The Beltsville Office Facility is scheduled to be completed by December 1997 and should be ready for occupancy by January 1998. This proposal includes an increase to provide necessary operations and maintenance for the new facility. A contract for the overall concept design of the South Building renovation and specific design for the first phase of construction was awarded in January 1997. We expect to award the contract for the first phase of construction in September 1997. The funds included in this request will be used to continue the renovation effort.

The budget proposes an increase for the central hazardous waste management account. These funds are used to meet requirements of the Comprehensive Environmental Response, Compensation, and Liability Act and the Resource Conservation and Recovery Act. The additional funds will be used to be more aggressive in our efforts to cleanup sites that have been previously identified. Specifically, we will target those projects with the highest risk to public safety and those with overdue compliance deadlines.

An increase is proposed for the Office of the Chief Economist (OCE) for agricultural weather-related services. OCE is responsible for weather monitoring and agriculture related weather analysis and houses the Joint Agricultural Weather Facility, co-staffed by USDA and the Department of Commerce. The funding would provide USDA with the capability to coordinate, implement, and utilize a national agricultural weather and climate data system to expedite decisions at the Federal level affecting agricultural commodity trade and markets, fire weather management and ecosystem conservation. For example, lack of observational data in agricultural areas and a breakdown in the dissemination of forecasts played a significant role in the destruction caused by the recent Florida freeze. The proposed increase would expand the collection of weather and climate data in agricultural areas and result in improved dissemination of observations and forecasts to producers. This would help producers mitigate the adverse impact of weather-related events. In addition, the National Weather Service (NWS) has recently undergone a major restructuring and modernization initiative. Funding is proposed to provide for compatible technology to allow the Department to continue to directly access the NWS data needed to carry out its weather and crop surveillance mission.

Funding is also included for the Commission on 21st Century Production Agriculture. This Commission, established by the 1996 Act, will produce two studies. The first study, due June 1, 1998, will be a comprehensive review of changes in the condition of production agriculture in the U.S. since the date the 1996 Act was enacted and the extent to which the changes are the result of this Act. The second study, due January 1, 2001, will be a comprehensive review of the future of production agriculture in the U.S. and the appropriate role of the Federal government in support of production agriculture. The Commission will be made up of eleven members, selected by the President and the House and Senate Agriculture Committees, who are to be appointed by October 1, 1997.

An increase is proposed to provide the National Appeals Division (NAD) with adequate resources to fulfill its statutory requirements and ensure fair and equitable treatment for USDA program participants. NAD was established to provide an impartial appeals process for adverse program decisions. Financial constraints in fiscal year 1996 as well as reduced funding in 1997 have impeded NAD's ability to obtain needed automated information systems and provide employees with necessary training.

An increase is proposed for the Office of the Inspector General. These funds will be used to enhance the audit and investigative functions of the office by providing funds for additional FERS costs for investigators, additional training, ADP and personnel support. This will support the Department's overall goal of improving the way USDA works.

The Office of the General Counsel (OGC) provides critical legal support and advice to the Department and its agencies. Recent budget austerity has eroded OGC's re-

PART 1

27

sources. An increase necessary to maintain appropriate staffing levels is proposed. This will enable OGC to handle more effectively the expanding number of legal issues confronting the Department, especially those related to trade, food safety, welfare reform, civil rights and the management of the National Forests.

Although the Department has made significant progress in implementing the Chief Financial Officers Act (the CFO Act), much work still needs to be done. An increase is proposed to provide the Office of the Chief Financial Officer with additional resources to facilitate the full implementation of the CFO Act in the Department.

Finally, the budget includes a small increase for the Office of Communications (OC) to conduct an outreach program to bring information about USDA programs to underserved groups through various media sources.

That concludes my statement. I am looking forward to working with the Committee in the months ahead in reviewing these budget proposals as we work to meet our common objectives of serving our customers and controlling Federal spending.

NEW SUBCOMMITTEE MEMBER

Senator COCHRAN. I am very pleased we have such good attendance at our subcommittee this morning. I am going to defer my questions until other members of the subcommittee have had an opportunity to make comments or ask you questions about the budget request. I have to be here this entire hearing. None of them is required to be. So, I am going to defer my questions, and will be happy to do that.

The distinguished ranking member of this subcommittee is the Senator from Arkansas, Senator Bumpers. I want you to know, though, that the former chairman of this committee was the first Senator here at this hearing, and I was going to call on him, assuming you were going to be here as promptly as he was.

Senator BUMPERS. I have never crossed him one time in my life. [Laughter.]

Senator COCHRAN. Senator Byrd is not only a new member of the subcommittee, but he is also a prompt member of the subcommittee, and we want to welcome him. We certainly appreciate his presence and his participation in the work of this subcommittee.

If you have no objection, I would call on him.

Senator BUMPERS. No objection, Mr. Chairman.

Senator COCHRAN. Senator Byrd.

Senator BYRD. Mr. Chairman, as one who believes strongly in the rules with respect to seniority, I am going to say thank you for your deference, your kind deferential treatment, and also a thank you to Senator Bumpers. But I will not run afoul of the rules of seniority. I am going to stay around a while, and I am going to be listening with interest to Senator Bumpers and others who have seniority over me. And I will wait until my turn to make any further comments.

Thank you very much.

Senator COCHRAN. Thank you, Senator Byrd.

Senator Bumpers.

PREPARED STATEMENT

Senator BUMPERS. Mr. Chairman, first of all, I ask unanimous consent my opening statement be inserted in the record.

Senator COCHRAN. Without objection, so ordered.

[The statement follows:]

PART 1

28

PREPARED STATEMENT OF SENATOR BUMPERS

I want to welcome Secretary Glickman, Secretary Rominger, Mr. Collins and Mr. Dewhurst to our subcommittee and I look forward to their statements. I also want to express an additional welcome to our new subcommittee members, Senator Byrd and Senator Leahy. The experience and expertise they bring will be most helpful as we work through the budget difficulties posed by the challenges of increasing demands and declining resources.

Secretary Glickman, by all measures and various reports, the optimism we expressed upon your confirmation as Secretary appear to have been understatements. These have, indeed, been trying times for rural America and for the many men and women who serve at the Department of Agriculture. In spite of the multitude of difficulties you and all of us have faced, you have exhibited unfailing leadership and confidence in executing your duties as Secretary. You have reminded us all that, as President Lincoln declared, USDA is the "Department of the People" and one in which all the people may feel served. Speaking on behalf of the entire subcommittee, I want to thank you for your untiring work and for the accomplishments you have achieved.

To examine the many facets of the Department of Agriculture is to touch upon many of the vital and most basic of services the federal government can provide the American people and, in fact, the people of the world. Few Departments of the federal government can lay claim to the variety of activities that fall under your jurisdiction. Food security and food safety, basic and applied research, natural resources, housing, rural utilities, international trade, and contributions to easing world hunger are all your responsibility.

Above all this, you have the task of educating an ever increasing urban population that the Department of Agriculture is more than a Department of Farmers and, at the same time, remember that without a strong base of agricultural production on the farm, we would all become a nation enslaved by the productive capabilities of our international friends and adversaries. It is a daunting responsibility.

Poultry production and processing is vitally important to the economy of my state. Just one year ago, we were faced with a threat of sanctions by the former Soviet Union that would have deprived us of valuable markets. You went to work, along with other members of the Administration, and overcame that threat. It is now reported that U.S. poultry exports into that country are proceeding without objection. Your actions not only served to protect the jobs of many men and women in Arkansas and other states, they also ensured the availability of high quality products to the Russian people and maintained our nation's position as a strong player in world markets.

Also, one year ago, you were presented the task of implementing a new farm bill, one much different than any farm bill administered by any of your predecessors in recent history. I won't belabor you and my colleagues with another rendition of my view of that legislation, but it presents you, and all of us, tremendous challenges in Departmental management and long term protection for the men and women on the farm who face daily threats of weather, pests, markets, and a host of other factors far beyond their control. Their livelihoods are on the line, and that line will become more and more tenuous in the days that are sure to come when farm prices tumble without a viable safety net to see them through. If farm security in the form of income and price support is a thing of the past, then it must be replaced by a security in the form of increased research, market development, and risk management. We have a long way to go and, perhaps, not long to get there.

The Department of Agriculture was created during a period of our history immersed in deep conflict and prone to intense introspection. One hundred years later, the Department had grown into a massive network connecting all parts of the nation, at the local level, where service delivery to a still largely rural population was the touchstone of efficiency. Now, introspection is renewed and your unenviable task is to revitalize a new touchstone of efficiency with a minimum of conflict. Modern communication, transportation, and other technologies have changed the face of service delivery challenges as much as similar changes have altered the face of agricultural production itself.

Still, we must remember that quality service must be maintained and common sense approaches must be evaluated before disruptive changes are thrust upon an unwary rural population. Your action of recent days to calm the concerns of USDA and county employees that sudden and arbitrary changes will not occur will prove to benefit us all. However the face of agriculture may appear in the 21st Century, we must ensure a legacy adequate to meet the demands of farmers, ranchers, and the ultimate consumers of their products. At this juncture of another agricultural revolution, one born of innovative research, environmental protection, and a global

PART 1

29

marketplace, history would not judge well any imprudent dismantling of the very means by which we have become the envy of the world.

As we turn to the task immediately before us, I am sure that there will be some areas in which we will find disagreement. But on the whole, I feel that we all want to meet at the same destination. We must allow our farmers the tools necessary to feed an ever hungry nation and world. We can't allow the strongest nation on earth to be home to an undernourished and under served population. Our food must be safe and our science sound. Our nation is and has always been blessed with the inventive genius to take us into the next highest plain of achievement. The tools are before us, all of us, and our charge is to manage them wisely.

RESEARCH ON GENETIC ENGINEERING

Senator BUMPERS. Second, I only have a couple of questions of the Secretary.

And the first one, Mr. Secretary, is: Does the Department of Agriculture have any ongoing research on genetic engineering, such as we have just seen come out of Scotland?

Secretary GLICKMAN. I am confident that we have a lot of biotechnology research going on. And much of that is related to genetic modifications. But I am not aware of any cloning research. I know that there obviously has been over the years embryonic research in terms of the development of stronger animals and more disease-resistant animals. We do genomapping for livestock. We are not doing the research to produce cloned animals.

Senator BUMPERS. Is genomapping similar to the Human Genome Project that we have at NIH?

Secretary GLICKMAN. I think so, yes.

USER FEE PROPOSAL

Senator BUMPERS. Second, Mr. Secretary, the fees that you have mentioned for the Food Service and Inspection Service, I think you told me in the office the other day that the fee is \$590 million—is that what you are asking for?

Secretary GLICKMAN. Well, \$390 million in fees, which is about 70 percent of FSIS's total budget. The rest of it would be under our budget through the general nonfee dollars.

Senator BUMPERS. So you are asking \$390 million?

Secretary GLICKMAN. \$390 million in fees, which is in-plant inspection and the other 30 percent is for research and supervision and overhead and a lot of the other functions of that part of the Department.

Senator BUMPERS. I think you told me in the office the other day that represents roughly one-half cent a pound?

Secretary GLICKMAN. If the full \$390 million were paid for by in-plant fees, we estimate about one-half cent a pound is what that would cost.

Senator BUMPERS. Of both meat and poultry?

Secretary GLICKMAN. That is correct.

Senator BUMPERS. Would you anticipate that that would be passed on to the consumers in higher prices for the goods and products?

Secretary GLICKMAN. I would honestly say that I would expect much of it to be passed on. I cannot tell you what the competitive conditions are out there. But we want to see the meat and poultry inspection program adequately financed. If we can figure out another way to do it without the fees, obviously we would. We are not

PART 1

hung up on the fees, but my concern is, given the tightness of the budget, that the integrity and safety of the meat and poultry supply is paramount. That is why we thought, if we cannot find it somewhere, then we have got to go with the fees.

HACCP

Senator BUMPERS. Is the so-called HACCP, which is an acronym, H-A-C-C-P. How far along are we on that inspection program in the meat and poultry business?

Secretary GLICKMAN. Well, our final rules were approved this past summer. We are starting with E. coli testing which just began. There is a whole process to go through. But this process will take about 3 years to complete.

A lot of the plants, larger plants, particularly, are already operating with HACCP right now. It is the medium-sized and smaller plants that will take a little longer to complete. But, I would say about 3 years.

Right now, at the end of this fiscal year, we estimate that about 75 percent of the pounds slaughtered, both meat and poultry, will be under the HACCP inspection system. And in fiscal year 1999, it is going to be 95 percent. In the year 2000, it will be complete.

Senator BUMPERS. Can you tell us what magnitude of improvement that is over the present system? For example, take the poultry industry, which, as you know, is extremely important in my State. What percentage of the poultry that comes off the assembly line has any kind of bacteria on it, do you know, under the present inspection system?

Secretary GLICKMAN. In the case of poultry, it is probably higher than in the case of beef, just because of the nature of how chickens are produced.

Senator BUMPERS. Really, the question—

Secretary GLICKMAN. Yes; just because there may be a higher incidence of some bacteria does not necessarily mean that the product is not clean or safe or that any problem cannot be eliminated when the product is cooked.

Senator BUMPERS. I am saying so far as the inspection is concerned, I am on your team. Of course, I have always maintained that nobody stands to benefit more from a perfect inspection system than the industry itself. Because every time there is any kind of an outbreak, they suffer in sales and revenues.

All I was trying to do was to ask you if you knew, for example, if 30 to 60 percent of the poultry today has some E. coli or something else on it? My question is, Would that be reduced to 10 percent under the new inspection system?

Secretary GLICKMAN. It would be reduced. I cannot tell you what levels. I would have to get you that information. But the reductions in levels of Salmonella and other pathogens would be reduced. In fact, most of the companies who are doing it now agree that the system provides a better method to test at various points of the slaughter process, so that inspection would not just be by sight. You would be able to test for the pathogens at various points. So there is a quantifiable improvement expected.

Senator BUMPERS. Mr. Dewhurst, did you have a comment on that?

PART 1

31

Mr. DEWHURST. I was just thinking, we did publish an impact statement when we put out the final rule on HACCP, and it has some estimates in it. I just do not remember what those were. But we'll give you all that information.

[The information follows:]

ECONOMIC IMPACT ANALYSIS

The Food Safety and Inspection Service has determined that the implementation of Hazard Analysis and Critical Control Point (HACCP) systems with pathogen reduction performance standards in meat and poultry plants will substantially reduce the incidence of pathogens that can cause foodborne illness.

FSIS conducted a final Regulatory Impact Analysis on implementation of the new HACCP-based regulatory program for inspected establishments. The regulatory impact analysis concluded that the final rule has potential annual public health benefits of \$990 million to \$3.7 billion because of reduced foodborne illness costs such as medical care and lost worktime.

FSIS is publishing the final Regulatory Impact Analysis along with the final rule.

Over a four-year period, the estimated cost to the meat and poultry industry for developing, implementing and operating the proposed pathogen reduction and HACCP systems is estimated at \$305 to \$357 million, averaging \$76 to \$89 million per year, or slightly more than one-tenth of a cent per pound of meat and poultry.

This is significantly lower than the annual estimated cost of implementing the proposed rule, which was about \$244.5 million per year, or slightly more than $\frac{2}{10}$ of a cent per pound of meat and poultry.

The recurring cost after full implementation of the pathogen reduction and HACCP systems is estimated at \$99.6 to \$119.8 million per year.

The rule has been developed to minimize the economic impact on small and very small plants. Small plants are those with 500 or fewer employees, the Small Business Administration's size standard for small meat and poultry manufacturing establishments. In addition, FSIS has designated establishments "very small" if they have fewer than 10 employees or annual sales of less than \$2.5 million.

Of the 6,200 USDA-inspected slaughter, processing, and combination slaughter and processing plants, over 2,900 (or 48 percent) are considered small plants and another 2,900 are considered very small plants.

The nearly 2,900 state-inspected plants—all assumed to be very small plants—will also be required to implement the pathogen reduction and HACCP requirements.

FSIS is allowing small and very small federal and state plants additional time to meet the new HACCP requirement and the *Salmonella* performance standard, thus minimizing the economic burden. Small plants have 30 months to implement HACCP systems and meet pathogen reduction performance standards. Very small plants have 42 months. All plants, regardless of size, will implement sanitation standard operating procedures and *E. coli* testing requirements at the same time, six months after publication of the final rule.

The frequency of mandatory microbial testing by slaughter plants for generic *E. coli* will be based on production volume. Slaughter establishments with lower production volume will have reduced sampling requirements, thereby reducing the burden on small businesses.

Of the 2,700 federal and state slaughter facilities, over 78 percent (the small and very small plants) will be required to conduct *E. coli* testing for only a specific period each year as long as they can demonstrate compliance with the established criteria. This will further reduce the burden for smaller slaughter operations.

Plants that now have good processing controls are expected to have relatively few implementation costs to comply with the proposal. Plants with little or no process controls would need to invest more to comply.

HONEY PROGRAM

Senator BUMPERS. Mr. Chairman, I had three or four other questions. I just want to close with this one question. When I was running for reelection in 1992, I was in Hot Springs, and I went to the courthouse. And there was a long line—I would say a 200-yard line—of people who were waiting for absentee ballots. So I started shaking hands. [Laughter.]

PART 1

And I got down about halfway through that line, and this young couple there—this very attractive young woman, about 30 years old, said, Senator Bumpers, I just want to know one thing: How do you stand on the honey program? Now, Arkansas is not noted as a honey-producing State, and I thought that was a really strange question. That was her only concern.

And obviously she had either heard Rush Limbaugh or some other news program, news magazine, talking about what a rip-off the honey system was, which I think at that time was costing us roughly \$30 million a year. Does that sound about right, Mr. Dewhurst?

Mr. DEWHURST. Yes, sir.

Senator BUMPERS. So I tried to get her the best information I had about the importance of the honey program. And she said, well, I can see I am not going to be able to vote for you. Now, I think—I am not sure, and I had not researched it—I think I may have voted 4 years later to eliminate that program.

And I want to publicly apologize for having done so, because I think it was a mistake, and I said it on the floor at the time, that oftentimes these programs that are targeted by the news magazines or the talk show hosts about how your money is spent—that ABC program, periodically, you know, “It is Your Money, Your Choice,” or some such thing as that—they can make those programs look terrible. But the truth of the matter is, bees pollinate 25 percent of all the crops in this country. And I am told that this is becoming a very critical problem.

I am also told by beekeepers that the number of beekeepers in this country is declining dramatically. In my home county, 5 years ago, we had nine; now we have one. And in New England, where they use a lot of honey hives to pollinate crops, they cannot get them anymore at any price. And when I think about the possible loss of \$5 billion in agricultural products to save \$30 million, that is not a good deal for the taxpayers or us or anybody else.

And I wanted to ask you if you can tell me if you have done any studies as to what the impact of eliminating the honey program has been?

Secretary GLICKMAN. Well, first of all, let me say, Senator, that I voted the same way as you did. I also have qualms about the impact on pollination and protection of the development of basic species of plants because of it.

Our research people are looking at it right now. I am not in a position to tell you whether we are going to recommend reestablishing a program at this stage. But there are real worries out there about this.

Senator BUMPERS. Mr. Secretary, our beekeepers cannot compete with Romania and South American countries, where most of our honey is coming from today. So I am simply saying I hope you will look very seriously at this, because I think it may turn out to be one of the most beneficial programs for the money in our whole Agriculture Department.

Secretary GLICKMAN. Our Agricultural Research Service is looking at that. There is a parasite that is killing bees out there as well, which is compounding the problem.

PART 1

33

Senator BUMPERS. Yes; they tell me—for example, I have a good friend who is a beekeeper in my hometown. He had nine hives. He is down to three. And he says the life of those hives used to be 3 years and now it is down to about 1½ years.

Secretary GLICKMAN. I remember this debate on the House floor. And there was an extraordinarily eloquent Congressman who has since passed away, named Silvio Conte. And he was a wonderful man. And he made a rhetorical career out of this issue, talking about how it was stinging the American taxpayers. But you are correct. Sometimes one's point of view is not necessarily compatible with all the truth. And I fell victim to that myself.

Senator BUMPERS. It is a small item, but in my opinion, it is a very big item, too.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator Bumpers.

Senator Byrd.

Senator BYRD. Thank you, Mr. Chairman.

And thank you, Mr. Secretary. Thank you, Senator Bumpers. I will just make a statement, and perhaps ask one question.

As a representative from the State of West Virginia, I know firsthand the challenges confronting rural America and the small family farm.

And incidentally, I wish every boy and girl in this country had an opportunity to live on a small family farm. I had that experience when I was a boy. And it forever shaped my attitudes and outlooks on life. And a great amount of my self-discipline, which I try to exercise today comes from the days when I was on that small family farm, back in the days of the 2-cent stamp and the penny postcard, no running water in the house, no electricity in the house. And I am very sympathetic to the problems of the small family farm.

If we read about the ancient Romans, we will find that the primary manpower resource came from the farmers in the Apennine Mountains. And during the latifundia, the purchasing of the small farms by senators and others in ancient Rome developed. The small farmers who left the farms, migrated into the cities, where there was crime, and they contributed to the growing welfare mobs. And we can pretty much trace the downfall of Rome from the year 133 B.C., when Tiberius Sempronius Gracchus, one of the Gracchi brothers, became a tribune, and promoted the distribution of lands and agrarian programs which would help to draw these people back to the farms.

We can take a great lesson from that. And if we note the history of ancient Rome, we will see a lot of parallels between that government and the ancient Romans and our early Americans of the 18th and 19th centuries. We have seen this happen in our own country as well. And we ought to take a lesson from what happened in ancient Rome, as the small family farmer left the farm and migrated into the towns.

The U.S. Department of Agriculture, the People's Department, it was called by President Lincoln, is an agency that provides meaningful benefits to rural States. And while I believe that all seven of the agency's mission areas merit recognition, I would like just briefly to touch on a few programs that are important to West Virginia. And I begin with the USDA's Rural Development Program,

PART 1

which provides assistance to one of my longstanding priorities: the implementation and maintenance of basic community infrastructure such as water and wastewater systems, through its Rural Utility Service Program.

While most Americans assume that when they turn on the faucet, clean, safe water will flow out, in West Virginia, 176,000 families live without an adequate supply of safe drinking water. And the estimated cost of needed water development projects in the State exceeds one-half of a billion dollars.

I applaud the USDA's efforts to alleviate this problem. Last year, under the capable leadership of Bobby Lewis, the West Virginia Rural Development State Director, the USDA made available the necessary resources to fund projects that will provide hundreds of West Virginians with access to a reliable source of clean drinking water for the first time. And much work remains, but I strongly support funding for the water and wastewater account.

Other programs under Rural Development, such as grants and loans for housing and community development, have also contributed to rural revitalization efforts in the State.

I took a trip in 1955, Mr. Chairman, as a member of the House Foreign Affairs Committee. And I was gone—we went around the world in an old Constellation. We spent 68 days on that trip, which, in these days, would have brought forth a number of investigators I suppose. [Laughter.]

NATIONAL CENTER FOR COOL AND COLD WATER AQUACULTURE

But I was greatly impressed when I visited particularly Asian countries—India and the Far East—at the dearth of sanitation and sanitary water and waste facilities. And I learned a great deal on that trip, and I have many pleasant memories. But one of the most pleasant memories I have is that of being able to go to a water faucet back home, when I returned to the United States, and I was able to turn on the water and drink it—turn the faucet on and drink the water without fear of becoming ill.

And we have a lot of people in West Virginia right today—and I would imagine in your State, Mr. Chairman, and other rural States—that do not have the luxury of clean drinking water. So I point to these unique needs of West Virginia, as to rural farmers, out. West Virginia farmers are hard-working family operators. It is my opinion that small and part-time businesses, such as West Virginia farm operations, represent the backbone of our Nation's economy and spirit of community.

I have been disappointed in the distribution to West Virginia of program benefits administered under the Farm Service Agency, the Agricultural Research Service, and the Cooperative State Research, Education and Extension Service to West Virginia. While limited benefits have been brought to West Virginia from these programs, they have been generally due to this subcommittee's attention to the worth of the small family farmer. And I appreciate the subcommittee's efforts.

I have only one quick illustration of an ARS project that this subcommittee made possible that has already had a valuable economic impact on West Virginia, although the facility has yet to be constructed. And I refer to the National Center for Cool and Cold

PART 1

35

Water Aquaculture. All leading sources of data now confirm that aquaculture production will create hundreds of jobs and generate millions of dollars in the State. And the development of this industry is a State government priority.

Many reports, further, suggest that abandoned mine sites can be used for aquaculture, with impressive economic results. Already, West Virginia, Mr. Secretary, boasts 40-plus active aquaculture producers, with increased activity expected this year. And so I thank the subcommittee for its vision, particularly the chairman and the ranking member.

I shall ask only one question, and with your permission and the permission of the subcommittee, submit others for the record, Mr. Chairman.

NATIONAL CENTER FOR COOL AND COLD WATER AQUACULTURE

That question would be with reference to the National Center for Cool and Cold Water Aquaculture, what actions, Mr. Secretary, will the USDA take to expand cool and cold water aquaculture opportunities in West Virginia?

Secretary GLICKMAN. First of all, Senator, we believe this is a very important project, that can have great positive impact on the development of an industry, which is still pretty much at a pretty elementary stage in terms of being able to produce farm-raised fish in cool and cold water environments. We see more in warm water environments.

And of course, Senator Cochran's own State is one of the leading aquaculture States in the country as it relates to catfish. That is an industry that, frankly, has grown like wildfire in the last 10 years. I visited a few of the facilities when I was down in Mississippi, and it is a remarkable thing.

We have a letter that is ready to go to you that defines the progress in this area. An architectural and engineering firm was selected in November of 1996 to design the facilities. And developing design concepts to accommodate specific facility needs will be initiated by March 31, 1997. That design process was mandated by Federal law.

We anticipate approval of the final design and plans by September 30, 1998. Pending the appropriation of full construction funding, a construction contract could be awarded in the last quarter of calendar year 1998. To expedite the ongoing design process, we have negotiated a reimbursable agreement with the Department of the Interior's Biological Service, which will allow a senior aquaculture scientist, with substantial aquaculture experience, to be detailed to assist us in moving this process forward as fast as we can.

To date, \$7.9 million has been appropriated for the project, \$6 million for construction and \$1.9 million for planning and design. An additional \$4.1 million of construction funds are required, for a total of \$12 million. Eighteen months is typically required for construction of this site. So it may not be absolutely required that the additional funds be in this appropriation, but it will have to be in the next appropriation for sure to accomplish that.

Reading from my staff's report, a staff research facility to address cool and cold water aquaculture production could be operational as early as early in the year 2000. I would just tell you that

PART 1

36

this is a high-priority project. We will see what we can try to do to accelerate it and expedite it any where we can. But we are moving on it.

Senator BYRD. Mr. Chairman, I thank the Secretary for the attention and the interest that he and the Department are giving to this very important matter, as far as we are concerned in West Virginia. I also thank the chairman for the assistance that he has rendered to us in West Virginia in this regard.

I close by referring to another trip that I took, which was not a junket, by the way. [Laughter.]

The chairman and I had the great privilege of visiting the old city of Ephesus, where Paul the Apostle walked the streets before we arrived there, as did Hannibal and Publius Cornelius Scipio Africanus Major. Scipio defeated Hannibal at the Battle of Zama in the year 202 B.C. And Hannibal eventually had to flee from Carthage to escape the tentacles of the Roman government, which continued to reach out, which sought to finally lay its hands on this great Carthaginian general. And he was with Scipio one day in Ephesus.

And as I say, Scipio had defeated Hannibal, who, by the way, Napoleon said was the greatest general of antiquity. In my book, I am not judge of who was the greatest general, but I have read a lot about Hannibal. And in my book, he is the greatest general also in antiquity and maybe down to more recent times.

But Scipio asked Hannibal who the three greatest generals of all time were. And Hannibal said that Alexander and Pyrrhus, who defeated the Romans at the Battle of Heraclea, in Asculum, in 280 B.C.—he used elephants for the first time—Pyrrhus used elephants for the first time on that peninsula. It was the first time that the Romans had ever seen elephants.

But Hannibal, to make a long story short, said the three greatest generals of all times were Pyrrhus, Alexander—no—yes—Pyrrhus, Alexander, and himself, Hannibal. And Scipio Africanus said, where would you rank yourself if I had not defeated you at Zama? And Hannibal then said, I would have been first. I would have been No. 1. But because you won that battle, I rate myself as No. 3.

Of course, Hannibal went ahead to commit suicide in 183 B.C. The Romans surrounded the compound in which he had taken refuge. One of his servants told him that the Romans were out there, looking around. And he said, well, go to the windows and make sure they are on all sides. And they reported back that they were indeed on all sides.

He made his way into a subterranean cavern and he always carried a little poison in a ring. So when the Romans finally broke into the compound and found Hannibal, lo and behold, he had foiled them once again. They did not take him alive.

Thank you.

Senator COCHRAN. Thank you, Senator Byrd.

Senator Kohl.

PREPARED STATEMENT

Senator KOHL. Thank you very much, Mr. Chairman. I have an opening statement that I would like to have inserted in the record.

PART 1

37

Senator COCHRAN. Without objection, it is so ordered.

[The statement follows:]

PREPARED STATEMENT OF SENATOR KOHL

Mr. Secretary: I appreciate your willingness to testify before this subcommittee today on the issue of the USDA's fiscal year 1998 budget submittal.

You have had a very big task over the past year as you undertake the hard and thankless job of implementing the significant program changes mandated by the 1996 farm bill. And for many of these changes, implementation is still in process.

Of particular importance to my state are the dairy reforms that are underway. Most important is the reform of milk marketing order reform process, which will not be fully implemented until 1999. I believe USDA has at its disposal the tools necessary to modernize this system, to make it more economically credible and equitable to all producers in all regions. As you are well aware, I feel strongly that USDA should use this opportunity to make the changes that are needed, instead of bowing to the significant political pressure against change, as so many previous Secretaries have done.

Unfortunately, since passage of the farm bill, dairy farmers across the nation have experienced a disastrous decline in prices. This past fall, prices fell by more than 25 percent in a period of 3 months, and prices remain relatively low today.

In response, you have taken a number of actions to help stabilize prices, and I applaud those efforts. I believe your willingness to increase the use of dairy products in USDA programs such as the School Lunch Program, the Commodity Supplemental Food Program, and the Dairy Export Incentive Program has helped bolster prices.

And your responsiveness on the issue of National Cheese Exchange reform is much appreciated as well. The flaws of the National Cheese Exchange and the market's inappropriate influence on farmers' milk checks, has been one factor contributing to the price volatility that farmers have experienced in recent years. Cheese Exchange reform is not a panacea for fixing the problems experienced by family dairy farmers. But any reform of the national milk pricing system must also include a more credible system for price discovery, and I appreciate your efforts, Mr. Secretary, on that matter.

And at the appropriate time, I will have a few questions for you about some of these issues.

NATIONAL CHEESE EXCHANGE

Senator KOHL. And, Mr. Secretary, we welcome you here today. I have three areas that I would like to cover with you. The first is with reference to the National Cheese Exchange.

Secretary GLICKMAN. Yes.

Senator KOHL. Last year, Mr. Secretary, when you testified before the subcommittee, we discussed concerns about the flaws of the National Cheese Exchange. As you know, Mr. Secretary, research funded by this subcommittee and conducted at the University of Wisconsin in Madison, highlighted the market failures of the National Cheese Exchange.

As you know, although less than 2 percent of all the cheese sold in the Nation is traded on the National Cheese Exchange, nevertheless, the price determined on the National Cheese Exchange in Green Bay acts as a reference price for almost all the commercial bulk sales of cheese in the country. And that is also used as a very important determinant by the USDA in setting milk prices paid to farmers.

Now, that exchange is very thinly traded. And as a result, no one has complete confidence in the prices that are determined on that exchange. And yet, as I said, these prices are used in a very important way with respect to both cheese and milk prices throughout our country. Now, you have worked on this, and I know you are greatly concerned about it. And I appreciate that concern. And you

PART 1

38

have been very helpful in coming forward with a proposal to delink the National Cheese Exchange from the USDA's calculations.

Last year I asked you to put together some proposals on alternative price discovery mechanisms. And I know that there are many proposals currently being considered in this regard. Mr. Secretary, if the USDA decides to delink the basic formula price from the National Cheese Exchange, what viable alternatives do you see to take their place?

Secretary GLICKMAN. Thank you, Senator Kohl. First of all, I want to thank you. You have led the way to get us to evaluate and reevaluate this process by which we rely on the National Cheese Exchange to determine the price of cheese, which is a big component of the price of milk and the basic formula price. You are correct, we are looking for options to remove that process. Because we believe that delinking that very thin method of determining cheese prices is important to give dairy farmers and others who use these markets some confidence that there is some viability to how the prices are set.

Now, I would say a couple of things, then I would ask Mr. Collins, our Chief Economist, to comment.

We have been receiving comments since 6 weeks or so ago, frankly, a lot of this effort was due to your pressure and Senator Feingold and Senator Specter and others, but you have been talking about this with me for about a year now. So we said we have got to find a process other than the Cheese Exchange. So we have been receiving comments since the end of January, in response to your request.

We have had about 80 so far. And the comments have been geared to what substitute methods are there out there, or what should we do internally if there are no substitute methods, whether it might be the futures market, which, as of today, does not really exist. There may be some desire to use such alternatives.

We have left the record open for about another 30 days to let people have some additional time to comment and then we are going to terminate that record. We then hope to have enough information to make some decisions as to what it ought to be.

But I would like Mr. Collins to comment specifically. And while I have not evaluated those comments yet, maybe he could talk a little bit about the general character of what those comments have been.

NATIONAL CHEESE EXCHANGE

Mr. COLLINS. Sure, Mr. Secretary, I would be happy to.

Senator Kohl, under milk marketing orders, our main goal is to value milk at its lowest valued use. That is what the basic formula price is. To do that, we really have two choices. We can value milk by looking at milk prices themselves, which we used to, or we can value milk looking at product prices, which is what we do now. Cheese, of course, is one of those product prices.

So basically, the alternatives before us, and the alternatives that are being suggested in the comment period, are for us to go back and value milk on a survey of processors by asking them what they pay for milk, or to find a replacement for the Cheese Exchange price. The difficulty is, of course, there is only one organized cash

PART 1

market for cheese in the United States. That cash market is the National Cheese Exchange. That is the only place where a cheese price is discovered in any formal way. And, that is the market that is under attack.

People would have us, as alternatives, go out and come up with some kind of survey of transactions that take place off the exchange. Most of the data we have suggest that those prices are based on the prices on the exchange. So it is not clear that we are going to get new information by surveying off-exchange prices.

Another alternative is simply to help foster the demise of the National Cheese Exchange, and replace it with a successor exchange. That process is underway, and is something the Department has been involved with also. We have been assisting any exchange that wants to start a new cash market for cheese. In particular, we provided some assistance to the Coffee, Sugar, and Cocoa Exchange in that regard.

So those are sort of the general range of options that we are looking at right now. As the Secretary said, comments have been pouring in. We have had about 80 comments so far in the last 2 weeks, and we are evaluating those. I am sure, until this comment period closes on March 31, we are going to get a lot more.

Secretary GLICKMAN. What I would like to do is, once we get a summary of those comments, then I would like to be able to come back to you and run through the kind of general options that are there, to determine whether these are the kinds of things that we can make or should use to make a decision whether to go back to computing milk based upon processed milk or go to the product value, which is cheese, which we are doing right now. However, we really need to get off this reliance on the Cheese Exchange. There is universal agreement on that.

Senator KOHL. That is good. Do I hear you saying that there is an agreement that we have to come up with an alternative price discovery mechanism, that you are hard at work in this process, and that by the end of March you are going to close the comment period and, very shortly thereafter, we are going to really get to trying to put in place an alternative price discovery mechanism?

Secretary GLICKMAN. I think that is a fair statement.

I would tell you that what I would like to do is, after the comment period, sit down with you and go over the general option areas available to us—they probably all have pluses and minuses to them—and talk about whether we have all the authorities that we need to do what we need to do or whether we need additional legislative authorities or not.

MILK MARKETING ORDER REFORM

Senator KOHL. OK, good. On milk marketing order reform, Mr. Secretary, I appreciate your comments about the Cheese Exchange. But let us not forget that one of the most important things, is the larger reform process underway—and that is milk marketing order reform. You and I have had many conversations, Mr. Secretary, about the outmoded and the inequitable nature of the current system. You have made many public statements, which I appreciate, including the comments that you made before this subcommittee last year, which I appreciate.

PART 1

40

Secretary GLICKMAN. Others remember those same comments, too, who do not appreciate them. [Laughter.]

Senator KOHL. I understand. But I appreciate them.

And you suggested that you agree with the assessment that we have to do something about the current pricing system.

As you know, we have many opinions about the issue represented on this subcommittee, and I fully respect the need of all Senators to represent the needs of farmers in their State. It is my hope that as you go through your reform process, you will find a way to find a system that is economically credible and fair to all producers. Ultimately, if the milk marketing system is going to have any future, it must reflect the modern realities of dairy markets, and it must be equitable.

In my mind, that means not only order consolidation, but also significant reform in the class I differential price structure, which has to take place if we are really going to have some kind of reform that is truly deserving of that name. In this context, we have been expecting a new discussion draft from the USDA regarding milk pricing and the milk pricing system. Could you tell us today when you expect to release that document to us?

Secretary GLICKMAN. I would ask, Mr. Collins, if you know generally, timewise?

Mr. COLLINS. We are very close. We have a draft document that is complete. It is in its final stages of review. I would almost say imminently, in the near future, we should have that out.

Secretary GLICKMAN. I have personally been a little concerned that we have not had enough of what I call serious options come from various parts of the country, various parts of the industry, as part of this process. What people are finding is this a tough nut to crack. So I get a lot of folks who are upset about the current system. But then when we say, OK, help us devise an alternative or modification that needs to take place, it is tougher to get that, even from the academic side of the equation. We have got some. It is coming; however, it is slower than I would like to see.

Senator KOHL. By the same token, imminently, you are going to have some serious proposals for us?

Secretary GLICKMAN. That is correct. Yes; we have got to get them out. And then, if they are going to be attacked or they are going to be challenged and improved or modified, we have got to get them out quickly.

RISK MANAGEMENT FOR DAIRY FARMERS

Senator KOHL. OK. Last, I would like to talk about risk management for dairy farmers.

In your testimony, you discuss efforts underway to help farmers manage risk. Given the rapid deregulation of agricultural markets as a result of the 1996 farm bill, and price volatility that is inevitably going to result, risk management, as we know, is a necessity. Most of the rhetoric that I have heard about risk management has been focused on the needs of crop farmers, with little discussion, Mr. Secretary, of the risk management also for livestock producers.

This past fall, dairy farmers saw their prices decline by over 25 percent in 3 months. And beef prices have also been very volatile in recent years. That sort of volatility makes it harder for the aver-

PART 1

41

age livestock producer to stay in business unless they have greater opportunities to manage the price risk.

So I would like to ask you, Mr. Secretary, what is the USDA doing to help livestock producers weather the storms of price volatility?

Secretary GLICKMAN. It is kind of interesting, the first time I saw the Washington Post comment since the farm bill was on dairy price volatility. I do not know if you saw that editorial. But it recognizes that we are in a much more risk-oriented environment now, generally speaking, in agriculture, as a result of the last farm bill.

There is no question that the focus has been on the crop side. In expanding this pilot program nationwide for revenue insurance, it has been on the crop side. However, we do have a couple of things—and I would again ask Mr. Collins to comment on this. One is the proposed options pilot program for milk. That has been submitted to the Department. We have not acted on it yet.

The whole area of agriculture options, as you know, over the years, has had a lot of speculative concerns about it. So whether it is in options for grains or options for milk, it is one that, since there is no futures market in milk products to speak of, it is one we are looking at. And perhaps Mr. Collins would comment on that.

The other thing is, as a part of our efforts on livestock concentration and the concerns about it, we have created a lot of new mechanisms on new market information for livestock. Some of those are out there already including more frequent reporting of prices of livestock, both cows as well as other farm animals. And a lot of your producers are already taking advantage of some of this increased market reporting information, much more frequent information, information on imports and exports across the borders.

Now, again, this is in the animal area, not in the raw product area. Keith, do you have any other comments? It is a very legitimate concern, in terms of how we deal with the issue of risk.

Mr. COLLINS. In dealing with risk, we really want to focus on two areas, financial management of farm business operations and marketing management of the product. We have a statutory requirement from the 1996 farm bill to run a risk management education program. There is a small amount of money in our budget to fund that effort. We have already begun that effort. The Risk Management Agency [RMA], as you know, focuses, as the Secretary said, on crops and crop insurance.

Secretary GLICKMAN. Although, if I might add, crop insurance for feed does provide some protection for the dairy producer. Because the feed costs have been a big part of the cash flow problem there.

RISK MANAGEMENT FOR DAIRY FARMERS

Mr. COLLINS. This risk management education initiative that we will run will also include livestock and dairy. It is going to be broader than just crops. It will involve developing packages of information to cover both financial management, as well as, marketing management; and, communicating that to producers to help them identify, prioritize, and deal with their risks.

PART 1

We also, as the Secretary said, have received from the Coffee, Sugar, and Cocoa Exchange a proposal for an Options Pilot Program for dairy producers. I would point out that the 1996 farm bill limits our ability to use the Options Pilot Program the way we did in the past. Such programs now have to be essentially budget-neutral, whereas in the past, we used CCC funding to fund those programs. Therefore, we are having some difficulty in studying the proposal from the Coffee, Sugar, and Cocoa Exchange; but, we are going to try to work with them and see what can be done in that area.

As you may know, there are a couple of dairy co-ops in the United States that are running programs that allow producers to hedge and use futures markets through their co-ops. I think, in fact, there are only two such co-ops that do that. And we would like to see those kinds of activities become more broadly developed, so that futures markets for dairy products do become much more viable than they currently are.

Senator KOHL. Well, I thank you. And I appreciate your sensitivity and your concern about this issue and this problem and your determination to try and do something about it to bring some stability, over and above what exists today, to livestock producers.

I also want to say, Mr. Secretary, that I am very impressed with the efforts that you have made thus far to understand and recognize and the determination you have shown about trying to do something with respect to the pricing system on milk. I know it has been done at some peril with respect to yourself and some of the criticism that you have received, but I think you really are determined to find some equity in this situation. And we understand equity is not all black and white.

And I have said across the State of Wisconsin that of all the Secretaries I have worked with, none has been, in my opinion, more determined to be forthcoming and decisive and to get something done. And across the State of Wisconsin, because of the comments that I have made, there are great expectations—

Secretary GLICKMAN. I knew that was coming. [Laughter.]

Senator KOHL. For what we hope that you can achieve. And for that, I want to say that I appreciate your efforts, and I am looking forward to getting something done, working with you.

Secretary GLICKMAN. Senator, obviously, you have had a great deal to do with inspiring my interest, as has Senator Leahy and others, as well. I think, philosophically, this is a very important issue for us. Because it relates to the viability of small-and medium-sized producers generally. It is not just in dairy. As you know, these trends toward fewer producers and more larger producers is almost in all segments of American agriculture.

Quite frankly, I do not think we in USDA, over the years, have given a lot of attention to the changing structure of agriculture. I am not saying that we fight the nature forces of the economy and economic trends. To the extent that we can kind of be a constructive, positive force in helping small-and medium-sized agriculture stay in business, that ought to be one of our prime focuses.

And that is not just in dairy. It is in the row crops and other commodities as well. And the markets are sometimes cruel. And Congress, in the 1996 farm bill, and we signed that bill, deter-

PART 1

43

mined to change that, to let the markets run more naturally, with less Government involvement. We also have an obligation to recognize that a little bit of what Senator Byrd talked about is right on target. The fundamental structure of the country is strengthened by the preservation of strong agriculture. That just does not mean five companies running the show. That means a healthy social structure as well.

I view the dairy issue as part of that issue, keeping enough folks on the land to preserve a social structure in this country as well.

Senator KOHL. That is something with which I could not agree more. And again, I am very impressed with your sensitivity, and I appreciate your being here and your willingness to work with us.

Secretary GLICKMAN. Thank you.

Senator KOHL. Thank you.

Senator COCHRAN. Thank you, Senator Kohl.

Senator Burns.

PREPARED STATEMENT

Senator BURNS. Thank you very much, Mr. Chairman, I have an opening statement that I would like to have inserted in the record.

Senator COCHRAN. Without objection, it is so ordered.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman.

I would like to offer my thanks to Secretary Glickman for coming to the Committee today to discuss the proposed Budget for the Department of Agriculture, as submitted by the President. I do have to tell the Secretary though that I am very disappointed in the budget that this Administration has proposed. I don't feel as though the Department of Agriculture has taken into account the agricultural producers of our country in this budget. They have listened to, too many groups that are no longer related to the production of food and fiber for our great land.

The issue of great concern to me, is the funding level for real agriculture in this budget, and the misperception that the American public has about where the dollars in this budget really go. I have concerns as well about the funding for those agencies and areas that directly impact the concerns and fears of the people who make their living on the ground providing a food supply for our country. Among these are the budgets for Agricultural Research, Grain Inspection Packers and Stockyards, predator control and those agencies which make sure that these people have access to information and the continued ability to work on the land.

I am also very glad that the Secretary is here today, since later this afternoon my Montana colleagues and I will be meeting with him to discuss an issue that is of vital importance to the state of Montana. For several years now I have held hope for the Department of Agriculture, through the Animal Plant Health Inspection Service to come to the front in the debate over the disease of brucellosis in the Yellowstone bison herd.

I have to say that as of this date I have been greatly disappointed in the agency and the department in general on this issue. I feel very dissatisfied by the way that the agency has handled both the animal and human health issue in this area. I hope the Secretary remembers what a great proponent I have been of APHIS in the past and the words of encouragement I have provided in these hearings. However, later this afternoon I will discuss more thoroughly this very issue with the Secretary and will not take any more Committee time than necessary to discuss this issue today.

Before concluding on this topic though, I would like to extend to you an invitation to come to Montana. I believe it imperative that you come out and see what exactly it is that the government of the state of Montana must face on a daily basis. To make this trip beneficial to all, I think you need to schedule this trip almost immediately. I would be more than glad to accompany you so that you can see the problem we are facing right up front and in person.

PART 1

44

Mr. Secretary, I continue, as in years past, to be very concerned about the Agricultural Research Budget. As always this Administration has continued to defund the grants, which are of extreme importance to states like mine and those that surround Montana. I am also concerned with the budget increase for the Agricultural Research Service which will provide funds for nutrition research and not provide an increase in funds for those areas which will provide for the farming family on the land.

In looking at the proposed budget, I have seen the increase in the ARS budget, but when I look at where the dollars are going, I see programs that will not help the family farm. The budget, as proposed by the President, will provide additional funds to the nutrition study of our food supply. Mr. Secretary, there are numerous groups in downtown Washington, that are providing this research at little or no input of taxpayer dollars.

When visiting with my fellow Montanans, I find that they want research dollars going to funds which will provide for them in the future, not to groups or organizations that seek to tell them what is in that steak or vegetable dish that they are eating tonight. What we seek are ways to increase what we have now and what we can do to help the family farmer.

These people ask that their tax dollars go to the universities that will provide for them in the future. They want to see their tax dollars go to something that will assist the future and their children. Yet this Administration seeks to provide funding for special interests that have no interest in the future of the food and fiber provided by agricultural producers in our nation.

While reviewing the budget proposal earlier this month I was also concerned with the manner in which the department thought it necessary to reduce funding for Grain Inspection, Packers and Stockyards. During the past two years Congress has heard the numerous concerns of the livestock producer on the issue of packer concentration. Yet as we look into your numbers, we see where you think you can get by asking more from this agency and provide them with less funds to investigate what is happening on the ground.

This work needs to be done to provide a sense of confidence in the federal government by the people that fund that very government. Yet it appears your department has no concern for the developing or renewing that confidence. I hope you will not tell me that the Department feels that they can make up the difference in user fees, because I have great concern about them as well.

Mr. Secretary, as the past year has moved by us, I have become increasingly concerned with the manner in which your department has proceeded with the implementation of the most recent farm bill. It appears to me, that the rule making procedure has been used to benefit the department and not the producers in the field. A case in point is the recent rule making on the Conservation Reserve Program.

Within the past few weeks you have finally put out the final rules on CRP. This week you are taking the time to educate your field personnel, and next week you start the process for signing up for the program. At this then, you only give producers a few days more than three weeks to make the decision of signing up for the program. This action is undefendable to me.

Basically, I guess I am concerned with the amount of leadership, and where the leadership in your department is coming from. One example of this comes directly from my office. Recently in an attempt to schedule the meeting for this afternoon, my staff was ignored in efforts to make contact with you to schedule this appointment. I will get into more detail with you on this later, but Mr. Secretary, I would expect a little more from a former member of Congress.

Mr. Chairman, I have lost a great deal of confidence in the Department of Agriculture this past year. I would hope that today, both in this meeting and later with Secretary Babbitt, that the Secretary can give me some reason to restore my faith and confidence in this department. The agriculture producers in our country deserve a department that is working for them and not against them. They expect and deserve a Secretary that will be out there telling their story. This is something that I would like to see as well.

We are facing a time in agriculture where the vast majority of the people of this country have no idea of the pleasure of being on the land, of working with livestock and seeing of nature reborn every spring. Our country needs leadership that will provide this rural lifestyle to continue and not always feel like "Big Brother" is trying to put them out of business and drive them off the land.

I look forward to listening to Secretary Glickman and learning what he plans to do with the funding that the Administration has budgeted for Agriculture this year. It is my sincere hope that he can give me reason to renew my confidence and faith in the Department of Agriculture.

Thank you, Mr. Chairman.

PART 1

45

ARS FUNDING

Senator BURNS. Mr. Secretary, thank you.

I want to stress just some of my concerns with this appropriation and where you have placed your emphasis and where I am going to—I am going to be very, very up forward with—I hope you change some of it. First of all, I do not think you have got near enough money in ARS. I think, if there is one area that we are lacking in the U.S. Department of Agriculture it is in agricultural research.

Now, you did increase some dollars there. But the dollars went the wrong way. We have got people all over this country doing nutrition studies and recommending diets and all this healthy stuff. And I will probably die before I am 62, but that is OK; it is because I eat all the wrong stuff. I happen to like it. But we are not doing enough as far as helping production agriculture.

Now, everybody wants to keep that young farmer on the farm, but I do not see anybody out here in the Department of Agriculture leading the band to say we ought to reform estate taxes so we can pass our farms on to the next generation. I do not see anybody in the Agriculture Department doing that.

Mr. Secretary, we are to the point now where we need an advocate for the farmer. We need an advocate for the people who provide the food and fiber for this country, and quit fiddling around with this other stuff.

And Robert Byrd hit it over here a while ago—the way we handle our water is very, very important. I have a daughter that graduates from medical school this spring. I am very proud of her. You know what she said? The advances that we have made in medicine have only contributed 5 percent to the increasing of the average life-span in this country. The rest of it has been the way we handle our water. That has really done more to extend our life expectancy than anything that we have done in this country. So I think it is very important.

In ARS, I do not think you have got enough money. In construction, we need some more money. And do not worry about the nutrition programs; let us worry about production agriculture. I want to change that formula a little bit. And I will work with you on that. That is one area.

The next one, and with that, through ARS, is extension. I think that is very important. It does nothing to do the work if we cannot get that information out to the people who have to apply the new technologies and the work that we have done through ARS.

INSPECTION ACTIVITIES

Let us talk about inspection just for a second. We got a situation on the border. We are going to address that. And we will talk to you about that more privately with the situation up there. Because I happen to believe that whoever said that they are going to pass along these increased fees on inspections to the consumer, they are as crazy as a bedbug. It is going to go right back to the producer.

Because I do not care how you look at it, agriculture will always—we will always buy retail, we will always sell wholesale, and we will pay the freight both ways and all the incidentals in be-

PART 1

46

tween. We will always do that. And anybody that does not understand that ain't never lived on 160 acres of two rocks and one dirt. And there is a difference right now. There is a disparity between the way we inspect chickens and poultry and the way we inspect red meats.

We are not playing with a level playing field there. And I think it is time that we take a good look at that. We have got some good people down in P&S and at our Inspection Service. They have some recommendations and I think we should take those recommendations.

FIELD OFFICE CLOSINGS

And then another area, you are talking about a reduction in force as far as our service centers are concerned. I want to see that reduction happen here before it happens at the point of sale, so to speak. We are talking about closing offices in Montana. And we have got long distances out there. And I would ask you to take a good look at your force here, and then take a look at the force out there at the sort of point of sale or point of service. That is where we need to put our people, and help some of these people through some of these very stressful times.

As far as the bee situation is concerned, I voted for the bees. I am happy to say, this old, conservative Republican voted for that liberal, old program of helping the beekeepers. Now, all at once, we are finding out that that was a very, very shortsighted situation. It is also shortsighted in the wool incentive. Because we have one-half as many sheep in this country as we had whenever that incentive went away. And that is the biggest share of it. And that did not cost the taxpayer anything but the administrative costs. And that is a shame.

So in order to cut programs and to be heroes to what we think is perceived as helping the taxpayer, we absolutely hurt the taxpayer and in a lot of different ways. So those are the areas that I will be looking at. I do not have any specific questions. But I am going to make some recommendations to you with regard to where we spend our money on these appropriations. Because I think there are some disparities there that are just very glaring.

ADVOCATE FOR AGRICULTURE

And, Mr. Secretary, I am down to the point where we in agriculture have got to have an advocate at the USDA. Everybody else has got one down there, but not this old guy out here that is—and we are going to lose a lot—do not worry about the numbers of cattle—we are going to take care of that—North Dakota, South Dakota, and eastern Montana—we are going to take care of a lot of those numbers this year. We are going to lose a lot of cattle—frozen to death, standing. Could not get feed to them.

And besides that, it has been terribly cold. And right now they are saying snow does not qualify as being a disaster. But we should take a look at that and see if we cannot do something about that.

But those are the areas that I am really concerned about—inspection, how we inspect, are we dealing with products coming into this country, are they coming in on the same label, are they going through the same hoops that our local producers have to go

PART 1

47

through. And that is my statement. I am going to see you this afternoon if I get out of here. Because I have got to go look on television now—about violence on television.

Secretary GLICKMAN. Can I just make a couple of quick comments?

Senator BURNS. Yes, sir.

Secretary GLICKMAN. First, I appreciate your comments concerning the Agricultural Research Service [ARS]. Congress has to reauthorize the research programs this year. So to the extent of redirecting priorities, that will be a part of the process. Clearly, we have the best agricultural research establishment in the world. We want to keep it that way.

INSPECTION ACTIVITIES

On the issue of inspection, just so that you know, we recently announced some changes in increasing the amount of random inspections of meat coming across from Canada. Your office probably got a copy of this, but we will make sure you get a copy of what was done. I think you will find that somewhat helpful in the process.

On the disparity issue, the fact is there are differences between chickens and beef, in terms of the numbers, the quantity, and everything else. I have said publicly my goal is to achieve relative parity in the inspection process.

Senator BURNS. We just want a level playing field. Because I ain't got too many chicken farms in Montana.

Secretary GLICKMAN. Both are big parts of American agriculture, poultry and beef.

Senator BURNS. I am not worried about chickens. I have never seen a seeing-eye chicken or a stock chicken or a guard chicken. I do not know what to use them for. [Laughter.]

Secretary GLICKMAN. As you know, I come from a State which actually is the largest beef processing State in the country.

Senator BURNS. I will talk to you about concentration now. [Laughter.]

Secretary GLICKMAN. But I have grown appreciative of the significance of the poultry industry. For example, in 1990, our sales of poultry to Russia were about zero. Last year, we sold nearly 1 billion dollars' worth of chickens to Russia—\$1 billion, from zero 10 years ago, roughly. One-third of all of our poultry exports go to Russia. Nearly 25 percent of everything the Russians buy from us, which includes pharmaceuticals, cars, airplanes, nearly 25 percent is chickens.

Senator BURNS. I am sorry I brought it up now. [Laughter.]

Secretary GLICKMAN. So I guess my point is that it is an important industry as well. At the same time, we do not want to give any one part of the livestock industry a disproportionate advantage in the slaughtering and in inspection process. That is not my goal. Our goal is to move those industries to a more comparable level. We are doing that as a matter of fact.

Senator BURNS. Well, there is a disparity there, and if we could address that, that would be fine. But that is not high on my agenda either. I think the ARS, extension, the way we deliver our services to our farmer, and we need an advocate. I have never seen a time when agriculture needed it more than we do right now. Because we

PART 1

48

have got a lot of answers for this society. And we are not having riots out there, you know. None of that. But we want to keep on producing, too.

And I am sure glad to hear now that—the cloning of the sheep, I realize why Dale would be concerned about that.

Thank you very much. [Laughter.]

Senator COCHRAN. Thank you, Senator Burns.

Senator Leahy.

Senator LEAHY. Thank you, Mr. Chairman. I am delighted to be a member on this subcommittee. You and I have served together on appropriations for many years, as well as on the Agriculture Committee because of the influence this subcommittee has on agriculture and the environment and USDA and the lives of people who use the WIC Program or other nutrition programs. And I find that very interesting.

NATIONAL CHEESE EXCHANGE

I listened to what Senator Kohl said about reducing the influence of the Cheese Exchange and the pricing of milk. Well, I agree. It makes no sense in my State of Vermont, for example, to see a little cheese exchange, which has really no influence in our State at all, other than the fact that whatever happens on it can dramatically change overnight the price of milk in Vermont. It has nothing to do with supply and demand. It has only to do with what one company or two companies might do in that one exchange.

I think that we can find a far better way to have a statistically reliable national survey system to monitor prices. What I would suggest is do something like we do with the New York Times best seller list. The New York Times goes each week to different booksellers, checking how the books are being done. For example, every week, the New York Times checks a list sort of at random, of bookstores. That way, no book publisher can just buy up all their own books and go up to the best seller list.

What has happened on the Cheese Exchange, though, is just the opposite. They know that every single week or month or whatever it be, you have to go to that same one exchange. So it is very easy to manipulate it.

As I said, when we see the price of milk drop precipitously, for example, in Vermont, and yet the supply and demand has not changed a bit, you have to ask what caused this. And if the cause is one small exchange and some people probably speculating or manipulating, then we have to find a different system. And I will work with you in any way we can to do that.

It has been mentioned here also the farm bill. And I would note to everybody, a lot of work went into that farm bill and passing it last year. It was a bipartisan coalition in the Senate. I was part of that. We worked very hard to compromise and to put one together. It meant that Republicans and Democrats had to work together. A lot of special interests, from the left to the right, were left outside the door while we tried to do what was best for this country.

I would also note, Mr. Chairman, that as I recall, that farm bill got the largest number of votes a farm bill has gotten, certainly since I have been in the U.S. Senate. I say that because I will fight

PART 1

49

any and all attempts to undo that bill before we have a chance to see how it works.

I have heard some discussion among some that say we have to revisit it and basically rewrite it. I will do everything, from having a chance to instruct my colleagues on what goes into a farm bill—I understand there are several hundred pages that they probably have not had a chance to read, although they may want to hear me say them over the days and weeks and months on the floor if there is going to be a change.

NUTRITION PROGRAMS

We established spending, such as the CRP, the Conservation Reserve Program. We have to work together, protecting these programs and to protect our environment. The nutrition programs—I support the President's request for \$100 million for a supplemental appropriations for the WIC Program. If we take advantage of the savings identified, we can provide supplemental funds to feed 400,000 additional infants, children, and pregnant women.

We have hungry children in a nation where none of us in this room goes hungry except by choice. If you stop to think about that, there is not a single person in this room who goes hungry or will go hungry today except by choice. We have a lot of children who do not have that choice. And we suffer as a nation if they start off hungry and if they go into life hungry.

We have one program that works well, the Farmers Market Nutrition Program in WIC, where we spend about \$6 million on that. That has worked very, very well in my State. What it means, Mr. Chairman, is that on these farmers markets, people can use WIC certificates and they get food that is extremely fresh, that had been growing hours before they get it.

I look forward to being on this committee. I have questions which I will submit for the record.

I was pleased, as I said, to see the question on the Cheese Exchange come up.

And I would hope that the Department might continue to look at the electronic benefits transfer system—that is an entirely different thing—on food stamps. As the son of a printer, I hate to say this—but we are spending hundreds of millions of dollars in printing food stamps. And there has to be a better way.

And also, I would think, from my days as a prosecutor, I think that you could track fraud a lot easier with an electronic system. It certainly would be fairly easy to set up a program where, if you suddenly see a huge spike in the use of food stamps in one small store, that you would at least call your investigators' attention to it.

Thank you, Mr. Chairman.

RUSSIA'S ECONOMIC AND POLITICAL SITUATION

Senator COCHRAN. Thank you very much, Senator Leahy.

Mr. Secretary, this morning I had an interesting experience, having been invited to a breakfast meeting sponsored by the Aspen Institute. I heard a presentation from Dr. Peter Reddaway, who is professor of political science and international affairs at George Washington University. He discussed the current political and eco-

PART 1

50

conomic situation in Russia. Your reference to the tremendous growth of Russia as a market for poultry exports reminded me of some things he said. I thought you might be interested in hearing some of his comments, because they may very well affect the capacity of Russia to continue to be an important market for United States food exports.

He said that the gross domestic product in Russia is down 50 percent over the last few years—I think he said 4 years—even though they have an inflation rate that is very modest—almost zero—and their debt-to-GDP ratio is about 7 percent. Those are the only good things that you can say about the Russian economy today. Because, in his view—and he said this is shared by others—the economy is in a very serious state—almost a state of near collapse because of the criminal element that has taken over in large measure. The economy is being criminalized and corrupted in ways that very few realize around the world today.

He said: In July, funds for rations to feed the military will cease to exist. The central government will not have funds to make available to the military to buy food. And that regional governments will be asked to provide those funds or foodstuffs to feed the military forces that are deployed in the various regions of Russia.

It is almost shocking or alarming to me to just hear the various other characteristics of the Russian economy. I bring that up because I am curious to know whether the Department of Agriculture is aware of these reports and whether or not any assessment is being done on the impact on American agriculture of the state of the economy in Russia.

Secretary GLICKMAN. The answer to the second question is yes. Our Foreign Agricultural Service is actively involved. We have people in Moscow and throughout the area, trying to analyze these conditions. And also we rely on intelligence reports as well.

But let me tell you an interesting thing. Vice President Gore and the Prime Minister of Russia, Mr. Chernomyrdin, they have this commission, the Gore-Chernomyrdin Commission. They meet twice a year, once there and once here. We just had our meeting here. I was with my counterpart, Mr. Zavaruka, who is the Deputy Minister for Agriculture. I am not sure I heard as bearish a sounding scenario, but it is clear that one of the reasons why they have just extraordinarily exploded their demand for American poultry is because they have lost their infrastructure to produce farm commodities of all sorts. They do not have the feed available. It is just a combination of factors.

One of the things that they clearly said to us was that you cannot expect to have these markets forever unless you help us develop our own poultry infrastructure, which our industry is beginning to do. We are involved in joint venture activities; and, we are trying to help with that. Because we believe, without that, we risk the fact, politically, of having these markets removed.

Remember, they tried to do this last year, alleging Salmonella, or some other sanitary type of problem. But they do not have, because of the lack of marketing and financing capability, much of an agricultural infrastructure at all. Obviously, we are worried about it. The days of us selling large amounts of grain have long passed. But there is some reason to believe they may need some grain in

PART 1

51

the future because of their infrastructure problems. We are ready, willing, and able to help with that. I talked with the Agriculture Minister about that as well.

They clearly are in deep trouble, but my impression from the meeting that we had was that there is some degree of political stability, depending of course on President Yeltsin's health and other things. We just have to do our best to try to improve their economic and political structures. In the meantime, they still need our poultry. They do not have the infrastructure to grow their own chickens in any kind of marketable way.

The old days of us being very dependent upon them in the grains are gone. They do not have the resources to buy it. We have seen ourselves become somewhat dependent on the poultry situation over the last few years and we have got to recognize that it may be tenuous. I mean we have got to hope their political structure is such that they can continue that process.

Senator COCHRAN. There are no estimates in the Department as to the length of time that this kind of purchase record or practice of buying poultry products can be sustained? Are you making any estimates or projections of that?

Secretary GLICKMAN. No; at least not as a result of these meetings. As you may know, when the Russians made sounds to cut off these imports of poultry, the Vice President personally intervened and the Prime Minister also personally intervened, to see what was going on. It is clear that we also have an obligation to help them develop their own indigenous industry. Our industry understands that and is working on that. But, I do not have any formal projections.

I would just tell you that we are dealing with a rather tenuous economy over there.

RUSSIA'S ECONOMIC AND POLITICAL SITUATION

Senator COCHRAN. One question that was asked of this professor at this breakfast meeting was what kind of aid programs would be most effective in assisting in the continued strengthening of the Russian economy. He talked about training programs, education exchanges, technical assistance, and the like. Are there any Department of Agriculture programs that are ongoing that you are requesting funding for that are specifically designed to deal with that problem in Russia?

Secretary GLICKMAN. Yes; but let me first tell you that we have a book we have published, called "Agriculture Baseline Projections to the Year 2005." Basically, it analyzes every commodity, every importer, every exporter. I would have to say that our projections, poultry trade projections, are actually a slight increase over the next 5 to 6 years.

Senator COCHRAN. Is that worldwide?

Secretary GLICKMAN. That is to Russia.

Senator COCHRAN. To Russia specifically?

Mr. COLLINS. Excuse me, that is worldwide. That would be Russia's global imports of poultry. That is premised on some recovery in their economy. The economic data on gross domestic product, which you pointed out, have been somewhat of a surprise to analysts who have followed Russia over the last several years. For

PART 1

52

about 2 or 3 years in a row now, people have been forecasting that Russia's gross domestic product [GDP] growth would turn positive in the upcoming year. It has not. It has remained negative.

GDP growth is doing much better than it was a couple of years ago. A couple of years ago it was declining at about a 12-percent-per-year rate. This current year, I believe the estimates are for a couple-of-percentage-point decline. I mean this is so horrific that Americans cannot even conceive of this. We define a United States recession as two quarters of negative GDP, and we are talking about 15-percent declines per year in Russia. I think I read in the Wall Street Journal recently that Russia's GDP just turned positive.

Right now, observers believe that Russia's annual GDP growth would probably not turn positive until 1998, but most likely 1999. But at least it seems to be stabilizing. The sharp declines of the last few years seem to be bottoming out at this point.

COCHRAN FELLOWSHIP PROGRAM

Secretary GLICKMAN. Let me just make a couple of comments. As you know, there is a program named after you, the Cochran Fellowship Program. And those do provide opportunities for technical assistance to individuals. I was just in South Africa, and I met one of the Cochran fellows. And this is a young man who came over here to learn about the wine industry. He was a Cochran fellow. He has gone back and has become a leader in South Africa, in terms of trying to develop black ownership of vineyards and involvement in the wine industry. And your name came up.

There I was in the middle of South Africa, and there was the name Cochran which came up. It is something that changed his life. It just shows you how this can work.

We have market development activities. Steve, maybe you might want to talk about the various assistance programs, credit programs, et cetera, emerging democracies programs, I do not have it right at the top of my chart here.

Mr. DEWHURST. We have a series of programs, some of which provide direct assistance to exports, like the export credit programs, and some of which provide training, or what I would call indirect assistance to foreign countries. The Cochran Fellowship Program is funded in the 1998 budget at the same level it was funded in 1997, \$2.4 million.

We have about 287 international participants from 30 countries in that program this year. Over 4,800 participants moved through that program since its inception. That program is planned to continue.

When you look at the entire international portfolio of the Department, you are talking about \$7.6 billion in programs. That includes everything from the Export Enhancement Program to the cooperator program run by the Foreign Agricultural Service. We have quite a tool kit of programs, all of which are being carried out to deal with various aspects of the kinds of help we need to give foreign countries or our own exporters.

Senator COCHRAN. I know that in our budget, we are going to be constrained by the allocation we get as a subcommittee. The anticipation is that if we are lucky, we will have the same amount of

PART 1

53

money for our discretionary programs next fiscal year as we had in the current fiscal year—which means no increase. I am wondering whether or not we are figuring out ways to make our dollars go further in these foreign assistance programs that stimulate demand for U.S. agriculture commodities and help foreign economies buy more of what we produce here for sale in the global market.

I know that in the cooperator program, for example—and I was going to ask you about this—

Secretary GLICKMAN. Which program, sir?

FOREIGN MARKET DEVELOPMENT COOPERATOR PROGRAM

Senator COCHRAN. With respect to the cooperator program that the Foreign Agricultural Service administers, there is a change that is suggested in the budget submission which would require co-operators, U.S. agriculture commodity groups, to pay more to participate in that program. Is that going to enlarge the program? Or is that required just to keep the program at current levels?

Secretary GLICKMAN. Steve, do you want to comment on the cooperator program?

Mr. DEWHURST. Yes, sir; it is required just to keep the program at current levels. The FAS, like a lot of our agencies, has costs that are rising faster than our ability to add money to their discretionary budget. And in particular, in the Foreign Agricultural Service, they jointly finance a computer center with the Commodity Credit Corporation. In the fiscal year 1998 budget, a greater share of that cost is on the FAS side of the agenda.

They have to absorb that cost. The way they have done it is to constrain the new money that is going into the cooperator program. The only way to keep the program at the prior level is, then, to ask the cooperators to make a greater contribution to the program.

Senator COCHRAN. Has there been any effort of outreach to discuss this with the participants, to see whether or not they are going to pay these extra assessments or required increases, or whether they are going to just maintain their current level of contribution and therefore decrease the activity in this program? Do you know the answer to that?

Mr. DEWHURST. No; I know that the Foreign Agricultural Service has had discussions with the cooperators. However, I do not know where they have come out on that question.

MARKET ACCESS PROGRAM

Secretary GLICKMAN. On the Market Access Program [MAP], the Foreign Agricultural Service has engaged in efforts to improve its operation, in targeting its impact more in recent years. I believe that program gets a lot of criticism; but, it is a drop in the bucket compared to what the rest of the world spends. We are proposing flat-lining that number this year.

Frankly, I would like to have more money to spend in it. But it has had a remarkable impact on everything from fresh fruits and vegetables to livestock. And we think it is very important.

The French, I think, spend as much on promoting their wine alone as we spend on our entire Market Access Program.

Senator COCHRAN. That is an argument I remember using against an amendment to knock out the money for the program

PART 1

54

when this bill was on the floor last year. We are always confronted with some amendment to either reduce the level of funding of the program or to cancel it completely. I am glad that the administration is supporting full funding for the program. I commend you for your efforts to get that included in the budget.

I was going to ask you about the changes that you mentioned are being made to target and reform and try to change the program to meet some of the criticisms. I know you probably do not have all that available to you, but I would like to have that for the record—what changes you are planning to implement or have implemented—so we will know what they are. I assume they are all authorized under the law and that you would not go beyond the authorities of existing law in changing the program. But whatever you have in mind or whatever you have in place, we would like to know about it.

Secretary GLICKMAN. OK, we will get you that.
[The information follows:]

MARKET ACCESS PROGRAM

Changes have been made in the Market Access Program (MAP) to make it more targeted and to increase small business participation in the program. For fiscal year 1998, the budget includes the full authorized permanent funding level of \$90 million for MAP.

The Market Access Program has been an important contributor to the gain in U.S. world market share of sales of consumer-oriented products since 1985. During this period, MAP and its predecessor, the Targeted Export Assistance Program, have helped this share grow from 11 percent to 18 percent in 1994. Each percent gain represents sales of more than \$1 billion. While changes in the value of the dollar have added to the growth, analysis carried out by FAS has indicated that market promotion contributed to more than half of the total increase.

Consistent with the Administration's commitment to streamlining government activity, new MAP regulations were published on February 1, 1995, that increased flexibility and simplified program requirements for participants. The revised regulations also reflected public comments and changes made by the Omnibus Budget Reconciliation Act of 1993. Among the changes made by the rule are:

- (a) U.S. exporters no longer need to show that a U.S. agricultural commodity faces an unfair trade practice in an overseas market in order to participate in the program;
- (b) Small businesses and cooperatives are accorded priority consideration in the allocation of brand promotion funding;
- (c) Application and allocation approval criteria are clarified;
- (d) Paperwork requirements are reduced;
- (e) Procedures for appealing compliance findings are added; and
- (f) Program evaluation requirements are clarified and simplified.

Secretary GLICKMAN. There has been some targeting to cooperatives and smaller operations. But we will get you that information.

Senator COCHRAN. Some of those changes may be required by the changes that we had to accept when the appropriations bill was on the floor.

Secretary GLICKMAN. That is right.

U.S. AGRICULTURAL OUTLOOK

Senator COCHRAN. In connection with the outlook in the report that you have there, talking about Russia's capacity to continue to purchase United States agricultural commodities in the global market, what is the outlook generally for world economic conditions and the impact that that will have on United States agriculture

PART 1

55

and the demand for United States agricultural commodities? What do you show in your outlook report?

Secretary GLICKMAN. Keith, you take it first.

Mr. COLLINS. Generally, it is fairly positive. And that is premised primarily on strong economic growth, particularly in Asia and in Latin America. Those would be the two greatest areas of growth. This past year we had agricultural exports of about \$60 billion. We show them coming down a little bit in the current year, to \$56.5 billion. And then, generally, we show them trending up to the year 2005, getting up to something in the order of \$80 billion.

But the driving force behind this is principally economic growth in less-developed countries, which, this year, will run about 5.5 percent. That is a tremendous source of growth, particularly for our feed grains and our oilseeds and our livestock products and our high-value products.

NORTH AMERICAN FREE-TRADE AGREEMENT

Senator COCHRAN. There are some who are suggesting that we have got some bilateral problems in Latin America. You mentioned that as a potential growth area. I wonder what your assessment of the North American Free-Trade Agreement has been for agriculture, and specifically for some of our commodities like rice, beef, and others, where some dramatic changes were predicted for the better. Have those turned out to be forthcoming? What is the consequence of that agreement on American agriculture?

Secretary GLICKMAN. Let me just say, by and large, the NAFTA agreement has been positive for agriculture, particularly livestock has been an area that has been positive. Now, the President of Chile is here as we speak. Yesterday he came in and the President met with him. And then we had a little larger meeting with the Trade Representative and myself and some other folks.

It was interesting. The first item mentioned was agriculture. We have some problems with Chile. One has to do with wheat and the importation of American wheat. They have some sanitary and phytosanitary requirements that we think are unrealistic and unnecessary. Also poultry is another area where we think the same thing is there.

We told them, both the President and I, said that the passage of fast-track legislation certainly could have an impact on agriculture and the ability to believe that they are taking our commodities will be a helpful factor in getting that fast-track legislation through. As a part of that, the President committed to send me to Chile a few weeks after he goes, in early May, to set up a consultative commission process on some of these bilateral trade issues with the Chileans.

We are also working with the Argentines along the same way, where we are trying to resolve some of these specific disputes that are taking place.

So I think it is pretty good. Let me just mention to you that during fiscal year 1996, United States agricultural exports to Canada and Mexico increased by 14.2 percent, reaching record levels. In the case of Mexico, United States agricultural exports reached \$5 billion in fiscal year 1996, an increase of 35 percent over fiscal year

PART 1

56

1995 and 38 percent over fiscal year 1993 pre-NAFTA levels. We have projected about \$5.1 billion this year.

We sell to Mexico about 75 percent of its agricultural imports. Part of that is due to our price advantage.

Imports from Mexico were \$3.67 billion in fiscal year 1996, slightly below the \$3.7 billion level for fiscal year 1995.

So, by and large, we have a positive balance of trade with Mexico, and it is growing as a result of NAFTA. Now, that does not mean there are not peculiar problems, such as tomatoes, avocados, and some of the specialty crops remain big problems. But, by and large, it is positive.

Senator COCHRAN. There was some indication to me that our rice industry is having some difficulty, at least the rice milling industry, because of increased exports of rough rice from the United States into overseas markets. There is only about 40 percent operating capacity being utilized of U.S. rice mills right now because of these increases in exportation of rough rice.

Is that something that has come to your attention, gotten to the Secretary's level yet? Is there any policy question here, or is this just a phenomenon of prices being attractive in the global market?

Secretary GLICKMAN. Keith, would you respond to that?

Mr. COLLINS. I would only say that it has been raised. We have heard about that. As we look at the data, the percentage of total exports that go out that are rough is still fairly small, perhaps 15 percent. In fact, they predominantly do go to Latin America. I have heard of other countries besides Mexico that get them, too. But I have not specifically heard much about Mexico recently. We will certainly look at that.

NORTH AMERICAN FREE-TRADE AGREEMENT

Senator COCHRAN. This was to Latin America. It was not just to Mexico. My information was to Latin America. Most other countries who grow rice and mill rice export only their milled rice, as I understand it.

Mr. COLLINS. Yes, sir.

Senator COCHRAN. But the U.S. rice mills have access only to U.S. rough rice. So if the rough rice is going out of country, they fear that they may not have enough to continue milling and doing it at a profit. That is the issue, and I just raised it to see if there was something that could be done and to make sure you had the information.

The other rice issue that I am aware of, which has been brought to my attention, involves the European Union [EU]. There is a quota apparently or an allocation of U.S. rice that has been made under a negotiated agreement. Over \$20 million of U.S. rice could be purchased under this arrangement, but the U.S. rice industry and the companies that would be providing it have not been able to work out any arrangement under which that rice would be sold—like who gets to sell the rice, who gets the \$20 million-plus of new business under this arrangement.

It has also been described to me as something where the Secretary of Agriculture has a role to play in this. I don't know whether or not you are involved in trying to work this out. I am told that

PART 1

57

you could sign a piece of paper and it would solve all the problems. I do not know whether it is that simple or not.

Secretary GLICKMAN. I do not know what that piece of paper is. But I will try to find it this afternoon. [Laughter.]

The only thing I can tell you is that this is a problem. We believe the European Union has failed to implement the two rice tariff rate quotas [TRQ's] that it committed to in 1995. It has to do with us allocating our portion of the TRQ. But until such time as they approve that, we are unable to allocate what we have not used.

And I raised this with my counterpart in the EU. Quite frankly, I think I got the regulatory runaround on the issue. So it is a gnawing problem. It has not been solved. And let me just mention that I plan to seek an interagency meeting on how to proceed on this issue. I have tried to deal with it on a bilateral basis with my counterpart in Europe.

Now, part of the problem, I have to tell you, is that the rice industry is somewhat split on how to allocate the TRQ and how to allocate the licenses. And the EU is using that split as kind of an excuse not to open the quota.

Anyway, the ball is in our court, because we cannot hit it back because the industry kind of will not give us the racquet to hit it back on yet. So we need some degree of unanimity among the industry as well. And the Europeans are taking advantage of this split.

Senator COCHRAN. There is a fear that if we do not use that allocation agreement, we are going to lose it. Someone else is going to end up selling that rice into that market which we had negotiated for U.S. rice producers. So I am glad to know that this does have the attention of your office and that you are working with an interagency group to try to resolve it.

Secretary GLICKMAN. Yes, sir.

PUBLIC LAW 480, TITLE I

Senator COCHRAN. I know that one other potential impact that could have negative consequences on that and other commodity industries is the proposed rescission that you included in the recent submission to cancel some \$50 million of appropriations that we have already approved for Public Law 480, title I. Is this going to have a serious economic impact on agricultural producers or exporters? And why is that request being made?

Secretary GLICKMAN. These, of course, are rescissions of unallocated dollars for long-term sales for market development, and I would ask Steve to talk a little bit about that budget item.

Mr. DEWHURST. It is simply a question of having to come up with some offsets for other things that were in the budget. I think it is important to understand about title I of Public Law 480 that of the \$50 million proposed for rescission, about one-half consists of money carried over from prior years in that program, and the other one-half was a reserve maintained in that program. The rescission does not affect the allocations that were already announced. If I recall, about \$200 million in program that was announced earlier this year is not affected by the rescission. So it is a constraint, in a sense there would be no new commitments, but it will not hurt commitments that were already made.

PART 1

58

Senator COCHRAN. There are other questions on the subject of the Public Law 480 program which I will submit and ask that they be answered for the record, and the nutrition programs, as well. I notice that there is an assumption in the budget submission that there will be legislative changes made in the Food Stamp Program, for example, which would affect the amount of funding that would be required by that program.

Senator Leahy made a very compelling argument against trying to rewrite the farm bill when this legislation gets to the floor, or in any other way, to try to reverse decisions that have already been made on agriculture commodity programs. Well, it seems to me that that argument can also be made for other programs that come under the jurisdiction of the Agriculture Committee. We went through a very long and difficult process to legislate changes under welfare reform, and some of those have affected the requirements for funds in the budget submission that is before the committee today, specifically, the Food Stamp Program.

I do not know how the committee is going to view these proposals, but my reaction is that we are not going to go back in and try to relegislate the welfare reform program. So the assumptions that are being made may be either wishful thinking on the part of the administration or an effort to play politics with those who might be pleased to hear that the administration is requesting more money than we can lawfully spend under the Food Stamp Program, and that is what it amounts to. We do not have the legislative authority to change the program and to provide benefits to those that are not entitled to benefits under the law.

Also, I think we are going to be hard-pressed to find the dollars in the discretionary programs to keep up with last year's levels of funding, and the administration comes in and asks for increases in the discretionary levels of funding, knowing good and well we cannot appropriate at that level. It may look good to somebody out there who is pleased that the administration is asking for increases, but everybody ought to realize that increases are not likely to be made available simply because of the constraints of the budget process or legislation that has already been passed and signed by the President. He signed these bills when they were before him, and is now coming in asking for changes in specific areas to permit the expenditure of more funds.

We will look at those. I am not saying that we will not. I think we have an obligation to consider anything that you submit for our consideration, and I am going to make every effort that we do that, and that we do that in a fair-minded way.

Secretary GLICKMAN. Senator, could I just make one comment?

Senator COCHRAN. Yes.

Secretary GLICKMAN. Obviously, this is part of a Government-wide welfare reform initiative that we have a piece of. The piece, of course, relates to two things, and one is ameliorating a bit the work requirement for able-bodied people from 18 to 50. I think right now you can be on food stamps no more than 3 months in any 3-year period of time, and I think the President's proposal is 6 months out of every year. The other part had to do with legal immigrants. That is an area where there has been, frankly, some bipartisan interest in trying to soften that blow a bit.

PART 1

59

So we put it in here because it is part of the general proposal, and I do not know how much we will be able to get done, whether it is part of the reconciliation process or however else it is handled. Obviously, if these proposals get enacted we have got to find the resources to do it as well. But we felt like we needed to put it in there.

RESEARCH

Senator COCHRAN. The issue of research has been brought up already. Senator Burns and others talked about various aspects of research. I know Senator Byrd mentioned the ARS National Cool and Cold Water Aquaculture Center in West Virginia. We are very happy that we are constructing at Stoneville, MS, the National Warmwater Aquaculture Center, and I was pleased to see the budget contains funds to conduct research at that site. I assume from that that the administration continues to support the completion of that project on schedule.

Secretary GLICKMAN. That is correct.

Senator COCHRAN. I might say that this is a very impressive industry in terms of its economic impact in our State, and on the entire country. It is of critical importance that we do the research necessary in disease analysis and productivity issues. This is a new industry. No one really can predict what the problems are going to be, but we know of some already, and Mississippi State University is engaged in some very important research, and at this center, too, in Stoneville. It will be a clearinghouse for all research in this area, and I am very impressed for the future of the industry that we are going to have this kind of resource center.

There are other research activities on college and university campuses, as well as federally owned facilities under the jurisdiction of ARS, that are doing important work. I do not know of any other area where we have to continue to be vigilant and thoughtful in the way we allocate our resources. But that is an area where we continue to be required to spend substantial sums, in my judgment, to ensure the vitality and health of American agriculture and the nutritious aspects of food and other commodities that are produced on our farms. So we will be working to review all of those requests in your budget on those subjects.

EXTENSION SERVICE

I am disappointed to see that there are what I consider to be substantial cutbacks in funds for the Extension Service in this budget. I am not going to try to get you to explain why or argue for those here at this meeting. But I do not know of many programs that are more popular in the Congress than the extension programs are.

There are a lot of people who derive benefits from extension activities in the small towns and rural communities all across America, and particularly in those States that are more rural than urban. The Extension Service is a very important Government activity. Without it, I do not know how we would get the information and the education benefits and the other activities extension provides to the people in these rural communities who derive these program benefits. So we will look very carefully at that request,

PART 1

60

and I am not optimistic that we will be able to sell a substantial reduction in extension to the other members of this committee.

TAX REFORM

And on the subject of tax reform, I am hopeful that the Department will get involved in helping to argue within the administration and to the President that he should support some of these initiatives that are coming from Congress now to reform our tax system to help ensure that we have profitability on our farms and that we are able to maintain an owner base out there committed to production agriculture. It is less and less attractive for young people to stay on the farm and try to make a living farming. We now have an estate tax law that is confiscatory. It hurts those most who have been frugal, who have worked hard, who have saved, who have tried to preserve the family farm. To then take the farm away from them or force them to sell it to pay Federal estate taxes is to me a very wrong-headed national policy.

We have had 2 days of hearings in the legislative committee on the subject of tax reform, specifically estate tax reform and capital gains tax treatment of sales of our farmlands. There are other issues—income averaging, and just recently we had to fight like crazy to get a change in policy by the Treasury Department on the subject of deferred contracts, where farmers were being taxed in 1 year when they had not even received payment on contracts to sell an agriculture commodity. I do not know of anything that made some farmers madder in my State than that decision.

Well, we have got a 1-year reprieve now, but I hope that the Department of Agriculture will get involved in helping to encourage reforms and decisions on Federal tax policy that will benefit production agriculture and those engaged in it.

Secretary GLICKMAN. I would say on that last issue we were actively engaged with Treasury to get this—well, it was on the alternative minimum tax issue result. And let me just say this: You know, again I bring my prior career with me in this thing. I believe that you are correct that we need to be identifying those mechanisms in a general way which keeps family-sized agriculture alive and encourages young people to stay in agriculture.

I am not endorsing any specific tax proposals, because that is part of a bigger package and relates to revenues and deficit reduction and other kinds of things. But I do agree with you that it is appropriate for us to look at the Tax Code as part of the total picture of how we can keep people in agriculture. And we are engaged in that, I want to assure you of that.

Senator COCHRAN. Senator Specter.

GREEN BAY CHEESE EXCHANGE

Senator SPECTER. Thank you very much, Mr. Chairman.

I join in welcoming Secretary Glickman and his distinguished team to this hearing. I had been here earlier, and Senator Cochran said you would run until about this time. I hope I have not delayed anybody. I think from the tenor of the questioning when I came in, you are still hard at work on very important subjects.

I thank you very much, Mr. Secretary, for coming to northeastern Pennsylvania a couple of weeks ago and bringing Mr. Col-

PART 1

61

lins and others on a very serious problem of milk pricing for the farmers nationally, but especially in northeastern Pennsylvania, where the price of milk has dropped precipitously in the immediate past. And I thank you for the attention which you have given to the issue of pricing and the question as to whether the price is artificially low because of the calculation of the price of cheese as it is impacted by the Green Bay Cheese Exchange.

The information which I got from Mr. Collins and you about an increase of 10 cents on the price of cheese would amount to \$1 per hundredweight increase for milk, and the meeting which we had was a very, very important meeting. And obviously, I know about the consequences of it more than you do unless your clipping service is as good as mine.

Secretary GLICKMAN. I saw the first day of clippings, but that was it.

Senator SPECTER. I have an instinct that you do not have the clipping service in northeast Pennsylvania as good as I do. If you do, your clipping service is extraordinary.

Secretary GLICKMAN. If we do, I am spending too much money on clipping services. [Laughter.]

Senator SPECTER. Knowing you, Mr. Secretary, I would say your talent is extraordinary, but I would tell you that it had a very, very beneficial impact to bring the Secretary up, and I had a request by Tobyhanna to bring the Secretary of Defense up. Everybody in the area now wants a Secretary for their relevant problem, so you have set quite a standard for me in northeastern Pennsylvania. [Laughter.]

MILK PRICING REEVALUATION

As you know, the sense-of-the-Senate resolution was passed 83 to 15 encouraging a reevaluation of the price of milk based upon the formula for cheese, and my first inquiry to you is what have you found on a survey of the cheese market nationally?

Secretary GLICKMAN. Well, I am going to ask Keith to respond. I would say that the trip to Pennsylvania was a particularly useful one for me, and I think for Mr. Collins, as well. The size of the crowd was unexpected. We had 500 to 600, 700 people there.

Actually, as you know, a couple of weeks before the meeting we started the process of evaluating alternatives. We have gotten about 80 comments in so far, and they keep coming in about five or six a day. The expiration date for that is about a month from now. However, the team is in the process of trying to find options, and I would like options all the way from the development of the futures market to our own self-determination of price without going outside, which is the way we used to do it, by evaluating processors.

So perhaps you might want to go through that.

Mr. COLLINS. We are really proceeding on two fronts. One is to deal in the regulatory sense with our basic formula price and replace the cheese exchange.

The second is the point of your question, to collect cheese price information.

PART 1

62

NATIONAL CHEESE EXCHANGE

Senator SPECTER. What is the first front again, Mr. Collins?

Mr. COLLINS. To deal with the potential for replacing the National Cheese Exchange price in the formula that we use to construct what is called the basic formula price. That is a question that is bound up in the potential for a formal rulemaking and not formal rulemaking. As you know, the sense-of-the-Senate resolution asks us to proceed using the Secretary's authorities consistent with the law. I would say consistent with the law does have some impact on us because we do have another dairy policy that has been litigated recently where it has been suggested that we acted in an arbitrary and capricious way. We know that whatever we do with respect to cheese prices and the basic formula price, we want it to be able to withstand being sued.

So we have gone through this comment period that the Secretary mentioned. The comments that we are receiving, about 80 of them in roughly a 2-week period, we are sorting through them to look for evidence on two fronts. The first would be flaws with the Cheese Exchange price itself, of which there already is a body of evidence from the academic community and elsewhere. The second then is trying to determine what would be a good replacement for the National Cheese Exchange price.

If we are going to replace it using the Secretary's discretionary authority and withstand a court challenge, we would have to have something that clearly remedies the defects that we identify in the National Cheese Exchange price. So that is the process we are going through with the comment period and our own internal analysis.

The second front is to collect cheese price information directly from the industry. And on that issue we have delayed our collection effort by several weeks at the request of the cheese industry. They asked to come in and meet with us because they were concerned about the approach we were using to collect the information. We met with them a couple of weeks ago, and we are going to proceed next week. We were going to proceed in the first week of February, but we got delayed. We are going to begin in the first week of March, a national effort to collect cheese, mainly because we wanted to have an opportunity to respond to the cheese industry.

Senator SPECTER. A national collection effort on cheese prices?

Mr. COLLINS. On cheese prices, yes, sir. We do not want to collect cheese.

Secretary GLICKMAN. The other thing, of course, is working with the Coffee, Sugar, and Cocoa Exchange, which we are still doing, to try to deal with this issue of a program either of futures or options markets to somehow have a definable futures price out there.

Mr. COLLINS. Also as a possible successor to the National Cheese Exchange itself. The cheese industry would like to relocate or change, close that exchange, open a new one, and we have offered our resources to help whatever exchange might want to start a cash market for cheese.

Secretary GLICKMAN. In doing so there may be a need for some appropriated funds in some of these areas for us to help do that. We will talk to you about it. Particularly in the options area. But

PART 1

63

as you know, we used to set this formula price differently in years past, and we did not use the Cheese Exchange before. There are alternative methods of doing it. One of the things we are exploring is to go back to the way we did it before. I do not know whether it will have much of an effect over the long-term price of the basic formula price, but there may be less volatility using that formula, and that is something that they are looking at right now, as well.

I want to get away from that market, as I told you before, and I told Senator Kohl when he was here, the nature and thinness of that market is unacceptable because cheese is such a big part of the setting of milk prices, through the basic formula price. But I was sued recently in the area of something called the Northeast Dairy Compact, where it was argued that I made a decision that was not based on a complete record. So that case is still in litigation, and I cannot really comment much further on that. I have got to make sure this record is complete so that whatever we do is defensible it is going to have a monumental economic impact; but, we are moving in the right direction and I know your interest in it. In fact, your interest has got this thing moving from second gear to first gear.

Senator SPECTER. First gear, Mr. Secretary?

Secretary GLICKMAN. I am sorry, third gear, fourth gear, whatever the fastest gear is, Senator Specter. [Laughter.]

Senator SPECTER. Mr. Secretary, we are interested in overdrive. [Laughter.]

I am a little surprised, and I had—this is as good an occasion as any to make the personal reference. Your grandfather, Jay Glickman, would be surprised to have the gears wrong.

Mr. Chairman, my compliments may be excessive to the Secretary or may not be excessive to the Secretary, but I have a deep bias in his favor because my father and his grandfather did business together in Kansas in the thirties. And their business activities included Jay Glickman, who was in the junk business and my father was in the junk business.

Secretary GLICKMAN. We now call it the recycling business. [Laughter.]

My father used to say if it was junk it would not have sent you to college and law school.

Senator SPECTER. I call it the junk business. It sent me to law school, and it was a tremendous incentive to get out of it. [Laughter.]

NATIONAL CHEESE EXCHANGE

Without going into any more detail except to say there were big trucks involved, my father had a big truck which I learned how to drive at an early age, and I knew the difference between first and second gear. [Laughter.]

I do not think Secretary Glickman spent enough time in the business. [Laughter.]

Secretary GLICKMAN. Duly noted. [Laughter.]

Senator SPECTER. But on the subject of when, Mr. Secretary, as you know, my concern about immediate action, we were there on February 10, and I was hopeful that we would have change by the 11th, and then by the 14th—we got the resolution passed on the

PART 1

13th, and I know that you are doing collateral work on the comments, but as already noted, there is a collateral way for you to do it, and that is on your unilateral authority. And I understand that you can be sued all the time on the grounds of arbitrary and capricious. That is the last refuge of the plaintiff on trying to upset something, to make a contention that it was arbitrary and capricious, because there is nothing which an administrator does that can withstand being arbitrary and capricious. It is easy to say, but very, very difficult to prove.

Secretary GLICKMAN. Well actually, in the one case it has basically been stated that I was arbitrary and capricious. I have been given an opportunity to become unarbitrary and uncapricious. Part of it has to do with this horrendous complexity of dairy pricing, which makes it difficult to act as clearly as I can act in corn and wheat and soybeans and other things.

I do not want this thing to delay, and I am not worried about getting sued. I am worried about having the record there so I can prevail. We are going to get sued probably no matter what we do.

Senator SPECTER. Well, it is easy to allege arbitrary and capricious. It just takes one line on the typewriter. But it is very, very hard to prove in the litigation field and very difficult to sustain that. And I know you are looking for an evidentiary base, and my question, maybe to Mr. Collins, is how far have you gotten on finding other pricing which would suggest a difference with what the Cheese Exchange has set as the price?

Mr. COLLINS. To be quite frank, not very far at all. The difficulty is that we are trying to determine a price of cheese. There is only one organized market in the United States in which a price of cheese is determined. Virtually all cheese contracts that take place between private buyers and sellers off of that market use that market as a benchmark. So where do you go for new information other than that market? That is the dilemma that we have found.

We also have many people who are concerned about this market and criticizing this market, but the criticisms are not coming from the participants in the market, neither the buyers nor the sellers, who both believe that they have a market that is representative and accurate. In that kind of an environment, it has been very tough for us to find a clear-cut alternative that is superior in representing supply and demand for cheese in the United States. So we are continuing to look, but it has not been easy.

MINNESOTA AND WISCONSIN PRICE

Secretary GLICKMAN. Now, I would say before the Cheese Exchange was used, there were alternative methods out there that we used, and perhaps you might explain what those methods were. So it is not as if there are not other options.

Mr. COLLINS. Yes; what the Secretary is referring to is that in the past, prior to May 1995, we used to survey processors of grade B milk in the States of Minnesota and Wisconsin and ask them what they paid for milk and what they thought they were going to pay for milk. And that was the price that we used to set the absolute floor for all the different classes of milk in the United States.

Secretary GLICKMAN. Called the M-W price.

PART 1

65

Mr. COLLINS. It was called the M-W price. It did not involve cheese prices at all. It was what was called the competitive pay price for milk.

In May 1995, however, is when we switched to using both a competitive pay price and an adjuster. The adjuster utilizes the National Cheese Exchange price.

Secretary GLICKMAN. Now, why did we do that?

Mr. COLLINS. We did that because—

Secretary GLICKMAN. And I am interested in knowing, too.

Mr. COLLINS. Our statisticians who collect and tell us what that price is became increasingly convinced that they could not report a reliable and accurate price. The number of grade B plants was waning. There would be fewer and fewer of them, and the ability to get grade B plant producers to tell us what they thought they were going to pay for milk in that month was just falling apart. They were not reporting. So our statisticians told us they thought that the price series had become inaccurate. That is why we held a formal hearing. We held a national hearing and adopted the process we have now using formal rulemaking.

Senator SPECTER. We have a vote at 12:30, and I know the chairman has been very patient and this is a very complex subject. Mr. Chairman, I wonder if we might explore the possibility of having a separate hearing on this subject. I know how crowded your schedule is. If I have to take the lead to preside, if the chairman cannot do so, this is a subject which I would like to move on before we leave for the recess, because there are a lot of people beyond Pennsylvania who are interested, and I wonder if we might not be able to put together such a hearing in the next 2 or 3 weeks.

Senator COCHRAN. Senator, let me just say that I would be glad to make every effort to get that done. I think that is a good idea. It is timely. People are worried about what is going to happen. And in the South, we want to be sure it is fair to our region, too. Just because we had not thought up the amendment that you thought up or pushed on the floor as successfully as you did, we have a big stake in this too.

GREEN BAY CHEESE EXCHANGE

Senator SPECTER. Well, Mr. Chairman, the amendment that I pushed, or resolution that I pushed, arose out of my discussions with the Secretary and Mr. Collins and we were working on this. And this is the kind of an issue that comes to a head, and I have a sense that if we scheduled a hearing in 2 or 3 weeks it would bring a lot of people together.

I had moved to have a hearing on the Antitrust Subcommittee on that Friday, and I did not do so for a number of reasons. But it created a lot of interest in a big hurry about having an antitrust hearing as to whether there was collusion or some impropriety in the Green Bay Cheese Exchange, and when a hearing is scheduled there is a lot of focus of attention and a lot of these questions would then be answered. So I thank you for your willingness to do that, and we will be eager to set that up.

Senator COCHRAN. I may ask Brett Favre to be the leadoff witness. He is the quarterback of the Green Bay Packers, and he is from Mississippi. [Laughter.]

PART 1

66

Senator SPECTER. We would be sure to have a balanced view.
[Laughter.]

Senator COCHRAN. Well, Senator, thank you very much.

Senator SPECTER. Thank you very much.

SUBMITTED QUESTIONS

Senator COCHRAN. Mr. Secretary, I have other questions, and other members do as well. Senator Faircloth and Senator Coverdell have asked me to submit questions for your response, which we will do. We hope you will be able to answer those, and the other questions that other members might submit as well, in a timely fashion.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

COUNTY OFFICE CLOSURES

Question. Mr. Secretary, it is my understanding that the President's budget assumes the elimination of 1,000 Farm Service Agency (FSA) county office employees during fiscal year 1998. Further, over the following four fiscal years, the budget assumes the elimination of an additional 4,000 county office employees. The President's budget assumes that 5,000 county employees will be cut during fiscal years 1998–2002. Is this correct?

Answer. In the fiscal year 1998 Budget proposal, a reduction of 2,119 staff years, of which 269 are Federal staff years and 1,850 are non-Federal staff years, is projected for fiscal year 1998. Current fiscal year 1997 staffing levels are 6,136 Federal staff years and 11,729 non-Federal staff years. An additional 5,000 non-Federal staff-year reduction is anticipated from fiscal year 1999 through fiscal year 2002, so the county office reduction is actually 6,850 rather than 5,000.

Question. If the information that I have is true, then by fiscal year 2002, the budget proposes that we will have reductions in federal FSA employees of 21 percent since fiscal year 1993, and reductions of county office employees of over 67 percent over the same period. Why are there disproportionate cuts in county office employees?

Answer. The FSA and other USDA agencies have made significant staffing reductions over the past several years. From fiscal year 1993 to the current fiscal year 1997, FSA reduced total staffing 21 percent. These reductions reflect an overall 19 percent reduction in Federal staff years, including 27 percent at Headquarters, and a 22 percent reduction in non-Federal staff years.

Fiscal year 1998 and the years through fiscal year 2002 reflect major proposed decreases in FSA non-Federal staff years. The fiscal year 1998 Budget proposes a reduction of 2,119 staff years for fiscal year 1998, of which 269 are Federal staff years and 1,850 are non-Federal staff years. It should be noted that although non-Federal staffing is being reduced by the programmatic impacts of the 1996 Act, the projected fiscal year 1998 Federal workforce of 5,877 includes approximately 2,265 employees at the county level performing Agricultural Credit program workload for direct and guaranteed loans. Furthermore, there are an additional 1,463 Federal FTE's at the State office level, including personnel that support farm credit activities as well as CCC activities, that perform program oversight, supervisory, and other support functions. In addition, over 260 Federal staff years are dedicated to providing common administrative support functions to the Foreign Agricultural Service and to the Risk Management Agency since, under USDA's reorganization, they no longer have administrative support personnel of their own. There is concern as to the magnitude of these reduced FSA county staffing levels by 2002 relative to projected Agency workload beyond 1998 because we want to assure service delivery to producers.

Question. It was my understanding that the reason the Department proposed a transfer of \$51 million in unused Conservation Reserve Program (CRP) balances to FSA salaries and expenses to finance buyouts in fiscal year 1997 was to avoid massive layoffs in the future. How do you propose to prevent reductions in force in the

PART 1

67

future years as buyouts become less attractive to employees and more expensive to taxpayers?

Answer. You are correct that these funds were needed in order for FSA to achieve the staff-year reductions estimated to be necessary in early fiscal year 1997 to downsize to the level appropriate to the anticipated workload of the 1996 Act and to stay within available fiscal year 1997 funding resources. Without this transfer to cover separation costs, the Agency would have been forced to conduct a much greater RIF during fiscal year 1997.

FSA does intend to continue to offer buyouts in an effort to minimize involuntary separations. However, not all reductions can be achieved through buyouts since the number of remaining buyout candidates is insufficient to meet the estimated 2,119 staff year reductions included in the fiscal year 1998 budget. It is also not likely that FSA will avoid future year reductions-in-force, given its budget targets through fiscal year 2002.

Question. Are you proposing reductions in force, if necessary, to reach these staff-year ceilings?

Answer. Yes, after FSA offers a voluntary buyout, then we plan to approve the use of RIF's to meet reduction targets.

Question. Has the Department asked the State Directors of FSA to provide a list of proposed county offices that could be closed in each of their States? If so, please provide to the committee the lists.

Answer. No specific plans or lists have been approved by my office concerning the number or location of FSA field office closures. Any preliminary office closing numbers reported reflect internal agency contingency planning and are not approved USDA plans. We intend to consult fully with Congress regarding any office closures before any actions are undertaken.

EMERGENCY CONSERVATION PROGRAM/DISASTER CONTINGENCY FUND

The Administration proposed no funding for the Emergency Conservation Program (ECP). Instead, a new \$5.8 billion contingent reserve for emergency funding requirements for various disaster assistance was proposed. I understand that this fund would be available to the President for disaster relief purposes and would be limited to 7 disaster assistance program.

Question. Does the Administration have a problem with the way disaster assistance has been handled by Congress? Why should we set up a contingency reserve fund?

Answer. While the Congress has been willing to respond to the needs for major disaster assistance, it has not always been able to enact measures to provide assistance in the most timely way. Even the most responsive action by Congress through supplemental appropriations following a disaster may not be timely if the need arises when the Congress is not in session. While some funds for non-emergency work related to disaster assistance are generally provided (and are requested in this budget) through regular appropriations, there is no way to truly assure a timely response to unanticipated disasters without a contingency funding mechanism.

The President's proposal will allow for the use of the contingency reserve funds through specified disaster assistance programs based on actual need. This will allow for appropriate available programs to be used to respond to a particular disaster. The proposal does provide for a 15-day period before release of funds after the President notifies the Congress. This will allow the Congress time to respond, but also assures that the Government will be able to assist communities stricken by a natural or other disaster in a timely way.

EMERGENCY CONSERVATION PROGRAM/DISASTER CONTINGENCY FUND

Question. What assurance would there be that USDA's emergency conservation and watershed prevention needs would be addressed, and not under funded to provide more funding for the five other disaster programs competing for contingency funds?

Answer. In our view, the \$5.8 billion proposal should be more than sufficient to handle all the Federal emergency work that might be needed by any of the disaster programs competing for contingency funds. It certainly would not be this Administration's intent to under fund one emergency account at the expense of another. Rather, having a central contingency reserve fund will enable Federal agencies, including FSA and NRCS, to better prepare and respond more quickly to natural disasters.

PART 1

68

CONTINGENCY FUND

The Administration proposed no funding for the Emergency Conservation Program (ECP). Instead, a new \$5.8 billion contingent reserve for emergency funding requirements for various disaster assistance was proposed. I understand that this fund would be available to the President for disaster relief purposes and would be limited to 7 disaster assistance programs.

Question. Why didn't the Administration include APHIS emergency activities as an eligible activity for the emergency disaster contingency fund?

Answer. The Department already has authority to fund extraordinary emergencies. We usually use the Commodity Credit Corporation (CCC) funds for this purpose.

REVENUE INSURANCE PILOT PROGRAM

Question. Mr. Secretary, you have proposed to make revenue insurance available nationwide. Currently, revenue insurance is a pilot program for certain crops in specified states. What has been the participation rate in this pilot program?

Answer. The Federal Crop Insurance Corporation developed the Income Protection—IP—Plan of Insurance. For the 1996 crop year, IP was available for corn, cotton, and spring wheat in 30 counties. For 1996, about 998 IP policies were purchased, covering about 218,000 net acres with total premiums of about \$3.4 million. For the 1997 crop year the IP pilot program was expanded and is available for corn, cotton, grain sorghum, soybeans, spring wheat, and winter wheat in 159 counties. Data for the 1997 crop year will not be available until late in the calendar year.

Under the authority of the Act, FCIC approved the Crop Revenue Coverage—CRC—and Revenue Assurance—RA plans developed by the private sector. For the 1996 crop year, CRC was available for corn and soybeans for all Iowa and Nebraska counties. For 1996, about 91,000 CRC policies were purchased, covering about 10.2 million net acres, with total premiums of about \$139.8 million. For the 1997 crop year, the availability of CRC for corn and soybeans includes all counties in the States of Colorado (corn only), Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, Ohio, Oklahoma, South Dakota, and Texas. In addition, for the 1997 crop year, CRC was made available for:

Cotton

Arizona—all counties
Georgia—all counties
Oklahoma—all counties
Texas—selected counties

Grain sorghum

Colorado—all counties
Nebraska—all counties
Oklahoma—all counties
Kansas—selected counties
Missouri—selected counties
South Dakota—selected counties

Spring wheat

Minnesota—all counties
Montana—selected counties
North Dakota—selected counties

Winter wheat

Kansas—all counties
Michigan—all counties
Nebraska—all counties
South Dakota—all counties
Texas—all counties
Washington—selected counties

FCIC approved the RA plan of insurance for corn and soybeans in all Iowa counties for the 1997 crop year. CRC and RA plans of insurance will only be available in counties if an existing multiple peril crop insurance program is also available for the crop.

Question. What are the estimated losses for this program in the pilot stage?

Answer. As of March 8, 1997, reinsured companies had reported losses of \$48.5 million for Crop Revenue Coverage for corn and soybeans in Iowa and Nebraska. The overall program loss ratio was 0.34. Losses paid to producers who purchased coverage other than catastrophic under the Actual Production History yield-based plan had been paid \$25.7 million, for a loss ratio of 0.29. By this time, reporting of losses normally is over 95 percent completed.

On that same date, losses of \$55 thousand and \$178 thousand had been reported for corn and wheat, respectively, under the Income Protection coverage plan. The respective loss ratios were 0.07 and 0.13. No losses had been reported for cotton under this revenue insurance plan. Since Income Protection is sold only in specific counties and not entire states, a comparable loss ratio for the APH coverage plan is not readily available.

NATIONWIDE EXPANSION OF REVENUE INSURANCE

Question. What is the estimated cost to extend this pilot program nationwide?

PART 1

69

Answer. The Administration is seeking legislative authority to offer revenue insurance nationwide. Presently, the Federal Crop Insurance Act authorizes only a pilot program of revenue insurance under direct Federal sponsorship. The plan or plans that may be offered are not yet known. Presumably, Crop Revenue Coverage would be one such plan. However, it probably does not meet the needs of all producers. Thus, some alternative plan similar to Income Protection or Revenue Assurance may be needed.

Most of the additional cost is expected to be due to greater participation induced by products that better meet producer's needs than does the standard yield-based coverage. To date, subsidies have been limited to the amount that would be paid if the producer had purchased the Actual Production History (APH) coverage plan. This cost generally is less than the APH plan for IP and RA. For CRC, the cost of the producer premium subsidy is the same as the APH plan, and an average of 9 percent extra is paid for administrative and operating expenses on the portion of the CRC premium that exceeds the premium that would have been paid under the APH plan. In general, the reimbursement to reinsured companies is slightly more than 2 percent greater than if the policy had been sold under the APH plan rather than CRC.

The cost thus depends upon several factors: the increase in total participation and the mix of products that producers purchase. Higher sales of CRC will increase costs; greater market penetration by products such as IP and RA will reduce costs.

For the purpose of the budget, FCIC assumed an increase in total participation on the order of 5 percent. It further assumed that most of the increase would be in CRC. To offset the costs associated with these assumptions, FCIC proposed that the statutory loss ratio target be reduced and made other program modifications. A part of the costs is offset by changes in other mandatory programs. The proposal is budget neutral.

CROP INSURANCE SAFETY NET

Question. Some farmers have expressed concern that no "safety net" exists for those that can't afford crop insurance or that no crop insurance coverage exists for a specific crop. Is there some way to address this concern?

Answer. Free catastrophic insurance coverage (50 percent insurance coverage indemnified at 60 percent of the maximum price) is available wherever crop insurance is offered. Producers are responsible for a minor \$50 processing fee for each crop. The fee is waived in instances when limited resource producers can not afford to pay it. Where crop insurance is not available for a crop, a noninsured assistance program provides coverage equivalent to catastrophic insurance coverage at no charge when a county suffers a widespread loss. Other alternative programs, such as the group risk plan, provide low cost coverage alternatives in many areas.

ADMINISTRATIVE EXPENSE REIMBURSEMENTS

Question. Mr. Secretary, when the administration proposed and the Congress enacted crop insurance reform, the savings from emergency ad hoc disaster relief payments provided through appropriations acts were used as PAYGO offset.

Now, for fiscal year 1998, the Administration's request indicates that this Committee is facing a new discretionary funding increase of \$203 million to reimburse private companies for crop insurance delivery expenses. This kind of supports my position at the time we enacted crop insurance reform, that it sounds too good to be true—in terms of avoiding additional costs in the future.

Why weren't the paygo emergency ad hoc disaster savings sufficient to fully offset the costs of this proposed program reform at the time it was enacted?

Answer. Prior to fiscal year 1995, the administrative and operating expenses associated with program delivery were paid from discretionary funds. The administration's budget for fiscal year 1995 requested a discretionary appropriation for this purpose. Continuation of the discretionary appropriation at baseline levels was assumed in the reform package. The appropriations committees did not fund this request. The authorizing committees were able to use paygo emergency ad hoc assistance savings to fully fund delivery expenses for fiscal years 1995 and 1996 and about 30 percent such expenses in fiscal year 1997. All such expenses for fiscal year 1997 ultimately were funded under the mandatory baseline with savings from other programs identified during the 1996 revisions to the Farm Bill. Under the reform package as enacted, approximately one-half of delivery expenses was to be paid from discretionary funds beginning in fiscal year 1998.

The request for \$203 million for fiscal year 1998 is consistent with the original reform proposal made by the administration and with the law as enacted. It is a

PART 1

70

request to restore the discretionary baseline that existed in fiscal years 1994 and prior.

Question. Since this cost was considered to be mandatory and is now discretionary, what would be the impact if the requested funding increase is not provided?

Answer. The General Accounting Office—GAO—recently concluded an audit of expenses associated with the delivery of the crop insurance program. The GAO found that the current reimbursement rates exceeded delivery expenses. This suggests that there are opportunities to achieve savings—\$203 million to \$150 million—in the reimbursements paid to companies without having an adverse effect on program delivery. However, if the amount requested from the discretionary account for administrative expense reimbursements is not provided, this would drastically impact the reinsured companies and their ability to deliver crop insurance products. If Congress were to appropriate anything less than the \$203 million, we would have to negotiate with the companies on how that money will be allocated. There is no other alternative in place.

Question. If an increase of \$203 million is required for fiscal year 1998, what additional discretionary funding will be required under current law in future fiscal years?

Answer. The \$203 million increase in discretionary funding for fiscal year 1998 is primarily due to the transfer of responsibilities and funds for the payment of sales commissions of agents. Consistent with the Federal Crop Insurance Reform Act of 1994, as amended, no amount can be paid from the insurance fund for sales agent commissions for the years 1998–2001. Under current law, it is estimated that in fiscal year 1999, the total request for discretionary funding will actually decrease, due to an estimated decrease in premium. For fiscal year 2000—FY 2007, it is estimated that premium levels will continually rise, therefore, slight increases in the funding requested for sales commissions of agents would occur. The amount of funding required for Administrative and Operating Expenses are only expected to increase due to inflation and pay cost increases.

REVENUE INSURANCE

Question. The Chairman of the Senate Agriculture Committee, Senator Lugar, has raised the question about the taxpayer burden of expanding crop revenue insurance. While it is desirable for producers to be able to purchase additional revenue protection, to what extent does the Department believe a Federal subsidy is required to make this commercially viable?

Answer. For many years, public policy had provided a 100 percent subsidized revenue protection plan to agriculture under the target price system. This subsidized program was eliminated under the Federal Agriculture Improvement and Reform Act of 1996. The issue now is to define the safety net that will be provided to agriculture in place of this program, and the extent to which it will be subsidized.

The issue of “subsidization of revenue insurance” must be carefully defined to assure that producers are fairly treated relative to the yield-based program and to assure there are no unintended consequences. There are many forms of revenue insurance. Many cost less than the standard yield-based coverage due to the tendency of prices and yields to change in different directions—i.e., low yields tend to be associated with high prices and vice-versa. The cost can be greater in areas having little benefit from this “natural hedge.” One form of revenue insurance—Crop Revenue Coverage—always costs more than the standard yield-based coverage. This is due to the “replacement cost” feature; that is, payment of lost production at the higher of the planting period price or the harvest period price. Because of this feature, Crop Revenue Coverage always will pay a greater indemnity than the standard yield-based coverage and therefore requires a higher premium.

Under current law, the subsidy to the producer for the premium used to determine the loss ratio is limited to the amount that would be paid had the producer purchased yield-based coverage. The subsidy for administrative and operating expenses of reinsured companies for products such as Income Protection and Revenue Assurance has been limited similarly. Only Crop Revenue Coverage has a higher cost for the administrative and operating expenses of reinsured companies, and that is limited to a small percentage (currently 9 percent, subject to more analysis of actual costs for delivery of this product) on the portion of the premium that exceeds the premium due under yield-based coverage.

The principal cost associated with expansion of revenue coverage is due to increased participation as producers respond to products that may meet their needs better than the standard yield-based coverage. This is not a subsidy of revenue insurance per se since subsidy would be authorized under the law if these producers had purchased the yield based coverage. The only additional subsidy that can be re-

PART 1

71

garded as due directly to revenue insurance is the small additional amount paid on a product such as Crop Revenue Coverage.

Current treatment of the different revenue policies creates inequities among them in terms of compensation for delivery expenses. Consider, for example, a policy of Revenue Assurance that generates 80 percent of the premium of yield-based coverage. This policy would generate 20 percent less compensation for delivery expenses. The frequency of loss adjustment may be slightly lower under such a policy than under the standard yield-based coverage, but the difference does not equate to 20 percent. Allowances for delivery expenses of Crop Revenue Coverage always will exceed the yield-based coverage. Such discrepancies may have the unintended consequence of encouraging greater efforts to market higher priced products.

FUNDING OF SALES COMMISSIONS OF AGENTS/DELIVERY EXPENSES

Question. The Administration is proposing legislative changes to reduce the reimbursement rate for delivery expenses, which I understand would lower the discretionary requirement from \$203 million to \$149 million. It is also proposing to make a portion of the overall reimbursement rate, not just the sales commission portion, discretionary and subject to appropriations. What would be the impact of this latter proposed change on discretionary appropriations requirements in fiscal year 1998 and future years and what is the rationale for making an increasing portion of these costs discretionary?

Answer. The 1998 budget includes an Administration proposal to reduce the administrative expense reimbursement paid to reinsured companies. As you know, under current law, the sales commissions have been paid by the FCIC Fund, which is a mandatory spending account, although still subject to appropriation.

However, current law requires that the sales commissions be treated as discretionary spending beginning in 1998.

The Department of Agriculture's (USDA) proposal does not specify a particular amount to be paid for sales commissions but reduces the overall reimbursement rate used to determine administrative expenses paid to the private insurance companies. The proposal would lower the reimbursement rate from 28 percent of premiums sold for multiple-peril crop insurance to 24.5 percent in 1998. The proposal specifies that 10.5 percentage points of the proposed rate be considered discretionary spending. This proposal achieves a reduction in discretionary spending of \$52,852,000 from current law to \$149,719,000 for 1998.

The USDA wanted the savings on the discretionary side of the budget to reduce the burden of the shift to discretionary spending that is required by current law. While we wanted to reduce delivery expenses, we did not want agents to bear more than a fair share of the reduction but wanted this to be a matter of negotiation between the agents and their companies, without our involvement. Therefore, our proposal provides for eliminating the distinction in current law that subjects only the sales commissions portion of delivery expenses to discretionary spending ceilings.

Question. Since the Subcommittee will, at a minimum, need to offset the cost of any increase provided, what funding reductions would you recommend in USDA's existing programs to offset the increase requested for crop insurance delivery expenses?

Answer. To offset the additional delivery expenses involved in expanding the revenue insurance program, the Department proposes to reduce the reimbursement rate used to determine administrative expenses paid to reinsured companies. This proposal would lower the rate from 28 percent to 24.5 percent in 1998. RMA also proposes to reduce the loss ratio from its current 1.10 level to 1.085 in 1998 and 1.06 thereafter. The reduction in the loss ratio partially offsets the cost of expanding nationwide revenue insurance. The Department is also coordinating efforts to further offset this proposal.

RURAL HOUSING LOAN LEVELS

The Section 502 Rural Housing fiscal year 1996 program level was \$1 billion. The 1997 program level was reduced to \$585 million due to higher interest rate changes in the economy. The fiscal year 1997 appropriated loan levels were based on the overly optimistic fiscal year 1997 President's loan levels.

Question. Are the proposed fiscal year 1998 loans levels more realistic than the levels the Administration submitted for fiscal year 1997 so that a reduction in the program level will not occur in fiscal year 1998?

Answer. The Section 502 Direct Program is the most sensitive to interest rate variations for a number of factors. Any change in interest rates can effect the subsidy rate and therefore the program level. In fiscal year 1997, the budget authority appropriated for the RHS single family housing program was \$83 million. It was

PART 1

72

intended to support a loan level of \$1 billion. However, the subsidy rate was based projected long-term interest rates of 5.53 percent. By the summer of 1996, the trend of falling interest rates had changed directions and it was realized that the forecast would be much lower than the execution rate which eventually turned out to be 7.11 percent. The impact of this increase lowered the Section 502 program level to \$585.3 million nationwide, or 52 percent of what Congress authorized as a program level when appropriating \$83 million budget authority. For fiscal year 1998, we are requesting \$128 million in budget authority with forecasted interest rate of 6.16 percent and subsidy cost of 12.81. We feel this is a realistic assumption based on the current economic trend, however, all direct loan programs will continue to be at risk given the dynamics of the current economy.

Question. Please explain the necessity of the Administration's proposal to transfer budget authority from HUD to the Rural Housing Service in order to administer section 8 Housing Assistance Payment contracts which are beginning to expire?

Answer. This transfer is in the best interest of the taxpayers. Rental Assistance (RA) administered by RHS is less expensive. Cost savings are due to differing Agency approaches for increasing the amount of the contract upon renewal. RA contracts are increased (with Agency approval) based on a determination of project costs, while Section 8 contracts were originally based on rents in the broader market. These Section 8 contracts are automatically increased through the application of the Annual Adjustment Factor, which in the past years led to subsidized rents which are sometimes in excess of the market rents for the area.

Under the fiscal year 1998 Budget, a one unit, five year Section 8 contract costs \$27,630. For RA, it cost \$14,324. Therefore, over five years, renewing the 3,665 units would cost \$52 million as RA units and \$101 million as Section 8 contracts: This would result in a five year savings of \$49 million.

Question. Is this proposal budget driven or will it assist Rural Housing Service to better satisfy the rental assistance renewal contracts for its customers?

Answer. Both. First, the cost savings to the taxpayers are significant. Under the fiscal year 1998 Budget, a one unit, five year Section 8 contract costs \$27,630. For RA, it cost \$14,324. Therefore, over five years, renewing the 3,665 units would cost \$52 million as RA units and \$101 million as Section 8 contracts: This would result in a five year savings of \$49 million.

Additionally, management fees will be reduced by approximately \$2 per unit on a monthly basis by eliminating HUD requirements for these projects. Savings to project owners/operators could be passed on in the form of lower project rents and thus reduce rental assistance needs.

FARM CREDIT PROPOSAL

Question. Mr. Secretary, in your opening statement you say that USDA will be proposing legislation to improve farm credit services, What is your proposal to improve farm credit services mentioned in your opening statement, Mr. Secretary?

Answer. We are proposing to provide some latitude for assisting those former borrowers who have received a debt forgiveness in the past. The 1996 Farm Bill banned such assistance, except for operating loans to ongoing borrowers whose loans have been restructured. We believe that the Farm Bill went too far in denying former borrowers a second chance. It is a stricter standard than even bankruptcy imposes. Our proposal would simply provide our borrowers with the same opportunity for rebuilding their credit record, in accordance with the standards of conventional lenders, and being able to return to us for farm loan assistance in times of need.

We are also asking for authority to conduct pilot programs, using farm credit program funding, to test innovative methods for meeting program objectives. For example current law does not permit using guaranteed loans for leases, which could be an effective means to assist beginning farmers. This could be tested on a pilot basis and, if successful, consideration could be given to authorizing a nationwide program.

Two other provisions of the proposal would make the guaranteed program more attractive to private lenders: allowing operating loan funds to be used for real estate installments and providing some flexibility for waiving the borrower training requirement.

We also are asking for some technical changes relating to homestead protection, and the shared appreciation agreements that apply to loan writedowns; as well as the elimination of the softwood timber program and net recovery buyouts, both of which are duplicated by other, broader based authorities.

NUTRITION EDUCATION AND TRAINING (NET) PROGRAM

The welfare reform bill eliminated permanent funding for the Nutrition Education Training (NET) program, as requested by the Administration. A \$10 million perma-

PART 1

73

ment annual appropriation had been provided for NET in previous years. This scored as PAYGO savings, but left the program unfunded for fiscal year 1997. In December of last year, the Administration reprogrammed \$3.75 million from the School Meals Initiative line item to avoid a disruption in the NET program. Now, the Administration's fiscal year 1997 supplemental/rescission package includes legislative language to reduce the \$100 million in mandatory funding provided for emergency food assistance commodity purchases by \$6.26 million to make this funding available for the NET program.

Question. Given the fact that grants to states are available through the school meals initiative and you have reprogrammed funds to make available \$3.75 million in fiscal year 1997 funding for the NET program, why is it a priority to provide additional supplemental funding to restore NET program funding to the fiscal year 1996 level?

Answer. We were able to reprogram the \$3.75 million in Team Nutrition money to NET, by not starting important Team Nutrition activities. This left NET with \$6.25 million less money than its 1996 level and \$6.25 million less than we had planned for it in 1997. Thus, the ongoing NET program was cut about 63 percent.

NET money is spent entirely at the State and local levels, so it meant big reductions in effort visible at the local level—fewer activities and projects, less material for use in the classroom, and fewer nutritionists. A 63 percent cut is not something that can go unnoticed.

This supplemental is a priority because we do not have discretionary funds that we can use to support NET. While the Administration supported changing NET from a permanent appropriation back to discretionary, we did not intend to see the program defunded—or cut 63 percent.

NET

Question. What activities are not being funded by states with NET program funding of \$3.75 million?

Answer. NET funds are allocated to States based on school enrollment. At the \$10 million level, some States have been able to maintain professional nutritionists who can conduct nutrition education programs and provide fairly extensive training and technical assistance to school food service workers. Even the smallest State received a minimum grant, amounting to \$62,500 in fiscal year 1996, enough to provide for one statewide nutrition coordinator.

At the \$3.75 million funding level, about half the States received a minimum grant of \$50,000 for fiscal year 1997, with the larger States receiving more, but not in proportion to their enrolled base. States are telling us that unless additional funds are provided they will be forced to curtail the “mini-grants” or small grants to local schools. They will also stop conducting teacher training workshops; and they will curtail classroom support. This means that teachers will have fewer nutrition education resources to use in conducting their classes.

AGRICULTURE WEATHER FORECASTING

Question. The fiscal year 1998 request for the Chief Economist's office includes additional funding of \$525,000 to modernize weather and climate acquisition.

What National Weather Service services to the agricultural community were terminated and what has been the impact on producers?

Answer. In May 1996, the National Weather Service (NWS) eliminated all agricultural weather services, all fruit frost programs, and fire weather services to non-federal agencies for non-wildfire activities, saving \$2.3 million annually and reducing staffing by 37 FTEs. Seven offices providing agricultural weather services exclusively were closed, including: Agricultural Weather Service Centers (AWSC) College Station, Texas; AWSC Stoneville, Mississippi, AWSC Auburn, Alabama; AWSC West Lafayette, Indiana; Weather Service Office (WSO) Yuma, Arizona; WSO Twin Falls, Idaho; and WSO Riverside, California. The products eliminated were: all fruit frost forecasts, specialized agricultural weather advisories, agricultural weather guidance and cranberry bog forecasts. In addition, NWS eliminated coordination on agricultural issues with federal, state, and local agencies. A detailed listing of terminated programs was published in the Federal Register, Wednesday, July 5, 1995.

Since May 1996, agricultural interests have had to rely on NWS services provided to the general public or on specialized services provided by private forecasters for a fee. Both the NWS and private forecasters rely on data collected and disseminated by the NWS. However, since the program termination, data from agricultural areas is not being collected. As a result, forecasters do not have access to the meteorological data they need to make accurate forecasts for agricultural areas.

PART 1

Question. How will the additional funding requested for the fiscal year 1998 to modernize weather and climate data acquisition benefit the agricultural community? Will the funding requested cover both the collection and dissemination of weather data to farmers? What additional funding will be required in future years?

Answer. The \$525,000 requested is to install state-of-the-art weather and climate data acquisition hardware in USDA. This is necessary due to the National Weather Service's modernization program. USDA must adopt communication technologies compatible with those being implemented throughout the NWS in order to continue receiving the global data and forecasts disseminated by the NWS. Specifically, USDA must upgrade its telecommunications equipment to receive data from NWS's Advanced Weather Interactive Processing System (AWIPS) and its primary telecommunications component NOAAPORT. Access to these data enables USDA to: provide comprehensive and timely information on the impact of weather and climate on agriculture, including the provision of weather data and analysis to agricultural users; monitor and interpret significant global weather developments and their implications for agriculture; publish the "Weekly Weather and Crop Bulletin;" and analyze the impacts of droughts, freezes and other significant events. The private sector utilizes USDA weather data and analysis to generate value-added products for use the agricultural community. In addition, many agencies within USDA operate programs that are weather sensitive and rely on access to NWS data. The modernization of USDA's technology would allow continued timely access to NWS data.

It is also important that the data obtained is accurate and comprehensive. Therefore, USDA is also requesting \$350,000 to begin an incremental process of re-acquiring agricultural data lost when the NWS terminated all agricultural weather programs. USDA will target one region of the country where data losses have had a significant negative impact and make all data collected available to both the NWS and private forecasters. In future budgets, additional funding may be requested to create a nationwide network of data collection and information delivery for the agricultural community.

Question. There was an AP story on Feb 19 which indicated that if Florida farmers had received formerly Federal-sponsored weather forecasts from the National Weather Service, they would have been able to protect their crops from the recent freeze. It also notes that farmers are unwilling or unable to pay for the commercial weather forecasting service and, now, Florida officials are waiting to see what the federal government does regarding farm forecasts before looking into a freeze warning system for the state.

To what extent is it true that the continued availability of National Weather Service data would have enabled Florida producers to protect their crops from freeze?

Answer. The National Weather Service acknowledges a reduction in surface weather observations in agricultural areas. During the Florida episode, surface observations available to NWS and private sector forecasters were limited to urban and airport sites; sites with well-documented warm bias. Had forecasters had hourly observations available from significantly cooler agricultural locations, these data would have triggered forecasters to issue freeze warnings early enough for growers with mitigation devices to react. Damage and losses can never be completely prevented, but it is clear that losses would have been reduced had weather data been available for rural sites. However, there is no way to quantify the extent to which crops could have been saved.

Question. In your view, what costs should be borne by the federal government, and to what extent should this data be paid for by state and local entities or by the farmers?

Answer. USDA supported the National Weather Service when it responded to congressional and administrative challenges to eliminate advisory and forecast services to specialized communities, provided there was no agricultural data loss in the transition. Unfortunately, primary data losses have occurred, and neither the NWS nor the private meteorological community can provide adequate services to the farm community without access to a sufficiently dense weather and climate data base that includes observations from agricultural sites. USDA believes specialized "value added" services to the agricultural community can and should be provided by the private sector, but that collection, quality assurance, archival and dissemination of basic weather and climate data is a federal responsibility. Basic weather and climate data are part of the environmental infrastructure, a national treasure, and must be maintained in order to respond to issues of sustainability, global change, and crop impact assessment on a regional and global scale.

PART 1

75

INFORMATION SYSTEMS/TECHNOLOGY ARCHITECTURE

Secretary Glickman, concern over the department's effective management and modernization of its information technology systems and investments prompted this Subcommittee in its reports accompanying the 1996 and 1997 appropriations acts to direct the Department to defer all computer acquisitions until the Department examined and had in place a Department-wide information systems technology architecture.

In November of last year, Deputy Secretary Rominger notified this Subcommittee that a freeze on new investments in information technology had been issued until work was completed on that architecture, and indicated that the architecture was targeted to be completed on February 1, 1997.

Obviously, the conversion of old information systems to a new architecture is a complex and costly undertaking. None of us want to hear about another debacle, such as that recently experienced by the Internal Revenue Service with its tax systems modernization effort.

Question. What is the status of the Department's information system technology business architecture plans?

Answer. The Department has developed a high level, base line architecture. This architecture is the framework or umbrella beneath which we will now fill out the detailed pieces. It has three distinct parts—a business/data architecture, a technical standard architecture, and a telecommunications architecture. Much work has yet to be done on the details but the current work does give us some basis for considering necessary, short term investments, even before we have all the pieces.

Question. Does the Department still have a moratorium in place on new information technology investment?

Answer. Yes, the new Executive Information Technology Investment Review Board (EITIRB), which is chaired by the Deputy Secretary and comprised of the Department's Subcabinet policy officials, has decided to keep the moratorium in place until the members fully understand the technical architecture and are comfortable that the necessary implementation process is in place to ensure successful post moratorium operations.

Question. Is the Department reviewing existing systems as part of its plans?

Answer. Yes, the Office of the Chief Information Officer has reviewed the existing major systems as part of the process mandated by the Office of Management and Budget (OMB) in its memorandum 97-02. This memorandum sets forth criteria, now known as the "Raines Rules", that technology investments are to be judged by. The new USDA EITIRB, will also monitor and evaluate existing technology projects as well as new ones, to ensure that they meet expected outcomes.

Question. Have further investments in existing systems also been frozen? If not, why?

Answer. Yes, the current moratorium covers significant information technology acquisitions and certain telecommunications equipment acquisitions. This includes new investments in existing systems.

Question. Is USDA incorporating the 1996 farm bill in its strategic planning for the modernization of its information systems technology?

Answer. Yes. The 1996 legislation significantly impacted the business of many USDA agencies. Agencies have assessed the impact of this legislation, as well as other factors including the existing budget constraints and have incorporated this information into their draft strategic plans. These documents will help USDA identify the business needs of the future and serve as the basis for identifying the technology that will be needed to support the changed business needs.

INFORMATION TECHNOLOGY INVESTMENTS

Question. Aside from the preparation of an architecture plan, what other measures has the Department taken or does it plan to take before information technology investments are made?

Answer. Two new Boards have been established to help develop and implement our architecture and IRM management plans. The EITIRB, chaired by the Deputy Secretary and consisting of the Subcabinet officials from each mission area, will review technology investment proposals and ongoing projects to ensure that they are economical and effective. An Information Resources Management (IRM) Council Board, consisting of the Senior Mission Area IRM leaders, will provide technical advice to the Chief Information Officer.

Question. Although the Deputy Secretary announced that all acquisitions were suspended early this year, the Department awarded a \$61 million contract to EDS. Why?

PART 1

76

Answer. The contract was actually awarded to a consortium of vendors, including EDS. It is for the procurement of support services, not computers, software, etc. It represented a joint effort by the Farm Service Agency and Natural Resources Conservation Service to provide a procurement vehicle from which support services could be obtained. No actual procurement takes place until task orders are issued against the contract. This new vehicle was needed because the existing support services contract vehicles of the two agencies have expired or will do so by the end of this fiscal year.

Question. What funding is included in the fiscal year 1998 budget, by account, for information technology system investments?

Answer. The total projected funding for technology investments under the fiscal year 1998 budget is \$1,236,808,000. A breakdown by Agency and account will be provided for the record.

[The information follows:]

USDA AGENCY INFORMATION TECHNOLOGY EXPENDITURES

[Net obligations, in thousands]

Agency/office	Program/budget account	Amount by account	Fiscal year 1998 agency total
Farm and Foreign Agricultural Services:			
Foreign Agricultural Service	FAS Appropriation	\$15,397	\$15,397
Farm Service Agency	CCC	106,207
	Appropriated—Salaries and Expenses	104,646	210,853
Risk Management Agency	Federal Crop Insurance Corp Revolving Fund.	3,000
	RMA Appropriated—Administrative and Operations.	20,338	23,338

FACILITIES CLOSURES AND PROGRAM TERMINATIONS

Question. Please provide the Committee with a consolidated list, by USDA agency, of proposed office and laboratory closures.

Answer. The Agriculture Research Service is proposing that the following two work sites and two locations be closed in fiscal year 1998:

Work Site Closures: Brawley, CA; Orono, ME

Location Closures: Mandan, ND; Prosser, WA

The Agricultural Marketing Service is proposing to close one location in fiscal year 1998 and two locations in fiscal year 1999 respectively:

Milk Market Administrators Office: Boise, ID

Cotton Grading Office: Hayti, MO

Cotton Grading Office: Lamesa, TX

The Animal and Plant Health Inspection Service is proposing to close five locations in fiscal year 1997 and three locations in fiscal year 1998 respectively:

International Services: Fort Lauderdale, FL

Veterinary Services: Jacksonville, FL

Animal Care: Tampa, FL

Plant Protection and Quarantine: Goldsboro, NC

Plant Protection and Quarantine: Spokane, WA

Animal Damage Control: Little Rock, AR

Animal Damage Control: Manhattan, KS

Animal Damage Control: St. Paul, MN

The Food Safety and Inspection Service is proposing to close twenty-nine office locations in fiscal year 1997:

Area Office: Long Beach, CA

Area Office: Sacramento, CA

Area Office: Tallahassee, FL

Area Office: Athens, GA

Area Office: Ames, IA

Area Office: Springfield, IL

Area Office: Topeka, KS

Area Office: Louisville, KY

Area Office: Baton Rouge, LA

Area Office: Jefferson City, MO

Area Office: Billings, MT

Area Office: New York, NY

Area Office: Fort Washington, PA

Area Office: Harrisburg, PA

Area Office: Austin, TX

Compliance Office: Alameda, CA

PART 1

78

Compliance Office: Atlanta, GA
 Compliance Office: Des Moines, IA
 Compliance Office: Moorestown, NJ
 Compliance Office: Dallas, TX
 Correlation Center: Ames, IA
 Egg Products Inspection Office: Modesto, CA
 Import Field Office: Long Beach CA
 Import Field Office: Miami, FL
 Import Field Office: Detroit, MI
 Import Field Office: New York, NY
 Import Field Office: Philadelphia, PA
 Import Field Office: Tocoma, WA
 Microbiology Laboratory: Beltsville, MD

Question. Please provide a list, by agency and for each year since fiscal year 1993, of the USDA offices and laboratories which have been closed and the amount of savings which has been achieved as a result of each closure.

Answer. The list of offices and laboratories closed since 1993 and the amount of savings which has been achieved as a result of each closure follows. Certain agencies within USDA have not had any cumulative savings due to the costs of alternative space acquisition and employee relocations associated with the closures. Out-year savings are expected and will be footnoted as applicable.

AGRICULTURAL RESEARCH SERVICE

Year	Savings	Office closures	Locations converted to work sites
1995	\$729,500	Fairbanks, AK
	450,000	Pasadena, CA
	756,200	Georgetown, DE
	450,000	Savannah, GA
	1,548,000	Lexington, KY

		Legal Services	Raleigh, NC
		Legal Services	Stillwater, OK
		Legal Services	Puerto Rico

Cumulative savings are expected in the outyears.

OFFICE OF THE INSPECTOR GENERAL

Year	Savings	Office closures	Locations
1994	\$5,000	Audit Residency Office	Huron, SD
1995	4,000	Audit Residency Office	Little Rock, AR

Question. Please provide the Committee with a consolidated list, by USDA agency, of proposed program and project terminations. Reflect funds for fiscal years 1996, 1997, and 1998.

Answer. A list of proposed program and project terminations proposed by ARS in fiscal year 1998 will be provided for the record.

[The information follows:]

U.S. DEPARTMENT OF AGRICULTURE, AGRICULTURAL RESEARCH SERVICE PROPOSED FISCAL YEAR 1998 PROJECT TERMINATIONS

Location/Research project	Fiscal year—		
	1996 actual	1997 estimate	1998 estimate
CALIFORNIA			
Albany:			
Flavor Optimization of Major Food Crops through Control of Metabolic Processes			\$357,600
Modification of Vegetable Oils as Raw Materials for Industrial Uses			681,900
In Vitro Creation & Commercialization of High Solids Tomatoes & High-Solids, Low Sugar Potatoes			398,900
New Bacterial Polysaccharides for Food & Industry			324,200
Novel Biopolymers Based on Agricultural Sources			282,500

DEPARTMENTWIDE OBLIGATIONS

Question. Please provide a summary of obligations, Department-wide, for each of fiscal years 1996–1998, for the following object classifications: salaries and benefits; travel; ADP hardware/software purchases; contracts, grants, and other extramural agreements; and equipment (other than ADP related).

Answer. The following table provides an estimate of the obligations for 1996, 1997 and the 1998 budget in millions of dollars, excluding the Forest Service:

[Dollars in millions]

Object class	1996 estimate	1997 estimate	1998 budget
Salaries & benefits	\$5,103	\$5,302	\$5,345
Travel	240	216	210
ADP hardware/software purchases	184	136	94
Contracts, grants & other extramural agreements	51,064	51,737	52,313
Equipment (other than ADP related)	85	90	75

Question. Please provide the Committee with a consolidated listing of obligations for fiscal years 1996–1998 for the following crosscutting program activities: civil rights enforcement; support for 1890 Institutions and Historically Black Colleges and Universities; pest management; food safety; nutrition (excluding benefits); USDA information activities; Congressional relations and legislative affairs offices; natural resources and environmental programs; and management activities to support Department programs.

Answer. The following table contains the information. Please note the amounts are dollars in millions.

[Dollars in millions]

Activities	1996 estimate	1997 estimate	1998 budget
Civil rights enforcement	\$12	\$13	\$14
1890 Institutions & HBCU	90	88	93
Pest management	204	216	249
Food safety	771	806	826
Nutrition	424	408	446
Congressional relations & legislative affairs offices	51	52	52
Natural resources & environment programs	3,387	3,550	3,672
Management activities to support Department programs	147	138	148

Question. Please provide the Committee a Department-wide table reflecting total staff-years and funding for fiscal years 1993, and 1996–98 for the following position classifications: Executive Senior Service positions; personnel specialists; computer specialists; budget analysts; program analysts; contract specialists; accountants and technicians; administrative; and economists.

PART 1

89

Positions	1993 estimate		1996 estimate		1997 estimate		1998 estimate	
	Staff years	Funds (000)	Staff years	Funds (000)	Staff years	Funds (000)	Staff years	Funds (000)
Senior Executive Service	389	\$40,984	352	\$39,286	339	\$38,814	343	\$40,574
Personnel Specialists	1,542	74,740	1,228	69,592	1,214	71,603	1,208	71,177

GOVERNMENT PERFORMANCE REVIEW ACT

Question. The Department have been involved in compliance with the Government Performance Review Act (GPRA) requirements, including the development of strategic plans, goals, performance measurements, etc. By USDA agency, please document staff years and obligations (including salaries, travel, contracts, training, etc.) incurred to date by fiscal year, in accomplishing this effort. How much is included in the fiscal year 1998 budget request for this purpose.

Answer. The information follows:

UNITED STATES DEPARTMENT OF AGRICULTURE STAFF YEARS AND OBLIGATIONS FOR GPRA

EMPLOYEE DETAILS/ASSIGNMENTS

The fiscal year 1997 appropriations act specifies that “No employee of the Department of Agriculture may be detailed or assigned to any agency or office funded by this Act to any other agency or office of the Department for more than 30 days unless the individual’s employing agency or office is fully reimbursed by the receiving agency or office for the salary or expenses of the employee for the period of assignment.”

Question. Has the USDA Office of General Counsel issued any opinions, interpretations, or guidance to USDA agencies relative to this statutory provision? If so, what? Please submit for the record any written opinions or communications and summaries of oral communications issued.

Answer. The Office of the General Counsel has issued no written opinions or memorandum generally addressing the limitation on employee details contained in section 730 of the Agriculture, Rural Development, Food and Drug Administration, and Related Agencies Appropriations Act, 1997, or the parallel provision also applying to USDA contained in the Interior portion of the fiscal year 1997 Omnibus Consolidated Appropriations Act. Attorneys from OGC have advised Department officials as to how those provisions should be interpreted. Simply stated, that advice has been that employees may not be detailed from any agency or office of the Department to any other such agency or office for more than 30 days without reimbursement to the employing agency or office. However, we have also recognized that, under the law, so long as an employee is performing duties for which any agency or office receives appropriations, the employee may be paid from the appropriation for that agency or office no matter where the employee is geographically or physically located.

Question. Please provide the Committee with a list, by agency, of each employee detail or assignment (by employing agency, title, and position) in each of fiscal years 1996 and 1997 for a period up to 30 days, and identify the agency to which that detail or assignment was made, its length, and the purpose of the detail/assignment. Provide this same information for employee details/assignments made for a period of more than 30 days, and indicate the dollar amount of reimbursement made to the employing agency for such detail/assignment.

Answer. The information follows:

DETAILED FOR LESS THAN 30 DAYS—FISCAL YEAR 1997

Position/agency	Detailed to	Date/length	Purpose
Agr. Economist (FAS)	FAS	10/1/96-11/1/96	Technical assistance—Nicaragua.
Program Analyst (FCS)	Under Secretary, FNCS	10/1/96-10/26/96	Support for FCS programs.
Conf. Asst. to Adm. (FCS)	Office of Public Affairs	10/1/96-10/27/96	Write speeches for the Secretary of Agriculture.
Policy Analyst (FCS)	Dept. of Treasury	10/1/96-10/12/96	Assist the leader of the Electronic Benefits Task Force.
Budget Officer (FCS)	Modernization of Administrative Processes (MAPP)	10/1/96-10/12/96	Analyze telecommunication activities.
Writer (FCS)	Under Secretary, FNCS	10/1/96-10/25/96	Write speeches, letters, etc.
Secretary (FCS)	OSEC	1/21/97-2/21/97	Secretarial support.
Secretary (NRCS)	Under Secretary, NRE	11/8/96-12/5/96	Clerical support.
Contracting Specialist (NRCS)	OO and GSA	12/16/96-1/31/97	WEL—Gain managerial experience.
Confidential Assistant (NRCS)	FSA	2/18/97-3/16/97	Assist at the Field Service Center.
Program Analyst (RMA)	OBPA	10/1/96-10/31/96	Experience at Dept. level.
Management Analyst (FS)	Under Secretary, NRE	10/1/96-10/31/96	Provide support.
Writer (FS)	Under Secretary, NRE	10/1/96-10/31/96	Provide support.
Writer (FS)	Office of Civil Rights	10/1/96-10/31/96	Provide support.

DISCRIMINATION COMPLAINTS/CIVIL RIGHTS ENFORCEMENT

Question. Mr. Secretary, you have worked to investigate and address complaints of discrimination and lack of service to minorities and small farmers in USDA farm loan programs. I know that your civil rights action team will soon be releasing its recommendations. Is the moratorium on loan foreclosures still in effect?

Answer. It is not really a moratorium, it is a review. All pending foreclosures will continue to be reviewed by state and federal officials to ensure that discrimination or unfair treatment was not a factor. If discrimination may have played a factor, the foreclosure is stopped. However, if there is no finding of discrimination, the foreclosure goes forward.

Question. Can you summarize the major findings of the team and what safeguards it recommends be instituted to make sure discrimination does not continue or occur again?

Some have suggested that this problem might be attributed to the county committee system. Did the action team find this to be the case? Is it recommending any changes in the county committee structure?

Answer. The Civil Rights Action Team made 92 recommendation in the areas of management, accountability, program delivery, workforce diversity and the organization structure of civil rights. The report also includes actions plans for implementing the recommendations. Most are feasible. Some may need further review. I have set a goal of implementing those recommendations that do not require legislative action within the next six months.

The most dramatic changes at USDA will come from our efforts to reign in authority to ensure accountability. USDA will seek legislative authority to convert all non-federal county positions in the Farm Services Agency to federal employee status.

Other immediate actions include: working to eliminate the backlog in both program and EEO complaints; vesting the Assistant Secretary for Administration with the authority to review the civil rights records of agency heads and Subcabinet officials; creating a civil rights arm of the Office of the General Counsel; establishing a national commission on small farms to develop an aggressive strategy for keeping this important American tradition alive and well; creating a department-wide workforce planning and recruitment effort; and requiring annual civil rights training for all employees.

A copy of the civil Rights Action Team Report is also provided for the use of the committee.

[CLERK'S NOTE.—The Civil Rights Action Team Report does not appear in the hearing record, but is available for review in the subcommittee's files.]

CIVIL RIGHTS

Question. At your request Mr. Secretary, additional funds were provided for fiscal year 1997 to reduce the backlog of equal employment opportunity and program discrimination complaint cases.

How did this backlog accumulate?

Answer. The backlog in employment cases resulted from a dramatic increase in the number of complaints being filed in the past five years, without a similar increase in the resources assigned. For example, the average number of counseling contacts annually for fiscal years 1987-1991 was 1360. For fiscal years 1992-1996, we experienced a 39 percent increase in counseling contacts to an annual average

PART 1

of 1884. More dramatically, the average number of formal complaints filed rose from an annual average of 271 for fiscal years 1987–1991 to an annual average of 630 for fiscal years 1992–96, a 132 percent increase. I will provide a table for the record showing the annual figures.

[The information follows:]

Fiscal year	Counseled	Formal filed	Formal closed
1987	1,469	332	363
1988	1,332	277	369
1989	1,078	247	327
1990	1,349	211	280
1991	1,572	288	261
1992	1,628	462	229
1993	2,005	683	459
1994	2,223	666	501
1995	1,732	772	383
1996	1,830	566	1,035

There are multiple reasons for the increase, and we do not pretend to be able to state with absolute certainty how much each factor contributed. However, we believe two changes in law and regulation were major factors. First, the Civil Rights Act of 1991 provided for compensatory damages in cases of intentional discrimination. This element of relief, whatever its merits otherwise, has raised the determination of employees to pursue their complaints further into the process. Second, the Equal Employment Opportunity Commission issued new regulations on October 1, 1993. These regulations established time frames for the informal process which made it more difficult to reach closure before a complaint became formal.

USDA management also must accept responsibility for allowing the situation progress to the point it has. During the period from March 1992 until November 1995, the organization responsible for adjudicating formal complaints underwent several official and unofficial reorganizations, including 12 destabilizing changes in management. It has become clear that increased resources will be needed on a permanent basis to made the necessary improvements in this area.

Question. Is progress being made with the additional funds provided?

Answer. The funds are being used to track, process and resolve the USDA employee complaints. In addition, there are plans to assemble two major staffs to review and to the extent possible resolve all of the 1450 outstanding employee complaints and 550 outstanding program complaints. It is my understanding that findings indicate that significant progress has been made toward investigating and holding hearings regarding the employment complaints. It is our expectation that this will lead to a significant reduction. However, the findings further indicate that most of the 550 program complaints have not been investigated. Further investigation will be necessary for most of the program complaints prior to the time these complaints can be resolved.

Question. What is being done to ensure that this problem does not recur in the future?

Answer. We are trying to attack the problem from three directions. First, it is critical that we improve our rate of resolving complaints during the informal stages. We will be exploring more use of mediation, and will soon be deciding on the optimum placement of the EEO counseling function. Second, we will be maintaining an increased staff of adjudicators to handle formal complaints, and trying to improve their productivity through training and process reengineering. Third, we will be initiating efforts to prevent complaints in the first place. Supervisors need to be better trained in performing their jobs, and we are taking steps to institutionalize such training. Supervisors also need to be held accountable, so problems can be corrected before they multiply. Finally, we need to provide and strengthen alternative methods of addressing disputes in the workplace; employees need an effective avenue to get their concerns addressed without filing a discrimination complaint when discrimination is not the real problem.

MARKET ACCESS PROGRAM

Changes have been made in the Market Access Program (MAP) to make it more targeted and to increase small business participation in the program. For fiscal year 1998, the budget includes the full authorized permanent funding level of \$90 million for MAP.

PART 1

100

Question. How important is the Market Access Program to the promotion and expansion of U.S. agricultural exports?

Answer. The Market Access Program has been an important contributor to the gain in U.S. world market share of sales of consumer-oriented products since 1985. During this period, MAP and its predecessor, the Targeted Export Assistance Program, have helped this share grow from 11 percent to 18 percent in 1994. Each percent gain represents sales of more than \$1 billion. While changes in the value of the dollar have added to the growth, analysis carried out by FAS has indicated that market promotion contributed to more than half of the total increase.

Mr. Secretary, your prepared testimony indicates that "additional program improvements have recently been made which are designed to broaden participation, clarify program participation criteria, strengthen evaluation and accountability, and simplify program requirements for participation."

Question. How have these program changes been executed and could you briefly summarize the changes made and the reasons for those changes?

Answer. Consistent with the Administration's commitment to streamlining government activity, new MAP regulations were published on February 1, 1995, that increased flexibility and simplified program requirements for participants. The revised regulations also reflected public comments and changes made by the Omnibus Budget Reconciliation Act of 1993. Among the changes made by the rule are:

(a) U.S. exporters no longer need to show that a U.S. agricultural commodity faces an unfair trade practice in an overseas market in order to participate in the program;

(b) small businesses and cooperatives are accorded priority consideration in the allocation of brand promotion funding;

(c) application and allocation approval criteria are clarified;

(d) procedures for appealing compliance findings are added; and

(e) paperwork requirements have been reduced by simplifying contracting standards and procedures and streamlining the format for various program documents.

With regards to evaluation, FAS allocates funds in a manner that effectively supports decision-making initiatives of the Government Performance and Results Act (GPRA) of 1993. FAS considers a number of factors when reviewing MAP proposals, several of which relate to export performance, both past performance and projected export goals. In fact, in the MAP competitive allocation process, 60 percent of the total weight relates to export performance.

In addition, each participant is required to conduct an annual program evaluation to determine the effectiveness of the participant's strategy in meeting overall goals. Participants must identify goals to be met within a specified time, a schedule of measurable milestones for gauging success, plans for achievement, and results of activities at regular intervals. The evaluation results are analyzed by FAS and help guide the development and scope of a participant's program.

With these changes in place, program management and accountability have been strengthened. For example, over the last 6 years compliance findings against program participants have decreased and repayments by program participants for unauthorized or inappropriate expenditures have been less than 1 percent of the total MAP funding level, a clear indication that these steps are working.

EXPORT ENHANCEMENT PROGRAM

The President's fiscal year 1998 budget proposes to make \$500 million available for the Export Enhancement Program, the maximum level permitted by provisions of the 1996 Farm Bill. Quite frankly, EEP was limited in the appropriations act for fiscal year 1997 and in previous years because there was a general consensus that the maximum permitted level would not be required.

Question. Do you expect to utilize the \$100 million currently available for the Export Enhancement Program, and why do you believe that the \$500 million maximum program level will be required in the fiscal year 1998?

Answer. EEP allocations for the July 1996-June 1997 period, announced last summer, were at the maximum quantity levels allowed under the Uruguay Round Agreement reduction commitments. However, at present, we do not believe that current world market conditions warrant the use of subsidies by anyone. In general, U.S. supplies are relatively tight, and we are exporting what we have available without the need to use subsidies. Unfortunately, the responsible restraint by the United States has been tested by renewed subsidization by the European Union, which began in September 1996. We believe it is extremely important that we maintain a strong position in order to protect our agricultural trade interests. Resumption of EEP is an option we may need to consider and we have, therefore, provided funding for EEP in 1998 at the maximum level permitted by the 1996 Farm Bill.

PART 1

101

PROPOSED PUBLIC LAW 480 TITLE I RESCISSION

The Administration proposes a \$50 million total reduction in fiscal year 1997 appropriations for Public Law 480 Title I (a \$3.5 million rescission of Title I ocean freight differential funds and a rescission of \$46.5 million in subsidy budget authority in the direct credit program). The budget indicates that commodity shipments would be reduced by 200,000 metric tons as a result of this proposed rescission. However, it also indicates that allocations of Title I commodity assistance that have already been announced for fiscal year 1997 would not be affected by the proposed rescission because the reduction in program funding will be taken from a reserve of unallocated funds and from unobligated funds carried over from fiscal year 1996.

Question. With respect to the proposed rescission of Public Law 480 Title I funding, what is the total reserve of unallocated funds and unobligated funds carried over from fiscal year 1996?

Answer. The total reserve of unallocated fiscal year 1997 funds is \$24.6 million, and the unobligated funds carried over from fiscal year 1996 total \$32.9 million. The total from both sources is \$57.5 million.

Question. How much of the proposed rescission would come from the reserve and how much would come from fiscal year 1996 carryover balances?

Answer. The fiscal year 1996 carryover funds have been made available for programming in fiscal year 1997 through the apportionment process and, thus, funding from both sources is now commingled. The rescission proposes to reduce budget authority for the Title I credit account by \$46.5 million and for the ocean freight differential account by \$3.5 million. Upon enactment of the rescission, just over \$7 million would remain in the ocean freight differential account for fiscal year 1997. We believe this remaining reserve is needed to meet current programming plans because the rate of ocean freight differential payments has been increasing recently. If our original estimate of the costs of meeting cargo preference requirements for Title I proves to have been too low, we will need the reserve to meet the higher costs.

Question. Does the proposed rescission have the impact of reducing commodity shipments by 200,000 metric tons because, in its absence, the unobligated and reserve funds would be spent?

Answer. Our tonnage estimates for Public Law 480 programming are always based on the assumption that program funds will be fully obligated. Consequently, when we reduce Title I budget authority by \$50 million, we need to make a corresponding reduction in our tonnage estimate.

Question. The law permits available funds to be transferred between titles of the Public Law 480 program. Has the Administration concluded that if unobligated and carryover funds are not required for Title I of the program, they also will not be required to supplement funds for Titles II and III of the program this year?

Answer. The decision to propose the Title I rescission was based on the need to identify an offset for the supplemental that has been requested that includes the Special Supplemental Nutrition Program for Women, Infants, and Children. However, at this time we have no reason to believe that funding will be inadequate for the Titles II and III programs this year. It is also important to note that, even with the rescission in Title I, we estimate total Public Law 480 commodity programming of 3.2 million metric tons for the year, which is still above the 3.0 million metric tons we programmed last year.

PUBLIC LAW 480—FISCAL YEAR 1998 REQUEST

The fiscal year 1998 request proposes to maintain funding for Titles II and III of the Public Law 480 program, but to reduce funding available for Title I credit sales. Direct credit authority is reduced from the fiscal year 1997 level of \$227 million to \$113 million (a reduction of \$114 million); the subsidy appropriation is reduced from \$186 million to \$88 million (a reduction of \$98 million); and ocean freight differential costs are reduced from \$14 million to \$10 million (a reduction of \$4 million). The budget also proposes to transfer budget and expenditures for the Title I concessional sales program from the international affairs function to the agricultural function. The rationale given for this shift is to allow the Title I program to be managed and budgeted as part of a consistent package of agricultural export programs.

Question. Why does the fiscal year 1998 request propose to reduce funding for the Public Law 480 Title I program?

Answer. The reduction proposed for Title I programming in fiscal year 1998 reflects constraints on discretionary spending and the difficult choices that had to be made in order to meet the President's commitment of balancing the Federal budget by fiscal year 2002. It is important to note that 1998 funding for Titles II and III

PART 1

102

of Public Law 480 will remain largely unchanged from 1997 enacted levels, which ensures that adequate resources will be available to meet the most serious food assistance needs, including emergencies.

Question. Is this proposed reduction in any way related to the proposed transfer of the program from the international affairs function to the agricultural function of the budget?

Answer. The reduction does not result from the transfer of Title I from the international affairs function to the agriculture function. In fact, one of the primary reasons for making the transfer is to improve the Department's ability to support future budgetary resources for the program. Because the market development objectives of Title I are more closely aligned with the purposes of the agriculture function, it will be easier to allocate funding for Title I there rather than in the international affairs function where the primary objectives are foreign policy and national security.

Question. I thought changes in budget presentation were made by OMB after consultation with the Budget Committees of the Congress. Why is this change proposed formally in the President's budget?

Answer. It is our understanding that OMB did consult with senior staff of the Budget Committees and the Agriculture Appropriations Subcommittees. Following those consultations, the President's budget was modified to move the Title I credit account to the agriculture function. Because of time constraints, ocean freight differential funding for Title I could not be transferred and remains in the international affairs function. However, we plan to modify the budget presentation for the 1999 budget so the ocean freight differential funding will also be included in the agriculture account.

Question. Are you asking that we legislate the change?

Answer. The President's budget has already transferred the Title I credit account to the agriculture function, so we will not be submitting proposed legislation on this matter.

Question. The prepared testimony indicates that the fiscal year 1998 budget request for the Public Law 480 program would provide for approximately the same level of metric tons of commodity assistance as currently estimated for fiscal year 1997. However, the budget justification indicates that the program level for Title I would decrease from 0.919 million metric tons grain equivalent (MMTGE) to 0.634 MMTGE in fiscal year 1998; the Title II program level would remain the same at 2.4 MMTGE; and the Title III program would be increased from 0.117 MMTGE to 0.150 MMTGE in fiscal year 1998. The fiscal year 1998 request in fact proposes a net reduction from fiscal year 1997 in Public Law 480 metric tons of commodity assistance and, specifically, a reduction of 0.285 metric tons in Title I commodity assistance from fiscal year 1997. Is this correct?

Answer. The table in the budget justification materials which provides estimates of Public Law 480 tonnages does not reflect the effect of the proposed rescission in Title I budget authority for fiscal year 1997. The rescission would reduce the tonnage estimate for fiscal year 1997 Title I programming by approximately 200,000 metric tons. If the effect of the rescission is taken into account, total Public Law 480 tonnage is estimated to be 3.2 million metric tons in both FYs 1997 and 1998.

SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

Mr. Secretary, the Administration is seeking \$100 million in fiscal year 1997 supplemental funding for the supplemental nutrition program for women, infants, and children (WIC).

Question. I understand that food package costs and participation have increased above projected levels. However, perhaps you could tell us the impacts of not acting on this request. Would available funding still be adequate to maintain the existing WIC caseload? In other words, are we talking about throwing WIC participants off the rolls without this additional funding, or are we talking about slowing the growth of or not further expanding program participation?

Answer. Our rationale for requesting the supplemental really is simple. We are committed to full funding WIC, serving about 7.5 million eligibles by the end of fiscal year 1998. This goal would be compromised by participation fall off forced by lack of funds.

Food and Consumer Service historical data shows that States usually underspend their grants, due to correctly cautious management and to the uncertainties of rebate cash flows, fluctuating demand for service and unanticipated food cost changes. This has resulted in carry over funds from one year to the next. While States will work harder than ever to fully use their grants this year, and should reduce carry over, program history suggests that carry over will be about 2.5 percent. If there

PART 1

103

is no supplemental, States may not be able to sustain their current caseload levels in fiscal year 1997.

MANAGING WIC WITHIN AVAILABLE FUNDS

Question. What did the Department do at the outset of the fiscal year to manage the WIC program within its available funding level so as to prevent a large drop in participation at the end of the year?

Answer. The States handle the WIC program at the recipient service level. USDA, through the Food and Consumer Service's seven Regional Offices, provides oversight, policy guidance, and technical assistance to WIC State Agencies. FCS does not allocate caseload to the States, only funding. And we believe that this is as it should be.

When we advise States of their grant levels at the start of the year, we provide them with a projection of the caseload we think they can handle, given their prior year's food costs, expected rebate revenue, and food inflation projections. We take a snapshot several times during the year to see if any State has funds it will not need, so that they can be recovered and reallocated to a State needs them. We provided States extra warnings this year, that funding was likely to be tight—and we are continuing with this process. Ultimately, however, the States decide which and how many individuals they can serve within their grants.

OFFSETS FOR WIC 1997 SUPPLEMENTAL REQUEST

Question. As you are aware, if this supplemental funding is provided, this subcommittee most likely would have to offset its cost, both in budget authority and outlays, by reducing existing appropriations for other USDA activities. The Administration has proposed a \$50 million rescission of Public Law 480 Title I funding, but this would offset only half the budget authority and only about one-third of the outlay impact of the requested WIC supplemental. Is this WIC supplemental funding request a priority if further reductions need to be made in existing funding for other USDA activities? If so, what other offsetting reductions would you suggest?

Answer. The WIC supplemental is a priority of the Administration's and has been accounted for in the President's plan to balance the budget by the year 2002. This plan includes other high priority USDA programs in addition to WIC. If the Administration's plan is adopted by Congress, no further cuts to USDA will be required to offset the WIC supplemental.

WIC OFFSETS FOR 1998

For fiscal year 1998, the administration proposes a \$378 million increase in WIC funding above the fiscal year 1997 level. I don't think there is a member of the Congress who would not like to fully fund the WIC program. However, I do not expect that this Subcommittee will receive a discretionary spending allocating higher than the fiscal year 1997 level, requiring at least an offsetting reduction for any increase provided.

Question. Is the proposed fiscal year 1998 WIC funding increase a priority for the Department to the extent that you would suggest offsetting reductions in funding for other USDA programs? What funding reductions would you suggest?

Answer. WIC full funding is a priority of the Administration's. Funding sufficient so that all eligibles may participate by the end of fiscal year 1998, has been taken into consideration in preparing the President's plan to balance the budget by the year 2002. If the President's plan is followed, no further offsetting reductions to Agriculture will be required.

OFFICE OF THE SECRETARY

Question. The explanatory notes indicate that \$207,000 in fiscal year 1997 and \$273,000 in fiscal year 1998 of the funds available for the Office of the Secretary will be obligated under another USDA appropriations for an Assistant to the Secretary for Western Affairs. Under which USDA appropriation will these funds be obligated? Is this a new position? Why was it created?

Answer. These funds will be obligated equally between the Forest Service and Rural Business-Cooperative Services. This is a new position established to represent the Secretary in natural resource and rural economic development issues that cut across USDA and other Federal agency lines. The position of Assistant to the Secretary for Western Affairs was created to coordinate with other Federal agencies, local, State and tribal governments issues of concern in the Western region.

PART 1

104

SERVICE CENTER IMPLEMENTATION

Question. The explanatory notes indicate of the \$7,500,000 appropriated in fiscal year 1998 for Infoshare and now designated for Service Center Implementation, \$3,098,302 was obligated in fiscal year 1996 and \$4,401,698 will be obligated in fiscal year 1997. Please provide a detailed breakdown, by fiscal year, on the purposes for which these funds were obligated.

Answer. I will be glad to provide this information for the record.
[The information follows:]

[Dollars in Thousands]

Project	Fiscal year 1996 actual	Fiscal year 1997 estimate	Project totals
Infoshare Program	\$495	\$495
Kentucky Pilot	438	438
Telecommunications	500	500
Business Process Reengineering/Business Process Improvement/Data Management	831	\$637	1,468
Change Management	657	2,760	3,417
Service Center Implementation Project Management	62	319	381
1996/1997 Departmental Administration/Office of the Chief Information Officer Oversight	115	285	400
Reserve for determination of future oversight needs	401	401

ADVISORY COMMITTEES

Question. For fiscal year 1997, the appropriations act establishes a \$1 million limitation on activities of advisory committees, panels, commissions, and task forces, excluding panels to comply with negotiated rulemaking or to evaluate competitively-awarded grants. Please provide a listing of the advisory committees, panels, commissions and task forces funded in fiscal year 1997, by agency, and the amount of funds allocated for each.

Answer. I will provide for the record a listing of those advisory committees, panels, commissions and task forces that are subject to the \$1 million limitation.

[The information follows:]

USDA Advisory Committees

<i>Policy Area and Committee Title</i>	<i>1997 Estimate</i>
Food, Nutrition and Consumer Services:	
National Advisory Council on Maternal, Infant and Fetal Nutrition
National Advisory Council on Commodity Distribution
Total
Food Safety:	
National Advisory Committee on Meat and Poultry Inspection	\$32,158
National Advisory Committee on Microbiological Criteria for Foods ..	38,517
Total	70,675
Research, Education and Economics:	
National Ag. Research, Extension, Education & Econ. Advisory Board	329,149
National Genetics Resources Advisory Council	19,000
Dietary Guidelines Advisory Committee	5,376
National Nutrition Monitoring Advisory Council	36,000
Forestry Research Advisory Council	24,748

PART 1

105

<i>Policy Area and Committee Title</i>	<i>1997 Estimate</i>
Census Advisory Committee on Agriculture Statistics	56,000
Total	470,273
Marketing and Regulatory Programs:	
Federal Grain Inspection Advisory Committee	30,000
Advisory Committee on Foreign Animal and Poultry Diseases	20,350
General Conference Committee of the Nat'l Poultry Improvement Plan	7,969
National Animal Damage Control Advisory Committee	25,000
National Organic Standards Board	43,000
Total	126,319
Farm and Foreign Agricultural Services:	
Agricultural Policy Advisory Committee for Trade	14,119
Ag. Tech. Adv. Comm. for Trade in: Animals & Animal Products	14,110
Fruits and Vegetables	14,110
Grain, Feed & Oilseeds	14,110
Sweeteners	14,110
Tobacco, Cotton & Peanuts	14,110
Edward R. Madigan Ag. Export Excellence Award Board	28,090
Beginning Farmers and Ranchers	
Total	126,869
Natural Resources & Environment:	
Task Force on Agricultural Air Quality	50,000
Total	50,000
Subtotal, Advisory Committees	844,136
Contingencies	155,864
Total, Advisory Committees Limitation	1,000,000

Question. Why is the Department proposing to eliminate this limitation in fiscal year 1998?

Answer. We have proposed this change in order to provide the agencies with the flexibility needed, within available resources, to carry out the appropriate level of committee activities in support of USDA programs.

ADVISORY COMMITTEES

Question. Please provide a list of the advisory committees, panels, commissions, and task forces, by agency, included in the fiscal year 1998 budget request, and the amount of funds proposed for each one.

[The information follows:]

<i>Agency/group</i>	<i>1998 estimate</i>
ARS—National Genetic Resources Advisory Council	\$23,000
ARS—National Nutrition Monitoring Advisory Council	37,000
ARS—Dietary Guidelines Advisory Committee	159,140
CSREES—National Agricultural Research, Education, Extension, and Economics Advisory Board	329,149
CSREES—Forestry Research Advisory Council	25,396
APHIS—Foreign Animal and Poultry Diseases Advisory Committee	20,913
APHIS—General Counsel of the National Poultry Improvement Plan	9,928
APHIS—National Animal Damage Control Advisory Committee	25,000
AMS—National Organic Standards Board	44,000
GIPSA—Federal Grain Inspection Service Advisory Committee	30,000
NASS—Census Committee on Agriculture Statistics	58,000
FAS—Agricultural Policy Advisory Committee for Trade	14,119
FAS—Ag Tech. Advisory Committee for Trade in Animal & Animal Prod- ucts	14,110
FAS—Ag Tech. Advisory Committee for Trade in Fruits and Vegetables	14,110
FAS—Ag Tech. Advisory Committee for Trade in Grain Feed and Oilseeds	14,110
FAS—Ag Tech. Advisory Committee for Trade in Sweeteners	14,110

<i>Agency/group</i>	<i>1998 estimate</i>
FAS—Ag Tech. Advisory Committee for Trade in Tobacco, Cotton and Peanuts	14,110
FAS—Edward R. Madigan Ag. Export Excellence Award Board	14,110
FSIS—National Advisory Committee on Microbiological Criteria for Foods	75,000
FSIS—National Advisory Committee on Meat and Poultry Inspection	75,000
NRCS—Task Force on Agricultural Air Quality	80,000
FSA—Advisory Committee on Beginning Farmers and Ranchers	35,393

HAZARDOUS WASTE MANAGEMENT

Question. The fiscal year 1998 request proposes an increase of \$9.3 million for hazardous waste management to meet mandated compliance deadlines for high risk sites. How many sites on USDA properties require hazardous waste cleanup, and what is your estimate of the amount of funds needed to complete all work identified?

Answer. The USDA currently estimates that over 4,500 sites under our jurisdiction, custody, or control will require a response action. The current estimate to complete this work is approximately, \$3.6 billion. This includes 1,728 abandoned or inactive mines at a cost of \$1.9 billion and up to 1,000 sites leased by the Commodity Credit Corporation at an estimated cost of \$1.5 billion. The Department has begun an initiative to increase the number of site cleanups by potentially responsible parties in order to accelerate the pace and share the financial responsibility for cleanup.

NATIONAL FINANCE CENTER

Question. The fiscal year 1997 appropriations act requires the Chief Financial Officer to actively market cross-servicing activities of the National Finance Center—NFC. Is this being done?

Answer. NFC is pursuing many avenues to actively market its full range of services to non-USDA agencies including actively participating in national conferences and symposiums to market NFC services Nationwide. In addition, publicizing NFC successes through established media and NFC publications is important to maintain the NFC's image as a leader in providing financial services.

In 1996, NFC began servicing the Federal Mediation and Conciliation Service and the Office of Congressional Compliance. We are scheduled to bring another four agencies into the National Finance Center over the next two years: the U.S. Capitol Police, the U.S. Architectural and Transportation Barriers Compliance Board, the Federal Housing Finance Board, and the Federal Elections Commission. NFC is also currently pursuing several other potential clients for our payroll systems as well as other administrative payment systems.

In addition, NFC is pursuing a number of marketing strategies to make our services more visible and appealing to potential users. For example, NFC held an NFC Payroll/Personnel EXPO here in Washington last October and participated in an information processing interagency conference in Austin, Texas, in December. NFC is scheduled to participate in at least four more conferences this fiscal year, allowing it to market the full range of NFC services to conference participants. NFC will also be initiating use of the Internet for marketing of services.

OFFICE OF THE INSPECTOR GENERAL: ASSET SHARING

Question. What amount has been deposited in the Department of Justice and/or Treasury Department Assets Forfeiture Fund in each of fiscal years 1996 and 1997 as a result of investigations in which the USDA Office of Inspector General (OIG) participates?

Answer. Cumulatively, over \$10 million has been identified for possible forfeiture to the Government as a result of our investigative actions since OIG was provided authority to receive proceeds from forfeitures in November 1995. In fiscal year 1996, property and/or funds valued at approximately \$7 million have been provided to the U.S. Department of Treasury's Assets Forfeiture Fund, and property and/or funds valued at approximately \$712,000 have been provided to the U.S. Department of Justice's Assets Forfeiture Fund as a result of investigations involving this agency. To date in fiscal year 1997, property and/or funds valued at approximately \$160,000 have been provided to the Treasury Asset Forfeiture Fund, and property and/or funds valued at approximately \$2.4 million have been provided to the Justice Assets Forfeiture Fund.

PART 1

107

Question. Is a memorandum of understanding between the OIG and the U.S. Department of Justice and/or U.S. Department of Treasury in place to allow USDA to receive an equitable share of these funds? If not, why?

Answer. Previously, a memorandum of understanding between OIG and the Department of Treasury was agreed to and signed by both agencies; however, Treasury has since withdrawn its agreement. No memorandum of understanding has been completed between OIG and the Department of Justice. Currently, OIG is involved in discussions with Justice, Treasury, and the Office of Management and Budget on OIG's receipt of forfeiture proceeds through equitable sharing. These discussions continue. Justice objects to equitable sharing with any Federal agency, including OIG.

QUESTIONS SUBMITTED BY SENATOR BOND

WIC SUGAR LIMIT

The USDA raised the possibility that it might alter the sugar cap for breakfast cereals approved for the WIC program many months ago and in response it received an avalanche of negative comments from parents, teachers, health professionals, public service and child care groups. The essential facts noted by the commentators is that the WIC diet is supplementary diet designed to be nutrient dense. For this reason it specifically limited the amount of sugar, fats and sodium. There seems to be no rational reason for adding empty sugar calories to a prescriptive diet designed for undernourished children.

Question. Can we expect that the retention of the sugar cap will be proclaimed by the Department in the near future?

Answer. As you noted, WIC foods are intended to provide nutrients lacking in the WIC population. And WIC foods are also a nutrition education tool used to help recipients learn how to select nutritional foods. We periodically consider recent research findings and advice from leading professional health and nutrition authorities to determine whether revisions in Federal program guidelines or regulations are needed.

The March 1996 WIC Cereal Sugar Limit Notice stated that USDA was aware that the newer clinical evidence indicated that sugar consumption is not believed to be an independent risk factor in the development of the chronic diseases of coronary heart disease, noninsulin diabetes, obesity and hyperactivity. We used the public forum of a Federal Register Notice to solicit feedback from the broad sectors of the community on whether continuation of a Federal restriction on the amount of sugar allowed in adult WIC cereal is still warranted. Among the many comments we received were suggestions that neither sugar nor any other attribute of WIC foods should be viewed in isolation, but rather they should be reviewed in the context of all of the WIC foods and their use in achieving WIC goals.

In follow-up, the Department will publish a notice in the Federal Register to summarize the public comments USDA received on the March 1996 Notice and to announce the Department's decision to examine WIC foods for consistency with the 1995 Dietary Guidelines for Americans and supporting scientific knowledge. USDA's Food and Consumer Service, in conjunction with the Center for Nutrition Policy and Promotion, will be conducting a scientific review of the WIC foods. Until this review is completed, the Department will not be making any changes in the current Federal sugar cap for WIC cereals.

AMERICAN DENTAL ASSOCIATION ON WIC SUGAR LIMIT

The American Dental Association is, as you know unconditionally opposed to an upward alteration in the sugar cap. The principal argument for such a revision seems to be that while additional sugar would do no good, it would also do no harm. This would be a strikingly weak argument even if it were true but it clearly is not. Added sugar would mean increased tooth decay among a group of children who already have a higher incidence of caries than the general juvenile population does.

Question. Has the position of the American Dental Association in this matter been given the full consideration it obviously deserves?

Answer. Yes. We have reviewed the materials provided by the American Dental Association in looking at the WIC sugar limits. Also, we welcome the American Dental Association's interest in WIC and in WIC foods, and encourage them to help us with our planned review of all WIC foods, including the sugar limits. Further, we hope the American Dental Association will help with our other programs in any way that they can.

PART 1

108

NATIONAL CORN GENOME INITIATIVE

On December 18, Senator Mosley-Braun and I sent a letter to you regarding the status of USDA's efforts to provide funding for the National Corn Genome Initiative (NCGI) which is the critical research priority by corn growers and processors. As we said in the letter, we believe that this project is of vital interest to our efforts to retain our leadership position in agricultural research and to ensure that our producers have the tools necessary for environmentally-responsible and sustainable agricultural production.

We had hoped that the research components of the Fund for Rural America might be recognized as a part of the Fund for Rural America. It was specifically mentioned in Farm Bill report language and is precisely the kind of basic science that will be the basis for us being competitive into the next century or falling behind. While I understand that many rural development projects yield immediate and visible benefits and are important, we should also have the vision to provide the tools that will be the key to success in the future.

The letter also notes that the fiscal year 1997 funding bill for the USDA included language urging that the Department provide increased attention and develop a long-term approach for corn genome mapping.

Question. We have not received a response to the December 18 letter. While I understand the Department has been active during the period since, I have several questions regarding the Corn Genome Mapping project. Does the Department consider the NCGI eligible for Fund for Rural America grants?

Answer. A broad-reaching proposal to map the corn genome could be submitted to the Fund for Rural America—FRA. Given that the FRA is designed to support multifunctional and multidisciplinary projects that combine research, education, and extension to some degree, the proposal should be one that also looks at the impact of the mapping project on the community, on breeders, and/or on producers. It might be beneficial to include technology transfer to indicate how the generated information will be disseminated and used.

Question. If so, will the Department give such an endeavor priority under the criterion that has been issued?

Answer. The FRA is a peer-reviewed competitive grants program. Many high quality proposals are expected to be submitted. All proposals will be reviewed competitively for quality, merit, and relevance. A proposal on corn genome mapping will compete under the same procedures through the peer review process.

Question. Are there funding limits (ceilings) on research projects funded by the Fund for Rural America? If so, what are they?

Answer. The Fund for Rural America includes several funding limits. The limit on planning grants for up to six months is \$25,000. Standard grants can be funded at up to \$600,000 for the life of a project; projects can extend for up to four years but cannot exceed the \$600,000 cap on total funding regardless of length of time. Center projects can be funded at up to \$1.0 million per year for up to four years. This puts the cap on total funding for a four-year center grant at up to \$4.0 million.

Question. What efforts are currently underway at the Department to fund genome mapping projects?

Answer. The major effort currently underway in the Department to fund genome mapping projects is the Plant Genome Program supported through the Cooperative State Research, Education, and Extension Services's—CSREES—National Research Initiative Competitive Grants Program—NRICGP—along with database development supported by the Agricultural Research Service—ARS. Other sources of funding include Special Research Grants, Hatch Act formula funds, and the NRICGP Animal Genetics Program under CSREES.

Question. Does the fiscal year 1998 request include funding for NCGI?

Answer. The fiscal year 1998 request does not include specific funding for NCGI. However, a portion of the increases requested for the CSREES NRICGP will be directed towards the priority area of plant genetic enhancement.

Question. If not, is the Department taking steps towards developing a long-term approach for funding this project?

Answer. ARS and CSREES are in the process of establishing an interagency corn genome mapping team to lay the groundwork for fiscal year 1999 and to develop strategies for corn genome mapping work.

PART 1

109

QUESTION SUBMITTED BY SENATOR MCCONNELL

WIC SUGAR LIMIT

It strikes me, Mr. Secretary, that an upward revision of the sugar cap on WIC cereals might set a precedent that could effect a wide variety of government actions and programs. The purpose of the WIC program has from the beginning been clearly and narrowly defined. It is to provide a defined service—a nutrient dense diet—to a defined group—women, infants and children who without a special supplementary diet would be poorly nourished and would inevitably suffer the serious physical and mental consequences of under nourishment.

This is a program which meets its goal in a most impressive way and it is clearly not a program that should be tinkered with.

Question. Would you agree with this observation? And if you would, would you also agree a lowering of WIC's very high standards for foods in the program would establish an unfortunate precedent that could be applied to dilute the original purpose of other precisely targeted programs?

Answer. Yes. I would agree with your observation. WIC foods are intended to provide nutrients lacking in the WIC population. Also, WIC foods are a nutrition education tool, used to help recipients learn how to select nutritional foods. We periodically consider recent research findings and advice from leading professional health and nutrition authorities to determine whether revisions in Federal program guidelines or regulations are needed.

The March 1996 WIC Cereal Sugar Limit Notice stated that USDA was aware that the newer clinical evidence indicated that sugar consumption is not believed to be an independent risk factor in the development of the chronic diseases of coronary heart disease, noninsulin diabetes, obesity and hyperactivity. We used the public forum of a Federal Register Notice to solicit feedback from the broad sectors of the community on whether continuation of a Federal restriction on the amount of sugar allowed in adult WIC cereal is still warranted. Among the many comments we received were suggestions that neither sugar nor any other attribute of WIC foods should be viewed in isolation, but rather they should be reviewed in the context of all of the WIC foods and their use in achieving WIC goals.

In follow-up, the Department will publish a notice in the Federal Register to summarize the public comments USDA received on the March 1996 Notice and to announce the Department's decision to examine WIC foods for consistency with the 1995 Dietary Guidelines for Americans and supporting scientific knowledge. USDA's Food and Consumer Service, in conjunction with the Center for Nutrition Policy and Promotion, will be conducting a scientific review of the WIC foods. Until this review is completed, the Department will not be making any changes in the current Federal sugar cap for WIC cereals.

QUESTIONS SUBMITTED BY SENATOR BURNS

BISON MANAGEMENT

Question. Mr. Secretary, I have always had great respect for the Animal Plant Health Inspection Service and the work that they have done to provide a healthy standards for American agriculture. I have never had a problem working with the restrictions that they have imposed in order to re-enter this country after visiting foreign countries. Today though this faith is waning. Can you explain to me the value of the guarantees that APHIS has provided the State of Montana?

Answer. One of APHIS' top priorities is to ensure the integrity of the Cooperative State-Federal Brucellosis Eradication Program and to protect the brucellosis-free status of the States surrounding Yellowstone National Park. These goals are critical to our efforts to encourage and support the domestic and international trade of beef cattle.

APHIS, along with the National Park Service (NPS), proposed a plan to stop bison from migrating outside of Yellowstone. This proposal suggests expanding the bison range into the adjacent Gallatin National Forest. The NPS will deploy 24-hour patrols to keep bison migrating from Yellowstone to a minimum and contain those animals that stray to a section of the Gallatin National Forest.

Question. I ask this Mr. Secretary, because in the past States have either placed or threatened to place restrictions on the shipment of Montana beef cattle into their States. Yet APHIS continued to guarantee the brucellosis free status of Montana. Can you explain the value of your determination to continue the brucellosis free status for Montana?

PART 1

110

Answer. Maintaining Montana brucellosis free enables Montana ranchers, as well as other border States, to continue shipping cattle into other markets. The threat of the spread of brucellosis can cause havoc to the state's livestock economy.

Question. In more than a dozen years of discussion among all the parties involved, and more recently the discussions between your office and Secretary Babbitt. Would you provide me with a breakdown on the movement that has occurred, if any?

Answer. APHIS, in cooperation with the Department of Interior's (DOI) NPS and the State of Montana, has recently agreed to an interim management plan in Yellowstone. The plan includes provisions for the capture, testing, slaughter, and removal of diseased bison that migrate outside certain areas in or adjacent to the Park. Federal and State agencies are also using additional coordinated nonlethal means to manage the bison and maintain the viability of the Yellowstone herd. Additionally, APHIS is working with DOI and State officials to develop long-term solutions that would eliminate brucellosis from the Park's herd and manage its population within the confines of available rangeland.

Question. Mr. Secretary, it is my understanding that you have finally taken a role in this discussions on this issue. With this in mind I would like to know why it took so long for you to come to the table on this matter?

Answer. As you know, this has been a very critical and sensitive issue. I have been engaged in the ongoing discussions regarding the management of bison at Yellowstone. I would like to take this opportunity to reassure you that I am committed to making progress towards a long-term solution for bison management that is acceptable to all parties involved in this process.

APPROPRIATE FUNDING MECHANISMS

Question. Mr. Secretary can you provide the committee with your position on the issue of funding of grants from the federal government? Do you in your position believe more in competitive grants or do you have faith and a commitment to the formula form of providing funding for agriculture research?

Answer. Federal grant programs provide the most effective mechanism for eliciting and supporting meritorious science being conducted by the land-grant universities, public and private universities, Federal laboratories, and other research institutions and individuals across the country. Federal dollars often support highly innovative research which requires an investment in time and money to which private industry often cannot commit.

However, Federal formula funding is also necessary to have a balanced funding portfolio. Formula funding for the land-grant universities continues to provide stable support for core university staff, operations, and equipment. Formula funding is also used to support on-going research projects which provide the information required to respond to critical issues currently faced by the agricultural community.

FEDERAL SUPPORT FOR AGRICULTURAL RESEARCH

Question. Mr. Secretary, could you provide me and this committee with any and all information you have of organizations outside the Federal government that are in a true position to pick up the role of USDA in agricultural research? I would like to find out where you expect the slack to be picked up and how you can justify the funding you have established at this time?

Answer. The USDA budget for agricultural research in fiscal year 1998 is \$1.8 billion, and represents a continuing strong commitment to that activity. Our role is to address research issues that are national and regional in scope, and long term and high risk in nature. Within the constraints of our budget and in order to ensure that we provide the resources necessary to work on those programs and new issues of highest priority in the broad national interest, we have proposed termination of some projects and activities judged to be less critical at this time. USDA has not specifically suggested that the terminated research be picked up by other organizations outside the Federal government.

However, other organizations also conduct research relevant to agriculture. Land-grant institutions, for example, are well noted for their research capabilities. Some industry or other private organizations are also involved in agricultural research. However, they tend to focus on projects that solve a specific industry problem or where there is financial profit. We recognize that both state and private institutions, like the Federal government, are experiencing financial constraints, which limits their level of research.

To the extent a particular problem or research activity is truly essential to a state, local or private sector group, they need to go through the same difficult priority setting process, as USDA has done, to decide on how best to allocate their available resources. All Federal agencies, universities and private industry need to work

PART 1

111

together in partnership to assure a well-balanced agricultural research agenda that collectively serves national, regional, state and local agricultural interests.

JUSTIFY REDIRECTION OF RESEARCH DOLLARS

Question. Mr. Secretary, I know you are aware of the many threats, including kernal bunt, foreign competition, that face our producers in the world market. Can you explain to me how you can justify the redirection of research dollars at a time when our yields on crops are dropping and when we face the problems of outside pressure on our crops.

Answer. Federal resources are being curtailed government-wide in an effort to reduce the deficit and help balance the Federal Budget. The Administration and the Congress are examining all programs in order to generate savings that will enable a leaner, more responsive Federal government that will provide for the most essential services to promote the Nation's economy, sustain the environment and improve the lives of all Americans.

The ongoing ARS research programs that have been identified for termination have been deemed less critical for ARS to continue in light of higher priority research needs and important agricultural problems. The savings achieved will be redirected to finance higher priority agricultural research initiatives recommended by the Secretary and the Administration in accordance with the President's budget.

Finally, we believe the trend in total factor productivity—a broad measure of output per unit of purchased inputs, labor, and capital rather than just yields per acre, is more appropriate indicator of the return on investments in agricultural research. The trend in factor productivity is encouraging. In the period 1948–1993, the productivity increased at an annual rate of 1.8 percent.

DISASTER ASSISTANCE

Question. Mr. Secretary, I understand that you have the authority to establish an emergency committee made up of leaders of the various agencies in the States. Mr. Secretary, can you explain why these committees don't seem to be functioning in the many States in the west that are suffering through very difficult conditions this winter?

Answer. A USDA State Emergency Board (SEB) is established in each State and in the Caribbean Area. The boards constitute the organization responsible for carrying out USDA's national security and emergency functions. The boards consist of representatives from the following: Farm Service Agency, Animal and Plant Health Inspection Service, Food and Consumer Service, Forest Service, Food Safety and Inspection Service, Natural Resources Conservation Service, National Agricultural Statistics Service, and Rural Utilities Service. The SEB's are functioning and meet on a regularly scheduled basis and when needed. For example, SEB's in Montana, North Dakota, and South Dakota have reviewed or will review the Damage Assessment Reports required for those States' Secretarial Designation requests.

Question. I cannot understand how people sitting in Washington can look at news reports and think that the only disaster in the mid-west this year occurred in North and South Dakota. Mr. Secretary, storms do not understand State lines. Can you explain the process for declaring feed assistance disaster for the States?

Answer. Requests for FSA implementation of feed assistance programs originate from county committees which are composed of producers and ranchers in the local communities. However, the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act) suspended, through the year 2002, several provisions of the Agricultural Act of 1949, including all Livestock Feed Programs and the Indian Acute Distress Donation Program. With the exception of 210 counties in four States that were authorized to provide assistance before the suspension, most livestock producers were left without any viable emergency feed assistance programs for the 1996 crop year.

USDA implemented the Disaster Reserve Assistance Program (DRAP) for the 1996 crop year only on the basis of an FR Notice published on October 29, 1996. Funding for the program was provided by sales of disaster reserve stocks. The Disaster Reserve was authorized under the 1970 Act, Section 813(c). A concurrent resolution of Congress in 1996 provided authority for the Secretary to use these stocks. DRAP has been authorized in 463 counties in 20 States, and has eligibility criteria similar to the former LFP; however, DRAP provides a 30 percent cost share rather than 50 percent. No authority currently exists beyond the 1996 crop year for this program. Proposals are being developed to utilize the provisions under the Agricultural Act of 1970 to operate emergency programs for 1997 and future years; however, funds are limited.

PART 1

112

In response to severe winter weather in the Plains, USDA developed and delivered the Emergency Feed Grain Donation Program (EFGDP) in North and South Dakota, and the Foundation Livestock Relief Program (FLRP) was implemented in North and South Dakota, portions of Minnesota, and in several contiguous counties in adjacent States. Authority for the program was an Interim Rule, effective January 10, 1997, which amended 7 CFR Section 1439.402(a) to read: "(a) Assistance is for eligible livestock that are commingled, stranded, and unidentified as to the livestock owner. . . . Such losses must occur during the 1996 crop year because of snow or freezing conditions where a emergency declaration has been made by the President and while emergency snow conditions exist as determined by DAFP."

According to this Interim Rule, the President must have made an emergency declaration for a State or county as a condition of eligibility for initiating this program. The entire States of South Dakota, North Dakota, and certain counties in Minnesota were declared disaster areas by President Clinton. The FSA Deputy Administrator for Farm Programs (DAFP) determined that all counties in North and South Dakota met all eligibility requirements for EFGDP, and that all counties in North and South Dakota, counties contiguous to North and South Dakota, and counties in Minnesota for which a Presidential disaster declaration was made, were eligible for assistance under FLRP.

As indicated above, although EFGDP benefits were limited to North and South Dakota, FLRP benefits were available in North and South Dakota, and certain counties in Minnesota, Iowa, Nebraska, Wyoming, and Montana.

Question. In Montana this winter we have seen people feeding in October who are not usually scheduled to feed until late spring. We have cattle starving because of the conditions of the range. They cannot get to the sod and find the forage necessary to continue. Yet it took until January for the department to address this situation. Then it took another two weeks to get the information into the hands of those people who need the help. Could you explain this?

Answer. As indicated in an answer to another question, the 1996 Act suspended all emergency livestock feed programs beginning with the 1996 crop year through the year 2002. Emergency livestock feed assistance was implemented for the 1996 crop year on an ad hoc basis on the basis of an FR Notice published on October 29, 1996. Funding for the programs was provided by sales of disaster reserve stocks. The Disaster Reserve was authorized under the 1970 Act, Section 813(c). A Presidential designation in 1996 provided authority for the Secretary to use these stocks.

Although much of the fall grazing acreages in the Northern Plains were covered by snow in November, emergency conditions did not ensue until severe storms and extended sub-zero temperature conditions occurred, beginning in January. At that time, assistance was requested from USDA, and Secretary Glickman responded by initiating the EFGDP and FLRP programs, effective as early as January 10, 1997.

PACKER CONCENTRATION

Question. Mr. Secretary, what are the Department's plans for continued investigation into what is happening in regards to packer concentration?

Answer. I established a task force in the Department co-chaired by the Assistant Secretary for Marketing and Regulatory Programs and the Chief Economist. The Department has already (1) broadened the coverage of market reports to include the volume of slaughter cattle contracted for sale, (2) expanded reporting of livestock and poultry markets to include value-based pricing indicators (ie., premiums and discounts) and,(3) sought comments on the petition for rulemaking from the Western Organization of Resource Councils (WORC) requesting USDA to restrict certain livestock procurement practices. We are also seeking comments regarding regulations to address contract poultry grower issues.

CONSERVATION RESERVE PROGRAM

Question. I would appreciate you explaining to me the process of the determination of lands that will be eligible for admittance into the Conservation Reserve Program. I would also be very interested in the process that was used in the rule making procedure. I am greatly concerned that the way the rules were written that you provided no opportunity for Congressional review. We have numerous inquiries in our offices as to what happened and why it happened in the way it did.

My question is, how can you justify making almost half of the crop land in America eligible for the enrollment in the program, when the acreage for inclusion in the program is capped at 36.4 million acres?

Answer. The focus of CRP involves three major objectives, including reducing soil erosion, improving water quality, and enhancing wildlife habitat. Our determination to include a larger pool of eligible acreage ensures that acreage with the greatest

PART 1

113

environmental benefits, considering all program objectives based on the environmental benefits index, will be selected. It was also decided that all land classified as Highly Erodible Land should be eligible to be offered for CRP since those lands are subject to conservation compliance provisions.

Also, because no more than 25 percent of the cropland in a county can be enrolled in the program at one time, a significant amount of otherwise eligible land could not effectively compete for enrollment. Once a county has reached the 25 percent limit, enrollment generally ceases, even for lands that may be eligible and rank higher based on EBI scores than other accepted lands in another county that has not reached the 25 percent limit. Thus, of the 230 million to 240 million acres, about 55 to 60 percent of the 420 million acres of U.S. cropland in 1992 (including cultivated and non-cultivated cropland and CRP lands), that are eligible based on environmental and cropping history criteria only about 100 million acres (less than 25 percent of U.S. cropland) could ever really have a chance to be enrolled.

After the proposed rule was published in September 1996, 3,467 comments were received which were reviewed by National, State, and local FSA employees to categorize by subject. An interagency team composed of several USDA agencies, United States Fish and Wildlife Service and the Environmental Protection Agency developed issues which were reviewed by NRCS and FSA field employees and a final rule was published in February 1997. USDA is committed to moving forward with the sign-up and notifying producers as soon as possible.

ROLE OF THE SECRETARY OF AGRICULTURE

Question. In my statement, I mentioned the problems my staff faced in scheduling a meeting with you. On numerous occasions they called your office over a two week period of time. On one occasion they were told that you were on travel and that they would get back to us to schedule a meeting. Mr. Secretary, we never heard from them. I wonder if this is commonplace in the department and if you can assure me that this type of action was an oversight or what exactly occurred here.

Answer. I regret that there was a misunderstanding regarding our efforts to schedule a meeting with you and other members of the Montana congressional delegation on February 27. Coordinating the schedules of one Congressman, two Senators and two Cabinet Secretaries is never an easy task, but I am happy that ultimately we were able to arrange a meeting to discuss the bison issue. I am sorry that your staff was apparently not contacted directly with respect to the scheduling of this meeting. However, I am told by our scheduling office that it is easier to coordinate delegation-wide meetings when one congressional office serves as the principle point of contact for the scheduling of such meetings. In most cases, this minimizes confusion and misunderstandings. I regret that this was not the case in this instance.

Question. Could you provide me a brief summary of what plans are in the coming year to get out in the country and talk about the agriculture producers in our country?

Answer. Throughout my 18 years in the United States Congress and during the two years as Secretary of Agriculture, I have traveled to 37 states visiting both rural and urban communities impacted by USDA programs and services. The members of my subcabinet and I are tireless advocates for all Americans living in rural communities and agricultural producers, especially family farmers. Last year alone 1 million Americans moved back into rural communities, and rural incomes—both on and off the farm—are steadily climbing. I have traveled from Indiana where I met with producers to discuss corn and row crop issues to the central valley of California where farmers and I talked about vegetable harvesting and international trade. I have flown around North Carolina to view hurricane damage and flown to Indonesia to increase U.S. agricultural markets abroad. Everyday, my subcabinet and I work to ensure that the United States is the number one agriculture producer in the world.

At USDA, we are changing the way government does business by increasing opportunities for all stakeholders—consumers, producers, and industry—to have a voice in policy development. After attending countless listening sessions on issues such as concentration, food safety, dairy pricing, and civil rights—we have taken decisive action to make things better. My plans for the coming year are to take every opportunity I get to listen to agricultural producers and rural Americans and serve as their advocate at home and abroad.

Question. What do you see as your role for being the primary spokesman for agriculture in America? I would hope that you will be more involved than I have witnessed in the past.

PART 1

114

Answer. Most Americans do not realize how much they are touched each day by the programs and services of the United States Department of Agriculture. As an 18 year Congressman and now as Secretary of Agriculture, my job has always been to educate Americans that from the food we eat, to the clothes we wear, to the soil we farm and the streams we fish, USDA programs affect the quality of life all Americans enjoy. USDA programs impact the American landscape from our National Forests to the great plains, soil conservation, agriculture research, and food and nutrition programs—they are all a part of USDA.

Although the recent Farm Bill significantly reduced the Department's role in production agriculture, there is still much the Department is doing to ensure the continued economic prosperity of the U.S. agricultural sector. We are working to expand trade opportunities, promote a fair and competitive marketplace at home and abroad, and improve the safety net for farmers. Also, the research the Department conducts helps farmers to be more productive, more environmentally conscious, and more profitable, all at the same time. American agriculture has seen a lot of change and progress, and the future holds even more. As the primary spokesman for agriculture, I want to help farmers and ranchers take advantage of the tremendous opportunities this new era in agriculture offers.

FARM SERVICE ADMINISTRATION

Question. It is my understanding that the Administration looks to reduce the staffing of the field offices in the states. That there is a movement afoot to make the employees of the county offices federal employees. Could you explain the entire process by which you are looking to reduce the Farm Service Administration at the state and county level?

Answer. The fiscal year 1998 President's budget anticipates reducing the Farm Service Agency's employment by approximately 2,100 staff years from fiscal year 1997 estimated levels. This reduction, primarily in the field, reflects the reduced workload associated with the programmatic impacts of the 1996 Farm Bill and anticipated closing of another 500 USDA field service centers by 1999. We are uncertain at this time of where the employee reductions and office closures will take place because agency and USDA plans have not been finalized. We anticipate spending much of fiscal year 1997 analyzing our delivery systems for additional opportunities to achieve greater efficiencies in the Farm Service Agency and other agencies located in the field. FSA and other program delivery agencies face a different future today than they did one year ago. The 1996 Farm Bill significantly changed FSA workload requirements and further study is needed. To assure that USDA provides the best service possible to our customers, any decisions to close USDA field offices or reduce an agency presence in a USDA service center must be done in coordination with other agencies located at the site, including Rural Development and Natural Resources and Conservation Service. No additional office closures will take place until the situation has been thoroughly studied and USDA plans have been shared with Congress and USDA's customers.

Question. What is the plan to make county directors and staff Federal employees?

Answer. While the Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994 provides that Federal and non-Federal employees could be used interchangeably in local USDA offices in the implementation of programs and activities assigned to the FSA, operating a dual employee delivery system at the county level has been difficult. Recently, the USDA Civil Rights Action Team (CRAT) recommended that the FSA county committee system be modernized by converting all county non-Federal employees to Federal status. This will require legislation.

Question. Would you not agree that this will move the focus from local control to a more centralized Federal control system?

Answer. Converting non-Federal county employees to Federal status would remove local county committee control from employment decisions in FSA county offices. However, this change would not significantly lessen or eliminate the county committee program delivery system because county committees would retain most of their responsibilities for programs and other functions delegated to them by the Secretary of Agriculture and the FSA Administrator.

I support the effort to convert non-Federal county employees to Federal status for the following reasons: 1) FSA Federal and non-Federal county employees are working side-by-side, and as farm credit functions continue to be integrated, are, in many cases, doing the same work. 2) having all FSA county employees under one Federal personnel system makes it easier for FSA to supervise and deliver programs in the field; treat all county employees fairly, consistently, and equitably; and extend Career Transition Assistance Program benefits to all county employees who are invol-

PART 1

115

untarily separated. 3) as pointed out by the CRAT report, converting non-Federal employees to Federal status makes all county employees accountable to Federal regulations and minimizes the effect of farmer elected county committees on employment decisions.

Question. Can you describe the process that will be used to reduce the state office numbers?

Answer. No agency or USDA plans for reducing employees or number of offices have been finalized. The fiscal year 1998 President's budget proposes a reduction of 2,119 staff years, of which 269 are federal staff years and 1,850 are non-Federal staff years. These staffing reductions reflect the programmatic impact of the 1996 Farm Bill, and imply a reduction of about 500 local offices providing service delivery. In order for FSA to meet the changing mission of the agency, FSA is in the process of preparing strategic plans to address these issues and determine program delivery changes which will provide an optimum organizational structure to reduce costs and streamline the delivery of services. However, no plans have been approved at this time. Once plans are finalized, FSA intends to offer buyouts in an effort to minimize involuntary separations. However, it is unlikely that all reductions can be achieved through buyouts. After we have offered a voluntary buyout, then FSA will use RIF's to meet reduction targets. Federal RIF procedures (using tenure, veterans' preference, performance, and length of service) will be used to determine which Federal employees will be RIFed. Internal FSA RIF procedures (identifying the employees who are best qualified to perform work) will be used to determine which non-Federal employees will be RIFed. If non-Federal employees are converted to Federal civil service status, they will be subject to Federal RIF procedures after the conversion.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

Question. Mr. Secretary, you have been blessed by having a very competent person in the leadership position at GIPSA. Can you explain to me how it is that you expect these people to address the continuing concerns of the agriculture producers in our country, without providing them with the funds to do any such investigation and prosecution?

Answer. An additional \$2.8 million is included in the fiscal year 1998 Budget request for GIPSA to increase their capability to monitor and analyze packer market competition, study the implications of structural change and behavioral practices in the meat packing industry, address poultry compliances issues, and enable the electronic submission of industry data. These additional resources will enable an increased capability to support legal actions that require complex economic and statistical analyses.

WIC SUGAR LIMIT

Question. I wrote to you in June 1996 regarding USDA's Notice of Intent to Propose Rulemaking regarding the Special Supplemental Nutrition Program for Women, Infants and Children (WIC). USDA proposed to review the nutritional regulations limiting the amount of sugar in WIC-eligible cereals. In my June letter, I expressed my support of WIC and the program's current cap on sugar content, given the importance of a healthy and nutritious diet to WIC recipients. I wanted to reiterate my support for the current limit on sugar content, and I again request any information supporting a review of this issue by USDA.

Answer. I am pleased to know that you, like many of your colleagues in Congress, are a supporter of the WIC Program. We periodically consider recent research findings and advice from leading professional health and nutrition authorities to determine whether revisions in Federal program guidelines or regulations are needed.

The March 1996 WIC Cereal Sugar Limit Notice stated that USDA was aware that the newer clinical evidence indicated that sugar consumption is not believed to be an independent risk factor in the development of the chronic diseases of coronary heart disease, noninsulin diabetes, obesity and hyperactivity. We used the public forum of a Federal Register Notice to solicit feedback from the broad sectors of the community on whether continuation of a Federal restriction on the amount of sugar allowed in adult WIC cereal is still warranted. Among the many comments we received were suggestions that neither sugar nor any other attribute of WIC foods should be viewed in isolation, but rather they should be reviewed in the context of all of the WIC foods and their use in achieving WIC goals.

In follow-up, the Department will publish a notice in the Federal Register to summarize the public comments USDA received on the March 1996 Notice and to announce the Department's decision to examine WIC foods for consistency with the 1995 Dietary Guidelines for Americans and supporting scientific knowledge. USDA's

PART 1

116

Food and Consumer Service, in conjunction with the Center for Nutrition Policy and Promotion, will be conducting a scientific review of the WIC foods. Until this review is completed, the Department will not be making any changes in the current Federal sugar cap for WIC cereals.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

ORGANIC STANDARDS

Several years ago, Congress enacted legislation to establish federal standard for organic products of which there is a growing demand. Organic producers in Arkansas have shared with me their continuing frustration with the delays in USDA's promulgation of these standards.

Question. What is the status of this effort and when do you think these standards will be in place?

Answer. I share your frustration and have been assured that these are complex standards for a wide range of fruits, vegetables, nuts, field crops, livestock, dairy, and poultry. We anticipate that the proposed rule for national standards for organic products will be published this spring. In addition to standards for production, the national organic program will include provisions for labeling of organic products; certification of organic farms and processing facilities; USDA accreditation of private and State agents who will conduct certification; compliance and enforcement measures; user fees; and criteria for determining the equivalency of imported organic products. When the comment period on the proposed rule has closed, we will move as quickly as possible to address concerns that are raised and publish a final rule in time for the next crop season. Accreditation of private and State agents, and the certification of farms and processing facilities, would begin shortly thereafter.

Question. Can you provide information relating to the economic loss to the organic industry due to the failure to implement these standards?

Answer. The organic industry has been growing at a rate of 22 percent each year for the past six years. We estimate that the implementation of national organic standards will allow the industry to continue to grow at this rate, or higher, for several more years, particularly with the introduction of organically produced meats and poultry.

PROGRAM TERMINATIONS

Question. The FAIR Act of 1996 terminated many programs that had long been relied upon by farmers across America. Even before the 96 Act, congress had taken other action to terminate or vastly modify various agricultural programs. The Honey Program comes quickly to mind. I know the 96 Act creates a commission to evaluate the direction farm policy should take in the 21st Century. But I am wondering what evaluations you may have already made about the short and long term effects of terminating programs like the Honey Program? Is USDA following the effects of the termination of farm programs?

Answer. USDA continues to establish supply, use, and price estimates for a number of crops that remain eligible for production flexibility contract payments but were subject to the termination of programs such as the Acreage Limitation, Cash Land Diversion, and Farmer Owned Reserve Programs.

In the case of honey, all prior program provisions and payments were terminated. No formal evaluation of effects of this program termination has been initiated and accounting for honey program supply and use at the national level has been discontinued. However, honey marketing information continues to be collected. The monthly National Honey Market News continues to be published by USDA's Agricultural Marketing Service. This publication tracks State-level honey prices and weather, disease, and marketing events affecting the industry. Additionally, USDA's National Agricultural Statistics Service is continuing its survey and reporting of the number of honey producing colonies, yield, production, stocks, average price per pound, and value of production. These information collection activities do not constitute an evaluation of the full effects of the termination of the honey program, but they do help us monitor the situation in the honey production sector.

Question. What has been the effect of eliminating the Honey Program on the pollination of crops?

Answer. USDA is not currently examining the effects of the elimination of the Honey Program on crop pollination. In May 1994, USDA's Economic Research Service published "The U.S. Beekeeping Industry," a study directed by Congress. That report included a profile of the pollination industry but did not establish any particular linkages between pollination services and provisions of the Honey Program,

PART 1

so a baseline relationship between the old program and the availability of pollination is lacking.

The marketing loan provision for honey terminated effective with the 1994 honey crop, and loans were available only through the 1995 crop. However, in August 1995 the U.S. entered into an agreement with the Government of China limiting Chinese honey exports to the U.S. and establishing a price floor for Chinese imports. This agreement is generally viewed as a major cause of the increase in domestic honey prices from an average of 53.9 cents per pound in 1993 and 52.8 cents in 1994 to 68.5 cents in 1995 and 89.4 cents in 1996. Over the same period, and in spite of these market-price increases, honey production has steadily declined. USDA estimates domestic honey production at 230.6 million pounds in 1993 and at 198.1 million pounds in 1996. Some industry opinion is that price increases since 1993 have only offset operating-cost increases that have occurred due to mite and disease problems.

The steady decline in the estimated number of colonies (from 2.876 million in 1993 to 2.566 million in 1996) suggests an overall decline in pollination, and the cause of the decline in colonies appears to be mites and diseases and not the reduction/termination of price supports. It is widely held in the honey industry that mites and diseases have largely eliminated feral bee populations, thereby eliminating pollination unless provided by commercially managed colonies. The results of these mite and disease problems are lack of pollination or deformed fruits and vegetables due to reduced pollination.

Question. Is research on Honey Bee disease and similar topics keeping pace with this problem?

Answer. Research in honey-bee disease and mite control is not keeping pace with the growth of these problems, as evidenced by the dramatic decline in the number of colonies (from 3.528 million in 1989 to 2.566 million in 1996). There is evidence that mites are becoming resistant to the one insecticide that has been in use, and effective treatments are not yet perfected for the viral, bacterial, and fungal diseases that result in colony loss. Further reductions in colony numbers are anticipated and reduced commercial pollination services may result.

Question. What other problems do you foresee for the termination or substantial modifications of other traditional farm programs?

Answer. The new Farm Bill has substantially modified many of our traditional programs. It is widely assumed that the termination of Federal acreage controls on crops previously managed by acreage reductions and land diversions will generate more price and income risk for producers and possibly more volatile prices for consumers. It has been difficult to separate the effects of programs from the effects of market factors on price volatility. However, the phase out of programs that provided price and income support signals the need for greater efforts within remaining programs to protect producers from income fluctuations. Thus, the Department is proposing an expansion of the revenue insurance programs and is proposing other steps to improve risk management programs.

Another concern is that any decline in income payments as a result of a program phaseout may make it more difficult for some commodities to compete in international markets that are heavily subsidized. And since export markets are crucial to the prosperity of many commodity producers, the effect of program changes on our ability to compete in these markets is an important concern. On the plus side, the modifications which increase producer flexibility to respond to market signals should enhance our competitiveness in international markets.

The Department will be studying the effects of changes made in the 1996 Farm Bill. Clearly, when programs are terminated or modified, substantial adjustments are required by producers and landowners. Our experience with program terminations is quite limited. The Honey Program was recently terminated as well as the Wool and Mohair Program. Both were rather specialized and its not clear yet what lessons can eventually be drawn from these cases.

The wool and mohair support programs authorized under the National Wool Act were phased out during the 1994 and 1995 marketing years, and the National Wool Act was repealed as of December 31, 1995. Since the program ended, USDA has maintained two annual reports—*Sheep and Goats* and *Wool and Mohair*—which indicate that both industries have continued a decline that began long before the program phase-out. USDA also has continued holding quarterly interagency meetings to derive supply/use estimates and projections for both commodities. However, USDA has not conducted a formal study to assess the effects of the termination of the program.

Although support to individual producers has been terminated, the Federal Agriculture, Improvement and Reform Act of 1996 authorized up to \$50 million for a National Sheep Industry Improvement Center. One objective is to “strengthen and

PART 1

118

enhance production and marketing of sheep or goat products in the U.S.” Rural Development is the lead agency for this effort.

FARM SAFETY NET

Question. I understand you will soon be sending to Congress a package of legislative proposals to improve the safety net for farmers and ranchers to help ease some of the harsh results of the FAIR Act of 1996. Included in that package will be a proposal to extend the period of time in which commodities may be held under CCC loan.

I have been hearing from farmers in my state, cotton farmers in particular, who are suffering terribly from falling market prices and whose CCC loans will be expiring this summer. For example, a cotton farmer in southeast Arkansas may have cotton under loan for \$0.52 a pound. The price on the New York Cotton Board is around \$0.73 a pound. The farmer may now be able to sell his cotton to a merchant for an \$0.08 equity giving him a total of \$0.60 a pound, far below the New York price. If the term of the loan could be extended, many farmers would be able to ride out the current marketing cycle. However, I fear many farmers in my state will not be able to stay in business long enough to wait for a lengthy legislative process to amend the 1996 Act.

What steps can USDA take immediately to reduce the harm to cotton farmers, and to farmers generally, resulting from current market conditions?

Answer. Virtually no policy initiatives have been left to USDA under the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act) which could be used to strengthen prices. This is the primary reason that we have submitted our legislative proposal which would grant authority for 6-month loan extensions under certain market conditions. The tenor of the 1996 Act is that farmers will look more to the marketplace for their income and essentially requires that farmers learn new marketing techniques. At this point, we can only suggest that farmers try to hedge their crops on New York. Instead of selling loan equities to merchants, farmers do have the option of selling on New York, themselves, and receiving more than the merchants are offering.

Question. Is there anything USDA can do in this respect short of legislation?

Answer. The 1996 Act eliminated the authority for loan extensions, and we cannot use other legislation such as the Commodity Credit Corporation Charter Act as authority to do so. New authority must be enacted by Congress.

COUNTY OFFICE CLOSURES

Question. I appreciate your statement of recent days that county offices will not be closed without close examination of continuing demands for service delivery. Can you provide an idea of the type of criteria and timetables you will use in implementing further downsizing and office closures?

Answer. The fiscal year 1998 President's budget anticipates reducing the FSA's employment by approximately 2,100 staff years from fiscal year 1997 estimated levels. This reduction, primarily in the field, reflects the reduced workload associated with the programmatic impacts of the 1996 Farm Bill and the anticipated closing of 500 USDA field service centers by the end of 1999 as stated in the 1998 Budget proposal. Agency and USDA plans have not yet been finalized and will not be until after consultations with Congress on any further office closures. We anticipate spending much of fiscal year 1997 analyzing our service delivery systems in order to obtain an optimum organizational structure while stressing efficient and effective service to our customers. This includes contracting for an independent study to explore opportunities for further savings in FSA and NRCS.

Question. If we have no choice but to provide funding levels for personnel below the budget request, do you have enough buy-out or similar authorities to avoid the disruptive results of simple Reductions in Force?

Answer. The fiscal year 1998 President's Budget request for FSA Salaries and Expenses includes \$56.2 million in separation costs in order to achieve staffing reductions of 2,119 employees in fiscal year 1998. This amount includes \$6.7 million to separate 269 Federal office employees and \$49.5 million to separate 1,850 non-Federal county office employees. These estimates reflect the assumption that reductions-in-force will make up 75 percent of all separations since the number of employees eligible for buy-out is declining due to the major use of buyouts within the FSA over the last several years. If Congress appropriates 1998 funds below the budget request, the Agency would be forced to conduct an even greater RIF in fiscal year 1998. As stated, not all reductions can be achieved through buyouts since the number of remaining buyout candidates is insufficient to meet any additional staff reduction that reduced funding levels might require.

PART 1

119

MEAT AND POULTRY INSPECTION USER FEES

The budget again proposes user fees for meat and poultry inspection. This time, the proposal goes beyond previous efforts to recover the cost of second shift activities and would, instead, cover all in plant activities. This would cover roughly 70 percent of all FSIS costs and generate approximately \$390 million annually.

User fee proposals have been defeated in the past for a number of reasons and, obviously, this is a matter for the authorization committee. One of the reasons for these defeats has been a perception that having the companies paying for food safety inspection might be like the fox guarding the proverbial hen house.

Question. Is there a strategy whereby the imposition of these fees could be perceived as enhancing food safety and, thereby, improving consumer confidence?

Answer. The Administration believes that expanding the authority for the collection of user fees is essential to the successful long-term implementation of meat, poultry, and egg products inspection reforms, including HACCP. The collection of user fees will permit the agency to achieve dual goals of ensuring that the demand for on-site inspection services are met and the implementation of reforms to improve food safety are completed. Ensuring adequate inspection coverage and improving inspection processes will give consumers greater confidence in the safety of the American food supply. Some have indicated that the collection of user fees will compromise our ability to fulfill our obligation to ensure the safety of the food supply. This is not so. We currently collect fees for overtime holiday, and for providing voluntary inspection services to facilities handling nontraditional animals, which does not affect the manner in which we carry out our inspection responsibility.

CONSERVATION RESERVE PROGRAM

Question. You recently announced new rules to implement the Conservation Reserve Program (CRP) hoping to achieve a total enrollment of 36.4 million acres. CRP has been criticized for keeping valuable lands out of production and enrolling lands of questionable environmental benefit.

Your final rule, in my opinion, is well suited to meet the objectives of CRP that I think are worthwhile and of which I believe will silent past criticisms. Still, there are those who might question the fact that, technically, millions of acres will be eligible that are of marginal environmental value. I understand the use of your Environmental Benefits Index should result in the enrollment of only the most environmentally sensitive lands.

Can you explain how you will regard the "cost" factor of your eligibility criteria to make sure lands of value environmentally will be enrolled instead of less advisable lands?

Answer. The cost factor is one component of the overall Environmental Benefit Index (EBI). The EBI is simply the sum of 6 environmental factors plus cost. The cost factor provides more points to offers with lower rental rates. If two bids had the exact same scores for environmental benefits, the offer with the lower rental rate would receive a higher score and would be ranked above the other offer. CRP rental rates are based on soil productivity; thus, the bid with the more productive land will rank lower than the less productive acreage. The decision on the weights to be used for the cost factor will be determined after signup concludes.

Question. How soon do you think you will have the results of your first sign-up under the new rules?

Answer. Our goal is to notify producers as soon as possible after signup concludes. We anticipate the fifteenth CRP signup to be the largest in the history of the program. This will present the Department many challenges but we are committed to getting the job done in a timely manner. All producers will be notified as soon as possible; however, due to the volume of offers to be processed, it is likely to be late May or early June before producers receive word on the acceptance or rejection of their offer.

FUND FOR RURAL AMERICA

Question. The Fair Act of 1996 provides you \$100 million annually for three years to fund research and rural development activities beyond the normal appropriations process. There has been concern that unless the Fund was used in a most innovative manner, there would be attempts to recapture those savings for shortfalls in other discretionary items.

Do you think the Fund for Rural America will meet the "innovative" test? Can you explain how your implementation of the Fund will do more than simply placing additional funds in select appropriations? How will you use the Fund to do what this subcommittee can't?

PART 1

120

Answer. As you are aware, I decided to use the Fund to augment the single family housing program level which, because of interest rate differences decreased from \$1 billion to \$525 million in fiscal year 1997. Using the Fund enabled us to increase the program level to \$740 million. We also used the Fund for Water 2000 projects, Rural Business Enterprise Grants, and to meet some other critical needs. I am convinced the Research component of the Fund will generate innovative projects that address both agricultural and rural development problems. In addition, I directed that a small part of the Fund be used to address some needs related to value-added cooperative development efforts. The announcement on the use of this funding will be forthcoming.

RURAL DEVELOPMENT PROGRAM

Question. The budget proposal calls for combining several rural development programs in order to give additional flexibility to State Directors. Previous appropriations bill have given you increasing levels of flexibility to mix and match rural development programs, Your proposal also calls for \$50 million for rural development grants to states.

Can you quantify the result of the flexibility in program delivery previously provided by appropriations acts? Even though \$25 million of the \$50 million in grants to states are "matching" grants, what assurance do you have that the states will spend an additional \$25 million from what they would otherwise spend? Have you examined the history of other federal economic development grant programs that were delegated to the states? If so, what were the fate of those programs? If we provide grants to the states, do you advise allowing the states broad use of those funds for any activity?

Answer. I understand that during 1996 there was 46 instances of State Directors transferring budget authority within the water and waste disposal loan and grant programs. The vast majority of the transfers were from grant to loans, indicating to me that the State Directors were exercising good judgement by funding more projects than they would have under previous authority. A total of 30 state offices transferred budget authority from grants to loans. The monetary effect of these transfers was \$9 million in grant generated \$40 million more in loans. Sixteen states transferred budget authority from the loan program to grants, thereby reducing available loan funds by \$9.3 million to make \$2 million in grant funds available. One State Director shifted all of the grant funds to loans.

I understand the 1996 Farm Bill requires that States not supplant normal state expenditures with the funds made available under RCAP. We would of course have to monitor that, but there is some assurance the funds would be used for additional projects. I agree that the history of block grants is checkered. However, the Fair Act requires that the States expend the block grant funds for purposes similar to those funded by our agencies.

MUNICIPAL ANNEXATION

Question. Section 1926(b) of the Consolidated Farm and Rural Development Act imposes prohibitions on the curtailment or limitation of services provided through certain USDA programs.

Please provide your view of what a repeal or substantial modification of this section would do to the delivery of services to rural areas and additional cost to USDA that might result through defaults or by other means. What is the Department's position on any changes to this provision?

Answer. There are several areas of concern when discussing the annexation of property served by USDA financed water and waste systems. These concerns are:

1. Many rural systems serve users that are sparsely located and not easily served by traditional municipal systems. If part of the system is annexed, the remaining system must remain viable, but to do so may require increases in user rates that would make the system non-affordable to most users. If that occurs the entire system fails.

2. If all or part of a system is annexed, the USDA borrower must receive appropriate value for it because the borrower is still obligated to repay the USDA loan. If the system involves grant funds, then the value must reflect the value of the grant when originally financed. Otherwise the system is obtained at less than true value.

3. To ensure protection of loan security, USDA must approve any lease or sale that pertains to a USDA financed system. In many parts of the country the service areas are defined by State or local jurisdictions and when the service area is defined prior to development of systems, the need to invoke protection under section 1926(b) is alleviated. However, other States do not establish legal boundaries. It should be

PART 1

121

noted that section 1926(b) does not prevent the annexation of areas into a city. It only prohibits cities from taking USDA financed systems and the customer base that is needed to ensure that the debt is repaid.

FALLING TRADE PROJECTIONS

Last year, you reported that U.S. agricultural exports were approaching \$60 billion and you anticipated we would exceed that amount during the current fiscal year. Earlier this week, you released figures showing the estimate for fiscal year 1997 is \$55.5 billion and projections for fiscal year 1998 are only up to \$56.5 billion. These figures are well below the \$59.8 billion of fiscal year 1996 let alone the anticipated \$60 billion plus.

Question. To what can you attribute this decline in export activity?

Answer. The Department first released its \$60 billion forecast for fiscal year 1996 U.S. agricultural exports in February 1996, after only the first quarter of trade data was available. The Department held to the \$60 billion figure when trade forecasts were reexamined in May and August of 1996. When the full fiscal year 1996 trade figures were available in November 1996, the figure came in at \$59.8 billion—a difference of less than one-half of one percent from the forecast which the Department had carried for nine months.

In December 1996, the Department released its second fiscal year 1997 export forecast placing the value at \$55.5 billion. In February 1997, the fiscal year 1997 export forecast was revised upward \$1 billion to \$56.5 billion. This is the Department's current fiscal year 1997 forecast. There are no official Department trade forecasts for fiscal year 1998.

The decline from \$58.9 billion in fiscal year 1996 to an estimated \$56.5 billion in fiscal year 1997 is mainly due to reduced export prospects for U.S. wheat and corn which should more than offset expected export gains for U.S. soybeans and products, and high-value meat and horticultural products. Both lower prices and lower shipment volumes are expected to reduce export value for U.S. wheat and corn. With respect to wheat, Argentina and Australia have just harvested their largest wheat crops on record, and the European Union has also harvested a large crop. Faced with greater competition in global export markets, world prices have weakened and U.S. export volume is expected lower. With respect to corn, larger crops in some key importing countries and increased availability of foreign feed grain supplies, including feed-quality wheat, are expected to reduce U.S. corn export value and volume.

Question. What outlook do you have for the years beyond fiscal year 1998?

Answer. With respect to long-term trade forecasts, the Department's Economic Research Service publishes its "Agricultural Baseline Projections" twice a year. ERS currently projects U.S. agricultural exports to the year 2005, which reflect the U.S. agricultural policies set in place by the 1996 Farm Bill as well as other important domestic and international factors affecting trade. According to ERS's latest projections, published in January 1997, U.S. agricultural exports initially decline from the record set in 1996, but then begin a steady rise in 1998 to approach \$80 billion by 2005.

From 1998 to 2005, high-value product exports are projected to account for about 60 percent of total U.S. agricultural exports led by export gains in horticultural and animal products. Bulk commodities should continue to account for about 40 percent of the total, which implies that export gains for bulk commodities will remain above the gains recorded in the late 1980's and early 1990's.

It is important to understand that such long-term projections are based on trend analysis and, therefore, cannot be expected to anticipate the inevitable shorter-term, year-to-year variations from the estimated trends. The bulk commodity portion of U.S. agricultural exports is especially hard to forecast due to the difficulty of predicting short-term supply "shocks"—that is, annual changes in U.S. and major foreign producer crop size.

PUBLIC LAW 480 REDUCTIONS

The budget proposal provides a reduction of Public Law 480 Title I by \$117.2 million in program level. In addition, the budget calls for a rescission of \$50 million in budget authority in fiscal year 1997. In particular, the rice shipments under Title I are projected to drop from 126,000 metric tons in fiscal year 1997 (without the rescission) to 17,000 metric tons in fiscal year 1998.

Question. In view of declining trade figures, why has USDA called for further reductions in Title I?

Answer. The budget proposes reduced funding for Public Law 480 Title I in fiscal year 1998 because of the constraints on discretionary spending we face. In order to

PART 1

122

meet the President's goal of balancing the budget by 2002, we are required to make difficult choices and propose lower funding for certain programs.

Question. Since Title I levels can be transferred to Title II, does this action indicate less of a need for Title II?

Answer. The reduction proposed for the Title I program is not directly related to funding requirements for the Title II program. However, in developing our Public Law 480 budget proposals, we have maintained funding for Title II donations at the current year level because of its humanitarian objectives, while proposing a reduced program level for Title I.

RICE TRQ IN THE EU

As part of the GATT Agreement, the U.S. was to achieve duty-free access for rice imports equalling 38,000 tons into the EU. To date, no U.S. rice has been exported to the EU duty-free. I understand you have little if any authority to take action until an agreement within the U.S. rice industry has been achieved.

Question. Can you provide your thoughts regarding ways to resolve this issue?

Answer. As compensation for lost trade resulting from the accession of Austria, Finland, and Sweden to the European Union, an agreement between the United States and the EU was negotiated under the GATT and went into effect on January 1, 1996. As part of this compensation package, the EU agreed to open a tariff-rate quota or TRQ of 63,000 metric tons for semi-milled and wholly milled rice at a zero in-quota duty, of which 38,000 metric tons was reserved for the United States. The compensation also provided for a TRQ of 20,000 metric tons of husked brown rice to enter at an 88 ECU/MT in-quota duty, of which 8,000 metric tons was reserved for the United States.

In July 1996, the EU passed a regulation implementing the TRQs for rice, but this did not include a system to allocate the U.S. portion of the TRQs. The Commission was waiting for the U.S. industry allocation system to be finalized before implementing the TRQs for the United States. In order to implement a system for allocating the U.S. share of the TRQs, several U.S. industry groups have applied to the U.S. Department of Commerce for an Export Trade Certificate of Review. However, largely because of the lack of agreement within the U.S. industry, the EU has not yet opened the TRQs for either 1996 or 1997.

There seem to be only three possible ways in which this issue could be resolved. Ideally, if the U.S. industry could come to agreement on a way to allocate the quota, the U.S. industry could benefit from the quota rents which are worth about \$30 million a year. Alternatively, if the U.S. government were given the ability to allocate quotas, the benefits would still remain on the U.S. side. If neither of these options is feasible, however, it will be necessary to allow the EU to allocate the quotas; this would deprive the United States of the quota rents, but would at least preserve the market access of the TRQ's.

Question. What do you see as being at stake for the U.S. rice industry long-term?

Answer. The stakes are substantial. As a result of the three new countries acceding to the EU, the United States lost a considerable amount of rice trade. U.S. exports of milled rice to those countries fell from an average \$17.1 million in 1992-94 to an average \$3.8 million in 1995-96; exports of brown rice to the three countries fell from \$1.1 million in 1992-94 to \$23,570 in 1995-96.

Question. In what way might this dispute spill over into other trade issues such as trade barriers such as with Chile or China?

Answer. The way in which this issue is resolved could have an impact on how we negotiate quotas with other countries in the future, i.e., whether we try to achieve—either for the U.S. industry or for the U.S. government—the quota rents inherent in any TRQ.

QUESTION SUBMITTED BY SENATOR KOHL

STATE TRADING ENTERPRISES

Mr. Secretary, on the issue of international trade, we have had several discussions about our mutual concerns about the activities of the monopoly state trading enterprises, such as the New Zealand Dairy Board and the Canadian Wheat Board, and some of the unfair trade advantages that those groups have in the world market. And I appreciate your efforts to make this matter a priority in international negotiations, such as the recent WTO Ministerial Meeting in Singapore.

Question. Given the growing importance on this matter, and the potential negative effects of STEs on the international trade potential of so many commodities of importance to the United States, would you be willing to establish a special STE

PART 1

123

Advisory Group? We have such a low threshold of knowledge on this issue, and there is so much at stake, I believe a more concentrated effort could be useful.

Answer. The import and export activities of STEs, along with other issues such as tariff reductions, definitions of subsidy policies, and further cuts in subsidy levels, continue to be priority issues for the Department as we assess compliance with Uruguay Round commitments and our goals and objectives for continuation of the reform process in agricultural trade. Regarding any WTO-inconsistent policies of STEs, we welcome industry input, including through our Agricultural Technical Advisory Committee and Agricultural Policy Advisory Committee system. Such input would supplement the considerable amount of analysis of STEs which has already been done by the Department and the General Accounting Office.

Additionally, as we prepare for the continuation of agricultural negotiations in the year 2000, we would welcome industry input on negotiating objectives with respect to STEs. We do not believe that a special advisory group is required at this time, as appropriate mechanisms already exist, but welcome hearing your concerns.

QUESTIONS SUBMITTED BY SENATOR BYRD

WATER 2000

Question. What progress did the U.S. Department of Agriculture (USDA) achieve on meeting the goals of Water 2000 in West Virginia in fiscal year 1996?

Answer. In fiscal year 1996 the USDA achieved significant, steady progress in the state of West Virginia toward the safe drinking water service targeting goals of Water 2000.

In total, the department invested \$23.3 million in Water and Wastewater loans and grants (\$13.1 million in loans, \$10.2 million in grants) in water and wastewater projects in West Virginia. This investment funded a total of 22 drinking water projects, and three wastewater projects.

Of the 22 water projects, 14 were deeply targeted Water 2000 investments to the projects of lower income communities with significant numbers of unserved or under served residents.

Finally, of the 54 projects funded by the department in mid-July of 1996 as part of its Water 2000 nationwide roll-out, four were in West Virginia (Page-Kincaid Service District, Downs Public Service District, Leadsville, and Red Sulphur Public Service District). Of a total of \$58.7 million in loans and grants invested in the roll-out, \$2.25 million went to West Virginia.

These numbers show that despite a 25 percent overall reduction in funds for fiscal year 1996, the department made measurable progress on Water 2000 in West Virginia, the state with the fifth greatest need in the nation for targeted safe drinking water investments.

Question. What progress does the agency expect to make in fiscal year 1997?

Answer. For fiscal year 1997, a 35 percent increase in the loan and grant program level means that the department will fund substantially more targeted drinking water projects in West Virginia than in fiscal year 1996.

Our staff in West Virginia are working closely with the State Infrastructure Fund to leverage their loan and grant dollars. Such co-funded proposals compete very well for national USDA discretionary funds.

Question. What progress does the agency expect to make toward the goals of Water 2000 with respect to the President's budget?

Answer. Within the President's request for loans and grants, the USDA will continue to make significant, steady progress toward the goals of Water 2000. Nationwide in fiscal year 1995 and fiscal year 1996, combined, the USDA invested \$351,960,836 in deeply targeted loans and \$195,306,345 in deeply targeted grants, for a total of \$547,267,181, in 535 Water 2000 projects. This investment, however, still leaves a gap of over \$2.8 billion to reach the at least \$3.4 billion needed (according to the USDA's 1995 Water 2000 Needs Assessment) to correct the nation's most serious rural safe drinking water problems.

Question. Are there any barriers that the agency can identify that are preventing West Virginia agencies from receiving USDA telecommunications grants and loans?

Answer. There are no barriers in West Virginia that we are aware of. We have received very few applications from West Virginia over the past four years of the program.

FSA DOWNSIZING

Question. How will the expected Farm Service Agency downsizing impact West Virginia?

PART 1

124

Answer. I cannot provide any details on that because no specific agency or USDA plans for reducing employees or numbers of offices, by State, have yet been finalized. Any decisions to close USDA field offices must be done in coordination with other agencies, including Rural Development and Natural Resources Conservation Service, and approved by me, after full consultation with Congress.

FLOOD CONTROL PLANNING

Question. In 1996, the President made five national disaster declarations for West Virginia as a result of severe flooding. The affected communities critically need leadership in developing flood control plans. Please provide recommendations on how the USDA might assist West Virginia.

Answer. In response to Congressional appropriations language, the Natural Resources Conservation Service (NRCS) is providing \$300,000 from the PL-534 program under Watershed Protection and Flood Prevention to develop community-based comprehensive resource management plans for communities devastated by the 1996 flood events. The funds are being used to secure Agricultural/Engineering consulting firms to develop a North Fork South Branch Potomac River Watershed Plan. The consultant will work under the direction of the NRCS Community Based Assistance planner and will provide direct assistance to the North Fork Watershed Committee.

Also, NRCS is working with other Federal agencies in West Virginia and other states where there has been a declared national disaster to implement guidance issued on February 18, 1997, by the Office of Management and Budget and the Council on Environmental Quality. This guidance establishes a goal that Federal agencies "...achieve a rapid and effective response to damaged flood and floodplain management systems that will minimize risk to life and property, while ensuring a cost-effective approach to flood damage mitigation and floodplain management and the protection of important environmental and natural resource values that are inherent to the floodplain and adjacent lands."

This guidance includes the following procedure:

1. Setup or use existing repair coordination team to review all needs and proposals
2. Include representative from applicable state and federal agencies
3. Make recommendations as to the appropriate program and measure to use in addressing the damages
4. Encourage local community involvement
5. Develop a flood response plan.

The local NRCS staff and the other agriculture agencies work together after each storm event or other natural disaster to identify the damaged areas and develop damage survey reports (DSRs). DSRs include the work needed and the estimated cost. Total costs are then included in a request for supplemental appropriations for the Emergency Watershed Protection Program (EWP).

AQUACULTURE

Question. While the National Center for Cool and Cold Water Aquaculture is under construction, what actions will the USDA take to expand cool and cold water aquaculture opportunities in the state?

Answer. The National Center for Cool and Cold Water Aquaculture (NCCCWA) could be operational as early as the year 2000. While the Center is under construction, USDA will take the following actions to expand cool and coldwater aquaculture opportunities in West Virginia:

1. The Agricultural Research Service (ARS) will continue to work closely with the Freshwater Institute in Shepherdstown in implementing a comprehensive research program in "Development of Aquacultural Systems for Appalachia", administered by ARS. The goal of this program is to promote the expansion and diversification of the cold water aquaculture industry through the development of high volume, under-utilized water resources common to Appalachia. With guidance from ARS, the Freshwater Institute is presently developing a new 5-year proposal to design and install a scaled-up intensive production facility for trout and other salmonids, employing state-of-the-art technology for water reuse, that will be evaluated for commercial use.

2. ARS will continue to conduct an aquaculture research program at its Appalachian Fruit Research Laboratory in Kearneysville. The focus of this program is to determine the feasibility of using fish wastes from intensive aquaculture production systems as a nutrient source for fruits produced hydroponically in greenhouses. This is a promising approach to managing aquaculture wastes, maintaining water quality, and diversifying agriculture in West Virginia and Appalachia. ARS is conducting

PART 1

125

this program in cooperation with the Freshwater Institute and the Leetown, WV Science Center of the U.S. Department of the Interior.

3. ARS has reached an agreement with the Leetown Science Center (LSC) to contract for the services of a highly qualified LSC fisheries scientist, with considerable aquaculture experience, to serve as an on-site liaison for the design phase of the NCCCWA. This individual will assist ARS in ensuring that the facility design complements the facilities and resources of the LSC and optimizes the opportunities for conducting research and delivering results that best serve the needs of the U.S. in general and West Virginia in particular.

4. ARS will work closely with the University of West Virginia and appropriate state agencies to identify and develop opportunities for collaboration in aquaculture research and delivery of research results.

5. ARS is developing a technical resource group, consisting of aquaculture scientists, representatives of the cool and coldwater aquaculture industry, and key individuals in West Virginia. This group will work closely with ARS to help define a comprehensive research program for the NCCCWA that will best serve the interests of the U.S. aquaculture industry and the state of West Virginia and that will effectively complement related programs within and outside West Virginia.

QUESTIONS SUBMITTED BY SENATOR LEAHY

NATIONAL CHEESE EXCHANGE

I think everyone would agree that dairy farmers, regardless of the region, deserve a fair, accurate, and representative price for milk. I am deeply concerned that the cheese exchange fails to meet those important criteria. Strong evidence shows that the cheese exchange may have been manipulated by large corporate traders to the detriment of farmers across the country. As you know, Senator Jeffords and I recently sent you a letter explaining our view of the cheese exchange and its role in determining the Basic Formula Price. I think an alternative pricing mechanism which deserves strong consideration is a national electronic survey, operated by the Department.

Question. I would like to know whether you think a national electronic survey of dairy prices could provide a more accurate estimate than the current system of using the cheese exchange?

Answer. In response to concerns about the accuracy of cheese prices reported by the National Cheese Exchange, I have directed the National Agricultural Statistics Service to develop a weekly cheddar cheese price survey. With the support of the industry, this weekly survey will provide a timely reliable national cheese price. Plans include the combination of reporting through electronic mail, facsimile, and telephone to expedite data collection.

On January 29, 1997, the Department announced it was taking steps to address concerns raised about how milk prices are calculated and is seeking comments on whether there exists a superior alternative to NCE prices for administering Federal milk marketing orders. If improved price setting arrangements are identified, the Department will not wait for the Milk Marketing Order reform deadline of April 1999 to implement them.

Question. Do you believe such a survey would require additional funding?

Answer. Although conducting the weekly price survey of cheddar cheese prices is a new activity for the National Agricultural Statistics Service, they will perform this activity within available funds.

CONSERVATION RESERVE PROGRAM

Question. I appreciate the efforts the Department has made in carrying out our intent to refocus the Conservation Reserve Program to enroll the most environmentally-sensitive lands as contracts begin to expire later this year. As part of this effort, I understand you are going to enroll cropped wetlands and adjacent upland buffers, as well as upland buffers around non-cropped wetlands in the CRP. Departmental guidance indicates that these adjacent upland buffers may be up to six times the size of the wetlands around which they are established. Has the Department developed technical criteria for establishing these buffers to ensure that only the lands needed to buffer the wetland from adjacent land use are enrolled and to establish manageable contracts?

Answer. Guidance has been issued by the Natural Resources Conservation Service to its field units to ensure that buffer areas are limited to that which is needed (copy attached). Additionally, NRCS is undertaking a coordinated oversight effort to determine the extent to which the buffer area decisions and other technical CRP de-

PART 1

126

cisions being made in the field are consistent with national guidance and to determine where it may be necessary to issue additional instructions.

Question. What efforts are you making to ensure that accepting wetlands and associated buffers into the CRP will not result in direct competition with enrollment in the Wetlands Reserve Program, potentially driving up the cost of both programs?

Answer. The Department does not believe there is a competition problem. The purpose of expanding CRP land eligibility to include cropped wetlands and their adjacent lands is to restore and protect wetland functions and values to achieve substantial wildlife habitat, water quality, erosion control, and flood control benefits without competing with existing programs like WRP. The maximum enrollment level under each program and the duration and extent of conservation protection are notably different which could result in each program having a separate landowner constituency. If there is a cost increase, it may be in the form of higher WRP per acre easement payment costs as the WRP program begins to enroll a higher percentage of PC's in lieu of cropped wetlands. Generally, the PC's would be expected to have a somewhat higher land value than would the cropped wetlands.

WETLANDS RESERVE PROGRAM

Question. We restructured the Wetlands Reserve Program in the 1996 Farm Bill such that the Department would enroll, to the extent practicable, one-third of the acres in permanent easements, one-third of the acres in temporary easements, one-third in voluntary cooperative agreements. Have you experienced interest among landowners in all three enrollment types to meet the 1/3-1/3-1/3 enrollment goals?

Answer. Under the 1997 continuous sign-up, we have received applications for all three of the program components. Landowners have thus far offered approximately 144,000 acres for permanent easements, 96,000 acres for 30-year easements, and 13,000 acres for restoration cost-share agreements. We anticipate that landowner offers will continue throughout the year in the same relative proportion that has occurred during the first five months of the year. By the end of September, total offers will likely be at least double that which has already been received. This extensive backlog list of ranked offers will serve as the basis for the initial allocation under the 1998 program.

Question. Is splitting the enrollment equally among these three options practicable? If not, do you have an alternative ratio that would be more reasonable to achieve?

Answer. The 1/3-1/3-1/3 split is not the best manner in which the program could be implemented. Based on the landowner response to date it is apparent that permanent easements are the most popular and are being severely underfunded. The 30-year easements, while less popular than the permanent easements, still have enough landowner interest to make it practicable for the Department to reach the goal established in the 1996 Act. The restoration cost-share agreements appear to be far less popular than will be needed for the Department to be able to reach the goal established in the 1996 Act. This may become even more problematic once the CRP cropped wetlands enrollment begins to take full effect. For the Department to be able to enroll the most cost efficient and most ecologically sound wetland restoration projects in response to landowner offers, a ratio of 45 percent permanent, 40 percent 30-year, and 15 percent restoration cost share agreement would be more practicable. We do continue to support having all three options as components of the WRP.

MITIGATION EXEMPTIONS

Question. An underlying theme of the Wetland Conservation provisions in the 1996 Farm Bill was increasing mitigation flexibility options to the producer, while maintaining existing wetland functions and values on the landscape. How is USDA implementing these provisions to ensure wetlands functions and values are in fact being maintained?

Answer. In order to successfully implement the wetland mitigation exemption provision of the 1996 Farm Bill, it is necessary to conduct functional assessments of the wetlands to determine the impact of the conversion activities in order to replace the functions that are lost. Interagency (NRCS, USACE, FWS, EPA) workshops are scheduled this spring to provide guidance to the states on developing an Interim Wetland Functional Assessment Method based on the philosophy of the Hydrogeomorphic Approach to the Functional Assessment of Wetlands (HGM approach). The objective of the workshops is to train partners in the development of a functional assessment method that has the potential to be used by all agencies involved in wetland programs. Thus, providing a science-based process for making mitigation decisions which is developed and supported by these agencies.

PART 1

127

When a wetland mitigation exemption is granted by NRCS, the landowner is required to place an easement on the mitigation site. NRCS documents the information regarding the functions and values lost on the converted site and the functions and values replaced on the mitigation site, based upon the output from a functional assessment evaluation. It is the responsibility of NRCS to ensure that the proposed mitigation plan is viable. NRCS will conduct follow-up inspections of the mitigation sites until all practices are successfully established, including successful establishment of vegetation and restoration of hydrological features as planned.

CONSERVATION RESERVE PROGRAM

Question. As you know, I and many other Northeastern Senators played an important role in making sure CRP was reauthorized. That represents a huge federal financial contribution. Obviously, one reason we could do so was our belief that CRP could help address water quality and other environmental problems in our regions. In the last generation of CRP, the region from Virginia north enrolled only 300,000 acres. In Vermont, only 193 acres were enrolled. Most experts believe that a critical reason was the rate structure. CRP pays prevailing agricultural rental rates. And, in much of the Northeast, even the speculative possibility of development has a strong influence on fair market value. Second, in much of our region, the rental market is influenced by residential landowners who rent farmland out at cheap rates, essentially to make sure the land is cared for. And it seems to me that CRP is not paying fair market value. The proof is that we have extremely limited enrollments in my region.

The market is showing us the rates as they are now set are not at fair market value, or farmers would be enrolling their land. So my question is—what is the Department going to do about this?

Answer. Rental rates have been developed to reflect the dryland agricultural market value cash rents, or cash equivalent of a share rent, for each cropped soil in each county through two general steps. In the first step, NRCS and FSA national offices developed a soil productivity index for each unique soil type based on existing soil characteristics data from soil surveys. In the second step, these draft soil rental rates were distributed to each State and County FSA and NRCS office, who worked with other agencies to review and analyze, and if necessary, adjust the rates to ensure that they reflected prevailing market rents.

The State and county FSA committee in Vermont, along with other local representatives with knowledge of agricultural rental rates, developed dryland cash rental rates, adjusted for soil productivity, for each soil. The State and county FSA committees, with NRCS concurrence, determined that the rates needed no further adjustments. The CRP rental rate accurately reflects the local prevailing agricultural rental rates in their State.

Along with the use of an environmental benefits index, adoption of the new soil-specific market-based maximum acceptable rental rates has had a positive effect on CRP enrollment in the northeastern U.S. (including Virginia). As a proportion of total CRP enrollment, the northeast's share nearly doubled from about 0.7 percent of the 33.9 million acres that were enrolled before 1990; to about 1.3 percent of the 3.1 million acres that were enrolled after 1990.

Question. The Department clearly has authority to be creative on this issue, the Food Security Act (paragraph 1234(c)(1), states: "In determining the amount of annual rental payments to be paid to owners and operators for . . . (CRP), the Secretary may consider, among other things, the amount necessary to encourage owners or operators . . . to participate in the program . . ."

In other words, you may consider what rates will actually encourage enrollments. Further, section 1231(f)(4) states, that in conservation priority watersheds: the Secretary shall attempt to maximize water quality and habitat benefits . . . by promoting significant level of enrollment . . . by whatever means the Secretary determines appropriate and consistent with no additional measures are necessary to promote a "significant level of enrollment." But in the Northeastern priority areas, such as Lake Champlain, additional incentives would seem to be necessary to promote "significant level of enrollment."

What type of incentives could the Department use to address this concern and have you done it in other areas of the country?

Answer. CCC currently provides incentives to encourage enrollment of certain high priority environmental practices such as filter strips and riparian buffer areas. The incentives provide an annual increase of 10 percent to 20 percent over the site specific soil rental rate for the CRP offer. The incentives are used to encourage the implementation of these high priority practices. Any producer in any region of the

PART 1

country is eligible to receive an incentive payment if they install certain continuous signup practices such as riparian buffer areas.

Question. My region has a number of water bodies of high public concern that are threatened by pollution. Obvious examples include Lake Champlain, Long Island Sound, and the Chesapeake Bay. In many of these areas, farmers, environmentalists and State officials have come together to develop a comprehensive plan to improve water quality, but they sorely need financial support. I have heard about new use of the CRP provision that allows you to approve State-submitted Conservation Reserve Enhancement Programs which would allow States to submit comprehensive plans to tailor CRP to local needs with an additional contribution of State funds. This seems to demonstrate an important way to show the public that CRP can make a real difference for dealing with pollution problems and that incentive-based approaches can solve a specific problem. I know that several states are awaiting the Department's reaction to plans submitted by Maryland and Illinois.

What is the Department's attitude toward them? Do you have a schedule for approving these plans?

Answer. The Department supports the development of partnerships with States to address critical resource needs of State and National importance using applicable and appropriate provisions of CRP. State Government, working with CCC, is requested to develop a comprehensive plan that outlines: (1) the resource issues to be addressed; (2), the expected societal benefits to be achieved by the program; (3), the State and local contributions; and (4) the role of CRP to address resource issues. Currently, negotiations are under way between USDA and State agencies in both Maryland and Minnesota to develop and finalize Conservation Reserve Enhancement Programs.

Question. Have you set a date when other States would be invited to submit proposals?

Answer. States may submit requests for a State Enhancement Program at any time. The final rule published in the Federal Register included language regarding the availability of the Conservation Reserve Enhancement Program, and training has been provided to all FSA and NRCS State personnel.

A number of Senators have raised concerns over the Department's decision to expand the amount of eligible land for enrollment in CRP as the bulk of existing CRP contracts expire. I have long been a champion of the Program and believe that under the new rule the Agriculture Department will have the opportunity to move this Program forward to maximize environmental benefits and to help American farmers conserve the resources of their land. How the Department applies the Environmental Benefits Index (EBI) to select land for enrollment will be critical to ensuring that CRP funds are used most appropriately. I am concerned about several factors in the EBI and how they will be used in the 15th sign-up.

First, I am concerned about the cost factor in the EBI. Land with very high environmental benefits but relatively high cost should not be disadvantaged by the index. At the same time, it is very important that within a state or region, the cost factor in EBI be used to maximize competition to ensure the most cost-effective program possible.

Question. Will the cost factor be used primarily to encourage competition within regions? Or will it be used to give priority to enrollments in low-cost land areas rather than to the most competitive bids within a given area?

Answer. The Environmental Benefit Index (EBI) is the sum of 6 environmental factors plus cost. The EBI is designed to rank lands for enrollment into CRP that will maximize environmental benefits relative to cost. In order to effectively achieve that goal, each CRP offer is evaluated relative to every other offer in the country. An offer with a lower point score on the 6 environmental indices but a lower rental rate may not be more competitive than an offer that has a higher score on the 6 environmental factors and a high cost per acre. EBI is evaluated based on the total score of environmental factors and cost.

Second, I am concerned that during the 15th sign-up and a possible fall sign-up the Department will be flooded with applications from expiring contract holders. In this situation, it is possible to enroll a great deal of land that has a lower EBI in the next two sign-ups than land that may be available for enrollment in future years.

Question. Will the USDA implement a "floor" for an EBI rating when it is selecting the land for enrollment in future sign-ups?

Answer. After signup, CCC will thoroughly review all offers to ensure that land accepted into CRP provides significant environmental benefits relative to cost. CCC will use actual CRP bid data to evaluate the relative environmental benefits for each offer. Bids that do not provide significant environmental benefits relative to

PART 1

cost will not be enrolled in the program. USDA will announce the minimum EBI value at the same time it notifies producers of bid acceptance.

Third, it appears that any cropland near any water body or within any impaired watershed will receive the maximum number of points. The concern I have heard expressed is if these points are too easy to achieve, the effect could be enrollment of many whole fields even though partial field practice enrollment would be adequate to meet whatever water quality concerns do exist.

Question. How will the Department determine how much land should be enrolled to meet a specific water quality objective?

Answer. The EBI is composed of six environmental factors (soil erosion, water quality, wildlife habitat, long-term retention beyond the contract period, air quality, and conservation priority area). Rather than focus on an individual factor, the EBI was constructed to maximize the environmental benefits of all factors related to cost. Also, any area offered for CRP will likely contribute multiple environmental benefits making it difficult to target individual factors.

The determination of how much land to enroll during the 15th sign-up is limited by the authorized program level of 36.4 million acres. It is impossible to determine, though, the amount of land that will be accepted until after the end of sign-up when all offers are evaluated.

Question. Within the water quality scoring system, will maximum points be given to rare and native habitat and critical areas?

Answer. High priority water quality areas can be designated to receive an additional 30 points under the water quality factor of the EBI if the use of CRP will assist in achieving the desired water quality and habitat protection objectives in a cost-effective manner. The critical area may contain areas of rare and native habitat which may be designated by the State technical committee and approved by the State FSA Committee.

Question. Fourth, will the EBI be applied nationally or regionally?

Answer. The EBI will be applied nationally. Every offer will be compared against every other offer. Each offer will be ranked and evaluated and only those offers that provide significant environmental benefits relative to cost, will be eligible to enroll in CRP. In order to achieve the goal of maximizing environmental benefits relative to cost, each offer must be compared to every other offer.

Question. For instance, if a parcel of land in one region of the country ranks high in comparison to parcels in its region, but less favorably in comparison to parcels in other regions, how will the Department evaluate its EBI rating?

Answer. The Department will utilize the actual CRP bid data and other data sources to evaluate the impacts of the EBI. Utilizing the bid data, the Department will evaluate the impacts that EBI could have on land selection for enrollment into the program and the environmental and program impacts. This data will be available when determining the weight for the cost component of the EBI.

Question. Fifth, in the three categories being considered in the EBI (water quality, wildlife habitat and soil erosion) will there be a minimum threshold in each category for land to be enrolled? For example, if an application ranks very low in soil erosion and water quality but very high in wildlife habitat, could it be enrolled in the CRP only for its wildlife benefits?

Answer. There will be no decision on a minimum EBI threshold until after the CRP offer data is evaluated. The overall score of all factors is used to develop the EBI score. It is this score that is used to rank an offer. An offer that ranks low on one factor (water quality) but high on the other environmental factors could be enrolled into the program. Applicants have opportunities to increase their score by planting better wildlife cover or reducing their bid amount.

To be eligible for enrollment, crop land must have a cropping history, be physically and legally capable of being cropped in a normal manner and meet one of the following conditions:

- Have an Erosion Index (EI) of 8 or higher or be considered highly erodible land according to the conservation compliance provisions; (Redefined fields must have an EI of 8 or higher)
- Be considered a cropped wetland;
- Be devoted to any of a number of highly beneficial environmental practices, such as filter strips, riparian buffers, grass waterways, shelter belts, wellhead protection area, and other similar practices;
- Be subject to scour erosion;
- Be located in a national or state CRP conservation priority area; or
- Be cropland associated with or surrounding non-cropped wetlands.

Question. Finally, assuming the Department's goal is to sign-up 36.4 million acres, will the Department reserve a set amount of acres as a "future land bank" for acre-

PART 1

130

age to be enrolled under continuous sign-up in order to provide the necessary flexibility to conserve land with high environmental benefits in the future?

Answer. The Department will reserve acreage for continuous sign-up and for State Enhancement Programs.

CONSERVATION FARM OPTION

Question. The new farm bill creates a Conservation Farm Option which provides for ten-year contracts with farmers utilizing a combination of land retirement, incentive and cost-share payments to foster long-term, innovative conservation improvements. This program holds great promise for encouraging total resource management planning, alternative farming systems and practices, innovative combinations of land management improvements and partial field land retirements. It is my understanding that the program in its first year of implementation will go out as a request for proposals without the need for formal rulemaking. What is the current status of the request for proposals?

Answer. The Conservation Farm Option (CFO) request for proposals for fiscal year 1997 is undergoing final review prior to issuance in the Federal Register.

Question. When will it be issued and when will the proposals be due?

Answer. The CFO request for proposals is expected to be published in the Federal Register by March 31, 1997 subject to approval by OMB. Proposals will be due on or about May 15, 1997.

Question. Will there be appropriate program information and technical assistance for groups and individual farmers who may wish to apply for funds?

Answer. Yes. Appropriate CFO program information will be published in the Federal register and technical assistance will be available at the field level for groups and individual farmers who wish to apply.

GREEN MOUNTAIN NATIONAL FOREST

Question. In the Fiscal Year 1997 Omnibus Appropriations Act, Congress authorized a land exchange between the Green Mountain National Forest (GMNF) and Sugarbush Resort Holdings, Inc. and allowed the proceeds of that exchange to be retained by GMNF for purchase of other lands to be added to the Forest in the future. The land exchange would have considerable benefits for the GMNF and the public. The GMNF would be able to acquire lands that are more consistent with the goals of the management of the GMNF and would provide far greater environmental benefits than the parcel GMNF would offer to Sugarbush. In addition, Sugarbush would acquire a 57-acre parking lot from the Forest Service and be able to provide better skier access and facilities from Sugarbush Village. The GMNF staff have done an exemplary job in negotiating and preparing this exchange. At this point in time, all the details of the exchange have been resolved except one—Departmental approval of the exchange. Although the appropriations language was drafted and interpreted to allow the exchange, one technical question remained involving the establishment of an escrow account. It is my understanding that this question is being resolved to the satisfaction of the USDA Office of the General Counsel. I appreciate the cooperation and hard work on behalf of both agencies to resolve this issue. Unfortunately, due to the short construction period in Vermont approval of the exchange is needed in the immediate future. I am confident that your staff will be able to move this exchange forward with great efficiency. When can I expect the Forest Service to indicate to the GMNF that the land exchange is approved?

Answer. The Green Mountain National Forest is moving forward with the exchange as directed in the legislation. The Forest Supervisor is prepared to issue a decision on the exchange soon and we anticipate the first portion of the exchange will be processed by May 1 of this year.

ELECTRONIC BENEFIT TRANSFER—FOOD STAMPS

Question. I have favored eliminating the use of paper food stamp coupons and switching over to an electronic benefit transfer system for some time. It has been estimated that program losses caused by diversion of benefits and fraud could be reduced by as much as 80 percent under a national EBT system. USDA spends millions each year just on printing and distributing coupons that are used once. Would you support the mandatory elimination of paper food stamp coupons? How is the Department supporting the adoption of the EBT system in the fiscal year 1998 Budget?

Answer. The welfare reform legislation enacted last August does, in effect, mandate the elimination of coupons insofar as it requires full implementation of EBT by the year 2002. Other provisions of that legislation serve to promote timely imple-

PART 1

131

mentation of EBT, including the exemption of EBT systems from Regulation E requirements.

Currently, EBT is operational in 18 States—Statewide in 8 of these States—and in various stages of planning and implementation in the remaining States.

The 1998 Budget supports EBT implementation via sharing the cost 50:50 with the States, under the standard food stamp administrative cost share formula. In addition, \$4.6 million is earmarked for EBT implementation, less than in prior years reflecting a reduced need for implementation funding at this stage.

EBT will eventually supplant the cost of the paper food stamp system—the printing, distribution, and redemption activities—these costs will all disappear. In their place, the program will incur greatly reduced costs for card issuance and electronic redemption. Another advantage, as you point out, is that EBT will help detect and deter trafficking and some ineligible items purchases. EBT provides an audit trail making it possible to identify both stores and recipients that are abusing the program, and to do so at a fraction of the cost of traditional, labor intensive investigatory activity—which were in many cases, prohibitively expensive. In fact, EBT has already helped identify existing fraud—and EBT was at first being blamed for causing it, rather than getting credit for detecting it. Nonetheless, EBT will significantly improve program integrity. Until further advances are made, however, trafficking and ineligible items abuses are still possible with EBT, they are just harder to do without detection.

RURAL DEVELOPMENT INITIATIVES

Question. The 1996 Farm Bill included authorization for a one hundred million dollar Fund for Rural America. I strongly supported the establishment of the Fund as a much needed resource for the Department to support rural development initiatives and research that fall between the cracks of existing programs. Too often strict regulatory requirements of narrowly targeted Departmental programs disqualify innovative projects that could more effectively address the needs of rural communities.

I was therefore disappointed by the Department's decision to depend almost all of the rural development allocation on backlogs within existing rural development programs. I agree completely with the need to augment fiscal year 1997 funding for rural housing programs to offset the interest rate assumptions in the bill which would have dramatically reduced the loan program level. I am also a strong supporter of the Department's distance learning and water and sewer programs. However, within the approximately \$53.8 million direct to rural development initiatives, I had hoped to see some commitment to flexible and innovative approaches to problems facing rural America.

Do you support using the flexibility provided by the Fund for Rural America to fund initiatives which do not fit within the framework of existing Department programs, but which might more effectively address the problems facing rural communities?

Answer. I certainly support more flexible approaches to the problems of rural America. This is why the Administration strongly supported the Rural Community Advancement Program (RCAP) which contains that flexibility. Unfortunately, implementation of RCAP was blocked by the 1997 Appropriations Act.

The statutes providing for the Fund for Rural America requires the moneys specifically for rural development be used through existing programs. We are therefore limited to a certain extent by existing statutory and regulatory requirements. Additionally, it was the opinion of many Members of Congress that the funds be used to address the backlog of applications so prevalent in many of our programs and the Appropriations Act Conference Report encouraged the Department to use the funds to address the shortfall in program funding caused by the difference in interest rates. Therefore, I directed the funds be utilized to meet the most pressing needs. As you are aware, I also directed that a portion of the funds, \$2.2 million, be used for value-added cooperative development efforts and I expect some innovative proposals to come forth from this process. We will be announcing the availability of these funds in the near future and inviting applications. I also believe we will see some innovative proposals from the research component of the Fund for Rural America.

Question. I was also disappointed by the lack of communication between the Department and Congress regarding the disposition of the Fund. As an author of the bill which established the Fund I had hoped to discuss ideas about the Congressional intent behind the program. Unfortunately that opportunity was not available until the division of the Fund was finalized.

How do you intend to improve communications between members of this Committee and the Department to allow input from interested members and to ensure that

PART 1

132

detail about how the Fund for Rural America will be used are available to members well before their publication in the Federal Register?

Answer. A significant number of the Members of Congress did contact my office to express their thoughts on how the Fund for Rural America should be utilized. Those ideas, as well as the thoughts of a number of others from outside the Department, were considered in the deliberations on how best to use the funds.

RURAL FIRE TASK FORCE

Question. I would like to thank you for the unflagging support you have shown for the AmericaCorps program. The initiatives that the Department has funded in Vermont have improved nutrition services to children and the elderly, improved trails and recreation in the Green Mountain national Forest and reduced fire insurance costs for the hundreds of homeowners touched by the rural Fire Task Force.

While the AmericaCorps direct grant program has ended, the initiatives the Department helped to establish have not. I have written to you asking for your assistance in helping those organizations which wish to continue make the transition from direct Federal assistance. The Rural Fire Task Force in particular has shown tremendous return in reductions of fire insurance costs for a minimal investment of Federal dollars.

Are there existing Department of Agriculture programs the Rural Fire Task Force could apply to, or funding available within the Department to ensure that this valuable initiative will continue despite the loss of the AmeriCorps direct grant program?

Answer. There are three components to the forest service cooperative fire programs including rural fire prevention and control (through the Interior Appropriations Committee), the rural development community fire protection grant funds are passed through to the Forest Service which in turn funds applications from the State Foresters, and the Federal excess property programs through the Defense Department. In addition, there is the rural development community facilities loan program which finances a significant number of fire protection projects. I would suggest the Rural Fire Task Force contact the State Forester and the Rural Development State Director in Vermont and inquire as to the availability of funds for fiscal year 1997.

EMPOWERMENT ZONE/ENTERPRISE COMMUNITIES

Question. In 1994 when the first round of rural and urban Empowerment Zone and Enterprise Communities (EZ/ECs) were chosen, I was surprised to discover that no Vermont communities were eligible for consideration as rural Enterprise Communities. This despite the fact that Vermont is the most rural State in the country based on the 1990 Census. While Vermont does not have the high poverty levels and unemployment rates the current EZ/EC criteria require, it faces other hurdles such as higher cost of living, high fuel and heating costs and high costs for construction of housing and utilities. When take in combination with the common rural problems of a small tax base and small, widely separated communities it is clear that Vermont and other northern states have a need for rural EZ/ECs as the southern states that this designation has largely been restricted to.

The Administration requested funding in its fiscal year 1997 and fiscal year 1998 proposed budgets for another round of Enterprise Communities. I believe that any new round of rural Enterprise Communities should take into consideration a broader spectrum of economic indicators to ensure that struggling rural communities in all parts of the country are eligible to compete.

Question. What are the specific criteria for consideration as a rural Enterprise Community? How are those criteria scored?

Answer. The criteria in the legislation proposing a second round of designations is again based on the degree of poverty. Each census tract in the area seeking designation must have a poverty rate of not less than 20 percent with at least 90 percent of the census tracts having poverty rates of not less than 25 percent. The only exception provided for is that the Secretary of Agriculture may designate not more than one EZ and not more than 5 EC's that satisfy emigration criteria developed by the Secretary.

I certainly agree that there are rural areas experiencing economic problems that are not associated with poverty or unemployment and that the Federal government needs the flexibility necessary to address those problems. However, the reasoning behind the EZ/EC legislation is that traditional approaches to solving these problems have not worked well in poverty stricken communities and a comprehensive, well-focused effort is needed to build the economic infrastructure necessary to re-

PART 1

133

verse the situation. This approach is being proven successful by the initial round of rural designations.

Question. Are the criteria and scoring for the selection of EZ/EC's set by law or by Departmental regulation?

Answer. The criteria for designation as an EZ/EC are established in statute. The criteria for rating and scoring the applications will be established in regulation.

Question. What steps would be required to modify selection criteria for rural EZ/EC's?

Answer. Members of Congress will have ample opportunity to review and modify the legislation as it considered by Congress. Subsequent regulations will also be available for public comment.

Question. Would you support expanding the criteria for rural EZ/ECs to address the problems facing rural communities in northern states?

Answer. I would be happy to discuss possible solutions to the problems facing rural communities in the northern states with you.

QUESTIONS SUBMITTED BY SENATOR FAIRCLOTH

TOBACCO RESEARCH

Question. What has been the result of this language on ARS and CSREES research efforts for the production, processing or marketing of tobacco or tobacco products?

Answer. ARS terminated its research program on the production, processing, or marketing of tobacco or tobacco products, and no CSREES funds have been approved for these purposes. Tobacco research is still conducted at the State Agricultural Experiment Stations supported by state or industry funds.

Question. Are there any USDA funds expended for the production, processing or marketing of tobacco products?

Answer. There are no ARS funds expended for research on the production, processing, or marketing of tobacco products. CSREES no longer approves Federally-supported research projects directly dealing with tobacco production and processing. There are however, some funded projects using tobacco as a model system for basic genetic and physiological studies. Research dealing with the health effects of tobacco use is still permitted.

Question. Has the Department analyzed what the impact of this language has been on tobacco farmers and tobacco-producing States? I wish to see any documentation that the Department can provide on this matter.

Answer. Neither ARS or CSREES has collected information to analyze the impact of research restriction on tobacco farmers and tobacco-producing states.

Question. Is it your understanding that this language prohibits any ARS or CSREES employee at the state level from doing research on anything to do with tobacco?

Answer. ARS and CSREES employees are not specifically prohibited from doing research on anything to do with tobacco. In some instances, research must be performed on plants that are amenable to specific kinds of manipulations in experiments. Tobacco plants often serve this purpose, and they are widely used for basic research in plant molecular biology. Tobacco plants can be regarded as the "white rat" of the plant sciences. Although the objectives of these experiments are not specifically related to production, processing, or marketing of tobacco, all crops benefit from the advances of knowledge and direct applications that might develop from sound basic science.

Question. Is it your understanding that this language would prohibit any ARS or CSREES employee at the state level from doing research on alternative uses of tobacco?

Answer. Research on certain alternative uses of tobacco might be permissible if the research objectives are to improve production systems for other crops, rather than for the production and processing of the tobacco crop itself. For example, ARS has in the past conducted research to identify unique insecticidal compounds from tobacco and closely related plants, and to learn how to use those natural compounds for pest control as part of integrated pest management for cotton and other crops.

Question. Does this language affect any other tobacco program that falls under the Tobacco Division of USDA?

Answer. There are no other tobacco-related programs in ARS or CSREES.

PART 1

134

QUESTIONS SUBMITTED BY SENATOR COVERDELL

KARNAL BUNT

Question. How much money do you anticipate will be spent by the Animal and Plant Health Inspection Service (APHIS) this year and next to enforce any quarantines imposed to prevent the spread of Karnal Bunt (Kb)?

Answer. In fiscal year 1997, we anticipate spending approximately \$5.6 million on regulatory activities to enforce Karnal Bunt (Kb) quarantines. Our costs are decreasing as we develop efficiencies in our quarantine enforcement methods. The budget requests an increase of \$4.5 million for pest detection activities in fiscal year 1998 largely for Karnal Bunt regulatory activities, the National Survey, and to examine alternative control and eradication measures for Karnal bunt and potential future infestations.

Question. Do you believe implementing a quarantine in the Southeast is necessary, in light of the fact you have not found any bunted kernels?

Answer. We will not take regulatory action in the Southeast unless proof exists that Karnal Bunt is present. We are examining wheat lots for bunted kernels and conducting pathogenicity tests with spores recovered from the Southeast to determine whether there is the presence of the disease.

Question. In the United States Department of Agriculture's 1998 Budget Summary, there is a request by the Animal and Plant Health Inspection Service (APHIS) of \$9 million for pest detection activities, a \$5 million increase from fiscal year 1997. The stated reason for this large increase is to enable APHIS to provide assurance to all trade partners that Karnal Bunt is not present in major wheat-producing areas of the United States. How can you provide such an assurance if Karnal Bunt has been detected from coast to coast?

Answer. Since March 1996, we have committed \$65 million for program operations and compensation to producers. With survey data, we can clearly demonstrate where the disease is and is not. And, it has not been detected coast to coast. Because of this, we have largely maintained market access for U.S. wheat from non-infected areas. To date, negotiations have been successful with several significant markets, including Germany and Italy.

Question. Which States will this increased money be spent?

Answer. We will spend this increased money in the 42 wheat-producing States for conducting the National Survey and in the Karnal Bunt regulated areas which are currently limited to the Southwest.

Question. It is my understanding that Karnal Bunt is a disease which can not be eradicated. Do you believe that Karnal Bunt can be eradicated?

Answer. As a regulatory agency, APHIS considers eradication a reasonable first objective in dealing with a new quarantine pest. When Karnal Bunt was first detected in March 1996, this position was strongly supported by various industry groups, State departments of agriculture, and officials involved in international trade. Presently, the main goals of the program are to (1) protect U.S. export markets, (2) protect U.S. wheat producers in Karnal Bunt-free areas, (3) provide the best possible option for producers in regulated areas, and (4) maintain the best possible information on where Karnal Bunt is located.

Question. If yes, please explain how? If no, how much will it cost to continuously implement a quarantine on a disease that can not be eradicated?

Answer. The management strategy we are currently using against Karnal Bunt concentrates on minimizing the probability that it will expand beyond areas where it currently exists and detecting and identifying it in other areas to which it might have inadvertently been moved. We expect that this strategy will be sufficient to allow wheat exports to continue moving.

With a program like Karnal Bunt, where the negative consequences that affect exports is so great, we feel that regular investment in enforcement activities are justifiable since these activities would play a crucial role in protecting export markets. During fiscal year 1997, we plan to spend approximately \$5.6 million on enforcement activities and to conduct the National Survey. Our costs are decreasing as we develop efficiencies in our quarantine enforcement methods.

Question. Do you believe Karnal Bunt is a major disease threat?

Answer. While there is no human or animal health problem associated with this plant disease, it is considered a pest of quarantine significance by more than 30 nations with which the U.S. does business. In the next few months, APHIS will be addressing this issue at an international forum in an attempt to create a better understanding of this disease within the international agricultural community.

Question. If APHIS found Karnal Bunt spores or Karnal Bunt in the Midwest, would that change your opinion?

PART 1

135

Answer. Well, if Karnal Bunt spores were found in the Midwest, we would have a much more serious problem with the export market. As a result, we would have to change our program strategy since we would no longer meet our goals of protecting U.S. export markets or of protecting U.S. wheat producers in Karnal Bunt-free areas.

Currently, exports are not significantly affected. Only three percent of U.S. wheat is located in Arizona. We are able to certify wheat for export by demonstrating that over 90 percent of U.S. wheat originates in areas where Karnal Bunt is not known to be present and we have seen relatively normal movements of wheat exports since the beginning of our program.

Question. Since a quarantine was imposed in the Southwest, what have the economic losses been for farmers?

Answer. For the 1996 crops, we estimated the losses for compensation to be \$39 million.

Question. It is my understanding that you plan on compensating farmers affected by any quarantine imposed to prevent the spread of Karnal Bunt. How much do you anticipate this will cost?

Answer. For the 1997 crops, we estimate the losses to be significantly reduced because of the actions which were already taken in the regulated areas and the knowledge gained from the National Survey. At this time, we estimate the losses at no more than \$10 million.

Question. Who will be eligible?

Answer. If regulations are necessary for the 1997 crop, compensation will be provided to producers and handlers of regulated wheat, and owners of grain storage facilities which require decontamination.

Question. Is this included in your budget request for fiscal year 1998?

Answer. At this time, we have no way of projecting whether additional Karnal Bunt areas will be identified for the 1998 crop. The increase of \$4.5 million included in the fiscal year 1998 Budget for pest detection is primarily for Karnal Bunt regulatory activities and to conduct the National Survey.

Question. Are there plans by you or the Administration to work with other nations to have the status of Karnal Bunt changed from a major to minor disease threat?

Answer. We have initiated plans for an international conference this summer to consider whether the status of Karnal Bunt should be changed. By that time, APHIS will have the results from pathogenicity tests performed on spore samples from the southeastern United States. We will be asking Mexico and Canada to sponsor the conference, possibly through the auspices of the North American Plant Pathology Organization (KNOOP). Hopefully, this conference will provide all countries the opportunity to review the available data and create rational and objective standards for the international movement of grains affected by various smut diseases. The suggested conference title is, "The International Conference on Regulatory Issues Related to Smut in Small Grains in the United States".

Question. If Karnal Bunt is found in the Midwest, would your answer change?

Answer. No, it would not.

Question. What increased costs do you anticipate for farmers if there is a quarantine imposed in the Southeast?

Answer. If regulations are necessary, we have estimated the additional needs for compensation to be \$6.4 million.

Question. How will this affect peanuts, vialia onions, cotton, and other major crops in the Southeast?

Answer. Field-packed nuts and vegetables that meet normal industry standards for cleanliness are not considered to be contaminated. If we find a bunted kernel in a field that is double-cropped, we would place restrictions only on soil movement. The term "soil" generally refers to large clumps or clods; dust or road film is not considered to be soil. Cotton harvesting would not be affected.

Question. What will be the economic losses for farmers in the Southeast?

Answer. If regulations are necessary, our estimate of the losses to be compensated is about \$6.4 million.

Question. Does the U.S. Department of Agriculture regulate suspect spores?

Answer. No regulatory action will be taken until clear evidence exists that the disease is present.

Question. What is the reliability of the spore identification techniques and can your current DNA test differentiate between Karnal Bunt spores and spores from fungi present on weedy and cultivated grasses found in the Southeast?

Answer. APHIS' test procedures provide a reasonable assurance that spore counts of one or more in a 50-gram sample, from a railcar or elevator, will be detected. Spore counts which average less than one per 50 grams may not be detected. APHIS policy accepts the negligible risk of spread of the disease posed by such spore counts.

PART 1

136

Current DNA testing does not distinguish between Kb spores and ryegrass spores. The pathogenicity tests underway are designed to determine if the ryegrass pathogen infects wheat. And, we are developing other tests to distinguish the two pathogens based on physical and chemical properties.

SUBCOMMITTEE RECESS

Senator COCHRAN. The next hearing of this subcommittee will be on Tuesday, March 4, at 10 a.m. in this room, 124, of the Dirksen Senate Office Building. We will hear at that time from the Department's witnesses on the budget request regarding food safety, marketing, and regulatory programs. Until then, the subcommittee stands in recess.

[Whereupon, at 12:35 p.m., Thursday, February 27, the subcommittee was recessed, to reconvene at 10:08 a.m., Tuesday, March 4.]

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

TUESDAY, MARCH 4, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:08 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Burns, and Bumpers.

DEPARTMENT OF AGRICULTURE

**STATEMENT OF MICHAEL DUNN, ASSISTANT SECRETARY, MARKETING
AND REGULATORY PROGRAMS**

**ACCOMPANIED BY DENNIS KAPLAN, DEPUTY DIRECTOR, OFFICE OF
BUDGET AND PROGRAM ANALYSIS**

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

STATEMENT OF TERRY MEDLEY, ADMINISTRATOR

AGRICULTURAL MARKETING SERVICE

STATEMENT OF LON HATAMIYA, ADMINISTRATOR

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

STATEMENT OF JAMES R. BAKER, ADMINISTRATOR

FOOD SAFETY AND INSPECTION SERVICE

STATEMENT OF THOMAS J. BILLY, ADMINISTRATOR

ACCOMPANIED BY DR. CRAIG REED

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

This morning we are very happy to welcome our panel of witnesses to discuss the proposed budget for the Department of Agriculture as it relates to the Food Safety and Inspection Service; the Animal and Plant Health Inspection Service; the Agricultural Marketing Service; and the Grain Inspection, Packers and Stockyards Administration.

We are happy to have with us Assistant Secretary for Marketing and Regulatory Programs Michael Dunn. We welcome you and your colleagues, the Administrators of these programs which I men-

PART 1

138

tioned. We also welcome Mr. Kaplan from the Budget Office of the Department of Agriculture.

Mr. Secretary, we have copies of your statements and we will make them all a part of the record. But before proceeding any further, I'm going to see if my colleagues have any opening comments or statements they would like to make.

Senator Burns.

STATEMENT OF SENATOR BURNS

Senator BURNS. Thank you, Mr. Chairman. I have just a couple of comments, but I think it would be better if my statement just be entered in the record.

I still have some concerns about Mr. Billy and some of the concerns we have on the border of meat inspections coming in from Canada. I would hope that we could maybe lay aside some fears that we have in the State of Montana.

Anytime we start talking about food inspection and food safety, we know that part of the problem in the Northwest with the Jack-in-the-Box situation was not created by American producers.

I am concerned about how we are moving more to a fee situation with our inspection service. Food safety is everybody's problem, and we know who will pay the fees for inspection. It will be the producer. That will be one of the expenses that has to be incurred by a processing plant whenever they start buying and paying for the raw product. They will take it off of the purchase price. I said this the last time. Anybody that does not believe that we in agriculture do not live at the end of the railroad where we buy retail and sell wholesale and we pay the freight both ways and all the fees that are incurred has never experienced being raised on 160 acres of two rocks and one dirt like I have been.

So, we understand those.

Mr. Baker, I see you today and I want to congratulate you on what you have done in your Department. I think you have brought a lot of credibility. And P&S, maybe it ain't working as smooth as we would like to see it in some places, but I think you have done a great job there and I want to commend you for that.

Other than that, I would just put my statement in the record, Mr. Chairman, and thank you for holding this hearing.

PREPARED STATEMENTS

Senator COCHRAN. Thank you, Senator Burns.

Senator BUMPERS. Mr. Chairman, I have a statement I'll put in the record.

Senator COCHRAN. Without objection, the statements will be made a part of the record.

[The statements follow:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman.

I would like to welcome the Assistant Secretary and the Agency Administrators to the committee hearing today. In an attempt to get the input we all seek I will try to keep my statement as short as possible. This should provide us with the time we need to hear testimony from these people and learn more about the budget proposal put forth by the Department of Agriculture and the Administration.

PART 1

139

I would like to address my issues as they appear to us in the list of witnesses appearing before the committee today. With this I will start with the Administrator of the Food Safety and Inspection Service.

Mr. Billy, I must say coming from a state with little or no poultry production, and from a state that shares a border with our neighbors to the north, that I cannot see the workings of a partnership between Congress and the Food Safety and Inspection Service. I can also see that, with the most recent lawsuit filed by the state of Ohio against the Federal government that this partnership does not seem to be working as well as you are describing here today. I also have to say that the co-operation does not seem to be as clear to the producers and consumers in the field. I will commend you and your agency for going out into the field to get an understanding of what those packing houses of a smaller size are facing, but I do not believe that you have alleviated all the fears that these people have about staying in business.

As with the general Department budget, I am concerned about the number of employees that you are taking out of the field. It appears to me that we continue to reduce those jobs in the field that mean most to our smaller communities and provide the real work in this government.

I also have fears about the changes that are being proposed in regulatory form. I agree with you that the basic goal of FSIS should be the improvement of the safety of our food sources. But the clear, sharp and precise fact we see, is that if somebody gets ill from food borne pathogens, then it is always related to our own American products. Not the meat and vegetables we see coming in from other countries. Our producers in Montana, Mississippi, Missouri, Washington, Arkansas and Wisconsin take the hit in the public eye.

Mr. Billy, I hope that in your position you can and will continue to work to form the partnerships that you have mentioned in your testimony today. With this partnership comes much work and even heartbreaks at times, but it is what the people in America seek from government, and it is my hope that you can work out the many particulars which are required in this close working relationship.

Mr. Chairman I would also like to welcome Assistant Secretary Mike Dunn and the Administrators of the Animal Plant Health Inspection Service, Agricultural Marketing Service and the Grain Inspection Packers and Stockyards Administration to this hearing. These are all good people I am willing to put my faith in as they work for the future of American agriculture.

It wasn't even a week ago that I met with the Assistant Secretary and the APHIS Administrator along with Secretary Glickman to discuss a very important issue in Montana, Bison. I was pleased to see how far the Department of Agriculture has come in the past two years, but still am disappointed in the current state of the Yellowstone bison herd. I appreciate the way you came to the table with some suggestions which I hope the Secretary of the Interior will open his mind too in the coming months.

There are a few issues of concern I have with the budget proposal coming out of Marketing and Regulatory Programs. First among these in my state is the issue of the reduced funding in the Animal Damage Control budget. I understand that according to your testimony Mr. Secretary that you feel that this is in response to the wishes of Congress. Well I can guarantee you that this is not among the wishes of this member of Congress. Approximately two years ago, Secretary Babbitt found it necessary to introduce a predator into Yellowstone National Park, the Canadian wolf. With this action he placed a predator on the ground that preys upon the livestock in Montana. This is bad enough, for the controls are rigid in defending one's property. But add to this the increased numbers of coyotes in western states and you have a serious problem.

The problem we face is that due to the wolf ADC, is unable to do the work necessary to provide protection for the livestock producers in Montana. The real problem will be down the road however, because without ADC workers and control, the people will begin to take the law and the necessary steps for protection into their own hands. The results of this of course will be the criminal prosecution for a number of people only trying to protect what is theirs.

When we talk about the needs on the ground today, one of the main areas of interest that all of us in the west share, is the need for effective work in the area of packers and stockyards. As we have seen in the past two years, this has been a high point of interest with all members of Congress in the west. We have discussed and we have bargained and we have read the reports, but the basic premise which is on the ground is that the packers are taking advantage of the producer. Now this is not something that is new, it goes on in all commodities and with all manners of livestock, but the fact is the people have a lack of confidence in the government to do something. I have the utmost faith and confidence in the Adminis-

PART 1

140

trator of the agency, but he really needs the help of the Department and this Congress to do an effective job.

I do not have the answer in my hip pocket to the problems we face in this area, but I do know we do need to work with Mr. Baker to see that he can and does get the most bang for the dollar. I look forward to sitting down with him in the near future to discuss many of the concerns we share with the current system, and what Congress can do to assist him.

Finally, I have real problems with the inclusion of the large numbers and the amounts sought to be generated by the user fees in this budget. I do not think that this is the really fair approach to the funding needs of this Department. I believe the Administration and the Department is falling into the same mind set as the majority of our country is, that they see the Ag budget and figure it all goes to the farmers and ranchers. Well we see numerous dollars, over half of the Ag budget I believe, going to programs of a social nature. Food Stamps, and WIC are among these. I do not want to see the poor and the needy in our land suffer any more than anyone at this table, but let's be honest when we are dealing with the taxpayer's funds.

The imposition of the user fees is just another tax on the people in rural America, and they are not in a much better position to afford than many of the people that live in our cities. These people toil day in and day out for the tax dollars they put into the treasury of this land, and now we are asking them to pay more for services that they really feel that they have paid for with their original tax payment.

I know in Montana we don't have the great need for mass transit that we find here on the east coast and in our nation's capital. But we do have the need for the services provided by APHIS, AMS and GIPSA. These are what we like to think we pay our tax dollars for. Now this Administration and the Department have made a move, which I believe we have fought in the past, to pass additional costs onto our producers. As I mentioned to Secretary Glickman last Thursday before this committee, these costs are not going to be borne by the consumer, they are reflected directly in the price which is paid to the producer for the food and fiber they provide this country. At this time I do not know where I will make up the difference, but I will work hard to protect my agricultural producers in Montana and throughout this country against this tax plan by the Administration.

Mr. Chairman, I really wanted to keep this short and sweet and to the point, but agriculture is still the number one industry in Montana and I need to make my feelings known on a variety of topics which this hearing allows me to address. I am sure I will need to address many of these again down the road, but I need to make my intentions known. I thank you, Mr. Chairman for the time, and I look forward to hearing from the panel today.

PREPARED STATEMENT OF SENATOR BUMPERS

I wish to join Senator Cochran in welcoming our guests from the U.S. Department of Agriculture who appear before us this morning. Agencies of the Department of Agriculture have jurisdiction over a vast array of services and obligations. However, within the purview of all those agencies there may be no others that hold the high level of responsibility for protecting the continued health and safety of agriculture and the ultimate consumer of all that agriculture may produce than those collected here today.

We all recall from history, nearly 100 years ago, how President Theodore Roosevelt having just completed reading Sinclair Lewis' *The Jungle*, tossed his breakfast out the window when placed before him. Reminded of and revolted by the imagery of Lewis' masterpiece, wound too much in fact for comfort, President Roosevelt reportedly stormed from the room to begin work toward passage of legislation that led to the creation of the Food Safety and Inspection Service. Whether it is to the writing skills of Lewis or the ill-served breakfast of a President, we all owe a great deal of gratitude.

As much as we think we know about how to protect our crops and livestock from pests and disease, truth is we live in a very dynamic world where new threats to agricultural stability appear to be in a constant state of introduction to our shores. Problems we never thought we might see, such as Karnal Bunt, and hopefully never will see, such as Bovine Spongiform Encephalopathy (Mad Cow Disease), remind us we must be ever vigil in the protection of our productive capabilities and consumer confidence in those products. In some cases, introduction of serious pests, such as the Imported Fire Ant or the Zebra Mussel, are inadvertent. Still, that does not reduce our responsibilities in removing these threats from the public domain.

PART 1

141

Aside from pathogens, insects, diseases, and other adversaries of nature, we must also guard against the unwise use of chemicals as methods of control. Pesticides have helped American Agriculture produce bountiful and hardy foods and certainly rank among those items we regard as the arsenal of the agricultural revolution. These products remain important for continued production and we are learning more about proper means of application. We must continue to learn more about how to ensure our food is safe from all forms of harm.

American agriculture is as dynamic as the forces of life itself. New forms and presentation of products, such as organics, cater to the ever changing demands of the public. Growth and changes in the livestock sector remind us to ensure that the benefits of growth accrue to all. A safe and healthy agriculture, and a safe and healthy world of consumers can feel secure that there are those at USDA charged with the duty to see that these dynamic forces remain positive.

The budget before us presents certain challenges. We are here to discuss the range of priorities, areas in which attention should decline or increase, and the manner in which some of these services should be paid. In some cases, we might even need to find agreement on who the actual beneficiary may be. But regardless of the points of detail, I believe we can all agree that the work before us is serious and touches on levels of safety no one here is willing to reduce even slightly.

STATEMENT OF MICHAEL DUNN

Senator COCHRAN. Mr. Secretary, why don't you proceed and make whatever comments or statements that you think would be helpful for the committee.

Mr. DUNN. Thank you, Mr. Chairman. I thank you and members of the committee. I am pleased to appear before you today to discuss the activities of marketing and regulatory programs at the U.S. Department of Agriculture for fiscal year 1998.

I have a written statement and would like that to be made part of the record.

Senator COCHRAN. Without objection, it is so ordered.

Mr. DUNN. With me today are Terry Medley, Administrator for the Animal and Plant Health Inspection Service; Lon Hatamiya, Administrator for the Agricultural Marketing Service; and James Baker, Administrator for the Grain Inspection, Packers and Stockyards Administration. They have written statements for the record and will answer questions regarding the specific proposals.

The Marketing and Regulatory Program activities are funded by both the taxpayers and beneficiaries of program services. The programs are proposed to carry out \$789 million of activities. Over \$396 million of that will be funded through fees from beneficiaries of these services. Currently over 58 percent of the Department's user fee programs are administered by marketing and regulatory programs. These programs have been marketed, tested, and are high performers under the Government Performance and Results Act.

The fiscal year 1998 budget on the discretionary side, we request a current law appropriation of \$431 million for APHIS, \$51 million for the Agricultural Marketing Service, and \$25.7 million for the Grain Inspection, Packers and Stockyards Administration.

Legislation will be submitted to cover \$28 million more in user fees. The budget proposes new fees to recover the cost of administering programs in all three of the agencies.

APHIS provides leadership in anticipating and responding to issues involving animal and plant health, conflicts with wildlife, environmental stewardship, and animal well-being.

PART 1

142

The APHIS 1998 budget request proposes under current law \$424 million for salaries and expenses compared to fiscal year 1997 appropriations of \$435 million.

The budget request contains an increase of \$1.3 million for the Agricultural Quarantine Inspection Program to handle the increased workload along the Mexican and Canadian borders and from Hawaii and Puerto Rico.

Approximately \$9 million are requested for increased pest detection activities and will be largely devoted toward the Karnal bunt program.

The budget proposes a decrease of \$3.3 million for animal damage control.

APHIS will conduct architectural and engineering work with carryover money funded by the screwworm program for a sterile screwworm rearing facility to be built in Panama. Legislation will be proposed to cover the costs of providing activities for animal welfare, veterinary biologics, pink bollworm, biotechnology, and the swine health protection program. We believe that the identifiable beneficiaries of these Federal programs, rather than the general taxpayer, should pay for the services they receive.

An appropriation of \$3.2 million is proposed to complement the Agricultural Research Service's request for modernization of the Plum Island Animal Disease Center and \$4.0 million for basic facility repairs, alterations and preventive maintenance.

Agricultural Marketing Service's fundamental mission is to facilitate the strategic marketing of agricultural products in domestic and international markets while ensuring fair trade practices and promoting a competitive and efficient marketplace to benefit consumers of U.S. food and fiber products.

In response to the changing needs of its customers, the AMS has improved program delivery and broadened the focus of programs to incorporate a global approach to marketing services. The Market News reports are nearly 700 reports on a daily basis available on the Internet.

In response to recommendations made by the Advisory Committee on Agricultural Concentration, AMS broadened the scope of market news to include more information about cattle traded under contract or formula, value-based pricing, and regional market forces. These actions have given our farmers and ranchers more tools to compete in today's marketplace which relies on timely and accurate market information.

AMS's budget request under current law for fiscal year 1998 is \$49.8 million for the Marketing Service Program and \$1.2 million for the Federal-State Marketing Improvement Program. We are requesting an increase of \$320,000 to begin marketing news collection in South and Central America and the Pacific rim. Market surveys conducted by AMS for these areas are needed as international competitions increase in the post-GATT and NAFTA economy.

We are also requesting an increase of \$500,000 to expand domestic market news reporting in accordance with recommendations made by the Secretary's Advisory Committee on Agricultural Concentration.

We are working diligently to publish a rule on the national organic standards and to implement a national program. In order to

PART 1

meet the increased responsibility for accrediting organic certifiers and administering the program, the AMS budget includes an increase of \$505,000. Consistent with the National Organic Standards Act, we will seek to recover the cost of the program through user fees that will be deposited into the Treasury.

The budget also proposes to return program funding for the Pesticide Data Program to AMS from the Environmental Protection Agency. With the implementation of the Food Quality Protection Act, the pesticide residue data will play a critical role in conducting risk assessments of re-registration of pesticides.

Finally I want to discuss GIPSA. Its mission is to facilitate the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural products, and to promote fair and competitive trading practices for the overall benefit of consumers in American agriculture.

Federal grain personnel work with over 2,000 State and private inspectors to provide highly qualified inspection and weighing services on a user-fee basis. In 1996 this unique mix of Federal, State, and private inspection agencies provided 2.3 million inspections on an estimated 250 million metric tons of grains and oilseeds, issued 118,000 official weight certificates, and weighed over 114 million metric tons of grain, and met with trade teams representing 41 countries around the world.

GIPSA's Packers and Stockyards is located in 11 offices throughout the United States to monitor compliance with the Packers and Stockyards Act with approximately \$95 billion of livestock, meat, and poultry products.

During fiscal year 1996, GIPSA targeted resources at providing financial protection, promoting fair business action, and enabling a competitive marketing environment for livestock, meat, and poultry.

GIPSA's 1998 budget request under current law is \$68.8 million, of which \$25.7 million represents appropriated funds. The remaining \$43.1 million represents user fee authority for grain inspectors and weighing services.

The fiscal year 1998 budget proposes legislation to authorize, subject to appropriations, the collection of \$3.6 million in additional user fees to cover the costs of grain standardization activities. The grain industry is the primary beneficiary of the grain standards and should pay for these services.

For P&S programs, the budget proposes \$14.8 million which includes increases of \$225,000 to allow GIPSA to establish electronic filing procedures for annual reports, \$1.6 million for activities in the packer competition and industry structure areas, and \$750,000 for poultry compliance activities.

Increasing concentration, structural change, declining market performance, and the increased use of complex formula and value-based marketing systems by packers continue to raise questions of regulatory and policy significance. Additional resources will allow GIPSA to expand its monitoring and investigations regarding the anticompetitive implications of structural change and behavioral practices in the meat packing industry and will afford us an increased capability to support legal actions that require complex economic and statistical analyses.

PART 1

144

Finally, the fiscal year 1998 budget proposes legislation to authorize the collection of license fees to administer the activities under the P&S Act. All meatpackers, live poultry dealers, stockyard owners, market agencies, and dealers, as defined in the P&S Act, would be subject to license fees.

Also included is a legislative proposal regarding a statutory dealer trust to require livestock inventories and accounts receivable due from sales of livestock to be held in trust for unpaid cash sellers when a dealer fails to pay for livestock.

I appreciate the opportunity to present the budget for marketing and regulatory programs. We believe the proposed funding amounts and sources of funding will provide the level of service wanted by our customers: the agricultural producing and marketing industry, consumers, and the general public. We are happy to answer any questions.

PREPARED STATEMENTS

Senator COCHRAN. Thank you very much, Mr. Secretary. We have your complete statement, and it will be made part of the record along with the statements of Mr. Medley, Mr. Hatamiya, and Mr. Baker.

[The statements follow:]

PREPARED STATEMENT OF MICHAEL DUNN

Mr. Chairman and members of the Committee, I am pleased to appear before you to discuss the activities of the Marketing and Regulatory Programs of the U.S. Department of Agriculture and to present our fiscal year 1998 budget proposals.

With me today are Terry Medley, Administrator of the Animal and Plant Health Inspection Service, Lon Hatamiya, Administrator of the Agricultural Marketing Service, and James Baker, Administrator of the Grain Inspection, Packers and Stockyards Administration. They have statements for the record and will answer questions regarding specific budget proposals.

MARKETING AND REGULATORY PROGRAMS

The mission of the Marketing and Regulatory Programs is to facilitate the domestic and international marketing of U.S. agricultural products and to ensure the health and care of animals and plants while improving market competitiveness and the economy for the overall benefit of both consumers and American agriculture. We contribute to all four fundamental themes underpinning the Department's budget proposals for 1998. We have activities to: expand agricultural economic and trade opportunities; ensure a healthy, safe, affordable food supply; manage our natural resources in a sensible way; and, reinvent government and save taxpayers money.

The Marketing and Regulatory Program activities are funded by both the taxpayers and beneficiaries of program services. The programs are proposed to carry-out \$789 million of activity. Over \$396 million will be funded through user fees from beneficiaries of these services. Currently, over 58 percent of the Department's user fee programs are administered by the Marketing and Regulatory Programs. These programs have been market tested and should be high performers under the Government Performance and Results Act.

Fiscal Year 1998 Budget

On the discretionary side, we are requesting a current law appropriation of \$431.7 million for the Animal and Plant Health Inspection Service; \$51.0 million for the Agricultural Marketing Service; and \$25.7 million for the Grain Inspection, Packers and Stockyards Administration. Legislation will be submitted to recover \$28 million more in user fees. The budget proposes new license fees to recover the cost of administering the Packers and Stockyards Act (P&S Act), additional fees for selected APHIS activities, and for developing grain standards. In addition, on the mandatory side, nearly \$11 million in user fees would be collected to finance the Federal oversight of marketing agreements and orders. I will use the remainder of my time to

PART 1

145

highlight the Department's budget requests for the Marketing and Regulatory Programs.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

APHIS provides leadership in anticipating and responding to issues involving animal and plant health, conflicts with wildlife, environmental stewardship, and animal well-being. With its customers and stakeholders, APHIS promotes the health of animal and plant resources by facilitating their movement in the global marketplace. These efforts help ensure abundant agricultural products and services for U.S. consumers, and expand export markets for our farmers.

The responsibilities of APHIS have grown as agricultural markets have embraced the challenges and opportunities of global trade. Protection of U.S. agriculture was previously accomplished by excluding imports from countries which might have foreign pests and diseases. The development of new "rules" of trade through GATT, NAFTA, and other agreements now must address sanitary and phytosanitary barriers based upon risk assessment procedures, regionalization and equivalence. Ensuring access to foreign markets has become more complicated and is a critical component of protecting U.S. agriculture. For example, the dynamic biology and epidemiology of animal and plant pests and diseases such as Karnal bunt, vesicular stomatitis, and fruit flies, all represent risks to U.S. agriculture's productivity and access to foreign markets. But, these risks can be ameliorated with adequate prevention, monitoring systems and response actions. APHIS is ready to meet the opportunity and challenge to develop new partnerships with States, industry, and the public.

APHIS Priorities

Protecting American producers from harmful pests and diseases.—APHIS has inspectors at international ports of entry—including land border ports, airports, and seaports—around the clock. Last fiscal year, they conducted over 77 million inspections and intercepted approximately 1.9 million illegal agricultural products. Seizures of contraband prevented the introduction of nearly 56,000 plant pests that could have been dangerous to U.S. agriculture and more than 290,000 lots of unauthorized meat and animal byproducts that could have had the potential to spread health threats. If there were outbreaks of foot-and-mouth disease, exotic Newcastle disease, or hog cholera, they could have had an overwhelmingly negative impact on the \$186 billion in annual cash receipts from agricultural products.

One of the most visible and successful port of entry inspection efforts is the Beagle Brigade program. Inspectors use specially trained beagles at 20 international airports to detect prohibited fruits, plants, and meat. The beagles identified 73,751 instances of illegal contraband in 1996 and can detect agricultural contraband about 90 percent of the time.

Facilitating trade.—With survey data, we are able to demonstrate where diseases exist and where it does not exist. Because of these data, we have maintained nearly 99 percent of the \$6 billion wheat export market. Most countries have continued to accept our export certificates and we have met with others to negotiate their acceptance of wheat from regulated areas that test negative for Karnal bunt. We have negotiated successfully with several significant markets, including Germany and Italy.

One of the many new markets we have helped open has been pork to Russia. Since 1993, producers have shipped more than \$30 million worth of pork, making Russia a valuable market for U.S. farmers. We have also opened new export markets in both China and Japan for U.S. apples. Industry officials have estimated these markets will mean hundreds of millions of dollars of income for U.S. farmers.

Behind the scenes, we help farmers maintain access to international markets by providing foreign governments with up-to-date scientific information on the status of U.S. plant and animal health. For instance, we have worked to keep the Korean market for cowhide at more than \$700 million—making it the largest agricultural export to Korea. In addition, we negotiated the sanitary requirements with Russian officials that allowed the resumption of U.S. poultry exports to Russia. Through these successful efforts, we maintained access to Russia's \$500 to \$700 million market for U.S. poultry.

We also certify U.S. agricultural products for export to ensure that our trading partner's plant and animal health requirements are being met. In fiscal year 1996, about 279,000 Federal certificates were issued for plant products alone and another 527,000 ruminants and horses were certified for shipment to foreign destinations. We issue these certificates on demand—including evenings, weekends, and holidays—on a user-fee basis. These fees help us reduce the Federal Government's costs to taxpayers by charging the cost of providing these services to the direct beneficiary.

PART 1

146

APHIS has proposed a rule setting up the regionalization framework. Under regionalization, countries would recognize pest and disease status on an area or regional—rather than national—basis. A region's risk-class levels—ranging from “negligible risk” to “very high or unknown risk”—would depend on the region's geographic location; environmental conditions; prevalence of diseases; type of commodity; country's animal health infrastructure with regard to its disease monitoring, surveillance systems, and its level of enforcement to contain diseases and pests. Canada has already made the commitment to regionalization by accepting parts of the United States as free of bluetongue disease. The European Community is considering doing the same. We hope to move forward with regionalization and join these countries on this new frontier of agricultural trade.

Monitoring animal and plant health.—Our National Animal Health Monitoring System—or NAHMS program—surveys the Nation's livestock and poultry herds to systematically establish a baseline measure of U.S. livestock and poultry health. By sampling animals at slaughter, we are advancing our surveillance goals to detect, isolate, and eradicate diseases like brucellosis and tuberculosis. As you know, we have been taking actions to prevent the introduction of Bovine Spongiform Encephalopathy (BSE) since the late 1980's.

For plant pests, APHIS and cooperators in the Cooperative Agricultural Pest Survey (CAPS) conduct detection surveys for incipient infestations of exotic pests. These data provide Federal and State officials, and the private sector, with information used to manage cooperative pest control programs. APHIS used the CAPS network to implement the National Survey for Karnal bunt and the emergency response after the detection of the pathogen that causes the disease in Arizona in March 1996. The data gathered through these pest surveys enabled the Agency to continue certifying wheat for export subsequent to the 1996 detection.

The Internet enables us to quickly and efficiently reach our customers. For example, a sheep producer in North Dakota can use the information superhighway to access our interactive database and get information regarding the voluntary scrapie certification program. A poultry producer in Georgia can visit the APHIS home-page to review regulations, search for emergency bulletins, and find current export health requirements. And, a cattle rancher in New Mexico or a dairy herd owner in Ohio can locate information about national trends collected by our National Animal Health Monitoring System.

Our scientists at the National Veterinary Services Laboratories in Ames, Iowa, strive to identify and improve the diagnostic kits and procedures used to test livestock and poultry. One such advance included a more accurate method of distinguishing the hog cholera virus from a similar virus that causes bovine viral diarrhea. Another involved molecular techniques to distinguish pathogenic from non-pathogenic strains of avian influenza (AI). Scientists used this latter test two years ago in California to confirm a potentially deadly strain of AI in shipment of birds. That shipment was denied entry and we prevented millions of dollars of potential losses.

Last August, exotic Newcastle disease was detected in the United States at a pet bird facility in Missouri. An early response team worked with State officials and traced the incident to smuggled birds. Through quarantines and testing they eliminated the risk to our commercial poultry industry.

Reducing the impact of existing pests and diseases on U.S. agriculture.—The Animal Damage Control (ADC) program minimizes the effects of wildlife on livestock and crops and protects human health and safety from wildlife damage. Recent surveys indicate that predators have killed 96,200 calves and 21,200 adult cattle valued at \$39.5 million annually. Coyotes and dogs continued to be the largest predators of cattle. Bird and other wildlife strikes are a serious economic and safety problem for aircraft in the United States. The National Wildlife Research Center, working with the Federal Aviation Administration (FAA), found that 2,220 strikes to civilian aircraft mostly by gulls and waterfowl occurred in 1994. Losses from strikes to U.S. military aircraft are estimated to average \$112 million per year; a similar loss occurs for civilian aircraft. ADC provided assistance to 340 airports regarding appropriate control programs to minimize wildlife hazards in 1996.

We have reached a major milestone in the Cooperative State-Federal Brucellosis Rapid Completion Plan by bringing the total number of quarantined herds in the United States down to a record low of 32 as of December 31, 1996. This tremendous achievement points towards eliminating this disease by the end of fiscal year 1998. Significant progress is being made also toward the final eradication of bovine tuberculosis. Currently, 44 states are accredited free, and six States are in a modified accredited status. One of our proudest achievements in the eradication program has been the significant decrease in the number of Mexican-origin cattle identified with tuberculosis at slaughter. APHIS has the infrastructure, statutory authorities, and

PART 1

147

operational and technical expertise for managing a wide range of pest and disease activities which include grasshopper, noxious weeds, boll weevil, biocontrol, and pink bollworm.

Being the Federal leader of animal care and horse protection.—Many citizens have recently expressed concern about the care and handling of wildlife in captivity; particularly those used for exhibition in zoos and circuses. We have developed regulatory proposals regarding the treatment and training requirements for elephants and other dangerous exotic animals. In looking for ways to improve our enforcement efforts, we seek cooperation with our partners to carry out our regulatory responsibilities effectively. For example, APHIS recently signed a Memorandum of Understanding with the State of Missouri to share information on Animal Welfare Act (AWA) inspections. We are also continuing to pursue augmentation of our AWA enforcement authority. For instance, we are looking at ways of increasing our authority to refuse licenses to individuals not in compliance with the AWA—or anyone convicted of violating any Federal, State, or local animal welfare law. In our efforts to improve enforcement of the Horse Protection Act (HPA), APHIS officials depend on individuals certified through the Designated Qualified Persons (DQP) program to assist in monitoring horse shows for compliance.

Developing new or improved methods based on science.—The National Wildlife Research Center has made significant progress toward developing immunocontraceptive vaccines for non-lethal wildlife damage management. In the biotechnology field, after extensive review to assure minimal risk, APHIS deregulated seven new plant varieties. They are: herbicide tolerant cotton; male sterile and herbicide tolerant corn; tomato altered for fruit ripening; Colorado potato beetle resistant potato; virus resistant squash; herbicide tolerant soybean; and virus resistant papaya. These new technologies are important advances for agriculture.

The international harmonization of regulations for genetically modified products involve several activities. First, we work with other countries, including all European countries, to build confidence in the review processes and work to extend existing regulatory approaches for traditional plant products to new, genetically modified products. Second, we work with other countries to coordinate our different national regulatory approaches through bilateral and multilateral forums, such as the Organization for Economic Cooperation and Development. Third, we attempt to base our review system on rational, science-based regulations. The recent trade agreements support this regulatory approach.

APHIS' 1998 Budget Request

The current law request proposes \$424 million for salaries and expenses, compared to the fiscal year 1997 appropriation of \$435 million. The budget request contains an increase of \$1.3 million for the Agricultural Quarantine Inspection Program (AQI) appropriated program that inspects travelers along the Mexican and Canadian borders and from Hawaii and Puerto Rico to the mainland. The 1998 budget requests approximately \$9 million for pest detection activities; largely devoted to the Karnal bunt (KB) program. The budget proposes a decrease of \$3.3 million for Animal Damage Control operation by seeking at least 50 percent of total program support from each State. This proposal is responsive to Congressional encouragement that APHIS maximize cost-sharing of ADC control activities. The budget also proposes a decrease of \$9.8 million in the boll weevil program since it is no longer necessary to provide Federal funding in areas where the boll weevil no longer exists. APHIS will still assist in establishing new program areas, oversee and provide technical support to boll weevil detection and control activities in the eradicated and non-infested areas. In addition, APHIS intends to conduct architectural and engineering work for a sterile screwworm rearing facility, to be built in Panama with carryover funding for screwworm. Legislation will be proposed to recover the costs of providing certain costs for animal welfare, veterinary biologics, pink bollworm, biotechnology and the Swine Health protection Act. We believe that the identifiable beneficiaries of these Federal programs, rather than the general taxpayer, should pay for the services they receive.

An appropriation of \$7.2 million is proposed for maintenance and modernization of APHIS facilities in 1998 to complement the Agricultural Research Service's request to continue modernization of the Plum Island Animal Disease Center and for general repairs and maintenance on existing buildings.

AGRICULTURAL MARKETING SERVICE

The fundamental mission of AMS is to facilitate the strategic marketing of agricultural products in domestic and international markets, while ensuring fair-trading practices, and promoting a competitive and efficient marketplace to the benefit of consumers of U.S. food and fiber products. The AMS programs enable the private

PART 1

148

sector marketing system to provide food and other agricultural products more efficiently, with greater dependability, lower economic cost, and higher equitable treatment among the participants. AMS' activities include the dissemination of market information, development of grade standards—many of which are used in the voluntary grading programs funded by user fees—protection of producers from unfair marketing practices, random testing of commodities for pesticide residues, oversight of industry funded programs to promote agricultural products, research and technical assistance aimed at improving efficiency of food marketing and distribution. AMS also administers marketing agreements and orders at the national level and purchases commodities that support domestic feeding programs.

Program Accomplishments and Plans

In response to the changing needs of its customers, AMS has improved program delivery and broadened the focus of its programs to incorporate a global approach to marketing services. Using additional funds provided for fiscal year 1997 for Market News activities, AMS absorbed reporting functions in states, such as California, that were unable to provide the level of coverage necessary to maintain the integrity of national market reporting. Market news coverage for critical California markets was maintained by establishing a new office in Fresno, California, and reporting California livestock, grain, and hay markets utilizing AMS staff located in other states.

The U.S. Department of Agriculture's market news reports are now available on the Internet's World Wide Web. The new Market News Communications System will carry nearly 700 reports on a daily basis. The World Wide Web is just one more step we have taken to increase accessibility to and the timeliness of market news information.

In response to recommendations made by the Advisory Committee on Agricultural Concentration, AMS broadened the scope of market news to include more information about cattle traded under contract or formula, value-based pricing, and regional market forces. These actions have given our farmers and ranchers more tools to compete in today's marketplace, which relies on timely and accurate market information. We are happy to be on the forefront of supplying American agriculture all the information they need in order to strategically produce and successfully market products in a globally competitive marketplace.

As the global marketplace has grown in importance, we have taken initial steps to meet the international information needs of American agriculture. Within limited available funds AMS has developed international market intelligence to support expanded foreign markets. Through cooperative exchanges of information between the United States and countries in Europe, Canada, Mexico, and Asia, AMS provides critical market information, such as current prices and volume traded, to U.S. producers that want to take advantage of these markets. Market news reports containing this information have enabled agricultural exporters to take advantage of expanding global marketing opportunities. In addition, AMS is providing technical assistance aimed at increasing U.S. export opportunities through market development activities focusing on market information, quality assessment, and product distribution systems. These activities are primarily conducted through USDA's Emerging Markets Program by representing U.S. commercial interests in various international standard setting organizations.

Under the Pesticide Recordkeeping Program, AMS is working to achieve national coverage by 1998. Currently, AMS provides funding for educational materials, training programs, and inspection of certified private applicators' records through cooperative agreements with 22 states. In states that are unable to enter into cooperative agreements with AMS, Federal employees administer the program. In addition, the State Cooperative Extension Services and other organizations deliver educational information.

AMS works closely with State programs to enhance marketing of agricultural products. For example, AMS has developed a Partners in Quality, or PIQ program with the States to design a unique system of procedures, documentation, and audits for packing houses. The Federal-State Improvement program improves the efficiency of the agricultural marketing chain through cooperative grant agreements with State Departments of Agriculture and other State agencies. And, the Pesticide Data program is a cooperative Federal/State effort to obtain statistically defensible data on pesticide residues in food.

AMS' 1998 Budget Request

For 1998, we are requesting a budget of \$49.8 million for the Marketing Service Program and \$1.2 million for the Federal-State Marketing Improvement Program. We are requesting an increase of \$320,000 to expand international market news re-

PART 1

149

porting to South and Central America, and Pacific Rim countries. Market surveys conducted by AMS have indicated a great demand for this information by the food and fiber industry as they meet increased competition in the post-GATT and NAFTA economy.

We are also requesting an increase of \$500,000 to expand domestic market news reporting in accordance with the recommendations of the Secretary's Advisory Committee on Agricultural Concentration. As I mentioned earlier, initial steps have been taken within available funds to address some of the concerns raised by the Committee. However, more needs to be done including 1) increased reporting on the terms of cattle traded under contract sales; 2) expanded reporting on value-based pricing indicators; 3) establishment of more timely and detailed reports of import and export data on livestock and meat; and, 4) reporting the distribution of slaughter cattle by grade and yield on a regional basis. We must adapt to the changing needs of the industry in order to ensure a healthy competitive environment for all players.

We are working diligently to publish a draft rule on the National Organic Standards by late spring and to implement a National program. The program will facilitate the marketing of agricultural products as organically produced both domestically and internationally. AMS plans to begin accrediting state agricultural departments and private persons who will inspect participating producers and handlers to certify compliance with the organic program after the final rule is published in late 1997. AMS estimates that when the program is implemented approximately 35 private agencies will certify over 6,800 organic producers and handlers. In order to meet the increased responsibility for accrediting organic certifiers and administering the program, the AMS budget includes an increase of \$505,000. Consistent with the National Organic Standards Act, we will seek to recover the cost of the program through user fees that will be deposited into the Treasury.

The budget also proposes to return program funding for the Pesticide Data Program to AMS from the Environmental Protection Agency (EPA). The Administration believes that funding for the Pesticide Data Program within AMS is preferable to funding the program within EPA. PDP uses state-of-the-art equipment that can detect residues in parts per billion. We find detectable residues in less than 46 to 62 percent of the test samples. Residues, which are less than 10 percent of the tolerance levels set by EPA, occur in 90 percent of the samples. Only 1.3 percent of the samples contain violative residues; 88 percent of which represent pesticides having no tolerance on that particular commodity—often due to long-term uncontrollable carryover effects from DDT. These data help the Department dispel the notion that pesticide residues are pervasive and at dangerous levels. It also helps improve the confidence which domestic and foreign consumers have in the food safety of our products. The Economic Research Service has used this data and published reports to help the Department target its agricultural research and extension resources. These programs implement integrated pest management practices and eliminate mistakes by farmers in applying pesticides, in controlling drift from adjacent fields or in following best management field rotation practices.

AMS has the technical staff and program infrastructure in place to meet the multiple demands for pesticide residue data. Since the program was created, AMS has forged highly successful cooperative working relationships with participating states to obtain statistically defensible data. AMS staff have worked with many others to refine the scientific methodology for collecting and conducting the tests so the data is useful not only to EPA, but also the Food and Drug Administration, USDA's Foreign Agricultural Service, Economic Research Service, Agricultural Research Service, other academia, the agricultural industry, and consumers. With the implementation of the Food Quality Protection Act, the pesticide residue data will play a more critical role for conducting risk assessments for the reregistration of pesticides. The program continuity provided by funding the program in AMS will ensure the integrity of the data and that all the needs of agriculture and the security and safety of the food supply to the public are met.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

The Grain Inspection, Packers and Stockyards Administration's (GIPSA) mission is to facilitate the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural products, and to promote fair and competitive trading practices for the overall benefit of consumers and American agriculture. GIPSA personnel are situated in field locations across the country to serve our customers in the grain, livestock and poultry industries.

Organization and Performance

Federal grain personnel work with over 2,000 State and private inspectors to provide high-quality inspection and weighing services on a user-fee basis. Federal in-

PART 1

150

spectors service 42 export elevators located in Georgia, Illinois, Indiana, Louisiana, Maryland, New York, Ohio, Oregon, and Texas. A small Federal staff also provides service at six export elevators in Eastern Canada for U.S. grain transshipped through Canadian ports. Eight delegated States provide services at an additional 20 export elevators located in Alabama, California, Minnesota, Mississippi, South Carolina, Virginia, Washington, and Wisconsin. Sixty-five (65) designated agencies service the domestic market under GIPSA supervision. In 1996, this unique mix of Federal, State, and private inspection agencies provided 2.3 million inspections on an estimated 250 million metric tons of grains and oilseeds; issued over 118,000 official weight certificates; weighed over 114 million metric tons of grain; and met with trade teams representing 41 countries around the world to teach them about GIPSA and the U.S. grain marketing system.

GIPSA's grain program collected over \$34 million to conduct over 2.3 million official inspections, 600,000 protein and oil tests, 115,000 mycotoxin tests, and for a variety of other official inspection and weighing services on U.S. exports of wheat, corn, coarse grains, rice and soybeans. These products were valued at approximately \$27 billion. Our activities cost only a little over one-tenth of 1 percent of the total value of the exports.

In fiscal year 1996, GIPSA's grain program pursued a number of initiatives to re-engineer and automate our business and administrative functions in an attempt to contain costs, lessen risks, and increase the productivity associated with grain handling. We worked closely with the U.S. grain handling industry on Electronic Data Interchange (EDI), an electronic commerce project designed to automate business transactions involving U.S. grain. A reengineered quality assurance and quality control program for the official grain inspection system will improve the quality and accuracy of inspection results nationwide. The new, proactive program integrates automated technology, empowers front-line employees to take action, and increases the use of statistical quality control processes to further improve the performance of the official grain inspection system.

GIPSA continued to be the sole laboratory for grain inspection equipment in the National Type Evaluation Program. This program is a cooperative effort with the National Institute of Standards and Technology and the National Conference on Weights and Measures for standardizing the commercial grain inspection equipment. GIPSA continued numerous grain moisture meter calibration changes to improve the accuracy and consistency of commercial grain moisture measurements.

GIPSA also helped educate our worldwide customers about the quality and value of U.S. grain exports. GIPSA representatives met with 77 teams from 41 countries to provide information, technical guidance, and educational seminars.

GIPSA's Packers and Stockyards Program is located in 11 offices strategically sited throughout the United States to monitor compliance with the P&S Act. The Commerce Department estimates the annual wholesale value of livestock, meat, and poultry products to be approximately \$95 billion. At the close of fiscal year 1996, there were 1,348 stockyards; 6,988 market agencies/dealers; and 2,169 packer buyers registered with GIPSA to engage in the livestock marketing business. There also were approximately 6,000 slaughtering and processing packers; an estimated 6,500 meat distributors, brokers, and dealers; and an estimated 225 poultry firms subject to the P&S Act.

During fiscal year 1996, GIPSA targeted resources at providing financial protection, promoting fair business practices, and enabling a competitive marketing environment for livestock, meat, and poultry. The Agency conducted over 2,000 investigations which disclosed over 800 violations of the P&S Act. Formal actions were requested in 84 cases and 62 administrative or justice complaints were issued to bring firms into compliance with the P&S Act. Administrative decisions and orders were issued in 49 cases during fiscal year 1996. Most violations were corrected voluntarily. Several cases resulted in livestock and poultry producers receiving additional funds for the sale of their product. Financial investigations during fiscal year 1996 resulted in \$3.5 million being restored to custodial accounts established and maintained for the benefit of livestock sellers. Packer and poultry trust activities also returned over \$400,000 to livestock sellers and over \$100,000 to poultry growers during the fiscal year. During fiscal year 1996, 205 insolvent dealers and market agencies corrected or reduced their insolvencies by \$11.2 million. GIPSA closely monitored anticompetitive practices to determine whether there were apportioned territories, price agreements or arrangements not to compete, and payoffs or kickbacks to buyers. A high priority is placed on investigating all complaints and developing information regarding the failure of livestock dealers, market agencies, or packers to compete for the purchase of livestock.

In 1996, a major investigation of fed cattle procurement practices in Kansas was completed. The investigation examined over 15,000 purchase transactions involving

PART 1

two million head of cattle and found that supply and demand factors were the primary causes of price declines in the spring of 1995. GIPSA began several other actions to increase enforcement activities in the area of anticompetitive-type practices involving the Nation's major meat packers. A major cattle procurement investigation in Texas will examine over 37,000 purchase transactions involving over six million head of cattle sold during 1995 and 1996. A major slaughter hog procurement investigation will examine approximately 50,000 purchase transactions involving over 2.5 million head of slaughter hogs. Using data from the Kansas and Texas fed cattle investigations, GIPSA will conduct economic analyses during fiscal year 1997 on the effect of forward contracting, packer feeding, and marketing agreement/formula pricing arrangements.

In fiscal year 1997, GIPSA will use a review by USDA's Office of the Inspector General (OIG) to increase its effectiveness and make full use of its authority to investigate and rectify anticompetitive practices and arrangements. GIPSA's structure and operating practices and procedures may need to be modified to enhance its responsiveness to the needs of a changing industry.

GIPSA has solicited public comment on the need for regulations to address contract poultry grower financial arrangements. Many poultry growers have complained about the behavior of some contractors who have been comparing the production costs between growers in determining payment. Growers also have complained about the inaccuracy of feed weights, untimely feed delivery, inconvenient pickup procedures and unacceptable procedures for weighing live birds picked up for slaughter.

Strategic Planning

The draft GIPSA Strategic Plan was developed to guide the agency into the next century and to help ensure that our programs and services remain relevant to our customers and American agriculture. It was developed in a cooperative effort with all GIPSA employees and our customers. The four major goals that will guide our planning processes and initiatives for the upcoming years are to ensure that: programs are cost-effective and responsive to markets served; the credibility of programs is unquestionable; GIPSA employees are highly-skilled professionals providing quality customer service; and, customers' expectations are harmonized with GIPSA's authority and capabilities.

As part of the strategic planning process, GIPSA identified several measures that will allow us to quantitatively evaluate our performance. In the grain program, GIPSA will begin measuring the performance of the new quality assurance and control system for accuracy and consistency; the average cost of oversight per metric ton of grain inspected; the number of new tests developed; the number of improved methods/calibrations implemented; and the average cost of export grain inspection per metric ton. For the P&S programs, GIPSA will implement a new electronic tracking system for complaints and investigations. This system will enable us to establish performance goals based on the new tracking and monitoring system, and to provide for more effective allocation of resources.

GIPSA's 1998 Budget Request

To fund the important initiatives and to enable GIPSA to remain a valuable part of American agriculture, under current law, GIPSA's total budget request for fiscal year 1998 is \$68.8 million, of which \$25.7 million represents appropriations funding. The remaining \$43.1 million represents user fee authority for grain inspection and weighing services.

For fiscal year 1998, the President's budget proposes a total program level for grain inspection of \$54.0 million, with \$10.9 million appropriated for compliance, standardization, and methods development activities. The fiscal year 1998 budget also proposes legislation to authorize, subject to appropriations, the collection of \$3.6 million in additional user fees to cover the costs of grain standardization activities. The grain industry, which is the primary beneficiary of the grain standards, should pay for the services they receive rather than the general taxpayer.

For P&S Programs, the budget proposes \$14.8 million, which includes increases of \$225,000 to allow GIPSA to establish electronic filing procedures for annual reports, which is consistent with the requirements of the Paperwork Reduction Act of 1995; \$1.6 million for activities in the packer competition and industry structure areas; and \$750,000 for poultry compliance activities.

Increasing concentration, structural change, declining market performance, and the increasing use of complex formula and value-based marketing systems by packers continue to raise questions of regulatory and policy significance. Additional resources will allow GIPSA to expand its monitoring and investigations regarding the anti-competitive implications of structural changes and behavioral practices in the

PART 1

152

meat packing industry, and will afford us an increased capability to support legal actions that require complex economic and statistical analyses. Continuous, systematic collection and analysis of data along with aggressive investigative activities are required to address these issues effectively. The needs for these additional resources were supported by recommendations from the Secretary's Advisory Committee on Agricultural Concentration.

Finally, the fiscal year 1998 budget proposes legislation to authorize the collection of license fees to administer all activities under the P&S Act. All meat packers, live poultry dealers, stockyard owners, market agencies, and dealers, as defined in the P&S Act, would be subject to the license fees. Also included is a legislative proposal regarding a statutory dealer trust to require livestock inventories and accounts receivable due from the sale of livestock to be held in trust for unpaid cash sellers when a dealer fails to pay for livestock.

CONCLUSION

I appreciate this opportunity to present the budget for the Marketing and Regulatory Programs. We believe the proposed funding amounts and sources of funding will provide the level of service wanted by our customers—the agricultural producing and marketing industry, consumers, and the general public. We are happy to answer any questions.

PREPARED STATEMENT OF TERRY L. MEDLEY

Mr. Chairman and members of the Committee, I am very pleased to report on the use of resources you have entrusted to us. Using these resources, we help to ensure a wholesome, affordable food supply while stimulating global economies, safeguarding agricultural resources, and protecting ecological systems. I will report on our efforts and outcomes in more detail.

OUR MISSION

APHIS leads the way in anticipating and responding to issues involving animal and plant health, conflicts with wildlife, environmental stewardship, and animal well-being. Together with our customers and stakeholders, we promote the health of animal and plant resources to facilitate their movement in the global marketplace, which helps to ensure abundant agricultural products and services for U.S. consumers and necessary export markets for our farmers.

EXTERNAL AND INTERNAL FACTORS

In developing its overall strategy for accomplishing its mission, APHIS considers a wide range of internal and external factors. The following factors serve as challenges and opportunities for APHIS programs:

1. *The growing importance of global trade to U.S. agriculture and the development of new "rules" of trade through GATT, NAFTA, and other agreements.*—APHIS responsibilities have grown as agricultural markets have become global in nature. We once thought protecting U.S. agriculture meant excluding foreign pests and diseases. New rules concerning sanitary and phytosanitary regulations mean that we must base exclusion decisions upon risk assessment procedures and concern for equivalence. Equivalence of sanitary and phytosanitary regulations among nations is the key to ensuring access to foreign markets and a critical component of protecting U.S. agriculture.

2. *The dynamic biology and epidemiology of animal and plant pests and diseases.*—Threats to plants, domestic animals, and wildlife are dynamic. Pests, such as fruit flies, and diseases, such as stomatitis and karnal bunt, represent risks to U.S. agricultural productivity and access to foreign markets. APHIS is continuously challenged to update prevention strategies, monitoring systems, and response actions needed to ensure effective prevention, control and response.

3. *The need to expand upon and develop new partnerships with States, industry, and the public.*—The role of the Federal government in agriculture continues to change, driven in large part by budgetary constraints and the need for partnerships to carry out new and complex programs. In a cooperative effort, we share responsibility for animal and plant health with the States and industry while public involvement, both directly and through the media, is expanding. APHIS has both the opportunity and the challenge to plan its mission and carry out its implementation strategies through new forms of collaboration and cooperation.

PART 1

153

OUR PRIORITIES

1. *Our first priority is to protect American producers and maintain export markets by preventing the introduction and establishment of pests and diseases harmful to U.S. agriculture.*—APHIS conducts many activities to protect the health of U.S. plant and animal resources: including preclearance inspections, permit decisions, port of entry inspections, quarantine treatments, monitoring and detection surveys, and eradication of exotic plant and animal pests and diseases. While these activities are fundamental to protecting U.S. plant and animal resources, they succeed only when they are part of a comprehensive safeguarding system that reduces pest risk.

Inspecting people and cargo

Our inspectors work at international ports of entry—including land border ports, airports, and seaports—around the clock. Last fiscal year, we conducted over 77 million inspections and intercepted nearly 1.9 million illegal agricultural products. These products harbored over 56,000 plant pests that could have infested U.S. farms and led to billions of dollars in losses and control costs.

Our officials also intercepted more than 290,000 lots of unauthorized meat and animal byproducts that have the potential to spread health threats such as foot-and-mouth disease, exotic Newcastle disease, and hog cholera to American livestock and poultry. These diseases could dramatically reduce the \$186 billion Americans receive annually in cash receipts from agricultural products.

One of the most visible and successful parts of our pest and disease exclusion efforts is the Beagle Brigade program. This program pairs beagles and inspectors at 19 international airports throughout the country to detect prohibited fruits, plants, and meat. Our beagles can detect agricultural contraband about 90 percent of the time. The beagles identified illegal contraband 73,751 times in 1996.

Our Agency takes action against those agricultural diseases and pests that find their way into our country undetected. One example is the pathogen that causes Karnal bunt. Since the pathogen's discovery in Arizona in early March of 1996, we have worked with States and industry to focus on four main objectives. The first is to protect U.S. wheat producers who do not have Karnal bunt; the second is to provide the best possible options for those who are affected by Karnal bunt; the third is to protect the movement of wheat into domestic and international markets. And finally, the fourth is to ensure that we maintain the flow of pertinent disease information to guide our efforts.

We recognized early on that, we would need to determine the actual presence of the disease and limit the paths that enable its spread. We initiated the national Karnal bunt survey and conducted targeted delimiting surveys and traceback efforts to track the movement of suspected grain and seed. We have made every effort to be attentive to the needs of producers—striking a balance between the need to protect those affected, while also keeping U.S. wheat moving in domestic and foreign commerce. Accordingly, as we gathered preharvest survey results, we began to adjust the initial boundaries of regulated areas. We removed areas from quarantine in July. In October, we again refined the regulations, establishing criteria for levels of risk and relieving some restrictions.

As we have said from the very beginning, we intend to keep our efforts to combat this disease flexible and risk-based. We will continue national survey activities as we determine the appropriate long term response to Karnal bunt.

2. *A second priority is to facilitate trade.*—Competitiveness in international trade is of vital national interest to the United States. We seek to maximize trade opportunities and access to new markets by developing new export protocols which assure that exported animals and plants and related products meet the requirements of recipient nations, and by integrating contemporary science into negotiations with trading partners. The establishment of the World Trade Organization has significantly changed the rules of trade and dramatically increased the importance of international standards. By ensuring compliance with international standards and the entry requirements of importing countries, APHIS facilitates the export of U.S. agricultural products, livestock, and poultry. Because APHIS resolves sanitary and phytosanitary issues between states, it is uniquely positioned to align interstate regulations with international standards.

Keeping products flowing to foreign countries

APHIS keeps exports flowing by maintaining existing markets and opening new ones. Let me describe a few examples.

With Karnal bunt disease survey data, we can clearly demonstrate the limited distribution of the disease and we can show other countries that Karnal bunt does not impact the quality of U.S. wheat. Because of this, we maintained 99 percent of the \$6 billion wheat export market. Most countries have continued to accept our ex-

PART 1

154

port certificates and we have met with others to negotiate their acceptance of wheat from regulated areas that tests negative. We have negotiated successfully with several significant markets, including Germany and Italy.

We have opened new export markets in both China and Japan for U.S. apples. These are markets that were not even considered a few years ago. Now, because of our efforts, industry officials have estimated that apple shipments to Japan alone will mean hundreds of millions of dollars of income for U.S. farmers. Several livestock protocols have just been negotiated with China, opening this market to exports of U.S. ruminants, swine, ratites and germ plasm. The negotiations have been long and steady, taking over ten years to get into this current market of over \$10 million for U.S. livestock. China, with its rapidly expanding economy, is considered one of the largest potential markets for U.S. animal-related exports.

We also worked to keep the market for cowhide exports to Korea open and thriving. In recent years, the export of such hides has provided American agricultural producers with more than \$700 million in revenues—making it the largest Korean market for any U.S. agricultural product.

Maintaining information on pests and diseases

A key to maintaining access to already established international markets and obtaining access to new markets is providing foreign governments with up-to-date scientific information on U.S. plant and animal health status. Quality animal health status information allowed us to reach an agreement on sanitary requirements that permitted the resumption of U.S. poultry exports to Russia. The accord establishes a framework for reviewing U.S. poultry processing plants and cold storage facilities that export poultry to Russia and provides for development of mutually acceptable criteria for review of U.S. facilities in the future. Documentation on six poultry diseases of concern will now accompany birds from farms to processing plants as a result of a cooperative State-Federal-industry program. Through these successful negotiations, we maintained access to Russia's \$500 to \$700 million market for U.S. poultry.

This information is essential if we are to certify U.S. agricultural products for export. In fiscal year 1996, we issued over 279,000 Federal certificates for plant products alone and certified another 527,000 ruminants and horses for shipment to foreign destinations.

Allowing trade from regional areas

We are preparing to seize the economic opportunities that are developing in world trade. "Regionalization" is a key provision in our international trade agreements. It is a concept that the Department of Agriculture has advocated for many years as beneficial to world agriculture.

Under regionalization, countries recognize pest and disease status on an area or regional—rather than national—basis, allowing trade in agricultural products to occur from regional areas. Regionalization will afford U.S. producers exciting new export opportunities, as pest and disease free areas of our country are relieved from restrictions. In addition, adherence to this principle should reduce the impact of trade disruptions if a disease or pest outbreak occurs in a limited region of the United States.

APHIS has proposed a rule setting up the framework for how we would establish regionalization principles. APHIS' proposed criteria for animal disease regionalization would establish requirements for foreign regions based on scientific risk class levels. A region's risk-class level—ranging from "negligible risk" to "very high or unknown risk"—would vary depending on many factors. Among them are the region's geographic location and environment, the prevalence of diseases of concern, and the type of commodity. Other factors to consider are the foreign country's animal health infrastructure, disease monitoring and surveillance systems, and the level of enforcement to contain diseases and pests. Of course, in the realm of international trade, we must be prepared to answer these same questions. We are confident that U.S. agriculture will fare well.

We believe American agricultural producers will benefit from regionalization in the future. Canada has already made the commitment to regionalization by accepting parts of the United States as free of bluetongue disease. The European Community is considering doing the same. We hope to move forward with regionalization and join these countries on this new frontier of agricultural trade.

3. *A third priority is animal and plant health monitoring.*—APHIS must maintain a domestic infrastructure to assure a strong animal and plant health monitoring and surveillance program. As part of this effort, the Agency maintains a cadre of trained, committed professionals to respond immediately to potential animal and plant health emergencies.

PART 1

155

Knowing the health status of our plants and animals

We have in place both formal and informal monitoring and surveillance programs. Our National Animal Health Monitoring System—or NAHMS program—surveys the Nation's livestock and poultry herds. The program's goal is to systematically establish a baseline measure of U.S. livestock and poultry health. Our other formal programs include disease-specific testing and depopulation, foreign disease investigations, and the testing of livestock at slaughter. By using samples from animals at slaughter, for example, we are advancing our surveillance goals to detect, isolate, and eradicate diseases like brucellosis and tuberculosis.

Bovine Spongiform Encephalopathy (BSE) has never been detected in the United States, and the USDA has worked aggressively and proactively to keep it that way. In a recent hearing before the House Committee on Government Reform and Oversight, we explained issues surrounding BSE and actions taken to prevent its introduction. We understand that the public is concerned about BSE, particularly in light of the recent announcement in Great Britain that a newly identified variation of Creutzfeldt-Jakob disease in humans may be linked to the BSE epidemic in cattle. APHIS is continuing to work cooperatively with FSIS, FDA, the Department of Health and Human Service's Centers for Disease Control and Prevention, and other Federal agencies—as well as industry, animal health organizations, and independent scientific experts—to evaluate and reassess our policies regarding BSE. We have established five working groups focusing on specific aspects of the disease. We are committed to maintaining a coordinated, science-based, and effective approach that will keep the United States free of BSE.

APHIS conducts detection surveys for incipient infestations of exotic pests that could potentially cause economic damage if spread in the United States. APHIS and cooperators in the Cooperative Agricultural Pest Survey (CAPS) conduct surveys and manage the data obtained. The data provide Federal and State officials, and the private sector, with information on exotic pest detections, agricultural export requirements, and the management of cooperative pest control programs. APHIS used the CAPS network to implement the National Survey for Karnal Bunt in an emergency response to the detection of the pathogen that caused the disease in Arizona in March 1996. The data gathered through these surveys enabled the Agency to continue certifying wheat for export even after the 1996 detection.

APHIS' places information about diseases and pests directly into the hands of producers, practitioners, and government officials using the latest information technology. We are also taking full advantage of the Internet and using it to quickly and efficiently reach our customers. For example, a sheep producer in North Dakota can link up to our interactive database and get information regarding the voluntary scrapie certification program. A poultry producer in Georgia can visit the APHIS home page to review regulations, search for emergency bulletins, and find current export health requirements. A cattle rancher in New Mexico or a dairy herd owner in Ohio can locate information about national trends collected by our National Animal Health Monitoring System.

We cannot rely solely upon individual programs to protect U.S. livestock. Our efforts to prevent the entry of prohibited animal products at our borders alone cannot protect us. Monitoring and surveillance programs cannot stand by themselves. For this reason, we must continue to explore new projects and new tools.

Our scientists at the National Veterinary Services Laboratories in Ames, Iowa, strive to identify and improve the diagnostic kits and procedures used to test livestock and poultry. Their work with researchers and their attention to the most current veterinary literature have led to several diagnostic advances. These advances include a more accurate method of distinguishing hog cholera virus from a similar virus that causes bovine viral diarrhea and molecular techniques to distinguish pathogenetic from nonpathogenic strains of avian influenza (AI). Scientists used this test 2 years ago in California to confirm a potentially deadly strain of AI in a shipment of birds. The shipment was denied entry and we prevented millions of dollars of potential losses.

In addition, APHIS will open its Center for Plant Health Science and Technology in Raleigh, North Carolina in 1997. The Center will provide the best possible scientific and technological support for the protection of U.S. plant resources and the facilitation of agricultural trade.

Emergency response

We are not waiting for inspiration to come at the moment of crisis. We have taken steps with State governments and industry to protect U.S. livestock and poultry. Underlying these efforts are three emergency management principles: prevention, preparedness, and response.

PART 1

156

Although APHIS inspectors have remained vigilant in their watch at our ports of entry and have proven an effective first line of defense, we cannot rely simply on prevention. To be prepared, we must constantly educate our people on foreign disease identification and make sure they are armed with the best information available. To do this, we send people across the globe to study first hand the diseases not endemic to the United States. For example, we now have APHIS personnel in Armenia to study Foot-and-mouth disease, and others in Poland to review the hog cholera situation in Central and Eastern Europe. In addition, APHIS assisted the Government of Surinam in detection and trapping activities for the Carambola fruit fly.

The third principle of our emergency management strategy is response. We have two highly prepared and trained teams which act as independent disease eradication forces, specializing in early responses. These teams are dispatched immediately at the first indication of a foreign animal disease or plant pest. They analyze the situation and examine what steps may be necessary. With over \$186 billion in U.S. cash receipts from agricultural products at risk, we must be poised to act quickly when breaches in our preventative security occur.

Last August, we detected exotic Newcastle disease at a pet bird facility in Missouri. An early response team was on the scene immediately. They worked with State officials to trace the incident to smuggled birds. Through quarantines and testing, they eliminated the risk to our commercial poultry industry. Swift identification of the disease and prompt response—two of the things we have been preparing ourselves to do—made all the difference.

4. *A fourth priority is to manage those pests and diseases which have been detected and identified as having a significant impact on U.S. agriculture.*—In cooperation with the States, APHIS works to improve the general health of our Nation's multi-billion dollar agriculture industry through management techniques designed to eradicate harmful pest and diseases, or, if eradication is not feasible, minimize their economic impact.

Protecting people, property, and the environment

The Animal Damage Control (ADC) program helps protect agricultural and natural resources, property, and public health and safety. ADC also provides the world's only research center devoted entirely to the development of methods for wildlife damage management, and currently allocates about \$7 million a year towards non-lethal methods development activities.

Since 1989, ADC has worked closely with the National Agricultural Statistics Service to determine the range and extent of wildlife damage to various agricultural resources. Wildlife damage has been estimated at approximately \$3 billion a year, of which about \$610 million annually is damage to agricultural resources alone.

Bird and other wildlife strikes are a serious economic and safety problem for civilian aircraft in the United States. For the first time, ADC's National Wildlife Research Center, working with the Federal Aviation Administration, completed an analysis of all wildlife strikes reported for an entire year. The 1994 analysis revealed 2,220 reported wildlife strikes to civilian aircraft. Biologists estimate that less than 20 percent of the total strikes were actually reported. The estimated nationwide economic losses from wildlife strikes to civilian aircraft in 1994 exceeded \$100 million. Losses from wildlife strikes to U.S. military aircraft are estimated at \$112 million per year.

ADC has responded by providing assistance to 340 airports across the United States, by recommending or providing appropriate control programs to minimize wildlife hazards in fiscal year 1996. In September 1996, ADC conducted an airport training and certification program for wildlife biologists. Thirty ADC wildlife biologists received specialized training in identifying and managing wildlife hazards to air-traffic safety.

In fiscal year 1994, ADC completed and published the program's final environmental impact statement. Since that time, the program has completed over 40 environmental analyses on site-specific projects throughout the country, and ADC employees have received National Environmental Policy Act training conducted by the National Association of Environmental Professionals and a private contractor.

Managing animal and plant pests and diseases

As a testament to our cooperative efforts with producers and the States, many of our disease eradication programs are nearing successful completion. We have reached a major milestone in the Cooperative State-Federal Brucellosis Rapid Completion Plan by bringing the total number of quarantined herds in the United States down to a record low of 32 as of December 31, 1996. This is a tremendous achieve-

PART 1

ment, and we are working our way toward elimination of this disease. We need continued industry cooperation to reach the goal of full eradication by the end of 1998.

We are making significant progress in eradicating bovine tuberculosis. Currently, 44 states are accredited free, and six States are in a modified accredited status. One of our proudest achievements has been the significant decrease in the number of Mexican-origin cattle identified as having tuberculosis at slaughter. Since 1993, there has been a 72 percent decrease in the number of tuberculosis cases in imported Mexican feedlot animals. This is evidence that the Mexican tuberculosis program is progressing and that our ban on Holstein imports, which have a higher percentage of infection than other Mexican cattle, is effective.

APHIS is uniquely capable of managing plant pests because of its infrastructure, statutory authorities, and operational and technical expertise. We have a role in managing plant pests such as grasshopper, noxious weeds, boll weevil, biocontrol, and pink bollworm. We develop and implement new management programs only after broad input and demonstrated potential for success and support. Success requires cooperation with industry, State cooperators, and other Federal Agencies. The ultimate goal of such programs is to transfer the technology to the States and industry.

5. *A fifth priority is to provide Federal leadership in the areas of animal care and horse protection.*—Many citizens are concerned about the care and handling of wildlife in captivity—particularly those used in exhibition in zoos and circuses. We are striving to address their concerns and to make certain that all animals covered under the Animal Welfare Act receive proper care and treatment. We are counting on continued cooperation with our partners to carry out our regulatory responsibilities effectively. More and more, we are reaching out to form new partnerships with State and local governments, animal welfare advocates, and members of the industry to assist us in educating the public about animal health and welfare issues. For example, APHIS officials recently entered into a memorandum of understanding with officials from the State of Missouri to enable us to share information from our AWA inspections with them. This arrangement allows us to provide Missouri State officials with copies of our inspection reports of licensed premises. In return they provide us with any information they have about individuals conducting regulated activities without a license.

We are also continuing to pursue augmentation of our AWA enforcement authority. For instance, we want to increase our authority to refuse to issue or renew licenses to individuals not in compliance with the AWA—or anyone convicted of violating any Federal, State, or local animal welfare law.

One of our particular concerns is the care and handling of elephants. Certainly, we are very much aware of the increasing public attention and concern about the treatment these animals receive in zoos and circuses, as well as the methods used to train them. In response, we have developed regulatory proposals relating specifically to the treatment and training requirements for elephants and other dangerous exotic animals.

To improve enforcement of the Horse Protection Act (HPA), APHIS officials depend on individuals certified through the Designated Qualified Persons (DQP) program to assist in monitoring horse shows for compliance. Our strategic direction for improved enforcement of the HPA calls for a greater emphasis on the important role DQP's play in preventing the mistreatment of horses. Many concerned individuals have contacted APHIS officials about this important issue, and we will consider their views as we develop and further refine our objectives and proposals.

6. *A sixth priority is to develop new or improved scientific methods for our work.*—These scientific and technical activities help carry forward the efforts of protecting American agriculture with the most effective exclusion, monitoring, and management methods.

The National Wildlife Research Center researchers have made significant progress toward developing immunocontraceptive vaccines for non-lethal wildlife damage management. We are developing new animal drug applications for submission to FDA to permit field testing of zona pellucida vaccine and gonadotropin releasing hormone vaccine for the control of deer and other damage causing wildlife.

Biotechnology Advances

In fiscal year 1996, APHIS issued determinations of non-regulated status for seven new plant varieties: herbicide tolerant cotton; male sterile and herbicide tolerant corn; tomato with altered fruit ripening; Colorado potato beetle resistant potato; virus resistant squash; herbicide tolerant soybean; and virus resistant papaya. Also, the Agency continued to provide daily Internet updates on field testing and commercialization of new agricultural crop varieties.

PART 1

158

We have established three broad goals for the international harmonization of regulations for genetically modified products. First, we will seek to ensure the integration of compatible national approaches. This means we will work with other countries, including all European countries, to identify the common aspects of our regulatory systems. By doing so, we can build confidence in each other's review processes and work to extend existing regulatory approaches for traditional plant products to new, genetically modified products. Second, we will work with other countries to ensure that our different national regulatory approaches are coordinated. Toward this end, we will work in bilateral and multilateral forums, such as the Organization for Economic Cooperation and Development, to exchange information on how reviews of genetically modified plants are being conducted and on products being researched. Third, we will work to ensure that scientific principles are used in evaluating genetically modified products. We strive to base our review system on rational, science-based regulations. Under recent trade agreements, this regulatory approach has been further supported at the international level.

FISCAL YEAR 1998 BUDGET REQUEST

The current law request proposes \$424 million for salaries and expenses, compared to the fiscal year 1997 current estimate of \$435 million. On the mandatory side we anticipate having available an additional \$41 million for the AQI user fee program based on the FAIR Act authority, bringing that program to a program level of \$141 million. We request \$7.2 million for maintenance and modernization of APHIS facilities in 1998. Of this amount, \$3.2 million would be provided, in addition to a \$5 million proposal included in the Agricultural Research Service's budget, to support continued modernization of the Plum Island Animal Disease Center, Plum Island, New York. We would fund general repairs and maintenance on existing buildings with the remaining \$4 million.

We request approximately \$9 million, as compared to \$4 million in 1997, for pest detection activities. This increase is largely needed for the Karnal Bunt (KB) program to enable APHIS to assure all trade partners that KB is not present in major wheat-producing areas of the United States. The budget request also contains an increase of \$1.3 million for the AQI appropriated program, which is responsible for inspecting people and cargo crossing the Mexican and Canadian borders; those traveling from Hawaii and Puerto Rico to the mainland; as well as private and military aircraft and small tonnage vessels from Hawaii and Puerto Rico. Because of increased traffic of untreated Asian and European agricultural products into the United States through Canada, we must increase inspections to reduce the risk of introducing exotic agricultural pests via this route. We will conduct additional predeparture inspections in Hawaii and preclearance inspections in Canada and Mexico. The budget proposes a decrease of \$3.3 million for Animal Damage Control Operations. This reduction will produce savings in Federal ADC spending by encouraging States and private entities that do not currently spend a matching amount to contribute at least 50 percent to the cost of operating the direct activities from the ADC program in their State. The budget proposes to maintain the current level of support for States that cost share in excess of 50 percent. The budget also proposes a decrease of \$9.8 million in the boll weevil program since it is no longer necessary to provide Federal funding in areas where the boll weevil does not exist. APHIS will still offset initial start-up cost in new program areas, as well as oversee and provide technical support to boll weevil detection and control activities in the eradicated and non-infested areas.

Let me highlight a few of our proposals in more detail. The first proposal relates to Animal Damage Control Operations. While the Administration supports an effective ADC program, we feel that, in many instances, cooperators need to accept a greater responsibility in paying for the services that they receive. In addition, there is currently a significant disparity between the portion of the total program that each State pays—ranging from zero percent to 94 percent. Many States pay a significant portion of their program costs, and should be congratulated. Other States need to do better. The Appropriations Committees, in fiscal year 1997 report language concurred with this by encouraging “cost sharing of control activities to the maximum extent possible”. Therefore, the Administration has proposed paying no more than 50 percent of each State's total program. This is not a question of supporting the ADC program, but rather one of fairness and equity between the Federal government and cooperators, and among cooperators.

Second is the proposed screwworm facility in Panama. We realize the problems associated with continuing the operation of the current fly rearing facility located in Mexico. Therefore, the budget includes sufficient funding, through the use of prior balances, for the architectural and engineering work and environmental studies as-

PART 1

159

sociated with the construction of a new fly rearing facility in Darien. We anticipate that the facility will be ready for operation during fiscal year 2000, which is when we expect that it will be needed.

Third, within the increase requested for pest detection, we propose to use approximately \$500 thousand to work with other agencies to look at potential future infestations, and determine the appropriate control measures. The costs associated with dealing with Karnal bunt have taught us that we may need to consider alternative responses that may be less costly to both the government and the industry. This will be an ongoing effort.

Finally, we have proposed savings from the enactment of five new user fees. I realize that in many cases, user fees are not popular. However, I urge the Committee to consider these fees in the context of who the main beneficiaries are.

CONCLUSION

APHIS has achieved great success in protecting American agriculture, of which we are most proud. Animal and plant pests and diseases, however, are very tenacious and can reinfest or reinfest if we let down the safeguard. Every day there are thousands of opportunities for exotic pests and diseases to violate our borders and pest and disease free areas. We can and must continue our record of success as we move toward the third millennium. With the cooperation of Federal and State governments and industry, we will continue to find new ways to do so. Together, we can continue to improve and protect the health of the Nation's animal and plant resources and the economic opportunities that effort represents.

We appreciate the Committee's strong support of our programs in the past, and look forward to meeting the challenge of protecting and strengthening American agriculture in the future. We will be happy to answer any questions.

PREPARED STATEMENT OF LON S. HATAMIYA

Mr. Chairman and Members of the Committee, I am pleased to have this opportunity to represent the Agricultural Marketing Service and to present our fiscal year 1998 budget proposals.

MISSION

First, I would like to remind you of our agency's mission, strategic goals, activities, and funding sources, and mention a few current issues in the agricultural marketplace.

The mission of the Agricultural Marketing Service is to facilitate the strategic marketing of agricultural products in domestic and international markets, while ensuring fair trading practices and promoting a competitive and efficient marketplace, to the benefit of consumers of U.S. food and fiber products. In other words, our programs are designed to help create more efficient markets which benefit agricultural producers, processors, and consumers.

STRATEGIC GOALS

AMS' strategic goals are: 1) to provide high quality service and products, in a cost-effective and efficient manner, to meet changing customer needs; 2) to develop new marketing services to increase customer satisfaction and expand our customer base; and 3) to tailor and focus agency services to better facilitate strategic marketing of U.S. agricultural products in international markets.

ACTIVITIES

Our Market News, Standardization and Grading activities facilitate the domestic and international marketing of agricultural commodities. The AMS Market News program provides timely, accurate, and unbiased market information on numerous agricultural commodities. Market information assists agricultural producers and traders to make critical buying, selling, and pricing decisions. Commodity standards provide a common language of quality for buyers and sellers in the U.S. and abroad. AMS grading and certification services provide an impartial evaluation of product quality so that purchasers can buy commodities without having to personally inspect them.

The Shell Egg Surveillance program assures consumers of the safety of shell eggs by monitoring the proper disposition of certain undergrade and restricted eggs through regular inspections of shell egg handling operations.

Our Market Protection and Promotion activities include Organic Certification, Pesticide Recordkeeping, Federal Seed, and Research and Promotion. The Organic

PART 1

160

Certification program is developing national standards and definitions to govern the production and handling of “organic” agricultural products so that consumers can be assured of the validity of the label. The program will also accredit agents who will certify organic products to facilitate trading between the states and abroad. The Pesticide Recordkeeping Program educates private certified applicators of Federally restricted-use pesticides about recordkeeping requirements, and monitors compliance with those requirements. The Federal Seed Act program protects growers by regulating agricultural and vegetable seed moving in interstate commerce, prohibiting false labeling and advertising, and prohibiting the shipment of prohibited noxious-weed seed into a State. When a violation is verified by testing and investigation, program personnel administratively resolve the complaint or initiate legal action. Research and promotion programs are used by agricultural producers to broaden and enhance national and international markets for various commodities. Each of these industry-funded programs reimburses AMS for the cost of overseeing its program.

AMS’ Wholesale Market Development program works to expand and improve domestic markets for agricultural products by providing technical advice and assistance to states and municipalities that are interested in creating or upgrading wholesale markets, auction and collection markets, retail and farmers’ markets, and urban markets. Program personnel also conduct cooperative feasibility studies to evaluate and suggest more efficient ways to handle and market agricultural products.

The nation’s transportation system is crucial for agricultural products to reach their markets. AMS provides technical assistance to shippers and carriers and participates in transportation regulatory actions. We also provide economic analysis and recommend improvements to domestic and international agricultural transportation.

The Federal-State Marketing Improvement program makes matching funds available to state marketing agencies to improve the efficiency of the agricultural marketing chain. Such projects might identify and test alternative farm commodities, identify international markets, or test the use of new technology in agricultural marketing.

The Perishable Agricultural Commodities Act, or PACA, protects producers, shippers and distributors from loss due to unfair and fraudulent practices in the marketing of perishable agricultural commodities. Our PACA program enforces the Act by investigating violations.

AMS uses Section 32 funds to stabilize market conditions and improves the returns to producers through marketing agreements and orders and commodity purchases. Marketing agreements and orders are regulations that are requested and funded by the regulated producers and handlers, and locally administered by marketing order committees and market administrators. AMS oversees and administratively supports the activities of the industry. AMS purchases selected meats, fish, poultry, fruits and vegetables to remove excess supplies from the markets and provide a dependable supply of agricultural commodities for the National School Lunch and other domestic feeding programs.

FUNDING SOURCES

Despite our wide range of activities, AMS places a universal emphasis on providing service as cost-effectively as possible. This is because over 75 percent of AMS funding is revenue we generate by providing services voluntarily requested by our customers. Because our programs depend on our customers’ requests for service, we must ensure that these services evolve to meet the needs of our customers, and that the fees we charge are acceptable to industry. We operate all of our programs—user-funded and appropriated—on this cost-conscious principle. All of our Marketing Services programs—including market news, pesticide recordkeeping, Federal Seed, organic standards, transportation, and wholesale market development—as well as our Federal/State Market Improvement Program, are operating on less than \$40 million in appropriated funds this year. Administrative costs for commodity purchase services and marketing order oversight are funded from Section 32 customs receipt funds. Our user funded programs total \$171 million.

CURRENT ISSUES

Before I present our budget proposals, I would like to discuss the AMS programs that received increased funding this fiscal year.

PART 1

161

Domestic Market Reporting

This fiscal year, Congress appropriated additional funding to support domestic market reporting. Because several key agricultural production states reduced or completely eliminated their market news programs, AMS has increased its Market News activities to maintain the integrity of national market reporting. Producers, marketers, and others in related industries rely on AMS Market News data on agricultural commodity supply, movement, contracts, inventories and prices to make selling, buying, and pricing decisions. We must have sufficient information on major production and market states, such as California, to present an accurate picture of the national market. The AMS Market News Program has absorbed those nationally significant reporting functions formerly provided by states through a series of consolidations and a shifting of resources, and by adding staff where necessary. These changes, which include establishing a new office in Fresno, California, and reporting California livestock, grain, and hay markets from AMS offices in Washington, Oregon, Arizona, and Colorado, will enable us to continue to provide timely, accurate, and unbiased market information.

Pesticide Recordkeeping

We also received funding this year to expand pesticide recordkeeping monitoring activities nationwide. The Pesticide Recordkeeping Program was established by Congress in 1990 to ensure that certified private applicators of restricted use pesticides maintain records comparable to records maintained by commercial applicators in each state. This program provides data that can be used by state and Federal agencies to design sound pesticide practices and by the medical community for treatment of individuals exposed to pesticides.

AMS is working to provide national coverage by providing educational materials, programs, and inspections of private applicators' records. In the majority of states, these activities are accomplished through cooperative agreements with the state designated agencies. Where states are unable to enter into a cooperative agreement with AMS, Federal employees will conduct inspections of certified private applicators' records and provide educational information. AMS will also continue to provide funding for state programs that train certified applicators, and the development of educational materials by state and Federal programs. The State Cooperative Extension Services and other organizations deliver educational information to people affected by the regulations. We expect the program to reach national coverage by the end of 1998.

FISCAL YEAR 1998 BUDGET REQUESTS

Now, I wish to present our budget requests. We are proposing a net increase in Marketing Services funds totaling \$11.3 million; \$320 thousand for international market reporting, \$500 thousand to expand market reporting to help counter the effects of market concentration, \$505 thousand to implement the Organic Certification Program nationwide, and \$9.8 million to restore funding for the Pesticide Data Program to AMS. We are also proposing user fees for oversight of marketing agreements and orders.

International Market News

To effectively compete in export markets, U.S. agriculture must have easy access to a consistent, public source of timely information on international prices. For fiscal year 1997, the forecast for U.S. agricultural exports is approximately \$56 billion, with a volume of almost 147 million metric tons. This year, livestock products, poultry meat and horticultural exports are expected to reach record levels. Meat exports are expected to reach almost \$5 billion, poultry and poultry products \$3 billion, and horticultural exports are forecast at almost \$11 billion. Of total agricultural exports, about 43 percent are expected to come from sales in Asia, 16 percent in Western Europe, and almost 17 percent in Latin America. Agricultural imports are forecast at \$34 billion in fiscal year 1997. The fiscal 1997 agricultural trade surplus is projected at almost \$22 billion.

AMS is currently collecting limited international market information, but more in-depth information from a wider array of markets is needed. For example, the meat industry is requesting more information from Korea and other Pacific Rim countries to remain competitive in the rapidly expanding world meat market. AMS reporters will need to establish contact with private companies and government sources to collect and exchange market information. Cost increases to provide foreign market information would include reporters, travel, and electronic communications. Improving our knowledge of overseas markets should have a significant positive impact on the ability of our products to compete successfully in the international marketplace.

PART 1

162

Enhanced Market Reporting

We must also adapt to market changes occurring in the U.S. The Department is increasingly concerned about the effects of industry concentration and the resulting potential for non-competitive behavior. Concentration can have a significant negative impact on small farmers and producers. The Secretary's Advisory Committee on Agricultural Concentration recommended that the price discovery and reporting processes be enhanced to ensure fair competition. The advisory committee recommended that AMS Market News: 1) increase its reporting on the terms of cattle traded under contract sales, 2) expand its reporting of value-based pricing indicators, 3) institute more timely and more detailed reports of import and export data on livestock and meat, and 4) report the distribution of slaughter cattle by grade and yield on a regional basis. Initial steps have been taken to address these information needs; however, resource availability is limiting our ability to be fully responsive. These initiatives will require additional AMS reporters, more travel, and improved technology to cover auction sales and to collect additional information from producers and packers.

Organic Certification

The organic food industry is estimated to have a value of nearly \$3 billion and is growing more than 20 percent a year. With this growth has come increasing confusion in the marketplace about what is and what is not organic. The Organic Foods Production Act of 1990 required the Secretary to establish and implement national minimum organic standards and a program to certify organic production. The Act was requested by the organic community after they observed problems such as fraudulent use of the term "organic", customer confusion, variations among certifiers on standards and requirements, and excessive documentation required by foreign importers before they would accept products certified in the U.S. By using recommendations from the National Organic Standards Board and public input from certifiers, consumers, producers and handlers, AMS has developed a public-private partnership that encourages innovation within the boundaries of organic principles and legislative intent.

National standards and definitions of agricultural products that are organically produced will facilitate the movement of products between States and assure consumers of the validity and integrity of the organic label. Beyond the domestic market, standardized organic production will facilitate international marketing of U.S. organic products. We will work to harmonize AMS standards with those of existing and developing international organic programs.

The National Organic Standards Board—which consists of growers, processors, consumers, environmentalists, a retailer and a scientist—has prepared recommendations on more than 120 substances for the National List of allowed synthetics and prohibited natural substances for use in organic production and processing. We expect to publish the rules and implementation plan for production and processing standards and for accreditation of certification agents this year. After that, we will begin accrediting representatives of state agricultural departments and private persons who will inspect producers and handlers to certify compliance with the organic program. We need additional resources to expedite development of the program, ensure labeling integrity, and facilitate global trade of our country's organic products. Once the program is fully established, certifying agents will be assessed fees for USDA accreditation, which is provided for under current legislative authority. Any fees collected will be deposited into the Treasury.

Pesticide Data Program

The Food Quality Protection Act, passed in August 1996, confirmed the need for collection of pesticide residue data. The Act states that "The Secretary of Agriculture shall ensure that the residue data collection activities conducted by the Department of Agriculture in cooperation with EPA and the Department of Health and Human Services, provide for the improved collection of pesticide residues, including guidelines for the use of comparable analytical and standardized reporting methods, and the increased sampling of foods most likely consumed by children." The fiscal year 1997 Appropriations Act cut funding for the Pesticide Data Program from AMS and placed it in EPA's budget for fiscal year 1997. EPA has been working with the cooperating states and AMS to ensure that data collection is continued. For fiscal year 1998, we are requesting that the Pesticide Data Program funding be returned to AMS.

Since the program's inception five years ago, we have established statistically reliable procedures, an automated information system for pesticide residue data, and good working relationships with industry and participating state and Federal agencies. AMS' procedures are statistically designed to make unbiased estimates of resi-

PART 1

163

dues collected in the ten cooperating states that represent half of the U.S. population. Between 50 and 60 samples of each commodity are collected and analyzed each month. The pesticides targeted for data collection were selected by EPA in consultation with AMS. The commodities chosen for testing are among those most prevalently consumed by the American public. The number of fruits and vegetables collected is based on state population, wheat samples are collected based on state and monthly production data, and milk samples are collected based on state production and represent at least 45 percent of the available fluid milk in the U.S. market. Samples are collected as close to the consumer as possible, ensuring an estimate of actual exposure that includes post-harvest applications of fungicides and growth regulators. Also, before analysis, samples are prepared according to practices of the average consumer (such as peeling or washing). Since the program began, 25 commodities have been included for testing, 19 of which are considered high consumption commodities by infants and children. Eleven commodities are currently included in the program.

The Administration believes funding the Pesticide Data program through AMS is more appropriate than EPA. The program has thrived and grown in international stature because we were able to rely on our agricultural marketing expertise to develop a statistically reliable testing system. The AMS residue testing results have been used to confront barriers to international trade of U.S. agricultural commodities and in the establishment of international standards. USDA's Foreign Agricultural Service uses data from the program to convince foreign governments that our food is safe, and has found the program's findings to be an invaluable tool in facilitating U.S. exports. Pesticide Data Program personnel also provide information to the Codex Alimentarius Commission and the World Health Organization.

AMS already has the systems, equipment and experience needed to consolidate and report the vast quantities of data collected, and we have proven that we can operate this program effectively and efficiently to carry out residue testing work that will satisfy the public's demand for a safe food supply.

LEGISLATIVE PROPOSAL

We are again proposing authorizing legislation that will allow AMS to collect assessments for the Federal oversight of marketing agreements and orders. The proposed fees would cover the costs of establishing and amending the orders through public hearings, and other general oversight and administration of the program. Currently, all Federal oversight of these programs is funded from the Section 32 permanent appropriation. The Secretary issues marketing agreements and orders for a given marketing area in response to requests by a majority of producers. Marketing orders are administrated locally by marketing order committees and market administrators whose costs are already funded from assessments on regulated producers and handlers. AMS proposes to recover Federal costs through increased assessments paid by the producers and handlers who benefit from the agreements and orders. Each industry would have to determine whether or not the benefits provided by their marketing order were sufficient to outweigh the additional cost. We estimate that this proposal will result in savings of \$10.7 million, offset in fiscal year 1998 by one-time liabilities costs of about \$500 thousand, for a net savings of \$10 million in the first year.

BUDGET REQUEST SUMMARY

In total, our 1998 budget request includes \$49.8 million in appropriated funding for our marketing services programs, \$1.2 million for Payments to States and Possessions, and \$16.9 million from Section 32 funds for administration of commodity purchase services and marketing agreements and orders. Approval of the legislative proposal to charge user fees for marketing agreements and orders would reduce our request by \$10.2 million. Thank you for this opportunity to present our budget proposals.

PREPARED STATEMENT OF JAMES R. BAKER

Mr. Chairman and members of the Committee, I am pleased to submit the fiscal year 1998 budget proposal for the Grain Inspection, Packers and Stockyards Administration (GIPSA).

GIPSA is part of USDA's Marketing and Regulatory Programs, which are working to ensure a productive and competitive global marketplace for U.S. agricultural products. GIPSA's mission is to facilitate the marketing of livestock, poultry, meat,

PART 1

164

cereals, oilseeds, and related agricultural products, and to promote fair and competitive trading practices for the overall benefit of consumers and American agriculture.

Our mission is carried out in two different segments of American agriculture. GIPSA's Federal Grain Inspection Service (FGIS) provides the U.S. grain market with Federal quality standards and a uniform system for applying them. Our Packers and Stockyards Programs (P&S) ensure open and competitive markets for livestock, meat, and poultry.

GIPSA has both service and regulatory roles. It provides impartial, accurate quality and quantity measurements to create an environment that promotes fairness and efficiency. And, the Agency's programs provide financial protection to livestock producers and ensure fair and competitive markets.

The existence of GIPSA as an unbiased, third-party entity helps ensure a fair and competitive marketing system for all involved in the merchandising of grain and related products, livestock, meat, and poultry.

ORGANIZATION

GIPSA is comprised of approximately 840 personnel, including full-time, temporary, and intermittent employees. GIPSA personnel are situated in field locations across the country to serve our customers.

Federal grain personnel work with over 2,000 State and private inspectors to provide high-quality inspection and weighing services on a user-fee basis. Federal inspectors service 42 export elevators located in Georgia, Illinois, Indiana, Louisiana, Maryland, New York, Ohio, Oregon, and Texas. A small Federal staff also provides service at 6 export elevators in Eastern Canada for U.S. grain transshipped through Canadian ports. Eight delegated States provide services at an additional 20 export elevators located in Alabama, California, Minnesota, Mississippi, South Carolina, Virginia, Washington, and Wisconsin. Sixty-five (65) designated agencies service the domestic market under GIPSA supervision. In 1996, this unique mix of Federal, State, and private inspection agencies provided 2.3 million inspections on an estimated 250 million metric tons of grains and oilseeds; issued over 118,000 official weight certificates; weighed over 114 million metric tons of grain; and met trade teams representing 38 countries around the world to teach them about GIPSA and the U.S. grain marketing system.

GIPSA's Packers and Stockyards Programs' is comprised of 180 full-time employees; 135 of whom are employed in 11 offices strategically located throughout the United States to monitor compliance with the P&S Act. During fiscal year 1996, GIPSA concentrated resources on providing financial protection and promoting fair business practices and a competitive marketing environment for livestock, meat, and poultry. The Agency conducted over 2,000 investigations, disclosing over 800 violations of the P&S Act. Formal actions were requested in 84 cases and 62 administrative or justice complaints were issued in order to bring firms into compliance with the P&S Act. Administrative decisions and orders were issued in 49 cases during fiscal year 1996; however, most violations were corrected on a voluntary basis with several resulting in livestock and poultry producers receiving additional funds for the sale of their product.

This, of course, is only a brief summary of our accomplishments. I'd like to provide some more in-depth information about our programs and their activities.

GIPSA'S FEDERAL GRAIN INSPECTION SERVICE

GIPSA's grain program plays a critically important role in facilitating the marketing of U.S. grain and related commodities. We provide the U.S. grain market with Federal quality standards and a uniform system to apply these standards. Through this program, GIPSA provides descriptions (grades) and testing methodologies for measuring the quality and quantity of grain, rice, edible beans, and related commodities, and, provides an array of inspection and weighing services, on a fee basis, through a unique partnership of Federal, State, and private laboratories.

By serving as an impartial third party, GIPSA ensures that the standards are applied and the weights recorded in a fair and accurate manner. Our presence in the market advances the orderly and efficient marketing and effective distribution of U.S. grain and other assigned commodities from the Nation's farms to domestic and foreign buyers.

Our guidance in carrying out these important tasks is provided by the U.S. Grain Standards Act (USGSA) and the Agricultural Marketing Act of 1946 (AMA) as it relates to the inspection of rice, pulses, lentils, and processed grain products. Under these two Acts, GIPSA:

—Establishes official U.S. grading standards and testing procedures for eight grains (barley, corn, oats, rye, sorghum, triticale, wheat, and mixed grain), and

PART 1

165

- four oilseeds (canola, flaxseed, soybeans, and sunflower seed) under the USGSA; and for rice, lentils, dry peas, and a variety of edible beans under the AMA.
- Provides American agriculture and customers of U.S. grain around the world with a national inspection and weighing system that applies the official grading and testing standards and procedures in a uniform, accurate, and impartial manner.
- Inspects and weighs exported grain and oilseeds. Domestic grain and oilseed shipments, grain and oilseed imported into the United States, and crops with standards under the AMA are inspected and weighed upon request.
- Monitors grain handling practices to prevent the deceptive use of the grading standards and official inspection and weighing results, and the degradation of grain quality through the introduction of foreign material, dockage, or other nongrain material to grain.

Through these permissive and mandatory programs, GIPSA promotes the efficient and effective marketing of U.S. grain and other commodities from farmers to end users.

To better illustrate the impact and efficiency of GIPSA's grain inspection program, consider the following: USDA's "Outlook for U.S. Agricultural Exports" (December 4, 1996) reports that in fiscal year 1996, U.S. exports of wheat, corn, coarse grains, rice and soybeans were valued at approximately \$27 billion. GIPSA's grain program, which operates on a user fee basis, collected fee revenue of \$30 million for over 2.3 million official inspections, 600,000 protein and oil tests, 115,000 mycotoxin tests, and a variety of other official inspection and weighing services on these exports. Our revenues totaled a little over one-tenth of 1 percent of the total value of the exports.

In fiscal year 1996, GIPSA's grain program pursued a number of initiatives to improve service delivery and organizational effectiveness. We recognize that re-engineering and automating our business and administrative functions are essential if we are to contain costs, lessen the risks, and increase the productivity associated with grain handling.

In fiscal year 1996, GIPSA continued to work closely with the U.S. grain handling industry on Electronic Data Interchange (EDI), an electronic commerce project designed to automate business transactions involving U.S. grain. As part of this important initiative, GIPSA is developing a standardized data file for its inspection and weighing results that will directly support the EDI functions.

Also in fiscal year 1996, GIPSA began implementing a reengineered quality assurance and quality control program for the official grain inspection system to ensure the quality and accuracy of inspection results nationwide. The new, proactive program integrates automation technology, empowerment of front-line employees, and statistical quality control processes to further improve the performance of the official inspection system.

GIPSA continued cooperative efforts with the National Institute of Standards and Technology and the National Conference on Weights and Measures to standardize commercial grain inspection equipment as part of the National Type Evaluation Program (NTEP). GIPSA serves as the sole NTEP laboratory for grain inspection equipment. In fiscal year 1996, GIPSA continued to collect calibration data that were used as the basis for numerous grain moisture meter calibration changes to improve the accuracy and consistency of commercial grain moisture measurements.

Our efforts to facilitate the marketing of U.S. grain are not concentrated solely within our borders. GIPSA also is working to help educate our worldwide customers about the quality and value of U.S. grain exports. In fiscal year 1996, GIPSA representatives met with 77 teams from 41 countries to provide information, technical guidance, and educational seminars.

The grain program will continue to work to ensure our relevance and value to American agriculture. We are reaffirming our commitment to facilitating the marketing of U.S. grain by responding to our customers' needs and providing the highest quality grain inspection and weighing services to all whom we serve—from farmer to domestic and international end users, and all those in between. Our efforts in fiscal year 1997 will focus on networking the Federal, State, and private partners comprising the system, and working with our customers to identify how we can apply automation to reengineer our administrative and inspection processes to achieve greater efficiency and productivity.

In fiscal year 1997, our commitment to improved efficiency and effectiveness will continue to serve American agriculture well, as U.S. agricultural exports are expected to total \$55.5 billion. Exports of wheat, corn, coarse grains, rice and soybeans are expected to account for \$18.5 billion of that total ("Outlook for U.S. Agricultural Exports," December 1996).

PART 1

166

GIPSA'S PACKERS AND STOCKYARDS PROGRAMS (P&S)

The principal purpose of GIPSA's Packers and Stockyards (P&S) Programs is to provide financial protection and promote fair business practices and a competitive marketing environment for livestock, meat, and poultry. Our programs foster fair and open competition, and guard against deceptive and fraudulent practices affecting the movement and price of meat animals and their products. We also work to protect consumers and members of the livestock, meat, and poultry industries from unfair business practices. To carry out these important roles, GIPSA:

- Administers the Packers and Stockyards Act of 1921.
- Carries out the Secretary's responsibilities under Section 1324 of the Food Security Act of 1985, which permits States to establish "central filing systems" to prenotify buyers, commission merchants, and selling agencies of security interests against farm products, and issue regulations and certify the systems that meet the criteria in the statute.
- Enforces the Truth-in-Lending Act, the Fair Credit Reporting Act, and the Freedom of Information Act as each relates to persons and firms subject to the P&S Act.

The production and marketing of livestock, meat, and poultry are important to American agriculture and significantly impact the Nation's economy. The Commerce Department estimates the annual wholesale value of livestock, meat, and poultry products to be approximately \$95 billion. At the close of fiscal year 1996, there were 1,348 stockyards; 6,988 market agencies/dealers; and 2,169 packer buyers registered with GIPSA to engage in the livestock marketing business. There also were approximately 6,000 slaughtering and processing packers; an estimated 6,500 meat distributors, brokers, and dealers; and an estimated 225 poultry firms subject to the P&S Act.

GIPSA's P&S Programs continues to provide payment protection to livestock and poultry producers by focusing on the financial area. Financial investigations during fiscal year 1996 resulted in \$3.5 million being restored to custodial accounts established and maintained for the benefit of livestock sellers. Packer and poultry trust activities also returned over \$400,000 to livestock sellers and over \$100,000 to poultry growers during the fiscal year. Dealers and market agencies are required to meet solvency requirements, a critical component of payment protection of the P&S Act. During fiscal year 1996, 205 insolvent dealers and market agencies corrected or reduced their insolvencies by \$11.2 million.

GIPSA closely monitors anticompetitive practices which may be impeding the free trade of livestock. Any practice, agreement, or understanding that excludes potential buyers from bidding in open competition is considered a restraint on competition. Examples of such practices include apportioning territories, price agreements or arrangements not to compete, and payoffs or kickbacks to buyers. A high priority is placed on investigating all complaints and further developing information received concerning the failure of livestock dealers, market agencies, or packers to compete for the purchase of livestock.

In 1996, a major investigation of fed cattle procurement practices in Kansas was completed. The investigation examined over 15,000 purchase transactions involving 2 million head of cattle. The results, which were released in March 1996, indicated that supply and demand factors were the primary causes of price declines in the spring of 1995. In fiscal year 1996, GIPSA began several actions to increase enforcement activities in the area of anticompetitive-type practices involving the Nation's major meat packers. The Agency initiated a major cattle procurement investigation in Texas that will examine over 37,000 purchase transactions involving over 6 million head of cattle sold during 1995 and 1996. A major slaughter hog procurement investigation was also initiated during 1996. This investigation will examine approximately 50,000 purchase transactions involving over 2.5 million head of slaughter hogs. Using data from the Kansas and Texas fed cattle investigations, GIPSA will conduct economic analyses during fiscal year 1997 on the effect of forward contracting, packer feeding, and marketing agreement/formula pricing arrangements.

In fiscal year 1997, GIPSA will continue to improve the efficiency of its P&S Programs, and ensure that the programs play an effective role in the U.S. livestock, poultry, and meat marketing system. A key activity in our improvement process involves a review by USDA's Office of the Inspector General (OIG) of current enforcement practices under the P&S Act. The OIG review is expected to provide data on how GIPSA can maximize its effectiveness and make full use of its authority to investigate and correct anticompetitive practices and arrangements. The review also will examine whether GIPSA's structure and operating practices and procedures should be modified to enhance its responsiveness to the needs of a changing industry.

PART 1

167

Also in fiscal year 1997, GIPSA will solicit public comment on the need for regulations addressing contract poultry grower financial arrangements. Currently, the predominant method used to pay growers for flocks under a poultry growing arrangement is based on a system that compares a grower's results to that of other growers during a specified time period. Many poultry growers have repeatedly expressed concern that comparing their production costs against those of other growers to determine payment is unfair. Growers also have expressed concerns about the accuracy of feed weights and feed delivery, pickup procedures, and the procedures for weighing live birds picked up for slaughter.

As you can see, a great deal was accomplished in fiscal year 1996 and much is planned for fiscal year 1997 in both of GIPSA's program areas. Our efforts to continuously improve our programs and services were greatly enhanced last fiscal year by the development of the Agency's first strategic plan.

STRATEGIC PLANNING

The GIPSA Strategic Plan was developed to guide the agency into the next century and to help ensure that our programs and services remain relevant to our customers and American agriculture. The American public and international customers of U.S. agricultural products want an ample supply of quality food at a reasonable price. This means American markets must be efficient, competitive, and quality-conscious. GIPSA's general goals, as well as the agency's products and services, are oriented toward fulfilling this need for a fair, competitive, and efficient market system.

The strategic plan, developed in a cooperative effort by all GIPSA employees and our customers, outlines four major goals that will guide our planning processes and initiatives for the upcoming years:

- We will ensure that programs are cost-effective and responsive to markets served.
- We will ensure that the credibility of programs is unquestionable.
- We will ensure that GIPSA employees are highly-skilled professionals providing quality customer service.
- We will work to harmonize customers' expectations with GIPSA's authority and capabilities.

As part of the strategic planning process, GIPSA identified several measures that will allow us to quantitatively evaluate our performance. In the grain program, in fiscal year 1998, GIPSA will begin measuring the performance of the new quality assurance and control system for accuracy and consistency; the average cost of oversight per metric ton of grain inspected; the number of new tests developed and improved methods/calibrations implemented; and the average cost of export grain inspection per metric ton.

For the P&S programs, GIPSA will implement a new electronic tracking system for complaints and investigations. This will enable us to establish performance goals based on the new tracking and monitoring system, and to provide for more effective allocation of resources. In developing our strategic plan, GIPSA reaffirmed its commitment to strengthening the cost-effectiveness, responsiveness, and credibility of our programs and services. In fiscal year 1998, GIPSA will be pursuing a number of initiatives that will reflect the goals and commitments outlined in our strategic plan. As mentioned above, these initiatives include establishing guidelines and developing the technology for joint industry/GIPSA ventures to automate the grain inspection process at export grain elevators; designing and implementing an investigation tracking and monitoring system; networking all of the Federal, State, and private partners comprising the official grain inspection and weighing system; implementing a new quality assurance and control program for grain inspection activities; and conducting regional and industry-wide reviews and investigations in the livestock, meat, and poultry industries.

FISCAL YEAR 1998 BUDGET REQUEST

To fund these important initiatives and to enable GIPSA to remain a valuable part of American agriculture, under current law, GIPSA's total budget request for fiscal year 1998 is \$68.8 million, of which \$25.7 million represents appropriations. The remaining \$43.1 million represents user fee authority for inspection and weighing services.

For fiscal year 1998, the President's budget proposes a total program level for grain inspection of \$54.0 million, with \$10.9 million appropriated for compliance, standardization, and methods development activities. The fiscal year 1998 budget also proposes legislation to authorize the collection of \$3.6 million in additional user fees to cover the costs of grain standardization activities.

PART 1

168

For P&S Programs, the budget proposes \$14.8 million, which includes increases of \$225,000 to allow GIPSA to establish electronic filing procedures for annual reports, which is consistent with the requirements of the Paperwork Reduction Act of 1995; \$1,595,000 for activities in the packer competition and industry structure areas; and \$750,000 for poultry compliance activities.

Increasing concentration, structural change, market performance, and the use of complex formula and value-based marketing systems by packers continue to raise questions of regulatory and policy significance. Additional resources will allow GIPSA to expand our capability to monitor and investigate the competitive implications of structural changes and behavioral practices in the meat packing industry, and will increase our capability to support legal actions that require complex economic and statistical analyses. Continuous, systematic collection and analysis of data along with aggressive investigative activities are required to address these issues effectively.

To promote competition and improve market performance and confidence in the livestock and poultry sectors, the Secretary's Advisory Committee on Agricultural Concentration recommended increased monitoring and enforcement of antitrust and regulatory policy and, specifically, increased antitrust enforcement under current regulations of the P&S Act. Since anticompetitive practices are complex and often encompass broad geographic areas, investigations involving building cases for unacceptable behavior has become more difficult and resource-intensive.

The requested increase in funds for P&S Programs will allow GIPSA to conduct additional detailed investigations and analyses in selected geographic markets on a timely basis. It also will help us meet our responsibility of fostering fair and open competition, and guarding against deceptive and fraudulent practices that affect the movement and price of meat animals and meat food products.

As the industry continues to rapidly move to value-based methods of pricing, the complexity and sophistication of the packing industry's procurement and pricing methods will continue to increase. With this change also comes greater opportunity for packers to engage in unfair, unjustly discriminatory, or deceptive practices to the detriment of livestock producers. The Agency must be able to commit the necessary resources to conduct the type of complex investigations that are required to ensure the integrity of the accounting and payment to producers.

The Secretary's Advisory Committee on Agricultural Concentration also offered recommendations to address anticompetitive practices in the poultry industry. In recent years, contract poultry growers have looked to USDA for help in assuring they are treated fairly when dealing with large, integrated poultry companies. The Committee recommended that the Secretary be provided the same administrative enforcement authority for poultry as currently exists for red meat to protect contract poultry growers from unfair and discriminatory practices.

The increase of \$750,000 for poultry compliance will allow GIPSA to operate on other than a complaint-driven basis and permit increased compliance investigations into the poultry industry. More in-depth investigations will increase the Agency's ability to identify or address practices in the industry that may be unfair, unjustly discriminatory, or deceptive before practices escalate.

Finally, as in previous years, the fiscal year 1998 budget proposes legislation to authorize the collection of license fees to administer all activities under the P&S Act. In fiscal year 1998, funds would be available only to the extent provided in advance in appropriations acts. All meat packers, live poultry dealers, stockyard owners, market agencies, and dealers, as defined in the P&S Act, would be subject to the license fees. Also included is a request to provide for a legislative proposal regarding a statutory dealer trust to require livestock inventories and accounts receivable due from the sale of livestock to be held in trust for unpaid cash sellers when a dealer fails to pay for livestock. If the user fee legislation is enacted, the cost of administering this provision would be recovered through license fees.

CONCLUSION

Mr. Chairman, this concludes my statement. I appreciate the opportunity to testify on behalf of one of USDA's newest agencies. I will be happy to answer any questions the Committee may have.

INTRODUCTION OF WITNESS

Senator COCHRAN. Before proceeding with questions of you or your colleagues who administer these programs, I am going to call on Thomas Billy for his statement as well. I know that the Under Secretary's position is vacant. Mike Taylor was in that job and now

PART 1

169

is no longer with the Department I understand. I assume you have been elevated to be Acting Under Secretary, or at least you do not have a boss here. You are the head man. Right? [Laughter.]

Mr. BILLY. Yes, sir.

Senator COCHRAN. And you have an equal footing—and I want everybody to understand that—with the marketing and regulatory programs. We consider that to be the case anyway.

So, I am going to ask you to proceed with any comments or statements that you have about the budget for the Food Safety and Inspection Service, Mr. Billy, and then we will have a chance to have questions on all these subjects. Please proceed.

STATEMENT OF THOMAS J. BILLY

Mr. BILLY. Thank you, Mr. Chairman, and members of the subcommittee.

I am pleased to appear before you today to discuss the President's fiscal year 1998 budget request for the Food Safety and Inspection Service. I request that my full statement be entered into the record.

Senator COCHRAN. Without objection, it is so ordered.

Mr. BILLY. Thank you very much.

As you may know, I became the Administrator of the Food Safety and Inspection Service in October 1996, after serving as the Associate Administrator for 2 years.

FOOD SAFETY PARTNERSHIP

During my years as a public servant, I have become convinced that the only way we can serve the American public is through partnerships. I believe that the Congress and FSIS are partners, striving toward the same results: safer food and a more efficient use of the taxpayers' dollars. I wish to acknowledge your role in supporting the 1997 budget request, and making an essential contribution to fulfilling our Federal responsibilities in food safety.

Now, I want to tell you very briefly about our role in the partnership during the last year, and how we plan to continue to fulfill our responsibilities. I will talk briefly about the progress we are making because of the partnerships we have formed with key constituencies, including consumers, the regulated industry, and our own employees.

FUNDAMENTAL CHANGES IN FSIS

In the last 2 years, FSIS has been working toward two goals: to make food safer by finding better ways to control pathogens and to make better use of our resources. We recognize that the agency would have to change its reliance on the traditional command-and-control method of doing business and that this would require a fundamental cultural change within the agency. Our employees and all of our constituencies would have to be part of that change and, more important, have a role in determining the nature of the changes and the methods for their implementation. In short, we had to form partnerships and work in a more open environment to make the needed changes.

PART 1

170

During fiscal year 1996, we set in motion a public process for determining what changes are needed. The product of that effort is a comprehensive food safety strategy. We have already begun making changes and will continue implementing them into the next century. I would like to briefly describe a few of those key changes and what they mean to the agency and to the American public.

PATHOGEN REDUCTION AND HACCP

The agency reached a milestone last July with publication of the final rule on pathogen reduction and the hazard analysis and critical control point system, known as HACCP, which will directly target and systematically reduce harmful bacteria on raw products, as well as other likely hazards. It will equip FSIS inspection personnel with the scientific and regulatory tools they need to ensure that slaughter establishments meet specific standards, and that we will reinforce all of the plants' responsibilities in terms of producing a safe product.

We began implementation of the rule a little more than a month ago. On January 27 of this year, all plants had to have plant-specific sanitation standard operating procedures, or SOP's, to ensure that they are meeting their responsibility for proper sanitation of facilities, equipment, and operations. In addition, most slaughter plants were required to begin testing for generic E. coli, to verify process control effectiveness in preventing fecal contamination, the primary pathway for pathogenic bacteria.

Next, all plants will develop a HACCP plan. HACCP systems identify critical control points that address likely product safety hazards.

HACCP implementation will be phased in according to plant size. In recognizing the special difficulties that small plants will face, we have initiated an aggressive program to provide assistance to these small plants.

The HACCP rule established Salmonella performance standards for chilled carcasses and for raw ground products. Through their HACCP programs, plants will be required to achieve a prevalence for Salmonella contamination that is below the national baseline prevalence for each class of product. FSIS will continually sample and test to verify compliance.

Now, by January 25 of the year 2000, all provisions of the final rule will have been implemented. The final rule sets an important framework for change in FSIS, but is by no means the completion of our full strategy for change. We must now envision our food safety and consumer protection goals in a HACCP world.

FSIS REORGANIZATION

We also realized that FSIS would need a new organization to make the necessary changes to achieve our goals. In fiscal year 1996, we began implementing a sweeping reorganization that will help us carry out our regulatory responsibilities in a more scientific and efficient manner.

We are flattening and streamlining our management structures both in headquarters and in the field and consolidating four former independent field structures into one. Our new structure will accommodate the agency's need to function with fewer nonfrontline

PART 1

171

staff. As we streamline our organization, we will increase the proportion of resources deployed to the frontline work force, that is, our food inspectors, in-plant veterinarians, our import inspectors, laboratory personnel, and compliance officers. This should allow us to handle industry growth without seeking additional inspection resources through the budget process.

I am very proud that we have reduced the number of headquarters units reporting to the Administrator from 13 to 7. At the same time, we created a new Office of Public Health and Science which will improve the public health focus of our program. It will ensure that our policies meet the performance goal of improving public health.

Over the next 2 years, we will reduce the number of field management offices from 46 to 18 district offices and a technical services center. I strongly believe that the 18 new district offices will make supervisory spans of control more manageable, and better balance the workload that we have.

A new Technical Services Center has been established, and will open in Omaha, NE, this summer.

FOOD SAFETY EDUCATION PROGRAM

We cannot operate the science-based inspection system of the future without first preparing our inspection work force for these changes. We have begun training our inspection work force to implement the new rule and started a new education program at Texas A&M University to provide in-plant inspectors with a more scientific foundation to work in a HACCP environment. The program will focus on giving a basic understanding of why food safety problems occur and why certain inspection tasks must be done rather than simply showing employees how to carry out the tasks.

We also have offered to reimburse employees for courses that they would take on their own time near their work sites in subjects such as statistics and microbiology.

REGULATORY REFORM

Another important area—we have initiated a comprehensive review of our entire set of operations to reduce costs and burden to industry and consumers without compromising public health and safety. As part of this effort, I am pleased to report that we are well underway with our efforts to eliminate a number of regulatory provisions and convert others to performance standards needed for HACCP.

In December 1995, we published an advance notice of proposed rulemaking in the Federal Register describing our regulatory reform strategy. We also invited comment on a list of regulations that may need revision to be consistent with HACCP.

Now, as a down payment, at that same time, we published three other documents: a final rule streamlining our prior approval system for labels, a proposal to cooperate more closely with the Food and Drug Administration on ingredient approvals, and a proposal to allow deviations from FSIS standards of identity and composition to produce products with reduced fat, cholesterol, and sodium.

Since then, we have published a proposal to eliminate prior approval for blueprints, equipment, and certain partial quality control

PART 1

172

programs, a proposal to shift from detailed command-and-control requirements in existing regulations to performance standards for certain meat and poultry products, and an advance notice of proposed rulemaking to evaluate the need for meat and poultry standards of identity and composition.

When our regulatory reform is completed, it will clarify the proper roles of Government and industry in ensuring a safe, wholesome food supply.

EMPHASIS ON PUBLIC HEALTH

We are also working with CDC and FDA in terms of public health, and we have started a new sentinel site project in cooperation with those agencies where we are looking at developing procedures to collect better information in terms of illnesses that are caused by various food products, including meat, poultry, and egg products.

PRESIDENT'S FOOD SAFETY INITIATIVE

On January 25, the President announced the administration's food safety initiative which includes an expansion of the sentinel site project into the Nation's early warning system. The current sentinel sites are an integral part of the early warning system and the President is requesting funding for FSIS, FDA, and CDC to increase the number of sites from five to eight, to better equip and link the sites, and to make available the state-of-the-art laboratory and electronic technology that is needed.

In our 1998 budget request, we are asking for additional funds to expand surveillance and population surveys to include *Campylobacter* infections in the sentinel site project.

EGG SAFETY

Another area we are emphasizing is egg safety. We are working to address the concerns you expressed in the fiscal year 1997 committee report concerning the 1991 amendment to the Egg Products Inspection Act establishing the average ambient temperature for the transportation of eggs and egg products. We are working closely with FDA to develop science-based regulatory standards for proper cooling of shell eggs and are looking at how best to implement the statutory shell egg requirements in the context of a HACCP-based farm-to-table strategy for eggs.

FOOD SAFETY BEYOND THE PLANT

As we implement the pathogen reduction and HACCP rule in inspected establishments, we have already begun exploring what is needed to improve food safety after products leave the establishments. We hear a lot from industry expressing concerns that you need to address every place on the farm-to-table continuum where hazards can develop and ensure that there are appropriate controls.

On the retail level, we recognize that the primary responsibility for overseeing food safety resides with State and local governments. We fully support the forum provided by the Conference for Food Protection for developing the best model code for State adoption,

PART 1

173

and we are committed to strengthening how the existing code addresses meat, poultry, and egg products. We are also committed to providing appropriate assistance to see that the Food Code is adopted nationwide by the States.

NEW TECHNOLOGY

Another area I would like to emphasize is the importance of new technology. Within FSIS through our field automation and information management [FAIM] project which you have supported, we are equipping our inspectors with computers to better allow them to communicate, access, and apply technical regulations and directives, and receive training on HACCP. The FAIM initiative supports both the agency's field reorganization and HACCP implementation.

I am pleased to say that all large plants will be covered by FAIM as of January 1998, the effective date for the HACCP rule in these establishments.

We are also using more rapid tests and automation in our laboratories to speed the availability of test results, and we are redesigning our training and continuing education programs to teach our employees to take advantage of this new technology.

We also are encouraging new technology outside the agency. During the last several years, we have approved a number of new technologies for use in plants to improve food safety, including organic acids, trisodium phosphate, and steam pasteurization. We will continue to help industry to test new technology in plants. As a result of your support in the 1997 budget, we particularly are focusing on small plants to help them adapt new technology to improve food safety and assisting these small plants in developing alternative process controls that meet HACCP standards.

1998 BUDGET REQUEST

Now, we are encouraged by the importance placed on food safety throughout USDA and support the initiatives proposed by the Agricultural Research Service for preharvest and postharvest food safety research and by the Cooperative State Research, Education, and Extension Service for grant programs to be carried out by the land grant universities.

To continue making food safety improvements and to accomplish our goals, we are making a current law request of \$591.2 million, an increase of \$17.2 million over the amount provided in 1997. This proposal includes increases of \$13.7 million for statutory pay increases, \$1.1 million for the increased costs of State inspection programs, and a net increase of \$2.4 million for program investments.

In fiscal year 1998, FSIS will continue to see progress in terms of transforming the inspection process and will make no requests for increase in staffing levels. We are requesting an increase for pay costs to maintain the current inspection staffing levels so that we can cover the slaughter lines and the processing operations, and avoid disruption in production processes.

In fiscal year 1998, FSIS proposes to build on the changes and investments we have started over the last 2 years, and I am confident that the results will improve both food safety and our efficiency.

PART 1

174

USER FEE PROPOSAL

Now, the administration believes that the collection of user fees is essential to the successful long-term implementation of the meat, poultry, and egg products inspection reforms. Legislation will be proposed to recover \$390 million in new user fees to pay the cost of salaries and benefits for personnel providing direct inspection services. The user fee proposal would result in the industry paying about 70 percent of the total cost of the program.

For 1998, we are requesting an appropriation of \$201 million to provide laboratory support for inspection, animal production food safety investments, investments in new inspection systems improvements, and program administration. This proposal is intended to assure that resources are available now and in the future to provide the level of inspection necessary to meet the demand for such services, including the growth in the industry, and to maintain consumer confidence, with the balanced budget also held in proper context. The overall impact of consumer prices as a result of these fees is estimated to be less than one-half cent per pound for meat and poultry production.

The Federal Government must share with industry, who derives direct benefits from inspection, the fiscal responsibility for providing services that are essential to ensuring food safety. To accomplish a balanced Federal budget, cost burdens must be shifted from taxpayers to those who benefit directly from the provided services. The food industry profits in the marketplace from the level of consumer confidence provided by Federal inspection programs. Additionally, the inspection programs provide a level playing field in maintaining standards of safety, wholesomeness, and labeling among individual industry entities competing for market advantage.

That concludes my oral statement.

PREPARED STATEMENT

Senator COCHRAN. Thank you very much, Mr. Billy. We have your complete statement, and it will be made part of the record. [The statement follows:]

PREPARED STATEMENT OF THOMAS J. BILLY

Mr. Chairman and Members of the Subcommittee, I am pleased to appear before you today to discuss the President's fiscal year 1998 budget request for the Food Safety and Inspection Service (FSIS). As you may know, I became the Administrator of FSIS in October 1996, after serving as Associate Administrator since October 1994.

During my years as a public servant, I have learned that the job of ensuring food safety involves much of government and requires multiple resources and authorities. I've seen food safety from several sides now, having worked at the National Marine Fisheries Service with its voluntary seafood inspection program, at the Food and Drug Administration, and now at FSIS. I am convinced that the only way we can serve the American public is through partnerships.

I believe also that Congress and FSIS are partners, striving toward the same results—safer food and a more efficient use of taxpayer dollars. I wish to acknowledge your role in supporting the 1997 budget request and making an essential contribution to fulfilling our Federal responsibilities in food safety. Now, I want to tell you about our role in the partnership during the last year and how we plan to continue to fulfill our responsibilities. I will also talk about the progress we are making because of partnerships with key constituencies, including consumers, the regulated industry, and our own employees.

PART 1

175

CURRENT INSPECTION ACTIVITIES

FSIS has a long, proud history of protecting the public health. Our mission is to ensure that the Nation's commercial supply of meat, poultry, and egg products is safe, wholesome, and accurately labeled, as required by the Federal Meat Inspection Act, the Poultry Products Inspection Act, and the Egg Products Inspection Act.

FSIS inspects approximately 5,900 plants that slaughter cattle, swine, sheep, goats, horses, chickens and turkeys, and process eggs as well as produce a wide range of processed products, including hams, sausage, stews, pizzas, and frozen dinners.

In addition to inspecting animals before and after slaughter and during processing, our inspectors provide samples to laboratories to test for the presence of chemical residues. FSIS also sets standards for a range of activities associated with the production of meat and poultry products, including the use of equipment, sanitation procedures, and product labeling.

In fiscal year 1996, our domestic inspectors examined approximately 88 billion pounds of meat and poultry and 3 billion pounds of egg products for public consumption. While the inspection of domestically produced meat, poultry, and egg products consumes the bulk of FSIS resources, FSIS also recognizes the vital importance of inspecting imported products. To ensure the safety of imported products, FSIS maintains a comprehensive system of import controls to carry out the requirements of the Federal meat, poultry, and egg products inspection laws.

This system of import controls involves two major components. The first is oversight to ensure that exporting countries have government inspection controls equivalent to those of the United States. Such countries must undergo a rigorous review process before they can become eligible to export product to the United States, and periodic in-country reviews, including on-site plant reviews, are carried out to maintain such eligibility.

The second component is the reinspection of meat and poultry products as they enter the United States. Reinspection is based on statistical sampling and verifies that the foreign country's inspection system is working. This reinspection is carried out by approximately 74 import inspectors covering some 160 active import inspection locations. In 1996, nearly 2.4 billion pounds of imported meat and poultry products were passed for entry into the United States.

FSIS provides assistance to State inspection programs and reviews those programs to ensure that they are maintaining inspection requirements at least equal to those of the Federal program.

Another part of the FSIS food safety program involves our laboratories, which provide scientific and technical support to inspection personnel through laboratory testing for chemical and antibiotic residues, microbiological contamination, pathology diagnostics, processed product composition, and economic adulteration.

FSIS currently operates three multidisciplinary laboratories to carry out food safety and composition tests. During fiscal year 1996, over 1.7 million analyses were performed on meat, poultry, and egg product samples by federally operated laboratories.

FSIS conducts compliance and enforcement activities to address situations where unsafe, unwholesome, and inaccurately labeled products have been produced or marketed. FSIS investigates cases of administrative, civil, or criminal violation of meat, poultry, and egg product regulations and works in conjunction with the USDA Office of the General Counsel and the Department of Justice to correct problems and prosecute offenders when necessary.

In fiscal year 1996, 31,099 compliance reviews were conducted. As a result of these reviews and other compliance activities, more than 22 million pounds of meat and poultry were detained for noncompliance with meat and poultry laws. Forty recalls were conducted involving over 2.3 million pounds of product. In addition, 48 convictions were obtained against firms and individuals for violations of the meat and poultry inspection laws.

FUNDAMENTAL CHANGES IN FSIS

In the last two years, FSIS has been working toward two major goals: to make food safer by finding better ways to control pathogens, and to make better use of our resources. We recognized that the Agency would have to change its reliance on our traditional command and control method of doing business and that this would require a fundamental cultural change within FSIS. Our employees and all of our constituencies would have to be part of the change and, more importantly, have a role in determining the nature of the changes and the method of their implementation. In short, we had to form partnerships and work in a more open environment to make the needed changes. During fiscal year 1996, we set in motion a public

PART 1

176

process for determining what changes were needed. The product of that effort is a comprehensive food safety strategy. We have already begun making changes and will continue implementing them into the next century. I'd like to describe a few of the key changes, how they came about, and what they mean for the Agency and the American people.

PATHOGEN REDUCTION AND HACCP

The traditional FSIS system of organoleptic inspection has limitations in dealing adequately with the problem of pathogenic microorganisms—harmful bacteria—on raw meat and poultry products. It cannot detect invisible bacteria such as *Salmonella*, *E. coli* O157:H7, *Campylobacter*, and *Listeria monocytogenes*, which contribute significantly to foodborne illness in the United States.

The Agency reached a milestone last July with publication of the final rule on Pathogen Reduction and the Hazard Analysis and Critical Control Point system, known as HACCP, which will directly target and systematically reduce harmful bacteria on raw products, as well as other likely hazards. It will equip FSIS inspection personnel with the scientific and regulatory tools they need to ensure that slaughter establishments meet specific standards of food safety performance in terms of such bacteria, and will also reinforce all plants' responsibilities for safe product. Let me briefly describe the major provisions of the Pathogen Reduction and HACCP rule.

We began implementation of the rule a little more than a month ago. On January 27, all plants had to have plant-specific Sanitation Standard Operating Procedures (SOP's) to ensure that they are meeting their responsibility for proper sanitation of facilities, equipment, and operations. The written sanitation SOP's must describe the specific measures plant management will put in place to prevent direct product contamination. In addition, most slaughter plants were required to begin testing their products for generic *E. coli* as an indicator of process control effectiveness for preventing fecal contamination, the primary pathway for pathogenic bacteria.

All plants will develop a HACCP plan based on the seven principles established by the National Advisory Committee on Microbiological Criteria for Foods. HACCP systems identify critical control points that address likely product safety hazards, rather than quality or economic adulteration problems.

HACCP implementation will be phased in according to plant size. Large plants with 500 or more employees must have plans in place on January 26, 1998. For small plants with 10 to 499 employees, the implementation date is January 27, 1999. For very small plants, with fewer than 10 employees or annual sales of less than \$2.5 million, the implementation date is January 25, 2000.

In recognizing the special difficulties that small plants will face, we have initiated an aggressive program to provide assistance to these plants. We will provide a Guidebook for the preparation of HACCP Plans, a Hazards and Preventive Measures Guide, and model plans for various product categories. We have held special constituent meetings to determine what specific, tailored assistance small plants will need. FSIS is assessing those needs and developing assistance tools that are not presently available. Current plans call for demonstration projects for HACCP in small plants. Additionally, USDA's Fund for Rural America will complement FSIS efforts by providing research and extension assistance in rural communities to help small and very small plants assess and meet their training and facilities needs in order to implement HACCP.

The HACCP rule established *Salmonella* performance standards for chilled carcasses and raw ground products. Through their HACCP programs, plants will be required to achieve a prevalence of *Salmonella* contamination that is below the national baseline prevalence for each class of raw product, as reflected in the FSIS baseline surveys. FSIS will continually sample and test to verify compliance.

By January 25, 2000, all provisions of the final rule will have been implemented. The final rule sets an important framework for change in FSIS, but by no means is it the culmination of our strategy for change. We must now envision our food safety and consumer protection goals in a HACCP world.

CHANGES IN THE FSIS ORGANIZATION

We realized early on that FSIS would need a new organization to make the changes necessary to achieve our goals. In fiscal year 1996, we began implementing a sweeping reorganization that will help us carry out our regulatory responsibilities in a more scientific and efficient manner. We sought input on the changes from our constituencies and our employees at all grade levels throughout the Agency. As a result, the reorganization is based on a top-to-bottom review of the Agency's regulatory roles, resource allocations, and organizational needs.

PART 1

177

We are flattening and streamlining management structures both at headquarters and in the field, and consolidating four former independent field structures into one. Our new structure will accommodate the Agency's need to function with fewer non-frontline staff. As we streamline the organization, we will increase the proportion of resources deployed to the frontline work force—food inspectors, in-plant veterinarians, import inspectors, laboratory personnel, compliance officers, and first-level supervisors.

I am very proud that we reduced the number of headquarters units reporting to the administrator from 13 to 7. At the same time, we created a new Office of Public Health and Science, which will improve the public health focus of our program. It will ensure that our policies meet the performance goal of improving public health. We also created a new Office of Policy, Program Development and Evaluation which will centralize all policy and rulemaking functions in the Agency.

Over the next two years, we will reduce the number of field management offices from 46 to 18 district offices and a Technical Services Center. I strongly believe that the 18 new district offices will make supervisory spans of control more manageable and better balance the workload.

A new Technical Services Center has been established and will be opened in Omaha, Nebraska, this summer. It will provide technical expertise and guidance to inspection personnel on the interpretation, enforcement, and application of domestic and import regulations, policies, and systems. We expect that the Center will enable FSIS to provide much quicker technical assistance and far more consistency in inspection across the country.

REGULATORY REFORM

FSIS is committed to comprehensive regulatory review of our entire operations to reduce cost and burden to industry and consumers without compromising public health and safety. As part of this effort, I'm pleased to report that we are well underway with our efforts to convert our regulations to the performance standards needed for HACCP. In December 1995, we published an advance notice of proposed rulemaking in the Federal Register describing our regulatory reform strategy. We also invited comment on a list of FSIS regulations that may need revision to be consistent with HACCP. At the same time, we published three other documents: a final rule streamlining our prior approval system for labels; a proposal to cooperate more closely with the Food and Drug Administration on ingredient approvals; and a proposal to allow deviations from FSIS standards of identity and composition to produce products with reduced fat, cholesterol, and sodium.

Since then, we have published a proposal to eliminate prior approval for blueprints, equipment, and certain partial quality control programs; a proposal to shift from detailed command and control requirements in existing regulations to performance standards for certain meat and poultry products; and an advance notice of proposed rulemaking to evaluate the need for meat and poultry standards of identity and composition.

When our regulatory reform is completed, it will clarify the proper roles of government and industry in ensuring safe food. It will focus FSIS resources on preventing harmful bacteria and other hazards in meat and poultry products. And it will make the Agency more responsive to all our constituencies.

EMPHASIS ON PUBLIC HEALTH

Our major goal is an improvement in the safety of meat, poultry, and egg products that leads to fewer people getting sick. As you know, the Government Performance and Results Act of 1993 directs Federal agencies to measure the results of their programs in terms of societal impacts. Year after year, we have been able to tell you how many pounds of product we inspected and how many laboratory tests we conducted. What we now need to tell you is how these programs make a difference to public health.

To assess the public health impact of a modernized inspection system, FSIS began working with the Centers for Disease Control and Prevention (CDC) and the Food and Drug Administration (FDA). Past estimates of the annual incidence of foodborne illness cover a very broad range and clearly indicate the need for more accurate data, including the source and cause of the problem. Limited regional studies have clearly implicated meat and poultry as vehicles for several foodborne pathogens; however, we need more precise national data.

FSIS is working with CDC and FDA to monitor five foodborne illness "sentinel sites." These sites were established to estimate the national incidence of the major foodborne diseases and to explore what relationships may exist between specific pathogens and the types of meat, poultry, and other food products associated with

PART 1

178

them. On January 25, the President announced the Administration's Food Safety Initiative, which includes an expansion of the sentinel site project into the Nation's Early Warning System. The current sentinel sites are an integral part of the Early Warning System, and the President has requested funding for FSIS, FDA and CDC to increase the number of sites from five to eight, better equip and link the sites, and make available state of the art laboratory and electronic technology.

In February 1997, the sentinel sites provided FSIS with preliminary data on the occurrence of diarrheal illness in 1996 due to bacterial foodborne pathogens, including *E. coli* O157:H7, *Salmonella*, *Campylobacter*, *Yersenia*, *Listeria*, and *Vibrios*. And through case-control studies, which are in progress, the sites will provide data to determine the proportion of culture-confirmed cases of illness due to *E. coli* O157:H7 and *Salmonella* serogroups B and D attributable to eating meat and poultry products; and through population surveys, we will learn more about how people handle and prepare food. In our 1998 budget request, we are asking for additional funds to expand surveillance and population surveys, and to include *Campylobacter* infections in the Sentinel Sites case-control study.

With sentinel site information, FSIS can review HACCP programs and, where appropriate, trigger changes to prevent future outbreaks of foodborne illness. The sites will provide critical human health information to support risk assessments to determine whether pathogen performance criteria and standards are effectively reducing the incidence of foodborne illness.

As you know, we were directed by you in the fiscal year 1997 Committee Report to report on the incidence of foodborne illness in cooperation with CDC. The report found that there were 7,259 laboratory confirmed cases of diarrheal illness in calendar year 1996 in the five sites. Also, *Campylobacter* was the most frequently isolated bacterium, with *Salmonella* second, *Shigella* third, and *E. coli* fourth. CDC will officially close its books on 1996 at the end of March and we will provide updated information to you when final figures are available.

We are continuing our nationwide baseline studies to measure the levels of pathogens that currently exist on meat and poultry products. With this and other information, we expect to know earlier in the process if a potential public health problem exists and be able to carry out risk assessments, as required.

As a regulatory agency focused on public health, we must be able to rapidly adjust our policies and procedures to new information and emerging public health risk. With our enhanced front-line capability under the new organizational structure, we will be better able not only to address immediate public health problems, but to adjust our regulatory policies and procedures as necessary.

CHANGES IN INSPECTION

With implementation of the final rule on Pathogen Reduction and HACCP, there are additional opportunities to improve the way we carry out inspection activities, to improve both food safety and allocation of resources. We believe the implementation of HACCP will permit us to make improvements in the inspection process and redeploy some of our current in-plant inspection work force both to HACCP verification tasks, and to new tasks outside of traditional in-plant settings in furtherance of our farm-to-table strategy.

I also strongly believe that the final HACCP rule will provide much greater consistency in meat and poultry inspection across the country and between meat and poultry inspection. But it will be a consistency based on a common, consistent regulatory framework. It will not be based on the command and control philosophy of the past.

We are aware that there are activities we carry out within plants as part of the inspection process that have limited value in terms of public health protection or meeting other consumer protection responsibilities. We also know that there are important public health tasks we do not carry out under the current system of inspection. We are planning demonstration projects to explore improved methods for conducting inspection, and will follow a public process to obtain input from all stakeholders.

EGG SAFETY

Egg safety is another important area that deserves our attention. One emerging issue regarding the safety of eggs relates to phage-type 4 *Salmonella enteritidis* (Se).

We are monitoring the situation, and our concerns are growing. Through reports from the CDC, we know that human illnesses caused by phage-type 4 *Salmonella enteritidis* are increasing and spreading geographically. The first human cases of

PART 1

179

salmonellosis due to *Salmonella enteritidis* phage-type 4 occurred in California and Texas. It has now been found in Utah and other parts of the U.S.

The good news is that studies in U.S. broilers to date have not shown an increase in Se following the detection of Sephage-type 4 in this country. We believe that the steps we are taking now to reduce Se in eggs are important regardless of the type of Se we are dealing with; but we need to take some additional steps based on information that suggests phage-type 4 Se may be an invasive infection in poultry.

We have allocated funds to perform phage-typing of Se poultry isolates taken from our pathogen reduction testing program under HACCP. As I stated earlier, FSIS will conduct a *Salmonella* testing program under HACCP. We are also considering conducting a sampling program for liquid eggs and spent hens to monitor national trends for phage-type 4 Se.

We are working to address the concerns you expressed in the fiscal year 1997 Committee Report concerning the 1991 amendment to the Egg Products Inspection Act establishing an average ambient temperature for the transportation of eggs and egg products. We plan to work closely with FDA to develop science-based regulatory standards for proper cooling of shell eggs and are looking at how best to implement the statutory shell egg requirement in the context of our HACCP-based farm-to-table food safety strategy for eggs.

In close cooperation with the Food and Drug Administration (FDA), FSIS has undertaken a number of activities to address shell egg safety. With FDA, we conducted a conference in November to receive information on temperature control interventions and verification techniques in the transportation and storage of meat, poultry, seafood, eggs and egg products. We are conducting a science-based, quantitative risk assessment for shell eggs and egg products, and are talking with industry regarding steps they might take voluntarily to address the problem of *Salmonella enteritidis*. FSIS and FDA are also considering ways to solicit information through the rule-making process on issues of comprehensive food safety in shell eggs from production to food preparation. We plan to address this issue in the same public way we have addressed meat and poultry safety over the past few years, and will base actions on available science. In addition to working on shell egg safety with FDA, we are evaluating options for proposed regulations to mandate HACCP for plants that process shell eggs.

FOOD SAFETY BEYOND THE PLANT

As we implement the Pathogen Reduction and HACCP rule in inspected establishments, we have already begun exploring what is needed to improve food safety after products leave establishments. Opportunities to improve food safety exist all along the farm-to-table chain and we have an obligation to explore how best to take advantage of these opportunities by working with other Federal, State and local regulatory agencies.

On November 22, FSIS and FDA published in the Federal Register an advanced notice of proposed rulemaking to seek input on ways to improve food safety during transportation and storage. We are seeking comment on how the Federal government should be involved in this area. The November conference we sponsored with FDA on time, temperature, and transportation identified desirable and feasible temperature control interventions and verification techniques to improve food safety.

On the retail level, we recognize that the primary responsibility for overseeing food safety resides with State and local governments. We fully support the forum provided by the Conference for Food Protection for developing the best model code for State adoption. We are committed to strengthening how the existing Code addresses the meat, poultry, and egg products. We also are committed to providing appropriate assistance to see the Food Code adopted nationwide.

CHANGES IN THE WAY WE COMMUNICATE WITH ALL CONSTITUENCIES

When we began the changes at FSIS, we knew that HACCP could greatly improve food safety by identifying and controlling hazards before products reach consumers. HACCP principles have already been proven effective. However, simply imposing a new regulatory system over the old one would never work. To be successful, the Agency had to enlist the full participation of consumers, the meat and poultry industry, and all other constituencies.

FSIS far exceeded the requirements of the Administrative Procedures Act in reaching out to involve all stakeholders in this program. In addition to normal communication channels, such as notices in the Federal Register, letters were sent to thousands of organizations representing consumers, the industry, the public health community, academia, and other Federal, State, and local agencies. The Agency held seven information briefings on the proposal throughout the country, a two-day hear-

PART 1

180

ing in Washington, D.C. and three Scientific and Technical Conferences. The commenters raised new issues, questioned traditional wisdom, and related personal experiences. To share the new information, FSIS held another six meetings, this time focusing on specific issues raised during the comment process, culminating in a Food Safety Forum hosted by Secretary Glickman.

FSIS made substantial changes to the proposed HACCP regulation, based on the results of this outreach effort. For instance, the "indicator organism" for testing for basic safety was changed from Salmonella to E. coli and the testing requirements were changed to be much less burdensome on small plants.

After the final rule was published in July 1996, FSIS held more than a dozen additional meetings, in Washington, D.C. and across the country, to explain how the regulation would be implemented and to explain specific aspects, as well as identify the assistance available to help small plants implement HACCP. Again, we encouraged suggestions to help us fine tune implementation of the regulation.

For FSIS, a significant achievement was the process for consensus-building among competing and sometimes combative interests and a new openness to ideas. Naturally, all FSIS constituencies did not agree on every detail of the HACCP regulation and its implementation. However, they universally praised the open process that considered all viewpoints and brought together divergent constituencies that had believed themselves forever locked in opposition. It was the first time that such a variety of FSIS constituencies discussed their differing viewpoints face to face, gaining an understanding of each others' needs and concerns. For instance, the mother of a child who died from E. coli O157:H7 after eating a hamburger talked directly to the owner of a small meat plant who questioned whether he could ever guarantee that meat was free of pathogens. A union official, a plant manager, and a consumer advocate all agreed that inspectors need more scientific training. Many constituencies have asked that FSIS continue to hold public meetings, on all aspects of the Agency's work. We will do so.

During the process, we reached out to our employees in ways that we had not tried before. Now, we are investing in our employees. We cannot operate the science-based inspection system of the future without first preparing our inspection work force for these changes. We have begun training the inspection work force to implement the new rule and started a new education program at Texas A&M University to provide in-plant inspectors with a more scientific foundation to work in a HACCP environment. The program will focus on giving a basic understanding of why food safety problems occur and why certain inspection tasks must be done, rather than simply showing employees how to carry out such tasks. In addition, we will reimburse employees for the cost of courses they take on their own time near their work sites in subjects such as statistics and microbiology.

FORMING NEW PARTNERSHIPS

We are forming new partnerships with state and other government agencies and with academia, to ensure that we have the best information on which to base policy decisions. The Sentinel Sites project that I've already discussed is one such effort.

For the past couple of years, we have been working closely with FDA and State government agencies to address food safety gaps in the transportation and retail areas.

Our new food safety research agenda was developed cooperatively by the Food Safety Research Working Group, which is composed of scientists with a broad base of expertise in food safety and public health issues from USDA, FDA, CDC, the National Institutes of Health, and the Department of Defense. The agenda recognizes that it will require the combined efforts of government, industry, and academia to meet the need for human health research. Further, we must leverage our limited animal production food safety resources with producer groups, academia, States, and other Federal agencies to identify improvement opportunities in animal production.

FSIS is publishing three notices in the *Commerce Business Daily* to indicate our intent to work with animal producers, scientists in academia and government agencies at both the Federal and State levels to develop and foster voluntary food safety measures that can reasonably be taken on the farm, through marketing channels and during pre-slaughter preparation to decrease public health hazards in animals presented for slaughter.

NEW TECHNOLOGY

New technology will play a vital role in the new FSIS, both within and outside the Agency.

Within FSIS, through the Field Automation and Information Management (FAIM) project which you have supported, we are equipping our inspection work force with

PART 1

181

computers to better allow them to communicate, access and apply technical regulations and directives, and receive training on HACCP. The FAIM initiative supports both the Agency's field reorganization and HACCP implementation. All large HACCP plants will be covered by FAIM as of January 1998, the effective date of the HACCP rule for these plants.

We are using more rapid tests and automation in our laboratories to speed the availability of test results, and we are redesigning our training and continuing education programs to teach our employees to take advantage of this technology.

We will encourage new technology outside of the Agency. During the last several years we have approved a number of new technologies for use in plants to improve food safety—including organic acids, trisodium phosphate, and steam pasteurization. We will continue to help the industry to test new technology in plants. As a result of your support on the 1997 Budget, we particularly are helping small plants adapt new technology to improve food safety and assisting small plants in developing alternative process controls that meet HACCP standards.

INTERNATIONAL CHANGES

Our changes in regulation extend to imported products as well. The inspection systems of foreign countries must be equivalent to the U.S. system before product can be imported into the United States. Nations wishing to export to the United States had until January 27 to advise us they would implement the January 27 provisions of the Pathogen Reduction and HACCP regulation into their inspection systems. Otherwise, their product will not be allowed entry.

Working through the Codex Alimentarius Commission, we will continue to stress the role of science in international standard-setting and actively participate in the process.

1998 BUDGET REQUEST

We are encouraged by the importance placed on food safety throughout USDA and support the initiatives proposed by the Agricultural Research Service for Pre-harvest and Post-harvest food safety research, and by the Cooperative State Research, Education, and Extension Service for grant programs to be carried out by land grant universities.

To continue making food safety improvements and to accomplish our goals, we are making a current law request of \$591.2 million—an increase of \$17.2 million over the amount provided for 1997. This proposal includes increases of \$13.7 million for statutory pay increases, \$1.1 million for the increased costs of State inspection programs, and a net increase of \$2.4 million for program investments.

In fiscal year 1998, FSIS will again continue the process of transforming the inspection process with no requested increase in staffing levels. To support our partnership with employees, we are requesting an increase for pay costs to maintain current inspection staffing levels.

In fiscal year 1998, FSIS proposes to build on the changes and investments we have begun during the last two years. I am confident that the results will improve both food safety and FSIS' efficiency. Let me describe the initiatives for program investment covered by this budget request.

1998 BUDGET INITIATIVES

Changes in the FSIS organizational structure, particularly in field support, have been driven largely by the need to operate more efficiently as we carry out our regulatory responsibilities in a more scientific manner under the HACCP regulation. The first two initiatives address the need for additional resources to facilitate completion of a streamlined field management structure and to make this new organization fully functional to manage its changing responsibilities.

We are requesting an increase of \$1,000,000 for relocation costs to complete the restructuring process. Up to 75 employees will be transferred to the new district offices and the Technical Services Center during fiscal year 1998. Due to the cost of mandatory salary increases, inflation, and relocations in fiscal year 1997, the Agency will need an increase of \$1 million to begin a two-year effort to complete the restructuring of FSIS field management.

An additional \$1,250,000 is requested to begin equipping field staff in the new district offices and Technical Services Center with upgraded automated data processing (ADP) and telecommunications technology in order to link the field, headquarters, and plants as we streamline our organizational structure. We need to maximize the productivity of a finite work force charged with managing an increased workload. As I mentioned earlier, FSIS will consolidate 46 program field offices into 18 district offices, a Technical Center and two administrative centers, with a major reduction

PART 1

182

in support personnel. The consolidation will continue through fiscal year 1999. In fiscal year 1998, funds are needed to provide updated ADP and telecommunications equipment to support local area network (LAN) and wide area network (WAN) capabilities.

As the importance of international trade increases, so has the workload of the Office of U.S. Codex in FSIS, which carries out government-wide responsibilities. The requested increase of \$100,000 is needed to provide for increased staffing support and to meet the USDA commitment to provide one-third of the cost for a meeting of the reactivated Codex Committee on Fresh Fruits and Vegetables, with the balance of funding for this meeting being provided by other Federal agencies.

As part of the President's Food Safety Initiative and our farm-to-table strategy, we are requesting an increase of \$565,000 to provide training in HACCP principles for State and local food regulatory officers responsible for both meat and poultry inspection and distribution and retail compliance. During the past several years, consumers have come to demand convenient and easily-prepared meat and poultry food products. This change has resulted in retail stores and restaurants using manufacturing techniques previously used only in inspected establishments. In addition, traditional processes, such as meat grinding, that were once considered "low risk" are now recognized as a "significant risk" to food safety.

We believe that the State and local officials who regulate food safety at the retail and restaurant level must receive HACCP-related training that is comparable to what our inspectors receive. The requested increase is needed to begin a two-year program to train FSIS and State food safety regulators who will then train State, county and city inspectors across approximately 3,000 government agencies.

Reflecting the emphasis we place on improving public health as we work in partnership with other agencies, we request an increase of \$500,000 to support expanded pathogen data analysis in the CDC's Food Safety Early Warning System. This initiative will enable FSIS to get a more complete picture of the incidence of foodborne illness by including data on the high priority pathogen, *Campylobacter*. CDC has shared preliminary data which indicate that *Campylobacteris* the most common foodborne pathogen and the requested increase is needed so that we can determine the impact of *Campylobacter* on public health and identify appropriate follow-up actions.

Additional savings of \$1,000,000 in non-inplant field management staffing is expected to result from continued implementation of the Field Automation and Information Management (FAIM) Project.

USER FEES

The Administration believes that the collection of user fees is essential to the successful long-term implementation of meat, poultry, and egg products inspection reforms. Legislation will be proposed to recover \$390 million in new user fees to pay for the cost of salaries and benefits for personnel providing direct inspection services. The user fee proposal would result in the industry paying about 70 percent of the total cost of the program. For 1998, we are requesting an appropriation of \$201 million to provide laboratory support for inspection, animal production food safety investments, investments in new inspection system improvements designed to enhance safety and productivity, and program administration. This proposal is intended to assure that resources are available now and in the future to provide the level of inspection necessary to meet the demand for such services and maintain consumer confidence, within the balanced Federal budget context. The overall impact on consumer prices as a result of these fees would be less than one-half cent per pound of meat and poultry production.

The Federal Government must share with industry, who derives direct benefits from inspection, the fiscal responsibility for providing services that are essential to ensuring food safety. To accomplish a balanced Federal budget, cost burdens must be shifted from taxpayers to those that benefit directly from the provided services. The food industry profits in the marketplace from the level of consumer confidence provided by the Federal inspection programs. Additionally, the inspection programs provide a level playing field in maintaining standards of safety, wholesomeness and labeling among individual industry entities competing for market advantage.

CONCLUSION

Mr. Chairman, this concludes my prepared statement. Thank you for the opportunity to testify on how FSIS is meeting its responsibilities in the partnership that we have with Congress to improve the safety of meat, poultry, and egg products, and thereby reduce the incidence of foodborne illness. I will be happy to answer any questions that you or other members of the Subcommittee may have.

PART 1

183

FISCAL YEAR 1996 FUNDS FOR IN-PLANT INSPECTION

Senator COCHRAN. Mr. Billy, there was one thing that I wanted to ask you at the outset, and then I will yield to my colleagues for any questions that they have.

The Omnibus Consolidated Rescissions and Appropriations Act of 1996 made \$363 million available for salaries and benefits of in-plant inspection personnel, unless the Secretary certified to the House and Senate Appropriations Committees that a lesser amount would be adequate to fully meet in-plant inspection requirements for the fiscal year.

A letter was received from the Secretary on January 2, 1997, saying that the FSIS had spent \$354 million of the 1996 appropriation on the salaries and benefits of its inspection work force, and that "the employment adjustments, subsequent to the April 26, 1996, statute, enabled FSIS to avoid disruptions in inspection service for the balance of the year."

I am told that several poultry plants in the Southeast have had to shut down inspection lines due to the shortage of online inspectors, and that some of these shutdowns have resulted in the destruction of poultry.

What is meant by the statement in that letter? And, how many FSIS full-time and intermittent inspectors are on the payroll to adequately meet in-plant inspection requirements?

Mr. BILLY. Mr. Chairman, I do not have the specific information, but I would be happy to provide that for the record. Let me give you a general response.

We were committed to providing the services that are needed by slaughter plants and processing plants in terms of inspection coverage. Because of the processes of balancing expenditures in terms of the cost of salaries and benefits and at the same time making the appropriate investments that are talked about in terms of the HACCP approach and introducing the new technology into the agency, we worked very hard to maintain an appropriate balance and minimize to the maximum extent possible any impact on the plants.

So, that continues to be our goal. We are in the process of continually hiring new inspectors to replace those that choose to leave, and as a result of that, I think we are doing a good job of providing the services as required under the law.

[The information follows:]

In the first part of fiscal year 1996 in-plant inspection employment dropped and, due to recruitment difficulties, did not rebound until spring. To assist in recruitment, FSIS removed the cap on other than permanent full-time employment to cover all requests for on-line inspection, and increased permanent full-time employment. Permanent full-time employment increased from its lowest level of 7,347 in January 1996 to 7,531 at the end of September 1996. In addition, by the end of fiscal year 1996 FSIS had the full-time equivalent of 539 other than permanent full-time employees, which was an increase of 74 over fiscal year 1995.

Senator COCHRAN. Do you anticipate any shutdowns being required under the budget request that you are submitting to the committee?

Mr. BILLY. No, sir; this will enable us to provide full service to the plants as they need it.

PART 1

184

HACCP IMPLEMENTATION AND INSPECTION ALTERNATIVES

Senator COCHRAN. To what extent is HACCP permitting a downsizing of the inspectors that are located in the plants for individual inspections of poultry?

Mr. BILLY. Our first focus is to implement HACCP in the plants. The first wave of plants to have HACCP in place will be in January 1998. That will be a total of approximately 500 plants, the largest plants. The remainder of the roughly 5,500 plants will implement HACCP over the succeeding 2 years. So, we are really on the front edge of implementing HACCP throughout the industry.

Tied to that implementation, where the plants set up a HACCP plan and implement it and we verify that they are following their HACCP plan, we have announced our intent to publish a notice to reevaluate how we provide inspection coverage, particularly focused on slaughter plants, and through a public process so that all of the stakeholders have an opportunity to participate, explore alternative inspection strategies for meeting the mandate in the law, carcass-by-carcass inspection, and assuring that the products produced are safe and wholesome. This will all be done under the context of a HACCP approach.

Through that process, we will then implement pilot studies in various plants—already a number of plants have volunteered to participate—where we will explore alternative staffing strategies that both meet the requirements and assure that the product produced is safe and wholesome.

If in fact those pilot studies demonstrate that alternative approaches under a HACCP basis are effective, we would then propose to do a rulemaking to modify our current requirements in terms of how we approach inspection and slaughter facilities. We believe that this will result in an opportunity to free up a number of inspectors which we intend to assign in distribution areas beyond the plants. This is an area that has been emphasized by both industry and the consumer community in terms of addressing the food safety hazards beyond the slaughter and processing plants.

HACCP-BASED ASSISTANCE

Senator COCHRAN. Are you going to move into the restaurants and retail outlets or what?

Mr. BILLY. No, sir; it is unrealistic for us to consider that. There are approximately 1 million retail establishments, and they are under the jurisdiction of State and local authorities. What we think we can do is provide better technical assistance to the States in terms of how to approach what they do on a HACCP basis, develop new standards, and perhaps provide some training as well to assist the States and the local authorities in ensuring that meat, poultry, and egg products are handled effectively at the retail level.

TRANSITION TO HACCP

Senator COCHRAN. I read your statement and on page 17, I notice that you compared the final HACCP rule with the command-and-control philosophy of the past and suggested that once the rule is implemented and in place, we will have a modern, up-to-date, new regulatory framework.

PART 1

185

One thing that concerns me is the suggestion that you keep talking about the command-and-control philosophy of the past. It seems to me that we are still in the past in terms of the philosophy. Is that an incorrect observation?

Mr. BILLY. I think, Mr. Chairman, that we are in a period of transition. It is a fact that there exist in our rules currently a number of command-and-control type requirements that need to be modified. I outlined in my statement examples of where we are proceeding to do that and either eliminate them or shift them to performance standards.

REGULATORY REFORM

Senator COCHRAN. I hear talk about it and everybody is saying that there is change occurring, but I do not know what it is. I cannot tell from reading your statement what it is and I do not hear from out in the field what it is. We talk about this new system and that changes are being made, and your statement is evidence of what I am talking about: "We are aware that there are activities we carry out within plants as part of the inspection process that have limited value in terms of public health protection or meeting other consumer protection responsibilities."

My question is then why are you doing them?

Mr. BILLY. They reflect current and longstanding regulatory requirements that we are in the process of changing. Let me give you two examples.

One is for years the agency has required plants to submit blueprints, equipment requirements, process control plans to the agency for prior approval. We have published a proposal to eliminate those kinds of requirements.

I was struck by the comparison between my experience at the Food and Drug Administration and FSIS now where the rest of the food industry seems to be able to design and build plants and select equipment without the Government prior-approving every step that they take, and I believe we can eliminate those requirements.

The interesting thing is, when we put out the rulemaking proposal to do that, the majority of the comments we got back, primarily from the industry, say do not eliminate those requirements; we are comfortable with them. But I still believe it is the right thing to do, to stop having those kinds of command-and-control type requirements.

Another example is requirements for the production of various types of products. I will use the example of roast beef where if you look at our existing regulations, they spell out a several-step process which every plant must follow to produce that product rather than simply establishing the end result requirement. Here is the food safety requirement you have to meet. It is up to you decide how you produce this product to give the industry more flexibility.

We have similarly proposed in a proposed rule to eliminate that several-step requirement and strip that right out of the regulations so that plants have more flexibility to do it, but to assure at the same time that the food safety objective is met.

And that is the process that we are moving on to change these kinds of requirements, but we must do it through a rulemaking process. That is why I mentioned several examples in my prepared

PART 1

186

statement that we are proceeding through this process and we will complete it. It is important to us to eliminate those kinds of command-and-control requirements and to fundamentally rely on HACCP as the basis for addressing food safety.

Senator COCHRAN. Thank you.
Senator Bumpers.

PATHOGEN REDUCTION AND HACCP

Senator BUMPERS. Pursuing Senator Cochran's line of questioning, Mr. Billy, what percentage reduction in bacteria on a chicken carcass do you get with HACCP as opposed to the old method? I am for it. I do not mean to be offensive.

Mr. BILLY. No; I understand.

What we have proposed to do in the HACCP and pathogen reduction rule is to require with the implementation of HACCP that all plants meet the national prevalence for Salmonella.

Senator BUMPERS. What does that mean, national prevalence?

Mr. BILLY. National prevalence? Sort of the national average that the industry is now accomplishing. What that means is that those plants that are not currently performing at that level will have to improve their process control to meet that national average, if you will. That is the step that is contained in the new rule to provide for improvement in terms of the presence of Salmonella and other similar pathogens on poultry or meat products.

Senator BUMPERS. That is going to be a shifting target, is it not? Because as you implement this program between now and the year 2002?

Mr. BILLY. The year 2000.

Senator BUMPERS. The average is going to continue to climb. So, a plant that might be in compliance in 1998—because the improvement is going to continue to climb, somebody that is in compliance in 1998 may not be in compliance in the year 2000 or 2002. Do you follow the question?

Mr. BILLY. Yes, I do.

To address that question, what we are planning to do is to conduct new baseline surveys over the course of a year—you need to do it over the course of a year to get the seasonal variation—and measure, if you will the performance of the industry with the implementation of HACCP. If it looks like, in fact, what you have laid out in your scenario is the case, then we would consider whether we would propose through rulemaking to modify the performance standards we now have in place to reflect those kinds of improvements. So, that is the strategy that is contained in our new rule.

Senator BUMPERS. Well, let me ask the first question in a slightly different way. How much improvement, if you can tell me, as a percentage will we see under HACCP in the year 2002 than we experienced under the old inspection system?

Mr. BILLY. I think that we will see significant improvement because with the performance standards for Salmonella and the E. coli testing that are required in the new regulation, slaughter plants in particular for the first time will be using microbiological testing to monitor their process control. That kind of information is not available through the current inspection approach, where we are using visual inspection to monitor for fecal contamination. But

PART 1

187

you cannot see the bacteria, so shifting to this kind of microbiological testing regime, we think, will give us real data to show progress and show the kind of reductions that you are asking about.

I am not able to tell you what we will be able to accomplish by the year 2000. We are only now implementing this new system. There is a lot of information out there to show that HACCP works very well, and I think many in the industry are already using HACCP because of the advantages that it provides. So, I think we will see very good progress in terms of reducing the levels of pathogens on products coming out of slaughter plants.

COST OF HACCP

Senator BUMPERS. What kind of economic burden, if any, does it place on the industry to implement HACCP?

Mr. BILLY. We provided in the final rule a detailed economic cost impact analysis, and it will cost the industry several hundred million dollars to implement HACCP and pathogen reduction over the full course of the 3½-year implementation period.

Senator BUMPERS. You are talking about the implementation. Is that also true on a continuing basis? I assume it is going to cost them money to implement it, but is the cost of inspection, once it is implemented, higher than the old system as far as the industry is concerned?

Mr. BILLY. The cost of inspection? No, sir; it will not be higher.

Senator BUMPERS. It will not be higher?

Mr. BILLY. No.

Senator BUMPERS. Has the Department done any studies as to consumer confidence on the poultry industry so far as pathogens and bacteria are concerned?

Mr. BILLY. I am not aware, sir, of any such surveys. I can say this, that there was a very wide support for the final HACCP and pathogen reduction rule. Certainly those that represent the public, the consumers, have embraced it and believe that it is a very positive step forward, and have so indicated in their publications and statements. So, that is the indirect measure.

Senator BUMPERS. Does FSIS have any follow-on inspection system in mind? Are you working on anything? HACCP is not going to be pertinent—you are not going to eliminate all the bacteria.

Let me ask you this question. Under the old system, what percentage of poultry that came through a processing plant had bacteria on it?

Mr. BILLY. Well, all poultry would have bacteria on it. If you are focusing on the pathogens, the things that cause people to get sick, it depended on the type of poultry that you are talking about. Our national baseline surveys, if I recall correctly—and I will provide this for the record in detail—broilers had approximately 20 percent positives for Salmonella as an example, and for ground turkey I believe it was up around 50 percent. So, that is the number of samples that you would find positive. The analysis phase of the baseline study on whole turkeys will be completed in July 1997.

PART 1

188

[CLERK'S NOTE.—The information referred to will not appear in the hearing record, but is printed in the Federal Register, Vol. 61, No. 144, Thursday, July 25, 1996, pp. 38806 and 38846–38847.]

Senator BUMPERS. But you cannot tell me what studies so far show will be the case after we implement the HACCP system?

Mr. BILLY. No; there is no information like that, sir, to answer your question. That is why we are going to do the follow-on baseline surveys to develop that specific kind of information.

Senator BUMPERS. I think that is very important, otherwise we do not know what we are getting here for this cost.

Mr. BILLY. Can I add one other thing?

SENTINEL SITE SURVEY

Senator BUMPERS. Certainly.

Mr. BILLY. The sentinel site project that we have started with CDC and FDA is also going to provide us new, important information because everyone pretty much acknowledges that the traditional reporting system for illnesses associated with food products has a number of flaws in it that do not allow us to rely on it to measure such progress.

Toward that end, we are cosponsoring the sentinel sites project, where in five geographic locations around the country we are very proactively looking for illness associated with food products, and in our case those products that we regulate. The data that will be developed under that sentinel sites project will be extrapolated out to reflect the national situation. It is designed statistically to do that. It will allow us to have much better information about actual illness caused by products that we regulate.

We started this over a year ago. We are currently developing, if you will, the baseline information, and then as HACCP kicks in and the pathogen reduction performance standards, we will be able to use that system to do a very direct comparison and show the progress that we are making in terms of actual illness.

Senator BUMPERS. Do you have any doubt whatever in your mind that HACCP is going to be a major improvement?

Mr. BILLY. I have no doubt whatsoever. It will make a huge difference.

Senator BUMPERS. What was your answer to my question, do you have any follow-on system in mind. You said no?

Mr. BILLY. No.

BOLL WEEVIL

Senator BUMPERS. Shifting gears and a similar question on a separate subject and that is the boll weevil eradication. Do you have any studies to show what the profit margins have been for farmers who have had the boll weevil eradicated in their States as compared to those that have not?

I am sorry. Mr. Medley, that is your question.

Mr. MEDLEY. The Cotton Council and grower foundations have acquired information about improved cotton yields and reduced production costs on over 4 million successfully eradicated acres. The rate of return on funds invested in boll weevil eradication is estimated to be at least \$12 for every \$1 in program cost.

PART 1

189

Senator BUMPERS. Mr. Medley, in your budget justification, here is what you say. "Two separate economic studies indicate that once boll weevil eradication is accomplished, there is an estimated yield increase of at least 69 pounds per acre, pesticide savings of \$30 per acre, and land value increases of \$14 per acre."

That is a lot of money.

Mr. MEDLEY. Yes, it is, Senator.

Senator BUMPERS. So, you have done a study to verify this?

Mr. MEDLEY. Yes; starting with our successful eradication in the Carolinas, we have been able to track over the years, not only the increase in acres planted and yield from successful eradication, but the significant profits that you referred to as well. There are increased benefits for gins and mills resulting from increased yields. The Agricultural Research Service recently published a document that verifies the economic benefits of this very successful eradication program.

Senator BUMPERS. I have been pretty excited about this program ever since it started and I have been anxiously awaiting it coming to Arkansas. Of course, as you know, we turned it down, and I think one of the reasons we turned it down was because of the upfront cost. The farmer has to put up 70 percent. Is that not correct?

Mr. MEDLEY. It was on a 70-30 basis for initial programs in the Southeast and Southwest. In recent expansion areas like Texas, the grower share is even higher and can be as much as 100 percent.

Senator BUMPERS. Why does it vary from State to State?

Mr. MEDLEY. We have tried to move from the 70-30 split, which had been the initial share, to where the Department only provides technical assistance to grower foundations and limited startup costs. In expansion areas like in Texas, producers are substantially bearing all the costs of the program through referendum.

Senator BUMPERS. What has been the cost per acre for most farmers as far as their participating share was concerned?

Mr. MEDLEY. In active eradication areas, producers may pay between \$10 to \$35 per acre per year. In areas where the program has been completed, producers pay \$2 to \$3 per acre per year.

Senator BUMPERS. Is that for 1 year or more?

Mr. MEDLEY. We normally consider active eradication covering a 3- or 4-year period.

Senator BUMPERS. So, you are talking about \$6 to \$8?

Mr. MEDLEY. The annual acreage assessment for growers can range from \$10 to \$35 for active eradication areas.

Senator BUMPERS. Did you mean \$2 per acre per year?

Mr. MEDLEY. The \$2 per acre per year assessment would be in posteradication areas.

Senator BUMPERS. Do you have any idea why a farmer would vote no when he is going to get an increase of 69 pounds per acre and \$14 an acre increase in the value of his land? I would like to invest in that one.

Mr. MEDLEY. Unfortunately, Senator, there have been other issues affecting this program. For example, last year because of heavy infestations of the beet armyworm, some producers felt that the eradication program, because of the use of the chemicals, reduced beneficial organisms and therefore caused a reduction in

PART 1

190

yield. This could have been the reason some of the producers voted no.

Senator BUMPERS. Mr. Medley, in my State the farmers generally north of I-40 I think oppose this. Those south of it would approve of it. Is there any way to redraw the regional lines for the election to allow the farmers—[Laughter.]

Mr. MEDLEY. Senator, you are probably a lot more familiar with that type of gerrymander than I am. [Laughter.]

Senator BUMPERS. Well, then does that mean you are going to turn it over to me? [Laughter.]

Mr. MEDLEY. We provide technical assistance and may provide a portion of the startup cost when growers pass a referendum.

Senator BUMPERS. As I stated in my opening questions, I think one of the reasons Arkansas turned it down was because of the up-front cost. Now, you had a loan program and all these other people have had the benefit of the loan program, but now you are terminating that. So, I think the loan program could have been sold to people as long as they could pay it back while they were getting this 69 pounds an acre more.

Mr. MEDLEY. The Farm Service Agency administers the loan program—that loan program of \$34 million was authorized for fiscal year 1997. The idea behind the loan program was to help provide funds to cover those types of up-front costs.

Senator BUMPERS. I am going to talk to my farmers. I had really been anxiously awaiting that program coming to our State and was a little dismayed about the outcome of it. But I want to talk to these people and find out really what is on their minds, and if it is the up-front costs, then I may try to, with Senator Cochran's assistance, get the loan money restored.

Mr. MEDLEY. Senator, we definitely feel that the boll weevil eradication program is an excellent example of using integrated pest management to deal with serious agricultural pests for the benefit of agriculture.

Senator BUMPERS. Mr. Chairman, I have few questions for the record that I will submit.

Senator COCHRAN. Thank you very much, Senator.

Senator Burns.

Senator BURNS. Thank you very much.

I will come down and draw your lines for you. [Laughter.]

SPOT SHORTAGES IN INSPECTION

Mr. Billy, just to give you an example of how slow I am, I listened to you very intently and I do not know any more now than I did before you started.

Senator BUMPERS. Well, that is not a very nice way to start the questions.

Senator BURNS. Well, no. I know it is not.

Did it actually happen? Did they have to shut down some plants because the inspection was running behind and there was some carcasses lost? Did that actually happen? I think that was asked.

We are going to substitute here. We are going to send in a tight end. [Laughter.]

Dr. REED. We did have some temporary spot shortages. We did have some plants that had to drop shackles and there were some

PART 1

191

inspector locations where so many people were out, we just could not cover them. But they were spot shortages and we generally had a plan to get people in there right away.

CURRENT USER FEE SYSTEM

Senator BURNS. OK. Being as that happened, can you tell me the difference, if any—describe the difference of the fee situation on who pays what with respect to fowl inspection and red meat inspection.

Mr. BILLY. Yes, Senator. What we are planning to do—

Senator BURNS. No; not what you are planning to do. I mean right now.

Mr. BILLY. Oh, the current fees that are charged? We currently charge overtime and holiday fees when inspectors have to work.

Senator BURNS. No, no; but I mean who pays what in a chicken plant and who pays what in a slaughter plant handling red meats. Do the taxpayers pay most of it in one and not the other, or vice versa? Or are they the same?

Mr. BILLY. It is the same set of rules that apply to both. If plants have approved shifts, a primary shift, even a secondary shift, then that is paid for by the taxpayer. If a plant has unexpected overtime where they have to keep operating to complete the processing of animals that have arrived, then that unexpected overtime is paid for through fees, and that applies equally to meat and poultry slaughter facilities.

Senator BURNS. Both of them are collected the same.

Mr. BILLY. The same way.

Senator BURNS. Both of them pay the same fee.

Mr. BILLY. Yes, sir.

Senator BURNS. I see a lot of heads out there going that way. OK. That is not the story I get, but I will accept that.

INSPECTION OF CANADIAN IMPORTS

Now, walk me through what we do with processed meats coming in from Canada. Do we have inspectors in Canadian plants?

Mr. BILLY. No, sir; we rely on the Canadian inspection system which we review periodically to verify that it is meeting our requirements in terms of our rules and procedures. Then we reinspect the product at the border to make sure that the Canadian inspection system has, in fact, worked effectively. That is done through a statistical sampling program where a certain number of shipments are sampled, examined by the inspector, and perhaps sampled for residues, and the labeling is reviewed. That system is applied not only to Canada, but to all other countries that are approved to ship product to the United States.

Senator BURNS. Now, is there another inspection?

Mr. BILLY. If the product is further processed—in other words, it goes through an import inspection station and then is shipped to a processing plant to be further processed—then that material would be considered a raw material entering that inspected establishment and would be further inspected to assure that it is wholesome and suitable for processing.

Senator BURNS. Now, I have been told—are all the trucks, are all the loads that cross, say, at Sunburst—is every truck inspected?

PART 1

192

Mr. BILLY. No, sir; the determination is made based on the paperwork that accompanies a shipment whether a particular shipment will be subject to anything beyond a review of the paperwork.

Senator BURNS. Who makes that determination?

Mr. BILLY. Our inspectors. Our inspectors receive instructions from an automated system that is designed statistically to ensure that an appropriate number of shipments from all the plants that are approved to ship are sampled on a continuing basis. So, it is a statistically based system.

The data that is collected, based on inspection, is fed back into the system and it could well trigger more frequent inspection of a plant if that is warranted based on the inspection results, but that would be reflected in the instructions that the inspector receives for each shipment as it comes through the border.

Senator BURNS. Who makes the decision on what box you look at and what box you do not look at?

Mr. BILLY. It depends on what the product is. If it is carcasses, for example, we have a brandnew strategy for dealing with carcasses that come across the border. We started jointly with Canada back in 1994 to develop a revised approach for sampling carcasses.

The way it works is that we would make sure the Canadian inspectors assure that the carcasses that are put on the back of the truck are randomly picked from the whole load and are so identified. If that shipment then is subject to inspection, we would look at those carcasses as the first order of business to determine whether, in fact, the carcasses meet all of our requirements. If they do not, the shipment would be refused entry into the United States. If they do, then that shipment would be cleared and shipped on for further processing.

This new system has added an additional check and balance, in that we will be routinely checking further at the point of receipt of these shipments to verify that, in fact, the entire load met the same requirements, and that will be done on an ongoing basis. So, that is a new check and balance that we have added into our inspection protocol, and we think that it will provide stronger information in terms of the effectiveness of this approach.

Now, if it is a packaged product, we would then randomly sample the packages depending on the type of product that was on a truck.

ANIMAL DAMAGE CONTROL

Senator BURNS. Mr. Medley, we are kind of concerned about another area. You have cut your ADC funds half in two, and we have got a little situation—I am going to be very provincial about this—up in Montana where coyotes are just really—we are in big trouble. You are asking the States to pick up more of that, but yet it is a Federal program that puts wolves on us. It is Federal programs that keeps off of public lands or Government-owned lands where you have a high prevalence of these predators. Then I have another question, but is there any reason why this cutback in these dollars?

Mr. MEDLEY. Senator, the proposal is to achieve a 50–50 cost share with the States in carrying out animal damage control activities. Currently, there is a disparity in the level of support that is being provided by individual States, ranging from approximately zero to 94 percent of total State program cost. This proposal is to

PART 1

193

have Federal contributions no more than 50 percent of total program costs for each State.

It would not impact the wolf program where specific funds were allocated to the Department as well as to Interior for carrying out that program.

In Montana, the State pays about 37 percent of the program operating costs. This proposal would reduce Federal contributions so the Montana program would become a 50-50 cost share. We would try to minimize any impact, but that is the proposal, Senator.

Senator BURNS. Well, but that is going to impact us more and more and more. I would hope, working with my chairman, that I could replace some of those dollars because we are in big trouble.

We have had two things that have been devastating to us. First, we lost our wool incentive program. It cost the taxpayer nothing. So, our numbers continue to drop. And then the coyotes are just absolutely—they are bad.

Now, there might be nothing to eat anyway because we have had a pretty good winter up there in that part of the world, so we are concerned about the ADC funds and this type of thing.

RESPONSIBILITY FOR FOOD SAFETY

We are in this mind set, Mr. Billy, of why is it that you think that the industry has more at stake in food safety than the consumer does?

Mr. BILLY. In fact, Senator, I believe that the responsibilities are shared across the whole spectrum from the producer, the slaughter plant, the processor, the distributor or the retailer, and the consumer. At each point there are responsibilities that have to be met.

It is for that reason, with respect to consumers, that we believe we need to partner with industry and others to develop a more effective approach for consumer education so that consumers can carry out their responsibilities.

When I was a young man—and I suspect this was true with you as well—I took a home economics class in junior high school to learn the basics about food safety and how to prepare and store foods. That has fallen by the wayside, and as a result, we have got young people coming out of school that do not begin to understand their basic responsibilities for food safety.

I think that is costing our Nation. I think we need to find a way to change that and to better equip the consumers to carry out their responsibilities. So, it does not all fall on one. I think it is a shared responsibility across the board.

Senator BURNS. I am glad to hear you say it. Now, I didn't take home economics. Maybe I should have. But I am glad to hear you say that. I wish everybody would go around here and start putting these back in schools.

Mr. BILLY. I agree.

Senator BURNS. We got another hearing going on right down here. It is the AmeriCorps, volunteers do something for America. Of course, they only cost you \$28,000 for them to volunteer. That is a hell of a volunteer.

You are right. It is passe. Everybody thinks that that is kind of—that was old days. FFA, that is old days. The 4-H is old days. And

PART 1

194

those are things that are ingredients that really made this country tick. Yet, you go around to these grey poupon and white wine parties and if you want to talk about weeds or home economics, you are going to be standing there talking by yourself. So, I am certainly glad to hear you say something about it.

I want to work with you on your fees because I think the consumers of America have as much at stake in food safety as the producer does because I think the producer basically tries to do a good job.

Mr. BILLY. I agree.

Senator BURNS. He loses control of that, however, when that last whatever walks off the back of the truck. He loses all control. He is completely in the hands of somebody else, but yet if something happens down the line, he is the one that takes the lick. And that is just plain, simple American, good old agriculture kind of philosophy, and it has always been that way.

And I do not know how you change it, but I say—and I still say—that the second thing we do everybody in this room—the second thing we do every day after we get up is eat. I do not know the first thing you do. You got a lot of options. [Laughter.]

But the second thing you do is eat. I think they have as much at stake that they are getting a food product that is, one, nutritious and, one, that it is safe.

I would concur with all of us here. That is basically why I am very supportive of this panel and what they do, but I am very concerned about are we sometimes being penny-wise and dollar-dumb in some of our investments. So, I would hope that we could work with the chairman and maybe move some dollars around and get it done.

But basically I think you do a good job.

The Canadian thing I do not think you allayed many fears with our people in Montana when your people were up there. We are going to have a hearing up there, as you well know. That is to allow your people to present what we are planning to do as far as inspection that make sure that the people north of that border—now, you have never been involved in border wars like we are in Montana. You got to remember, we got 200 to 300 loads of cattle coming across that border every day plus processed stuff, and now they love to market their grain down here.

We have a hell of a time moving anything north. One time we could not get in there because our wheelbase on our tractors was too long. We could not get across the border to market our product, and yet we are supposed to have a Free Trade Agreement. Now, that is not right.

So, that is all the questions I have. I just look forward to working with you and on these budgets to make sure that we put the dollars where they need to be put because our problems are not like the problems that they have in Mississippi. We do not want to step on the problems and not address the problems they have in Mississippi, but on the other hand, we want to solve some of ours too and make sure that we look at this in an equitable manner.

I get a big kick. We are all down there looking and sending emergency dollars down South on them floods now. We are going to lose a half a million head of cattle due to this winter in the Dakotas

PART 1

195

and eastern Montana. A half a million head. And there ain't nobody going to come roaring up there with any checkbook or draft book wanting to buy them carcasses whenever we start finding someplace to go with them. I will guarantee you that.

And all that water has got to come down, so you are going to get hit again, by the way. We are going to send it all down to you again as soon as the sun comes out, anyway.

So, thank you very much, Mr. Chairman. I just want to work with you to make sure that we got some equity in the budget. That is what I am concerned about.

IMPORT/EXPORT

Senator COCHRAN. Thank you, Senator Burns.

Let me ask a couple of questions about the Marketing Service. I noticed in the statement of Secretary Dunn comments about how AMS does things behind the scenes to help pave the way for the marketing of U.S. food products and commodities in overseas markets. We have been successful in many specific instances in that connection, one of which was to deal with the problem Russia raised 2 years ago, or whenever it was, with our poultry exports. They were shutting them down because of suspected problems with food safety or contamination and the like. You mentioned specifically having opened up new markets for pork products in Russia.

Tell us about both of those. Have there been any recurrent problems in connection with poultry exports? And, what did you do to help pave the way to increase access in that market for our pork products?

Mr. DUNN. Thank you, Mr. Chairman.

I am going to ask Administrator Medley to address those questions.

As you are well aware, the Russian group was over here in the United States. They did a tour with not only USDA Agricultural Marketing Service agencies but also with Farm Service agencies and FSIS to take a look at our organization. It was a joint effort on the part of the agencies at the Department of Agriculture working in cooperation with each other, and I will let Mr. Medley address what we did to assure the health of the chickens that we utilize in the poultry business.

Mr. MEDLEY. Thank you, Mr. Dunn. I will call on Mr. Billy to add information because it was a partnership among APHIS, FSIS, as well as the State veterinary services, the State veterinarians, and industry.

Mr. Chairman, Russia was raising concern about numerous poultry diseases and our ability to certify that our poultry was free of those particular diseases. We were able, with the help of industry, State, and Federal participants, to show our counterparts in Russia that we do have an overall system to certify the safety of our poultry products.

In addition to specific diseases, we clarified issues about the pathogens which cause the disease.

Very recently, we conducted a followup meeting in Russia which again focused on some of the science issues that are associated with the certification process.

PART 1

196

We see this, Mr. Chairman, as part of our responsibility in APHIS to facilitate exports and also to maintain markets by making sure that when sanitary/phytosanitary issues are raised, that they are legitimate and that we address them. This is what we did in this particular case. We assured our Russian counterparts that our poultry disease reporting system was adequate for us to be able to certify the health status of the poultry being exported.

Mr. BILLY. We did a similar thing, Mr. Chairman, with regard to the food safety issues that focused on Salmonella and various types of residues that could potentially be present in poultry. We were able to negotiate an arrangement, where through a minimal amount of testing, we could verify that, in fact, these were not problems in terms of meeting the Russian requirements for such products.

We were very pleased to sign that new agreement with my counterpart, Dr. Avilov, last April. As I understand it, the products have been flowing in very smoothly and effectively.

MARKET ACCESS AND TRADE PRACTICES

Senator COCHRAN. The question of how we are going to continue to ensure access to markets is always one that is on our minds. I cannot help but notice the continued trade deficits that we have in some places. Japan, for example, is almost \$50 billion I think this year. China is developing a huge trade surplus with us now.

What efforts are we making in those two markets, if any, to try to break down barriers, if any exist, in areas similar to those described in your statements where we have had success stories in the past? Are there problems that are outstanding with these two countries, and is there anything we can do about it through the agencies that are represented here today?

Mr. MEDLEY. Mr. Chairman, in fiscal year 1996 we had almost \$60 billion in agricultural exports. Our largest market, of course, was Japan, followed by Europe. In agricultural exports, we had a surplus of over \$27 billion in 1996 and we are anticipating a surplus of over \$22 billion in 1997.

To maintain and expand markets, we are making sure that any trade restrictions or requirements on trade are based only on valid, sanitary/phytosanitary conditions. We are working with the Foreign Agricultural Service as well as the U.S. Trade Representative to create a level playing field for U.S. agriculture.

It is not always easy. There are certain areas where basic phytosanitary principles have not been accepted or not fairly applied. In bilateral negotiations, we seek to correct these situations. This week, we are in bilateral negotiations with Japan to deal with certain phytosanitary issues.

Mr. DUNN. Mr. Chairman, specifically on China, just this last month we signed an agreement with a contingency of Chinese experts that were over here in the United States to take a look at how APHIS operates.

But one of the things that we have found in order for our producers and our processors and traders to be extremely knowledgeable about what is happening in the international sector is that they need the same type of information on agricultural market news

PART 1

197

that they have here domestically. I would ask Mr. Lon Hatamiya maybe to elaborate a bit on that.

Senator COCHRAN. Mr. Hatamiya.

Mr. HATAMIYA. Mr. Chairman, if you have seen our budget request this year, we are asking for additional funds to increase our international market news collection and dissemination. Much of that will be in the areas where you mentioned, in the Pacific Rim, in terms of China, Southeast Asia, and Japan, as well as South America where we think there are emerging markets where domestically grown products can be sold.

Another area that we are actively involved in is in standards development. We believe the U.S. standards should be used as a standard worldwide, so we are actively involved with international standards organizations to ensure that our voice is there to break down any kinds of trade barriers that may exist due to differing standards from one country to the next.

But we believe that the key to gaining access for U.S. producers to sell in these countries is to have as much information as possible so the producers can maintain their competitiveness when they try to enter into these markets, as well as to gain further access to these markets.

Senator COCHRAN. Senator Bumpers raised a question about the boll weevil loan program. We included in the fiscal year 1997 appropriations act, funding for this new loan program but nothing has happened to date. There were never any regulations issued, so none of the funds have been used. Why not?

Mr. DUNN. Mr. Chairman, the approval of that program about 5 months ago was for our Farm Service Agency to be able to give a loan program to supplement the producers to buy into the boll weevil eradication program.

The Farm Service Agency has been, in fact, working on their regulations. I met with them earlier this week to find out exactly where we were on those regulations. They have assured me that they have been completed and are in the process of completing the internal review that we have for those regulations.

I do have some concerns that it is getting late in the season and that we are losing our opportunity to use that program this year.

One of the concerns that the Farm Service Agency had was the need for an EIS or environmental assessment for their program which is required by law. What I have offered for them to do is have APHIS provide that service for them and I am guardedly optimistic that we are on track to getting that program out so that we can still utilize those funds that were appropriated, Mr. Chairman.

Senator COCHRAN. The President's budget for this next year, fiscal year 1998, proposes to terminate the boll weevil eradication loan program. Is there any additional information that you can give the committee as to why the administration is proposing to terminate it?

Mr. DUNN. I would have to defer to the Farm Service Agency folks when they are here or maybe to Mr. Kaplan on an overview.

Mr. KAPLAN. It was just due to the cap on the discretionary budget, sir, and the fact that it has not been implemented yet.

Senator COCHRAN. The President did not request a rescission of the funds or a deferral or anything like that, did he? Is this called

PART 1

198

impoundment? Is that not what we had the Budget Act passed for? If funds are appropriated for a program, shouldn't they be spent as the Congress and the law directs that they be spent?

Mr. KAPLAN. As Assistant Secretary Dunn said, we still hope to get the regulations out this year and make the funds available.

Senator COCHRAN. Does the Department have a view—or should we ask others when they appear before us—why USDA has stalled and why the Department may not share our view that this is a good way to accelerate the eradication of boll weevil infestations?

Mr. DUNN. I think on the contrary, Mr. Chairman, I think we do view this as a good opportunity to use those funds this year. The Farm Service Agency has established those regulations internally. I know many folks wonder what passes for work for an Assistant Secretary, and it is my responsibility to ensure that we get those out and I have to take part of the blame here. I can assure you that is on my radar screen. I have had inner-departmental meetings to get those regulations out so we can still use those funds this year.

Senator COCHRAN. Well, I appreciate hearing that, and I am encouraged by that answer, Mr. Secretary. I worry that the President's budget request is down \$9.8 million from the fiscal year 1997 appropriated level for the APHIS boll weevil eradication program and no funding is proposed for the loan program.

There are several areas that have not participated in the program. Some are having additional referenda. Senator Bumpers mentioned the situation in Arkansas. We have had a region in our State where approval has not been obtained to complete statewide coverage of the program, but I understand that the proponents are working on that and are dealing with information awareness and whatever else may be needed to complete this program.

One thing that we noticed was that in Alabama the per-acre costs were higher than in other neighboring States.

Do you have any information that you could give the committee as to why this disparity exists and what the cost differences are?

Mr. DUNN. I have asked our internal management people to take a look at that situation and to give us back a report. I have not received it at this time, Mr. Chairman.

Senator COCHRAN. When you do have it, would you give us at least some information on that subject if you have it available to you?

Mr. DUNN. Yes, sir.

AMBIENT TEMPERATURE OF EGGS

Senator COCHRAN. There is also another statute and directive on the subject of ambient temperature of eggs that regulations should have been issued on 7 years ago. I think it was 1991 when a law directed that be done, and it still has not been done as far as we can tell. This is touched on, I think, in Mr. Billy's statement to the effect that FDA and others are being asked for input into the process, and that this may get done sometime soon.

I think one of the reasons why the industry is so concerned is that you have identified some outbreaks of Salmonella. This may have been prevented if the regulations on ambient temperature

PART 1

199

had been developed and implemented as contemplated by the congressional directives.

What is going on here? What is the problem?

Mr. BILLY. Mr. Chairman, the specific requirements that are contained in that amendment would have us establish a requirement that vehicles that convey eggs to the marketplace meet an average ambient temperature of 45 degrees. When the Department started to develop regulations to implement that provision, it became clear, based on the comments received, that there were several problems with that approach.

First, that approach would have a very high impact on the small companies that transport eggs to market because of the cost involved in implementing that provision. So, there was a concern about the cost impact in particular on small operators.

Second, there were concerns about how you would enforce such a requirement because if you open the truck to take samples, depending on when you would check that temperature, you could have a problem with what the ambient temperature is in the back of the truck, and not necessarily have it reflect what the temperature of the eggs were, and whether they were, in fact, being cooled down below the temperature at which pathogens can grow and multiply.

Finally, there was no provision for looking at the continuum of when eggs are first laid and then washed and put into cartons, and then as they move through the process of distribution to the marketplace. You could have that provision met, yet have temperatures in the eggs because of how they are handled prior to distribution where the temperature was high and would not be lowered significantly during transportation. That provision does not specifically target the question of temperature in the sense of getting the temperature down so that pathogens cannot grow and multiply if they are present.

The approach that we are taking is to look at that continuum in terms of when the eggs are laid, how they are handled at that stage, so that we can, in fact, properly manage the combination of time and temperature. The temperature is brought down in a consistent manner to meet the requirements of how the eggs are shipped and sold at retail. So, we think a more comprehensive approach that focuses on the temperature of the eggs rather than the temperature of the vehicle in which they are being transported will net us a better result in terms of egg safety.

We are doing a risk assessment, as required, to look at that continuum and identify what the most effective approach from both the public health and cost point of view would be in terms of dealing with that issue. In the meantime, we have encouraged the industry, those that have the means, to meet that requirement. To the extent that it does provide some margin of positive impact, we welcome that and we are encouraging that. But we think our approach will be more comprehensive and focus in particular on the eggs in terms of getting their temperature down to assure that any pathogens present are not multiplying on the way to the marketplace.

Senator COCHRAN. Were the recent HACCP regulations designed to cover shell eggs?

PART 1

200

Mr. BILLY. No, sir; we are approaching that on a separate rule-making basis jointly with FDA because they have responsibility for shell egg safety, except for this one provision on the transportation of shell eggs to market, which is a requirement that USDA must address.

Senator COCHRAN. Do you intend to mandate HACCP for plants that process shell eggs?

Mr. BILLY. Yes; we believe that that is an appropriate step that would accomplish two or three things.

One, we think that it will allow us again to modify our inspection approach to focus on the key control measures that are critical from the point of view of the safety of egg products. We have talked to the industry and they seem to be very supportive of that kind of a transition to a HACCP-type approach. In fact, we have received a petition that would encourage us to move forward in terms of a HACCP-type approach for egg products.

HACCP FOR EGG PRODUCTS

Senator COCHRAN. This may be too big of a question for this hearing, and if it is, I will be glad to entertain your suggestion that it be submitted for the record.

What are your options for proposed regulations under HACCP?

Mr. BILLY. Well, we think that we can have several approaches considered. One perhaps would be to look at whether we could do it on a voluntary basis. If there is very strong interest and commitment from the industry, perhaps we can approach this on a voluntary basis and end up with the same kind of result that would be otherwise the case if we chose a mandatory approach.

We also need to look at whether HACCP is needed for all types of egg products. It may be the case with certain types of products that you do not need to take that step in terms of assuring the safety of the product.

Then we need to carefully look at the timing, the phase-in, and what we would discontinue doing in terms of our current continuous inspection approach.

So, there are different ways of implementing such a new requirement that would minimize the cost impact and any disruption, but at the same time properly address the safety of egg products.

Senator COCHRAN. Thank you very much.

I do not want the Grain Inspection Service to think that we have forgotten about you over there.

Mr. BAKER. I did not think you had.

PACKER CONCENTRATION

Senator COCHRAN. There is one area that I wanted to touch on. The Secretary may want to comment, of course, and certainly we would appreciate his doing so if he wants to.

The budget proposes an increase of \$2.3 million for the Grain Inspection, Packers and Stockyards Administration to carry out recommendations of the Advisory Committee on Concentration. There has been a good deal of speculation and concern that prices being paid to producers were low because we had just a few big packers and stockyards. The producers and the beef cattle farmers and

PART 1

201

ranchers were suffering as a result of that, and there were some recommendations made.

How are you going to spend that money? What are you going to do with the \$2.3 million in additional funds and what activities are going to be carried out?

Mr. DUNN. Mr. Chairman, I will lead off while Mr. Baker collects his thoughts on that.

This has been one of Secretary Glickman's highest priorities since he has become Secretary of Agriculture. He initially started off, went around the country, and had town meetings. He heard over and over again that concentration was a big issue of great concern by all segments of the agriculture industry.

As a result, he put together an advisory committee made up of 21 members, and they have given us some 68 recommendations of things that they would like us to do.

We have asked the Office of Inspector General, in fact, to take a look at packers and stockyards to see if we have the right mix, the right makeup, the proper people there, and are we going about the investigations as we ought to to ensure that we can address these concentration issues.

We are going to be in the future taking a look at increasing some economists to do an econometric model of what the industry ought to look like, increase some legal staff to give us some better insight of how we go about gathering information, working closer with the Office of General Counsel to ensure that we go through and get some better convictions or a better record on our convictions.

Now, specifically on the dollar amount we have requested, I will let Mr. Baker respond to that.

Mr. BAKER. Mr. Chairman, approximately one-third of that is money that is being requested in the poultry area where our agency can gear up to better evaluate and better investigate contract poultry production dealing with large, complex integrators and poultry people. That is basically one-third of it.

The other two-thirds is in refocusing our efforts in the procurement of packers and the complex industry that is out there. We do, I think, an excellent job in dealing with the average-type cases that are brought before P&S and all, but the big anticompetitive cases that we are presently involved in are requiring tremendous resources that are not available to us. For us to gear up and get into that picture, we have got to have more money. This is the third year we have asked for it. Maybe the third year is the charm, and we sure need more money.

MARKET REPORTING

Senator COCHRAN. AMS also has \$500,000 requested to carry out the findings of that committee. How are you going to use that, Mr. Hatamiya?

Mr. HATAMIYA. Mr. Chairman, there are a number of proposals we are putting together, but primarily they are in the area of market information and collection. From the advisory committee's report, there was a need for more value-based information both at the cattle, hogs, sheep, at all levels where concentration exists.

What we are going to do is try to implement the \$500,000 we are requesting to better report prices and to do it in a matrix format

PART 1

202

where the value reporting will give some essential understanding across geographic regions. We are also adding people at auction markets for direct coverage of daily trading to better reflect contract pricing.

So, there are a number of issues in all of these areas where we think we can better cover markets and revise what we have been doing in the past to produce information that is more usable for the producer in this day and age. With the changes in international trade, we think it is also important to have a better basis for what we are reporting.

Senator COCHRAN. I appreciate very much the cooperation that you all have given to our subcommittee. You have been patient with our questions and our requests for information to help us better understand the budget request and its implications for the agriculture and food industries and for consumers, who I guess have the most to lose of anybody if we have a contaminated food supply.

My impression from what I have heard today and also just as general information that is available to the public is that we have the safest food supply in the world. We have a system that is probably more intense, in terms of the concentration of effort, science and energy, to help assure the safety of the food supply than that of any country in the world.

I think we can all take pride in that. We have worked very hard over a long period of years, and our predecessors in these jobs have as well, to help achieve these goals. So, we take it very seriously here in the Senate and we know the agencies of the Department of Agriculture, who are all represented here today, do as well. So, for that good effort, I want to personally commend you all.

SUBMITTED QUESTIONS

I thank you all again for being here and for your testimony. The additional questions that we will submit we hope will be answered in a timely fashion, for which we will be very grateful.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

FOOD SAFETY AND INSPECTION SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FSIS COMPUTER TECHNOLOGY INVESTMENTS

The President's budget requests an increase of \$1.25 million to upgrade automated data processing (ADP) and technology in support of the Agency's computer technology enhancements. USDA has not implemented agency-wide architecture by February 1, as Deputy Secretary Rominger stated in his November 12 letter. The agency has not even completed the strategic planning necessary to identify and understand its core business processes.

Question. FSIS has stated that funds are necessary in fiscal year 1998 to provide ADP and telecommunications equipment which are currently not available. Has FSIS constructed a strategic plan that coordinates with USDA's overall plan?

Answer. FSIS conducts an ongoing long-range planning process for information resource management (IRM) to maximize the use of information technology (IT) in facilitating and supporting our agency's program mission, and to improve the availability, quality, management and use of information throughout FSIS. FSIS updates its IT Long-Range Plan annually to ensure compliance with the overall USDA IT architecture.

PART 1

FSIS has contributed several staff members to work with the Department on USDA's Information Technology (IT) Architecture. By working with USDA on the overall IT structure, we are very confident that FSIS plans are compliant with the USDA IT architecture. FSIS actively supports and serves on the USDA IRM Council Board, the IRM Planning Sub-Council, the Data Administration Sub-Council and the Telecommunications Sub-Council. The agency fully participates in the ongoing USDA IRM modernization initiative, which addresses prioritized action items selected by the USDA IRM Council Board on the basis of the recommendations identified in the USDA IRM Modernization Report.

Question. If USDA has not implemented the agency-wide architecture or completed the strategic planning, then is FSIS limited in its ability to move forward?

Answer. In January, FSIS requested and received an IT waiver from USDA to conduct computer acquisitions for the Field Automation and Information Management (FAIM) project. The waiver enables FSIS to continue implementation of the FAIM project through the purchase of desktop and notebook computers for use by FSIS inspection personnel. As a result of this waiver, FSIS is able to move forward with providing the necessary infrastructure to support the FSIS field reorganization and new inspection methodologies, such as HACCP.

USDA continues to develop information architecture, its Enterprise Network. Telecommunications is part of information architecture and is included in the USDA-wide Enterprise Network. FSIS has submitted its inventory forecast needs and a Telecommunications Management Plan to the Department for review. We have every expectation of approval and implementation within the time frames specified.

Question. Is this subject to the Department's moratorium on new computer system investments?

Answer. The requested increase of \$1.25 million for upgraded automated data processing (ADP) and telecommunications technology would be subject to the Department's moratorium, based on the agency's experience with FAIM in fiscal year 1997. However, we would expect to request a waiver, based on a similar justification for FAIM, that the requested equipment purchases are essential to implementation of the field reorganization.

Question. How much has been invested in the Field Automation and Information Management (FAIM) project to date (please indicate by fiscal year).

Answer. Direct FAIM obligations total \$9.75 million through January 1997. This includes hardware, software, supplies, maintenance, travel for trainees to the training center at Texas A&M University, training, contracting, and associated telecommunications costs. In addition, there are agency costs that are identified as part of the OMB Circular A-11 Exhibit 43 on Information Technology. For example, the FAIM staff receives programming assistance for FAIM applications from others within the agency, for which FAIM has identified the staff years as part of the system life-cycle, and which are included in the Exhibit 43 under "Personnel work-years."

[The information follows:]

<i>Fiscal year</i>	<i>Cost</i>
1996 ¹	\$7,230,000
1997 through January 31, 1997	2,520,000
Total obligations	9,750,000

¹Of the total \$8.4 million appropriated, \$1.2 million was "carried over" into fiscal year 1997 for the purchase of a new hardware/software platform.

Question. What is the total cost of this system?

Answer. Through fiscal year 1997, the cost for FAIM is \$16.95 million. An additional \$8.5 million is requested for fiscal year 1998, the third year of the five year FAIM project.

FSIS EMPLOYEE RELOCATION COSTS

The fiscal year 1998 budget requests \$1 million for relocation costs of FSIS employees.

Question. What is the status of the FSIS centralized administrative offices located in Minneapolis, Minnesota and Urbandale, Iowa?

Answer. All field personnel functions are being consolidated in Minneapolis, MN, which is the site of an existing field personnel office. Consolidation is expected to be completed by the end of fiscal year 1997 and the office will be fully staffed to manage personnel functions, including hiring, merit promotions, lateral reassignments, and work reductions.

PART 1

204

The Financial Processing Center in Urbandale, Iowa opened at the end of September 1996 and expects to complete consolidation of field finance functions by the end of fiscal year 1997, including pay, the collection of revenues from reimbursements and trust funds, and processing of payments for travel.

Question. What is the status and location of the new district offices?

Answer. The new district offices are currently being established and will begin operating with core staff by June 1997. The location of these offices are as follows: Alameda, CA; Salem, OR; Boulder, CO; Minneapolis, MN; Lawrence, KS; Springdale, AR; Dallas, TX; Madison, WI; Chicago, IL; Pickerington, OH; Philadelphia, PA; Albany, NY; Boston, MA; Greenbelt, MD; Raleigh, NC; Des Moines, IA; Atlanta, GA and Jackson, MS.

Question. On what basis was a site selected for the Technical Services Center?

Answer. An FSIS committee scored and ranked each site considered based on a number of criteria, including space availability and cost, labor market conditions, and air service. For the six cities that best met these criteria, both first year and ten year costs were compared, and there was not a significant difference on the cost amortized over ten years.

Consideration then was given to additional characteristics of the sites, including: time zone that facilitates nationwide contacts; a rural agricultural community surrounding; population levels in terms of the impact of FSIS employment; advantages offered by site representatives such as financial and family relocation services; and immediate availability of suitable office space facilities.

In reviewing the top sites based upon these factors, Omaha, NE was selected because it offers several advantages. It is a mid-size city in the Central Time Zone with a rural agricultural community surrounding. In addition, Omaha offered a three year supplement of \$300,000 each year to offset costs to the Federal Government. The city provides family relocation services in conjunction with those provided by FSIS, and has identified several office buildings with suitable space available for occupancy consistent with FSIS time frames.

Question. Will \$1 million be adequate for the relocation of employees beginning in fiscal year 1997 and completing the relocation by the end of fiscal year 1999? If not, how much do you project will be needed for fiscal year 1998 and fiscal year 1999?

Answer. An increase of \$1 million in fiscal year 1998, to be continued in fiscal year 1999, is needed to complete relocation of positions to the district offices, technical services center, and centralized administrative offices. The requested increase will provide sufficient funds to complete the relocation through fiscal year 1999.

Question. What is the total net savings from FSIS field management streamlining once this process is completed?

Answer. From fiscal year 1995 through fiscal year 1997, FSIS will have met targets for streamlining and administrative cost reductions that total nearly \$11 million and more than 300 staff years. Implementation of the agency reorganization to consolidate field management will enable FSIS to manage within this reduced level of staffing and funding levels.

HACCP

1. The President's budget requests \$565,000 to provide Hazard Analysis and Critical Control Point (HAACP) training to state and local food regulatory officers.

Question. Will restaurants and retail stores be required to implement HACCP in the future?

Answer. FSIS and FDA have no plans to impose HACCP requirements on restaurants or retail stores. Nonetheless, the federal agencies are encouraging all who process food commercially to adopt HACCP voluntarily because it is a rational, effective, and universally applicable method for assuring the safety of processed foods.

Question. What is the Administration's position on merging state and federal meat inspection so meat inspected by state agencies can be sold across state lines?

Answer. USDA is not philosophically opposed to interstate shipment of state inspected products and is ready to address the concerns of state inspected plants and State Departments of Agriculture underlying this issue. However, it is not ready to endorse the "merging" of state and federal inspection or other specific solutions proposed for those concerns without further analysis of the issues. USDA has committed to holding public meetings on this issue June 16 and 17, 1997, in Sioux Falls, South Dakota, and on July 8, 1997, in Washington, DC, to get more information and provide a record upon which it can base a full analysis of its policy options.

USDA is very concerned that state inspected processors wishing to distribute their product across state lines view the obtaining of federal inspection to be an unreasonable obstacle in their path, and would consider changes in how FSIS grants federal

PART 1

205

inspection to such plants if warranted. Similarly, USDA views state inspection programs as an essential part of the nation's food safety network, and is open to new ideas on how to better support them and keep them viable. The Department wants to have the best possible working relationship with state meat and poultry inspection programs and the establishments they inspect.

Any additional major changes in USDA's inspection program, on top of major organizational changes already underway within FSIS, would divert USDA resources from implementing HACCP and pathogen reduction requirements, and could lead to delays in these risk reduction efforts. That is, the public benefits of instituting such changes at this juncture should be carefully weighed against the public costs.

2. When do you plan to have all the HACCP regulatory reforms in place and completed?

Answer. The target for completing all HACCP regulatory reforms is 1999.

3. It is my understanding that FSIS is considering publishing on the Internet and through other media the results of the agency's Salmonella testing of meat and poultry processing establishments.

Question. Is FSIS considering publishing the agency's Salmonella testing of meat and poultry processing establishments on the Internet?

Answer. Last fall, during public meetings explaining the regulatory provisions of FSIS' HACCP final rule, Agency officials indicated that the Agency was considering publication of Salmonella test results on the Internet. Since those public meetings, FSIS has received oral and written correspondence from interested parties expressing concern over the Agency's intention to make the test results available on the Internet. In response to this interest, FSIS is holding a public meeting March 6, 1997, to hear these concerns and to receive public input on the best method for making the test results available.

Question. Is this data you are publishing intermediate results?

Answer. The data under consideration for publication includes pre-implementation and compliance results.

Question. If so, how can you justify publishing this information?

Answer. FSIS will collect samples from meat and poultry establishments prior to the scheduled date for HACCP implementation for that group of plants. The test results from these pre-implementation samples are intended to provide information on what FSIS needs to know in order to effectively administer and enforce the regulation; what individual establishments need to know about their present level of compliance with the Salmonella performance standards in order to develop HACCP plans that ensure that products meet those pathogen reduction performance standards; and what FSIS, the industry, and the general public need to know about Salmonella levels at the starting point for the new system of regulating meat and poultry products. Information gathered on Salmonella testing is subject to release under the Freedom of Information Act. The possible publication of data on the Internet would facilitate the general public's ability to know about Salmonella levels at the starting point for the new system of regulating meat and poultry. On the other hand, very legitimate concerns were raised about the improper use of such available data, particularly by foreign interests and foreign markets. We expect to make a decision in mid 1997.

Question. Will it lead to any enforcement action?

Answer. The data collected during the pre-implementation period will not lead to enforcement action. Once the effective date for compliance with the Salmonella performance standards has occurred for a given group of plants, the test results of sample analysis of product from those plants may lead to enforcement action, if the plant's test results reflect that it is not complying with the pathogen reduction performance standard. It should be noted that data associated with a regulatory case is withheld, pending a final outcome.

Question. Will this lead consumers and prospective international customers into believing that the U.S. products tested are unsafe or unwholesome?

Answer. FSIS has conducted Salmonella testing on ready-to-eat products for many years. Testing on ready-to-eat products has been on a product acceptance basis, meaning that the test results do signify whether the products are wholesome and safe for consumption. The presence of any pathogen in ready-to-eat products indicates that the food production process is out of control and the product produced under the process is adulterated. FSIS works with industry to recall ready-to-eat products contaminated with human pathogens to protect the public health.

This is not true, however, with Salmonella testing on carcasses and raw ground products. FSIS' Salmonella testing program on carcasses and raw ground products serves to verify the effectiveness of establishment process control activities in reducing pathogen levels on raw products. The test results from this program are not used for product acceptance purposes. FSIS is aware that the objectives of this test-

PART 1

206

ing program are different than those of testing programs on ready-to-eat products. For that reason, FSIS intends to provide explanatory information with the release of test results to insure that consumers and international customers understand that positive findings of Salmonella on raw products are not an indication of unsafe or unwholesome product.

IN-PLANT INSPECTION PERSONNEL

1. HACCP is to be implemented in increments through year 2000. As HACCP becomes the inspection system in all plants, in-plant inspectors will no longer be needed.

Question. Is this correct?

Answer. No. In-plant inspection will be required under HACCP. Implementation of HACCP is not a means to reduce the size of, or eliminate the need for, in-plant inspectors. Under HACCP, inspectors will be needed both within and beyond slaughter and processing plants as FSIS broadens the scope of food safety activities. FSIS is requiring HACCP, along with pathogen reduction, and Sanitation Standard Operating Procedures (SOPs), to improve food safety and begin the long-awaited modernization of USDA's meat and poultry inspection system. FSIS expects this combination of HACCP-based process control, microbial testing, pathogen reduction performance standards, and sanitation SOPs to significantly reduce contamination of meat and poultry with harmful bacteria and reduce the risk of foodborne illness. FSIS's non-safety regulatory responsibilities for wholesomeness, product integrity and labeling under the laws will continue to require inspection activity in plants.

Question. Explain how personnel will be altered through year 2000 as the current inspection system is replaced by the HACCP system.

Answer. Implementation of the final rule on HACCP and Pathogen Reduction systems will result in far-reaching changes in the respective roles of industry and FSIS inspection personnel in assuring the public a meat and poultry supply that meets appropriate sanitation and safety standards and is not adulterated or misbranded. The Pathogen Reduction and HACCP systems rule represents a change in regulatory philosophy and thus will change the focus, tasks, behavior, and priorities of agency employees, particularly front-line inspection personnel. It will more clearly define and separate the role of the food producer and regulator.

Traditionally, some plants have relied on inspectors to identify deficiencies on a daily basis before the company would take action to correct food safety problems. This factor, and the prescriptive nature of the requirements, has often blurred the line between industry and regulator. Under HACCP, plant owners and operators will be responsible for manufacturing products that are not adulterated or misbranded and that meet performance criteria and standards. Inspectors will be responsible for inspecting facilities, operations, records, and products to verify that regulatory requirements have been met and for taking enforcement action when there is sufficient evidence that requirements have not been met. Under the new system, inspection personnel will exercise the following regulatory oversight responsibilities.

[The information follows:]

HACCP RESPONSIBILITIES TO BE PERFORMED BY INSPECTION PERSONNEL

- Evaluation: to determine that each plant's sanitation SOP and HACCP plan conforms with the regulatory requirements.
- Verification: to determine, on an ongoing basis, that a plant is carrying out its SOP and HACCP plan, including microbial verification.
- Documentation: to prepare written material to document failure to meet regulatory requirements.
- Enforcement: to take appropriate actions when a plant is not in conformance with established regulatory requirements.

4. How much money do you have budgeted for reimbursement to employees' for continued education?

Answer. In fiscal year 1997, FSIS expects to reimburse approximately \$300,000 to in-plant inspection employees for the cost of courses they take on their own time near their work sites in subjects such as statistics and microbiology.

To further enhance the ability of our food inspectors to work in a HACCP environment, the new Food Safety Educational Program was developed in conjunction with Texas A&M University in College Station, Texas. This program is budgeted for \$1,000,000 in fiscal year 1997, and will cover such topics as microbiology, risk assessment, environmental sanitation, food chemistry, and statistical quality control. Students will have the opportunity to experience "hands-on" laboratory training to support lectures. This four week academic program is intensive and demanding, and

PART 1

207

covers as much as would be expected in a normal college semester. College credit will be earned for successful completion of the course. This program will provide nine four-week classes, with 30 inspectors in each class.

5. Why was Texas A&M University chosen to provide in-plant inspectors a scientific foundation in a HACCP environment?

Answer. In 1987, Texas A&M University was competitively awarded a five year contract to assist in providing training and educational opportunities to FSIS personnel. The University successfully competed for a second five year contract which began in 1993. During the nine years FSIS has collaborated with Texas A&M University, they have demonstrated a willingness and capacity to provide high quality educational support. Further, those nine years have given them a greater understanding of the FSIS mission and the environment our personnel work in on a daily basis. The College of Agriculture and College of Veterinary Medicine at Texas A&M have programs in Food Science and Food Technology as well as a highly regarded faculty that FSIS can draw upon to develop educational programs that will help prepare FSIS employees for their changing inspection roles. The current contract allows for development of new programs within the existing provisions to respond to emerging or changing needs.

6. In your statement Mr. Billy, you propose to increase the proportion of resources for the front-line workforce. Food inspectors is one of the areas targeted.

Question. Does this mean there will be a net increase in front-line workforce, including inspectors, as HACCP is fully implemented?

Answer. The 1997 Appropriation provided an increase of \$3.2 million for increased inspection staffing to enable FSIS to provide adequate inspection resources as we make the transition from the current inspection system to HACCP-based inspection. In addition to this increase, the proportion of inspection staff will increase as streamlining of non-front-line positions continues. The fiscal year 1998 budget request includes no further increases for inspection staffing, but includes an increase for full pay costs to maintain current staffing levels in order to cover the slaughter lines and processing operations.

Question. Are we to assume all employee cuts will occur in administrative positions?

Answer. The intent of continued streamlining efforts is to reduce non-front-line positions which include administrative and program positions. Front-line positions include food inspectors, in-plant veterinarians, import inspectors, circuit supervisors, compliance officers, and laboratory personnel.

7. The Committee's fiscal year 1997 recommendation included the full amount requested in your budget to fill all inspector vacancies and to fully implement the hazard analysis and critical control points (HACCP) system.

Question. What actions is FSIS taking to streamline the inspection system for efficiency?

Answer. The agency is reforming its existing regulations to be consistent with HACCP principles and greater reliance on performance standards and to remove unnecessary regulatory obstacles to innovation. On December 29, 1995, FSIS published an advance notice of proposed rulemaking (ANPR) and additional rulemaking proposals describing the agency's strategy for regulatory and inspectional reform and initiating the rulemaking process required to achieve necessary changes. On May 2, 1996, FSIS also published two additional regulatory reform documents—a proposal to eliminate the prior approval system for facility blueprints, equipment, and most partial quality control plans and a proposal to add a performance standard alternative to the current command-and-control requirements governing cooked meat and poultry products. FSIS will ensure that current regulations are revised as necessary before the implementation dates to ensure consistency with the new rules.

FSIS will soon begin a public process to develop and evaluate new approaches to inspection that would ensure that FSIS is making the best possible use of its resources to improve food safety while still meeting all of the consumer protection objectives of the current system. FSIS anticipates a redeployment of some of its inspection resources to successfully implement HACCP and better target food safety hazards during transportation, storage, and retail sale.

Question. Are your HACCP regulations not making it intensive by layering new programs on top of old ones?

Answer. FSIS is undergoing a transition from the traditional inspection system to HACCP-based inspection. Until HACCP provisions are fully implemented, there will be unavoidable, but temporary overlap in inspection activities to ensure the safety of meat and poultry products. FSIS is pursuing the implementation of HACCP provisions in accordance with the time frames in the final rule—for fiscal year 1997, January 27 implementation of sanitation SOPs in all plants and generic

PART 1

208

E. coli testing in slaughter plants. At the same time, the agency's top rulemaking priority is eliminating regulatory provisions that are not consistent with HACCP.

RISK OF MAD COW DISEASE

The Washington Post reported that new machines used to debone meat have raised concerns from consumer groups of the existence of "Mad Cow Disease". The machines not only separate meat from bone but also extract bone, bone marrow, and even spinal cord tissue. The disease may be contracted by humans from eating meat containing spinal cord tissue from infected cows. There has been no discovery of this disease in the United States.

Question. What is USDA's opinion of the advanced meat recovery (AMR) process currently being used by the beef industry?

Answer. USDA considers the meat derived from bones by properly controlled and operated AMR systems to be wholesome and safe for human consumption. Neither spinal cord, central nervous system tissue, nor excessive bone material should be present if the AMR process is properly controlled by the establishment. USDA does not believe that spinal cord, central nervous system tissue, or excessive bone material should be included in product labeled as boneless meat regardless of the process through which the product is derived.

Question. How have the consumers' concerns been allayed?

Answer. The Food Safety and Inspection Service is preparing a directive to define inspection tasks which will specifically deal with the inappropriate presence of spinal cord in boneless meat derived from AMR systems. FSIS will continue to analyze AMR system survey data to determine the necessity of regulation which addresses the composition of product from AMR systems. FSIS will consider what rule-making or other regulatory action may be appropriate to clarify the status of product derived from AMR systems.

RESEARCH FUNDING

In your statement Mr. Billy, you mention several areas where research will play an integral role in the Food Safety Initiative.

Question. What is the Department's total budget for the food safety/pathogen reduction research?

Answer. The Department's overall budget for food safety research is estimated at about \$63 million in 1997. The 1998 President's budget funds food safety research at \$72 million, or about \$9 million or 14 percent above 1997.

About \$50 million or 80 percent of the total research is conducted by the Agricultural Research Service (ARS). The agency aims to improve the quality and safety of animal products used as food for humans and to reduce losses in animal productivity resulting from pathogens, diseases, parasites, and insect pests. ARS conducts both pre- and post-harvest research to reduce potential risks for consumers by targeting toxicants, chemical residues, and other substances which contaminate the food supply.

An increase of \$4.1 million in the ARS 1998 budget is focused on control of pathogens which cause food-borne illness such as Salmonella, Campylobacter, and E. coli, and to develop pre-harvest detection and enumeration methods required to identify specific control points and strategies to limit infection in meat and poultry products. The request also provides for post-harvest research to facilitate the development of effective Hazard Analysis and Critical Control Point (HACCP) programs in the slaughter and processing of meat and poultry products.

The land-grant universities with financial support from the Cooperative State Research, Education, and Extension Service (CSREES) are the other major providers of food safety technology and research-based information. The CSREES budget for food safety research is about \$12 million in 1997. The agency uses formula funds and special research grants to develop rapid, selective and sensitive methods for pathogen detection prior to consumer consumption, and to develop intervention technologies to eliminate pathogens. In addition, the National Research Initiative (NRI) supports studies on risk assessment that will lead to improved methods for detection and/or control of disease-causing microorganisms, and to benefit and cost analysis in support of HACCP regulations.

An increase of \$2 million is proposed in the CSREES 1998 budget for competitively awarded special research grants to investigate pre- and post-harvest issues for detection and control of pathogens and for production, processing, and handling management practices and enhance food safety education programs emphasizing pre-harvest activities, HACCP and other quality assurance programs, and industry compliance education. An additional \$2 million is proposed to enhance food safety

PART 1

education programs focusing on pre-harvest activities, HACCP and other quality assurance programs, state certification programs, and industry compliance education.

Research activities carried out by other Departmental agencies include improving the early warning system for foodborne illness and for providing HACCP training for state and local health officials, and for improving consumer education.

In addition to food safety research, the Secretary has allocated \$10 million of the Fund for Rural America to address four specific activities, one of which is aimed at assisting small meat and poultry processors implement HACCP plans. This assistance will complement efforts by FSIS to provide direct technical assistance to small establishments for achieving improved food safety under the new inspection system. The Department is currently evaluating proposals submitted for this activity and will announce actual funding allocations this summer.

GRANTS-TO-STATES

The budget request for fiscal year 1998 is \$1.13 million to defray increased costs in State inspection programs and to pay for State inspectors.

Question. How many states currently participate in the Grants-to-States program?

Answer. Currently, 26 states participate in the Grants-to-States Program.

Question. What amount does each participating state receive?

Answer.

[The information follows:]

[Obligations in Thousands of Dollars]

State	1996	1997	1998

THE PRESIDENT'S FOOD SAFETY INITIATIVE

1. Before the President's budget was released, The Washington Post reported on January 25, 1997, that President Clinton would request a total of \$43 million to fight outbreaks of food contamination. The article also stated that \$31.5 million would be requested for food safety research and inspection systems. Of that amount, FSIS would get under this proposal \$8.5 million.

PART 1

210

Question. Please provide the activities and the money requested in the fiscal year 1998 budget that are considered to be a part of the President's Food Safety Initiative.

Answer. The January 25, 1997, Washington Post article incorrectly reported that FSIS would receive \$8.5 million under the President's food safety initiative. The initiative includes \$9,179,000 for USDA, of which \$1,065,000 is for FSIS initiatives. This includes \$500,000 for the Sentinel Site Survey to support the "Early Warning System" for public health surveillance and \$565,000 to provide HACCP training for State and local food regulatory officers.

Question. Which activities are currently the existing mission of the FSIS? Which proposals are new to FSIS and are a result of the President's initiatives?

Answer. FSIS currently provides \$1 million annually and works with the Centers for Disease Control and Prevention (CDC) and the Food and Drug Administration (FDA) on the Sentinel Site Survey to assist our efforts at protecting the public health through ensuring the safety of meat, poultry, and egg products. The objective of the Sentinel Site Survey is to estimate the national incidence of the major foodborne diseases and to explore what relationships may exist between specific pathogens and the types of meat, poultry, and other food products associated with them.

With sentinel site information, FSIS can identify areas of concern, review HACCP programs and, where appropriate, trigger changes to prevent future outbreaks of foodborne illness. The requested increase of \$500,000 will enable FSIS to obtain information on the high priority pathogen, *Campylobacter*, the most common foodborne pathogen. This information will provide FSIS with a more complete picture of the incidence of foodborne illness, which is necessary in order to identify appropriate measures for controlling and preventing foodborne illness.

FSIS is committed to assisting States with implementation of HACCP requirements. The requested increase of \$565,000 to provide HACCP training to State and local regulatory officials at the retail level will further assist States, and address the risk to food safety in meat and poultry processing activities regulated by State and local authorities.

2. The President's Food Safety Initiative creates an early warning system that consists of five food sentinel sites. In addition, the President's budget also requests monies for additional states to have improved surveillance, investigation, control, and prevention of food borne disease outbreaks.

Question. What is FSIS's role in the new "Early Warning System"?

Answer. The "Early Warning System" described in the President's Food Safety Initiative builds on the existing Sentinel Site Surveillance Project, recently named "FoodNet". FSIS has scientific input through its membership on the project steering committee and its participation in investigating outbreaks of illness associated with meat and poultry products.

Question. How much money does FSIS contribute to each of the five food sentinel sites?

Answer. Through an agreement with CDC, FSIS provides \$1 million per year to FoodNet and has proposed an increase of \$0.5 million for fiscal year 1998 to cover *Campylobacter* case control studies at the expanded eight sites. FoodNet activities and resources at the sites are managed by CDC, who also selects each site through a competitive process.

Question. How many total sites does the President's Food Safety Initiative propose and what are their locations?

Answer. The President's Food Safety Initiative proposes to conduct FoodNet in no less than eight sites. Surveillance will continue at the five sites established in 1995, which encompass the Minneapolis/St. Paul, Minnesota metropolitan area; Oregon; selected counties in Northern California; Connecticut; and the Atlanta, Georgia metropolitan area. These sites represent approximately 13 million people, or 5 percent of the U.S. population.

An additional three sites will expand surveillance coverage to about 10 percent of the U.S. population. These sites are being selected by CDC through a competitive process. Two of the sites are the Rochester, NY area and the Baltimore, MD area. The selection process has not been completed for the eighth site.

Question. Are these sites permanent which will require yearly allocations?

Answer. CDC manages the selection and surveillance of sites. Funding requirements for FoodNet are expected to continue on a yearly basis, as proposed.

Question. How will the requested funds be used to improve surveillance, investigation, control, and prevention of food borne disease outbreaks?

Answer. The requested increase would cover *Campylobacter* case-control studies at the expanded eight sites. Expanding surveillance coverage to eight sites, or 10 percent of the population, would increase the statistical significance of the effort

PART 1

among the sites and federal agencies. By strengthening FoodNet, the initiative will create the "early warning" capability described by the President. Such a system could detect large outbreaks as they begin, then quickly alert states and federal agencies, whose rapid response could avert further foodborne illnesses and deaths.

Epidemic investigations as well as planned case-control studies within the expanded surveillance network will identify specific foods or food processing activities associated with pathogens and human illness. By identifying and implementing corresponding control or prevention practices throughout the food chain, the risk of foodborne illness could be reduced nationwide.

Question. Outline your farm-to-table strategy for inspection.

Answer. The final HACCP rule addresses hazards within slaughter and processing plants. FSIS recognizes, however, that these measures must be part of a comprehensive food safety strategy that addresses hazards at other points in the farm-to-table chain. To that end, FSIS is broadening the scope of its food safety activities beyond slaughter and processing plants, with particular new emphasis on hazards that arise during transportation, distribution, and retail sale.

To improve food safety at the animal production and intermediate stages before the slaughter plant, FSIS is working with industry, academia, and other government agencies to develop and foster measures that can be taken on the farm, and through distribution and marketing of animals to reduce food safety hazards associated with animals presented for slaughter. FSIS does not intend to mandate production practices at this stage, but instead believes that the voluntary application of food safety assurance programs based on HACCP principles can be useful in establishing risk reduction practices on the farm and during intermediate marketing stages. The agency believes that continued public concern about foodborne pathogens and the adoption of HACCP and performance standards will increase incentives for producers to adopt food safety practices at the animal production level.

Food safety during transportation, storage and retail sale are also important links in the food safety chain. In these areas, FSIS, FDA, and State and local governments share authority for oversight of food products. FSIS and FDA are jointly working to develop standards governing the safety of foods during transportation and storage, with particular emphasis on the importance of temperature control in minimizing the growth of pathogenic microorganisms.

In the retail area, FSIS and FDA are working with state officials to ensure the adoption of uniform, science-based standards and to foster the adoption of HACCP-type preventive approaches. State and local authorities have primary responsibility for food safety oversight of retail stores and restaurants, but FSIS and FDA, working through the Conference for Food Protection, can provide expertise and leadership to support local authorities and foster the development of sound food safety standards and practices nationwide.

Even as progress is made in reducing contamination during these stages, it will remain critical that retail food handlers and consumers follow safe food handling practices. Proper storage, preparation, and cooking of meat and poultry products are essential to achieving the goal of reducing the risk of foodborne illness to the maximum extent possible. FSIS intends to augment its food handler education efforts by expanding its collaboration with industry, other government agencies, consumer and public interest groups, educators and the media to foster the effective delivery of food safety education and information.

Question. What resources are required?

Answer. For fiscal year 1998, a program level request of \$591.2 million is required to maintain the inspection workforce at its current level in order to provide inspection; to provide laboratory capability to meet HACCP requirements for product sampling and testing; and provide scientific leadership on food safety priorities, such as the FoodNet.

USER FEES

1. The fiscal year 1998 President's budget proposes user fees to recover the full cost of direct on-site product inspection. It is estimated that this proposal will generate \$390 million in new revenues. Last year, the Administration proposed user fees to pay for inspection incurred during overtime. The industry and Congress balked at this proposal and refused to incorporate user fees.

Question. If user fees for overtime shifts were proposed and rejected by the Congress and industry, why do you believe a user fee proposal to recover the full costs of inspection would fare any better?

Answer. The administration believes that the collection of user fees is essential to the successful long-term implementation of meat, poultry, and egg products inspection reforms. If industry takes responsibility for the cost of inspection, industry

PART 1

212

would be assured of sufficient resources to efficiently operate plants, and the Administration could then fully focus its efforts on developing and implementing necessary inspection reforms which would thereby improve consumer confidence in meat, poultry, and egg products. With inspection no longer subject to annual budget pressures, the agency will not have to balance food safety reform initiatives against inspection staffing needs.

Question. Has this proposal been submitted to the Congress?

Answer. The legislative proposal will be submitted to Congress in the next few weeks.

Question. What benefits would consumers receive if these fees were authorized?

Answer. If industry takes responsibility for the cost of inspection, the Administration can then fully focus its efforts on developing and implementing necessary inspection reforms which would thereby improve consumer confidence in meat, poultry, and egg products.

Question. How does the agency plan to implement these user fees?

Answer. FSIS is analyzing a number of user fee approaches. These include systems based on inspection staff years, pound of liveweight or raw meat input, numbers of carcasses, and registration for inspection. Through the rulemaking process, the agency will seek input from the public on developing a user fee system that is equitable, cost-effective and accountable. The Department has developed, and is pursuing an implementation schedule to ensure that regulations will be in place to implement the fees on October 1, 1997, assuming enactment of the legislation.

Question. Were all of the inspector vacancies filled with the fiscal year 1997 allocation?

Answer. The 1997 Appropriation is sufficient to provide inspection coverage that is adequate to ensure the safety of regulated product, as well as accommodate industry growth.

Question. Was HACCP fully implemented with the fiscal year 1997 allocation?

Answer. In accordance with the provisions of the final HACCP rule, pre-HACCP sanitation standard operating procedures, SOPs, were implemented in all plants and E. coli testing was begun in all slaughter plants, effective January 27. HACCP implementation will begin in fiscal year 1998, and the implementation schedule will be based on plant size. Large plants with 500 or more employees are required to have their HACCP systems in place by January 26, 1998. Small plants with 10 to 499 employees are required to implement HACCP by January 25, 1999. Very small plants with fewer than 10 employees or less than \$2.5 million in annual sales have until January 25, 2000 to implement HACCP.

2. Your total request for FSIS is \$591 million for fiscal year 1998. For fiscal year 1998, appropriations the Administration's legislative proposal for inspection user fees would require \$201 million to provide laboratory support for inspection, animal production food safety investments, investments in new inspection system improvements, and program administration.

Question. How would the adoption of this user fee legislation impact the fiscal year 1998 appropriations request for the FSIS?

Answer. The 1998 budget includes the assumption that adoption of the user fee legislation would reduce the FSIS Appropriations request from \$591.2 million to \$201.2 million for fiscal year 1998. Upon enactment of the legislation, FSIS will do rulemaking to implement a user fee system to recover an estimated \$390 million in inspection costs.

3. Assuming the enactment of the Administration's user fee proposal, the FSIS appropriations request for fiscal year 1998 is \$201 million. The assumption would also be that the legislative proposal for FSIS recovers \$390 million in user fees which will be paid by the industry. Your testimony states that the industry assumes 70 percent of the total cost of the program if the user fee proposal is enacted.

Question. What are the projected appropriations needed for fiscal year 1998 and the succeeding five years out?

Answer. Under current law, the projected appropriations needed are \$591.2 million for fiscal year 1998. Assuming enactment of the proposal to recover the cost of salaries and benefits for mandatory inspection, the projected fiscal year 1998 appropriations needed are \$201.2 million for laboratory support for inspection, animal production food safety investments, new inspection system improvements designed to enhance safety and productivity, and program administration. The long term implications of the proposed legislation are as yet to be determined.

Question. What specific costs would be borne by the industry for fiscal year 1998 and the succeeding five years out?

Answer. Industry would be responsible for the cost of all salaries and benefits of personnel performing mandatory inspection of meat, poultry, and egg products.

PART 1

213

Question. What assumptions are these appropriations and user fee collections based on in terms of the cost of the fees paid and the activities provided by these fees, e.g. fees collected only cover costs of in-plant inspections?

Answer. The estimated collection of \$390 million in the user fee proposal is based on the fiscal year 1998 projected cost of salaries and benefits for the fiscal year 1997 staffing ceiling of permanent full-time employees and other than permanent full-time employees who perform mandatory inspection of meat, poultry, and egg products.

Question. Do these assumptions change once HACCP is implemented?

Answer. The proposed legislation provides user fees for salaries and benefits of personnel conducting inspection and compliance services incident to the inspection of meat, poultry, and egg products. Under HACCP, we continue to recover the same costs.

Question. Have you consulted with industry on this user fee proposal?

Answer. Industry representatives are being invited to a meeting scheduled for March 10, to comment on the user fee proposal.

SALARIES AND EXPENSES

The Under Secretary for Food Safety and Inspection Service position remains vacant.

Question. What has been done with the funds provided for fiscal year 1997 and previous fiscal years?

Answer. The first annual appropriation for the Office of the Under Secretary for Food Safety was provided for fiscal year 1996. The total costs in fiscal year 1996 for this office were \$440,000 for the salaries and benefits, travel, and other operating costs of the Acting Under Secretary, one confidential assistant, and two clerical staff. For fiscal year 1997, very little of the funding for this office has been obligated since positions in the Office of the Under Secretary were vacated early in the fiscal year.

Question. Why was a request for funds made in the fiscal year 1998 President's budget?

Answer. Funding for the Office of the Under Secretary for Food Safety was included in the 1998 President's budget based on the expectation that positions for that office will be filled in fiscal year 1998.

QUESTIONS SUBMITTED BY SENATOR BURNS

EXPLANATION OF HACCP FINAL RULE TO PRODUCERS

Question. Mr. Billy, can you provide the committee information on what you are doing to explain the new rules and regulations on meat inspection to the people on the ground, the producers?

Answer. The Food Safety and Inspection Service (FSIS) has planned a series of meetings on the Plant Communications Initiative to improve communications with inspected establishments, especially small and very small plants, as they implement new federal food safety requirements for meat and poultry plants. These requirements are contained in the Hazard Analysis and Critical Control Points (HACCP) final rule.

FSIS has scheduled ten public meetings across the country, including one teleconference, to facilitate direct input on how the Agency can better communicate with plants. Locations for the meetings include Tennessee, Pennsylvania, Massachusetts, Missouri, Alabama, California, Illinois, North Carolina, Texas, and Wisconsin.

At each meeting, FSIS Administrator Thomas J. Billy and Dr. Craig Reed, Deputy Administrator for Field Operations, will meet with plant managers to discuss information and communication needs. In particular, the Agency would like to know:

—What kind of information plants need from FSIS to successfully implement HACCP;

—What are the best ways FSIS can meet plant needs, including working with new technologies; and

—How can FSIS get a consistent inspection message to all plants.

In addition to meetings, the Agency is working with groups of small and very small establishments and their institutional cooperators (universities, trade groups, and consultants) on projects which are designed to demonstrate how small plants can meet the requirements of the HACCP final rule. Material under development to explain the requirements for small and very small plants includes the following:

—Guidebook for the Development of HACCP Plans;

—Hazards and Controls Guide;

PART 1

214

- 13 Generic HACCP Models;
- Reproduction of a HACCP Plan Development Video Produced by Agriculture Canada and Agri-Food Canada;
- Guidance Material for E. coli Testing for Livestock and Poultry;
- Video for Sampling Carcasses for E. coli Testing; and
- Guidance Material on Statistical Process Control.

FSIS also recognized early that the implementation of the final HACCP rule would have a significant indirect impact on the food animal production community. The Agency is working proactively with the various industry and professional organizations which represent all segments of the food animal production process to raise the level of awareness about the regulation, its potential ramifications for their respective members, and what action they may wish to consider.

At the animal production level, the FSIS strategy is to encourage the voluntary use of the existing commodity food safety and quality assurance programs, which are based on HACCP principles, to reduce food safety risks. We believe that producers who implement the practices recommended in these programs will be able to provide slaughter plants with the assurances they need regarding the residue safety of the animals they process.

Question. In December of last year, the Food Safety and Inspection Service was asked to come to Montana to discuss the rules and regulations on meat inspected coming in from Canada to the general membership of the Montana Stockgrowers Association. There had been talk that there may be some discussion on a personnel matter in the agency at this same meeting. However, I believe all that was resolved and the topic of discussion was to be the inspection of meat coming across the border from Canada. Yet, a day later when I met with these same people they were anything but confident in the process and the discussion that had occurred. I would hope you could make it a part of this new program to make sure that the producers understand the process and the costs that they will ultimately bear. Can you assure this committee that you will meet with producer groups to make sure that they do understand what it is that they will be paying for?

Answer. A major objective of the ten public meetings FSIS has scheduled across the country is to find out from plant managers the kind of information plants need from FSIS to successfully implement HACCP. We intend to provide the needed information, and work with plants to assist them in implementing HACCP.

INTERSTATE SHIPMENT ISSUE

Question. What is the Agency doing at this time to resolve the differences that have recently occurred between the state inspection process and the federal?

Answer. FSIS is ready to address the concerns of state-inspected plants and state Departments of Agriculture underlying this issue, but is not ready to endorse the “merging” of state and federal inspection or other specific solutions proposed for those concerns without further analysis of the issues. FSIS is publishing a notice in the Federal Register announcing two public meetings on this issue on June 16 and 17, 1997, in Sioux Falls, South Dakota, and on July 22, in Washington, DC. These meetings are to solicit information on ways to improve Federal and State cooperation in the implementation of the Federal inspection laws and whether, and if so, how, those laws should be changed to permit State inspected product to move in interstate commerce.

USDA is very concerned that state-inspected processors wishing to distribute their product across state lines view the obtaining of federal inspection to be an unreasonable obstacle in their path, and would consider changes in how FSIS grants federal inspection to such plants if warranted. Similarly, USDA views state inspection programs as an essential part of the Nation’s food safety network, and is open to new ideas on how to better support them and keep them viable. The Department wants to have the best possible working relationship with state meat and poultry inspection programs and the establishments they inspect.

FSIS is in the process of making major changes in how it conducts federal inspection; changes aimed at reducing risks to public health through a shift to HACCP-based inspection and imposition of new pathogen reduction requirements. It is important that FSIS implement these changes with care and without delay, and that state programs have the guidance and assistance they need to make their inspection programs “equal to” the federal program in a timely fashion. Any additional major changes in its inspection program would divert USDA resources from risk reduction efforts and could lead to delays in implementing HACCP and pathogen reduction requirements. That is, it is suggested that the public costs of instituting such a change at this juncture may well outweigh the public benefits.

PART 1

215

DIFFERENCES IN INSPECTION OF MEAT AND POULTRY

Question. As I mentioned in my statement, in Montana we do not have a large number of chicken producers. However, if agriculture pulls the wagon of the economy in Montana, then livestock's production is the beast of burden. Can you put in real terms, that all America can understand, the difference in the treatment of white meat products and red meat products in the inspection process, and the cost difference?

Answer. FSIS contracted with the Research Triangle Institute (RTI) to conduct a comprehensive comparative study of meat and poultry regulations. RTI completed its study in June 1993. For the record, I will provide the study by RTI, and the FSIS analysis of the study. In summary, the study found that differences in the regulations and the inspection process are sometimes justified by the fact that "the two industries deal with different animals, and have different production processes," and that the "laws for market protection were designed to protect the markets within each industry . . . and to] use industry standards; and FSIS has no authority to reconcile those standards between industries." The study found that the cost of an inspector's salary and benefits per pound of inspected product is \$0.0020 liveweight for red meat and \$0.0046 liveweight for poultry.

[The information follows:]

[Research Triangle Institute, June 1993]

COMPARISON OF MEAT AND POULTRY REGULATIONS (SUMMARY REPORT)

BACKGROUND

The Food Safety and Inspection Service (FSIS) of the U.S. Department of Agriculture (USDA) is responsible for inspecting all meat and poultry products shipped in interstate commerce and for assuring consumers that meat and poultry products are wholesome; not adulterated; and are properly marked, labeled, and packaged. The Federal Meat Inspection Act (FMIA) and the Poultry Products Inspection Act (PPIA), both as amended, provide USDA this mandate. FSIS administers and reviews inspection activities to ensure that the agency's policies and regulations are consistent with the FMIA and PPIA.

Industry representatives have expressed concerns that differences in USDA regulations for meat and poultry inspection may benefit or harm one segment of the industry or the other. In response, the FSIS Administrator requested a comprehensive comparison of the meat and poultry regulations to identify and describe significant requirement differences. Consequently, Research Triangle Institute and three independent consultants (hereafter RTI) reviewed Title 9, Code of Federal Regulations, Subchapters A (Mandatory Meat Inspection [Parts 301–335]) and C (Mandatory Poultry Products Inspection [Part 381])¹ to identify all substantive regulatory requirements not already identical, outline the significant differences by specie, and classify the bases for those significant differences. The purpose of this report is to document RTI's findings and to outline its method of evaluation regarding this comprehensive regulatory comparison.

FINDINGS

In general, the regulations covering meat and poultry have been designed with the same intent—to protect "the health and welfare of consumers by assuring that meat and meat food products [or poultry products] are wholesome, not adulterated, and properly marked, labeled, and packaged" (p. 1139).² However, although the intent of the regulations remains the same, the actual requirements are quite different. This is to be expected considering that the regulated species have inherently different characteristics. These different characteristics were considered as the rules and regulations evolved. The regulations contain and present the means for effectively accommodating those differences as the respective meat and poultry industries go about challenges of converting raw materials into foods for humans and into other byproducts (e.g., pet food).

It is within this context that we attempted to outline the differences that currently exist between the meat and poultry regulations and to classify the bases for those differences. RTI applied a "general acceptance" rule in making its determinations. If RTI judged that objective and knowledgeable professionals would generally agree on the identification and classification of the regulatory differences found, then our findings were stated accordingly. Industry was not consulted, nor were cost

¹ 9 CFR Parts 301–335, and 381, respectively; Revised as of January 1, 1992, with ancillaries.

² 21 U.S.C. § 602 and § 451.

PART 1

evaluations conducted for determination of minor vs. significant differences. Furthermore, RTI did not attempt to justify the regulatory differences found. The following is the summary of our findings.

Minor Regulatory Differences In General

The meat and poultry regulations contain hundreds of differences in regulatory requirements. Most of these differences were identified as “minor.” Most of these “minor” regulatory differences are based on language variations (e.g., poultry regulations generally are shorter and more concise than are those for meat). These variations probably developed as a result of the time differential between regulatory enactment of the FMIA (1907) and the PPIA (1957).

Regulatory differences are deemed “minor” when the intent of the regulation is essentially the same and in RTI’s opinion there is no identifiable difference between the burdens imposed on meat and poultry producers. These differences are denoted in the main report document as “minor,” and no bases for these differences are given.

Significant Regulatory Differences in General

The regulations also reflect a number of significant regulatory differences that stem primarily from inherent differences in the two industries. First, the species slaughtered and processed are different, and they have different diseases and conditions. Thus, the procedures, processes, and equipment used to obtain consumer-ready products vary considerably between meat and poultry species. Differences of this type are outlined in the Appendix and are noted as being primarily based on inherent specie differences, which require variations in slaughter, processing, inspection, and labeling methods to ensure wholesome, nonadulterated products.

Second, the poultry industry had been growing and expanding under voluntary poultry inspection for many years prior to the mandatory Federal legislation of 1957. When the regulations were written for mandatory poultry inspection, customary and usual industry practices and standards of the time were incorporated into the regulations. Consequently, poultry regulations that are similar in subject category to meat regulations (e.g., standards of identity) reflect differences in 19th “traditional” industry practices that continue today (e.g., “chili con carne” must have a minimum of 40 percent fresh meat; “(poultry) chili” must have a minimum of 28 percent cooked, deboned meat). Differences of this nature are outlined in the Appendix, and the basis for these differences are classified as “traditional” (i.e., “traditional” industry practices were included in the regulatory language at the time of codification).

Finally, the poultry regulations in some parts contain very detailed requirements while the counterpart meat regulations are very general in content. This can be attributed largely to the fifty or so years difference in the ages of the FMIA and the PPIA. The meat inspection program evolved mostly during a period when policies and procedures were published in directives, manuals, and similar publications. The more recent poultry inspection program was developed mostly during a period when policies and procedures were promulgated by rulemaking, to permit public comment and better public notice consistent with the Administrative Procedure Act. (It should be noted, however, that in the last decade or so Federal agencies were discouraged from issuing new regulations, leading to a return to greater reliance on directives and policy guidance issued directly by FSIS for both meat and poultry inspection matters). It can be argued that such differences are also attributable to larger, more drastic technological and marketing changes occurring in the poultry industry in recent decades than in the red meat industry, leading to greater need for poultry inspection procedures to change and adapt. These differences have been outlined in the Appendix and their basis for differences identified primarily as “historical.”

These specie, traditional, and historical-based regulatory requirement differences are deemed “significant” in that they are not “minor” differences (i.e., the potential burden on producers for such regulations may be greater on one industry or another). These “significant” differences are outlined in the report and the basis for those differences are given.

Specific Significant Regulatory Differences

Although most regulatory differences between meat and poultry are minor and/or of no real consequence to either the meat or poultry industries, there was a general agreement at RTI and among its consultants that a small number of differences may be viewed as potentially significant in terms of cost advantage to one industry or another (or to FSIS in terms of the relative costs of administering the two regulatory programs). Again, these differences identified reflect the judgment and consensus of RTI; industry was not consulted, nor were cost evaluations done. These specific significant differences are outlined below by subject area. In addition, the

PART 1

Appendix page numbers and CFR citation references are given for ease in locating each difference.

1. Carcass Chilling Procedures

Traditional chiding methods for meat and poultry carcasses are different. Meat is chilled by exposing it to cold air. Poultry chilling by cold air and by cold water immersion are both permitted. Poultry carcasses normally are immersed in chilled water and ice. The immersion chilling method for poultry allows for the absorption of 8 percent or more of water by weight into the poultry carcass, a gain in carcass weight that dry chilling methods do not impart to livestock carcasses. Livestock carcasses may be sprayed while being chilled, but are not permitted to gain weight in the process. The basis for these differences is primarily traditional (i.e., current industry practices written into the regulations at the time of codification).

Page No.	Meat CFR	Poultry CFR
F-10 to F-15	None	§ 381.66(d)(1)–(6).

2. Humane Slaughter

There exist regulatory requirements—with their related procedures, controls, and penalties—for the humane slaughter of livestock. There are no corresponding laws or regulations for poultry. The basis for these differences is statutory (i.e., requirements for humane slaughter of livestock are contained in the FMIA; no comparable requirements for the humane slaughter of poultry are included in the PPIA). (See 21 U.S.C. § 603[b], 610[b].)

3. Poultry Reprocessing

Carcasses contaminated on the slaughter floor are considered adulterated. Poultry carcasses may be reprocessed by washing of contaminated areas with chlorinated water; poultry regulations allow for such reprocessing and provide for equipment and procedures to accomplish it. Contaminated meat may not be washed. Trimming of contaminated areas is the only accepted method for removal of ingesta or fecal materials from livestock carcasses. The PPIA expressly permits reprocessing of poultry; the FMIA has no such provision. (See 21 U.S.C. § 455[c].)

Page No.	Meat CFR	Poultry CFR
H-27 to H-28	None	§ 381.91(b)(1)–(2).

4. Poultry Slaughter Modernization

Certain regulations that provide for new poultry inspection procedures, responding to the modernization of poultry slaughter technologies, could have comparable applications to livestock slaughter but have not been adopted in meat post-mortem inspection. These include:

(a) The use of quality control (QC) concepts and cumulative sum (CUSUM) in establishing and controlling product nonconformities.

(b) Plant-operated QC programs and personnel for the purpose of attaining maximum production potential.

(c) Finished Product Standards (FPS) published in the regulations.

The basis for these differences is essentially “unknown” (i.e., these procedures could, with modification, be done for meat species the same as for poultry species).

PART 1

Page No.	Meat CFR	Poultry CFR
G-28 to G-50	None	§ 381.76(b)(3)(iv)(c) + .

5. Exemptions

Generally, the regulatory exemptions from inspection are more liberal for poultry than for meat. For instance, the meat regulations permit the uninspected slaughter and processing of livestock for household use only, but the poultry regulations permit the uninspected slaughter, processing, and sale of limited quantities of poultry and poultry products to consumers. In addition, the poultry regulations exempt from inspection certain products containing small amounts of poultry that would otherwise receive inspection under the meat regulations. The basis for most of the exemption differences is statutory. (See 21 U.S.C. § 464 and § 623.)

A-22	None	§ 381.10(a)(7)(b), (c).
A-22	None	§ 381.11(a).
A-23	None	§ 381.12.

6. Sanitation

The meat regulations require the mandatory use of 180 °F water to clean and disinfect slaughter equipment in many instances. There are no such requirements in poultry. The basis for this differences is “unknown.”

Page No.	Meat CFR	Poultry CFR
D-4	§ 308.3(d)(4)	§ 381.50(b).
D-12	§ 308.8(c)	§ 381.58(a).

7. Mechanically Separated Product

Mechanically Separated (Species) (MS[S]) meat product conforming to prescribed compositional standards is permitted to be used in limited quantities in certain products. Label and use restrictions are required, along with calcium content testing and labeling. A QC program is necessary for a plant to produce MS(S). Mechanically separated poultry (MSP), a comparable product, is permitted to be used in unlimited quantities in poultry products and labeled as chicken or turkey. Bone content is the only compositional standard required. A court decision declaring that mechanically separated meat product is not “meat,” coupled with relatively quick, large-scale introduction of MSP into various poultry products, appear to be the primary bases for these regulatory differences.

M-10 to M-11	§ 319.6	None.
M-17	§ 319.105(b)	None.

8. Cooking Temperatures

There exist regulatory requirements (and attendant controls and procedures that go with them) concerning time/temperature cooking relationships for the control of salmonella in beef, and for the control of trichina in pork. There is not a similar approach to cooking poultry rolls, which only require cooking to 160 °F. or to 155 °F

PART 1

if cured and smoked. The basis for these differences is that certain meat products are eaten “rare” by consumers; poultry products are generally not eaten “rare.”

Page No.	Meat CFR	Poultry CFR
L-35 to L-36	§ 318.17(a)–(c)(3)	§ 381.150.
L-71 to L-75	§ 318.17(d)(1)–(k)	None.

9. Use of Skin

The poultry regulations provide that poultry carcasses, cuts, and products may contain skin. The percentage permitted ranges from 8 to 20 percent (natural proportions) and may be added to the product without label declaration. In meat, pork jowls with attached skin is permitted in processed products with a proper label declaration. Detached skin is not permitted. The poultry regulations also permit the use of skin in natural proportions in poultry burgers and patties; hamburger must be made of beef of skeletal origin. Traditional poultry industry practice is the primary basis for these differences.

Page No.	Meat CFR	Poultry CFR
M-3	§ 319.15(b)	§ 381.160.
M-46	None	§ 381.168.

10. Chilling and Freezing Requirements

The poultry regulations contain numerous requirements concerning time/temperature relationships for the chilling or freezing of poultry carcasses and parts. These requirements consume inspector time to assure compliance. There are no such requirements for meat carcass chilling or freezing. The basis for these differences is traditional industry practice.

Page No.	Meat CFR	Poultry CFR
F-6 to F-10	None	§ 381.66(b)–(c)(5).
F-17 to F-18	None	§ 381.66(c)–(f)(6).

11. Standards of Identity

In similar meat and poultry products with standards of identity, the required percentage content of cooked poultry is usually less than the meat content. For examples “(meat) hash” must contain a minimum of 35 percent fresh meat; “(poultry) hash” must contain a minimum of 30 percent cooked, deboned meat. The basis for these differences is traditional industry practices.

Page No.	Meat CFR	Poultry CFR

	§ 319.312	§ 318.167.
M-7	§ 319.313	§ 318.167.

12. Moisture Limitations in Processed Products

Moisture limitations in processed products tend to favor poultry. For example:

(a) Fresh Meat Sausage must have ≤3 percent added water; Fresh Poultry Sausage has no limit.

(b) Cooked Meat Sausage must have ≤40 percent combined fat and water; Cooked Poultry Sausage has no limit.

(c) Pork Ham is protein fat free (PFF) controlled for both Domestic and Foreign Imports; Turkey Ham has no PFF control.

(d) Meat Roast must have label declaration of any added moisture; Poultry Roast may contain ≤10 percent added moisture without label declaration.

The Appendix’s entry under “basis for no compatible [poultry] regulation,” with regards to items (a)–(c), is “unknown.” With regards to item (d), the “basis for the difference” is traditional industry practices.

METHOD OF EVALUATION

Figure 1 is a Flow Diagram of the method of evaluation.

PART 1

221

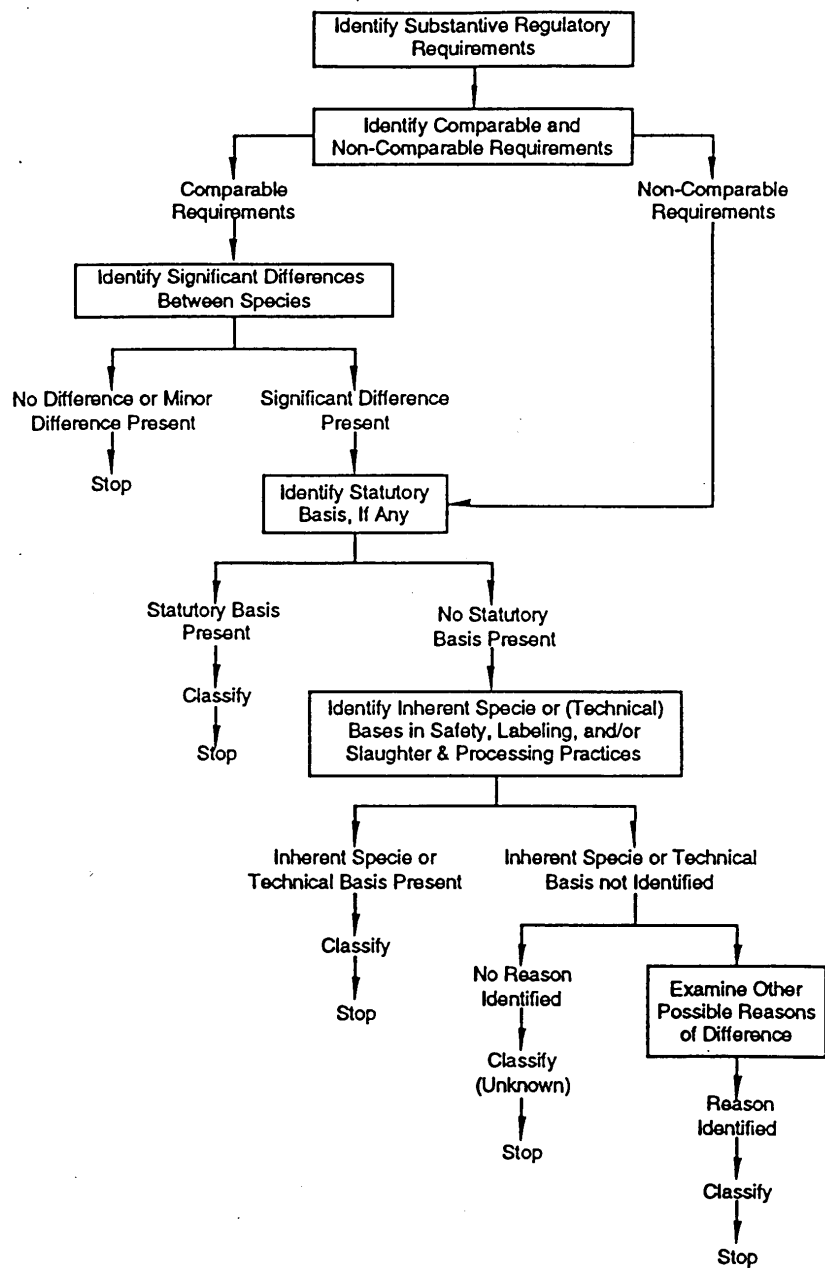

Figure 1. Method of Evaluation

Identify Regulatory Requirements for Meat and Poultry

RTI reviewed Title 9, CFR, Subchapters A (Mandatory Meat Inspection, Parts [301–335]) and C (Mandatory Poultry Products Inspection [Part 381])³ to identify all substantive requirements for meat and poultry, respectively. The substantive regulatory requirements reviewed correspond to 18 specific subject areas, as listed in the Appendix table of contents. All of Title 9, CFR, Subchapters A and C, was included in the study except 9 CFR § 301.1–2, § 302.1–3, § 303.2, § 318.21, § 318.300–311, § 321.1–2, § 331.1–6, § 318.1–7, § 318.153, § 381.185–186, § 318.220–225, and § 318.300–311. These sections were not included in the comparison because the regulations for meat and poultry were essentially identical in composition or the sections were not considered substantive regulatory requirements for comparison purposes (i.e., they were not included among the required subject categories listed in the Appendix table of contents). RTI used FSIS's Document Issuance Automated Library System (DIALS) to retrieve and download the most current issuance of the CFR.

Division of Comparable and Non-Comparable Meat and Poultry Regulatory Requirements (Part I vs. Part II)

After identifying all substantive meat and poultry regulatory requirements, the RTI staff input regulations into tables using word processing software. The tables were organized by subject category (e.g., “Exemptions”) and visually reviewed for comparability. The meat regulations were left essentially intact, and poultry regulations were electronically matched with the appropriate meat regulation. Any meat or poultry requirement not having a similar counterpart requirement was therefore also identified. Accordingly, the regulatory requirements in each subject category are separated into two pans (e.g., the subject category “Exemptions” is broken into “Exemptions [Part I]” and “Exemptions [Part II]”). Part I contains the meat and poultry requirements with comparable counterparts, and Part II contains the meat and poultry requirements without comparable counterparts.

Identify and Classify Differences of Comparable Meat and Poultry Regulatory Requirements (Part I)

Comparable meat and poultry requirements in each category were then reviewed and their differences identified. If there were no differences (i.e., the regulatory requirements were identical), the meat and poultry counterparts were identified as “same” and no further consideration was given. If differences existed, but the burden on the producer for such differences was deemed insignificant, the meat and poultry counterparts were identified as “minor” and no further consideration was given. If differences existed that were deemed significant, then they were summarized and listed in the table.

For the meat and poultry counterparts with significant differences, a classification was then made as to the “basis for differences.” Any notes or explanations germane to the differences were also included for informational support. The bases for differences were classified in the following order:

1. *Statutory.*—RTI examined the United States Code (primarily 21 U.S.C. § 451–§ 470 and § 601–§ 695) to determine whether each significant difference identified was based firmly on differences in the statutes. If it was, we noted this fact and gave the U.S. Code citation reference. No further consideration was given to regulatory differences based on statutory differences.

2. *Inherent Specie or Technical Differences.*—Significant regulatory differences between species without a clear basis in statutory differences were further assessed to determine any inherent specie or technical-related basis for the differences. Inherent specie differences (e.g., size, weight, age, type/severity/susceptibility of disease, etc.) or variations in safety, inspection, slaughter, processing, or labeling due to inherent specie differences were the primary bases identified. RTI applied a “general acceptance” rule in making these determinations. If we judged that objective and knowledgeable professionals would generally agree that a regulatory difference can be based on one or more inherent differences in specie-related food safety and/or production methods, we stated so. No further consideration was given to differences of this type.

3. *Other Reasons or Unknown.*—For significant differences without apparent statutory, inherent specie or technical basis, other reasons for the differences were explored. The primary reasons identified were traditional or historical industry practices that were codified into the regulations as the two industries grew and developed. Institutional and operational agency bases for differences were also identified.

³ Revised as of January 1, 1992, with ancillaries.

PART 1

223

If no clear basis for a significant difference between meat and poultry regulatory requirements could be identified, then we so noted (e.g., response of “unknown”).

Classify the Basis for Non-Comparable Meat and Poultry Regulatory Requirements (Part II)

For non-comparable meat and poultry regulatory requirements, no differences exist to identify or classify. Instead, for these requirements we classified the “basis for no comparable regulation.” We followed the same evaluative format as was done for comparable meat and poultry regulatory requirements to determine their “basis for significant differences.” In other words, the “basis for no comparable regulation” was identified as (1) Statutory, (2) Inherent Specie or Technical Reason, or (3) Other Reasons or Unknown.

It should be noted that the essential question being answered for non-comparable meat and poultry requirements is much different than the question being answered for those meat and poultry requirements that are comparable. Namely, identifying the “basis for no comparable regulation” (or the reason why there is no meat/poultry counterpart) is not the same as identifying the “basis for differences.” There exist no requirements for which to identify differences. Thus the choice of evaluative bases (1), (2) or (3) for non-comparable requirements will not necessarily be the same as when they are being chosen for comparable requirements.

MEMORANDUM FROM TERRY L. MEDLEY

To: Patricia Jensen, Acting Assistant Secretary, Marketing and Inspection Services
From: Terry L. Medley, J.D., Acting Administrator
Subject: Comparison of Meat and Poultry Regulations

In response to complaints from industry, some of them long-standing, that the Agency is “not regulating meat and poultry equitably,” FSIS contracted out to Research Triangle Institute (RTI) a comparison of the meat and poultry regulations. The report (see last tab) found many differences in the two laws and narrowed down to 12 the areas of the law in which they believed there were significant differences in the regulations.

The Agency (after combining two of the areas to simplify presentation and analysis), has studied these areas of the law to determine whether, in the actual conduct of inspection, they result in an inequitable application of the inspection laws, and, if so, what might be done to mitigate the inequities. The attached paper contains the FSIS analysis of the RTI results and some options for your consideration.

Although in this effort the Agency’s primary focus has been on equity, it has also had to consider the underlying purpose of the laws to assure that all proposed options meet the Department’s accountability for effective meat and poultry inspection as well as for an equitable application of the law. As indicated in Figure 1 there were problems in four areas with how well the Agency was meeting the underlying objectives of the law, and in one of those areas, there were both effectiveness and equity problems. FSIS has assumed in its analysis that the Agency’s responsibility is, first, to assure the objectives of these laws are being effectively met, and, second, to make the enforcement of the laws as equitable as possible.

The analysis helps to clarify the meaning of “equity” as an Agency regulatory responsibility and why there is an appearance of inequity in many instances where actual inequity does not exist. The following factors contribute to the appearance of inequity where none may exist:

- Some differences in the law are justified by the fact that the two industries deal with different animals and have different production processes.
- Some laws may be stated differently, but in application are enforced to the same objective.
- Laws for market protection were designed to protect the markets within each industry, not between them. These laws use industry standards, and the Agency has no authority to reconcile those standards between industries.

Time has obscured the differences in the way the laws originated for regulation of these two industries. Many enforcement standards in the meat laws were generated to protect against changes in certain meat products or bring about desired changes in meat production processes. When the poultry laws were passed at a much later date, many of those changes were already an accepted part of industry practice and were not specified in the law. In most of these areas, the Agency has not interpreted the differences in the law to reflect an intended difference in objectives and has tried to enforce the law to the same end in both industries. Thus, this analysis, in looking at Agency practice as well as the laws themselves, has found that not all differences in the laws result in inequitable regulation.

Tab/Area of regulation	Status of Enforcement			
	No inequity ¹	Inequity ²	Effectiveness question ³	Effectiveness and inequity question ⁴
1. Mechanically separated product				X
2. Humane slaughter	X			
3. Use of skin	X		X	
4. Standards of composition or identity	X			
5. Sanitation	X			
6. Slaughter inspection modernization		X

10. Exemptions		X		
11. Processed Products: moisture limitations	X		X	

¹Differences in regulations where no inequity was found in the application of the law.
²Differences in regulations where an inequity was found in the application of the law.
³Differences in regulations which raise a question as to whether the law is being enforced as effectively as possible.
⁴Differences in regulations which raise both a question of inequity and effectiveness.

MECHANICALLY SEPARATED PRODUCT

I. Issue

Mechanically Separated (Species) (MS[S]¹)—a meat food product—is strictly regulated as to its preparation, composition, usage, and labeling; mechanically deboned poultry (MDP) is not. These differences raise two policy issues. The first is whether current regulations are adequately protecting consumers. The second is whether different regulatory treatment for these similar substances is justified. The meat industry claims, and has sued the Department on this point, that differences in USDA regulations are unjustified.

II. Background

“Mechanical Separation” and “Mechanical Deboning” are methods of using machinery to separate tissue from meat and poultry bones to produce a very finely ground substance which contains bone, bone marrow, and certain minerals as well as muscle tissue. Before this relatively recent innovation, it was not economically feasible to use these tissues in meat and poultry products.

Mechanically Separated (Species) became the subject of consumer criticism in the mid-1970’s after USDA proposed, in order to equate meat with poultry policy, to allow its use in meat products and let processors label it as beef, pork, etc., without qualification to explain that it was not exclusively muscle tissue. This criticism led to a lawsuit in which the court found that MS(S) was not “meat” within USDA’s regulatory definition and that it was an added substance which must be identified in the product label ingredient list.

After the lawsuit, USDA undertook to resolve three consumer protection issues raised by mechanically separated products.

- Does the product present inherent health hazards?
- Is the product a unique ingredient that should be identified separately to distinguish it from “beef,” “pork” “chicken,” etc.?
- Should use of the product be limited, i.e., should it be restricted to a certain percentage of the foods in which it is used?

As to the first point, scientific studies established no unique health risks associated with the mechanical separation technique. However, it was determined that MS(S) is sufficiently different from muscle tissue meat in consistency and composition to require separate labeling. Usage limitations were also found to be necessary.

These findings led USDA to issue extensive regulations in 1978 which set preparation, composition, usage, and labeling constraints for MS(S) and required that it be produced only under a strict quality control program to be approved by the Agency. This rule assigned a definition and standard of identity for MS(S) which neces-

¹Mechanically Separated (Species) is a generic term. Specific products would include Mechanically Separated Beef, Mechanically Separated Pork, etc. Originally, this product was known as Mechanically Deboned Meat. Other names have been used or proposed over the years. For simplicity, this paper uses only the current term.

PART 1

sitated it be listed separately from meat in the ingredients statement of food product labels and on the principal display panel.

Additional rulemaking in 1982 reaffirmed the Department's position that MS(S) was not "meat." USDA further determined it was sufficient for processors to declare this substance in the product ingredient statement unless its use altered basic product characteristics, in which case it had to be identified on the principal display panel.

During this same period, MDP underwent product development separately from MS(S) without USDA regulation. Early distinctions in regulatory treatment were largely due to historical differences in how the two industries used these products and the way in which they came to public attention. One significant difference is that MS(S) was being considered for use in products that had previously contained only muscle meat.

The use of MDP in poultry hotdogs created less controversy. Poultry hotdogs did not exist before they were made with this substance, and consumers had no prior expectations about the formulation. Nevertheless, the same consumer protection issues were applicable to MDP. USDA, during its 1982 rulemaking for MS(S), promised to establish similar rules for the regulation of MDP at a later date. In 1983, the Agency developed, but did not publish in the Federal Register, a proposed regulation for MDP that paralleled the existing MS(S) rule. Continuation of the differences in regulatory treatment of MS(S) and MDP since that time has been attributable to decisions made at political levels in the Department. The effect of those differences has been a reluctance for processors to use MS(S) while MDP use has expanded.

For example, the meat industry has not used much MS(S) in product formulations. It claims that consumers will not buy products if they see MS(S) on the label. Similarly, the poultry industry claims that if they had to label MDP as a poultry hotdog ingredient, consumers will think the product has changed and they would stop buying it. FSIS has no information to verify these assumptions. FSIS has no information to show how much attention consumers pay or will pay to ingredients statements on a label. There is some question as to whether consumers know what mechanically separated/deboned products are.

If, as the two industries contend, people will not buy a product when its ingredients are accurately listed on the label, the current regulations requiring disclosure for MS(S) are clearly needed and consideration should be given to requiring MDP labeling as well. Additional health issues concerning MDP also need further analysis.

Earlier studies concluded there are no unique health risks in the use of mechanically separated product when it is used as an incidental ingredient in meat food products. This finding does not necessarily extrapolate to MDP which is frequently the main ingredient in poultry products. Known issues such as the calcium and cholesterol content of MDP will be resolved when nutrition labeling regulations take effect. Some evidence exists that the meat industry is getting around USDA's extensive MS(S) regulatory requirements by adding MDP to meat food products in what are now allowable proportions of "poultry."

In recent developments, the Agency has been sued by several sausage manufacturers who have argued that imposing labeling requirements on MS(S) while not imposing similar requirements on MDP is inconsistent and inequitable. In response to this lawsuit, FSIS issued an Advance Notice of Proposed Rulemaking (ANPR) in June 1993. The ANPR solicited comments, information, scientific data, and recommendations regarding the need for labeling poultry products produced by mechanical deboning and products in which MDP is used. Over 2,700 responses were received. A little over half the comments favored labeling of MDP, while the remainder did not. No compelling health and safety issues were raised, leaving what is substantially a consumer protection issue wrapped in the cloak of an economic controversy.

Because of the response to the ANPR, on March 3, 1994, FSIS published another ANPR seeking public comments on the Agency's tentative positions in pursuing the development of a proposed rule on the definition and labeling of poultry products produced by mechanical deboning and also by a more advanced mechanical separation system. A proposed rule was also published by FSIS on that date regarding meat products separated by mechanical means more advanced than the previous method of producing MS(S). This proposed rule declares products produced through the use of advanced separation machinery as "meat" without use limitations or specific labeling. Advanced meat/bone separation machinery and recovery systems do not crush, grind, or pulverize bones to remove tissue from carcasses. Such operations must be conducted under a USDA approved QC program. This proposed standard would not affect the current standard for MS(S).

PART 1

226

FSIS received 108 comments on the ANPR regarding MDP and 28 comments on the proposed rule regarding use of advanced separation systems for the production of meat. In compliance with a court order to decide the outcome of these issues, FSIS anticipates issuing a proposed rule on MDP and a final rule on the production of meat through use of advanced separation systems in August 1994.

III. Options

1. Propose regulatory requirements for MDP which are comparable to those for MS(S)
2. Maintain existing regulatory differences in the treatment of MS(S) and MDP.
3. Reassess how USDA should regulate both MS(S) and MDP in light of the new nutrition labeling requirements.

HUMANE SLAUGHTER

I. Issue

Federal meat inspection regulations contain substantial provisions to govern the humane slaughter of livestock. They provide for the characteristics of livestock pens, driveways, and ramps; descriptions of approved methods of slaughter; and procedures for tagging equipment and facility hazards that could lead to the inhumane treatment of animals.

Federal poultry inspection regulations also require the humane slaughter of poultry. The applicable regulation simply states that poultry will be slaughtered in accordance with "good commercial practices" and that birds must have ceased breathing prior to carcass scalding.

These differences in regulations reflect the fact that the statute for meat inspection contains specific requirements for humane slaughter of livestock, but the poultry inspection statute is silent on humane slaughtering.

It has been suggested that the differences in these regulations are resulting in an unjustified economic advantage for the poultry industry.

II. Background

Humane slaughter regulations have two objectives: the avoidance of unnecessary psychic or physical pain to the animal, and the avoidance of harm to human beings or animals that could result from the behavior of an excited animal. These objectives are more easily (i.e., technically and economically) accomplished with small animals like chickens and turkeys than they are with relatively large animals like hogs and cattle. This and the different timing of the passage of the meat and poultry statutes probably account for the differences in the statutory approach to humane treatment. Greater regulatory specification was needed for livestock to help USDA enforce FMIA statutory requirements that amounted to a considerable economic investment for the producers that did not already meet them. By the time the poultry inspection statutes were passed, appropriate humane treatment practices were already established in the industry, and Congress accepted them without including them in the legislation.

FSIS enforces humane slaughter practices in both the meat and poultry industry through facilities and equipment approvals and through in-plant inspection. Although not required by regulation, the slaughter process used by most poultry processors is parallel to that used for livestock, i.e., birds are stunned before they are killed. Other poultry producers, like meat producers, use ritual slaughter methods authorized by the law. Therefore, the Agency does not require additional regulations or a new law for the poultry industry to meet humane slaughter objectives or to correct an inequitable economic advantage for the poultry industry.

Congress passed up at least three opportunities (in 1958, 1967, and 1978) for enacting humane slaughter requirements for poultry parallel to those for meat. However, the increased interest in animal welfare has generated new interest from Congress in animal welfare legislation. One bill, H.R. 649, titled the "Humane Methods of Slaughter Act of 1993," introduced by Congressman Jacobs (D-IN), would provide slaughter requirements parallel to those for livestock. Specifically, the new law would specify that poultry be "rendered insensible to pain by electrical, chemical, or other means that is rapid and effective before or immediately after being shackled or otherwise prepared for slaughter."

USDA has taken a neutral position on the Jacobs bill. It has found no reason to oppose this legislation, but, at the same time, has no evidence that a new law is necessary to correct inhumane handling conditions in the poultry industry.

III. Opinions

1. Ignore the issue. The Department can ignore this issue on the basis that (a) different regulatory specifications are appropriate for different species, (b) USDA is

PART 1

presently meeting its responsibility with respect to humane slaughter, (c) FSIS is applying the law equitably to meat and poultry, and (d) there is no economic advantage accruing to the poultry industry as a result of the way the laws are specified.

2. Support new legislation. Alternatively, USDA could support new legislation for humane poultry slaughter that is parallel to that for livestock. New legislation for poultry would provide a regulatory standard which would help FSIS settle disputes if it finds a plant is not using industry-accepted standards. New legislation, like H.R. 649, would not have a significant economic impact upon the poultry industry because most establishments are already using methods required by the bill.

USE OF SKIN

I. Issue

USDA regulations permit the addition of detached skin to poultry products at levels ranging from 8 percent for raw boneless turkey thighs to 25 percent for cooked chicken rolls. Poultry processors are not required to label skin as a separate ingredient unless the amount added exceeds natural proportions of the bird species used, as defined by USDA regulations.

Detached skin may not be added to meat food products. This restriction is based upon the regulatory definition of “meat,” which is described as skeletal muscle tissue “with or without the accompanying and overlaying fat, and the portions of bone, skin, sinew, nerve, and blood vessels which normally accompany the muscle tissue *and which are not separated from it in the process of dressing.*” [emphasis added]

It has been suggested that the difference in these regulations gives an economic advantage to the poultry industry.

II. Background

The difference in the treatment of poultry and livestock skin in USDA regulations probably is attributable to the fact that poultry skin has customarily been considered to be part of the bird that may be eaten, while livestock skin has not customarily been used for food, except for specialty products such as “popped” pork rinds.

The regulatory definition of meat actually permits a natural level of skin to be left on the carcass, but few processors choose to do so. Thus, the interest in detached skin must indicate that the meat industry would like to use detached skin a “disguised fashion,” as the poultry industry does, as a substitute for muscle meat. Therefore, judging whether or not there is an inequity requires that we explore the two industries’ positions within the total context of their opportunity to substitute cheaper meat or byproducts for skeletal muscle meat, not just for their opportunity to use detached skin.

Although detached skin may not be added to meat products, attached skin and other muscle tissue components are allowed. These include beef cheek meat, head meat, and heart meat. Further, products such as frankfurters may contain a substantial proportion of meat by-products and fat. The amount of fat is not contained in the ingredient statement. Conversely, only poultry hearts, gizzards, and livers may be added to poultry products. It is thus difficult to contend that the difference in regulations with respect to detached skin leaves the meat industry without an equal opportunity to substitute cheaper products for skeletal muscle meat.

The issue that FSIS should be considering is whether the use of non-skeletal muscle tissue substitutes is adequately communicated to the consumer whose expectation is that “meat” and “poultry” are essentially skeletal muscle tissue products.

III. Options

1. Maintain status quo. Use of skin is not the central issue.
2. Require that use of detached skin be shown in the ingredient statement of all meat and poultry products.
3. Initiate a study of whether the consumer has adequate information on all products in which cheaper meat and poultry components are substituted for skeletal muscle meat.

STANDARDS OF COMPOSITION OR IDENTITY

I. Issue

Some meat products have a poultry “counterpart.” For example, chili with beef is paralleled by poultry chili, meat stew by poultry stew, and so on. Although these products may be quite similar except for their livestock species or poultry content,

PART 1

USDA standards of composition or identity² for poultry products may require a different percentage of poultry than the same-named meat version requires of meat.

For example, “beef stew” must contain at least 25 percent beef computed on the weight of fresh meat. Poultry stew, on the other hand, must contain 12 percent cooked deboned poultry of the kind used. In this example, standards of composition are computed for raw meat (which will be reduced in weight by processing) while poultry standards are based upon cooked poultry (which has already been reduced in weight by processing). Thus, the real difference between these products is much less than appears from the percentage alone.

II. Background

Both the Federal Meat Inspection Act (FMIA) and the Poultry Products Inspection Act (PPIA) permit the Secretary to issue food standards to protect markets from products which have standard names but have less than the commonly expected ingredients and thus compete unfairly with properly labeled foods.

To accomplish that statutory goal, the Agency bases all of its regulatory standards of composition or identity on pre-existing industry recipes and consumer expectations. For example, poultry stew existed as a standard industry product prior to 1957 when mandatory Federal inspection of poultry began. That recipe was adopted by USDA as a standard. Beef stews, which have been under Federal inspection since 1906, have traditionally been formulated in an entirely different manner, and they have a different USDA standard.

The following evidence refutes the assertion that the different standards for “same-named” items represent an inequitable application of the law.

First, meat and poultry products with identical names are not the same foods, and we have no evidence that consumers see them as interchangeable. In the marketplace, products tend to compete more within their type than across species. For example, a consumer who is shopping for chicken stew may compare a national brand with a store brand but would not necessarily consider a beef alternative. In any case, the standards are each “industry’s” standards and USDA has no authority to reconcile the two standards as an end in itself.

Second, differences between the standards of composition for meat and poultry products are to some extent accounted for by different methods of computing percentages. Apparently higher amounts of meat vis-a-vis poultry in same-named products would be largely offset by a weight reduction of approximately 30 percent as the meat product is processed. This natural reduction brings the percentage of meat and poultry in like products to a comparable level. Furthermore, red meat contains more fat than poultry and more may be needed in a formulation to reach an expected protein content.

Third, although historically USDA has been a gatekeeper at the marketplace door, setting product standards of composition that control and, in some respects limit competition, the role of food standards has been questioned in today’s market. Food standards were originally used to make simple distinctions in the quality of a product type, for example to distinguish preserves from jelly and mayonnaise from salad dressing. As the food processing industry has grown, the number of products in various food categories has increased enormously, and the public has changed its taste for certain ingredients. Established; food standards are increasingly looked upon as preserving some markets at the expense of desirable innovations and consumer interests, and therefore, their future as a viable regulatory tool is in question.

III. Option

Maintain status quo. Meat and poultry product standards of composition are generally comparable at present with most differences accounted for by historical differences in formulation, separate methods of computing percentages, and consumer expectations.

²Standards of composition and standards of identity are the two types of food standards. Food standards are used as labeling mechanisms by both the meat and poultry statutes. Food standards are product names used to protect products whose makeup and composition has been established by industry practice by requiring similar products that differ slightly in recipe to use a different name. Standards of composition identify the minimum amount of meat or poultry required in a product recipe. Standards of identity, on the other hand, set specific requirements for a food’s make-up: the kind and minimum amount of meat or poultry; maximum amount of fat or moisture; and any other ingredients allowed. Therefore, one might consider these standards as “content and labeling requirements.”

PART 1

229

SANITATION—WATER TEMPERATURE

I. Issue

The meat and poultry regulatory requirements on the use of hot water in sanitization differ in that the meat regulations specify how hot the water must be, while the poultry regulations do not. Both the National Livestock and Meat Board and the American Meat Institute have suggested in papers submitted to FSIS that this is economically advantageous to the poultry industry. The organizations have not, however, submitted data supporting their assertions or explanations of a specific inequity.

II. Background

The Federal meat inspection-regulations require the use of 180 °F. water or approved chemicals for cleaning floors, walls, inspection equipment, and other equipment that have become contaminated through contact with diseased carcasses. In addition, butchers and others who handle diseased carcasses and parts are required to use water heated to 180 °F. or approved chemicals for the cleaning of knives and implements.

The poultry products inspection regulations do not prescribe a particular temperature for water needed to clean floors, walls, inspection equipment, or other equipment that may have become contaminated by diseased carcasses. Industry practices would make such a requirement difficult to implement. Presently, the poultry industry is required to sanitize all evisceration equipment after each bird is opened.

III. Options

1. Amend the poultry regulations to require use of 180 °F. water for cleaning equipment and facilities that have contacted diseased carcasses.
2. Make no changes. There is no demonstrable reason to amend regulations, with respect to the temperature of water used for surfaces that may contact diseased carcasses.
3. Broaden the issue beyond diseased carcasses—undertake a review of the need to specify water temperature requirements for purposes of dealing with micro-biological contamination.

SLAUGHTER INSPECTION MODERNIZATION

I. Issue

Current regulations provide for the use of statistical quality control procedures known as Finished Product Standards (FPS) for inspecting young chickens and turkeys that are inspected using slaughter quality control inspection systems. FPS are applied by plant employees to determine if the production process is under control, and the use of FPS is monitored by FSIS inspectors. The use of FPS in the newest inspection processes represents the Agency's intention to modernize inspection by (1) focusing on process control rather than product compliance, and (2) having plant employees apply the systems that control the production process and FSIS inspectors monitor the plant's application of those systems.

FPS allows plants more control over their line speed. The question arises whether the meat industry is being unfairly disadvantaged by not having FPS procedures available to it.

II. Background

FPS have been developed as part of the inspection modernization needed to accommodate changes in the poultry industry, which has evolved and grown significantly in the last few decades. Vertical integration in the poultry industry has resulted in a high degree of uniformity among young chickens and made it possible to increase the efficiency of production lines. Inspection modernization has, therefore, been occurring in some areas of the poultry industry since the early 1980's, and along with it, the use of statistical procedures to control process.

Because of the lack of integration in the red meat industry and the correspondingly lower degree of uniformity among red meat animals, inspection modernization has proceeded at a slower pace than in the poultry industry. Even so, the cattle industry and the pork industry have developed to the point where in the professional opinion of Agency experts more efficient inspection systems that use statistical quality control procedures, to control process such as FPS, can be introduced. The Agency attempted to do this in 1988 by proposing rules for the streamlined Inspection System for Cattle, which included FPS. The system had been tested for some years and was found by an independent team of experts and the National Academy of Sciences to be technically satisfactory. However, the proposal was withdrawn in 1992 in response to political pressure, leaving the industry without FPS. (It has

PART 1

been alleged that the Government was “turning inspection over to industry.”) In the judgment of Agency experts, however, statistical quality control procedures, such as FPS, can be implemented effectively in the meat industry and are likely to be a component of future inspection systems.

III. Options

1. Take no action. There is no feasible way to mandate the use of FPS in the livestock industry independent of the Agency’s present, broader effort to modernize livestock inspection by designating sorting and system monitoring responsibilities based on solid scientific data.

2. The Agency, through HACCP and Agency guidelines, can encourage the development and use of FPS by the industry on a voluntary basis.

COOKING/HEATING TEMPERATURES

I. Issue

Generally, FSIS’ policy is that products represented as being cooked must in fact be cooked to a temperature with associated time duration sufficient to destroy pathogenic organisms that may be present. The RTI study noted that cooked poultry products must be cooked to an internal temperature of 160 °F. whereas only a few meat food products must be cooked to a specified—generally much lower than 160 °F. minimum temperature.

II. Background

All cooked poultry products must be cooked to an internal temperature of 160 °F., except for certain partially cooked products labeled as such and cured products which must be heated to a minimum internal temperature of 155 °F. (9 CFR 38.150). Because of the widely acknowledged presence of salmonella and other potentially harmful bacteria in fresh poultry, the requirement for a minimum cooking temperature is generally accepted by the industry, and 160 °F. is an accepted industry standard.

Unless labeled as “baked,” there is no minimum cooking temperature for meat food products generally. If “baked,” a meat product must be cooked to 160 °F. unless it is a pork product, which must be heated to 170 °F. (9 CFR 37.8(b)(10)). Otherwise, only the following three meat products have minimum heating temperature requirements:

1. Pork products that may appear to have been cooked must be heated (or treated in one of the other specified ways) to destroy trichinae.

2. Cooked Roast Beef or Corned Beef must be cooked in accord with a time-temperature chart, with temperatures permitted as low as 130 °F. for an appropriate duration to destroy salmonella.

3. Cooked, uncured meat patties must be cooked in accord with a time temperature chart, with temperatures permitted as low as 151 °F. for an appropriate duration to kill a variety of pathogenic bacteria (e.g. salmonella, E. coli O157:H7 and Listeria Monocytogenes) associated with undercooked or mishandled hamburgers.

Although there are only three regulations on point, Agency labeling guidelines, which supplement the regulations, among other things provide that “ham commodities” are “completely cooked” at 158 °F. Also, a recent Agency policy statement, comparing prescribed cooking temperatures at Federally inspected establishments with those recommended for retailers/restaurants/institutions and for household consumers, generally recommends higher cooking temperatures by retailers, etc., and consumers-where product has been handled more and there are generally fewer controls to prevent contamination or growth of any bacteria that may already be present.

All the minimum cooking temperatures and time-temperature cooking charts were established by notice-and-comment rulemaking on the basis of the best data available to the Agency. The Agency is receptive to petitions for amending its technical regulations if new data demonstrate the current regulations should be changed. The Agency has received no such petitions on cooking temperatures.

There appears to be no basis for asserting that our regulations unfairly benefit one industry over the other.

This issue must be viewed in the context of heightened public concern about pathogens in inspected products because of the E. coli O157:H7 outbreak from hamburger earlier this year and because of lingering suspicions about poultry from the allegations on CBS’ *60 Minutes* a few years ago.

III. Options

1. Take no action. This would be justified on the basis that these are duly promulgated food safety/public health requirements grounded on the best available sci-

entific data. The burden is on those who would change these requirements to provide data showing that the change advocated will improve food safety or provide the same level of public health protection if the change is intended to reduce demonstrable adverse impacts on the industry.

2. Undertake a study, in the context of our Pathogen Reduction Program, to reassess the scientific data that relates cooking temperatures to destruction of pathogenic organisms on all cooked product, and recommend regulation changes accordingly. The results of such a study would not necessarily affect the balance between temperature requirements in the two industries.

REMOVAL OF CONTAMINATION

I. Issue

Meat and poultry carcasses contaminated with ingesta or fecal material are considered adulterated and are to be condemned unless, under inspectors' supervision, they can be reprocessed to remove the contamination. While beef carcasses can only be trimmed, poultry carcasses may be trimmed or washed. The beef industry asserts that trimming, as applied, is inconsistently imposed, and leads to unnecessary loss of product, a problem the poultry industry largely is spared.

II. Background

The Poultry Products Inspection Act provides for removal of contamination ("reprocessing"). The regulations prescribe the methods by which poultry carcasses can be reprocessed. Poultry must be removed from the line of production and washed or trimmed at an approved reprocessing station. To receive approval for a reprocessing station, the establishment must submit in writing to FSIS a description of the proposed reprocessing station, and the proposed equipment to be utilized. FSIS may suspend approval of a reprocessing station if it is found that contaminated product is not being properly reprocessed.

This regulation was promulgated in 1978. Previously, both meat and poultry contaminants were removed by trimming alone. The 1978 rule was based on research conducted by USDA's Agricultural Research Service and the Food Safety and Quality Service, the predecessor of FSIS, supporting the industry's contention that poultry could be adequately reprocessed using the proposed alternative methods.

Subsequently, the poultry industry and USDA have been criticized by consumer groups and others who contend that washing merely removes visible contamination, leaving behind invisible pathogens which still pose a food safety risk and contribute to the spread of such bacteria to other poultry carcasses later in processing.

The Federal Meat Inspection Act does not specify how contamination must be removed from meat carcasses. The regulations provide that fecal material and other visible contaminants be ". . . removed [from meat] in a manner satisfactory to the inspector." Agency policy has always been to require fecal material to be trimmed from meat carcasses.

Recently, the meat industry and USDA have been criticized for not doing a better job of preventing bacterial contamination of red meat. This has led to FSIS' recent imposition of a "zero" tolerance for visible contaminants on red meat carcasses, more rigorous inspector oversight of trimming, and increased industry complaints about waste and lack of uniform enforcement.

The Agency has recently given administrative approval for the use of organic acid solutions in "pre-evisceration carcass sprays." These sprays are applied after hide removal and before evisceration to help reduce the likelihood of bacterial growth. A requirement for antimicrobial treatment, such as a spray, also is included in the proposed enhanced poultry inspection regulations. Inspection policy has been clear that these sprays are not to be used in lieu of trimming where fecal/ingestion contamination is suspected or other visible contaminants are present.

Thus, the meat industry clearly loses more product to trimming than does the poultry industry. So, to the extent trimming is unnecessary, there is a compelling argument to be made for permitting alternatives to trimming for red meat carcasses.

The question is, what is unnecessary trimmings Recent public concerns about microbiological contamination of meat and poultry argue that any increased flexibility permitted in procedures to remove contamination be amply supported by data.

III. Options

1. Rescind the current poultry regulations and limit reprocessing to trimming. Such action would surely be met with strong resistance by the poultry industry. However, those who have criticized the current regulations would be pleased.

2. Amend the meat regulations to permit washing. This could reduce some losses borne by the meat industry and be met with a favorable response by industry.

PART 1

3. Announce the Agency is open to consideration of new methods for reprocessing carcasses and that the burden of providing scientific data for any changes to current policies is on those advocating such changes. The Agency is currently conducting research on appropriate methods of removing microbiological contamination. Agency policy on removal of contaminants will be influenced by the results of this research.

CARCASS CHILLING PROCEDURES: MOISTURE LIMITATIONS

I. Issue

The Agency has long considered any weight gain in red meat carcasses attributable to added water to be "economic adulteration" proscribed under the FMIA. This includes any water that may be added during carcass chilling. Poultry carcasses, on the other hand, are expressly permitted to gain as much as eight percent added water as a result of chilling by immersion in water.

The red meat industry asserts this is grossly unfair. One industry estimate asserts that this equates to a greater than one billion dollar competitive advantage given to poultry over red meat.

II. Background

Both meat and poultry carcasses need to be chilled after the animals have been slaughtered to prevent growth of pathogenic and other bacteria, to which animal proteins are particularly susceptible, and degradation of the product.

The poultry regulations expressly require chilling of poultry carcasses to 40 °F. within two to eight hours, depending on the size of the carcass. Although air chilling is permitted, immersion of poultry carcasses in ice and water has long been the industry practice in the United States. In promulgating poultry regulations to implement the 1958 PPIA, USDA started with the current good manufacturing practices in the industry. This included the rapid chilling of carcasses by immersion in "chill tanks" and accommodation of a reasonable amount of water absorption, which is considered unavoidable by that chilling process.

The meat regulations have no express requirements for chilling of carcasses. Because of the size of the carcasses and the much larger volume of meat to exposed surface, immersion in water is not a practical method for chilling red meat carcasses. Air chilling of carcasses in large coolers has always been the industry practice. Because of the larger volume of meat to surface, it may require up to 24 hours of refrigeration to get a carcass thoroughly chilled. Recently, the industry has developed a method of spraying carcasses during chilling to prevent loss of carcass weight due to dehydration. This is permitted by the Agency as long as there is no net increase in weight.

In addressing this issue, the Agency must consider two objectives. The first is to assure that consumers are not being misled by the amount of water in the products they buy. The second is to assure that any regulation limiting water is applied equitably to the meat and poultry industries.

The purpose of regulating water absorption in meat and poultry products is to avoid allowing the industry to unnecessarily increase the weight (and therefore the cost) of the product. What is "reasonable" water absorption for water-chilled poultry carcasses is difficult to define precisely. However, it is clear that the eight percent water absorption that is now the norm in the poultry industry was not anticipated as "reasonable" based on the three to eight percent range established in tests of the chilling process some years ago. There is evidence that producers have pushed chilling technology in the direction of ensuring the maximum allowable water gain instead of in the direction of reducing water gain.

Changing regulations to permit no water gain in poultry would probably require significant changes in processing facilities and have a major economic impact on the industry and the price of poultry, perhaps gaining little for consumers over present regulations. However, on the basis of past tests of the water-chilling processing system, it is likely that reductions in the average absorption of water could be achieved with marginal changes in the process.

While it is true that the poultry industry, under current regulations, has a better opportunity than the meat industry to deceive the public by putting unnecessary water in its product, this does not necessarily mean that the meat industry should be permitted to have more water in its carcasses. To meet its consumer protection objectives, the Department must keep added water in fresh meat and poultry as low as possible within the constraints of the available processing systems. If the processing systems differ, different limits on the amount of water are not necessarily inequitable. The meat industry does not use water chilling. Allowing no water absorption where no water is used or allowing water consonant with the amount used appears to be appropriate.

III. Options

1. Amend the regulations to further restrict added water in fresh poultry. This might be done in incremental stages. The industry would not consider this a reasonable alternative in view of their present production technologies.
2. Amend the regulations to require some kind of label declaration when fresh poultry contains added water.
3. Relax inspection requirements to permit some weight gain by red meat carcasses if the industry can show additional use of water is necessary during chilling.

EXEMPTIONS

I. Issue

Both the Federal Meat Inspection Act (FMIA) and the Poultry Products Inspection Act (PPIA) have provisions for various exemptions from inplant inspection. In some cases, the statutory exemptions are identical; in others they are different.

The meat inspection regulations contain exemptions from Federal inspection for persons who slaughter livestock of their own raising, the custom slaughter of such livestock by another person or firm, slaughter and processing in any U.S. Territory (Guam, for example) for internal distribution and sale, processing operations of types traditionally conducted at retail stores and restaurants, meat processing at restaurant central kitchens, and the preparation of meat pizzas for service in public or private nonprofit institutions.

Poultry inspection regulations contain the same exemptions from Federal inspection specified above plus additional exemptions for certain enterprises engaged in intrastate commerce only. Another difference in the two regulatory schemes is that poultry regulations contain a clear definition of what constitutes a "poultry product" and is therefore subject to inspection. No parallel section exists to define an inspectable "meat food product."

II. Background

The 1906 FMIA included exemptions for farmers who slaughtered animals on the farm, for retail butchers, and for retail dealers in meat and meat food products. These exemptions were provided to poultry processors in 1957 with passage of the first mandatory poultry inspection statute. Authority to exempt certain products with a meat component was added in 1967 when the Wholesome Meat Act was passed. The same product exemption authority was extended to poultry a year later with passage of the Wholesome Poultry Products Act. The 1967 and 1968 laws also exempted the custom slaughter of livestock or poultry and added new provisions for retail exemptions.

In 1985, an exemption for restaurant central kitchens became law and in 1991 an exemption for certain pizza processors was passed. The last two exemptions are identical in statutory language and were implemented equally. However, the Wholesome Poultry Products Act contains additional exemptions for poultry processing which were not provided to meat processors by the Wholesome Meat Act. For example, the poultry statute and USDA regulations:

- Include slaughter in the list of processing operations which are traditional and usual for retail stores and may be conducted at those locations without inspection.
- Exempt the slaughter and processing of poultry by a producer on his own premises for intrastate distribution by the producer or another party.
- Provide an exemption for slaughter and processing by a producer or other party on his own premises for direct sale to household consumers, hotels, restaurants, and similar institutions.
- Exempt certain small enterprises slaughtering and/or cutting up poultry for intrastate commerce.
- Provide a detailed description of what foods with a poultry component may be exempted from definition as a poultry product, which has the effect of exempting them from inplant inspection.

Although the PPIA does not specifically exempt retail poultry slaughter, FSIS exemption regulations reflect a determination that the slaughter of poultry was, in 1968 when the Wholesome Poultry Products Act was passed, a traditional or usual operation conducted by retail operators and thus exempt from Federal inspection. Conversely, the slaughter of livestock for sale in commerce was not a traditional or usual retail operation in 1967 when the Wholesome Meat Act was passed and that has not been permitted.

The next three poultry exemptions cited above are statutory. The FMIA contains no parallel authority for these exemptions and none can be allowed. Generally speaking, inspection is required unless a specific statutory exemption exists. Since

the exemptions cited above for poultry are mandated by statute, USDA must grant them. Conversely, USDA may not grant parallel exemptions for meat operations because the FMIA does not sanction them.

The remaining regulatory difference is that poultry regulations define exempt products and the meat regulations do not. Both the PPIA and the FMIA provide the Secretary discretionary product exemption authority for foods which (1) have only a relatively small proportion of meat/poultry or (2) items such as sandwiches which consumers have historically not considered to be products of the meat or poultry industry. The statutory clauses are virtually identical.

The lack of meat food product exemption regulations which parallel the poultry product regulations is, however, a significant difference. Poultry processors may refer to USDA regulations for questions about whether a product is or is not subject to inspection based upon the percentage of poultry used in formulation. Meat processors must raise product exemption questions on a case-by-case basis with the Agency, which resolves them based upon policy precedents. In practice, however, meat and poultry processors make about the same number of individual inquiries concerning inspection or exemption regardless of the regulation.

In 1991, USDA was required by Congress to conduct a study of existing meat and poultry product exemptions and of a prospective exemption for wholesale meat outlets which conduct "simple" processing. These studies were conducted concurrently under FSIS supervision of a contract with the Research Triangle Institute (RTI). The RTI study concluded that USDA product exemptions based upon a low percentage of meat and poultry had been administered correctly. However, the study also found that product exemptions based upon consumer perceptions of whether the food was a product of the meat and poultry industry (for example, sandwiches) had not been consistently granted and that a review of all such exemptions presently in effect was warranted. RTI also found that so-called simple processing operations such as cut, grind, slice and repackage were not necessarily low risk and that a blanket exemption was not appropriate.

III. Options

1. Issue "Meat Food Product" exemption regulations. USDA has statutory authority to resolve the regulatory difference by issuing parallel regulations for meat processors. Although this option would resolve an administrative disparity, experience shows that it is not needed to correct a regulatory equity problem.

2. The Exemptions Study has been completed and submitted to Congress. FSIS is considering further options based upon study findings.

PROCESSED PRODUCTS: MOISTURE LIMITATIONS

I. Issue

Processed products include products such as sausages, roasts or cured products prepared from one or more kinds of meat, added water, and/or other ingredients. The Federal meat inspection regulations restrict the amount of water that can be added to many such processed meat products, but the poultry products inspection regulations restrict the added water in few comparable poultry products.

The meat industry suggests that the lack of comparable moisture limitations for the poultry industry gives that industry unfair economic advantage because the poultry industry profits by adding unnecessary water (and therefore weight) to products which compete with meat products in which unnecessary water is not allowed.

II. Background

Moisture limitation regulations were drafted not only to prevent consumers from being cheated by having unnecessary water (and thus weight) added to certain standardized meat products, but also to protect the industry's market. The Agency accepted the industry standards to determine when water was "deceptive." Industry standards were designed to prevent degradation of the product by "unfair" competitors and were not necessarily based on the minimum moisture technically possible.

The differences between meat and poultry regulations with added water restrictions resulted from the differences in the industry and in consumer expectations. The meat products of concern here, which had some history of "economic adulteration," generally had industry standards for moisture that the Department could use to determine when added water was deceptive. The poultry products of concern were mostly new products, without industry standards or demonstrable consumer expectations and about which no complaints had been made.

Determining whether the differences in moisture content regulation between meat and poultry are appropriate requires consideration of two issues: (1) are deceptive practices with respect to added water in processed products in both industries being effectively controlled; and (2) is the law being applied equitably to both industries.

The question raised is whether, under this kind of regulation, consumer protection is independent of or different from, industry standards. USDA meat regulations incorporate industry standards for the definition of “deceptive.” Thus, it could be concluded that poultry industry regulations, if they were promulgated, would likewise adopt prevailing industry standards to define “deceptive.” However, it appears that this issue is moot for poultry since the regulations do not limit moisture in processed poultry products at all. Therefore, FSIS regulations for poultry support neither the consumer protection nor the market protection objectives.

Without regulations for poultry, it is not possible for the Agency to pursue consumer protection objectives, at any level, with respect to moisture in processed poultry products. This is not an industry equity issue, but an issue of Agency accountability to the consumer.

Without regulations for poultry, it is also not possible for the Agency to protect the market for poultry products. This does not appear to be an equity issue between industries. The two inspection laws operate to protect product degradation within, not between industries. There is, however, a possibility of inequity if a meat product with regulatory limits on moisture content competes with a poultry product that has no limits. There is no evidence, however, that this was the purpose of these restrictions which appear to have had primarily a market protection, and only secondarily, a derivative consumer protection objective.

If we take into consideration the empirical evidence of the need for consumer protection for processed poultry products, it should be noted that there are no complaints about these products from consumers. However, most of these products are new, and consumers are not necessarily well informed about the ingredients or their composition.

If we take into consideration the empirical evidence of the need for market protection, it should be noted that in recent years, there has been increasing criticism of these kinds of regulations that protect one part of an industry’s market at the expense of another part that wants to produce slightly different versions of a product that the consumer might want. There is a widespread belief that the role of regulators to protect the “character” of food products, either as a way of protecting industry or consumers, inhibits innovation and competition, and has outlived its usefulness.

In recognizing how the changes in the processing industry have affected this kind of regulation, FSIS has adopted new regulatory approaches for some meat products. When it became apparent that some consumers prefer the increased “tenderness” that is achieved in products with relatively more water (such as ham), the Agency promulgated regulations to permit more than the traditional industry limits in these products as long as the added water is shown on the label. This approach has allowed the Agency to reconcile the two objectives of the moisture limit regulations in meat products. This approach would be appropriate for poultry products and would avoid the problem of determining what is “deceptive” under the dual objectives of these regulations.

III. Options

1. Promulgate regulations for processed poultry products to parallel those applying to the meat industry.
2. Promulgate regulations requiring any added water in meat and poultry products to be shown on the product’s label.

INSPECTION PROCESS FOR CANADIAN IMPORTS

Question. I asked the question about bringing me through the process about Canadian meat coming into the United States. Could you please review this entire process for me?

Answer. It is the job of FSIS to make sure that imported meat and poultry is produced under equivalent conditions and meets our standards.

Principles of Import Inspection

To ensure the safety of imported meat and poultry for American consumers, FSIS maintains a complex, comprehensive system of import controls. That system involves two major activities.

The first is oversight to ensure that exporting countries have inspection controls equivalent to those of the U.S. This includes carcass-by-carcass inspection, which is required of all countries exporting to the U.S. Such countries must undergo a rigorous review process before they can become eligible to export meat and poultry to the U.S. Thereafter, they are reviewed annually by FSIS inspection personnel to assure they maintain equivalent standards.

PART 1

The second part of our import control process is reinspection on a statistical basis, of meat and poultry products as they are presented for entry to the U.S. Port-of-entry reinspection is a monitoring program to make sure that the foreign country's inspection system is working properly. All of these products have already been inspected by the approved inspection system in the country of origin.

A country's overall inspection system must be equivalent to the U.S. system. To determine equivalence to U.S. inspection controls, we look at whether a country has the legal authority to impose requirements equivalent to ours. FSIS examines the organizational structure and staffing of the country's inspection program; and conducts an on-site review of the country's inspection operations, including facilities, equipment, laboratories, training, and individual establishments. Equivalent inspection, sanitation, quality, species verification, residue and microbiological standards must be codified in laws and regulations, and must be operating on a daily basis.

In 1992, the U.S. conducted an exhaustive review of the Canadian inspection system and documented its equivalency, noting, in fact, the remarkable similarities between the two inspection systems. These similarities provide added confidence in Canada's meat and poultry inspection system.

Part two of the import inspection system, port-of-entry reinspection, is a further monitoring of the effectiveness of the foreign country's inspection system. As I previously mentioned, meat products exported from Canada must first be inspected and passed by the Canadian system. Meat products are reinspected on a statistical basis at the U.S. port of entry by federal inspectors. Much of this product is further processed in the U.S., and subject to additional U.S. inspection in domestic plants. This includes products such as ground beef and carcasses, which generally are not sold to consumers in that form, but are made into other products in the U.S. under inspection. Therefore, these types of imported products are subject to more inspection than similar domestically produced products. First, it is inspected in the country of origin under an inspection system that is equivalent to that of the U.S. Next, a USDA import inspector at the border reinspects it. Then, it is subject to U.S. inspection when it is further processed. Finally, retail products are subject to checks in commerce by FSIS compliance officers.

Inspection of Imported Meat from Canada

In January 1989, the U.S.-Canada Free Trade Agreement took effect, calling for the removal of trade restraints between the two countries. The agreement encouraged free commerce in meat and poultry, but there were no specific provisions regarding inspection procedures.

Because of the similarities in our respective inspection systems, Canada and the U.S. were committed to extending the same equivalency to systems for reinspecting imported meat. Over the years, we have revised some of the procedures for inspecting imports from Canada, and that inspection process is explained below.

When a Canadian establishment is ready to ship product to the U.S. the plant must file an entry form with FSIS. Until recently, this was done through an Import Field office, but now the entry form is sent by facsimile to an FSIS import inspector at an official import inspection establishment. All of the import inspectors have computers, and the inspector enters the shipment information into the Automated Import Information System (AIIS), which allows us to track the shipment until it enters the U.S., and is presented for import reinspection.

After the shipment has passed Canadian inspection and is certified for export to the U.S., it is transported by truck to the border. All Canadian meat shipments must stop at a FSIS border import inspection station to receive an assignment. The truck may proceed inland to complete the inspection, although almost all inspections occur at the border. We have nine main locations along the Canadian border where meat exports can enter.

When the truck arrives at the FSIS import inspection station, the inspector goes to the computer and gets the specific reinspection assignment for that shipment. Up to this point, no one in Canada or the U.S. has any idea what type of reinspection will be assigned to the shipment. There are three possible types of inspection assignments.

First is an "inspect" assignment. The computer system is programmed to randomly select imported shipments for monitoring. The truck will be unloaded at the border inspection facility, with the exception of red meat carcasses, and the inspector checks the documents, including the export certificate from the Canadian Food Inspection Agency to verify labeling, and perform all applicable reinspection tasks. Generally, for fresh product, such as carcasses and meat cuts, reinspection includes a product examination in which the inspector visually checks for defects and contamination. It may also include taking a sample to send to the laboratory to check for species identification and for residues such as drugs and pesticides. For proc-

PART 1

essed product, including ground beef, it may also include checking net weight, condition of container, and laboratory analyses for species, microbiological contamination and food chemistry. Some products, such as ground meat, are subject to microbiological tests for *E. coli* 0157:H7. These products have undergone inspection in the Canadian system, which, like the U.S. system, continuously monitors slaughter and processing, and conducts the same visual and laboratory tests.

The criteria used to determine whether a shipment meets our requirements and passes reinspection is the same for every country that exports meat to the U.S., and it is the same standard enforced in U.S. plants on domestically slaughtered and processed meat.

In doing the “inspect” reinspection assignment, the inspector will randomly choose samples from throughout the shipment. Again, procedures are different for carcasses, which will be explained later. Inspectors are trained to retrieve random numbers from the computer, or another source if the computer is not available. Consequently, every container in the shipment has an equal chance of being selected for reinspection.

The number of samples required for reinspection is in accordance with statistical procedures. That is, they are sufficient to give us a picture of the condition of the entire shipment. If the shipment passes reinspection, the documents are stamped, and the truck moves inland. Again, much of this product goes to domestic, federally inspected plants for further processing, where it is subject to inspection for the third time. If the product is going straight to the consumer, it must state the country of origin on the label.

If the examination of the samples results in a rejection, the entire shipment is rejected, and the entire shipment must leave the U.S. The FSIS inspector enters these results in the computer, and the next 15 shipments of this same type of product from the same plant, equaling at least 15 times the weight of the rejected shipment, will be inspected regardless of where it enters the U.S. This is more restrictive for Canada than the other countries approved to export to the U.S. For other countries, it is only 10 consecutive lots that must pass reinspection. This is called “intensified inspection”, and it is the second type of inspection assignment that a shipment can get at the border.

The third type of assignment that shipments are subject to is the “skip” assignment. This means that the AIIS system did not select this shipment for hands-on reinspection. Overall, FSIS inspects about 1 out of every 9 or 10 Canadian shipments. However, even for a “skip” assignment, the inspector will have the doors of the truck opened and will look at the containers at the back of the truck, check the general condition of the product, ensure that the documents match the shipment, and verify the labeling. If the inspector notices anything wrong, the entire shipment may be unloaded and checked.

Questions have been raised about reinspection procedures for ground beef, especially when it arrives in large containers. These shipments are subjected to product examinations. The inspector randomly selects samples, and visually examines the product. The AIIS may also assign laboratory samples for species identification, chemical residues and *E. coli* 0157:H7.

Over the years, the Agency has strengthened inspection of all imported products significantly. However, there are areas we are continuing to improve. For example, we have implemented a modified approach for reinspecting Canadian red meat carcasses. This should increase everyone’s confidence that carcasses are undergoing proper scrutiny. In the past, we have not required the unloading of the entire shipment of carcasses at the border for selection of samples and reinspection as we do for other imported products. However, the entire load of carcasses has been later unloaded at the destination plant in the U.S. and subject to domestic inspection at that point and during further processing. This strategy was tied to basic food safety rules, which tell us that the more a product is handled, the greater the chance of contamination and temperature abuse, which increases human health risks to consumers. Therefore, it was determined more prudent to unload and reinspect the entire carcass shipment at its final destination.

Under the modified program, the Canadian Food Inspection Agency’s meat inspectors were trained to select samples according to U.S. requirements, mark those samples, and assure they are loaded at the back of the truck. The truck is then sealed with a Canadian Food Inspection Agency seal. When the truck reaches the border, and the load is an “inspect” assignment, the FSIS inspector uses these randomly selected samples. Knowing that some people may continue to be concerned about having the Canadian inspectors select samples, in March FSIS sent two separate teams to several Canadian plants exporting red meat carcasses to the U.S., to evaluate the new procedures. No major discrepancies were uncovered. The new program also includes a verification check at the final destination. USDA inspectors located

PART 1

238

at these USDA inspected plants look at the entire lot, randomly select their own samples, and reinspect them. These results are compared with the results received at the border, when FSIS import inspectors check the samples selected by Canadian inspectors. These comparisons enable us to determine if Canadian inspectors are correctly selecting samples.

INSPECTION PROCESS FOR U.S. EXPORTS TO CANADA

Question. In addition, could you describe step by step the means by which United States meat is inspected as it goes into Canada?

Answer. For the record, I will provide the brochure, "How to Export Meat and Poultry Products from the United States to Canada", which outlines step by step the process by which meat products are exported to Canada. Page 4 describes the Agriculture Agri-Food Canada inspector's duties in examining the exported product. [The information follows:]

[A Quick Reference Guide for the Industry]

HOW TO EXPORT MEAT AND POULTRY PRODUCTS FROM THE UNITED STATES TO CANADA

I. INTRODUCTION

This guide has been developed jointly by Agriculture and Agri-Food Canada (AAFC) and the Food Safety and Inspection Service (FSIS) to facilitate the movement of meat and poultry products across the Canada/United States border. All exported shipments must be presented to an AAFC inspector prior to entering commerce into Canada. Failure to present export shipments for reinspection can result in penalties that may interfere with your business. It is essential that all responsible parties (exporter, importer, Customs broker and transportation company) are aware of the procedures, including what documents are required, by whom and where the inspection takes place.

The information that you will find here is an overview of the export process. The information contained in this guide is subject to change without prior notice. A list of phone numbers (addendum #1) and examples of required documents are available at the back of this reference guide. More detailed procedures can be obtained from AAFC and FSIS headquarters, regional offices and import field offices.

II. PLANT/PRODUCT ELIGIBILITY

All U.S. federally inspected meat and poultry establishments are initially recognized as eligible to export to Canada, unless the facility has been specifically delisted.

There may be restrictions on certain types of U.S.D.A. inspected and passed meat and poultry products, which are listed in the *Export Requirements for Canada*. The exporter is responsible for ensuring that the products destined for export to Canada are produced, stored in, and shipped from a USDA/FSIS inspected facility.

Exporters are advised to check the *Eligibility Status of U.S. Meat and Poultry Plants Exporting to Canada—Delistment List* before preparing product for export. The export requirements for Canada and plant eligibility lists are available through the Export Requirement Library database [To access the system by modem: phone: (202) 501-7608] or by request from FSIS, Export Coordination Division (ECD).

III. REGISTRATION OF PRODUCT LABELS

All prepared meat and poultry products and retail package labels must be registered in advance by AAFC. Product labels intended for retail distribution must be bilingual (French and English.) The labels must include the mandatory labelling features:

- product name,
- country of origin,
- net quantity in metric units,
- list of ingredients, if applicable,
- name and address of the manufacturer or distributor,
- U.S.D.A. official inspection legend,
- storage (handling) instructions, if applicable,
- grading for beef, if applicable and
- grading for poultry carcasses, if applicable.

In addition, these labels must be submitted to FSIS, Food Labelling Division for U.S. label approval.

PART 1

239

Applications should be made to AAFC on AGR 1419, Request for Registration of Labels, Markings and Containers (addendum #2), with a proof of the proposed label attached. For more information on labelling requirements and application procedures, call (613) 952-8000, ext. 4685 or write: Agriculture and Agri-Food Canada, Food Inspection Directorate, Process, Formula and Label Registration Unit, 59 Camclot Drive, Nepean, Ontario, K1A 0Y9 CANADA.

Other shipping container labels on non-prepared products do not need advanced registration by AAFC, but must include the mandatory labelling features listed above. Agriculture and Agri-Food Canada inspectors will check labels on both shipping containers and retail-size packages.

IV. BORDER ENTRY PROCEDURES

A. Prior to shipping consignments of edible meat and poultry products:

1. The U.S. exporter must send the following information by facsimile to AAFC, Ottawa [fax number (613)991-3820]:

—Facsimile cover sheet, Notification of Intent to Import Meat Product Into Canada (addendum #3)

—FSIS form 9135-3 (Certificate for Export of Meat and Poultry Products) and FSIS form 9135-3A (Continuation Sheet), if applicable (addendum #4 and #5, respectively.)

IMPORTANT NOTICE: To avoid duplication of certificate numbers, FSIS form 9135-3 will be numbered according to year. The current certificate (US-CA-95) will be used until December 31, 1995. At that time, US-CA-96 will be available through the FSIS inspector at the establishment.

2. AAFC will review the documents for accuracy and completeness. The accepted copy of FSIS form 9135-3 will be stamped “*preverified*” and returned to the company, along with a AAFC computer generated “*Document Report*”. If the certificate is not accepted, the company will be notified of the reason for refusal. Resubmission must be made on a new FSIS form 9135-3.

B. Once the documents have been preverified, the shipment can proceed to the border with the original FSIS form 9135-3 (and 9135-3A, if applicable) that is signed by a U.S.D.A. veterinarian, the “preverified” copy of FSIS form 9135-3 (and 9135-3A, if applicable,) the original poultry grading certificate (if applicable) (addendum #6.) The company may forward a copy of the “Document Report” with the shipment to expedite passage through the border crossing. In addition, detailed instructions should be issued to the truck driver (addendum #7.)

1. All U.S. meat and poultry shipments must stop at Canada Customs. Trucks will then be referred to AAFC inspection at the border. The U.S. company has the option of using the services of a Customs broker to facilitate the paperwork requirements.

2. The shipment should cross the border within seven (7) work days following preverification of the export certificate. It is the exporter’s responsibility to notify AAFC by facsimile if the shipment is canceled or delayed.

C. The inspection assignment can be obtained in one or two ways:

1. At the Border

The AAFC inspector at the border will validate the shipment documents and generate the inspection assignment from the import control computer system and the import inspection report form (AGR 1422) (addendum #8.) Assignments will be for either a skip or full inspection.

(a) *Skip Lot.*—Following a cursory examination from the rear of the vehicle to observe the general condition of the shipment (transportation damage, incompatible product, container labels, export marks, etc.), the shipment can proceed to the final destination. A copy of AGR 1422 and a copy of FSIS form 9135-3 and 9135-3A (if applicable) will accompany the driver.

If the inspector observes a problem with the shipment, the inspector will override the computer system assignment. Depending on the problem, the shipment will either be refused entry or directed to the designated import reinspection facility for full inspection.

(b) *Full Inspection.*—The shipment will proceed to the designated import reinspection facility for full inspection. A copy of AGR 1422 and the original FSIS form 9135-3 and 9135-3A (if applicable) must accompany the driver.

If the product passes reinspection, the shipment can proceed to the final destination. If the product fails reinspection, product will be refused entry.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

INDUSTRY COSTS FOR HACCP IMPLEMENTATION IN RELATION TO USER FEES

Question. Now that HACCP is into the implementation stage, do you have any verifiable information about the compliance costs to industry and given those costs, especially for smaller firms, do you think it is fair to also impose user fees on the industry at this time?

Answer. HACCP implementation will begin in fiscal year 1998, however, pre-HACCP sanitation standard operating procedures, SOPS, were implemented in all plants effective January 27, 1997.

FSIS has developed estimates of the cost for industry to comply with a HACCP based system for the Final Regulatory Impact Assessment, which is in the final rule. These estimates inferred a reduction in implementation and operating costs for smaller establishments. I will be glad to provide the information for the record.

[The information follows:]

[CLERK'S NOTE.—The information does not appear in the hearing record but appears in the Federal Register, Vol. 61, No. 144, Thursday, July 35, 1996, pp. 38858–38860.]

The user fee proposal is intended to assure that resources are available now and in the future to provide the level of inspection necessary to meet the demand for such services and maintain consumer confidence, within the balanced Federal budget context.

EFFECT OF USER FEES ON CONSUMER CONFIDENCE

Question. You mention the need to protect consumer confidence. Have you made any analysis of public perception of the meat and poultry industry paying for in-plant inspection? Do they perceive any conflict-of-interest, real or imagined?

Answer. For over three-quarters of a century, USDA has had the authority to charge user fees for overtime and holiday work. In fiscal year 1998, we expect to collect nearly \$90 million in user fees under current law. It is important to note that there is strong confidence in the inspection program and the safety of products, regardless of whether the cost of inspection is covered by user fees or the appropriation. Over the years, there has been no perceived weakness in the inspection program associated with the existing user fees, and the perception is public acceptance of product for which industry pays an inspection user fee.

Question. In what manner might the implementation of user fees affect consumer confidence?

Answer. The implementation of user fees should improve consumer confidence in meat, poultry, and egg products. If industry takes responsibility for the cost of inspection, the Administration could then fully focus its efforts on developing and implementing necessary inspection reforms which would improve consumer confidence in inspected products.

QUESTIONS SUBMITTED BY SENATOR LEAHY

Food Safety and Inspection Service:

(1) In recent years there have been several incidents of tainted meat in the U.S. and abroad which have caused consumers to question the safety of the meat supply. To address these concerns, the Holstein Association, the dairy industry's largest breed registry, is in the process of developing proposals for an inexpensive system to identify and track livestock from the farm gate through processing and distribution channels to the consumer. Such a system could integrate vital herd, handling and human health information to allow rapid intervention when needed to prevent distribution of meat tainted with food borne pathogens.

Congress included report language in the fiscal year 1997 Agriculture Appropriations bill requesting that a National Farm Identification Pilot Program for dairy cows be conducted jointly by the Food Safety and Inspection Service (FSIS) and the Animal Plant Health Inspection Service (APHIS). The program was to be funded out of the FSIS account. It is my understanding that the FSIS has recently announced that it will be soliciting proposals for this project under a competitive bid process in the near future.

(A) Will that solicitation include a call for proposals for animal identification programs?

Answer. On February 27, 1997, FSIS published in the Commerce Business Daily a Request For Proposal for a series of pilot demonstration, animal production food safety projects in the non-fed beef, pork, poultry and sheep areas. The projects are

PART 1

241

intended to demonstrate the application, feasibility and effectiveness of current technologies for controlling contamination with particular emphasis on pre-slaughter pathogen reduction. Animal identification will be a required element of the non-fed beef project. An animal identification element will be encouraged, but not required, in the pork and sheep projects.

(B) In developing that solicitation, did FSIS take into consideration Sec. 1434 of the Research title (7USC 3196) that outlines factors the Secretary should consider in setting priorities for allocating funds for pre-harvest, on farm food safety, or animal well-being?

Answer. FSIS has only contracting authority, and is not covered by the provisions under Sec. 1434 of the Research title (7 USC 3196).

(C) When does FSIS expect to select projects for funding under this solicitation? Answer. FSIS expects to complete selection of the projects in July 1997.

(D) Since the fiscal year 1997 appropriations language directs the FSIS and APHIS to work cooperatively in developing an identification pilot program and APHIS has expertise in this area, would FSIS be able to transfer funds to APHIS to administer such a program, and would you support such a transfer?

Answer. FSIS will administer the animal production food safety pilot projects and will transfer funds to APHIS, as needed, if it is to our mutual benefit in conducting these projects.

AGRICULTURAL MARKETING SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

USDA PESTICIDE DATA PROGRAM

Question. Last year, USDA information on the Pesticide Data Program provided after the passage of the Food Quality Protection Act and the Fiscal Year 1997 Agriculture Appropriations Act indicated that “the most direct impacts from the lack of funding for PDP will be an insufficient amount of information to adequately meet the data requirements for assessing the diets of infants and children and the probable loss of important pesticide uses for minor crop producers due to the shortage of data to accurately assess the actual dietary exposure.” What is the main purpose of the Pesticide Data Program—to prevent the loss of important pesticide uses for minor crop producers, to provide the EPA with data on residue levels, or to assess the actual dietary risk posed by pesticides, particularly to children and infants?

Answer. In 1991 consumers and producers were alarmed by findings of alar on apples, cyanide on imported grapes, and other food contamination issues. The inability of the Department to respond analytically to these concerns indicated the need to develop comprehensive data bases regarding chemical use on agricultural crops, subsequent residues in foods, and food consumption. In response to consumer and producer concerns over pesticide residues in food, the Department initiated a multi-agency effort in 1991 to collect data to provide a more realistic assessment of pesticide levels in the food supply and to reassure consumers.

The establishment of the Pesticide Data Program (PDP) within AMS gave AMS a critical role in this initiative. PDP has created a statically reliable data base on pesticide residues in food as close to the consumer as possible. The National Agricultural Statistics Service (NASS) was assigned the responsibility of conducting pesticide use surveys. The Human Nutrition Information Service, now part of the Agricultural Research Service (ARS), and the Economic Research Service were assigned responsibilities for analyzing pesticide use and residue data to determine the economic impact of alternative pesticide uses and to estimate dietary exposure to residues.

As stated in our 1991 budget, the twofold goal for PDP is to develop a comprehensive data base on pesticide residues to help ensure the safety of the American food supply and to communicate this food safety information to consumers in the U.S. and to our international trading partners. In order to achieve this goal, we work closely with Environmental Protection Agency (EPA), the Food and Drug Administration (FDA), and the States to ensure that data collected meets multiple data needs. Each user of this data contributes to the understanding of the impact of pesticide residues in our food supply. By having access to AMS pesticide residue data, EPA has been able to more accurately determine exposure and dietary risk to the consumer, which facilitates the approval of safer pesticides of interest to agriculture. Information collected by AMS has assisted FDA by pinpointing areas where closer surveillance may be required as a follow-up to apparent violation identified by PDP.

PART 1

In addition, producers can assure consumers of the actual levels of pesticide residues in their food.

Since the program's inception we have had to change some facets of the program to respond to changing food safety concerns. For instance, we expanded the types of commodities tested under PDP to include processed products, dairy products, and grain to address pesticide residue data needs outlined in the National Academy of Science report on "Pesticides in Diets of Infants and Children." With the passage of the Food Quality Protection Act of 1996, PDP data will play a more critical role in the Government's risk assessment process used to evaluate pesticides in the re-registration of pesticides. This Act directs the Secretary to improve collection of pesticide residue data, especially those consumed by infants and children. As the program continues, you can be assured that other changes will have to be made to ensure that PDP responds more effectively to current food safety issues and gives consumers and producers confidence that the food supply is safe.

Question. Why should this be a USDA rather than an EPA Program?

Answer. USDA already has the staff, liaison, infrastructure, and computerized database to effectively manage Program activities. EPA authority requiring the use of contracts in lieu of cooperative agreements restricts the purchase of new instrumentation, which in the end will restrict PDP's ability to adapt new technology to meet the challenges of the future.

As I stated earlier, PDP data meets a twofold goal of helping ensure the safety of the American food supply and communicating that food safety information to consumers and producers. This broad goal is best achieved by AMS, since we are in a better position to identify the data requirements of PDP's multiple users. Each of these users play a critical role in ensuring the safety of the food supply. PDP data coupled with food consumption data permits EPA to conduct more accurate risk assessments. FDA utilizes PDP data to assist them in monitoring compliance with their regulations. Furthermore, PDP data coupled with NASS pesticide use data can lead to improved farm management practices, such as implementation of integrated pest management practices. There have been several commodities where crop rotation, drift, and other technical issues will have to be studied to better understand PDP's data—particularly when residues are detected in commodities on which the pesticides are not registered for use. Also, PDP is being used by the Foreign Agricultural Service and the State of California to support the export of U.S. commodities in a competitive global market. AMS will submit for the record a letter from the Administrator of the Foreign Agricultural Service attesting to the use of PDP data to develop trade relations with Pacific Rim countries and a letter describing how the Department of Food and Agriculture in California has used PDP data.

Question. What have been the results of the Pesticide Program Data since its creation in 1991?

Answer. PDP uses state-of-the-art equipment that can detect residues in the parts per billion. We find detectable residues in 60 to 70 percent of the test samples. However, for many commodity/pesticide combinations, the highest concentrations detected are a small fraction of the currently established tolerances. Over the years, 1.5 to 4 percent of the samples tested contained violative residues; the vast majority are for pesticides having no tolerance on that particular commodity. These data help the Department dispel the notion that pesticide residues are pervasive and at dangerous levels. It also helps maintain food safety confidence to domestic and foreign consumers. I will provide for the Committee copies of the Annual Data Summaries for 1991 through 1994. The 1995 Summary will be published in May 1997. Dietary risk assessments and decisions for re-registration are evaluated on an individual pesticide and commodity combination basis. Over the past 5 years, data have been collected for about 1,000 pesticide/commodity combinations.

Question. Does the EPA use data other than that from the Pesticide Data Program for its risk assessment process and for the re-registration and review of pesticides? In other words, is the Pesticide Data Program EPA's only source of this data?

Answer. PDP is not the only source of pesticide residue data used by EPA. However, over the years EPA has become more reliant on PDP data and today PDP is a critical data source for EPA's risk assessments evaluations. For some pesticide/commodity combinations, PDP data is the only information available to EPA. Data from sources other than PDP include regulatory, enforcement-based programs. The shortcomings of these regulatory programs for risk assessment purposes include: sampling is usually not statistically reliable, laboratory analyses are not performed at the low detection levels required by PDP protocols—rather they focus on residue concentrations near the established tolerances, sample preparation prior to analysis does not necessarily emulate consumer practices, residue detections usually are not confirmed, EPA's Good Laboratory Practices requirements for data quality are not

PART 1

243

required, and evaluation of laboratory competence through proficiency testing programs is limited. To our knowledge, there are no other programs in the world that can produce data for dietary risk assessment in the format provided by PDP that fulfills the requirements of the Food Quality Protection Act of 1996.

Question. Which Food Quality Protection Act mandates are fulfilled only by the continuation of the Pesticide Data Program?

Answer. Title III, Sec. 301 (c) of the Acts states: "The Secretary of Agriculture shall ensure that the residue data collection activities conducted by the Department of Agriculture in cooperation with the Environmental Protection Agency and the Department of Health and Human Services, provide for the improved data collection of pesticide residues, including guidelines for the use of comparable analytical and standardized reporting methods, and the increased sampling of foods most likely consumed by infants and children." PDP, as a result of this provision of the Act, will have a more significant role in providing data needed to evaluate cumulative exposures to pesticide residues with a common toxicological effect and to create a statistically reliable database on endocrine disruptors with the minute detection levels needed to assess dietary risk. No other program in the United States or other countries can generate data of the quality provided by PDP to meet the stringent risk assessments required by the Act.

Question. How many fruit and vegetable crops are being sampled under this program?

Answer. I have attached a copy of a chronological list of 27 commodities which have been included in the Program since its inception. The 11 fruit and vegetable commodities in the 1997 program are as follows: (1) fresh commodities—pears, potatoes—aldicarb testing only, spinach, sweet potatoes, tomatoes, and winter squash; (2) processed commodities—apple and orange juice, canned and frozen green beans, canned peaches, and frozen winter squash—alternating with fresh winter squash. In total, there are 14 commodities in the 1997 program, with no more than 13 being sampled at any time, if wheat, soybeans, and milk are included.

Question. How many States are participating in the program? What is the cost-sharing arrangement in each of these states? Please indicate staffing, equipment, and other related program costs being supported through federal versus state funding?

Answer. There are 10 States participating in the 1997 Pesticide Data Program (PDP) for fiscal year 1997. All States received funding for PDP operations through contracts issued by the Environmental Protection Agency. There are no State cost-sharing funds. The participating States and their proposed funding allocations are: California—\$2,430,000; Colorado—\$85,000; Florida—\$1,060,000; Maryland—\$75,000; Michigan—\$1,090,000; New York—\$1,730,000; Ohio—\$640,000; Texas—\$1,020,000; Washington—\$660,000; and Wisconsin—\$80,000. An additional \$100,000 is still unobligated until the contract cost proposals are finalized in April. There are no equipment costs for the States under these contracts; however, the contracts are supporting all state staffing costs.

Question. What arrangements have been made with the EPA for fiscal year 1997 to continue USDA pesticide data collection activities?

Answer. On February 25, 1997, an Interagency agreement was signed between the Agricultural Marketing Service (AMS) and EPA for \$1,251,000, to continue pesticide data collection activities. These funds will be shared among the USDA agencies participating in the Pesticide Data Program. AMS will receive \$891,000; National Agricultural Statistics Service—\$90,000; Grain Inspection, Packers and Stockyards Administration—\$250,000; and the Agricultural Research Service—\$20,000.

FEDERAL STATE MARKET NEWS SERVICE

Question. For fiscal year 1998, increased funding of \$1.1 million was provided when the Committee became aware of the fact that the agency was facing a massive withdrawal of state support for its cooperative federal-state market news program. Would you please give us an update on this situation, in terms of the number of states which have cut or completely eliminated funding for their market news programs and the impact this has had on your programs, on the agricultural industry, and on related industrial sectors.

Answer. The States that reduced their market news programs include Alabama, Kansas, Mississippi, Virginia, Texas, Kentucky, Wyoming, Iowa, Illinois, and Florida. States where programs were eliminated included California, New York, Washington, Ohio, Arizona, and Maine. To assume the responsibilities of the major state participants, AMS had to add a number of new reporters to its staff to ensure that the coverage of these critical commodities continue. We also undertook a business process reengineering effort that identified a number of initiatives relating to auto-

PART 1

244

mation, customer service and workplace improvement. AMS also plans to create a Customer Service Center in Fresno, California. The continued coverage of the critical markets by AMS benefits the various industries, the consumer, and the states, as the market information they need continues to be included in the nationwide system. AMS has assumed coverage of these markets with the additional funding received in fiscal year 1997. The broader responsibility assumed by federal market news staff has ensured that important market coverage continues and reports are being issued on time.

Question. Has the \$1.1 million been sufficient to enable the Federal program to fill critical gaps as state programs decline?

Answer. Yes, that amount has been sufficient to fill critical gaps.

Question. Are additional funds requested for fiscal year 1998 to address this situation? If not, why?

Answer. No, the level funds received in the fiscal year 1997 appropriation will be sufficient for this purpose in fiscal year 1998.

MARKET COMPETITION/CONCENTRATION

Question. What activities are being funded with the \$400,000 provided for fiscal year 1997 to carry out the recommendations of the Agricultural Concentration Committee?

Answer. The following initiatives for fiscal year 1997 were funded:

1. AMS developed a National Carcass Premium and Discount Report to provide the premiums and discounts paid for slaughter steers and heifers. This report reflects premiums and discounts relative to quality, cutability, and weight of carcasses that the packer is offering for the current week.

2. The weekly Forward Contract Slaughter Cattle Summary Report, developed by AMS, provides the volume of contract and formula priced cattle committed to packers for delivery in a specified month. The information is collected from cooperating feedlots in Texas, Oklahoma, Kansas, Colorado, Nebraska, and Wyoming. Price levels based on the Chicago Mercantile Exchange (CME) are included for cattle contracted on the CME. Cattle feeders can evaluate demand based on the volume of cattle committed to packers.

3. The AMS reporting of boxed beef is being expanded by including data of boxed beef sale commitments covering the upcoming 15 business days, rather than the upcoming 10 business days.

4. The Regional Beef Quality and Yield Report began in early February. The reporting of beef grading results on a regional basis will provide better geographic detail than the current national report allows.

5. AMS is finalizing a daily report for import and export volume data for livestock crossing the borders between the United States and Canada and the United States and Mexico. The report is a cooperative effort between AMS and the Animal and Plant Health Inspection Service.

6. AMS initiated a new report, "The International Meat Review," in January 1997. The objective of this biweekly report is to briefly illustrate the supply and demand factors which influence the export trade of U.S. beef, pork, and lamb meat products, as well as the meat imports from other countries.

7. Reporter positions, as well as support positions, have been added in strategic marketing areas in South Dakota, North Dakota, Nebraska, and Illinois to provide a broader coverage of market information and a more in-depth look at marketing activity.

Question. Out of the additional \$10 million released by the Secretary from the Fund for Rural America for research, extension, and education to counter concentration, food safety, nutrition, and gleaning, what amount will be allocated to counter concentration and what specific activities will be funded?

Answer. These funds are being managed by the Department's Research, Education and Economics mission area. We understand that the Department's Cooperative State Research, Education, and Extension Service is currently accepting grant applications from colleges, universities, laboratories, and research foundations. The \$10 million will be distributed among the four initiative areas—livestock concentration, food safety, disease prevention, and gleaning.

Question. Increased funding is requested for fiscal year 1998 to carry out the recommendations of the Advisory Committee on Concentration: \$500,000 for the Agricultural Marketing Service (AMS) to expand its reporting of livestock and poultry markets; and \$2.3 million for the Grain Inspection, Packers, and Stockyards Administration (GIPSA) to address packer competition and industry structure and poultry compliance. Please summarize the need for these additional funds and what activities will be carried out.

PART 1

245

Answer. Producers need timely, accurate, and precise information to successfully compete in today's global market. There is concern in the industry about the lack of market information, especially for small and medium-sized farm and ranch operations. Lack of transparency of the markets is cited in the advisory committee's recommendations and fairer competition for all participants is needed. To meet the needs of the industry, AMS will need to expand and develop strategic areas of market information and keep pace with changing technology and market structures.

The following activities will be carried out with fiscal 1998 funding:

1. The Secretary's Advisory Committee cited the need for a value-based matrix report to be developed for the cattle industry. This report would provide the economic indicators to help guide producers in supplying products that meet consumer demands. AMS will use the increased funds to work with all industry segments to develop this report.

2. Expansion of auction and direct market coverage of daily trading, focusing on the shifts in marketing patterns, would provide more market information for all market participants. Reporters would be added in strategic locations throughout the major trading areas of the country (Texas, Oklahoma, Kansas, Colorado, Iowa, Wyoming, and the Pacific Northwest) to help provide the basic market coverage that is needed.

3. Staff would be added and new communications technologies adapted to provide for additional cross checking of reported market transactions for cattle and hogs. Additional travel in expanding contacts, especially from the production segment, would be implemented.

4. Expanded reporting of trimmed beef products on a daily and weekly basis to provide greater coverage of beef marketing will be implemented. The meat industry has moved to more processed product marketing and away from commodity products.

5. AMS will continue to develop and implement import and export volume data reports for livestock crossing the borders of the United States and Canada and the United States and Mexico. These reports will include information on volume of cattle, hogs, sheep, goats, and horses, as well as destination for imports.

6. AMS will complete the development of marketing information reports for import of meat items. These reports will include information for beef, lamb, and pork.

7. AMS will strengthen and expand reports to reflect formula and contract specifications for cattle.

8. AMS will expand producer-generated direct hog reports to provide vital cross checks in the marketing of hogs. The recent changes that have occurred in the marketing of hogs, primarily of marketing on a carcass value-based concept, has necessitated the need for more producer input of data relative to marketing specifics.

9. Pork reports would be revised to more fully reflect further processed product rather than commodity product, and to provide greater coverage of pork trading. Additional reports would be developed to reflect cutout data for further processed product and provide the industry with a more accurate reflection of product value.

10. The American Sheep Industry (ASI) is discontinuing publication of their marketing bulletin. This publication included several AMS market news sheep and lamb reports. AMS will develop a weekly publication that will meet the needs of the sheep and lamb industry.

Question. Please provide for the record, by fiscal year, the funds provided for fiscal year 1997 and proposed for fiscal year 1998 to carry out each of the recommendations of the Committee on Concentration and/or to address agricultural market concentration of livestock pricing. What additional funding will be required in future fiscal years to carry out the Committee's recommendations?

Answer.

Fiscal Year 1997 Funding for Concentration/Livestock Pricing Issues

[Total Funding \$400,000]

National Carcass Premium and Discount Report	\$25,000
Forward Contract Slaughter Cattle Summary Report	40,000
Expansion of boxed beef reporting	10,000
Regional Beef Quality and Yield Report	10,000
Import and Export volume data reports	20,000
International Meat Review development	20,000
Reporter and support staff expansion	275,000
Total	400,000

PART 1

246

Fiscal Year 1998 Funding for Concentration/Livestock Pricing Issues

[Total Funding \$500,000]

Slaughter Cattle Matrix Report	\$50,000
Expansion of Auction & Direct Market Coverage	100,000
Addition of staff and support to expand cross checking of reported market transactions	200,000
Expanded reporting of trimmed beef products	20,000
Final development of import and export reports for livestock border crossings	5,000
Final implementation of meat import reports	5,000
Reports to reflect formula and contract specifications for cattle transactions	50,000
Expansion of producer-generated direct hog reports	50,000
Reports to reflect further processed pork product trading	10,000
Development of lamb and wool reports to help replace loss of ASI information	10,000
Total	500,000

The only additional funding that will be required to carry out the Committee's recommendations is for maintenance purposes and any additional request for services to resolve concentration and price discovery issues.

FISH AND FISH PRODUCT INSPECTION

Question. The Fiscal Year 1997 Agriculture Appropriations Act made permanent a provision that domestic fish and fish products produced in compliance with food safety standards accepted by the Food and Drug Administration be deemed to have met any inspection requirements of USDA or other Federal agencies for any Federal commodity purchase program. The USDA opposed this provision. Why?

Answer. USDA opposed the initial legislation because it restricted our ability as purchasing agents to ensure the quality of foods purchased by USDA. We rely on regulatory agencies such as Food and Drug Administration and USDA Food Safety and Inspection Service to ensure the safety of products distributed in food assistance programs. When products are purchased by competitive bid, a determination must be made as to whether a product meets minimum quality requirements described in the contract specifications; such as grade or quality characteristics, fat content, domestic product, and so forth. The initial legislation was subsequently changed to allow end item lot inspection to establish a reasonable degree of certainty that fish and fish products purchased meet all quality requirements. USDA modified existing purchasing specifications to implement the end item lot inspection.

ORGANIC CERTIFICATION PROGRAM

Question. The fiscal year 1998 budget proposes an increase of \$505,000 to continue implementation of the Organic Certification Program. How much is being allocated to the Organic Certification Program for fiscal year 1997?

Answer. AMS is allocating \$490,000 from its Marketing Services account for the Organic Certification Program in fiscal year 1997.

Question. Why has there been a delay in publishing the final rule for the Organic Certification Program? Last year, you reported to this Committee that you expected the rule to be published in 1996. Now you indicate that it will be published in late 1997.

Answer. Implementing the National Organic Certification Program has proven to be far more complex and time consuming than had been anticipated. USDA first received an appropriation for the program in fiscal year 1994 and only then was able to establish a staff to develop the proposed rule and work with the National Organic Standards Board, or NOSB. The NOSB provided the Secretary with program recommendations and reviewed materials to be included in the proposed rule as the national list of allowable materials. At its September 1996 meeting, the NOSB completed its review of the list of materials proposed for inclusion in the organic rule. We anticipate that the proposed rule for national standards for organic products will be published during the late spring of this year.

Question. The prepared testimony indicates that consistent with the National Organic Standards Act, the Department will seek to recover the cost of the program through user fees that will be deposited into the Treasury. With respect to this user fee proposal, why would these fees be deposited into the Treasury rather than being credited to the appropriations account so that the fee collections would be available to cover the costs of the program?

PART 1

247

Answer. The Department's Office of General Counsel has concluded there is insufficient statutory authority to credit fees collected to the appropriations account. Legislation would be required for AMS to retain user fees.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

ORGANIC STANDARDS

Question. We still hear a lot of criticism from farmers due to the delay in implementing Organic Standards as required by law. Can you give us your best estimate on the amount of economic value that has been lost to the organic industry due to the failure to implement standards by the statutory deadline?

Answer. Our early economic analysis determined that the organic industry has grown by 22 percent each of the last six years. We estimate that the implementation of national organic standards will allow the industry to continue grow as fast, or faster, for several more years. Interestingly, the process of developing National Organic Standards Board recommendations and writing the proposed rule seems to have had an energizing effect on the organic industry. The twelve Standards Board meetings and the four USDA livestock hearings have provided a public forum for producers, processors and certifying agents to come together to share ideas about solutions to common problems and to arrive at a mutual understanding about organic standards. These dialogues alone have created a greater cohesion and identification of common concerns within the organic industry.

PESTICIDE DATA PROGRAM (PDP)

Question. Last year we faced a problem in conference in which the House insisted this program should be funded through EPA rather than USDA.

What problems did this cause for the implementation of the program?

Answer. Cooperation between AMS and EPA has been excellent. However, with two agencies involved in providing direction to the States, extraordinary efforts have been made to assure that the communication process works. Although PDP operations were restarted within a week after the issuance of EPA letter contracts to the States on November 26, 1996, all is not ideal. The 3-month hiatus from September through November 1996 resulted in data shortages affecting calculations of national residue estimates for calendar year 1996.

Presently, the Program is operating under staffing shortages within USDA because of the fiscal year 1997 funding delays posed by the Congressionally mandated shift of funds from USDA to EPA. In addition, uncertainty as to whether EPA would be allowed by Congress to transfer funds to USDA to pay for in-house operations caused some staff re-allocations, transfers and disruptions within USDA, early in the year. Although restaffing efforts are underway, USDA is proceeding cautiously until continued program funding for fiscal year 1998 is obtained. Some States also lost staff for these same reasons.

The current staff, with full support from EPA staff, has made extraordinary efforts to maintain the monthly sampling plans for 1997, prepare the 1995 Calendar Year Data Summary for publication in June 1997, and conduct an Executive Steering Committee and Federal/State planning meetings in February 1997. Also, two new States were fully integrated into PDP's sampling system: Wisconsin began sampling all commodities and Maryland (which replaced North Carolina) entered the Program representing the mid-Atlantic region.

There have been program delivery impediments which we would like to share with you. Due to EPA statutory limitations, it was necessary to use contracts to fund the States in this program. Using EPA contract authority instead of AMS' cooperative agreements provided a very rigid operating structure. In the past, AMS' cooperative agreements were issued early in the fiscal year and provided greater flexibility to address changing priorities for sampling and testing by allowing us to reallocate program resources later in the fiscal year. EPA contracts have not been finalized to date, thus providing only 50 percent of the funds under a letter contract, pending finalization of these contracts. The States are continuing to conduct full-scale efforts. Finalization of the contracts is anticipated in June. Also, under EPA contracts, there is no authority to purchase or replace laboratory instrumentation, which is necessary to adopt more efficient technologies for use in PDP.

Question. Has USDA reached an agreement with EPA on funding for PDP for fiscal year 1997?

Answer. On February 25, 1997, an interagency agreement was signed between the AMS and EPA for \$1,251,000 to continue pesticide data collection activities. These funds will be shared among the USDA agencies participating in PDP. AMS will re-

PART 1

248

ceive \$891,000; National Agricultural Statistics Service, \$90,000; Grain Inspection, Packers and Stockyards Administration, \$250,000; and Agricultural Research Service, \$20,000.

Question. How does EPA use the information gathered by PDP?

Answer. PDP data is a primary source of information for EPA's reregistration and special review of pesticides in their dietary risk assessment process. PDP is also essential in the implementation of the Food Quality Protection Act of 1996, which includes provisions emphasizing children's health in pesticide tolerance setting. PDP data for pesticide residues in foods highly consumed by infants and children will be used to assess dietary risk based on the new risk assessment standards stated in the Act. There have been 15 reregistration activities using PDP's data: benomyl, captan, chlorothalonil, chlorpropham, DCPA, dicofol, ethion, fenamiphos, iprodione, mevinphos, quintozene, permethrin, propargite, thiabendazole, and trifluralin. PDP's data were also used in four special reviews: 2,4-D, diazinon, disulfoton, and methyl parathion; and in a pilot study concerning aldicarb in potatoes. In addition to these uses, AMS routinely supplies EPA with PDP data on a case-by-case basis.

Question. How does USDA use this information?

Answer. USDA's Foreign Agricultural Service (FAS) uses PDP data to resolve potential trade issues and to provide an advantage to American products over those of our competitors in an expanding global market, especially the Pacific Rim countries. Attached is a letter signed by the FAS Administrator explaining the importance of PDP in fulfilling a critical USDA mission. Similar use of PDP's data has been made by Departments of Agriculture in the participating States, such as California, as well as to address issues of concern within a State, such as Michigan did to allay fears of possible chlordane contamination of milk.

PDP residue data are becoming an important tool in characterizing Good Agricultural Practices issues which will impact USDA's integrated pest management activities—particularly with regard to minor crops such as fruits and vegetables. Some of the issues for commodities involve pesticide residues resulting from crop rotation, spray drift, and detection of residues in crops for which there is no registered use for a pesticide. AMS and other USDA agencies are studying these issues and their importance in marketing U.S. commodities.

PDP data are used by the Economic Research Service (ERS) to assess economic and production practices related to pest management, the Nation's food supply, and consumers. ERS also used PDP data to assess economic implications of alternative pest control practices.

QUESTION SUBMITTED BY SENATOR LEAHY

ORGANIC CERTIFICATION PROGRAM

Question. I authored the Organic Food Production Act which was included in the 1990 Farm Bill. The Act was a comprehensive piece of legislation aimed at establishing National Organic Standards for labeling organic and setting up a National Accreditation Program to certify organic producers and handlers. In 1992, the Secretary of Agriculture appointed the National Organic Standards Board to develop information and provide guidance to USDA in developing draft organic rules. The Board sent its recommendation to USDA almost two years ago, but we are still awaiting the final release of the draft rules. Does the Department plan to finalize the draft organic rules soon and send them to OMB for final clearance? If so, is there a specific time frame or date when this will happen?

Answer. We anticipate that the proposed rule for national standards for organic products will be published during the late spring of this year.

ANIMAL AND PLANT HEALTH INSPECTION SERVICE

QUESTIONS SUBMITTED BY SENATOR COCHRAN

APHIS SALARIES AND EXPENSES

Question. The budget proposes APHIS staffing reductions affecting certain areas as part of the Administration's personnel streamlining effort.

Please provide the staff year reductions this budget proposes, where these reductions will occur (in Washington or at the state level) and what impact these reductions will have on the following APHIS activities:

- Pest and Disease Exclusion Activities
- Plant and Animal Health Monitoring Activities

PART 1

- Pest and Disease Management Activities
- Animal Care Activities
- Scientific and Technical Services Activities
- Veterinary Diagnostics Program

Answer. The President's budget includes a reduction of \$5,480,000 and 349 staff years for APHIS. APHIS will attempt to minimize the staff year reduction impact in the field. Some staff years may be eliminated through attrition in anticipation of the consolidation of APHIS' regional offices. The following table shows the fiscal and staff year impact of these reductions by the activities you have indicated:

<i>Activity</i>	<i>Staff year reduction</i>
Pest and disease exclusion	- 91
Plant and animal health monitoring	- 14
Pest and disease management	- 185
Animal care	- 5
Scientific and technical services ¹	- 39
Others	- 15
<hr/>	
Total	- 349

¹ Includes a reduction of 9 staff years attributed to the veterinary diagnostics program.

AGRICULTURAL QUARANTINE INSPECTION PERSONNEL

Question. The budget request increases the agricultural quarantine inspection user fees program (AQI) by \$2.8 million from the fiscal year 1997 level of \$98 million. How many additional inspectors were hired in fiscal year 1996 and how many do you anticipate hiring in fiscal year 1997? Will this increase provide the sufficient number of inspectors needed? How many do you anticipate are needed for fiscal year 1998?

Answer. In fiscal year 1996, 201 inspectors were hired late in the fiscal year. We anticipate hiring 42 additional inspectors in fiscal year 1997. These hires along with normal attrition will allow us to increase estimated staff years in 1997 to 2,140.

These hiring, however, will provide the sufficient number of inspectors only for the immediate future. For example, a major new international terminal will open at JFK International Airport in May or June 1998, for which at least 15 additional AQI officers will be required.

Based on optimum staffing models, we predict that 82 additional inspectors will be needed in fiscal year 1998. While the staff years assigned to the AQI user fee program are being reduced in fiscal year 1998, the actual number in inspectors will increase. This is because of the streamlining efforts that will reduce administrative positions in the field and at headquarters that are also assigned to the AQI user fee program. In addition, we plan to reprioritize certain activities, realign shift coverages, and evaluate commodity risks to shift some existing resources to cover emerging needs.

Question. An increase of \$1.2 million is requested for the appropriated AQI program. The program was funded at a level of \$26.5 million in fiscal year 1997. How many staff years will be devoted to conduct predeparture inspections in Hawaii and preclearance inspections in Canada and Mexico?

Answer.

Location	Fiscal year—	
	1997	1998
Hawaii	138.6	158.6
Canada	4.1	5.1
Mexico	27	27

Question. This Subcommittee provided an additional \$700,000 to support the addition of 21 full-time inspection positions to supplement the resources for agriculture quarantine inspection at Hawaii's direct departure and interline airports. Was this directive fulfilled?

Answer. The conference reduced the increase to \$500,000. This amount supports 14 positions, which we have filled.

Question. What activities has the Department engaged in to test and evaluate new inspection technologies and other methods and hiring arrangements for con-

PART 1

ducting preclearance and arriving baggage inspections? Why hasn't the study requested by the Committee been delivered?

Answer. APHIS has made many improvements to enhance our inspection capabilities and achieve significant savings.

We have X-ray machines in place at major international airports and X-ray scanning machines at all foreign-arrival and predeparture sites and continue to expand their use as a screening tool. In recent months, we have reviewed new, highly sophisticated X-ray technology to enhance detection by allowing baggage to be viewed from several different angles rather than the one provided by current machines. We will evaluate new technology for cost effectiveness.

We are introducing the use of pest risk assessment to better concentrate our resources on high-risk activities. At the same time, we have increased the number of computers available for data collection. The data are essential for risk assessments and performance measurements.

We have developed computerized staffing guidelines based on the type and level of inspection performed. We are testing these guidelines now. While we anticipate that some fine tuning may be necessary, we believe these guidelines will ultimately help us to realize some significant cost savings while maintaining the desired level of coverage and agricultural protection.

The Federal Aviation Administration and APHIS are researching an automated baggage inspection system. The system is undergoing extensive tests and has yielded promising results, particularly in the area of tomographic imaging. In a recent test, the analysis software consistently identified objects imbedded in a Styrofoam cylinder. We have contracted for the advancement of analysis algorithms; the development of a unique radio frequency tag and an applicator for attaching the tag to bags; and a method to decrease the requirements for the tomographic reconstruction hardware. We anticipate completion of the prototype sometime during fiscal year 1998 and will test the system in Puerto Rico.

We have revised our organizational structure to establish a 10 to one employee to supervisor ratio. This will result in significant savings not only in Hawaii, but nationwide. In addition, we are examining policies overtime to ensure that APHIS maximizes human and fiscal resources. We have hired technicians and temporary personnel rather than higher graded officers to save costs. Using wide scale video conferencing saves costs and increases training opportunities for our personnel.

The study, requested by the Committee, will be delivered during the week of March 24. We apologize for the delay.

Question. Which new and expanded facilities will you provide with inspection officers? What additional resources will be required in future years to fully staff these and existing facilities?

Answer.

[Dollars in thousands]

Location	Staff-years	Funding ¹
New Facilities:		
Brownsville, TX (Los Tomates Bridge)	4	\$312
Eagle Pass, TX (Eagle Pass 2 Bridge)	3	129
Tecate, CA	2	145
Andrade, CA	1	98
Lukeville, AZ	1	98
Expanded Facilities:		
Santa Teresa, NM (El Paso Work unit)	1	29
Bismarck, ND (Pembina Station and Portal Station)	1	29
Blaine, WA	1	106
Existing Facilities:		
Brownsville, TX	1	29
El Paso, TX	3	110
Pharr, TX	1.5	43
Laredo, TX	6	208

¹ Includes salary, benefits, and non-salary costs.

Question. The budget says the Agency will strive to increase the number of facilities covered, peak periods, extended hours of coverage, and increases in the number of passengers. What is the Agency's goal for each of these areas?

PART 1

251

Answer. APHIS' goal is to cover all foreign passenger traffic facilities as effectively and efficiently as possible during peak periods, and extended hours within available resources. We will evaluate peak period traffic in conjunction with risk assessment survey data to determine the best utilization of staff resources. Hours of coverage will be expanded only if traffic volume and associated risk rises beyond that experienced during existing hours of coverage. APHIS will deal with increases in passenger traffic by conducting additional inspections and improving our targeting efficiency ration (a measure of officers' effectiveness selecting the highest-risk travelers and intercepting prohibited materials, pests, and diseases).

STERILE SCREWORM FLY PRODUCTION FACILITY

Question. Is the facility in Panama, which the Agency plans to use for the production of sterile screwworm flies, a new building which will be constructed or a building needing renovation?

Answer. The production facility in Panama will be a new one, designed and built on a site made available by the Government of Panama. A sugar mill previously occupied the site. A warehouse building, used by the sugar mill, is still in good condition and was incorporated into an existing master plan to store supplies and materials. Other buildings on the site will be razed.

Question. Your budget states that \$6 million from prior balances will be used for the architectural and engineering work and an environmental study for this facility. From which balances will this money come and why did these balances accrue?

Answer. Recent Appropriations Acts have granted APHIS authority to carry over up to 10 percent of the annual screwworm appropriation, to remain available until expended. At the beginning of fiscal year 1997, APHIS had \$3.7 million available from prior years in the screwworm program. These funds were accumulated gradually from program savings over the past three years. For example, at one point sterile fly production at the existing facility in Mexico could not keep up with planned dispersal objectives for technical reasons. As a result, dispersal and shipping costs were lower. In fiscal year 1995, the program achieved savings from devaluation of the Mexican peso. Further, in fiscal year 1996, the program planned to erect a chilled fly center and establish a surveillance program in Panama. These activities were delayed, so funds were carried forward to fiscal year 1997, and are expected to carry forward into fiscal year 1998.

Question. What are the future year costs of this facility?

Answer. We expect annual lease costs of about \$14 million for 12 years.

Question. What other affected nations will be contributing to the architectural and engineering work and the future costs of the facility? What costs will the United States and each of the nations involved contribute?

Answer. The entire project will be funded jointly by the United States and Panama through a joint Panama-US Screwworm Commission.

Panama will be contributing approximately \$800,000 to the architectural and engineering work and is expected to contribute 10 percent of the construction and operating costs of the facility. The United States will contribute the balance of the architectural and engineering work, estimated to be \$5 million and 90 percent of the construction and operating costs of the facility. Panama also contributed the land and \$11 million of infrastructure costs for the facility and screwworm eradication.

If other countries, or groups of countries, in the region detect screwworms at levels that pose a risk to domestic and export markets, they may be able to purchase flies from the Panama facility at levels sufficient to conduct control programs. If this should occur, the Panama-U.S. Commission will take steps to ensure sufficient supplies for the primary objective of barrier maintenance at the Darien Gap. Through collaboration among the Panama-U.S. Commission and nearby countries, the integrity of the barrier can be maintained.

KARNAL BUNT

The President's request for the pest detection program is an increase of \$4.5 million over the fiscal year 1997 appropriated level of \$4.2 million. It also states that the increase would primarily go to the Karnal bunt (KB) program.

Question. I understand that \$500,000 will be used to fund cooperative agreements to examine eradication strategies for Karnal bunt and other probable infestations. Of the other \$4 million requested, how much of this money will be spent on Karnal bunt? What activities will be funded with this money?

Answer. We expect to spend most of the \$4 million on Karnal Bunt (KB). This program increase supports enhanced domestic pest and disease surveys, expanded pest information data bases that will be shared with the States and industry, and the ability to scientifically verify disease and pest free areas or zones.

PART 1

252

The primary focus will be for pest detection surveys to enable APHIS to ensure that the \$10 billion international wheat market remains open. Accurate survey data provides assurance to trading partners that KB is not present in U.S. wheat producing areas. Survey technology developed through pest detection initiatives allows the wheat seed industry to fully adopt preventive practices for keeping the U.S. wheat crop KB free. The increase will support follow up surveys in the previously infected areas and any continuing regulatory activity required.

These same program components, including enhanced domestic program infrastructure, quick and continuous detection survey capability and technology transfer to the States and industry will easily incorporate other agricultural trade significant to pests and diseases. Pest detection will provide the much needed scientific backbone required for expanding U.S. agriculture exports.

Question. If the total \$4.5 million will not be used entirely on Karnal bunt, then what other activities will it be spent on?

Answer. The KB experience shows that we must strengthen our domestic infrastructure to detect and quickly react to plant pests and diseases. \$500,000 of the increase will be used to investigate alternative control and eradication strategies for KB and other potential infestations.

Question. Which countries have not accepted the U.S.'s exported wheat from regulated areas even though they test negative for Karnal bunt?

Answer. Approximately 60 countries have not accepted U.S. wheat from regulated areas, even if grain from these areas has tested negative for KB. But of these countries, only Peru and Venezuela have been asked to accept negative-tested wheat from regulated areas.

Question. If one suspect spore is found in a state, has that state's wheat been refused for export until it tests negative?

Answer. We have yet to experience such a case.

REGIONALIZATION

Question. The testimony indicates that APHIS has proposed a rule setting up the Regionalization framework. What is this?

Answer. APHIS published a proposed rule on April 18, 1996, establishing new criteria for allowing or excluding importations of animals and animal products based on Regionalization of animal diseases and scientific risk assessments. The proposed criteria for animal disease Regionalization establish requirements for importing ruminants and swine, and products of ruminants and swine, from foreign "regions" based on levels of risk. Under the proposed rule, a "region" can be a country, part of a country, or a group of countries combined into a single trading block. The proposed requirements would replace current import regulations that are based on APHIS declaring individual countries free of specific diseases. The establishment of risk-based regional import requirements is consistent with our obligations under the North American Free Trade Agreement and the General Agreement on Tariffs and Trade.

KARNAL BUNT

Question. Would this process be used for Karnal bunt?

Answer. We have convinced many other countries to essentially take a Regionalization approach to our wheat exports. Our National Survey enables us to identify where KB is present and to provide assurance to all trade partners that KB is not present in major wheat-producing areas of the United States.

Question. How will the Southeast be treated under this framework?

Answer. The Southeast will be treated the same as any other region with no bunted kernels. On March 17, 1997, we announced that we were no longer considering taking further regulatory action in the Southeast. We made this decision because no bunted kernels had been found in any samples in that region. We will soon publish a standard for determining the presence of KB that will apply to all parts of the country. Establishing this standard will ensure that all U.S. wheat producers and handlers are treated equitably regarding KB and that U.S. wheat has the necessary certification to remain competitive in global markets. These actions were consistent with USDA's objective to protect the U.S. wheat industry while limiting restrictions to areas where KB disease occurs.

Question. Is the Department promulgating rules for compensation for 1996 and 1997 for Karnal bunt in Arizona? If so, when?

Answer. Yes. We are promulgating several rules for compensation for 1996 and 1997 for KB in Arizona. We have drafted the final rule of the 1995-96 crop season compensation docket. This rule would extend compensation eligibility to handlers of

PART 1

253

wheat that tests negative for KB and participants in the National Survey who have positive finds.

We expect the final rule of the 1995–96 crop season compensation docket to be published by mid-April. Also, we expect the proposed rules for the 1996–97 crop season compensation docket and the 1995–96 seed and straw compensation to be published by early May. It is our intention to publish the proposed rules with a 15-day comment period. We anticipate that the final rules would be published in late May.

Question. What types of research on Karnal bunt is USDA involved in? Please list by agency all research that affects Karnal bunt.

Answer. Although APHIS does not conduct research, the Agriculture Research Service (ARS) is spending an estimated \$370,000 in fiscal year 1997 for KB research at Ft. Detrick in Frederick, Maryland. This research, which is being conducted under strict quarantine conditions, involves pathogenicity tests which are designed to distinguish between KB and the ryegrass smut. ARS also hopes to determine if ryegrass spores are capable of infecting wheat and causing KB. Additional greenhouse testing is planned to determine if various cultivated and wild grasses are susceptible to KB and to the smut found on ryegrass. The Economic Research Service is conducting economic analyses at the request of the Office of the Chief Economist. These analyses consist of an evaluation of the price and trade impacts for U.S. wheat of KB and an evaluation of the economic losses associated with KB for the wheat seed industry. In fiscal year 1998, APHIS will provide ARS with \$500,000 for the review of USDA's phytosanitary policy. Specifically, ARS will analyze the potential for pest outbreaks in the U.S. during the next 5 years, the impacts and risks associated with control measures other than total eradication, and whether total reliance on phytosanitary control is a reasonable long term policy.

Question. Is there a test which can differentiate between Karnal bunt spores and other spores?

Answer. There is a test which can differentiate between KB and all other smuts except ryegrass smut. A smut disease of ryegrass has spores similar in size and morphology to KB. Current DNA testing does not distinguish between the two diseases. This discovery has complicated identification of KB, particularly in areas such as the Southeast, where it is common to plant wheat in combination with various forage grasses, including ryegrass. ARS is conducting pathogenicity tests to distinguish between KB and the ryegrass smut. We expect these tests to be completed by April.

Question. APHIS has stated that the quarantine imposed on Arizona due to the discovery of Karnal bunt in March 1996 was mishandled and was an over-reaction. Since the European Community has less restrictive requirements for phytosanitary certificates, can Arizona assume that APHIS will relax its requirements similar to that of our foreign trading partner's requirements?

Answer. APHIS has never made that statement. Furthermore, the U.S. wheat industry has stated that USDA actions were entirely appropriate and consistent with the urgency of the problem. Now that a year has passed since the original detection in Arizona, we are discussing with our State counterparts and affected industries the need to shift our attention on KB from a quarantine perspective to a grain quality issue. This shift would signify our belief that KB does not cause significant yield loss. We are currently moving in this direction by proposing to ease restrictions based on new information about the distribution and risk of spread of KB. This would include relaxing our requirements on Arizona for wheat export. Under this proposal, which is currently being reviewed by the Office of Management and Budget, we would establish regulated boundaries based on the presence of bunted kernels and take regulatory action on grain movement based on the presence of teliospores. The European Union will accept U.S. wheat if no KB symptoms have been observed at the field and if samples taken before shipment are found to be free of KB.

ANIMAL DAMAGE CONTROL

The President's fiscal year 1998 request is \$23.7 million for the animal damage control operations activities, a decrease of \$3.25 million from the fiscal year 1997 level of \$26.9 million.

Question. What activities including the States/cooperators will be affected by this decrease?

Answer. Technical assistance and control work to prevent and reduce damage caused by wildlife, primarily to agricultural and natural resources, would be reduced. The States most greatly affected by the reduction unless there were increased cooperator funding would be Arkansas, Connecticut, Delaware, Iowa, Minnesota, Pennsylvania, and Rhode Island, which provide little or no cooperator funding. Animal damage control staffing would be reduced by 72. Wolf control work in

PART 1

Minnesota would cease unless cooperator funding were forthcoming. Additional impacts to affected States in the Eastern region include likely reductions in the following activities: protection of crops from blackbirds, and problems related to nuisance gulls, Canada goose, and vultures; livestock protection and general technical assistance for nuisance wildlife; assistance with deer problems to property, beaver control activities, and reduced support of the technical assistance hotline for rabies in Vermont.

In the Western region, impacts to affected States would likely include reduced: aerial predator control; training at airports relating to wildlife air strike hazards; and activities to protect threatened and endangered species.

Question. Please provide a list of the states that will be affected by the policy change that all states must provide 50 percent of the cost of all programs beginning in fiscal year 1998.

Answer. The following is a list of States in which Federal animal damage control contributions exceeded cooperator contributions in fiscal year 1996. Because contributed amounts can vary somewhat each year, this list is subject to change as new data for fiscal year 1997 becomes available.

State	Fiscal year 1996—	
	Appropriated	Cooperative
Alabama	\$159,900	\$31,963
Arizona	448,799	265,791
Arkansas	258,890
Colorado	790,480	240,854
Connecticut	9,370
Delaware	10,580
District of Columbia	4,761
Florida	151,950	78,743
Idaho	936,144	411,400
Indiana	96,700	21,513
Iowa	68,960	4,361
Kansas	75,000	33,804
Louisiana	361,600	221,520
Maine	135,700	45,320
Maryland	90,459	71,885
Massachusetts	75,897	36,450
Michigan	97,800	28,855
Minnesota	242,500	96
Missouri	103,440	54,063
Montana	973,500	547,194
Nebraska	393,874	332,556
Nevada	814,872	619,852
New Hampshire	175,306	68,549
New Mexico	1,242,585	1,098,776
New York	119,634	115,898
North Dakota	772,052	331,948
Ohio	148,900	70,000
Oregon	974,440	724,621
Pennsylvania	79,178
Rhode Island	8,433
Utah	996,992	840,175
Vermont	61,594	39,710
Wyoming	1,006,781	471,136
Total	11,887,071	6,807,033

Question. How would the proposed 50 percent cost-share requirement be implemented?

Answer. Under this proposal, APHIS would provide no more than 50 percent of total Federal and cooperative program costs in any State. Based on the most current Federal/cooperative contribution data available, Federal contributions would be provided on a limited basis from neighboring States, in States where the cooperative

PART 1

255

contribution is little or nothing. However, limited technical assistance would continue to be available on a limited basis.

Question. Was funding provided for cattail management and blackbird control efforts in North and South Dakota and Louisiana as directed in the fiscal year 1997 Senate Committee Report? How much? Is this included in your fiscal year 1998 baseline? Please provide a brief explanation of APHIS' accomplishments in this area.

Answer. Cattail management activities are ongoing in North Dakota. APHIS expects to treat about 4,500 acres during fiscal year 1997. Blackbird control activities are ongoing in North and South Dakota. In Louisiana, blackbird control activities are taking place in Evangeline, Vermillion, Acadia, Allen Calcasieu, Cameron, Jeff Davis, and St. Landry Parishes.

During fiscal year 1997, APHIS will spend approximately \$100,000 towards cattail management in North Dakota, and approximately \$368,000 towards blackbird control in North and South Dakota. An additional \$150,000 is expected to be spent in Louisiana during fiscal year 1997, toward blackbird control. Funding for cattail management in North Dakota, and blackbird control in North and South Dakota and Louisiana is included within the fiscal year 1998 budget request at approximately the same levels as fiscal year 1997.

During fiscal year 1996, 5,757 acres of cattails in North Dakota were treated with an EPA-approved herbicide. This reduces the amount of blackbird roosting and nesting habitat by controlling cattails. By making the habitat unattractive, blackbirds are forced to seek suitable roosting and nesting sites away from sunflower fields. Pyrotechnic devices were also provided to producers in areas where blackbird damage to sunflowers was severe. In Louisiana, APHIS was assisted by the Louisiana Rice Growers Association, the Louisiana Department of Agriculture, and Louisiana State University, with contributions of supplies, equipment, and staffing, to control blackbirds in rice-producing areas throughout the State.

Question. The Senate report for the fiscal year 1997 Agriculture Appropriations Act included an additional \$125,000 for the beaver damage control in Mississippi. Please provide a brief explanation of APHIS' accomplishments in this area. Is funding included in the budget to continue this work?

Answer. APHIS' 21 beaver control specialists provide assistance throughout the State of Mississippi, including the Delta National Forest. Cooperative funding for the beaver control program in Mississippi will total approximately \$763,000 during fiscal year 1997. Recent accomplishments include 1,863 projects in which the following resources were protected: timber, crops, turf and ornamental plants, dams and levies, irrigation systems, and roads and bridges.

APHIS will spend a total of approximately \$275,000 toward beaver damage control assistance in Mississippi during fiscal year 1997, including the Congressionally directed \$125,000. The fiscal year 1998 budget request includes funding for beaver control assistance at approximately the same level as fiscal year 1997.

Question. The Senate report for the Fiscal Year 1997 Agriculture Appropriations Act maintained funding for the cooperative agreement with the Hawaiian Sugar Planters Association for rodent control in sugarcane and macadamia nut crops. Please provide a brief explanation of APHIS' accomplishments in this area. Is funding included in the budget to continue this work?

Answer. APHIS has established a field office and developed improved methods of using rodenticide baits for controlling damage in macadamia nut orchards. Introduced rats that have maintained high populations in orchards and a variety of other habitats have caused the damage. Studies of rat movements using radio-telemetry and fluorescent dyes established that placement of bait in trees resulted in increased bait acceptance and specifically targeted the animals feeding on the growing macadamia nuts.

During fiscal year 1997, APHIS will spend approximately \$240,000 towards rodent control in sugarcane and macadamia nuts, and anticipates providing a similar level of support in fiscal year 1998.

Question. The Senate report for the Fiscal Year 1997 Agriculture Appropriations Act included funding to continue depredation efforts on fish-eating birds and other species which cause damage to the commercial fish industry in the mid-South. Please provide a brief explanation of APHIS' accomplishments in this area. Is funding included in the budget to continue this work?

Answer. We continue to reduce fish-eating bird damage to the aquaculture industry. APHIS has assigned three wildlife biologists in Florida, Mississippi, and Alabama to provide assistance and equipment to aquaculture producers. These include catfish farmers in Alabama, tropical fish and catfish farmers in Florida, and bait fish and catfish farmers in Arkansas. APHIS is expanding activities by providing

PART 1

256

additional assistance to catfish and crawfish farmers in Louisiana and trout farmers in Pennsylvania.

The fiscal year 1998 budget includes funding to continue aquaculture assistance activities at approximately the same level as will be provided during fiscal year 1997.

Question. The Senate report for the Fiscal Year 1997 Agriculture Appropriations Act continued funding at the fiscal year 1996 level for the Jack H. Berryman Institute of Wildlife Damage Management in Utah and the Monell Field Station in Pennsylvania. Please provide a brief explanation of APHIS' accomplishments in these areas.

Answer. The Jack H. Berryman Institute works to improve and resolve human/wildlife conflicts through education, outreach, and research. Research efforts at the Institute have been directed at a number of problems, including bird/aircraft strikes, deer/automobile collisions, bird depredation at aquaculture facilities, predation of ground nesting birds, predator control to protect livestock, and deer damage to agricultural crops. During 1996, the Institute added 13 new research studies to accompany 57 on-going studies.

The Institute also supports the work of 17 faculty members who teach 7 different wildlife damage management classes. Also, the Institute supports the work of 33 graduate students.

Outreach efforts conducted by the Institute include conducting public attitude surveys regarding wildlife and wildlife damage and the development and dissemination of wildlife damage management literature.

The Institute continues to develop wildlife damage management professionals. Since the inception of the Institute, 22 students have obtained graduate degrees. At least 6 graduates have been employed by APHIS, and several others by the International Association of Fish and Wildlife Agencies, the U.S. Fish and Wildlife Service, and the National Biological Survey.

Research conducted at Monell has provided a foundation from which the National Wildlife Research Center has been able to pursue additional specialized research specific to the needs of the animal damage control program. A recent example was the development of an effective grape flavored taste aversion substance called methyl anthranilate. It is now labeled for use as a bird repellent in water and on turf areas.

Question. Is funding included in the budget to continue this work?

Answer. APHIS provides \$35,000 per year in support of the Jack H. Berryman Institute, and approximately \$212,000 per year for an academic development program at Utah State University. APHIS continues to spend about \$80,000 annually to support the Monell Research Field Station in Philadelphia, Pennsylvania. APHIS has included funding in the fiscal year 1998 budget request for all of these efforts at about the current level.

Question. The Senate report for the Fiscal Year 1997 Agriculture Appropriations Act directed the Department to maintain the animal damage control office in Vermont. Please provide a brief explanation of APHIS' accomplishments in these areas. Is funding included in the budget to maintain this office?

Answer. APHIS continues to maintain the animal damage control office in Vermont. Through this office, APHIS employees serve in an advisory capacity on rabies task forces to help plan rabies management efforts. This office also offers a cooperatively established toll-free rabies information hotline to address public concerns regarding the northward spread of the mid-Atlantic strain of raccoon rabies. APHIS, in cooperation with the Vermont Departments of Fish and Wildlife, Health, and Agriculture, responded to nearly 3,400 phone calls regarding rabies in Vermont in fiscal year 1996.

As Vermont is one of the States in which Federal contributions exceed those of cooperators, support for animal damage control efforts in Vermont would be reduced as a result of the requested decrease in funding for fiscal year 1998 unless additional cooperator funding is forthcoming. The Vermont office would be maintained to provide continued advice on task forces for rabies management efforts, but the toll-free rabies hotline would be discontinued without more cooperator support.

BRUCELLOSIS ERADICATION PROGRAM

Question. The fiscal year 1998 budget request for the Brucellosis Eradication Program is \$19.9 million. This program is being decreased by \$1.7 million from the fiscal year 1997 level of \$21.7 million. The Agency's goal is to eradicate brucellosis by the end of the calendar year 1998. What activities will APHIS carry out in the Greater Yellowstone Area? How much money is designated for these activities?

PART 1

257

Answer. APHIS will continue to work with and assist the National Park Service and the State of Montana with the implementation of the Interim Bison Management Plan and with brucellosis management actions in the long-term bison management plan when it is finalized. The Agency will provide full-time veterinarians and part-time personnel to assist with liaison, planning, bison capture, testing, sampling, and research activities. APHIS will also provide regional and national staff assistance and advice to the Greater Yellowstone Interagency Brucellosis Committee and other ongoing efforts concerning brucellosis in the Yellowstone Area, including environmental impact statements and environmental assessments.

Additionally, the Agency will continue to provide resources for several ongoing brucellosis research projects including an interagency research project to evaluate the transmission of brucellosis in bison within Yellowstone National Park (YNP) and a research project to study the safety and efficacy of RB51 Brucella vaccine on pregnant YNP bison. The Agency will also fund new research proposals designed to gather information which would supplement current brucellosis eradication procedures for use by bison managers in YNP.

In fiscal year 1998, APHIS has agreed to provide bison handling facilities to the State of Montana for the capture and testing of bison migrating from the Park. The Agency has also offered assistance to the State of Wyoming to monitor the commingling of elk and cattle and to provide brucellosis vaccine to local livestock producers.

At the fiscal year 1998 funding level of \$19.9 million, APHIS will provide \$400,000 toward brucellosis control, monitoring, and eradication activities in the Greater Yellowstone Area and \$300,000 for several brucellosis research projects in bison and elk.

Question. The Secretary of Interior announced that the herds in Yellowstone should be vaccinated. Will APHIS assist in this activity?

Answer. Yes. APHIS has offered assistance in any brucellosis eradication activities, including vaccination, neutering, testing or other surveillance activities, which are undertaken in Yellowstone National Park, Grand Teton Nation Park, the National Elk refuge, or Wyoming elk feedgrounds.

Question. Once the Agency has completed the eradication of brucellosis, will you need appropriated funds to carry out some sort of maintenance program?

Answer. Yes. Surveillance activities need to continue for approximately five years after brucellosis is eradicated in the United States to ensure that no foci of infection have gone undetected. A reduced level of appropriated funds would be required for these surveillance activities.

Question. It was reported that a group in Montana claimed that USDA promised the state of Montana would not lose its brucellosis-free status if bison are allowed to roam in the state. Does this claim hold any truth?

Answer. To maintain the Brucellosis Class-Free status the State must comply with the conditions of the interim bison management agreement which requires that the State of Montana and the National Park Service prevent the movement of bison from YNP and the Brucellosis Management Areas (BMA's). The BMA's were established to reduce the number of migrating bison being killed. Additionally, the State of Montana must maintain an active brucellosis surveillance program and detect no source of the disease in the State to remain in the Brucellosis Class-Free category.

GOLDEN NEMATODE

Question. Is there a need to expand the golden nematode quarantine and survey program in the Northeast?

Answer. No, there is not. The current quarantine area encompasses all areas in the Northeast that are infested with or have been exposed to golden nematode.

Question. If so, why is the program decreased in fiscal year 1998 by \$9 million?

Answer. The decrease we are proposing for fiscal year 1998 amounts to only \$9,000 and will not affect the level of program delivery. This decrease is comprised of a \$14,000 decrease for streamlining and a \$5,000 increase for pay costs.

MEDITERRANEAN FRUIT FLY

Question. APHIS announced in the Federal Register on September 10, 1996 that the Mediterranean fruit fly has been eradicated in the areas in California and that the quarantine restrictions are no longer needed. Is the decrease proposed in the fiscal year 1998 for the fruit fly exclusion and detection activities due to this announcement?

Answer. No, it is not. The decrease proposed is for the program's share of the reduction in Federal employment costs. This decrease is comprised of a \$320,000 decrease for streamlining and a \$129,000 increase for pay costs.

PART 1

258

BOLL WEEVIL

In the Fiscal Year 1997 Agriculture Appropriations Act, a boll weevil eradication loan program was initiated at a program level of \$35 million. The fiscal year 1998 budget proposed to terminate this loan program. The Secretary must promulgate regulations for the fiscal year 1997 loan program, but has not yet done so.

Question. The thought was that a loan program would be a less costly way to increase funding for boll weevil eradication. Does the Department not share this view. Why?

Answer. The program regulations are being developed by the Farm Service Agency and they are under review. Since the program is controversial in some regions due to possible environmental impacts, the Farm Service Agency is currently working with APHIS to develop an environmental assessment to address these concerns. The proposed regulation is expected to be published, for comment, in the near future. Once the comments have been addressed, the implementing regulation will be published.

The President's budget requests \$6.45 million for the Boll Weevil Eradication Program. This is a decrease of \$9.8 million from the fiscal year 1997 appropriated level of \$16.2 million. Several areas of Mississippi, Louisiana, Arkansas, and Texas which have not previously participated in the eradication program will be entering into the program next year.

Question. How many new acres do these areas encompass?

Answer. Areas that will begin program operations in August 1997 include: 450,000 acres in the hill section of Mississippi; 125,000 acres in the Red River Valley of West Louisiana; 6,000 acres in southwest Arkansas; and 136,000 acres in the St. Lawrence area of west Texas. Areas that will begin program operations in fiscal year 1998 include: 200,000 acres in southwest Tennessee; 260,000 acres in the south delta of Mississippi; possibly 25,000 acres in New Mexico; and possibly two areas in Texas and Oklahoma totaling 1.06 million acres.

Question. Will your budget request support the initial startup costs in all these states adequately?

Answer. Yes, it will. Although we will be providing less funding in fiscal year 1998, the States will offset our reduced contribution by contributing a greater portion in fiscal year 1998, as they had agreed to in each State's referenda. Therefore, our budget request would adequately support initial startup costs when combined with an increased share from the States.

BUILDINGS AND FACILITIES

Question. The budget request includes a decrease of \$3.2 million for a one-time construction project provided in fiscal year 1996. Which project are you speaking of and why are these funds not required?

Answer. The \$3.2 million provided in fiscal year 1997 is for APHIS' share of the Plum Island Animal Disease Center modernization project, which is an ongoing project with ARS. In the past, the Appropriation Committees have asked us to justify all construction projects. Even though this was a project in fiscal year 1997, we justified it again for fiscal year 1998. In fiscal year 1998, we have requested another \$3.2 million, along with \$5.0 million requested by ARS, to fund APHIS' share of the ongoing modernization project at Plum Island Animal Disease Center. Funds will be used to upgrade electrical and structural deficiencies and to address safety and environmental issues.

HORSE PROTECTION

In the Senate report accompanying the fiscal year 1997 agriculture appropriations bill, the Committee directed the Department to provide more effective use of funds for the enforcement of the Horse Protection Act, to establish programs and policies for conducting horse show inspections and other related enforcement activities to USDA-certified horse industry organizations.

Question. Please provide a brief explanation of APHIS' accomplishments in these areas. Is funding included in the budget to continue this work?

Answer. We have drafted a strategic enforcement plan. This plan places increased regulatory authority and enforcement responsibilities on USDA-certified organizations. We developed the plan with the advice and equine expertise from both APHIS veterinarians and horse industry organizations.

We are now finalizing the plan. We revised the draft to incorporate information gathered from all sectors of the horse industry, as well as three public forums held in 1996. Federal Register comments, and write-in campaigns. Departmental review should be complete in March 1997. After making any necessary revisions, we will

PART 1

259

make the plan available to the horse industry to seek a final consensus. The proposed budget will allow us to continue in this effort.

NATIONAL POULTRY IMPROVEMENT ACT

Question. The fiscal year 1997 Agriculture Appropriations Senate report directed the Department to enhance the fiscal year 1997 funding for the National Poultry Improvement Program which is funded in the "Animal health monitoring and surveillance" account. Please provide a brief explanation of APHIS' accomplishments in this area. Is funding included in the budget to continue this work?

Answer. To enhance the National Poultry Improvement Plan (NPIP), APHIS increased the NPIP funding allocation from \$240,000 to \$260,000 in fiscal year 1997. APHIS plans to use the additional funds to hire an epidemiologist who will spend 50 percent of their time on the NPIP program and 50 percent on activities related to general poultry diseases.

Yes, \$260,000 is included in the fiscal year 1998 budget as part of the Animal Health Monitoring and Surveillance line item.

NOXIOUS WEEDS

The fiscal year 1997 Agriculture Appropriations Senate report directed the Department to include funding at the fiscal year 1995 level to continue its work on the eradication of goatsrue in Utah, to continue its efforts to control tropical soda apple in the Southeast, and to work with the Hawaii Department of Agriculture to secure environmentally safe controls for alien weed pests.

Question. Please provide a brief explanation of APHIS' accomplishments in these areas. Is funding included in the budget to continue this work?

Answer. In fiscal year 1997, we transferred \$100,000 to Utah State University, to conduct eradication activities in Cache County, Utah. Currently, we have a 5-year plan with the State of Utah to conduct post-eradication surveys to verify eradication. During this process, we provide technical expertise to the State. We have included \$30,000 in our fiscal year 1998 budget for this work.

To address outbreaks of Tropical Soda Apple (TSA) in the Southeast, we are concentrating on education, survey, and management of incipient infestations. In fiscal year 1996, we conducted surveys on properties in most States that have received cattle, bahiagrass, or composted manure from infested sites in Florida. As a result of these surveys, we have confirmed outbreaks in Alabama, Georgia, Mississippi, North Carolina, Pennsylvania, South Carolina, Tennessee, and Puerto Rico. In all instances, the confirmed infestations have either been eradicated or are under intensive management for eradication. We have included approximately \$100,000 in our fiscal year 1998 budget to continue this work.

Regarding alien weed pests, we are cooperating with the U.S. Forest Service, and several agencies from the Interior Department to bolster our protection of managed and natural ecosystems in Hawaii from introduced invasive plants. To deal with this issue, we are training our personnel as well as State personnel in Hawaii. Also, we are working with the State to establish a Hawaii Weed Team. This Team will cooperate to enhance effectiveness in preventing and controlling weeds in Hawaii. In addition, we are working with State officials to create a Hawaii Weed Detection and Reporting Network, which would include plant collectors, botanists, and weed scientists. This Network will ensure that the Hawaii Weed Team learns about new infestations so early actions can be taken when eradication is still feasible. We have included approximately \$30,000 in our fiscal year 1998 budget for this work.

ERADICATION OF KUDZU

Kudzu is a big problem in Mississippi. It is a nuisance because it takes over any vegetation in its path. Foresters find this weed to be extremely difficult to control with the current land management practices available to them.

APHIS has never been involved in any activities which would eradicate this weed. Kudzu is not listed (an official process that involves scientific review and publication in the Federal Register) as a noxious weed. The Federal Noxious Weed Act of 1974, 7 U.S.C. 2801-13, defines a noxious weed in part as a "plant which is of foreign origin, is new to or not widely prevalent in the United States, and can directly or indirectly injure crops." This Act provides APHIS' authority to eradicate or control noxious weeds.

Question. Is the definition of a noxious weed the only impediment that stops APHIS from getting involved in ways to eradicate Kudzu?

Answer. The definition is one impediment. Kudzu is widespread occupying five million acres in the eastern United States. Another major impediment is the large cost of a kudzu control program.

PART 1

260

Question. What is the estimated cost of eradicating Kudzu if the law was changed?

Answer. In practical terms, kudzu is well beyond the point of being eradicated totally from the United States. There is technology available to control kudzu and eliminate it from individual sites, however, an APHIS-directed program would have to be a massive, multi-year effort. If we became involved in a cooperative control effort with State agencies, Federal land management agencies, and private land owners, control costs would be a minimum of \$160 per acre, spread over three years. If we assume that 5 million acres are infested, the total cost of chemical control would be \$800 million. This estimate does not include costs associated with research, detection, delimiting, and appraisal surveys (before and after), monitoring, clean up treatments, and re-vegetation efforts.

QUESTIONS SUBMITTED BY SENATOR MCCONNELL

COMMERCIAL TRANSPORTATION OF EQUINE FOR SLAUGHTER

Question. During last years appropriation hearing I asked the Secretary for his cooperation and assistance in implementing Title IX—Miscellaneous, Subtitle A—Commercial Transportation of Equine for Slaughter. I was informed that a determination could be made, however, it would be difficult to enforce this regulation without additional funding to support inspection personnel and related costs. Please provide the Committee and myself the status of implementing the Commercial Transportation of Equine for Slaughter?

Answer. To date, the Commercial Transportation of Equine for Slaughter statute has not been implemented.

Question. Has the Department issued any guidelines/regulations? If not, when?

Answer. No guidelines or regulations have been issued. An interagency working group was formed to assess the feasibility of implementing this program and to determine program resource requirements. The group concluded that effective implementation of the program would require conducting preliminary research, producing an educational publication and video, and hiring a veterinary medical officer(s) and program assistants. It is not yet known when the Department will issue guidelines or regulations.

Question. Last year the Secretary said it would be difficult to enforce this regulation without additional funding, what can be done to enforce this provision without additional funds?

Answer. No enforcement activities can be conducted at the current funding level.

Question. If additional funds are needed did you request funds? If not, why?

Answer. Because of budget constraints, the Administration was not able to request additional funds for the commercial transportation of slaughter horses program.

Question. How much is needed to enforce this provision?

Answer. It is estimated that \$411,000 would be required to establish the Commercial Transport of Slaughter Horses program.

Question. Please provide a breakdown of how these funds would be spent?

Answer.

Commercial Transport of Slaughter Horses Program

<i>Cost category</i>	<i>Dollars (est.)</i>
Salaries and Benefits	\$245,000
Travel	31,000
Transportation of Things	17,000
Printing	8,000
Cooperative Agreements	34,000
Supplies and Materials	6,000
Equipment	70,000
Total	411,000

QUESTIONS SUBMITTED BY SENATOR BURNS

BRUCELLOSIS

Question. Quickly, I would like to state that I have been a strong proponent of the Animal and Plant Health Inspection Service. I have never had a problem coming

PART 1

261

into this country and proceeding through the protocols necessary to make sure that all the animals and plants in this country are protected. I would also like to commend you for the approach you are taking to make sure we have a clean and healthy bison herd in Yellowstone National Park.

I would like to start off by asking how many herds in America today are infected by Brucellosis? How many 10 years ago?

Answer. Of the estimated 1.2 million cattle herds in the United States, 26 are currently affected by brucellosis and under quarantine. Ten years ago, at the end of fiscal year 1987, there were 3,160 affected herds under quarantine.

Question. Does the reduction in funding adequately accept the risk as we continue to see it coming out of Yellowstone National Park?

Answer. The fiscal year 1998 President's Budget does include adequate funding for the brucellosis program, specifically for activities in the Greater Yellowstone Area (GYA). This funding will allow APHIS to continue to support research to develop alternative brucellosis vaccines for bison and elk and to study the transmission of brucellosis from wildlife to domestic livestock. In addition, funds will support a wildlife veterinarian in Montana to serve as a liaison among the involved government agencies.

APHIS is committed to working cooperatively with the involved government agencies to address the most critical issues. These include eliminating brucellosis in the GYA, providing additional suitable bison winter range outside the park, and coordinating these activities in such a way to encompass the interests of the stakeholders.

Question. Could you provide the committee with the brief on the current work being done on research for an effective vaccine for bison and also for elk as a treatment against Brucellosis?

Answer. To date, APHIS has committed more than \$3 million toward brucellosis research in the GYA. A new vaccine, RB51, has recently been approved for use in cattle. Researchers are also testing this vaccine on bison calves, male bison, pregnant bison, and elk to determine its safety and effectiveness. Specific examples of research on RB51 include a vaccination field study on bison yearlings in South Dakota, a vaccination safety and efficacy study on pregnant bison in Idaho, a vaccination safety study in male bison, vaccination safety field trials in bison calves, and a controlled study on the immune response of elk to the vaccine. Tests of the RB51 vaccine look promising. Before RB51 can be approved for use in bison and/or elk, the vaccine must pass additional safety and efficacy trials. This process may take up to 2 years.

Question. Mr. Medley, I appreciate your willingness to work with the state of Montana in protecting their Brucellosis free status, but in all reality what does your document mean to Montana and Wyoming when we have other states either that have with been imposing or threatening to impose sanctions on our states?

Answer. Most Federal requirements are relieved when States, such as Montana and Wyoming, attain Class Free status. Traditionally, State import requirements for brucellosis have paralleled the Federal interstate movement requirements. However, the States surrounding the GYA are in a unique situation. Their cattle are free of brucellosis, but a perception exists that their cattle may have been exposed to brucellosis infected bison from Yellowstone National Park. Several States have deemed it necessary to protect their cattle by imposing or threatening to impose additional import requirements, which are scientifically-based, on the surrounding States. Fortunately, most States believe that the class statuses of these States have not been compromised.

APHIS can minimize the concerns of the importing States by working with the National Park Service to properly handle the Yellowstone bison leaving the Park to prevent their exposure to the brucellosis free cattle in the States surrounding the Park. In addition, APHIS can work to minimize the imposition of State import requirements that interfere unnecessarily with interstate commerce. It is not unrealistic, however, to believe that some States may continue to impose testing requirements on cattle from around Yellowstone until brucellosis has been eradicated from the bison in the Park.

ANIMAL DAMAGE CONTROL

Question. Wolves have been introduced in Idaho, and Montana and are showing up in parts of Wyoming. With the increased wolf numbers, what impacts does the wolf presence in a given area have on the ADC program and it's ability to respond to other predation problems?

Answer. Gray wolves began naturally moving back into northwestern Montana from Canada in the mid-1980's. This naturally occurring population of wolves is increasing and now occupies northern Idaho as well as northwestern Montana, and

PART 1

consists of about 70 adults and yearlings and possibly 30 pups. To speed wolf recovery in the region, the U.S. Fish and Wildlife Service (FWS) captured 29 wolves in Canada in 1995 and 37 wolves in 1996. They released them into Yellowstone National Park and central Idaho. This group of wolves is considered a nonessential experimental population and it is increasing as well. Introduced wolves have successfully bred and are raising pups.

As evidenced by the increase in their numbers, both naturally occurring and reintroduced gray wolves can thrive in many areas of Idaho, Montana, and Wyoming. They sometimes frequent areas of human activity and some seem to select the same type of habitat that some people prefer, such as areas of interspersed forest and open areas typical of ranching communities in western Montana. Most of the wolves have not come into direct conflict with people, but some have killed livestock. An increase in these conflicts is expected as the wolf population increases.

ADC plays an important role in wolf recovery. This includes verification of wolf livestock predation, capturing depredating wolves, mediating conflicts between agencies and resource owners, and disseminating information to the livestock community and the general public. Wolf recovery and reintroduction in Idaho and Montana have caused restrictions on the use of traditional methods of control where wolves may exist. This results in more costly control methods such as aerial operations, to ensure ADC activities minimally impact wolves. Also, the presence of wolves creates additional workload, causing delays in ADC response time to requests for all predator control assistance in wolf recovery areas.

Question. Is the U.S. Fish and Wildlife Service contributing any research efforts on funding to address capturing methodologies that the USDA, APHIS, Animal Damage Control program could use that would minimize impacts that wolf recovery will have on other aspects of the ADC program?

Answer. APHIS does not receive funding from the FWS for research related to wildlife capturing methodology, nor is the Agency aware of other FWS involvement in such research.

Question. Plans to release Mexican wolves in New Mexico and Arizona next year are underway. Has the U.S. Fish and Wildlife Service given consideration to the impacts that the presence of wolves will have on the routine activities of the USDA, APHIS, Animal Damage Control program uses to reduce coyote damage to livestock? What ADC tools will be restricted? What is the increased cost to APHIS/ADC with a limitation on these tools? What the cumulative impacts to the livestock industry in terms of increase predation by predators other than wolves and increased management cost?

Answer. In the final ADC Environmental Impact Statement (EIS) for reintroduction of the Mexican Wolf within its historic range in the Southwestern United States, the FWS indicates that wolf reintroduction will primarily impact cattle resources in the area with potential losses to wolves ranging from 0 to 34 individual animals. FWS is uncertain but theorizes that populations of coyotes and mountain lions could also be displaced, which could result in temporary higher concentrations of these animals in some areas. The FWS will restrict the use of the M-44, neck snares, and foothold traps in the wolf recovery areas of Arizona and New Mexico. The final EIS also indicates that these restrictions will likely reduce ADC effectiveness in controlling other predators in the area unless ADC commits additional resources.

The FWS plans to issue a final rule for the proposed establishment of a non-essential experimental population of the Mexican Gray Wolf in Arizona and New Mexico before wolves are released in these areas. The final rule, which is expected to be published in the Federal Register about the first week in June 1997, will specify the circumstances under which control or management intervention of wolves can occur, and the methodologies which can be employed. Over the next 9 months, the FWS will develop detailed management plans and agreements to define its working relationship with cooperating agencies.

Under current management plans for wolf recovery in the Northern Rocky Mountain States, the use of traditional methods of control including M-44's, foothold traps, and snares would be restricted or forbidden in known wolf population areas.

Current management plan restrictions require more time consuming or more expensive control approaches such as aerial control, to ensure that ADC activities do not significantly impact wolf recovery efforts. Based on the impact of wolf management activities on ADC livestock protection efforts in Montana, APHIS estimates that increased costs currently amount to about \$85,000 per year. If similar programs were to be introduced in Arizona and New Mexico, initial impacts could be expected to be approximately the same in each State, with increases in proportion to increases in wolf populations.

PART 1

263

A study would be required to determine the impact of increased predation to the livestock industry. However, an increase in predation can be expected as workloads increase due to expanding wolf populations. Because of increased workload, ADC response time to requests for assistance, which involve traditional livestock protection activities, is increasingly delayed.

Restrictions on the use of traditional control tools are resulting in the use of more expensive control techniques such as aerial control. Also, a need for additional employees as wolf populations increase will most likely cause increased costs to both APHIS and cooperators.

Question. This fiscal year Congress appropriated \$100,000 to ADC for wolf damage control, and the U.S. Fish and Wildlife Service agreed to provide ADC an additional \$100,000 for this same purpose. How are these funds being spent, and are they adequate to respond to wolf damage complaints? Is this amount adequate for future problems as the wolf population grows?

Answer. Funds are used for verification of wolf livestock predation, capturing depredating wolves, mediating conflicts between agencies and resource owners, and disseminating information to the livestock community and the general public. The new interagency agreement between FWS and APHIS commits a total of \$200,000 per year toward efforts in dealing with wolf predation on livestock in Idaho, Montana, and Wyoming. APHIS currently estimates these efforts to cost approximately \$215,000 in fiscal year 1997.

In addition to a projected reprioritizing of approximately \$15,000 in fiscal year 1997 for wolf management efforts, APHIS is projecting the need to reprioritize approximately \$58,000 in fiscal year 1998, beyond the \$200,000 per year currently committed in the APHIS/FWS interagency agreement for work in Idaho, Montana, and Wyoming. With expected reintroductions of the Mexican wolf in the near future, APHIS may need to expand efforts to include the States of New Mexico and Arizona. Total efforts including the additional States could cost \$730,000 in fiscal year 1999, and \$1,162,000 in fiscal year 2000.

KARNAL BUNT

Question. Could you provide this committee with the current status of Karnal Bunt in the United States?

Answer. Currently, Karnal Bunt is confined to small areas in Arizona and California. We are now regulating four counties in Arizona and parts of two counties in California due to the presence of the disease. Our National Survey has demonstrated that the disease is apparently not present in detectable levels in other production areas. As a precautionary measure, though, we are also regulating small areas in New Mexico and Texas because infected seed was planted in these areas. Bunted kernels have never been collected from fields in these two States. These regulations are necessary to control the movement of infected grain and seed. For several years before the detection of Karnal Bunt in Arizona in March 1996, we had been conducting Karnal Bunt surveys as part of our Cooperative Agricultural Pest Survey program. The data gathered through these surveys has enabled us to continue certifying wheat for export even after the 1996 detection. To date through our National Survey, we have tested over 15,000 grain samples representing all wheat-producing areas in the United States. Based on these tests, we have not been able to confirm the presence of Karnal Bunt in any areas of the U.S. other than those where we knew the disease to be present.

In addition, we will co-host an international symposium in August with Mexico and Canada through the auspices of the North American Plant Protection Organization to gain consensus on Karnal Bunt's disease threat status. Our goal is to provide all countries with the opportunity to review all available data and create rational and objective standards for the international movement of grains affected by various smut diseases. Also, we will seek to determine if there is international support for minimizing regulatory actions on Karnal Bunt.

Question. How does this reflect upon our ability to export our product overseas to markets we have had long standing trade arrangements with?

Answer. Our wheat exports have not been significantly affected because Karnal Bunt has not reached the major wheat-producing areas of the United States. We are still able to certify most wheat for export by demonstrating that it is not coming from areas where Karnal Bunt is known to be present or areas at risk because of Karnal Bunt. Also, we can certify that over 90 percent of U.S. wheat originates in areas where Karnal Bunt is not known to be present; we have seen a relatively normal movement of wheat exports since the beginning of our program. The export of speciality wheat from the regulated areas in Arizona and California has been affected, but this is an extremely small portion of total U.S. exports. Because virtually

PART 1

264

all trade partners will accept wheat from areas where Karnal Bunt is not known to be present, the presence of the disease in regulated areas of the southwest will not materially affect wheat exports in the future.

Question. On the research end of the problem, could you provide me with the current status of providing a certificate to Montana State University, College of Agriculture, to allow them to hold in quarantine a portion of wheat infected with KB to do research on, under an agreement between Montana State university and the Agricultural Research Service?

Answer. In April, we provided a permit to Montana State University (MSU) to conduct specified laboratory research on Karnal Bunt under certain safeguards. These safeguards were agreed upon by MSU scientists, the Montana State Department of Agriculture, the Montana State Plant Health Director, and the Agricultural Research Service. The permit does not allow MSU to hold in quarantine any wheat infected with Karnal Bunt since they do not have a certified quarantine facility.

Question. Along this same line of thought, Montana State has requested on several occasions the assistance of a quarantine facility expert to review the plans and blueprints of a research lab in Bozeman, Montana. However, they continue to be bounced around in the process. Many times they are told the plans look good, but no real assessment can be made until the construction is complete. This sounds like sending good money after bad. Could you look into this situation and see what you can do to assist Montana State university in completion of the plans for the development of a research lab?

Answer. On February 15, the Davidson Kuhr Architects Company submitted drawings for a proposed quarantine facility at MSU to our National Plant Germplasm Quarantine Center in Beltsville, Maryland. We requested a written specification proposal from MSU to outline how safeguards that are included in our draft guidelines would be incorporated into their plans. MSU advised us that they would contact the architect to provide this additional documentation. On May 14, we contacted the architect company and confirmed that MSU had asked for a proposal for our review and evaluation. The architect then informed us that he will submit the proposal by early June. When we receive the proposal, it will take approximately two weeks for review. Once the architect corrects any deficiencies we may find, we will approve the proposal and construction may begin. We will conduct another evaluation once the facility has been completed and will continue providing the architect with any assistance he may need. This facility is needed to properly contain the Karnal Bunt organism.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

BOLL WEEVIL

Question. Your budget for fiscal year 1998 includes a decrease in spending for boll weevil eradication. You state fewer funds are needed due to the fact that the weevil has been eradicated in many areas. In those areas where the weevil has been eradicated, how do profit margins for cotton farmers compare to farmers in states where the weevil is still present? Rather than reducing funds, did you consider maintaining level funding and concentrating more on the remaining areas of infestation.

Answer. The current profit margin for cotton farmers in weevil-free areas, such as Georgia, is roughly \$200 per acre. In contrast, the current profit margin for cotton farmers in moderately infested areas of the mid-South, including southern Arkansas, is roughly only \$100 per acre. This disparity in profit margins is primarily due to reduced costs of pest control and increased yields for farmers in weevil-free areas.

In the earlier stages of the eradication program, growers assumed a higher risk of program failure in participating. Therefore, APHIS had to contribute significant financial resources to mitigate that risk. But as the number of eradicated acres has increased, the growers' risk of participating has decreased as we have effectively demonstrated the program's benefits. We consider it reasonable, as we try to reduce Federal expenditures to help balance the budget, to ask growers to pay a larger share of program costs.

Question. You further state that APHIS will pursue policies in which beneficiaries should contribute more to overall program funding through user fees or cooperative contributions. Last year, this subcommittee created a loan program through the Farm Service Agency to enable cotton farmers to engage in boll weevil eradication efforts to supplement direct funding from APHIS. In this way, farmers were putting more of their own money up front. Still, for some reason, the budget request for fiscal year 1998 would terminate that loan program. Don't you think that loan pro-

PART 1

265

gram was consistent with your aim of increased farmer contributions? Did you coordinate your boll weevil program with FSA?

Answer. Under the grant program, producers were not responsible for repayment. But under the loan program, producers now bear a larger share of the responsibility and costs and are responsible for repaying the loan. We believe that the loan program is a great benefit to the boll weevil eradication effort. Unfortunately, the regulations to operate the program were not in place prior to FSA's fiscal year 1998 budget request. Therefore, the request did not include any provision for the program.

We helped them prepare the environmental documentation for the loan program and we have acted as a liaison between FSA and cotton growers foundations. These regulations were published in the Federal Register on May 16, 1997

ANIMAL DAMAGE CONTROL

Question. The budget reduces the funding for ADC and goes further to require that no more than 50 percent of federal funds be used for ADC programs in any state. This could be problematic for states, such as Arkansas, where ADC programs have been used to control migratory species, such as blackbirds, rather than indigenous species, such as beaver, coyote, or other "localized" problem animals. It appears that Arkansas' ADC office will be closed under your proposal simply because it has concentrated its resources on federal migratory pest species instead of setting up a government subsidized pest control agency to compete with state agencies and private sector companies. Please explain your understanding of the separation of clear federal duties in the area of wildlife management and those duties that are the clear responsibility of State Wildlife Agencies and include a statement on migratory versus non-migratory species problems. Do you consider cooperatively financed ADC operations to be in direct competition with the private wildlife control industry? Does APHIS have any requirement or mechanism for Regional, Administrative, or Washington office to obtain cooperative funding?

Answer. APHIS has a responsibility to provide leadership and assistance to the States, local governments, and private individuals in managing damage caused by the Nation's wildlife. The Animal Damage Control Act, as amended, authorizes the Secretary of Agriculture to conduct activities and to enter into agreements with States, local jurisdictions, individuals, and public and private agencies, organizations, and institutions in the control of nuisance mammals and birds and those mammal and bird species that are reservoirs for zoonotic disease. The U. S. Fish and Wildlife Service is the regulatory Federal Agency primarily responsible for the conservation of migratory birds, threatened and endangered species, certain marine mammals, and sport fishes. Specific responsibilities of State wildlife agencies vary, but generally include regulatory authority to conserve and protect migratory and non-migratory wildlife, and species of special concern.

APHIS is specifically authorized to provide wildlife damage management assistance to these and other governmental agencies as well as private organizations and individuals. Such wildlife damage assistance is planned and implemented in coordination with the FWS and State wildlife management agencies to ensure regulatory compliance and environmental soundness. APHIS also coordinates wildlife damage management program efforts and negotiates related cooperative agreements in multiple states to enable more effective, cooperative, and cohesive programs.

The ADC program works closely with the pest control industry to ensure that competition with private enterprise does not occur. Where private resources exist, ADC personnel routinely refer people seeking assistance to local pest control or nuisance wildlife operators. APHIS personnel provide technical assistance, training, and instructional sessions in the use of various methods, both lethal and nonlethal to members of the pest control industry. APHIS works closely with industry in maintaining pesticide registrations, data gathering, addressing research needs, and also in providing assistance to industry members in obtaining the required migratory bird depredation permits. Additionally, APHIS has developed a training and certification program allowing pest control operators and others access to the avicide Compound DRC-1339 and the tranquilizer Alpha-Chloralose. Formerly, these chemicals were authorized for APHIS use only, but now may be used by the pest control operators when under the supervision of APHIS personnel.

APHIS has mechanisms in place to establish cooperatively funded agreements at the regional, administrative, or Washington office levels for ADC. Cooperative relationships have been established with various organizations and governmental agencies at regional and national levels, to identify and attain additional funding resources. This includes the aviation industry, the Federal Aviation Administration and the Department of Defense. Nevertheless, most ADC cooperative funding agree-

PART 1

ments are negotiated at the State level to provide effective and responsive service to cooperators. In regard to requirements for cooperative funding, ADC has maintained a policy for the past several years in which all new cooperative agreements must meet a minimum 50/50 percent cost ratio.

IMPORTED FIRE ANT

The University of Arkansas at Monticello, through APHIS, has been working with land owners in Arkansas and scientists at the University of Florida on methods to control the fire ant. They have been able to document real costs of the fire ant in terms of economic losses and I understand the techniques they have developed are of keen interest to local land owners and that their efforts in conjunction with the University of Florida may hold real promise through possible introductions of natural predator species they found in Argentina.

Question. Could you comment on your perception of the problems posed by the fire ant and the work conducted at and through the University of Arkansas at Monticello?

Answer. The imported fire ant (IFA) has spread through the most of its range in the Southeast and Central United States. It is currently established in the following regulated States: Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, Puerto Rico, South Carolina, Tennessee, and Texas. The threat posed by the IFA is especially significant since this pest lacks natural enemies and there are no effective, efficient, and environmentally acceptable control agents available for large scale application on agricultural land. Until the Environmental Protection Agency registers an acceptable control product, we cannot conduct any area-wide control activities. For APHIS to cooperate in control treatments, we would need to conduct a new environmental impact statement, which would require \$1 to \$1.5 million and 1.5 to 2 years to complete. We have completed a preliminary environmental assessment, which demonstrated a strong case for no action with current technology. Still, we are continuing to assist the States in preventing the spread of IFA to the Western United States. We will also help States maintain domestic markets for nursery products. In addition, we will continue to evaluate the efficacy of regulatory treatments for preventing further artificial spread of the IFA.

For the last several years, we have contributed \$200,000 per year to the University of Arkansas at Monticello through a cooperative agreement to conduct research on IFA's. The three areas funded by this agreement are a self-supporting community abatement program, an economic impact assessment, and an ARS biological control project. Of the \$200,000 provided to the University, \$76,000 is devoted to the abatement program, \$100,000 is devoted to the economic impact assessment; and \$24,000 is devoted to the biological control project.

For the abatement program, the University conducted several demonstrations of control programs in public areas to help area residents better manage fire ants using existing control methods. This project has developed plans that other communities can use to initiate their own abatement programs. Also, the project produced and distributed several videos and manuscripts. These public information tools are designed to describe the theory and practice of using community-wide programs to minimize control expenses and reinfestation rates and to inform individual landowners about temporary IFA control methods.

The economic assessment analyzed the effect of fire ants on agriculture and the general public. It concluded that IFA's cause \$1.1 billion annually in agricultural damage, harm to public health and welfare, and equipment problems. It also indicated that economic impacts are especially severe where human activity is frequent. In addition, it showed that pesticides alone will not provide a long-term solution to the problem because of IFA's rapid recolonization and colony growth rates. Therefore, the focus for IFA control is turning to non-pesticide strategies, such as biological controls.

Currently, the University is contributing to an ARS biological control project to find effective control agents for IFA in South America. When imported into the United States, these enemies could reduce populations to manageable levels similar to those found in most of South America. So far, this project has identified three different organisms for potential impact on IFA in the United States, including a parasitic fly that attacks only IFA, a protozoa disease that weakens the ants and eventually kills the colonies, and another parasitic ant that attaches itself to the IFA queen and causes a debilitating drain on the colony. When sufficient testing is completed, APHIS' role would be to mass produce and distribute the biological control agents. None of the identified organisms by themselves will be enough to eradicate IFA from the United States because the pest is so widespread, but we hope that the use of one or a combination of these methods will enable native ants to

PART 1

267

compete effectively with the IFA and manage its population, as well as reduce its economic and public health impact on the U.S. public.

QUESTIONS SUBMITTED BY SENATOR KOHL

ANIMAL DAMAGE CONTROL

Question. I understand that USDA is seeking a 50/50 cost-share funding arrangement for the Animal Damage Control cooperative programs for fiscal year 1998. Do you have any accounting to show how much of the field operations cooperators have funded in the past few years, by state and region?

Answer. The following table contains the amount of federal appropriated funds and cooperator contributed funds allocated by State for fiscal year 1994, fiscal year 1995 and fiscal year 1996. These funds are used for efforts such as resolution of wildlife conflicts at airports, the rabies control project in Texas and other human health and safety issues, as well as for the protection of endangered species and public and private property.

[The information follows:]

State	Fiscal year 1996		Fiscal year 1995		Fiscal year 1994

Question. It is my understanding that in some states, such as Wisconsin, the operators have actually funded more than 50 percent of the ADC field operation costs. Does your budget request for ADC reflect the increased federal funding that will be needed in states like Wisconsin, if USDA-ADC were to commit to funding a full 50 percent of the ADC field operation costs?

Answer. The fiscal year 1998 budget request proposes that APHIS provide no more than 50 percent of the total cooperative animal damage control operations costs in each State. As Wisconsin is one of the States in which cooperative funding exceeds federal contributions, APHIS would make no adjustment to the amount of federal contributions in this State.

QUESTIONS SUBMITTED BY SENATOR LEAHY

VERMONT INSPECTION STATIONS

In 1996 APHIS indicated its intention to close the Animal Inspection Station in Derby Line, one of two animal inspection stations in Vermont. This closure would have disrupted established routes of livestock trade with Canada for a minimal savings to the agency since the Derby Line office does not have its own full time staff. To compound the problem, the other inspection station in Highgate, where APHIS planned to consolidate its operation, is in the midst of a major upgrade resulting in significant construction activity at the site. The fiscal year 1997 Agriculture Appropriations bill included language requiring APHIS to continue operation of the Derby Line inspection station.

Question. What is the current operating status of the Derby Line animal inspection facility? What are the Department's most recent plans for the future of the Derby Line and Highgate stations? (Please include budget and time-line information.)

Answer. At this time, APHIS continues to operate the Derby Line animal inspection facility for livestock inspection services. The Committee directed that the Derby June Facility remain open until work at the Highgate is complete. We intend to comply with the report language.

We plan to close the Derby Line livestock inspection facility on September 1, 1997. The new livestock inspection facility, currently under construction at Highgate should be completed by July 1997. On September 1, 1997, complete and full time livestock inspection services will be offered at Highgate. Operating one full-time livestock inspection facility at Highgate will provide users with dependable access to livestock inspection services during normal business hours. The Department will save about \$35,000 annually through decreased rental and operating costs.

ASIAN LONG-HORNED BEETLE

The recently discovered Asian long-horned beetle infestations in Brooklyn and Amityville, New York have created a great deal of concern in Vermont and other Northeastern states. Some reports indicate that other areas may have been exposed to the beetle through shipment of logs to other parts of New York and Montreal. Given that the beetle has no natural enemies and attacks mostly Norway and sugar maples, I am greatly concerned that the spread of this insect into forested areas of New York, Vermont and Massachusetts could threaten the important maple sugar and fall foliage industries of the Northeast. The sugar maple is one of the most valuable trees in New England. The sap produces maple syrup; the wood is highly prized for furniture, paneling and wood flooring; and the leaves provide an important attraction for tourists in the autumn. It is my understanding that the Animal and Plant Health Inspection Service (APHIS) has been working with the New York Department of Agriculture and Markets to develop and implement an eradication plan.

PART 1

269

Question. What activities has APHIS undertaken to eliminate the beetle and what activities are planned under the fiscal year 1998 budget?

Answer. In October 1996, we released \$694,000 from our contingency fund to conduct an Asian long-horned beetle (ALB) eradication program. We are working with the USDA Forest Service and officials of State, county, and city agencies in New York State (NYS). The program consists primarily of tree removal, but it also includes detection and delimiting surveys and intensified extension/education efforts in NYS. Tree removal is nearing completion and the program will have removed all known infected trees by April 1, 1997. This will eliminate the next generation of ALB. Our role in tree removal involves oversight to assure that the trees are properly handled, processed, and disposed. If we discover additional infestations, eradication activities will continue beyond April 1. Surveys will be conducted annually for two years beginning in May 1997 in Long Island and Manhattan. Also, we will conduct intensive surveys annually for five years within the regulated areas (the Greenpoint area in Brooklyn and Amityville, Long Island). No ALB activities are included in our fiscal year 1998 budget since this problem surfaced after we submitted our budget. However, we must consider using miscellaneous plant pest funds or using contingency funds to continue the program in fiscal year 1998.

Question. What changes may be necessary in inspection practices to insure that another Asian long-horned beetle infestation does not occur?

Answer. To identify risks and prevent future introductions of ALB, we have published and distributed Pest Alerts and other bulletins to our inspectors. For example, on October 11, 1996 and again on March 14, 1997, we distributed a pest alert on ALB and its establishment in New York. This alert informed our inspectors about actions we can take and are taking at ports-of-entry to prevent additional introductions of the ALB and related pests. In addition, we recently distributed a Port Alert to our inspectors to inform them of potential pathways for the ALB and its relatives to help prevent further introductions like that on Long Island, New York. Until recently, our inspectors did not identify longhorned beetle larvae from Asia to genus Anoplophora. They now are able to recognize these larvae as being ALB larvae and can more accurately track cargo pathways that may introduce ALB. Also through these alerts, we continually advise our inspectors of policy changes regarding criteria for inspections and interceptions and provide information on the APHIS World Wide Web home page that would help them prevent future introductions. The log and lumber regulations that took effect in August 1995 and post-date the introduction of the Asian long-horned beetle (ALB) prohibit the importation of untreated fresh (green) lumber pallets. Untreated lumber is more likely to harbor the ALB than treated lumber or older, used lumber. In the meantime, we have intensified our efforts to monitor cargo from the Far East, the ALB's region of origin. The combination of these mitigation measures should provide adequate assurance that another ALB infestation does not occur.

Question. What steps has APHIS taken to identify potential exposure risks from other non-native pests that could be transported into eastern ports, and what steps is the agency taking to prevent that from happening?

Answer. Besides the ALB Pest Alerts and our enforcement of the log and lumber regulations, we began redefining several aspects of our entire plant pest and disease exclusion program in fiscal year 1996. This new focus has enabled us to concentrate on risk evaluation, new monitoring techniques, and continuous reviews of our practices. For example, we greatly expanded our commodity smuggling interdiction program in fiscal year 1996. This program, which is designed to prevent the smuggling of prohibited Oriental agricultural products, is now being conducted nationwide. Through our AQI results monitoring program, which we have initiated at almost all ports of entry nationwide, we evaluate the effectiveness of our inspections regarding plant pest and disease interceptions. Our statistical sampling and analysis enables us to predict how effective we are at preventing the introduction of harmful agricultural plant pests and diseases. In addition, we are continuing to enhance technology through the development of enhanced x-ray systems, photographic imaging, and the dissemination of actionable interceptions and improved automation capability. Also, we have instituted uniform staffing guidelines at all ports-of-entry nationwide and have evaluated assigned shift coverages to ensure that our inspectors are always available during peak activity, when there is the greatest risk of an introduction.

ANIMAL DAMAGE CONTROL

The President's fiscal year 1998 budget request for the Animal Damage Control program represents a \$3.2 million decrease in funding. The Department proposes to provide no more than 50 percent of the total program support for each State. In Ver-

PART 1

270

mont, the Rabies Hotline program has consistently provided an important service to Vermont farmers at relatively small cost.

Question. How will this program be affected by this funding decrease to the Animal Damage Control program? What other programs in Vermont may be affected by this new policy?

Answer. As Vermont currently is one of the States in which Federal contributions exceed those of cooperators Federal funding for animal damage control efforts in Vermont could be reduced as a result of the budget request. However, the 50 percent requirement applies to total State funds, not to individual projects, which allows states some flexibility. The Vermont office would be maintained to provide continued advice on task forces for rabies management efforts, but the toll-free rabies hotline would be discontinued unless cooperator funding were increased to support it.

QUESTION SUBMITTED BY SENATOR BOXER

HASS AVOCADOS

Question. In your announcement regarding the publication of the final rule allowing the importation of fresh Hass avocados into the Northeastern United States, you stressed that it is important to understand that the rule provides only an opportunity for Michoacan producers to qualify to export their product.

It is my understanding that no imports will be authorized until APHIS-supervised surveys prove that each orchard meets the pest status requirements specified in the rule before being certified for export.

In order to address my long standing concerns about the phytosanitary risks of importing Mexican avocados, I make the following requests: (1) Before Mexican orchards are certified for export, you provide representatives of the California Avocado Commission full access to all pest survey data; (2) You provide California avocado growers with an opportunity to review and comment on the protocol that is being prepared by APHIS to implement the rule; (3) APHIS provide the Committee with a monthly status report on the implementation of the rule, including an assessment of the pest survey findings, and the orchard certification process.

Answer. The pest survey data that ensures freedom of pests of certified orchards and municipalities can be made available to anyone, including the California Avocado Commission, prior to the shipping season. The work plan is the protocol that will be used to implement the rule. The work plan includes each party's responsibilities. Interested parties will be provided an opportunity to comment on the proposed protocol that is being prepared to implement the rule through meetings being planned for early spring with the United States North American Plant Protection Organization Industry Advisory Group. We will be glad to work with your office to establish a reasonable way of providing information on survey findings.

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

QUESTIONS SUBMITTED BY SENATOR COCHRAN

MARKET COMPETITION/CONCENTRATION

Question. What activities are being funded with the \$400,000 provided for fiscal year 1997 to carry out the recommendations of the Agricultural Concentration Committee?

Answer. Two specific projects were added to our fiscal year 1997 operating plans as a result of the additional \$400,000 received to carry out recommendations of the Agricultural Concentration Committee:

—An investigation of the lamb slaughter industry, which will include an extensive examination of slaughter lamb procurement practices, with an emphasis on evaluating competition and contracting arrangements.

—Followup analysis on the effects of captive supplies. Specifically, additional economic and statistical analyses will be conducted on the effects of forward contracting, packer feeding, and marketing agreement/formula pricing arrangements using data from the Kansas 1995 and the current Texas Feeder Cattle Procurement investigations.

Question. Out of the additional \$10 million released by the Secretary from the Fund for Rural America for research, extension, and education to counter concentration, food safety, nutrition, and gleaning, what amount will be allocated to counter concentration and what specific activities will be funded?

PART 1

Answer. Grain Inspection, Packers and Stockyards Administration (GIPSA) has submitted three research projects for consideration, dealing with certain areas such as: Economic Analysis of Poultry Integration; Vertical Coordination in Hog Production and Marketing; and Line-of-Business Reporting.

Question. Increased funding is requested for fiscal year 1998 to carry out the recommendations of the Advisory Committee on Concentration—\$500,000 for the Agricultural Marketing Service (AMS) to expand its reporting of livestock and poultry markets; and \$2.3 million for the Grain Inspection, Packers and Stockyards Administration (GIPSA) to address packer competition and industry structure and poultry compliance. Please summarize the need for these additional funds and what activities will be carried out.

Answer. The additional funds requested for fiscal year 1998 are needed for GIPSA to more aggressively pursue anticompetitive practices related to industry concentration. We have increased the frequency of anticompetitive investigations during the past two years. But this has come at the direct expense of programs designed to protect individual producers from unfair practices and provide financial protection. The additional funds will be used to recruit and integrate more economic, statistical, and legal expertise into investigative units that will conduct investigations involving anticompetitive practices, but not at the expense of our other vital enforcement responsibilities. In fiscal year 1998 we will conduct major anticompetitive practice investigations and detailed analyses in the slaughter steer and heifer, slaughter hog and slaughter cow industries and develop detailed evidence where incidences of anticompetitive practices are disclosed. Additional personnel with economic, statistical, and legal expertise will be critical to completing this work.

The additional funds requested for poultry compliance are necessary if the Agency is to initiate and perform more in-depth compliance investigations, rather than respond to complaints as they are received, as is the case today. These additional funds would allow the Agency to increase the number and expand the scope of compliance investigations, while at the same time continue investigating the increasing number of complaints being received from poultry growers.

Note: The Agricultural Marketing Service (AMS) response is shown under AMS.

Question. Please provide for the record, by fiscal year, the funds provided for fiscal year 1997 and proposed for fiscal year 1998 to carry out each of the recommendations of the Committee on Concentration and/or to address agricultural market concentration or livestock pricing. What additional funding will be required in future fiscal years to carry out the Committee's recommendations?

Answer. The Committee on Concentration proposed 55 recommendations. GIPSA's additional funding request focuses on four specific recommendations as follows:

	Fiscal year—	
	1997	1998
1. Antitrust enforcement of current regulations under the Packers and Stockyards (P&S) Act should be stepped up	\$100,000	\$1,000,000
2. Section 202 of the P&S Act, which deals with unfair trade practices, should be enforced to the letter of the law	1,000,000
3. Congress should appropriate sufficient resources to allow aggressive pursuit of violations of the P&S Act and address problems in their incipency	300,000
4. GIPSA should investigate lamb supply contracts for their impact on markets and market access for participants without a supply contract	300,000
Total	400,000	2,300,000

DEALER TRUST

Question. The Administration again proposes legislation to amend the Packers and Stockyards Act to provide for a statutory "dealer trust." The explanatory notes indicate that this legislative proposal, if adopted, would provide one-time start-up costs of \$3 million to convert to license fee status. Would this be a mandatory direct funding requirement or an increased appropriations requirement, and how does the Administration propose to offset this additional one-time cost?

Answer. If the Packers and Stockyards Act is amended to provide for a statutory "dealer trust" no start-up funding is requested by the Agency, since such a "trust" would only be triggered when a dealer failed to pay for livestock purchases.

PART 1

272

The explanatory notes referring to the \$3 million one-time start-up cost refer to the proposed license fee legislation rather than the dealer trust. There will be start-up costs associated with implementing the proposed license fees. The principal costs will be the funds needed to maintain ongoing operations during a transition period that will be required to promulgate the necessary implementing regulations and begin collecting the license fees. It would also fund the leave liability accumulated under the appropriated program. Without appropriated funding, these costs would become an immediate liability to the users. This would be a one-time increase in appropriations.

QUESTIONS SUBMITTED BY SENATOR BURNS

LIVESTOCK MARKETING

Question. Jim, I would like to thank you for taking time out of your busy schedule several times during the past year to come out to Montana and discuss what it is your agency is doing to protect the individual livestock producer in today's market. I know you have made an impact and have developed some good friendships that will go a long way in developing confidence in GIPSA and the work you are doing.

Mr. Baker, talking real numbers and real dollars could you please explain what it is that you need to do to make sure that there is confidence by the producers in the next round of marketing in the livestock market?

Answer. GIPSA has requested an increase of \$1,595,000 for packer competition and industry structure issues for fiscal year 1998. The additional funds are needed for GIPSA to more aggressively pursue anticompetitive practices related to industry concentration. We have increased the frequency of anticompetitive investigations during the past two years. But this has come at the direct expense of programs designed to protect individual producers from unfair practices and provide financial protection. The additional funds will be used to recruit and integrate more economic, statistical, and legal expertise into investigative units that will conduct investigations involving anticompetitive practices. In fiscal year 1998 we will conduct major investigations of anticompetitive practices and detailed analyses in the slaughter steer and heifer, slaughter hog and slaughter cow industries and develop detailed evidence where incidences of anticompetitive practices are disclosed. Additional personnel with economic, statistical, and legal expertise will be critical to completing this work.

Question. Could you provide the committee with a brief overview of the actions that have been completed in the past year to make sure that the packers are not taking advantage of the marketplace on livestock? What is it that this committee and Congress can do to assist you in the completion of this task?

Answer. During fiscal year 1996, GIPSA concentrated resources on providing financial protection and promoting fair business practices and a competitive marketing environment for livestock, meat, and poultry. The Agency conducted over 2,000 investigations, disclosing over 800 violations of the P&S Act. Formal actions were requested in 84 cases and 62 administrative or justice complaints were issued in order to bring firms into compliance with the P&S Act. Administrative decisions and orders were issued in 49 cases during fiscal year 1996; however, most violations were corrected on a voluntary basis with several resulting in livestock and poultry producers receiving additional funds for the sale of their product. In addition, four major investigations are currently underway dealing with cattle procurement in the Texas Panhandle; slaughter hog procurement in the central United States; poultry settlements in several states; and lamb procurement. Providing the additional funds that we need is the best action that the committee and Congress can do to assist us.

The Packers and Stockyards Programs budget for fiscal year 1998 proposes \$14.8 million, which includes increases of \$225,000 to allow GIPSA to establish electronic filing procedures for reports; \$1,595,000 for activities in the packer competition and industry structure areas; and \$750,000 for poultry compliance activities. These funds are essential for the Agency to meet its responsibility of fostering fair and open competition, and guard against deceptive and fraudulent practices that affect the livestock, meat, and poultry industries.

CANADIAN GRAIN

Question. Mr. Baker, we are beginning to hear rumblings in northern Montana border towns about the amount of feed grain that is being imported into Montana grain bins that are not of a quality that is equal to that which is being marketed by Montana producers. This same wheat then is being mixed and sold as Montana

PART 1

273

quality grain, and yet carries a large amount of substandard Canadian grain in that same load. Would you like to comment on this and if you are not prepared would you please take some time to look into this and find out what the situation is and report back to me and the committee?

Answer. Under the current NAFTA agreement and the U.S. Grain Standards Act, grain is allowed to move freely between Canada and the U.S. with official inspection occurring only at the buyer/seller's request. Canadian grain entering a U.S. grain elevator is not required to be identified or binned separately from U.S. grain. Further, the U.S. Grain Standards Act prohibits the blending of dockage and foreign material to grain but does not prohibit the blending of different qualities of grain. Consequently, any grain shipped from Montana elevators is graded based on its kind, class, quality, and condition as it relates to the official grain standards. The origin of the grain is not relevant to the inspection process when assessing quality.

SUBCOMMITTEE RECESS

Senator COCHRAN. This concludes today's hearing. Our next hearing will be on Tuesday, March 11, in this room, 124, of the Dirksen Senate Office Building at 10 a.m. We will hear at that time from Department witnesses on the requests for food and nutrition programs. Until then, the committee stands in recess.

[Whereupon, at 11:52 a.m., Tuesday, March 4, the subcommittee was recessed, to reconvene at 10:05 a.m., Tuesday, March 11.]

PART 1

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

TUESDAY, MARCH 11, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:05 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Bumpers, and Leahy

DEPARTMENT OF AGRICULTURE

GRAM**

FOOD AND CONSUMER SERVICE

STATEMENT OF WILLIAM E. LUDWIG, ADMINISTRATOR

ACCOMPANIED BY GEORGE A. BRALEY, ASSOCIATE ADMINISTRATOR

CENTER FOR NUTRITION POLICY AND PROMOTION

STATEMENT OF EILEEN KENNEDY, EXECUTIVE DIRECTOR

OPENING REMARKS

Senator COCHRAN. The meeting of the Agriculture Appropriations Subcommittee will please come to order.

Today we are continuing our review of the President's budget request for Agriculture, Rural Development, and Related Agencies. This morning we will specifically review the request for programs and activities of the Department of Agriculture's Food and Consumer Service.

Our witnesses this morning include Mary Ann Keeffe, who is Acting Under Secretary for Food, Nutrition, and Consumer Services.

We also have with us the Administrator of the Food and Consumer Service, William Ludwig; George Braley, Associate Administrator, Food and Consumer Service; and Dennis Kaplan,

PART 1

276

Budget Officer with the Department of Agriculture's Office of Budget and Program Analysis.

We welcome you, Ms. Keeffe, and invite you to proceed to make whatever comments or remarks you choose regarding this budget request. You may proceed.

STATEMENT OF MARY ANN KEEFFE

Ms. KEEFFE. Thank you very much, Mr. Chairman. It is my pleasure to be here this morning before the committee. As you know, in my role as the Acting Under Secretary for Food, Nutrition, and Consumer Services, I have responsibility for the Nation's food assistance programs.

In addition to those that you mentioned, Mr. Chairman, also accompanying me today is Ms. Yvette S. Jackson, the Deputy Administrator for the Food Stamp Program.

Senator COCHRAN. Ms. Jackson, we welcome you, and thank you for your being here.

Ms. KEEFFE. Mr. Chairman, I am speaking to you at a time of historic change in the manner in which Government operates. This administration came into office 4 years ago with a number of goals for our nutrition programs.

CHILDREN'S NUTRITION

These goals included improving the nutrition and health of children by updating the nutrition standards of the School Lunch and Breakfast Programs, making benefits available for all who qualify and wish to participate in the Special Supplemental Nutrition Program for Women, Infants, and Children, reinventing Government by working in partnership with the States to increase program efficiency and reduce abuse, implementing antifraud legislation to increase Food Stamp Program integrity, and ending welfare as we know it by replacing it with a system that offers hope, demands responsibility, and rewards work. We have been quite successful in meeting these goals.

Our 16 nutrition assistance programs, which include the Food Stamp Program, Child Nutrition, WIC, Commodity Programs, Nutrition Education and Training, and our Center for Nutrition Policy and Promotion, work individually and in concert with one another to alleviate food insecurity, promote healthier diets for children and low-income adults, and improve nutritional knowledge among all Americans.

Taken together, these programs provide a vitally important nutrition safety net for Americans.

Mr. Chairman, in recognition of your committee's level of interest in our budget request for this year, I would like to explain briefly the request in a couple of areas.

For the Special Supplemental Nutrition Program for Women, Infants, and Children, the President's budget includes both a supplemental request in fiscal year 1997 to maintain participation at current levels and for fiscal year 1998, adequate funds to meet the goal of fully funding the WIC Program.

PART 1

277

WIC SUPPLEMENTAL

The fiscal year 1997 \$100 million supplemental request is needed to avoid a dramatic reduction in participation this year. We estimate that the current fiscal year 1997 appropriation will support average monthly participation of 7.2 million persons.

Participation was well over 7.4 million at the end of last year and has remained at approximately that level through the first quarter of fiscal year 1997. This implies that, in the absence of additional funds, participation will have to fall to about 7 million by September of this year, which would mean a reduction of over 400,000 mothers and children.

Our budget request assumes that unspent funds of approximately \$100 million will be carried over from fiscal year 1997 to fiscal year 1998.

WIC CARRYOVER

We believe that a structural carryover of this level, which is about 2.5 percent, does not suggest poor program management, but is inherent to the prudent management of the WIC Program.

The fiscal year 1998 request of \$4.1 billion would allow us to achieve our longstanding bipartisan goal of fully funding the WIC Program at 7.5 million participants. This represents a modest expansion from the current participation level of 7.4 to 7.5 million by the yearend fiscal 1998. While the economy has improved in the years since this goal was first established, this funding target is still well below the current estimated WIC-eligible population of 9.2 million persons.

The WIC Program has sought and achieved high participation rates; and we believe it is critical to preserve these achievements. The fiscal year 1998 request is \$378 million above the current fiscal 1997 level. However, only a small fraction of those funds, about \$30 million, are for increased participation.

The majority of the increase reflects the inflation-adjusted level needed to support the current 7.4 million participants. And the request also includes a \$100 million contingency fund, which would be used only if food costs are significantly higher than expected.

I would also like to mention that both the fiscal year 1998 request and the supplemental include appropriations language that would provide USDA greater discretion in distributing funds among States. This discretion is needed to minimize participation disruptions this year and to ensure that States are funded at levels consistent with their needs as the program enters a period of greater funding stability.

Mr. Chairman, I thank you and the members of this subcommittee for your continued support of these important programs. With your support, we have had remarkable success in alleviating hunger and promoting healthier diets. We have made dramatic changes.

Mr. Chairman, I, along with the Administrator, Mr. Ludwig, and the Director of the Center for Nutrition Policy and Promotion, have submitted detailed testimony for the record.

My colleagues and I will be happy to answer any questions.

PART 1

278

PREPARED STATEMENTS

Senator COCHRAN. Thank you very much, Ms. Keeffe. Your statements will be included in the record in full. And we thank you for your cooperation and assistance to our committee.

[The statements follow:]

PREPARED STATEMENT OF MARY ANN KEEFFE

Mr. Chairman, Members of the Subcommittee, it is my pleasure to appear before you to discuss the President's fiscal year 1998 Budget Request for USDA's Food and Nutrition Programs. As you know, I am the acting Under Secretary for Food, Nutrition, and Consumer Services (FNCS), responsible for the Nation's domestic food assistance programs which provide access to a more nutritious diet for persons with low incomes and which encourage better eating choices among the Nation's children and their families. These programs include the anchor programs of Food Stamps, Child Nutrition and the Supplemental Nutrition Program for Women, Infants and Children (WIC). I am accompanied by William Ludwig, the Administrator of the Food and Consumer Service, George Braley, the Associate Administrator of the Food and Consumer Service, and Dennis Kaplan from the Department's Office of Budget and Program Analysis.

I am speaking to you at a time of historic change in the manner in which government operates. This Administration came into office four years ago with a number of goals for our nutrition programs. Those goals included improving the nutrition and health of children by reforming the 50 year old School Lunch and School Breakfast Programs and making benefits from the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) available for all who qualify and wish to participate. We also set about reinventing government by working in partnership with the States to increase program efficiency and reduce abuse. We implemented anti-fraud legislation to increase Food Stamp Program integrity. We ended welfare as we know it by replacing it with a system that offers hope, demands responsibility and rewards work. We have been quite successful in meeting these goals and in fulfilling our dual missions of supporting the agriculture economy and providing the nutrition safety net for low income Americans.

The mission of these programs is to improve the nutritional well-being of children and low-income families by helping them to make healthful food choices and provide access to nutritious foods for the people who need it. Our Nutrition Assistance Programs work both individually and in concert with one another to alleviate food insecurity and promote healthier diets for children and low-income adults and improve nutritional knowledge among all Americans. Taken together, these programs provide a nutrition safety net for low-income Americans. During the last four years FCS, together with this subcommittee, has made dramatic changes to these programs and achieved great results. Let me take a few moments to share some of our many accomplishments.

FOOD STAMP PROGRAM

The Food Stamp Program, the cornerstone of our Nutrition Assistance Programs expands and contracts with human need. In March 1994, the program served a historic number of low-income persons, 28 million in fact. Since then primarily due to economic improvements, it has contracted and is reaching over 10 million families—24 million people.

However, when the President signed into law the Personal Responsibility and Work Opportunity Reconciliation Act of 1996, he stated that some provisions must be readdressed in the future because they led to unwarranted harm to some families.

Our food stamp legislative proposals included in the President's fiscal year 1998 Budget address those concerns within the fiscal constraints of balancing the budget by fiscal year 2002. The proposals will increase the vehicle fair market value exclusion for fiscal year 1998 and begin indexing in fiscal year 1999. The proposals will impose a new tough but fair work requirement and disqualification penalty on those unemployed adults with no children who can work but refuse work; eliminate ineligibility of unemployed adults with no children who are willing to work but cannot find work and are not offered work opportunities by the private sector or the States because of high unemployment or lack of jobs in the area; provide additional funding to States to increase the availability of employment and training opportunities for unemployed adults with no children; and expand the State option for using food stamp benefits as a wage supplement to include participation by unemployed adults

PART 1

279

with no children. Additionally, we propose some changes limited to fiscal year 1997 for implementing the ban on food stamp receipt by current legal immigrant participants. Such changes will provide an extended opportunity for legal immigrants who are current food stamp participants to pursue and attain citizenship. By fiscal year 2002, our proposals will eliminate the cap on the excess shelter expense deduction to help families with children and high shelter expenses, and index the standard deduction.

Early in the Clinton Administration, we established six key principles for reforming the program: ensure economic responsiveness, provide for nutrition security, improve program integrity, modernize benefit delivery, expand State flexibility, and promote personal responsibility. These six principles formed the framework of not only administrative actions we have taken but also the major legislation proposed by the Administration in 1995 and 1996 that ultimately led to reform. They continue to guide our actions today.

Ensuring economic responsiveness and providing for nutrition security, our first two principles, are the aspects of the Food Stamp Program that distinguishes it from other Federal assistance programs. Welfare Reform assured the continued ability of the program to expand automatically to meet increased need when the economy is in recession and contract when the economy is growing. Food stamp benefits will continue to flow to eligible families in communities that face rising unemployment and poverty, cushioning the harsher effects of economic recession and stimulating weakening economies. Caseload reduction over the past 2½ years demonstrates this important aspect of the Food Stamp Program. For 30 years, the Food Stamp Program has been our pledge to “safeguard the health and well-being of the Nation’s population by raising levels of nutrition among low-income households.” Fulfilling this pledge means more than providing food. It means providing nutrition information and education, which is critical to improving the quality of diets, improving health, and reducing health care costs.

In our continuing effort to improve the health of all Americans through better knowledge of good nutrition, we have encouraged States to develop nutrition education and promotion programs, matching the money spent as part of the administrative cost of operating the program. In fiscal year 1996, 38 States had approved Food Stamp Nutrition Education Plans; up from just a handful of States 3 years ago. The Federal share of funding for these plans was \$20 million.

Program Integrity

Improving program integrity is our third principle. Two years ago, we proposed a comprehensive 13-point, anti-fraud legislative program for food stamps that attacked retailer trafficking, strengthened reauthorization controls, and allowed for stiffer penalties. Congress adopted, in some form, all of the Administration’s proposals. Welfare reform legislation also included several provisions directed toward recipients who violate program regulations. These provisions include doubled penalties, expanded claims collections procedures, and prohibitions against households receiving increased food stamp benefits in response to lower income because they are being penalized for failure to comply with the rules of welfare programs.

At the same time, we have reduced food stamp error rates. We have worked hard with the States and for the last two years error rates have fallen. The reduced error rates have prevented the loss of nearly \$350 million in erroneous payments in just two years, and we will continue with this work.

We are aggressively and unceasingly fighting food stamp fraud. Fraud in the Food Stamp Program or any program cannot and will not be tolerated. We have a responsibility to ensure that food stamp benefits are issued properly and accurately and are used for purchasing food. Preventing fraud is critical to ensure program integrity and to ensure that the program gets food to people who need it.

We are increasing our ability to visit food stores in person, by using the fiscal year 1997 appropriation of \$4.2 million to contract with vendors to procure documented observations of new applicant stores as well as those requesting to continue to participate in the program. This information is being used by our field offices to confirm applicant-supplied information, particularly that the store is in the business of selling an ample variety of staple food for home preparation and consumption.

We have coupled these achievements with our ongoing food stamp investigative efforts to ensure recipient access to food stores while limiting the program’s vulnerability to fraud, especially trafficking.

The use of intensive “sweeps” of many vendors has helped us identify the problem stores; and, just as important, it gets the message out to the public and to retailers that those who commit fraud will be caught. In the past calendar year we have conducted two such operations, “Trident” and “Five Points”. With FCS investigative resources alone, 734 stores were caught violating, 201 of which were caught traffick-

PART 1

280

ing. These operations took a combined total of 6 weeks. The media coverage will help provide a deterrent to other retailers from violating program rules. Also, the dollar amount of violation activity addressed through these operations was significant. The violating stores redeemed \$50 million in food stamp benefits the previous year.

We have continued to expand the Federal Tax Refund Offset Program (FTROP) to a total of 43 States and have added a Federal salary offset component. FTROP began as a pilot in 1992. Since that time, we have collected more than \$110 million which is returned to the Treasury. We expect this program to continue to grow until all States are participating.

We are modernizing benefit delivery, our fourth principle. Today, every State is planning for Electronic Benefit Transfer (EBT) implementation. We have progressed from just six operational sites in 1993 to eighteen today. By the end of this month, eight States will have Statewide systems. Approximately, 16 percent of all food stamp issuance now occurs through EBT. By the end of fiscal year 1998 we anticipate that about 40 States, representing 55 percent of all food stamp assistance, will have EBT in operation.

Expanding State flexibility, our fifth principle, is important because being responsive to the needs of our State partners helps assure their continued effective administration of the Food Stamp Program. The Administration's proposed food stamp reform legislation included provisions striking non-essential proscriptive, statutory requirements governing States' administrative practices. The proposed legislation also included authority for States to operate Simplified Food Stamp Programs for their welfare caseload. These legislative proposals, which were included in welfare reform legislation, were the second half of an earlier and on-going effort to review regulatory requirements and wipe unnecessary ones from the books.

Our sixth principle is promoting personal responsibility. The Administration proposed strong penalties for noncompliance with the program's work requirements and State options to require individuals to cooperate with the Child Support Enforcement program and to meet their obligations to support their children. These improvements were included in welfare reform.

As you can see Mr. Chairman, we have worked hard to reform the Food Stamp Program by retaining the National nutritional safety net, by establishing strong working partnerships with States, by improving program integrity, by expanding EBT, and by promoting personal responsibility.

CHILD NUTRITION PROGRAMS

The Administration has identified the Child Nutrition Programs as critical to fulfilling our national health responsibility. Through the National School Lunch Program, the School Breakfast Program, the Summer Food Service Program, the Child and Adult Care Food Program, and the Special Milk Program, FCS assists State and local governments in providing meals to children in a wide range of settings, including public and private schools, child care centers and homes, and summer recreation programs.

The Administration's fiscal year 1998 budget request seeks reduced funding for the Child and Adult Care Food Program (CACFP) when compared to prior year requests. The primary reason for this change is the method of making reimbursement payments to family day care homes contained in Public Law 104-193, the welfare reform legislation enacted on August 22, 1996. Public Law 104-193 replaced the former single payment rate method with a two-tiered reimbursement structure for family day care home reimbursement payments. As provided for in the statute, this new payment structure will be implemented effective July 1, 1997. The budget has been restructured accordingly.

As you know, we have taken a major step toward meeting our health responsibility through implementing the first full-scale reform of the National School Lunch Program in fifty years. USDA research showed that school meals—and children's diets overall—are too high in fat, saturated fat and sodium. This finding is extremely significant in light of scientific research that establishes the link between these dietary excesses and chronic diseases. We know that obesity, high cholesterol and high blood pressure are diet-related conditions that often begin in childhood. When we began the School Meals Initiative for Healthy Children, studies told us that 9 out of 10 children ate too much fat, too much saturated fat and 30 percent of children ate less than one serving of fruit a day. The effects on their future and on society would be devastating if we did not take action. Diet is associated with 5 out of the 10 leading causes of death in this country, including heart disease, and some cancers. Nutrition-related diseases cost society an estimated \$250 billion a year in medical care and lost productivity.

PART 1

281

The School Meals Initiative for Healthy Children updates the nutrition standards for school meals to be consistent with the Dietary Guidelines for Americans. This historic accomplishment means less fat, less sodium—and more balance—in children's diets. It means a potential improvement in children's health which will potentially have a substantial impact on health care costs and years of life. Estimates of value from similar dietary improvements for adults range from \$4 billion to over \$26 billion over 20 years due to improved life expectancy and reduction in early deaths.

Let me emphasize, however, that we did not simply mandate change on the school lunch plate and then walk away. We took several important steps to support schools, families, and communities in achieving the goal of healthier diets for our Nation's children. The Department dramatically improved the quality and availability of USDA commodities provided to local school districts. For example, reduced-fat peanut butter and cheese were made available to schools, enabling children to still enjoy food they like but in healthier forms.

Team Nutrition, launched in 1995, is a network of public/partnerships designed to promote making food choices for a healthy diet. It is based on the active involvement of over 200 National nutrition, education, health, agriculture and industry supporters and partners. Team Nutrition brings together stakeholders and builds community coalitions to bring healthier school meals and state-of-the-art training and technical assistance nutrition information to children and their families. We already have 17,000 schools serving over 9.8 million children actively participating in Team Nutrition.

Team Nutrition has two major components—technical assistance and training to support school food service personnel in providing healthful meals, and nutrition education to enable children to make food choices for a healthy diet. The technical assistance and training component provides state-of-the-art tools and techniques to improve meals. The nutrition education component is a multi-faceted education program. Team Nutrition uses research and science-based nutrition messages that reach children in a language they understand, building skills and motivating children to make food choices for a healthy diet. These messages have been integrated into the classroom curricula for elementary schools, materials for use wherever children live, learn, and play, including the cafeteria, and at home, as well as into nutrition education messages broadcast on National network media. For example, we have distributed a Tool Kit for Healthy School Meals, including a comprehensive set of new recipes, a training manual and a marketing guide to every school participating in the National School Lunch Program. All States and local school food service agencies have received "Serving it Safe," a training tool for food safety and sanitation. A complete operational kit for Assisted NuMenus has been provided for local schools; and food purchasing at schools has been enhanced with a food specification reference guide called "Choice Plus". We have provided National Healthy School Meals Training Workshops to "train the trainers" in meal preparation, and we have established on-line computer resources and information to support schools in meeting nutrition standards. Through Team Nutrition, we have also provided over \$6 million in Team Nutrition Grants to States to assist in implementation of the School Meals Initiative and will award another \$4 million in grants in 1997. Grant projects have included developing training programs for school food service personnel and a cafeteria classroom link to support nutrition education and healthy food choices. The National Food Service Management Institute is being provided \$800,000 for cooperative agreement work that includes an 800-phone-number help desk and a "Service on Site" project. Both of these efforts bring the services and expertise of the Institute to local food service operations. This training has been very well received by the school food service professionals.

With your support, Team Nutrition has accomplished much toward helping schools to provide healthier meals and to become the focal points for nutrition learning in their communities.

SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

This Administration is committed to making WIC available to eligible women, infants, and children who wish to participate in the program. Mr. Chairman, I would like to express my sincere appreciation for the support this subcommittee has provided the WIC Program.

The strong bipartisan support reflects a recognition of a program that works and works well and is cost effective. WIC makes a positive difference in the health status of low income women, infants and children through the provision of supplemental food packages rich in needed nutrients, nutrition education and counseling, and referrals to local sources of health care. WIC also promotes breastfeeding as the

PART 1

282

feeding method of choice, furnishes drug, tobacco, and alcohol abuse information, and promotes immunization. Studies have documented that participation in the WIC Program results in real improvement in the health of participants, including fewer premature births, a lower incidence of low birthweight, fewer infant deaths, increased likelihood of receiving prenatal care, and improved children's diets.

In recent years, thanks to strong bipartisan support, WIC funding has increased substantially from year to year. In addition, food package cost containment efforts have succeeded in allowing participation to increase substantially. Since the beginning of this Administration, we have added over 1.7 million participants to the program. Our current budget request would allow us to meet the long-standing goal of providing funds to serve 7.5 million persons by the end of fiscal year 1998.

The successful expansion of the WIC Program presents significant management challenges. We fully recognize the need to manage the transition from this period of rapid growth to one of more stable funding and participation. Our budget request is an integral component of our strategy for managing this transition without disruptive swings in participation this year and the next. The supplemental we have requested for fiscal year 1997 would allow for an orderly transition from fiscal year 1997 to fiscal year 1998 by maintaining participation at approximately current levels. Without the supplemental, we believe States will have to reduce participation by several hundred thousand.

We are working with State agencies on better management reporting which will lead to more timely and accurate data and improved systems to forecast demand, needs and costs. FCS has requested that States submit more comprehensive and timely spending and caseload management plans for use in better forecasting of participation trends and in making needed adjustments in caseload to manage within grant levels. We are also working on integrity rules for vendors and studying the funds allocation process to see if it can be made more responsive to need.

FCS will encourage cost control strategies for State use in managing expenditures. Rebate strategies for foods other than just infant formula, selection of food vendors with lower costs and history of good program management, and the use of the most economically allowable WIC foods will continue to be emphasized as major cost containment techniques.

In times when resources cannot meet demand, benefits must be targeted to those most in need. FCS plans to review policy and regulatory requirements to insure more consistent eligibility assessments and to refine States' techniques for effectively targeting benefits.

We will continue to develop new and better strategies and tools to ensure the continued success and effectiveness of the WIC Program, and to guarantee that WIC continues to contribute actively and positively to the preservation of the good health and well being of the Nation's low income, at risk population of pregnant, breastfeeding and postpartum women, infants and children.

COMMODITY ASSISTANCE PROGRAMS

In fiscal year 1996, the Commodity Assistance Programs were reconfigured to combine the Commodity Supplemental Food Program, The Emergency Food Assistance Program and the Soup Kitchens and Food Banks Program. FCS is committed to supporting the agricultural economy while at the same time, providing a nutrition safety net for those most in need. Our fiscal year 1998 request reflects continued support for our commodity programs, including the use of funds made available through the Food Stamp Program for purchasing commodities for distribution to States under the Food Distribution Program on Indian Reservations and the Emergency Food Assistance Program. This change further demonstrates our commitment to streamlining the commodity programs and providing States more flexibility. It also demonstrates our on-going efforts to respond to and better serve the needs of our clients.

In addition, we provide commodities to those in need of as a result of disaster situations. FCS is one of the first Federal agencies on the scene to provide disaster relief.

The Administration also supports food recovery. Food recovery allows us to share food resources that would otherwise be wasted. This activity is accomplished mainly through volunteerism. For example, TEFAP providers generally distribute large quantities of commodities donated by the private sector. Although our budget request does not specifically earmark funds for food recovery, TEFAP administrative funds may be used for this purpose.

PART 1

283

CENTER FOR NUTRITION POLICY AND PROMOTION

USDA's Center for Nutrition Policy and Promotion (the Center) was created on December 1, 1994, as part of the USDA reorganization. The Center is a classic example of how a small amount of resources can be leveraged to better serve the consumer. The best example of this was the release of the Dietary Guidelines for Americans. Our Center led the consumer research and co-chaired the interdepartmental work group with the Department of Health and Human Services that produced this key statement of Federal nutrition policy. This work showed how the Center fulfilled its mission as the focal point within USDA for linking scientific research to the consumer.

This year the Center is fulfilling its mission by completing a set of highly significant products. It is reporting on the nutrient content of the U.S. food supply—a key link in monitoring nutritional status in the United States; it is updating the Healthy Eating Index—a measurement of how well Americans are eating; and it is adapting the Food Guide Pyramid specifically for children. The Center is also positioning itself to launch, in fiscal year 1999, a National nutrition promotion campaign stressing the many consumer-oriented benefits of healthy eating.

RESEARCH AND EVALUATION

The three FCS research accounts are used to determine if policy objectives are met; test innovations; and describe what works, what does not work, and why. These accounts are instrumental in enabling the Agency to respond to the oversight responsibilities of Congress and have a proven track record of improved government performance. For example, FCS research made critical contributions to the emergence and expansion of Electronic Benefit Transfer, supporting the first demonstrations of feasibility and cost-effectiveness; helped to fight fraud and abuse and improve program operations, generating the first, and only, data-based estimates of the prevalence of food stamp trafficking and WIC overcharging practices; documented the Federal cost savings associated with participation in the WIC program; and, provided the foundation for historic changes in the school nutrition programs by determining the nutrients available in the school lunch and breakfast programs.

With the funding requested for fiscal year 1998, the Agency will be able to support efforts to help States identify effective ways to design programs using the new flexibility provided by welfare reform and understand the consequences of change, continue critical updates of basic program information; address fully Congressional questions about the impact of legislative changes on family day care homes; and collect and analyze data to provide Congress with outcome measures of program performance.

The relatively small expenditures made on research will help to protect the \$40 billion investment made in the Federal nutrition programs. Without such research support, we run the risk of making crucial policy decisions without adequate knowledge of the consequences.

FOOD PROGRAM ADMINISTRATION (FPA)

The FPA appropriation funds most of the salaries and expenses of the Food and Consumer Service, and is the critical account that ensures the effective use of other program appropriations. Efforts of Agency staff have resulted in progress toward improving the nutrition of program participants, strengthening program integrity, and implementing EBT Nationwide. These results were achieved despite staff reductions which in 1995 enabled FCS to meet its fiscal year 2000 streamlining target in accordance with the National Performance Review and the Vice President's goal of reducing the Federal work force. In spite of declining staff and overall systems resources, we have made significant improvements to our financial management operations. Our efforts have resulted in tighter controls over our financial resources and financial statement preparation. We are pleased with our progress to date. However, as a result of recent FPA funding reductions, FCS is now only able to deploy staff from crisis to crisis, which is proving insufficient for effective program administration.

Historically, the FPA account has been funded below the President's request. The fiscal year 1998 administrative request is a "bare bones" request. The Agency simply cannot sustain additional reduction in staff or funding without seriously impairing its ability to provide children and low-income families access to our Food Assistance Programs and provide basic program integrity oversight. Mr. Chairman, our administrative budget is less than one-third of one percent of total FCS budget authority. Providing less funding than our request may place billions of Federal dollars at risk to increased program fraud and abuse. In fact, our ability to prevent as well as re-

PART 1

284

solve problems identified in the past by GAO depend in part on sufficient administrative funding. The Food and Consumer Service, funded at the requested level, will continue serving as a model for Federal government efficiency.

CONCLUSION

Mr. Chairman, I would like to take this opportunity to thank you and members of this Subcommittee for your continued support of our Nutrition Assistance Programs. With your support, we have had remarkable success in alleviating hunger and promoting healthier diets for children and low income families. We have made dramatic changes—changes that will have a lasting effect on the recipients of our programs. Our fiscal year 1998 request reflects our continued efforts to provide a nutritional safety net for Americans and to provide adequate oversight of these programs. This concludes my statement. The testimony of William Ludwig, Administrator for the Food and Consumer Service presents more of the technical aspects of our request. Additional information on the Center will be provided by Eileen Kennedy. I request that both statements be submitted for the record. I will be happy to answer any questions that you may have.

PREPARED STATEMENT OF WILLIAM E. LUDWIG

Mr. Chairman, thank you for the opportunity to appear before this subcommittee to discuss the fiscal year 1998 budget request proposed for the U. S. Department of Agriculture's Nutrition Assistance Programs and the Food and Consumer Service (FCS). As the Administrator of FCS for the last three years, I want to take the opportunity to point out the exceptional performance of the agency during a period of extraordinary change and diminishing resources. Just in the past year, FCS has begun implementation of the historic changes effected by Welfare Reform, significantly improved its financial management and continued the expansion of the School Meals Initiative for Healthy Children. During this time, EBT has grown from a small experiment to the method for Food Stamp Benefit issuance. All of these major efforts have been accomplished with a declining staff, while many requirements, such as those in financial management, have continued to increase. I cannot say enough about the extraordinary efforts of the FCS staff under these difficult circumstances.

BUDGET REQUEST 1997 SUPPLEMENTALS

I want to begin my testimony on the particulars of the President's Budget request by discussing the need for supplemental appropriations for fiscal year 1997 in the Women, Infants and Children (WIC) and Nutrition Education and Training (NET) Programs.

A supplemental appropriation of \$6.25 million is needed in Child Nutrition to complete funding for NET. The cost of this supplemental is fully offset by a one-time reduction in food stamp funding for commodity purchases for The Emergency Food Assistance Program (TEFAP). We have recently shifted \$3.75 million from Team Nutrition to NET to continue the program in fiscal year 1997 until you can act on our supplemental request. The Appropriations Act for fiscal year 1997 did not include funds for NET because the program was funded by a permanent appropriation when the Appropriations Act was passed. The permanent appropriation was repealed by the subsequent enactment of Welfare Reform. We believe that it was an oversight that NET received no funding in fiscal year 1997. We are pleased that we were able to provide stop-gap funding to maintain the long-established network of State NET coordinators until the Congress can act on our supplemental request.

A supplemental appropriation of \$100 million is needed for the WIC program to assure that participation is maintained throughout fiscal year 1997 at approximately 7.4 million, the fiscal year 1996 year-end levels. Without the supplemental, WIC will experience a significant reduction in participation during 1997. This, in turn, would negatively impact our ability to meet 1998 goals for full funding in an orderly manner. This extremely cost effective program has benefited many needy and vulnerable people for many years. Since its modest start in 1972, the number of women, infants and children receiving food and health care, and achieving healthier lives has grown from a few thousand to last year's year-end level of 7.4 million. WIC is making a real difference in the health of pregnant women and infants, thus saving large health care costs in future budgets. Without this supplemental, participation could decline by several hundred thousand women, infants, and children. We are requesting that the Secretary be provided discretion to distribute funds among States outside the current regulatory funding formula. We would

PART 1

285

use this discretion to avoid disrupting service to high priority participants and ensure that States avoid large participation drops.

1998 BUDGET REQUEST

The Food, Nutrition, and Consumer Service requests \$40.6 billion in new budget authority in fiscal year 1998. This includes contingency reserves of \$2.5 billion for the Food Stamp Program and \$100 million for the Supplemental Nutrition Program for Women, Infants, and Children (WIC). The request is a decrease of \$258 million below the fiscal year 1997 appropriation level, based on continuing economic improvement and welfare reform. The President's 1998 request also contains policy proposals that will ameliorate some of the harsher aspects of welfare reform.

FOOD STAMP ACCOUNT

The Food Stamp account now contains funding for the Food Stamp Program and its alternatives, the Nutrition Assistance Program for Puerto Rico and the Food Distribution Program on Indian Reservations. Welfare Reform legislation also added section 27 to the Food Stamp Act which provides Food Stamp account funding for commodity purchases for TEFAP.

The Food Stamp Program is the primary source of nutrition assistance for low-income Americans. The mission of this nutrition security program is to assure low-income Americans access to a nutritious, healthful diet through food assistance and nutrition education, thereby improving the nutritional status of low-income households and strengthening the agricultural economy. We are requesting \$27.6 billion for the Food Stamp Program, including a contingency reserve of \$2.5 billion that will ensure available funding for any unforeseen circumstances, such as economic disturbances, natural disasters and Welfare Reform changes in the cash assistance programs that could lead to fluctuations in Food Stamp costs. Our request also includes \$1.2 billion for the Program of Nutrition Assistance for Puerto Rico, as well as funds for nutrition assistance for the Northern Marianas and American Samoa.

Under the current economic forecast for fiscal year 1998 we project that: The average rate of unemployment is expected to be 5.5 percent in 1998; program participation will average 23.4 million persons monthly in 1998; and the Thrifty Food Plan, will be \$415.00 for a family of four. These factors will result in an average monthly benefit of \$77.27 per person.

The number of program participants declined throughout fiscal year 1996, an indication of a strengthening economy. Throughout most of fiscal year 1996 and continuing into the early months of 1997, the number of food stamp recipients remained at approximately 1 million less each month than participation was for the same month in the previous year. This steady decline, which started in August of 1994, resulted in the Food Stamp Program spending \$3 billion less than it would have had participation not declined. This trend reflects the Food Stamp Program's ability to respond to changing economic conditions, expand in times of rising poverty and unemployment, and shrink as the economy improves.

The requested benefit reserve takes on new importance in light of dramatic changes effected by welfare reform. States have a great deal of latitude in implementing these changes. Welfare Reform has given States broad new authority under the Temporary Assistance for Needy Families block grant. The choices States make concerning the level and form of benefits provided can affect Food Stamp Program costs dramatically. For example, if States decide to reduce cash assistance, food stamp costs will increase. The benefit reserve serves as insurance in the event of unforeseen changes in the implementation of Welfare Reform. The benefit reserve provides the mechanism to protect the program's ability to get food to people who need it and to ensure that benefits will continue to be available for eligible low-income children, elderly, families and individuals.

FOOD STAMP PROGRAM PROPOSALS

The Personal Responsibility and Work Opportunity Reconciliation Act of 1996, signed by the President on August 22, 1996, is a historic law, for it has dramatically changed the cash welfare system. It promotes self-sufficiency and personal responsibility, it enhances State flexibility, it simplifies program administration, and it strengthens program integrity.

However, the President has also said that some provisions will cause unfair and unwarranted harm to many families. Our food stamp legislative proposals address those concerns within the fiscal constraints of balancing the budget by fiscal year 2002.

—They will create a real work requirement for unemployed adults by significantly increasing work opportunities, providing funds to create work slots so that al-

PART 1

286

most all individuals subject to the time limit who are unable to find employment would be offered a work slot, and establishing a tough sanction so that individuals are forced to make the choice of living up to the responsibilities of accepting food assistance or becoming ineligible for the program.

- They delay the implementation and deadline dates for removing legal resident participants from the program to help ensure a more orderly implementation and allow immigrants additional time to seek naturalization.
- By fiscal year 2002, our proposals will eliminate the cap on the excess shelter expense deduction to help families with children who have high shelter expenses.
- They will resume indexing the standard deduction in fiscal year 2002 to prevent further decline in the real value of this deduction.
- They will raise and index the vehicle fair market value exclusion, recognizing that access to reliable transportation is critical to finding and keeping employment.

We estimate that these proposals will increase Food Stamp Program costs by \$365 million in fiscal year 1997 and \$805 million in fiscal year 1998.

FOOD STAMP PROGRAM ANTI-FRAUD ACTIVITIES

Combating fraud and abuse in the Food Stamp Program remains a high priority of this Administration. Our strategy is to prevent fraud by ensuring that only legitimate stores participate in the Food Stamp Program and by strengthening penalties against those entities that violate program rules. USDA has also moved forward under new and existing statutory authority to enhance our ability to eliminate program violators and better enforce fines and penalties.

Our request supports measures that will eliminate retailers who misuse benefits and remove barriers to EBT expansion—both of which will strengthen the link between the Food Stamp Program and a healthful, nutritious diet. The Administration believes that the actions currently underway will provide significant deterrent to food stamp fraud.

We initiated a contract in fiscal year 1997 to use private vendors to increase the number of pre-authorization visits to stores wanting to participate in the program. Visits under this contract will begin this summer. Our fiscal year 1998 budget includes funding to continue contracting with private vendors to increase the number of on-site retailer visits and related FCS expenses. Funds for both years will finance contracts for pre and post authorization visits by contractors and related expenses such as follow-up visits by FCS staff and increased reviews of appeals from those stores denied participation in the program. These on-site visits are an important part of our efforts to ensure that only eligible stores are allowed to accept food stamps and restore confidence in the Government's management of the program. This requested funding will be used to ensure initial and continued store eligibility. FCS will continue to aggressively fight Food Stamp fraud and abuse. Administratively, the Agency will also continue to work on its own as well as with OIG and State and local officials to eliminate ineligible stores from the program. Over the past two years, the number of stores authorized to accept food stamps has declined from over 210,000 in September, 1994 to about 193,000 today.

FOOD STAMP PAYMENT ACCURACY

Payment accuracy will continue to be a major management focus. I am pleased to report to you that the States and my Agency, working together, have brought food stamp payment error down from 10.8 percent in 1993 to 9.7 percent. This has averted erroneous payment of nearly \$350 million in the last couple of years. However, 9.7 percent is still too high and we are concerned that the complexity of implementing Welfare Reform may distract State managers from continuing our successful campaign to reduce error rates. We will redouble our effort so that we can come back in future years and continue to bring you good news on error rates.

ELECTRONIC BENEFITS TRANSFER

In fiscal year 1998, the Administration will keep expanding the electronic delivery of Food Stamp Program benefits. Electronic Benefits Transfer (EBT) systems modernize delivery cost-effectively while improving recipient service, State management, benefit security, financial tracking, and fraud detection. EBT operates like a debit card system for recipients' food accounts.

All States have the option to use EBT and 18 States have already implemented EBT systems, delivering 15 percent of all Food Stamp Program benefits. Eight States—Maryland, New Mexico, South Carolina, Texas, Kansas, North and South Dakota and Utah—have Statewide EBT systems. Every other State is in the process

PART 1

287

of planning for or implementing EBT. This represents enormous progress in the last three years and demonstrates a growing consensus that EBT is effective and efficient. We will eventually eliminate paper coupons along with the stigma associated with using them and the inefficiencies of processing them. EBT not only supports the nutritional purpose of our program with a user friendly system, but is also beneficial for every stakeholder involved. Recipients, States, stores, banks, and the taxpayers all win.

FOOD STAMP TAX OFFSET EXPANSION

We are progressing in our efforts to expand the agency's debt collection efforts. In fiscal year 1991, the Department initiated a test for collecting claims that resulted from household error through Federal income tax refund offsets. Between calendar year 1992 and 1995, the number of participating States grew from 2 to 32 and collected a total of \$70 million. In calendar year 1996, 40 States participated and collected \$40 million in the Tax Offset Program. Collections from this program are estimated at \$35 million in fiscal year 1998. Welfare Reform has given FCS the authority to continue expanding this collection tool and we are encouraging all States to participate.

THE FOOD DISTRIBUTION PROGRAM ON INDIAN RESERVATIONS (FDPIR)

This program, a variant on the delivery mechanism of benefits under the authority of the Food Stamp Act, has recently begun to grow after several years of decline. There is currently \$65 million available in fiscal year 1997 and \$75 million is requested for fiscal year 1998. With the high unemployment in many FDPIR areas, concurrent with operation of food stamps, and the potential for Welfare Reform waivers of food stamp work requirements, we are not sure how much more growth to expect.

CHILD NUTRITION PROGRAMS

The purpose of the Child Nutrition Programs is to assist State and local governments in providing food services that serve healthful, nutritious meals to children in public and nonprofit private schools, child care institutions, certain adult day care centers, and summer recreation programs. We are requesting a total of \$7.8 billion for the Child Nutrition Programs. The request is \$870 million lower than the 1997 appropriations because we anticipate funds will be available from 1997. Welfare Reform legislation changed the rates paid per meal in the lunch and breakfast programs by rounding down the payments to the nearest cent and made substantial changes in the eligibility criteria for the Child and Adult Care Food Program and its payments structure. This budget request will provide the funding necessary to support the National School Lunch, the School Breakfast, Summer Food Service, the Child and Adult Care Food and the Special Milk Programs. We estimate that in fiscal year 1998 these programs will support: 4.4 billion school lunches, 1.2 billion school breakfasts, 1.7 billion meals in centers and family day care homes, 144 million summer food service meals, and 154 million half-pints of milk.

This request reflects the administration's commitment to improving the nutritional status of the Nation's children. FCS will also continue its efforts to streamline the administration of the Child Nutrition Programs at the State and local levels through promulgation of regulations and policy issuances affecting each of the programs.

SCHOOL MEALS INITIATIVE FOR HEALTHY CHILDREN

The USDA School Meals Initiative for Healthy Children is a comprehensive integrated plan to ensure that children have healthy meals at school. A major part of this plan is the historic update of nutrition standards so that school lunches and breakfasts meet the Dietary Guidelines for Americans. However, just enacting policies will not make this change a reality for every child, and USDA cannot accomplish this historic change alone. That is why USDA established Team Nutrition, a Nationwide integrated program designed to support implementation of the School Meals Initiative for Healthy Children.

The mission of Team Nutrition is to improve the health and education of children by creating innovative public and private partnerships that promote food choices for a healthful diet through the media, schools, families, and the community. It supports implementation of updated nutrition standards through two coordinated approaches—Nutrition Education and Training and Technical Assistance.

Nutrition Education is provided through a comprehensive, integrated program designed to build skills and motivate children to make food choices for a healthy diet

PART 1

288

in accordance with the Dietary Guidelines for Americans. This effort brings proven, focused, science-based nutrition messages to children in a language that they understand while strengthening social support for healthy children's diets among parents, educators, and food service professionals.

Team Nutrition is built around a framework of in-school and public communication efforts, with a focus on local schools and communities to support implementation of updated nutrition standards. Innovative educational resources are developed and distributed through supporter networks, directly by FCS and USDA's Cooperative State Research, Education, and Extension Service, and through other government agencies such as the Department of Education and the Department of Health and Human Services. Support is focused at the local level through Team Nutrition Schools, which actively engage children and their parents, food service staff, teachers, agricultural organizations, and other leaders in their communities to improve school meals. There are now over 17,000 Team Nutrition Schools across the country, and the number continues to grow.

Training and Technical Assistance is a "change-driven" program providing support to school food service personnel implementing the Dietary Guidelines for Americans. This effort will ensure that school nutrition and food service personnel have the education, motivation, training, and skills necessary to provide healthy meals that appeal to children and meet USDA's nutritional requirements. These personnel will also have a clear vision of their role in the school community and as integral team members of comprehensive school health programs.

In fiscal year 1998, FCS requests \$10 million for this two-pronged effort. These funds are critical to supporting schools' efforts toward achieving full implementation of the Dietary Guidelines in school meals. We will use the funding to support several important activities. Team Nutrition will continue to provide technical assistance and training for food service professionals and nutrition information that empowers children and families to make healthy food choices. We will accentuate the importance of public-private partnerships in order to maximize the Federal dollars available for this endeavor. The number of Team Nutrition schools will continue to grow, engaging additional children and their families, teachers, food service staff, agricultural organizations and other community leaders in improving school meals.

CHILD NUTRITION INTEGRITY

In keeping with the Department's commitment to make our programs more effective, FCS aggressively pursues suspension and debarment actions whenever suitable cause exists. To that end, FCS formed a task force dedicated to this effort and joined forces with the Department of Justice and the Defense Logistics Agency to identify offenders. At the time of our budget request, FCS had identified 221 individuals and corporations subject to suspension and debarment determinations; actions had been initiated against 202. Final administrative action had been taken in 159 cases with 80 entities debarred for 3 years from involvement on a nonprocurement basis with all Federal Programs. Compliance agreements aimed at protecting the Federal interest had been signed or were under discussion for 51 other corporations. FCS will continue to pursue appropriate debarment action as necessary.

Furthermore, coordinated review efforts attempt to improve school management of the National School Lunch Program through evaluation of the local meal service data and provides training and technical support to help improve local program accountability. Reviews have been conducted at over 7,000 schools.

SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS & CHILDREN (WIC)

The purpose of the WIC Program is to improve the health of nutritionally at risk, low-income pregnant, breastfeeding and postpartum women, infants and children up to their fifth birthday. The Budget requests \$4,108 million in 1998, an increase of \$378 million over the 1997 appropriated level. The size of the increase over 1997 is somewhat misleading, however, for several reasons. One, it does not reflect the proposed 1997 supplemental request of \$100 million. Two, it includes a contingency fund of \$100 million to guard against unanticipated food price costs. The contingency fund is assumed to have no outlays. Three, reductions in carryover funds from \$145 to \$100 million in 1997 provide \$45 million in additional program resources in 1997. Since carryover is assumed to remain constant at \$100 million in 1998, an additional \$45 million in Budget Authority is needed to maintain the same program level in 1998. When these three factors are accounted for, the Budget Authority request increases by only \$133 million between 1997 and 1998. Over \$100 million of the increase is needed to cover inflationary increases in program costs. Only about \$30 million is used to expand participation in 1998.

PART 1

289

During fiscal year 1996, the program continued to provide service to low-income women, infants and children at nutritional risk. Average participation in WIC for fiscal year 1996 was 7.2 million persons per month. For fiscal years 1997 and 1998, average participation is estimated at 7.40 and 7.45 million persons per month, respectively.

A major reason for WIC's success has been access to health care as well as an emphasis on nutrition education and provision of supplemental foods. Emphasis is placed on the benefits of breastfeeding, as well as the dangers of substance abuse including smoking during pregnancy. WIC also serves as a gateway to other related health and social services, such as prenatal care, well-child care, Medicaid, and immunization programs. Studies published by USDA and other groups have found that participation in WIC is highly cost effective and results in improved birth outcomes and reduced health care costs. During the past seven years, participation in this program has increased by over 70 percent, with the largest increases being in children's participation.

WIC COST CONTAINMENT INITIATIVES

All WIC State agencies and most Indian Tribal agencies have implemented some measure of cost containment activities in order to use their food grants more effectively. The use of infant formula rebates continues to be the most successful cost containment method. This subcommittee's support for WIC appropriations is evident from the program's growth. However, we cannot ignore contributions from successful cost containment efforts. This activity will help USDA to reduce formula cost by over \$1.2 billion in fiscal year 1997 which in turn allows the program to reach 1.7 million more participants each month.

WIC FUNDING ALLOCATION FORMULA

The Department is requesting authority to waive selected aspects of the grant allocation formula while awaiting regulatory revision. The current formula worked well when the program was growing rapidly. It is less well suited to allocating funds among States as the program moves closer to the goal of full funding. The rule making will update the formula to better serve the needs of a more stable full-funded program.

COMMODITY ASSISTANCE PROGRAMS

The Commodity Assistance Programs combines funding for the Commodity Supplemental Food Program (CSFP), administrative funding for The Emergency Food Assistance Program (TEFAP), The Nutrition Program for the Elderly (NPE) and Pacific Island Assistance. The budget requests:

- \$86 million in support of 123,900 women, infants, and children and 187,600 elderly in CSFP. In contrast to fiscal year 1997, when \$16 million of fiscal year 1996 funding was available to support this program, no funds from fiscal year 1997 are available for program operations in fiscal year 1998. This budget request will therefore necessitate a reduction in elderly participation.
- \$45 million for TEFAP administrative expenses plus the \$100 million available in the Food Stamp Account, allowing for a total program cost of \$145 million.
- \$140 million for NPE, which will fund an estimated 248 million meals at a payment rate of 56.4 cents per meal.
- \$1.2 million for Pacific Island Assistance, which will fund the nuclear affected islands, disaster relief for non-Presidentially declared disasters and the Freely-Associated States. This reduced funding is consistent with the phase-out of the Freely Associated States.

RESEARCH AND EVALUATION

The fiscal year 1997 appropriation severely restricted the funds available for research and evaluation on the grounds that the number of studies underway at FCS appeared high. The President's budget request includes \$17 million to partially restore these accounts to their historic levels.

There is a critical need for research and evaluation. FCS research is used to determine if policy objectives are met and to describe what works, what doesn't, and why. Research activities are instrumental in enabling FCS to respond to the oversight responsibilities of Congress; provide assistance to States to identify and share best practices; measure the effectiveness of program operations and alternatives; and provide objective, reliable outcome measures of program performance.

The Agency's research has a proven track record of improved government performance. For example, FCS research has:

PART 1

290

- Made critical contributions to the emergence and expansion of EBT, supporting the first demonstrations of feasibility and cost-effectiveness;
- Helped fight fraud and abuse by generating the first, and only, data-based estimates of the prevalence of food stamp trafficking;
- Determined the nutrients provided to school children in school lunches and breakfasts, leading to the first update of nutrition standards in school nutrition programs in 50 years; and
- Documented every dollar invested in prenatal WIC participation saves an average of \$3 in Medicaid costs during the first 60 days after an infant's birth.

The number of studies may appear large because we deal with multiple programs that are highly complex with many stakeholders and policy audiences, and we face a broad array of research issues related to food security, work, health, family, economic well-being, program management and program integrity. Our studies collect impartial and relevant data, use techniques that meet the highest standards of accepted scientific practice, and provide objective analyses. The investment in FCS research has proved beneficial over the years. We serve the needs of many audiences, and the technical credibility of our products is well established.

With the funding requested in the President's budget, the Agency will be able to:

- Expand efforts to assess the consequences of Welfare Reform on Food Stamp and Child Nutrition Program clients;
- Continue critical updates of basic program information, including the characteristics of food stamp participants and changes in nutrients available in school nutrition programs following the School Meals Initiative meal pattern improvements;
- Focus WIC research on improving program management and efficiency and improve WIC eligibility determination tools as recommended by the Institute of Medicine; and
- Expand development of cost-effective ways to improve program integrity and reduce administrative costs, focusing on operational improvements to reduce error and fight trafficking. Additional funds would enable extensions of ongoing work on recipient and retailer trafficking to better target investigations.

Restoring the investment in FCS research is critical in light of Welfare Reform, the most sweeping set of changes in social policy in the last 60 years. Congress needs to make an investment in policy-relevant research.

Our research request of \$17 million represents less than one half of one tenth of one percent of our investment in our programs. This is a tiny investment to provide vital information about how effectively we are spending \$40 billion annually.

GOVERNMENT PERFORMANCE AND RESULTS ACT

We have developed a five-year Strategic Plan in response to the requirements under the Government Performance and Results Act (GPRA) of 1993. This Strategic Plan defines the Agency's goals and objectives for all its nutrition assistance programs as well as administration and financial management. Each goal and objective is accompanied by one or more performance measures. In addition, we are developing the Annual Performance Plans required by GPRA. These plans are derived from the Strategic Plan and their activity outcomes are designed to contribute directly to meeting the Agency's strategic goals and objectives. We are also coordinating strategic planning with other agencies within the Department as a part of a USDA-wide effort to improve nutrition assistance and education.

FOOD PROGRAM ADMINISTRATION

Funding for the Food Program Administration is requested in the amount of \$105.5 million. The FPA appropriation funds the majority of the salaries and administrative expenses of FCS, although a small portion of these expenses are funded from program appropriations. The efforts of agency staff during fiscal year 1996 resulted in progress toward improving the nutrition of program recipients, strengthening program integrity, and implementing EBT Nationwide. However, due to restrictive staff year ceilings in the Food Stamp and Child Nutrition accounts, and continuing yearly reductions of 60 to 80 staff years in the FPA appropriation, we have only been able to deploy staff from crisis to crisis, which is making continuous, effective program administration nearly impossible.

The administrative resources required to keep pace with changing program needs and to implement new financial management initiatives such as: Federal Financial Management Improvement Act, Government Performance and Results Act, Government Management and Results Act, Debt Collection Improvement Act, Cash Management Improvement Act, and the Chief Financial Officers Act have further strained available staff years. Outside authorities, including GAO and OIG, have

PART 1

291

consistently called for additional staff to improve program oversight. Clearly, ensuring proper fiscal and program management for an agency managing over \$40 billion in program funds must be a top priority.

While the agency has struggled to maintain adequate program oversight by prioritizing its work and implementing numerous efficiencies, the dramatic loss in staff has stretched available FPA resources to the breaking point. It is imperative that FCS maintain a steady work force to meet the challenges of nutrition program delivery and keep up with new legislation such as Welfare Reform. Further resource reductions will most certainly result in increased risk to program integrity and possibly require significant organizational changes, including closure of Regional offices and reduction of program oversight functions.

Without the necessary staff to properly implement, control, and maintain accountability over FCS program funds, Federal oversight, financial reporting, and fiscal management to protect Government interests will suffer. FCS long ago met its fiscal year 1999 streamlining target in accordance with the National Performance Review and the Vice President's goals of reducing the Federal work force. The FCS administrative budget is a "bare bones" request. For the past several years, we have requested increases, which were not approved by the appropriations committees. This year's request is nothing more than last year's funding level plus half the inflation needed to offset mandated salary increases. No funding is requested for updating the agency's automated infrastructure, which demands attention. The agency simply can not sustain additional reductions in staff or funding without seriously impairing its ability to provide children and needy families with access to a more healthful diet through its Food Assistance Programs, nor can we maintain adequate vigilance over the resources entrusted to us by the Congress on behalf of the American taxpayer.

CONCLUSION

Since its inception in 1969, the goal of FCS has been to provide food and nutrition assistance for the Nation's children and low-income families. We are committed to achieving this goal as efficiently and effectively as possible. We believe that our request of \$40.6 billion and each proposal contained therein is crucial to continued efficient program operations.

Mr. Chairman, this summarizes the fiscal year 1998 FCS budget request. I will be happy to answer any questions that you may have.

PREPARED STATEMENT OF EILEEN KENNEDY

Good morning Mr. Chairman and Members of the Committee. I am Dr. Eileen Kennedy, Executive Director, of the Center for Nutrition Policy and Promotion (the Center) within the Food, Nutrition, and Consumer Service mission area of the U.S. Department of Agriculture. I am delighted to tell you about the exciting and innovative work our Center is doing and planning for the Department and for all Americans.

As the lead Federal Agency in human nutrition, the Department is charged with developing nutrition policy and conducting science-based nutrition education programs for all Americans, including those involved in Food Assistance Programs. Our Center, established in 1994, is the Department's focal point for linking scientific research to the consumer. It accomplishes this mission by developing and analyzing National survey data on food consumption, nutrient content of the U.S. food supply, food groups and recipes; by analyzing trends and determinants of dietary behavior, including responsiveness to consumer-oriented nutrition promotions; and assessing impacts of alternative approaches to improving the nutritional quality of American diets. To continue this work in fiscal year 1998, we are requesting \$2.499 million for the Center.

The Center is an exciting model of how the Federal government can be reinvented to leverage a relatively small investment into impressive achievements. Capitalizing on its multi-disciplinary, highly motivated and diverse staff, in fiscal year 1996, the Center produced (1) the "Nutrition Action Themes for the United States" that supported the U.S. delegation at the World Food Summit in Rome, Italy; (2) the report, "Expenditures on Children by Families" used by 50 percent of States in setting foster care payments; (3) food plans, including the Thrifty Food Plan, that constitute the basis for the Food Stamp Program benefits and military food cost allowances; and (4) "The State of Nutrition Education: A Report to the Secretary" that provided the first self-assessment of the Department's nutrition education programs and helped formulate a nutrition education policy for the 21st Century that meets the requirements of the Government Performance and Results Act.

PART 1

292

As a result of the Center's activities, Americans have a better understanding of good nutrition and a good diet. For example, recent survey data indicate that 60 percent of Americans recognize the Center produced Food Guide Pyramid. In addition, because the Center's activities and long rich history of nutrition education within USDA, significant, positive changes in the American diet are occurring. The percent of calories from fat has dropped from 40 percent to 33 percent. However, the challenge of improving the American diet continues. A government review in the summer of 1994, indicates that at the current rate of change, we will not meet the Year 2000 goals for reductions in fat and saturated fat. Continued efforts in nutrition promotion are critical. Within USDA, the Center will have a key role in nutrition promotion for all Americans.

The Center achieves its accomplishments using a few key strategies. First, a dynamic core of analysts from the disciplines of nutrition, food science, agricultural and consumer economics, social marketing, and computer and telecommunication specialties permits the Center to conduct significant in-house analysis and produce appropriate products for a variety of key customers. Second, the Center leverages its relatively small resources by entering into partnerships and alliances. For example, the Center spearheaded the "Community Nutrition Action Kit" by working with the Cooperative State Research, Education, and Extension Service to bring state-of-the-art nutrition education into every county in the Nation. This cost-effective project produced 35 fund and interactive activities for children, their families and their communities to promote food choices for a healthy diet. For another example, the Center represented the Department in the Dietary Guidelines Alliance—a new alliance of food industry, health organizations, and government to help consumers implement "The Dietary Guidelines for Americans." The Alliance's consumer-tested messages will be highlighted in March 1997 during National Nutrition Month.

In fiscal year 1997, the Center embarks on an enhanced mission to provide a vision for the 21st Century of how the Department of Agriculture can effectively apply science-based research from nutrition, economics, consumer marketing research, and other relevant disciplines to the challenge of recreating U.S. nutrition policy for a new Century. The Center is executing a strategy for identifying the needs of its most important customers—including decision makers and news makers who help disseminate messages—to provide them with targeted information in the form they can use best. Working with many close partners, the Center is completing a set of highly significant products—Thrifty Food Plan, Nutrient Content of the U.S. Food Supply, the new Healthy Eating Index, a new monthly series of briefs. At the same time the Center is updating the research base supporting the Food Guide Pyramid, planning for the next edition of the Dietary Guidelines, and positioning itself to launch a National nutrition promotion campaign stressing the many consumer-oriented benefits of healthy eating to coincide with the release of the next Dietary Guidelines in the Year 2000.

The Nation is now aware that nutrition is the link between diet and health. Four of the leading causes of death in the United States are linked to diet. Heart disease, cancer, stroke, and diabetes account for more than 1.4 million deaths annually, nearly two-thirds of the U.S. total. Diet also plays a role in other health conditions such as overweight, hypertension, and osteoporosis, which can reduce the quality of life and productivity and contribute to premature death. Taken together, these seven diet-related health conditions cost society an estimated \$250 billion each year in medical costs and lost productivity.

Improving the diets of all Americans can reduce early deaths, improve the quality of life and increase market opportunities for new food products and technologies. For example, Americans are currently eating too much saturated fat. Reducing the percentage of calories consumed from saturated fat by 3 percentage points could prevent about 100,000 new cases of coronary heart disease by the year 2005 and save nearly \$13 billion in medical costs and lost earnings.

By providing timely and insightful analysis to decision makers, by forecasting dietary trends, by promoting consumer-oriented nutrition messages, and by working collaboratively with key stakeholders in the food, agriculture and health fields, the Center can continue to leverage its modest resources and help Americans enjoy healthier diets and lives.

Mr. Chairman, this concludes my testimony. I will be happy to answer any questions that you may have.

WIC FARMERS MARKET NUTRITION PROGRAM

Senator COCHRAN. I know that Senator Leahy is a member of the Judiciary Committee, which is meeting as we speak on other is-

PART 1

293

sues, and may have to leave early. I am going to call on him at this point, if our distinguished ranking member has no objection, for any opening statements or questions that he may have.

Senator Leahy.

Senator LEAHY. Well, Mr. Chairman, I appreciate that courtesy. I know how much I enjoyed and have enjoyed working with you on the authorizing committee, both in years when either you have been chairman of various subcommittees and I have been ranking member or I have been chairman and you have been ranking member. We have worked closely together.

I am going to ask a question regarding my strong support of the WIC Farmers Nutrition Program. What this does, for those not aware, is to set up farmers markets that allow WIC families to buy from these farmers markets.

In my own State, that means a lot of them get the most nutritious and fresh food, but it also has the added advantage that if we are spending those WIC dollars, it is going right to people in the area. It has kind of a plus-plus situation with it.

FARMERS MARKET NUTRITION PROGRAM—EXPANSION

The President requested a funding increase, which I support, but I want to make sure that if we add increases, Vermont is going to be in good shape on this. But I want some money to go to States not yet in this program, if they want to.

Will you be able to take steps, if we do get more money, to be sure that this program reaches more States? My wife and I go to a couple farmers markets near where our home is in Vermont.

The chairman has visited that area with me a couple different times. And I just see the tremendous benefit. Every farmer there tells me how helpful it has been.

Will we be able to expand this?

Ms. KEEFFE. Senator, we are very hopeful that we will. In terms of the request that we have made for the Farmers Market Program this year, we foresee that we would be able to expand. We would have a little over \$2 million of that money earmarked for that purpose.

The priorities in the Farmers Market Program are, first, that we are able to meet the current levels of funding in current States that are already in the program.

The second priority is granting expansion requests within those States, and the third level is bringing new States into the program. We feel that with the increase that we have requested, we will be able to meet all of these priorities and will be able to expand.

We have had requests from a half dozen States that are interested in coming into the program. We are very excited by that.

WIC SUPPLEMENTAL FUNDING

Senator LEAHY. Well, I would encourage any States that have the opportunity to do so. I really think it is a win-win situation. The WIC participants are getting used to buying locally produced products, usually fresher, but it is also helping the local economy.

I testified that 400,000 participants may have to be taken off WIC unless the supplemental is approved. What States would be hurt the worst? Which States would be hurt the worst? Do we have

PART 1

294

that kind of a breakdown? And if not, could it be supplied for the record?

Mr. BRALEY. Senator Leahy, we have done our own analysis and we have also asked the States for their plans of how they would likely react to the current level of funding in the WIC Program.

A significant number of States have reported that they will have to reduce their participation below current levels. I believe the number is about nine geographic States.

We have Indian State agencies as well that are reporting the need to reduce their participation by more than 5 percent, some of them well above even a 5-percent reduction.

Those are fairly optimistic scenarios that the States have provided us. We think that because States will not be able to spend every dollar they have this year, that actual participation reductions would be even more severe than reported by the States.

We expect quite a few States would have to make major reductions in participation between now and the end of the year.

Senator LEAHY. Thank you.

ELECTRONIC BENEFITS TRANSFER [EBT]

And how are we doing on EBT?

Ms. KEEFFE. We are very proud of our progress in EBT, Senator. Currently, we have 18 States that have EBT operations. There are eight States where EBT is operating on a statewide basis. Currently, about 15 percent of all total benefits are provided via EBT.

By the end of fiscal 1997, we estimate that 25 States will be operational, and we will be delivering 30 percent of benefits via EBT. It is moving quite rapidly. We expect to attain the goal of being completely EBT operational by the year 2002.

Senator LEAHY. Good. Thank you.

I will put the rest in the record, Mr. Chairman.

Senator COCHRAN. Thank you very much, Senator, for your participation and your leadership in a lot of these nutrition areas. We know of your strong support for many of these programs and assistance and leadership in drafting a lot of the legislation that is funded in this bill.

Senator BUMPERS.

Senator BUMPERS. Mr. Chairman, I only have a couple questions, and I will submit the rest of mine for the record.

FEDERAL TAX REFUND OFFSET PROGRAM [FTROP]

But I guess, Mr. Ludwig, I probably should direct this question to you. You have indicated that the Food Stamp Offset Program has helped recapture, I think you said, \$70 million. Is that correct?

Mr. LUDWIG. It is approximately \$100 million, I believe, sir.

Senator BUMPERS. \$100 million?

Mr. LUDWIG. Yes, sir.

Senator BUMPERS. And 32 States are participating?

Mr. LUDWIG. Let me give you the updated numbers. As of 1996, a total of 40 States participated in the FTROP Program. We have collected in excess of \$100 million to date.

Senator BUMPERS. Why do we not just mandate all the States to do that? It seems to be a very effective collection program.

PART 1

295

Mr. LUDWIG. Yes, sir; we have seen great progress among our States over the last few years. We have the highest expectations that the remaining 10 will be coming on board and implementing FTROP over the next few years. We have not had the authority to mandate it on States, but they are proceeding forward.

Senator BUMPERS. Do we pay the States their administrative expense to operate this program?

Mr. LUDWIG. Yes, sir; we pay it on a 50-percent match.

Senator BUMPERS. Fifty percent of what they collect?

Mr. LUDWIG. No, sir.

Senator BUMPERS. Fifty percent match of the administrative expense.

Mr. LUDWIG. Yes, sir; 50 percent match of their administrative costs.

WIC FUNDING

Senator BUMPERS. On the WIC Program your budget request for 1998 is based on a caseload of 7.4 million, is that correct, Madam Secretary?

Ms. KEEFFE. In 1998 it is based on 7.5 million.

Senator BUMPERS. 7.5 million. What is the present caseload?

Ms. KEEFFE. Well, we are seeing numbers in excess of 7.4 million late last year, October and November figures from last year, which is why we are in the position of requesting the supplemental, because these numbers are higher than what we had estimated fiscal 1997 participation at.

Senator BUMPERS. Now, you are anticipating 7.5 million. We have a \$100 million supplemental coming up. You had \$100 million carryover. Is that not correct?

Ms. KEEFFE. Yes.

Senator BUMPERS. And you could use that without any further legislative authority, can you not, or do you have to have some authority to spend that carryover?

Ms. KEEFFE. No; we can spend it.

Senator BUMPERS. All right. I am just trying to put the numbers together.

Ms. KEEFFE. Sure.

WIC FUNDING INCREASES

Senator BUMPERS. You have a \$100 million carryover, \$100 million supplemental, and you are getting a \$300-plus million increase for 1998. So that totals \$500-plus million more that you will have. No; wait a minute. The supplemental is going to be for 1997, is it not?

Ms. KEEFFE. That is right. The supplemental is 1997.

Senator BUMPERS. And the carryover, too.

Ms. KEEFFE. And the carryover will be—we will not have it until we are into 1998, when, you know, all the finances come through and all the accounting. And the \$300-plus million in 1998 is not all total increase; \$100 million of that is a contingency fund that would only be used if food cost increases of an amount where we need to reach into that pot of money.

So that is just aside. If that, you know, were to happen, then that money can be used for food money for inflation.

PART 1

296

And, really, we are only talking about \$30 million of that money that is new, increased money for increased participation, if you will. The rest will take care of inflation.

Senator BUMPERS. Do you feel comfortable with your request for 1998, that that will be adequate?

Ms. KEEFFE. Yes; we do.

Senator BUMPERS. For 7.5 million?

Ms. KEEFFE. For 7.5 million. But we need the supplemental for where we are in fiscal 1997 to keep that growth in place. Otherwise we are going to drop behind.

WIC ELIGIBLES

Senator BUMPERS. What percentage of the total people who would be eligible for WIC if they applied, what percentage of 7.5 million of that—let me restate it.

If everybody in the country applied for WIC that would be eligible for it, how many would that be? What do you think the total pool is?

Ms. KEEFFE. Well, the eligible, the income eligible, population, we estimate at 11.4 million. And then the fully eligible, which means income eligible and nutritionally at risk, is 9.2 million.

Senator BUMPERS. Do you have any outreach programs to reach those people that are not on the program that would be eligible?

Ms. KEEFFE. Oh, yes; there has been a lot of outreach taking place which is why the program has successfully grown over the years. We estimate that 80-percent of those fully eligible would naturally participate. The 7.5 million figure is 82 percent of those fully eligible.

WIC IMMUNIZATION

Senator BUMPERS. Madame Secretary, I recently spoke to all the WIC directors who were in town. And following their convention, they met with CDC in a 1- or 2-day meeting. And I had tried to facilitate that meeting for some time to see if we could not get the immunization levels up through the WIC Program.

And I did not get any feedback for how well that meeting went. That has been a couple months ago, I guess. But the WIC directors that I have talked to are always anxious to participate and help out with the immunization program.

Did you happen to attend that meeting?

Ms. KEEFFE. I did, Senator. I had the pleasure of being there for the opening. It was really wonderful, because not only were there representatives of the WIC directors and CDC, but also the Association of State and Territorial Health Officials.

It was a wonderful opportunity to share experiences and success stories of what some States had been doing that were best practices and to be able to share those practices with others.

The support we have had from CDC in recent years to make money available to build data system infrastructure to track infant immunization in the WIC Program has been very helpful. WIC stands in the forefront of aggressively being part of child immunization, especially the very early years. This is something that, since I have come to the Food and Consumer Service I have been personally very involved with. I have also had the pleasure of working

PART 1

297

with Mrs. Bumpers and Mrs. Carter to see other areas in our programs where we could be helpful in promoting immunization, which, of course, is vitally important to young children.

PREPARED STATEMENT

Senator BUMPERS. Thank you very much, Ms Keeffe.

Ms. KEEFFE. Thank you.

Senator BUMPERS. Thank you, Mr. Chairman.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

I want to join my colleague, Senator Cochran, in welcoming before this subcommittee representatives of the United States Department of Agriculture. The subject today is a review of the budget request for USDA's Food and Consumer Service. The Food and Consumer Service has the responsibility of not only ensuring adequate diets for the most vulnerable of our people, but also increasing the public awareness and encouragement to improve the diets and nutrition-related health of our entire society.

Not only are these programs of special importance to the American people, they also represent a substantial portion of funding under the jurisdiction of this subcommittee. Of the total in new budget authority for all USDA programs funded by this subcommittee, those of the Food and Consumer Service represent \$39.8 billion, or 78.3. If you include additional amounts included in the legislative proposals to come before Congress, the Food and Consumer Service request increases to \$40.6 billion, or 79.3 percent of the USDA request before us.

In spite of the high proportion of subcommittee funding for nutrition programs, the amount requested is below what it might have been but for a couple of reasons. One is that fewer Americans are relying on Food Stamps and similar programs due to a continually improved economy. In March 1994 program participation levels reached an historic level of 28 million persons. Today, that figure has improved to a level of 24 million persons.

Another factor relating to the lower budget request is the passage last year of The Personal Responsibility and Work Opportunity Reconciliation Act of 1996, commonly referred to as Welfare Reform. I look forward to the testimony of today's witnesses on the effect Welfare Reform is having on their programs and their thoughts on legislative proposals to modify certain parts of that law.

In addition to the budget requests for fiscal year 1998, this subcommittee also is faced with a request for fiscal year 1997 supplemental funding for programs of the Food and Consumer Service. One supplemental item is funding for the Nutrition Education and Training Program. This program was previously included as mandatory spending in the Child Nutrition account, but Welfare Reform converted this program to discretionary spending. Since Welfare Reform passed subsequent to the fiscal year 1997 Appropriations Act, the sequence of events resulted in a shortfall for this program. I understand this request is fully offset by mandatory spending in The Emergency Food Assistance Program.

One other supplemental item is a request of \$100 million for the WIC program. Because of the importance of this program and the complexity of its allocation system, I would like to provide for the record an overview of why the supplemental request is before us.

WIC is, and has been, one of the most successful and popular programs within the federal government. While there has been differing opinions on funding levels for various USDA programs, support for the WIC program has always been unanimous. Not only does the program serve a most important constituency, women, infants, and children, it is also proven to be cost-effective. USDA documentation has established that for every \$1 spent on the WIC program, \$3 in Medicaid spending is saved during the first 60 days after an infant's birth.

For many years now, the bipartisan goal for the WIC program has been to achieve full funding in order that all eligible participants who wish to apply, may receive assistance. USDA has projected full funding will occur when participation levels can reach 7.5 million. I am pleased to say we are clearly in sight of that goal and the budget request before us will get us there.

Due in part to the rapid growth of the WIC program, in the range of 500,000 new participants a year, and the complexity of program delivery, there has been an historic amount of funding remaining unspent in one fiscal year yet available in the following year. This is the so-called WIC carryover.

PART 1

298

For reasons not entirely clear, the growth that was expected for fiscal year 1995 did not fully occur. That year, caseload was expected to reach 7.3 million participants but, in fact, it only reached 7.0 million. The result was a large increase in the carryover and a question about the accuracy of future caseload projections. In turn, USDA and OMB deemed it prudent to provide more conservative estimates for program growth and therefore projected growth in fiscal year 1996 would reach a year-end figure of 7.3 million, the same level they had predicted for the previous year.

Going into fiscal year 1997, USDA and OMB concluded that the funding level provided by this subcommittee would not allow for program growth, but it would be adequate to meet level participation needs. However, that projection has proved incorrect for a number of reasons.

First of all, the rate of program growth resumed its pre-fiscal year 1995 levels. Rather than a year-end level of 7.3 million, caseload in fiscal year 1996 reached 7.4 million. In addition, WIC-related food prices increased 1.1 percent above the budget forecast. As a result of these two factors, the carryover available for obligation in fiscal year 1997 is substantially below earlier assumptions.

By including the carryover from fiscal year 1996 with the amount this subcommittee provided in fiscal year 1997, it is now estimated that there is funding to support average participation this year of slightly more than 7.2 million, 200,000 participants below the level achieved by the end of fiscal year 1996. Since fiscal year 1997 started out at a level of 7.4 million participants, USDA has concluded that without supplemental funding, they will have to reduce caseload to 7.0 million in order to maintain an average of 7.2 million. As a consequence, some states are now preceding with plans to reduce current caseload, an effort directly counter to the long-held, bipartisan goal of achieving full participation.

In spite of the reduction in carryover in WIC funds described above, there is still a substantial sum of fiscal year 1996 dollars that were unspent at the beginning of this fiscal year. Because of the obvious irony of asking for a supplemental at a time when carryovers occur, I believe it is important to enter into the record an overview of how and why these carryovers occur.

Funds appropriated for the WIC program are available for expenditures for two fiscal years. Due to a number of factors, USDA and State WIC agencies do not know at the exact end of any given fiscal year exactly how many dollars were spent. In fact, State WIC agencies will not know these total amounts until a few months after the end of the fiscal year.

One of the reasons for this delay is that many of the WIC vouchers issued late in the year by state agencies are not redeemed and reflected back through the accounting system until the fiscal year is over.

It is further possible that all WIC recipients will not use all WIC vouchers issued. It is not until after October 1 that all vouchers issued in August and September are fully accounted for.

Another variable is the exact cost of the vouchers. The cost of a particular voucher equals the price of the food item purchased by a WIC participant on the day of the purchase. State agencies have no way of knowing what that purchase price will be until after the vouchers are redeemed and returned.

Another major item that controls WIC expenditures is the cost containment aspect of the program as required by law. Cost containment has been a very successful tool at reducing program costs and are estimated to save approximately \$1.1 billion annually. The cost containment contracts also add, however, to the difficulty of expending all available funds. A State generally cannot bill a manufacturer for rebates for infant formula sold in September until after September is over and the fiscal year has ended. A State may receive a check from an infant formula company early in a fiscal year that represents rebates for formula sold to WIC participants in the latter months of the previous fiscal year. Such checks are considered funding for the prior fiscal year. To the extent that such checks are not freely used to defray WIC expense incurred in the previous fiscal year, the remainder of the checks constitutes money classified as carryover money from the previous fiscal year.

We must also remember that because State WIC directors do not know exactly how much will be spent in any given year, they exercise prudent caution in order not to overspend their state's allocation. It is not uncommon for a state to withhold some of its allocation at the end of the year to avoid the possibility of overspending. This should not be viewed as an overly conservative practice, but rather a tool of sound program management.

If all states average expenditures of only 97 percent of their annual allocations, the total of carryover would equal \$120 million. As a guiding principle, USDA, State WIC directors, and the Congress should recognize approximately \$100 million as a reasonable and expected carryover amount. This amount is often referred to as

PART 1

299

“structural carryover”. While it might be confusing to some who question a supplemental request when there exists any carryover at all, it should be noted that a “structural carryover” is a recognized an inherent feature of program operations.

However, with or without the “structural” portion of the carryover, we now find ourselves in the position that the carryover currently available for obligation this fiscal year is below earlier projections. When you factor in increased food costs, which are provided in the Department’s Explanatory Notes, along with the reduced carryover from fiscal year 1996 we are, for the first time in about 15 years, faced with allocations to the states at a level insufficient to meet previous year participation for many states.

I would also like to mention this supplemental request in the context of the request for WIC funding in fiscal year 1998. In order to attain the goal of full funding for WIC, a participation level of 7.5 million women, infants, and children, the budget asks for an increase of \$378 million. \$100 million of that amount is reflected in the \$100 million supplemental request. In other words, the fiscal year 1998 increase totals \$378 million from the fiscal year 1997 level without a supplemental.

Also, the \$378 million increase includes another \$100 million to be held in reserve in the event of future unforeseen program expenses and to avoid the need for additional supplementals. In addition, the increase also includes amounts necessary to respond to food cost inflation and to recapture the fiscal year 1996 carryover reductions explained above. This leaves only a \$25 to \$30 million increase for actual program expansion. This is the amount necessary to bring the program participation from 7.4 million up to 7.5 million, which is full participation.

I hope that this explanation helps answer questions some may have about why the supplemental is needed, why there is a carryover, and how the supplemental request ties in with the request for fiscal year 1998. I offer it in full recognition of the budget constraints before this subcommittee. I honestly believe that every member of this subcommittee is fully committed to the goal of full funding for WIC, but I am a realist and I know finding offsets will be difficult if the budget process does not allow us to use the offsets identified in the President’s budget request.

In closing, I want to commend our guests for their fine and noble work. I often hear from farmers who complain that our appropriations bill has too little to do with real farming. When you look at the amount of spending in our bill for food assistance programs, you know what those farmers are talking about but you have to ask why they are saying it. Domestic feeding programs mean that more of the farmers products are getting to people who need them. Improved nutrition information means consumers can make better choices and farmers can better plan for improved markets. As long as there is hunger in America, no one can dispute the purpose of your mission.

I know there are many other important programs within the Food and Consumer Service that I will not take time here to touch on. I do note, however, the funding request for the Food Program Administration. I agree that your responsibility for \$40 billion in program activity is evidence enough for your need to retain adequate staff levels. Recent action to crack down on fraud and trafficking are probably signals that there is much more to be done. For these reasons, and others, we need to fully consider your requests for staff needs as well as your ability to conduct research on the changing nature of nutrition programs. In this way, we may better understand the changes effected by Welfare Reform and the economy generally and the implication of those changes on your programs. I hope this subcommittee can be helpful in giving you the tools necessary to do all these things.

WIC PARTICIPATION AND SUPPLEMENTAL FUNDING

Senator COCHRAN. Thank you, Senator Bumpers, for your contribution to this hearing.

I am also interested in this supplemental request. I think we need to go ahead and try to get as much information as we can, so we can make a decision about the supplemental.

While there are excess funds in some of the accounts because of changes in welfare reform, this is an account which you indicate we are going to have a shortfall. And, I am still a bit confused about the supplemental.

Are we trying to maintain the current level of participation, or is this designed to increase the level of participation to keep expanding the program?

PART 1

300

Ms. KEEFFE. The supplemental, Mr. Chairman, is to maintain participation at the current level. Without those funds, we feel that States will have to reduce caseload by approximately 400,000 persons by fiscal year end in order to get to that 7.2 number.

Senator COCHRAN. Senator Leahy asked you about the State-by-State analysis, if you had information about where the dropoffs from the program would occur. Is there a way to determine how many participants you would lose in each State?

Ms. KEEFFE. Let me just give a short answer, and I will have Mr. Braley elaborate. I do not think we know precisely. States are very well intentioned and feel that they are going to be able to spend all the money that they have in their accounts.

WIC STATE PLANS

But we certainly have to look at what the record and history teach us in the program, and how this program operates. We feel by necessity they end up with a carryover at the end of each fiscal year. I think this is very understandable.

But for them to take a position that, well, this year we are not going to have that carryover, we are going to be able to spend down every cent, I do not think is very realistic.

Mr. BRALEY. Mr. Chairman, to elaborate a little bit on the Under Secretary's point, historically States have carried over in the last 3 years between 3.5 and 4 percent of the funds that have been appropriated to them.

The submitted plans indicate that they would reduce carryover to less than 1 percent, about seven-tenths of 1 percent. That is unprecedented even in years when dollars have been tight, as they are this year. We believe that about as low as they could get would be about 2.5 percent of the total grant.

The reason is that there are a lot of uncertainties. As for example, States issue vouchers in the WIC Program toward the end of the fiscal year, it is not until the next year that those vouchers are redeemed and they actually know what their obligations are.

Similarly, States have rebate contracts with infant formula companies, and they do not receive the proceeds from those contracts until the next year.

The consequences of overspending are severe for a State, so they tend to underspend slightly, even though in their planning at this time of year they typically say, well, sure, I can spend everything that is available.

We have taken the carryover amounts that we expect to carry from last year into this year, which were about \$145 million, and, recognizing that funding is tight this year, reduced that to about \$100 million, about a 30-percent reduction.

WIC PARTICIPATION

Even with that drawdown, we believe States can serve only an average of 7.2 million participants this year. Therefore, by the end of the year, because States started way above that figure, they are going to have to come down to about 7 million participants, unless the supplemental funding is provided.

PART 1

301

The reason for the supplemental is to maintain participation levels that were achieved at the end of fiscal year 1996 and the beginning of fiscal year 1997.

In the reports we have just received, nine States reported a participation reduction in excess of 5 percent, even if they anticipated spending the full amount of the resources available. I can either read those now or provide them for the record.

Senator COCHRAN. I think providing them for the record will be helpful to us, and will give us a chance to review them and try to make a determination about the response the subcommittee ought to make.

[The information follows:]

WIC: States with estimated participation decreases greater than 5 percent: Minnesota, New Mexico, Arkansas, Massachusetts, Nebraska, Louisiana, West Virginia, Alabama, and Hawaii.

FUNDING SOURCES

Senator COCHRAN. Is there a suggestion as to where the additional funds should come from. In this budget process here, when we add funds over and above what we are allowed, we have to take it from some other accounts. What is the recommendation of the administration as to where we take this money from?

Mr. BRALEY. My understanding is—and maybe Mr. Kaplan can correct me, if I am wrong on this—one-half of the offset was from Public Law 480 programs within the Department of Agriculture, and the other one-half was elsewhere in Government, but not specified. There was an offset for all of the supplementals that were planned Governmentwide. So one-half of it is within the Department, and the other one-half is in a more general category.

Senator COCHRAN. Mr. Kaplan, is that the way you did it?

Mr. KAPLAN. Yes, sir.

Senator COCHRAN. Well, I am curious about that. Because, for example, I notice in the food stamp budget proposal here there are proposed changes in the law that would result in more appropriated dollars for the Food Stamp Program than if we do not change the law as recommended. That is, if the authorizing committee does not change the law—that is not the responsibility of the Appropriations Committee.

But, if the authorizing committee does change the law to add benefits under the Food Stamp Program, as I understand the budget process, it will have to make other changes in the law in some other area to offset the additional cost of those benefits.

Is there in the budget submission any suggestion as to what changes in the law ought to be made by the Agriculture Committee to reduce the cost of the programs under its jurisdiction at the same time you are asking it to change the law to increase the cost of the Food Stamp Program.

Mr. KAPLAN. No, sir; just the increases that are in the President's budget.

Senator COCHRAN. OK. Well, it is an interesting exercise, is it not, that you can submit a budget, if you are the administration, and presume these changes to increase spending and make people happier. To tell people that they are going to get more money from the Federal Government, but not tell them the other side of the

PART 1

302

coin, which is that if these changes really are made under existing law, there are going to have to be changes in other programs to pay for them.

But you do not want to tell the beneficiaries of those other programs that they are going to get less, because you are going to take those funds and give them to food stamp beneficiaries who will be given new benefits.

Ms. KEEFFE. Mr. Chairman, I think it is fair to say in this discussion that the President is committed to a balanced budget. The changes that he has recommended in the Food Stamp Program are part of his balanced budget submission.

Senator COCHRAN. I understand that he has talked about the fact that the budget is a balanced budget, but no one agrees with him who is keeping the score, at least no one who understands the trigger that calls for all the big cuts to come in the last couple of years of the budget cycle and the tax increases that would be required to be imposed to balance the budget.

If you just look at the changes in programs, the changes in obligations of the Federal Government, it does not come out that way. Only the automatic, so-called trigger, makes it a balanced budget. I think that is an appropriate summary description of the budget that has been submitted by the President.

I am trying not to get into the macroanalysis of the budget, as they are doing on the Budget Committee. I would rather let Pete Domenici discuss that with Mr. Raines or others.

What we are interested in is what we have to do on this subcommittee and what the Agriculture Committee has to do with respect to proposed changes in the law. It just seems that the requests that we have gotten are to increase spending for programs that are very popular with the beneficiaries, but we never tell anybody that if you do that, you must cut spending somewhere else.

CHANGES IN THE FOOD STAMP PROGRAM

I was just curious if you had any suggestions specifically about what programs to cut. The changes that you are contemplating in the food stamp area I understand relate to work requirements and to those who might be terminated who now are getting benefits because of immigrant status.

Are those the main changes that are requested in the Food Stamp Program?

Ms. KEEFFE. Well, there are several areas, Mr. Chairman. I am going to ask Ms. Jackson to go into greater detail.

Ms. JACKSON. Mr. Chairman, you are correct that one of the major changes is a change to basically change the work requirement for able-bodied adults between the ages of 18 to 50, to try and create what the administration feels is a real work requirement by increasing work opportunities through increased employment and training funding for States; by changing the time limit from 3 and 36 months that a person could receive benefits without working to 6 and 12 months; also by strengthening the penalties against individuals who refuse to work; and by also giving States more flexibility to use the food stamp benefit as a wage subsidy to encourage more private employment.

PART 1

303

In addition to that proposal, there are also proposals to eliminate the excess shelter deduction cap by the year 2002, to help families with children who have heavy housing and heating expenses. There is also a proposal to resume indexing the standard deduction by the year 2002 to prevent further decline of the actual value of this deduction.

There is also a proposal to raise and index the vehicle fair market value exclusion, recognizing that in order for people to work, they have to have reliable transportation.

So all of these are included in the proposal.

The one area relating to legal immigrants is a proposal for the 1997 budget. We propose to postpone the implementation of the restrictions for legal immigrants from the August 22 deadline, which is currently set in law, to September 30.

The idea there is to give individuals who are already applying for citizenship more time to become naturalized. But there is no proposal for legal immigrants and food stamps beyond 1997.

FOOD STAMP ERROR RATES AND PAYMENT ACCURACY

Senator COCHRAN. There is a statement in your submission about the error rates and the fact that you have made some progress in working with States to improve payment accuracy. Could you tell us how you are working to deal with this problem, and what are the reasons for this success in bringing the error rate down?

Ms. JACKSON. Well, we were very concerned, Mr. Chairman, that during fiscal years 1992 and 1993 the national error rate increased in the Food Stamp Program. We instituted some partnership programs with States and, through our regional offices, targeted States with very high error rates.

We also sponsored a national payment accuracy conference to try to raise the consciousness level, particularly of top management in States, about the need to focus on payment accuracy.

We were given additional funding to provide State Exchange money to States. This funds transportation for them to travel to other States that had been very successful in reducing their error rates, to see firsthand what types of initiatives and programs they established.

All of these various activities have been very successful in allowing us to reduce the payment error rate. The high rate that we had in the program was in fiscal year 1993, where the error rate went all the way up to 10.81 percent. That is both underpayments as well as overpayments.

We were able to reduce that error rate down to 10.32 percent in fiscal year 1994 and then 9.72 percent in fiscal year 1995. Those reductions over those 2 years, from 1993 to 1994 and then again from 1994 to 1995, resulted in savings to the American taxpayer of over \$350 million.

We are pleased that early results from the 1996 data show that we are still in that downward trend.

Senator COCHRAN. Well, that is good news. I had heard about that and wanted to bring it out and urge you to continue to use your good judgment and imagination on how to deal with that.

PART 1

304

Ms. KEEFFE. Mr. Chairman, this is an area, that really exemplifies the Federal Government and the States working cooperatively to achieve this positive story. We were the impetus behind this, and we did have this funding earmarked to move aggressively in this area, but it is really the States that have turned this around. I think it is a very positive story.

FOOD STAMP PROGRAM CONTINGENCY RESERVE

Senator COCHRAN. As a result of welfare reform, there is a suggested new importance for the Food Stamp contingency reserve. Your statement indicates that \$2.5 billion is requested for a contingency reserve.

Could you tell us if you have done any assessment on how the program funding requirements might fluctuate, given the choices States make concerning the level and form of benefits provided and waivers requested under welfare reform?

Ms. KEEFFE. Well, I think that one of the rationales for requesting the contingency is welfare reform and its uncertainties. The amount we requested really is not too large. It translates into 6 weeks' worth of Food Stamp benefits.

Another reason for the contingency fund is the situation we are in right now. It does not have anything to do with welfare reform, but disaster flooding and emergency food stamp issuance. This is an area where the contingency is also very helpful. We have been faced with a number of serious disasters in recent years, and it is helpful to have contingency funding. The combination of potential disasters, coupled with the uncertainties of welfare reform, made us think that this was not an outlandish amount to request.

Senator COCHRAN. Well, in 1997 we had a \$100 million contingency reserve. Will that \$100 million be needed?

Mr. BRALEY. Mr. Chairman, we do not anticipate needing it. I know you have been with this committee for a number of years, and it was not too many years ago that we consistently needed food stamp supplementals.

We started requesting the contingency reserve because it is difficult to predict exactly how much the Food Stamp Program is going to cost.

Especially with welfare reform this year, we thought it was particularly critical to have a significant contingency reserve in case some of the estimates are wrong or in case some things happen in the economy that would cause that to happen.

It is a year of a lot of change and uncertainty. The reserve is even more important than it has been in the last several years, from our perspective.

DISASTER ASSISTANCE IN THE FOOD STAMP PROGRAM

Senator COCHRAN. What is the outlook, if you know, about the natural disaster impact on food stamp dollars in fiscal year 1997?

Mr. BRALEY. Mr. Chairman, we are just really getting disaster efforts underway in States, so it is a little early to tell. Mr. Ludwig may want to comment further on that.

Mr. LUDWIG. Mr. Chairman, we are early in the year, but I will speak about what we have going right now. Then I will talk briefly about what we have had in previous years.

PART 1

305

As of this morning, I have authorized emergency food stamps for 12 counties in the State of Arkansas.

Now, those are not entire counties, but are segments of the counties that actually had destruction. We approved four counties in Arkansas Saturday morning, and the additional eight last night. So we do have 12 counties there.

I am expecting to receive requests from both Ohio and Indiana. We do not know, since we have not received the request, exactly how many counties are going to be affected. One of the problems with a flood, as it all moves south and downstream, is that there is more flooding.

Until an area is actually cleared of the water, it is hard to determine what portions of counties were affected. We are expecting the aforementioned two States to come forward.

On more of a global basis, and speaking from last year's history, we have not moved yet into hurricane season. Last year we had an unprecedented number of hurricanes on the east coast. We are also looking at additional flooding due to the vast amounts of snow that fell throughout the Midwest.

So in the long-term projections, between the snow and the hurricanes, we believe we will have quite a year for disasters. The last 2 years we have had a significant number.

NATURAL DISASTER SPENDING IN THE FOOD STAMP PROGRAM

Senator COCHRAN. Do you know how much funding in each of the last 2 years has been required in the Food Stamp Program as a result of natural disasters?

Mr. LUDWIG. I can get that number for you. We have it.
[The information follows:]

In fiscal year 1995, the Food Stamp Program spent zero money on disaster response. In fiscal year 1996, the Food Stamp Program issued \$64,888,920 worth of benefits responding to three disasters: Hurricane Marilyn in the Virgin Islands, the floods in the Pacific Northwest, and Hurricane Fran in North Carolina.

Senator COCHRAN. Yes; that would be good to just have in the record what we spent in 1996 and in 1995. I know in 1997, we have had these tornadoes and floods already. We have read about and seen broadcast reports of the damages and the terrible problems that victims have had in coping with those disasters.

I know in my State I think nine counties have now been designated eligible for some form of Federal disaster assistance. I do not know whether the food stamp benefits are included in that or not.

But if they are, we certainly do not want to turn around and find out we do not have the money to make those available and we have to rush through a supplemental, and maybe the Congress will be out on a recess or whatever.

I do not want to run into a situation where we do not have the funds to respond quickly to these emergency situations. That is why I am asking these questions about the contingency reserve.

You know, one thing I do remember, Mr. Braley, and I know you do as well, the tendency of some who are in leadership positions on Appropriations to intentionally underestimate in the annual appropriations bill funds that would be needed for mandatory pro-

PART 1

306

grams to build in the necessity for a supplemental. It was just part of the process in years past.

That is probably not a good budget practice and we would be criticized today if it were done. But who knows what these costs are going to be. They are estimates, as we are all acknowledging here.

We do not know what the natural disasters are going to cause in terms of outlay responsibilities for food stamps. And there are many other areas in this part of the appropriations bill where we are just not able to exactly predict what the needs are going to be.

I think the submission, insofar as you can do it, is straightforward and we appreciate that very much. And we commit to you that we will endeavor to work with you to help satisfy these needs that we have under the law.

Many of these are mandatory programs. We do not have a choice about making the payments available. If people are entitled to benefits under the law, we must fund the benefits that they are entitled to. So this committee is going to cooperate with the administration in that regard.

WELFARE REFORM AND THE CONTINGENCY RESERVE

Let me ask you one other question about the contingency reserve. Does the fiscal year 1998 request rely solely on the contingency reserve to accommodate any increased cost resulting from the choices States might make under welfare reform?

Ms. KEEFFE. That certainly was something that we were trying to anticipate in making that request. The \$2.5 billion benefit reserve is about 10 percent of the total food stamp money.

Our most basic assumption is a continued good economy. There is no reason to think otherwise. We cannot assume how States are going to react in regards to TANF and that part of welfare reform which would then trigger changes in food stamps.

With those questions, we came up with the basis for our request.

ELECTRONIC BENEFITS TRANSFER AND FRAUD REDUCTION

Senator COCHRAN. In connection with the electronic benefits transfer, I know Senator Leahy asked you how that was going.

In your prepared statement, Mr. Ludwig, you mentioned that eight States now have these systems in place for the delivery of food stamp benefits. Ten others have already implemented the system, and every other State is in the process of planning for or implementing the system. Do you have any feedback yet on the extent to which these systems are working to improve efficiency and to reduce fraud?

Mr. LUDWIG. Yes, sir; we do have some preliminary results on those issues. Three years ago, internally we began a major initiative to get States to implement EBT. As we stated earlier, today we have 18 States in pilot status. In excess of 40 States are in some type of major development process right now.

EBT does not eliminate fraud. But it gives us the ability to track individuals or retailers that are committing fraud. With the paper coupon, we do not have any processes to know where those coupons go and how they ultimately get to the street.

PART 1

307

With EBT we have an electronic tracking system that shows when benefits are redeemed, where they are redeemed, and for what amounts they are redeemed.

We are in the process of piloting a new software program, ALERT, that statistically gives us the results of individual stores with probabilities of which stores are trafficking. The system targets stores based on the store size in comparison to other stores in similar situations and their redeeming processes, so that we can decide from our compliance standpoint and from the OIG standpoint, which stores we should visit.

So yes, we are getting positive feedback. Two years ago, we had 225,000 stores redeeming food stamp benefits. Today we are down to approximately 196,000 stores. We think there is a combination of reasons for that, EBT being one and our stepped-up compliance efforts another.

EBT: SAVINGS AND COSTS

Senator COCHRAN. There is an indication in your request that there is a reduction in the cost of printing and shipping and processing stamps as a result of the development of the electronic benefit alternative. What is the potential savings in this area when all States have implemented their EBT systems?

Ms. JACKSON. Right now the total cost in printing and distribution is \$49 million. So we would be able to realize, once all States are operational, almost that entire amount in savings in terms of the current printing contract and all of the related expenses in distributing the coupons.

Senator COCHRAN. What level of funding, if any, is included in the request for this next year for work on the electronic benefits transfer of Food Stamps? Are there Federal costs associated with expanding this program and putting it on line in every State?

Ms. JACKSON. We are matching State costs at a 50-percent match rate. So for every dollar spent by a State, we are matching that with a dollar in Federal funds to encourage the expansion of EBT.

REGULATION E

Basically in the past, the biggest complaint that we heard from States as to why they were moving slowly in implementing EBT was because they were fearful of potential increased costs of regulation E. Welfare reform legislation basically eliminated regulation E from State EBT systems. So those increased costs that States were concerned about no longer exist.

So we think that States are going to continue to move very rapidly. And as I said, we are matching their administrative expenses at a 50-percent match rate.

Senator COCHRAN. What is regulation E?

Ms. JACKSON. Regulation E regulates how debit and credit cards work today. If you take, for example, an ATM card and lose it, as long as you report the loss within 48 hours, you are not liable for any more than the first \$50 of loss. That also applies for most consumer credit cards today.

The Federal Reserve Board once had ruled that regulation E would also apply to EBT cards. That was a huge concern for States because of the fear that fraud and abuse would basically dramati-

PART 1

308

cally increase State costs. Those costs would be carried by the card issuer, and, in this case it would have been State governments.

Welfare reform legislation ruled that State EBT systems were not subject to regulation E. Therefore, the potential increased costs that concerned States are no longer an issue. We feel that was one of the last remaining big barriers to EBT implementation.

Senator COCHRAN. Who bears the loss, if there are losses?

Ms. JACKSON. Right now, because of the legislation, basically the cards will work the way food coupons work today. The recipient is responsible.

However, there are more protections with EBT than with the food coupons. Right now if a recipient loses his or her coupons, except for extenuating circumstances, such as a disaster, they are not replaceable. They are treated like cash.

The EBT card, however, is protected because it has to be used in conjunction with a personal identification number. As long as a person does not do something foolish, like write that PIN number on the card—and they are specifically instructed not to do that—a lost EBT card basically should be nonuseable as long as the person has not publicized their personal identification number.

So that is the added protection that the EBT system provides to our customers. It is far more secure against theft and loss than coupons.

WIC FUNDING REQUEST

Senator COCHRAN. The WIC supplemental funding request of \$100 million we have discussed. I think we ought to fully understand the estimated shortfall. If I understood what you said, we would lose 400,000 program participants if we did not approve the \$100 million supplemental, is that correct?

Ms. KEEFFE. Yes; that is our assumption based on the numbers.

Senator COCHRAN. Because I had heard another number from Mr. Braley on some subject, but that was not this number dropoff.

Mr. BRALEY. No; the reduction that we expect to experience would be about 400,000, from about 7.4 million down to 7 million participants.

Senator COCHRAN. OK. I have some other questions on the WIC request. I understand \$4.108 billion is the total request for the full 1998 fiscal year, which represents an increase of \$378 million over fiscal year 1997, and, I understand from your testimony, that would achieve full funding of the WIC Program by the end of the fiscal year—some 7.5 million participants.

Ms. KEEFFE. That is correct.

Senator COCHRAN. And that includes the increased participation, as well as a \$100 million contingency fund if food costs exceed budget estimates.

Ms. KEEFFE. Yes.

Senator COCHRAN. As you know, WIC is a popular program. I expect that we will do everything possible to try to ensure that there is full funding.

WIC EFFECTIVENESS

There is no question about the efficacy in terms of health cost savings and improved learning capacity and just general well-being

PART 1

309

that is a cost savings in other programs, as a result of the WIC Program.

I think our hearings have clearly established that over time. The access to clinics and the immunizations, which many times are administered at or near the WIC clinic sites, are very, very important in the overall health of the population that is served by the program.

Ms. KEEFFE. Well, you have stated it very well, Mr. Chairman. Of course, we are deeply appreciative of your support in the past, as well as that from the entire committee. I think everyone has recognized what we say—in short, WIC works. It is a wonderful program.

We have research that demonstrates its success. It is also a program that has been managed effectively over the years. It has received high marks in that regard.

So we are very close to our goal. We really are hopeful that we will be able to have the supplemental for 1997, as well as the funding request for fiscal year 1998.

WIC ELIGIBILITY STANDARDS

Senator COCHRAN. I know it is very subjective to make the determinations that are necessary to establish eligibility for participation. There is just no exact science in place to measure against any set of standards to determine nutritional risk, for example, which is part of the process to determine eligibility.

Are you satisfied that the guidelines are sufficient and the practices are to the point where you can say that there is little or no abuse of this program in falsifying things like nutritional risk or just making subjective judgments that are not based on facts?

Ms. KEEFFE. Well, this is an area that we are continuing to investigate. We would like to see more intra-State uniformity in regard to the nutrition eligibility standards. Our Office of Analysis and Evaluation is planning a report on this.

We have also been working with the National Academy of Sciences that also has researched this area. We are not entirely comfortable that there is not much uniformity.

We do not know of any instances of terrible abuse; however, we are trying rather aggressively to establish more uniformity.

WIC COST CONTROL

Senator COCHRAN. In our State of Mississippi, John Barr has been one of the leaders in the Nation at State administrators' organizations and in developing new ways of keeping costs down and administrative overhead under control.

I wonder why we continue to see nationwide though, administrative expenses that are a high percentage of the total, or the average, cost of the WIC food package. I understand that it is now about 26 percent. Is that high or low? Should we be happy with this? It seems to me that that is too high.

Mr. BRALEY. Well, Mr. Chairman, those costs include traditional administrative costs comparable to those in other programs like food stamps, and a lot of nutrition services and referrals to other health programs, provisions of nutrition education, and a whole host of activities under the nutrition services and administrative

PART 1

310

grant heading. So, to call those funds strictly administrative understates what is really provided by those funds.

The other thing that has happened is the tremendous success we have had in reducing food package costs through infant formula rebates. We have realized a \$1.1 billion influx or recycling of funds in the WIC Program through these rebates.

That has had the effect of lowering the cost of food per person, which makes the percent of dollars spent on nutrition services and administration go up compared to funds spent on food.

So it is certainly an area that we continue to look at and work with States. The States would indicate that they are doing a lot with those resources and that the program is not overfunded.

WIC FUNDING FORMULA AND PARTICIPATION

Senator COCHRAN. There is a request in your budget that the bill include language, our appropriations bill include language, authorizing the Secretary to adjust allocations to the States to reflect food funds spent forward and to make other funding formula revisions.

I am, quite frankly, reluctant to recommend that the committee do that without knowing what the practical results will be. Do you have any notion now as to who the winners and losers would be under such a formula change?

Mr. BRALEY. Well, Mr. Chairman, I think there are two goals that we want to achieve. If we had a supplemental for this year, we want to mitigate the effects in caseload in those States which would have to make dramatic reductions so that high-priority participants are not forced off the program.

In 1998, I think the emphasis shifts from that approach to also recognizing that some States have had an opportunity to grow and reach a fairly good saturation level in terms of serving the eligibles in their State.

We would like some flexibility to try to target some of the States that have lower than average participation rates but still protecting existing participation levels in other States.

That is a little bit of a roundabout answer, and I cannot give you the specific States that would be winners and losers under that, because it would be something we would have to judge based on what has happened up to that point in particular States with regard to how much money they have used and how many participants they have served.

We feel we do need some flexibility outside of the existing funding formula to minimize the adverse effects in some States and also make sure that other States have an opportunity to grow and reach full potential.

WIC PARTICIPATION RATES

Senator COCHRAN. As a matter of curiosity, do you have any notion as to which States are those States that you describe as having a lower rate of participation than others? Could I guess Idaho, Utah, North and South Dakota?

Mr. BRALEY. We do have information in terms of the estimates of eligibles in each State and what percentage of those eligibles are served in the current program.

PART 1

I think some of the Western States do have less participation among eligibles than some of the Eastern States. But there is quite a bit of variation. We could certainly provide that information for the record on a State-by-State basis.

Senator COCHRAN. That would be good to have, just as a matter of curiosity.

Mr. BRALEY. Yes, sir.

[The information follows:]

RATES OF PARTICIPATION (BY STATE) AMONG WIC ELIGIBLES

The Food and Consumer Service (FCS) annually estimates the number of women, infants and children who are both income-eligible for WIC and at nutritional risk at the National level. National participation rates are then calculated relative to this estimate of the fully-eligible population.

FCS also develops estimates of the number of infants and children who are income-eligible for the program by State. These estimates, which are provided annually to the States, are produced primarily for use in the WIC funding formula to determine each State's share of the National estimated income-eligible population. Estimates of income-eligible pregnant, post partum and breastfeeding are typically not developed for use in the funding formula. Because women are estimated as a direct function of income-eligible infants, their inclusion would not have a significant impact on the percentage distribution of eligibles among States. In addition, FCS does not attempt to make estimates of the incidence of nutritional risk at the State level, as accurate data on State-specific incidence of nutritional risk is not available.

In order to address your question, the Agency has calculated the number of income-eligible women in each State for 1994 (latest data available), assuming the same relationship between the number of income-eligible infants and income-eligible women as is used for developing National estimates. These estimates were added to the estimated number of income-eligible infants and children to create State-level estimates of the total income-eligible population in 1994. These estimates were then compared to average monthly participation by State in order to estimate participation rates among the income-eligible population in 1994.

While these data can provide some indication of the relative coverage of the WIC program by State, they cannot be considered true coverage rates because they do not factor in the incidence of nutritional risk. Further, they are not directly comparable to the National WIC coverage estimates produced by FCS, which are based on the fully-eligible population estimate.

[The information follows:]

RATES OF PARTICIPATION (BY STATE) AMONG WIC ELIGIBLES—FISCAL YEAR 1994

State	Income-eligibles estimate ¹	Monthly average participation	Percent of income-eligibles served (coverage rate)
Alabama	177,042	122,328	69
Alaska	32,432	15,882	49

Wisconsin	137,611	107,088	78
Wyoming	17,008	12,256	72

¹This estimate does not include persons who become adjunctly income-eligible through State Medicaid programs with eligibility standards over 185 percent of poverty.

WIC FUNDING FORMULA

Senator COCHRAN. Of course, those would be States that you would give more money to under your new plan.

Mr. BRALEY. The funding formula that we developed was developed at a time when WIC participation and funding was growing dramatically from year to year. We have reached the point now where funding is relatively stable.

As a result, this year, for the first time, we were not able to meet last year's grant levels plus inflation in States because the resources were not there. That meant everybody was treated exactly the same as they had been historically in terms of being able to

PART 1

313

maintain participation. If we had some additional funding, it would have been nice to recognize the fact that some States have not had an opportunity to reach their potential. That is one factor which would be considered in making allocations under the budget request.

Senator COCHRAN. Do you think some of these reasons are societal or cultural and there is less willingness to admit that you need to depend on the Government for help, or can you look to your neighbors, or to the churches or the community to help you meet those needs? Is that part of the reason why we have those differences among States?

Mr. BRALEY. Well, that may be a part of it. But, Mr. Chairman, what we are looking at is that some States are now using all of the resources that they have available to them. They are serving a smaller proportion of their State's eligibles than their neighboring States and have indicated that they have more people that could potentially be served if the resources were available. We are not trying to encourage States to take money that they cannot effectively use to serve additional clients. Any resources we get would be targeted to States who have a demonstrated ability to use that money to serve eligible clients.

WIC PARTICIPATION VARIATION AMONG STATES

Senator COCHRAN. Well, it would be helpful to have your analysis and explanation in writing for the record to set out what you have learned over time and where we are in the recognition of differences among States and why they do or do not participate in the program, and why some participate more than others. That would be helpful to know.

[The information follows:]

There are numerous reasons why States would have varying degrees of participation among their eligible populations. Historically, States have varied in the degree to which they have emphasized development and expansion of the WIC program since its establishment in 1972. Those States which emphasized WIC expansion at an earlier stage generally were funded at relatively higher levels than other States. More recently, States have differed in their ability to develop infrastructure and conduct outreach in order to reach more of their eligible population. In addition, States' per-person costs can vary substantially. States with relatively low costs for example due, to higher infant formula rebates, are able to serve more persons with the funds available to them.

In 1995, the formula used by FCS to determine State's WIC food grants was revised, in part to better target funds to States which have been underfunded relative to the size of their eligible population. The formula defines each State's "fair share" of total available funds as equal to their share of the estimated total population of income-eligible infants and children. After providing each State funds equal to the prior year grant plus inflation, the formula targets all remaining funds to States which are under their "fair share".

Senator COCHRAN. You suggest, without saying so, that you may be submitting a new regulation in this connection. You indicate, for example, that this legislative discretion to revise the funding formula is needed in recognition of the time needed for a regulatory change, et cetera.

So you are contemplating, I presume, making a change in the regulation, is that not correct?

Mr. BRALEY. That is correct, Mr. Chairman. I think we need to do that in recognition of the fact that the dynamics of the program

PART 1

314

have changed as it is reaching full funding levels. The last time we wrote a regulation governing the funding formula, it was when we were foreseeing continued growth for a number of years in the program. I think the dynamics of the situation now warrant at least a reopening of that issue, although we could conceivably come out somewhere near where we are now. But I think the circumstances have evolved to a point where it is time to reopen that question.

WIC AND NATIVE AMERICANS

Senator COCHRAN. Are these program dollars available on native American reservations and through tribal organizations?

Mr. BRALEY. They are, Mr. Chairman. Over 30 of the State agencies that we speak of when we talk about 86 or 87 State agencies in the WIC Program are organizations that serve native Americans. They function as independent tribal organizations in administering the WIC Program.

Senator COCHRAN. Do you see any differences in the administration of the program in terms of overall costs or participation levels among those groups as you do among the population at large?

Mr. BRALEY. Mr. Chairman, I have not looked at the specific figures. I imagine the administrative costs in some of the smaller organizations could be slightly higher just due to economies of scale.

I think in terms of being responsive to the needs of the native American populations that they are serving, I think they are quite effective.

Senator COCHRAN. I assume then that you are going to proceed with a regulatory change so that even if we provide you with some language that you would find helpful, that would be only an interim authority. You would proceed with the regulatory change in any event.

Ms. KEEFFE. That is correct, Mr. Chairman. But as you know, going through the regulatory process takes time. That is why we are requesting an immediate change through the appropriations process.

WIC INFANT FORMULA REBATES

Senator COCHRAN. You may have answered this awhile ago. You were talking about the infant formula rebates. Has the Department taken action through the regulatory process on this? Do you have a regulation on that now?

We included legislative authority in the appropriations bill last year to ensure maximum cost savings from infant formula rebates, that infant formula rebates be awarded on the basis of lowest net wholesale cost.

In our report, we indicated that we were acting on an interim basis and encouraged the Department to utilize the rulemaking process to address the issue on a permanent basis. Has that been done?

Mr. BRALEY. That regulation is in clearance within the Department, and we hope to issue it in the near future.

Senator COCHRAN. What savings, if any, can you identify from competitive bidding for the purchase of infant formula for WIC participants over time, from 1995 to 1997, for example? How many

PART 1

315

participants have been funded as a result of savings in each of these years?

Ms. KEEFFE. Currently, Mr. Chairman, we estimate \$1 billion annually is saved or comes back into the program through rebates, and that the savings accounts for approximately 24 percent of WIC participants.

WIC AND CHILD IMMUNIZATION

Senator COCHRAN. Do you know what increase in child immunizations can be attributed to the WIC Program? I mentioned that in some of my comments about the program. Do we have any kind of quantitative analysis of that?

Ms. KEEFFE. I do not have a figure available with me, but we certainly can look into it. It is an area where the program has been very aggressive. We will certainly be glad to submit it for the record, if there is a figure or at least an estimate in that regard. [The information follows:]

While the Centers for Disease Control and Prevention (CDC) data suggest that immunization coverage rates are at an all time high, the data is not sufficiently detailed to be able to specifically attribute the increase to a particular initiative or program such as WIC. Nevertheless, given the many activities and cooperative efforts underway in the WIC program, and CDC's special emphasis on using WIC as a major conduit to a large segment of the target population, it would be reasonable to assume that WIC is instrumental in facilitating major positive impacts on coverage rates. CDC has made the assertion that WIC is one of its most important allies in raising and maintaining immunization coverage rates. In fact, CDC has suggested that WIC may have been instrumental in the control of the 1989-91 measles epidemic.

WIC program administrators at all levels agree that one of the major public health challenges of this decade is a need to improve our Nation's capacity to deliver age-appropriate immunizations to infants and young children in need. As an adjunct to critically needed health care, the WIC Program plays a large role in the public health community's response to immunization promotion. While applicants may be prompted to come to the WIC clinic just for food help, they are also provided WIC nutrition education and enter a gateway to health care services through WIC referrals. Among these services are immunization screening and referrals. As the largest single point of access to preschool children nationally—reaching about 45 percent of all infants—WIC can make and is making a positive difference in the health and well being of low income children.

The FCS and CDC have developed and maintained a strong partnership with State cooperators in WIC and immunization to improve the quality of services and the health status of children under 2 years of age who are in need of nutrition assistance and immunizations.

To help raise and sustain high immunization coverage rates, numerous special WIC immunization promotion activities are taking place at the National, State and local levels. All WIC State agencies (including territories and Indian Tribal Organizations) are actively involved with immunization promotion activities. These activities range from comprehensive immunization screening and referral procedures and media campaigns to providing incentives and sending immunization reminders to clients. Some WIC agencies have expanded clinic hours to include immunization screening and others have formed immunization promotion task forces and committees. Many offer on-site immunizations for the convenience of families.

As a result of these initiatives, the WIC Program has been and will continue to be a major contributor to the current high levels of immunization coverage among low income children in the United States.

Just over the past year activities have included:

—The National Association of WIC Directors (NAWD), the Association of State and Territorial Health Officials (ASTHO), CDC, and FCS co-hosted a WIC immunization promotion conference, entitled "Working Together for Healthier Children," February 12 and 13, 1997. The conference fostered positive communication at the State level between Immunization Programs and the WIC Program by: increasing understanding of each programs' goals and objectives; and highlighting win-win situations in State and local WIC and immunization part-

PART 1

316

nerships. The conference also focused on State WIC Directors' and Immunization Program Managers' concerns.

—FCS, CDC, NAWD, and ASTHO have formed the WIC/Immunization Research and Evaluation Subcommittee. The purpose of this group is to coordinate research and evaluation activities directly related to immunization promotion efforts in WIC. The Subcommittee facilitates and reports on cost-effective strategies that improve vaccination coverage rates among WIC participants.

—FCS has been active and supportive of strengthening State Immunization Information Systems as a major initiative to improve immunization status assessment and referrals among WIC children. To further promote this linkage, in fiscal year 1996, FCS awarded a total of \$946,793 for State *WIC/Immunization System Linkage Grants* to nine WIC State agencies to design, develop, and implement information system linkages between State Immunization Information Systems and WIC data systems at the State and local levels. Made possible through funding from the Centers for Disease Control and Prevention's National Immunization Program, the purpose of this partnership is to enhance automation capabilities in WIC clinics to facilitate accurate and efficient assessment of the immunization needs of WIC infants and children. Grants were awarded to the following States: Alabama, Chickasaw Indian Nation, Florida, Iowa, Massachusetts, Nevada, Rhode Island, Texas, and Virginia.

—During the 1997 31st National Immunization Conference to be held in Detroit, Michigan, the WIC Program will be a prominent point of discussion. Representatives from FCS and State and local WIC staff will be present at approximately 25 workshops and many poster sessions. The conference provides WIC with an opportunity to show the more than 2,000 attendees from both private and public sectors WIC's commitment to improving the quality of services, preventing the occurrence of health problems, and improving the health status of WIC participants under 2 years of age.

Immunization promotion activities in WIC are comprehensive and numerous. FCS would be pleased to provide a briefing in greater depth regarding WIC's role in increasing and maintaining immunization coverage rates.

Senator COCHRAN. You might check in our State of Mississippi. I think we have the best participation rate and immunization rate of any State in the Union for childhood immunizations.

It is not just because of the WIC Program, but it is because of strong leadership in the public health community and in State government agencies. So the Federal Government cannot claim any credit for it.

But I point it out to say that the Federal Government might be able to learn from the successful experience in the State of Mississippi and use that in your communications and training programs that you have with administrators from other States, if they would like to find out how that was achieved. It might be helpful.

We are talking about overall health of our population of children around the country, and that is one of the main goals of the WIC Program. This is something that ought to be emulated.

Ms. KEEFFE. Right. Thank you.

Senator COCHRAN. That is a matter of record in hearings that the Appropriations Committee had a couple of years ago. So it is not new information. But we continue to achieve great results in our State in that area.

WIC FARMERS MARKET NUTRITION PROGRAM

Senator Leahy mentioned the Farmers Market Nutrition Program. I did not think any State but Vermont was eligible for that program. [Laughter.]

Was I wrong about that? I notice you asked for some money here, to increase the funding from \$6.75 to \$12 million. Will that extend the program to Mississippi, or will it still be in Vermont only?

PART 1

317

Ms. KEEFFE. Well, Mississippi is one of those States that I referred to, Mr. Chairman, that has expressed interest in becoming part of the program. We are hopeful that with that additional funding this year, that they will join.

Senator COCHRAN. Well, that is good to hear. And I am hopeful that we can look at other options for making sure that we have food, nutrition, education, and health care available to those who need that kind of assistance from the Federal Government. So when we can expand Federal programs like WIC, particularly those that are cost effective, we want to encourage it.

Ms. KEEFFE. Of course, I think the Farmers Market Program is one of those little jewels that really accomplishes so much with a relatively little amount of money.

In terms of being part of the Department of Agriculture, that connection is made with agriculture and small local resource farmers. It introduces people to the whole concept of purchasing nutritious foods from their local farmers, and the benefits of fresh foods. We think this is wonderful, especially for people who otherwise really do not know that this exists.

NUTRITION EDUCATION AND TRAINING PROGRAM

Senator COCHRAN. I know when we visited the other day in anticipation of this hearing, we talked about the Nutrition Education Training Program, the NET Program, and the supplemental funding request. There has been \$10 million in annual direct funding for NET in previous years.

The administration's fiscal year 1997 supplementals and rescissions package includes proposed legislative language to shift to the NET Program \$6.25 million in food stamp funding for commodity purchases of The Emergency Food Assistance Program.

Given the fact that grants to States are available through the school meals initiative, and you have reprogrammed funds to make available almost \$4 million in fiscal 1997 funding for the NET Program, why is it a priority to provide additional supplemental funding for this program?

Ms. KEEFFE. Well, Mr. Chairman, the NET Program has existed for almost 20 years and has a well-established record of success in providing nutrition education for the child nutrition programs.

As you mentioned, the money was lost last year through legislation that moved simultaneously on two different tracks. Our appropriations legislation was completed before welfare reform was. In welfare reform, the NET money was dropped from the mandatory account and we had no means to fund it on the appropriations side.

Beginning in 1996, the school meals initiative for healthy children standards were taking effect in schools where we were upgrading nutrition standards. The nutrition education component of that is very important. And the NET network, if you will, which always provided that education, no longer had a means to function. We were able to take \$3.75 million from Team Nutrition education funds to temporarily fund it.

However, that was all the money that was available for us to move at that time. The other money in the Team Nutrition account was earmarked for training and technical assistance, most of it in

PART 1

318

the form of grants to States for training and really was not appropriate for NET funding.

Therefore, we have asked for the additional \$6.25 million as a supplemental for fiscal 1997, and requested that the \$10 million, the amount NET has been funded at in recent years, be a part of fiscal 1998.

NET provides the infrastructure for nutrition education and the Team Nutrition funding provides the materials for that education. The two really work in conjunction with each other, in partnership, to provide that very important nutrition education message to children.

NET; IMPACTS OF WELFARE REFORM

Senator COCHRAN. What is confusing to me is that the welfare reform bill eliminated the funding for NET, as requested by the administration. That is my information. Did the administration not request that permanent funding be eliminated in the welfare reform process?

Ms. KEEFFE. I do not believe so, Mr. Chairman. It had moved over into the mandatory account last year.

Mr. BRALEY. Mr. Chairman—

Ms. KEEFFE. We are going to clarify.

NET FUNDING

Mr. BRALEY. Yes; we can provide that information for the record in terms of the sequence of events. I believe there was a request to shift the funding from one area to another, and it did not get funded last year, I think that was inadvertent. That is the reason we are in this position.

Senator COCHRAN. We have so many accounting games that we play with each other, it is hard to figure out what is on the level anymore. I think we are turning ourselves into not only just counting beans, but it is difficult to communicate with all these rules and nuances that I do not fully understand I have to admit.

Well, I would appreciate an explanation of that for the record. It seems that we have on the one hand the administration requesting elimination of the direct funding of a program, and then coming in and asking for a supplemental to restore part of the funding and then shifting money, reprogramming from another account to have it funded.

We all know there is a constituency out there that loves the program. I learned that really early on when I said, Why did we fund this? And the answer was, Because everybody likes it.

We have a lot of folks out there who would be upset if you terminated this program or made any cuts in it. We have had a \$10 million program for a good while.

[The information follows:]

NUTRITION EDUCATION AND TRAINING (NET) FUNDING FOR FISCAL YEAR 1997

Neither the budget request nor the Appropriations Act for fiscal year 1997 contained funds for NET because funds were available under permanent appropriations authorized under Child Nutrition legislation prior to welfare reform.

NET was specifically identified as a program not funded in the 1997 Appropriations Act. As part of Welfare Reform, the permanent funding for NET was deleted.

PART 1

319

The Agriculture Appropriations Act for Fiscal Year 1997 passed, followed quickly by the passage of Welfare Reform. Due to the timing of the two pieces of legislation, there was no opportunity to add funding to the Appropriations Act. Welfare reform also changed the funding authorization from mandatory to discretionary.

Subsequent to the passage of the Appropriations Act for fiscal year 1997, \$3.75 million was reprogrammed within the Child Nutrition account to make the funds available for NET. Funds were issued to States in December, 1997.

Ms. KEEFFE. Well, I think it is also an important time in terms of the work of that program, too. We certainly heard very clearly, when we were upgrading the nutrition standards in school meals, how important it is to reach children with nutrition education, as well reach the school food service providers with the training and technical assistance that was important to them.

The work NET does and the fact that it is well established and well received in the school community is crucial at this time, considering that we are making vast changes in the meals. It is important that we continue to reach the children in any way necessary.

IMPACTS ON NET PROGRAM ACTIVITIES

Senator COCHRAN. I have a question here that my staff has prepared, and I am going to ask it, because I am curious to know what the answer is. You may have already answered it, though.

What activities are not being funded by States with available NET Program funding of \$3.75 million?

Mr. BRALEY. Mr. Chairman, as I understand it, the States are barely able to keep a program operating at this point at that funding level.

A lot of States have curtailed significantly their programmatic activities, work with actual school districts, and their customary nutrition education to teachers and food service workers.

Early on, before the shift in funding was done to provide even the \$3.7 million, a number of NET coordinators were laid off. Consequently, there has been a severe impact on the ability of that program to perform its function.

I think it is safe to say that folks who are still working in that area are doing the best they can with very limited resources, but it is not funded at a level that will sustain the kind of quality program we have had historically.

Senator COCHRAN. I think you and I both misunderstood the question. And that is why I asked it, to see if I could figure it out while you were answering it.

TEAM NUTRITION FUNDING

I think what the question means is, since the \$3.75 million was reprogrammed by the administration from the school meals initiative line item, what programs that had been paid for with that money suffered the loss of \$3.75 million and what was the impact of that on the States?

Ms. KEEFFE. Well, that money would have gone for educational materials related to the Team Nutrition effort. A lot of that money is in the form of 2-year money. We had money in the pipeline that was able to carry forward a lot of the materials that were already in progress.

Certainly one notable area where I have had personal experience when visiting a lot of schools is getting our materials translated

PART 1

320

into Spanish. We have a tremendous need for this throughout the country, but we have recognized we are not going to be able to fund it this fiscal year. We have had to make it clear to States that they will have to wait until next year.

So it basically is materials in support of our Team Nutrition schools, which now we have 20,000 schools across America that have signed on to be Team Nutrition schools. The nutrition education materials that we have as part of that effort to get into schools, to help with nutrition education for the children, is definitely on a slower track as a result of the loss of those funds for that part of the program.

COMMODITY ASSISTANCE PROGRAMS

Senator COCHRAN. I am going to submit questions regarding the Commodity Assistance Program and some of the other programs. I visited one of our warehouses in Jackson, MS, where a lot of these commodities are accumulated and distributed to soup kitchens and others providing meals to folks in that fashion. It seemed to me to be an important program to support, and I hope that we can find a way to continue to support that.

Do you provide enough flexibility, do you think, in these programs to suit the administrators in the States? I know you are adding programs to the Commodity Assistance Program, the Nutrition Program for the Elderly, and Pacific Island Assistance. Is this to give people more flexibility or less?

Ms. KEEFFE. In the commodity assistance programs, Mr. Chairman, we are providing more flexibility than we have in the past through legislation which has combined the old TEFAP Program, along with soup kitchens and food banks.

It is really the States who are able to determine best how to serve the needs of their communities, whether through congregate feeding in soup kitchens, through pantry food banks, or mass distribution of commodities, which used to be the old TEFAP Program.

States make the determinations. The administrative funding applies across the board to help run those programs in the best way.

In addition to that, of course, the funding also comes into play with the gleaning and food rescue initiatives that the Department has been undertaking, which of course are voluntary efforts on the part of people to secure more foods for soup kitchens in food banks. Those administrative funds for the commodity assistance programs have been very beneficial in helping to handle those extra foods that they get through those processes as well.

FOOD RECOVERY AND GLEANING

Senator COCHRAN. I am also interested in the National Food Service Management Institute funding, and I will submit questions on that and Team nutrition as well and on administrative costs, research and evaluation, and other subjects.

You mentioned the food recovery and gleaning initiative. I think Bill Emerson led an effort to put that into law, the Good Samaritan Act, I think it is now called.

PART 1

321

The Secretary indicated that at the Department there is an initiative under way to carry out the spirit of that law and try to reclaim foods and distribute them to places where the need exists.

Is there any effort by the Food and Consumer Service to implement that program? What progress, if any, are you making in that regard?

Ms. KEEFFE. Mr. Chairman, we have worked very closely with the goals of that program—I hesitate to call it a program because that has other implications—but with that effort of the Secretary. I know the Secretary takes every available occasion to encourage groups to help out with this effort.

It has many facets, from gleaning in the fields, to food rescue from supermarkets, terminal docks, or leftover foods from restaurants, and matching this excess food, which is of course in tremendous quantities in this country, to people in need.

Certainly through our commodity assistance programs, soup kitchens, and food banks, there is a natural connection. So we have been working with the Secretary's efforts through our Food Distribution Division, which works with those programs.

As I said, the important administrative funding for these commodity programs helps them to deal with the foods that originate from this voluntary effort. It has been very exciting. I think it has been very well received. The Department, of course, for many years has been providing food to D.C. Central Kitchen from our own cafeterias every week. The Secretary has been encouraging other Federal Departments to do the same.

Senator COCHRAN. In a visit I had to the Mississippi gulf coast, we were conducting hearings on the subject of the growing aquaculture industry there, shellfish particularly, and research using fish instead of other animals for research laboratories.

Anyway, part of our tour included a stop at a place where they were developing machinery to reclaim what would be wasted fish that would have been thrown away. And it was just amazing.

They were making products like—what is it? It is something that you can use just a regular fish and make it taste like crabmeat or lobster or shrimp, some of these other varieties of shellfish particularly.

It was quite amazing to see the efficiencies and the technologies that can be harnessed in reclaiming food waste like that. I hope we do learn to waste less and be more efficient in the use of our food supply.

It is almost shameful how much food we throw away every day in America. I have the notion that we could feed entire countries from just the scraps from the tables of American families.

AGENCY ADMINISTRATION

There are a couple of questions that I had in my notebook, which I was going to submit, about program administration requirements. You mentioned that there were problems regarding appropriations for staff-years.

And you have not had, because of restricted staff-year ceilings in these accounts, any option except just to deploy staff from crisis to crisis, which makes effective program administration nearly impossible.

PART 1

322

You do have a lot of responsibilities, nearly \$40 billion in program funds to administer. That is quite a huge amount. I think that has gotten up to over 70 percent of the Department's total budget.

Ms. KEEFFE. Yes; that is correct. Moreover, we have less than 2 percent of the personnel.

Senator COCHRAN. How many staff have you lost? Do you have numbers to indicate lost staff-years from your agency?

Ms. KEEFFE. I do. Actually, one of the ways I look at it is to go back to 1980, because the growth of our programs from that time has been dramatic. And yet our staff and administration levels have been dropping significantly.

STREAMLINING GOALS

We dropped from 2,800 employees to 1,750 today, which is about a 40-percent decrease. During that same time, our programs have doubled in size. It really is a critical situation.

And, as you know, we have a major integrity role in these programs. There has been a lot of recent emphasis on this. It is something that we take very seriously but we really have reached the point at which we are truly at a barebones level of operation.

Just in the few years that I have been associated with the programs, we have lost 60 personnel one year, and 80 in another. Now those do not sound large when you are talking about numbers of Government employees, but out of a total base of less than 2,000 people, those are substantial numbers in a given year.

I really think that we are to a point which we cannot go below. What we have requested is holding the line where we are. We have met all of our streamlining requirements, and are ahead on those numbers. So we really need to stay the course in terms of where we are right now.

Mr. LUDWIG. Mr. Chairman, Mary Ann is exactly right. We have reached all our streamlining objectives. But what she did not mention is that we met our streamlining objectives 3 years ahead of schedule. In the past 4 years, FCS has reduced our supervisory ratio by 40 percent to a 1-to-7 ratio and we reduced headquarters staff over 12 percent. This also was 3 years ahead of our schedule. Additionally, we reduced the number of senior staff level positions, that is GS-14's, 15's, and SES'ers, by over 18 percent over the last 4 years.

Basically, Mr. Chairman, we do not have the bodies to do the everyday preventive maintenance of our programs. On any given day, we will have between 12 and 18 audits, either through the Inspector General's Office or the GAO office, evaluating our agency.

Based on those numbers and the reduced numbers of staff-years, we go, as you said, from crisis to crisis instead of being able to be proactive in our programs and heading off crises.

Senator COCHRAN. What is the answer to it?

Mr. LUDWIG. We have reduced staff as Mary Ann has said, anywhere from 60 to 100 positions every year. Over the last 17 years, we have lost in excess of 1,000 employees. We are down to less than 1,800, about 1,750. If I could just hold what I have, I would be happy.

PART 1

323

Senator COCHRAN. Well, you have asked for an increase of \$1.6 million above last year's level for program administration.

Mr. LUDWIG. Those numbers basically cover inflation.

Senator COCHRAN. Does it take into account cost-of-living adjustments or pay increases and the like—

Mr. LUDWIG. Yes, sir; it includes one-half of the mandatory pay increases.

Senator COCHRAN. For all the employees?

Mr. LUDWIG. Yes, sir.

CLOSING REMARKS

Senator COCHRAN. Well, we appreciate very much your explanation of the Department's request for these programs that are under this subcommittee's jurisdiction. They are all very important and serve very important needs in our Nation.

This committee wants to work with you in a cooperative way to be sure that the programs receive the funds that are necessary for their appropriate administration, and we will work to achieve that goal with you.

SUBMITTED QUESTIONS

For the questions that are submitted, we hope that you will be able to respond to them in a timely fashion so we can have the benefit of your input into the process as we decide on the levels of funding for this next fiscal year.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

WIC FISCAL YEAR 1997 SUPPLEMENTAL FUNDING REQUEST

Question. The Administration is seeking \$100 million in fiscal year 1997 supplemental funding for the Supplemental Nutrition Program for Women, Infants, and Children (WIC).

What has been the increase in the cost of a food package above the original fiscal year 1997 budget estimate level?

Answer. In the original 1997 budget, the Agency estimated that the average cost of a WIC food package for all of fiscal year 1997 would be \$31.91—about 3.3 percent above what was estimated at that time would be the final for 1996. However, the actual average cost of a food package in the first quarter of 1997 is \$31.85—about 4.2 percent above first quarter 1996, which was \$30.53.

Question. What has been the increase in the average monthly caseload above the fiscal year 1996 level?

Answer. Average monthly WIC caseload in fiscal year 1996 was 7.193 million. At the end of fiscal year 1996 the caseload was 7.428 million. During the first quarter of fiscal year 1997, caseload averaged 7.386 million—that is, in October of fiscal year 1997 caseload was 7.474 million, in November it was 7.400 million and in December it was 7.283 million. The WIC program has a normal seasonal pattern in which participation falls in December and rises again in January.

Question. What did the Department do at the outset of the fiscal year to manage the WIC Program within available funding to avoid disruptive participation cuts and to first serve "high priority" women, infants and children?

Answer. Total fiscal year 1997 projected grant and participation levels, including reallocation estimates, were provided to States in September. States were advised that the total funds available for fiscal year 1997 would not be sufficient to meet last year's grant levels, adjusted based on inflation. These September estimates indicated that many States would need to manage caseload levels carefully to ensure expenditures would not exceed available fiscal year 1997 funding.

PART 1

324

In January, when it was clear that many WIC State agencies might be in danger of overspending their WIC grants, FCS transmitted alerts to all WIC State agencies of the seriousness of the situation and requested State spending and participation plans for fiscal year 1997. States were again provided estimated grant levels reflecting all anticipated available funding, to include both appropriated funds and reallocation of prior year unspent funds. The agency will continue to work with States that will need to reduce caseload levels and /or tailor food packages more based on recipient need and/or increase food package management efforts as the year progresses so they will not overspend their grant.

When funds are not available to serve all eligible persons seeking WIC services, State agencies are required by WIC Program regulations to establish waiting lists which use a participant priority ranking system. Participants are assigned a priority level at certification which is based on their degree of nutritional and medical risk. This priority system ensures that the highest priority persons are served when caseload slots become available.

Question. You indicate that without this supplemental funding, states will have to reduce participation by 400,000. Would you please justify this estimate and give us reductions which would occur by state.

Answer. At the end of fiscal year 1996, WIC participation was 7.4 million persons and has remained at approximately this level through the first quarter of fiscal year 1997. FCS estimates that the current appropriation will serve an average of 7.2 million persons per month in fiscal year 1997. In order to achieve an average of 7.2 million for fiscal year 1997, WIC participation must fall to 7.0 million by year end—a reduction of approximately 400,000 women, infants and children who would otherwise receive WIC benefits. The Agency does not have adequate information at this time to produce State-by-State estimates associated with this 400,000 reduction in participation.

States have submitted detailed expenditure and participation plans to FCS, that were provided to the subcommittee on March 13, 1997. However, based on historical evidence, our analysis indicates that the expenditure assumptions upon which many State plans are based are not supportable, because they indicate that States will spend all or nearly-all the resources available in 1997. Without a supplemental in fiscal year 1997, the Agency estimates that participation may decline by 400,000 by the end of the year and that there will be a significant drawdown of carryover funds.

Question. Will 400,000 current WIC participants be dropped from the program without the supplemental funding requested? Please explain.

Answer. At the end of fiscal year 1996, WIC participation was 7.4 million and has remained at approximately this level through the first quarter of fiscal year 1997. FCS estimates that the current appropriation will serve an average of 7.2 million persons per month in fiscal year 1997. This assumes that funds States carryover from 1996 to 1997 is reduced by \$45 million and these funds are used to support participation in 1997. In order to achieve an average of 7.2 million for fiscal year 1997, WIC participation must fall to 7.0 million by year end—a reduction of approximately 400,000 women, infants and children who would otherwise receive WIC benefits.

When participation demand exceeds available funding, WIC State agencies establish participant waiting lists based on a priority system established by nutritional risk criteria and/or tailor the food packages more carefully to address specific recipient nutritional needs. It is anticipated that WIC State agencies will employ a variety of measures to reduce caseload, as necessary. Some participants may no longer be at nutritional risk at the end of their certification period and would therefore not be recertified. Also, States may choose, in accordance with Program regulations, not to recertify lower priority participants at the completion of the current certification period, providing benefits to only those determined to be in the highest priority categories. Many States may need to establish waiting lists for all or most new applicants, again in accordance with the priority system established by the WIC State agency. As a last resort, State agencies do have the authority to discontinue Program benefits to certified participants. Such action may be taken only after the State agency has explored alternative actions. If taken, the action should affect the least possible number of participants and those participants whose nutritional and health status would be least affected by the withdrawal of Program benefits.

The expectation is that States will continue to do their best to carefully manage their caseloads and closely scrutinize and monitor their expenditures, making adjustments to caseload as necessary, by not certifying new applicants, by not recertifying some recipients or, as a last resort, by discontinuing benefits mid-certification.

PART 1

325

WIC FARMERS' MARKET NUTRITION PROGRAM

Question. The fiscal year 1997 appropriations act makes "up to" \$6.75 million of the funding provided for WIC available to carry out the WIC Farmers' Market Nutrition Program. If the Administration thought there might be a shortfall in funding for WIC, why did it make funding available to the WIC Farmers' Market Nutrition Program?

Answer. In September 1996, FCS allocated the farmers' market funds based on the best available information that was available at that time. That information reflected that approximately \$145 million in recoverable fiscal year 1996 WIC funds would be available in addition to the fiscal year 1997 appropriated funds. It was thought that the sum of these funds would be sufficient to support the expected WIC September 1996, participation level of 7.3 million.

Subsequently, data became available reflecting a higher participation rate than anticipated. Thus, it became apparent that WIC caseloads could not be fully maintained with currently available funding for fiscal year 1997. In response to this unanticipated need, the Agency has requested supplemental funding, so that both the FMNP and, the WIC Program may continue without disruption.

Question. The Administration's requested supplemental language also proposes to allow the Secretary of Agriculture to distribute the supplemental funds among States using criteria other than the current regulatory funding formula. How would the Secretary's distribution of these funds differ from the current regulatory funding formula? Please provide a comparison by state.

Answer. Current WIC program funding regulations require that the first priority for allocating funds is to provide all State agencies with stability funding, which is each State agency's prior year food grant plus inflation. Funds remaining after stability food grants are met are allocated through the fair share component. A State's fair share of funds is defined as equal to its share of the National estimated WIC-eligible population. The fair share component provides funds to States with stability grants below their fair share level.

The Department is requesting flexibility in allocating the supplemental funding in order to ensure that the Secretary allocates funds with the goal of minimizing fluctuations in program participation. FCS anticipates that the allocation process of the supplemental funds would be as follows: (1) allocate funds to under fair share State agencies requiring additional funds to maintain current participation; and to the extent that additional funds are available, (2) allocate funds to over fair share State agencies requiring additional funds to maintain current participation up to the level of their defined stability grants.

The Agency is currently unable to provide an allocation comparison by State. One element in determining eligibility for supplemental funding is not known at this time—the magnitude of declines in participation resulting from financial shortfalls. However, information reflecting each State's percent of fair share as of March 1997, is provided for the record.

[The information follows.]

WIC PROGRAM FISCAL YEAR 1997 FOOD GRANT AS PERCENT OF FAIR SHARE

[As of January reallocation]

State agency	Fiscal year 1997—		(C) Food grant as percent of fairshare
	(A) Fairshare (w/ January reallocation)	(B) Food grant (w/January reallocation)

WIC PROGRAM FISCAL YEAR 1997 FOOD GRANT AS PERCENT OF FAIR SHARE—Continued

[As of January reallocation]

State agency	Fiscal year 1997—		(C) Food grant as percent of fairshare
	(A) Fairshare (w/ January reallocation)	(B) Food grant (w/January reallocation)	
National	2,792,372,972	2,792,372,972	100.00

Question. I understand that States are submitting to the Department detailed expenditure and participation plans based on current funding levels which reflect food cost data, cost containment initiatives, anticipated fiscal year 1996 and 1997 spend forward amounts and anticipated surpluses and shortfalls in funding levels. Please make this information available for the record.

Answer. WIC State agency fiscal year 1997 spending plans were received by the FCS from all WIC State agencies in February. An analysis of the spending plans, as well as the actual plans provided by each State agency, were provided to the Senate Appropriations Committee on March 18, 1997.

FISCAL YEAR 1998 WIC REQUEST

Question. A WIC contingency fund of \$100 million is requested for fiscal year 1998 to avoid participation reductions from unexpected food price increases. The Secretary would be authorized to release amounts from the contingency reserve “should food costs exceed budget estimates.” What is the budget estimate which would be used as the “trigger” for the proposed reserve?

Answer. The contingency fund is intended to serve as a buffer against unforeseen conditions which could threaten the goal of supporting participation at a stable, full funding level. It is for use only if needed to avoid participation reductions from the full-funding level caused by higher-than-expected food costs. FCS believes it is important to provide this buffer as the program enters a period of greater funding stability. In the past, when WIC participation was increasing steadily each year, higher-than-expected food costs would have resulted in slower program growth. However, in the coming year, when participation is expected to be much more stable and many States will only have funds to support current participation, unanticipated inflation would mean actual reductions in service, rather than simply a reduction in the growth rate.

The Administration has not established a fixed technical approach for determining the circumstances under which contingency funds would be spent.

Question. Why does the budget propose that the requested contingency reserve funds remain available until expended?

Answer. The contingency reserve is intended to serve as a buffer against unforeseen conditions which could threaten the goal of supporting participation at a stable, full funding level, and would be used only if needed to avoid participation reductions from the full-funding level caused by higher-than-expected food costs. FCS believes that the need for such a buffer will remain beyond fiscal year 1998 as the program operates at a stable level. Furthermore, it is the Agency’s best estimate that these funds will not be used in fiscal year 1998. It is requested that the budget authority for this fund remain available until expended, rather than periodically re-establishing the budget authority for such a fund, as would be required if the budget authority is granted for a fixed period.

Question. The “full funding” level is assumed to be approximately 7.5 million persons. Please provide the Committee with a detailed explanation of how this full participation estimate was produced.

Answer. The “Eligibility And Coverage Estimates 1995 Update—U.S. and Outlying Areas” is provided for the record.

[The information follows:]

SPECIAL SUPPLEMENTAL NUTRITION PROGRAM FOR WOMEN, INFANTS, AND CHILDREN (WIC)

ELIGIBILITY AND COVERAGE ESTIMATES 1995 UPDATE—U.S. AND OUTLYING AREAS

Overview

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) is a Federal-State nutrition and health assistance program for low-income

PART 1

329

childbearing women, infants and young children. To be eligible, an applicant must meet three basic criteria:

(1) *Categorical*—Participants must be pregnant women, breastfeeding women up to 1 year after delivery, non-breastfeeding postpartum women up to 6 months after delivery, infants up to 12 months of age, or children up to their fifth birthday.

(2) *Income*—The maximum income limit is 185 percent of the U.S. Poverty Guidelines (e.g., \$28,860 for a family of four as of July 1, 1996). In addition, individuals are automatically considered income-eligible if they receive benefits under the Federal Medicaid, Aid to Families with Dependent Children (AFDC), or Food Stamps Program (FSP). Income limits for the AFDC and FSP are below the WIC income cutoff; however, in some cases, Medicaid serves persons over 185 percent of poverty.

(3) *Nutritional Risk*—Participants must be certified to be at nutritional risk. Three major types of risk are recognized: *medically based* risk, such as anemia, underweight, maternal age, history of pregnancy complications or poor outcomes, etc., *diet-based* risk—inadequate dietary patterns, as determined by 24-hour food recall or food-frequency analysis, and *predisposing risk conditions*, such as homelessness and migrancy.

1995 ESTIMATE OF WIC ELIGIBLE

[Numbers in thousands]

	Pregnant women	Postpartum and breastfeeding women	Infants	Children	Total
1994:					
Income eligible	1,266	906	1,703	7,709	11,584
Fully eligible	1,156	832	1,618	5,797	9,403
Participation (CY)	682	842	1,796	3,298	6,618
Coverage (FY) (percent)	59	101	111	57	70
1995:					
Income eligible	1,300	931	1,748	7,313	11,292
Fully eligible	1,187	855	1,661	5,499	9,202
Participation (CY)	689	900	1,817	3,541	6,947
Coverage (CY) (percent)	58	105	109	64	75

The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (Public Law 104-193) replaced AFDC with the Temporary Assistance for Needy Families (TANF) program. TANF recipients will continue to be considered automatically income eligible for WIC as long as the income standards established by States for TANF are not less restrictive than those for AFDC.

Estimates of persons eligible for the WIC program are used for several purposes. They provide an indication of the number of persons who would participate in WIC if funds were available. As such, the eligibles estimates are an important component in developing program budget estimates used in the President's budget request and the Congressional budget process. Finally, the eligibles estimates provide a basis for estimating program coverage—that is, for determining what share of the eligible population the program is currently reaching. Based on the March 1996 Current Population Survey (CPS), FCS estimates that 9.2 million women, infants and children were fully eligible for the WIC Program in 1995, a 2.1 percent decrease from the number estimated eligible in 1994. A total of 11.3 million women, infants and children fell below the WIC income eligibility limit in 1995, vs. an estimated 11.6 million in 1994.

Program Coverage

The decrease in the estimated number of WIC income-eligibles, combined with an increase in average monthly participation of over 300,000 for the calendar year, allowed overall program coverage to increase by five percentage points, from 70 percent in 1994 to 75 percent in 1995. This coverage estimate does not factor in increases in participation that have occurred since 1995.

Estimated coverage of pregnant women is approximately 58 percent for 1995. This represents the proportion of women at all stages of pregnancy who are participating in WIC. Because women are very unlikely to participate in WIC for a full 40 weeks of pregnancy, this rate should be expected to be significantly below 100 percent. For example, if all eligible pregnant women were to participate for six months of their pregnancy, the calculated participation rate would equal 65 percent.

PART 1

Estimated coverage rates for infants and breastfeeding/postpartum women were over 100 percent in 1995. These extremely high coverage rates are likely attributable to some disparities between the methodology used to estimate income-eligibles and the certification practices in the WIC program, as well as the imprecision inherent in any survey-based estimate. However, these data do strongly suggest that the program has likely achieved virtually full coverage of persons in this category at the national level. Estimated coverage of children also rose substantially from 1994 to 1995, from 57 percent to 64 percent.

The estimate of 9.2 million WIC eligible persons in 1995 assumes that about 4 out of 5 income eligible persons are also at nutritional risk and thus fully eligible for the WIC Program. The estimates of pregnant, postpartum and breastfeeding women are based on the count of infants from the CPS and relationships found in the 1990 Decennial Census.

WIC Full Participation

The President's Budget proposes to fully fund the WIC Program and serve 7.5 million women, infants, and children by the end of fiscal year 1998. The full funding participation level, providing adequate funding to serve all eligible persons who would chose to participate in WIC, has been assumed to be approximately 7.5 million persons for budget purposes for the past several years. This target was originally based on a budget estimate prepared in 1993 by the Congressional Budget Office. It is also consistent with FCS' full participation estimate produced in 1996 using 1994 WIC eligibles data.

Using the same methodology as was used for last year's full participation estimates, the 1995 eligibles data would imply that 7.3 million persons would participate in the program if adequate funds were available. This methodology assumes that, on average, approximately 80 percent of all persons fully-eligible for the program would participate.¹

This key assumption regarding the overall maximum participation rate is not exact and now appears somewhat low. First, year-end fiscal year 1996 participation was approximately 100,000 greater than the 7.3 million level calculated by the model. This alone indicates that the 80 percent participation rate assumption understates the actual participation rate. Indeed, the program has a goal of increasing participation rates and has been successful in achieving high participation rates for infants and women. The key variable in determining overall program participation rates is the participation rate among children. The strong and steady participation growth that occurred among children in WIC throughout fiscal year 1996 suggests that a 80 percent maximum participation rate for the program is likely too low. The conclusion that the 80 percent participation assumption is too low is further supported by the experience of the Food Stamp Program, where participation rates for families with children under 5 are over 90 percent.

The 7.5 million full funding participation target is slightly above the full participation level estimated based on 1995 CPS data using previous methods. Given that the estimated number of fully-eligible persons exceeds this level and the actual participation experience of WIC and other low-income assistance programs serving children, a full funding participation target for fiscal year 1998 of 7.5 million is reasonable and prudent.

Question. Based on your estimates, administrative expenses represent approximately 26 percent of the average cost of a WIC food package. Of this amount, what portion is for administrative program costs and what portion is for nutrition services?

Answer. The latest nutrition services and administration (NSA) expenditure data available is for fiscal year 1995. This data shows that 74 percent of total expenditures were for supplemental foods and 26 percent of total expenditures were for NSA. NSA refers not only to program management costs, but to all costs other than the cost of the supplemental foods. Only 9 percent of total expenditures were for program management. This amount includes the cost to authorize and monitor vendors to accept WIC food instruments; printing, reconciling and payment of food instruments; development and management of ADP systems; accounting, reporting, and auditing; and outreach. Nutrition education and breastfeeding promotion and support were 6 percent of total expenditures. These services include the preparation and provision of education sessions (group or individual) on nutrition and breastfeeding promotion and support; peer counseling support for breastfeeding mothers; breastfeeding aids such as breast pumps; equipment and materials for nutrition education; and interpreter or translator services to facilitate nutrition edu-

¹ This estimate also assumes that a portion of the WIC-eligible population (approximately 65,000 persons) would continue to be served by the Commodity Supplemental Food Program.

PART 1

cation. The remaining 11 percent of total expenditures were for other client services. These services include diet and health assessments for certification; issuance and explanation of food instruments; referrals to other health and social services; voter registration activities; other coordination efforts, such as immunization promotion and drug, alcohol and tobacco education; and coordination with other family and child health and social programs.

Question. The fiscal year 1998 budget also requests appropriations bill language authorizing the Secretary to adjust fiscal year 1998 state allocations to reflect food funds spent forward, and to make other funding formula revisions.

Please provide a detailed explanation of the revisions which would be made to the current regulatory formula, the reasons for each revision, and a comparison of the allocation each state would receive under the revised versus the current regulatory formula.

Answer. The Department is requesting legislative language authorizing the Secretary to adjust the funds allocation process in fiscal year 1998. The first adjustment would require the Secretary to reduce each State agency's allocation for fiscal year 1998 appropriated funds by the amount of food funds that the State chooses to spend forward from fiscal year 1997. This will provide the Department with the ability to reallocate a greater amount of funds to States most in need. The second change pertains to the allocation of fiscal year 1997 funds that are recovered from the States. To the extent funds are available, funds would be allocated to all States to maintain the level of funding received in fiscal year 1997, adjusted based on inflation. Any additional funds would be allocated to under fair share States that the Secretary has determined can effectively utilize and manage additional funds. Under fair share States are those States that are not receiving funds commensurate with their percent of the total WIC population.

A comparison of the allocation each State would receive under the revised formula can not be provided at this time. Additionally, the Agency is unable to determine which States will be under fair share and would be eligible to receive additional funds. However, FCS provided a list of fair share grants and food grants as of January 1997, in answer to your previous question. These give a sense of where States are with respect to fair shares to date.

Question. You indicated that the Department plans to proceed with a regulatory change so that the requested appropriations bill language would provide only interim authority. When does the Administration plan to publish a proposed rule?

Answer. The Department plans to revise the current food funding formula in consultation with WIC State agencies. The Agency envisions that the proposed rule would be published in fiscal year 1998.

INFANT FORMULA REBATES

Question. What savings have been generated from competitive bidding by States for the purchase of infant formula for WIC participants in each of fiscal years 1995 through 1997? How many participants have been funded as a result of this savings in each of these years?

Answer. Infant formula rebates reduce the cost of infant formula, thereby allowing additional participants to be served monthly. The requested information is provided for the record; however, the rebates listed include rebate savings for other foods, e.g., infant cereal, but infant formula rebates represent the vast majority of rebates.

[The information follows:]

[Dollars in thousands]

Fiscal year	Rebates	Estimated participation increase due to rebate savings
1995	\$1,051,000	1,620,000
1996	¹ 1,180,000	1,790,000
1997 ²	1,172,000	1,720,000

¹ Rebates reported by State agencies as of 2/24/97.

² Estimated rebates from infant formula only.

Question. How successful have efforts been to promote breastfeeding as the feeding method of choice among WIC participants? What impact does this have on savings from infant formula rebates?

Answer. FCS believes that WIC's efforts to promote breastfeeding as the feeding method of choice for all mothers, particularly among WIC participants is having an

PART 1

332

impact. Proprietary marketing data from the Ross Laboratories Mothers Survey is the most recent source of breastfeeding data available at this time. The Ross data as well as other information suggest that WIC breastfeeding rates are growing, and are growing at a faster rate than among non-participants. For example, the Ross data showed that between 1989, when Congress enacted several provisions to strengthen WIC's support for breastfeeding, and 1994, the percentage of WIC mothers breastfeeding in the hospital increased from 34 to 44 percent, while the percentage of non-WIC mothers breastfeeding in the hospital rose from 63 to 69 percent. This is an increase of ten percentage points for WIC mothers compared to six percentage points for non-WIC mothers. The 1993 General Accounting Office (GAO) report to Congress entitled *Breastfeeding-WIC's Efforts to Promote Breastfeeding Have Increased* provides additional encouraging information. The GAO report indicated that between 1989 and 1992, in-hospital breastfeeding among WIC participants increased nearly 12 percent. The percentage increase in the breastfeeding rate of WIC participants was more than twice the 5 point increase of other women in the hospital. The Agency believes that substantial efforts directed at improving breastfeeding rates in WIC by Federal, State and local personnel are responsible for the encouraging trend exemplified in these data.

Infant formula rebates serve to reduce the net cost of infant formula to the program. If a breastfed infant receives no formula, or less formula than he/she would otherwise have received, program expenditures are reduced by the net cost of the formula that would otherwise have been provided. However, there are additional costs associated with serving the breastfeeding mother, as the food package provided to breastfeeding women is almost as large as the package provided to those using infant formula. Breastfeeding women can participate for up to a year, whereas non-breastfeeding postpartum women are eligible for up to six months while they also receive formula for their infant. In effect, it is possible but unlikely that significant increase in the incidence and duration of breastfeeding may increase overall program costs even as the cost of infant formula is further reduced. In any case, the promotion of breastfeeding in the WIC program is a priority for health rather than cost considerations.

CHILD IMMUNIZATION

Question. Please give us a status report on how successfully the WIC program has been utilized to increase child immunizations. What level of funding is being spent on this in 1997? What is proposed for fiscal year 1998?

Answer. The WIC Program has been and will continue to be a major contributor to the current high levels of immunization coverage among low income children in the United States. In fact, the Centers for Disease Control and Prevention (CDC) considers the WIC program to be one of its most important allies in raising and maintaining immunization coverage rates. Of the 87 WIC State agencies (including territories and Indian Tribal Organizations), all are currently actively involved with immunization promotion activities. These range from comprehensive immunization screening procedures and media campaigns to providing incentives and sending immunization reminders to clients.

WIC agencies provide direct ongoing administrative support for immunization promotion efforts. Allowable WIC expenditures which can be covered by WIC program Nutrition Services and Administrative funding include activities such as immunization education, outreach, assessment of immunization status (which ranges from manual to computerized assessment), referral and follow up. WIC agencies develop cost allocation agreements to fairly share costs of immunization promotion activities with CDC and other sources of support for immunization. The amount of WIC funds spent on immunization activities is unknown because State WIC agencies are not required to report on this type of expenditure. As technical assistance to WIC State agencies, CDC is developing a new methodology for calculating the costs of WIC immunization activities which may provide a tool for estimating WIC immunization expenditures in the future.

CDC has contributed funds directly to WIC to meet mutual immunization goals. In 1995, Congress directed CDC to ensure that all grantees receiving Immunization Action Plan (IAP) funds reserve 10 percent of those funds for the purpose of funding immunization assessment and referral services in WIC sites. Immunization grantees must use the funds for WIC linkages unless the grantee can document that assessment and referral are taking place in WIC sites without the need for specific funds. This amounted to approximately \$10 million in both fiscal years 1996 and 1997. Future year funding from CDC is unknown at this time.

In fiscal year 1996 approximately \$1 million of CDC funding was provided to nine WIC State agencies to design, develop, and implement information system linkages

PART 1

333

between State Immunization Information Systems and WIC data systems at State and local agency levels.

CAP ON SUGAR IN WIC-APPROVED BREAKFAST CEREALS

Question. In its hearings last year and in the report on the fiscal year 1997 appropriations act, this Committee expressed concerns about the Department's effort to revisit the limitation on the sugar content of WIC-approved cereals. Specifically, we recalled that the WIC sugar cap has been examined by the Department on a least seven prior occasions, each of which resulted in a confirmation of the cap at its current level (6 grams of sugar per ounce). We also expressed our sense that, unless there is new evidence that this particular nutrition standard requires further study, the Department's effort may represent an inefficient use of limited resources.

We understand that despite full consideration of the Department's Notice of Intent to Propose Rulemaking, with significant participation in the public comment opportunity, this matter stands unresolved.

Are there any new developments in the underlying research that would prevent a resolution of this issue?

Answer. Since the time that the Department conducted its last review of WIC food packages, the 1995 Dietary Guidelines were issued. That, in combination with the fact that recent studies continue to fail to document an association between sugar consumption and an increased risk of certain diseases and medical conditions, prompted the Department in March of 1996 to seek public opinion on the continued appropriateness of the current regulatory sugar caps for WIC cereals. While commenters were generally very supportive of retaining the current cap, some suggested that the Department should undertake a more comprehensive review of packages, rather than just considering the sugar content of cereals. In response, the Department intends to publish another Federal Register notice announcing specific future intentions regarding this new review.

In the interim, the Department is taking no action to propose changes in current WIC regulations.

Question. What was the outcome of comments the Department received?

Answer. At the close of the 90-day comment period on the WIC Cereal Sugar Limit Notice published in the Federal Register on March 18, 1996, the Department received 731 letters from a total of 878 commenters, representing a wide range of interested parties. Eight hundred and nine commenters expressed support for retaining the 6-gram sugar limit unchanged, 27 commenters recommended that the limit be redefined to discount naturally occurring sugars found in grain and fruit ingredients in cereals, 26 commenters favored an elimination of the sugar limit, 7 commenters suggested that USDA establish a lower sugar limit, and 11 commenters expressed other points of view. (A few commenters expressed two positions in their letters, which were captured accordingly in the counts reported above.)

As of March 13, 1997, 164 letters, representing 182 commenters, were received after the closing date for the notice's comment period. Although late letters were read and considered, they were not included among the official counts comprising the comment analysis stated above. Of these, 156 commenters supported retaining the sugar limit unchanged, while the remaining 26 comments took other positions.

NUTRITION EDUCATION TRAINING (NET) PROGRAM FISCAL YEAR 1997 SUPPLEMENTAL FUNDING REQUEST

Question. The Administration's fiscal year 1997 supplemental/rescission package includes legislative language to shift to the NET program \$6.25 million in food stamp funding for commodity purchases of The Emergency Food Assistance Program (TEFAP).

Given the fact that grants to states are available through the school meals initiative and you have reprogrammed funds to make available \$3.75 million in fiscal year 1996 funding for the Nutrition Education and Training (NET) Program, why is it a priority to provide additional supplemental funding for the NET program?

Answer. Through Team Nutrition, the program that supports implementation of the School Meals Initiative for Healthy Children, grants are offered to State agencies on a competitive basis. These grants provide money to establish or enhance training programs for school food service personnel to enable local school districts to provide healthy meals to children and to meet the USDA nutrition requirements. In 1996, 17 States were awarded Team Nutrition Training Grants for School Meals for a total funding of \$2,710,920.

The Nutrition Education and Training Program (NET), in contrast, provides grants to all States. Under the legislative mandate NET provides: (1) instruction to educators to enable them to impart nutrition education to children and parents; (2)

PART 1

instruction in basic nutrition, as well as food service management training, to school food service personnel; and (3) funds for educational materials development for use with these audiences.

NET provides ongoing nutrition education and food service training support to the Child Nutrition Programs. With \$3.75 million reprogrammed to fund NET activities in fiscal year 1997, funds were divided equally among all States at a level of \$66,951 to make it feasible to keep the Program in operation in every State. This amount is less than the current legislated minimum NET grant of \$75,000, an amount needed to support the service delivery infrastructure, i.e., in-service training for teachers through community colleges; lending resource centers for instructional materials; mini-grants to local schools, that can meet minimum obligations to each program audience. The minimum grant currently applies in 20 States with relatively low numbers of children enrolled in schools and child care institutions. NET funds are allocated based on enrollment figures obtained annually from the Department of Education.

The \$66,951, then, severely underfunds States with higher enrollments, hindering their ability to adequately meet the needs in their States for nutrition education and training. Some of these needs are continuous as new teachers, food service personnel, and children enter the school system each year. Knowledge and skills of educators and food service personnel must be updated as new information in food and nutrition becomes available. NET has a vital role in the implementation of the current activities in the Team Nutrition initiative.

WIC FARMERS' MARKET NUTRITION PROGRAM

Question. The fiscal year 1998 request proposes to increase funding for the WIC Farmers' Market Nutrition Program from \$6.75 to \$12 million.

How many state agencies and Indian tribal organizations are currently participating in this program? Please identify the number of farmers' markets by State and Indian tribal organization supported by this program and indicate the amount of funds being allocated for each.

Answer. Thirty State agencies (including 2 Indian tribal organizations) are currently participating in the program. A chart is provided for the record that shows the number of farmers' markets and current grant amounts for fiscal year 1997 by State agency.

[The information follows:]

	Fiscal year 1997 Federal grant	Number of mar- kets
California	\$150,102	47
Chickasaw, OK	40,000	5
Connecticut	261,810	45
District of Columbia	145,760	6
Illinois	104,097	8

PART 1

	Fiscal year 1997 Federal grant	Number of mar- kets
Texas	936,863	44
Vermont	74,676	27
Washington	135,230	18
West Virginia	68,015	10
Wisconsin	233,054	13
Undistributed funds ¹	25,000
Total	6,750,000	1,247

¹These are funds that were initially allocated for Cherokee, Oklahoma which has since withdrawn from the program. The funds remain undistributed due to current FMNP funding restrictions.

Question. Which states or Indian tribal organizations have expressed interest in beginning programs? Which states or Indian tribal organizations have made requests to expand their programs?

Answer. Colorado, Florida, Idaho, Mississippi, Montana, Nebraska, Georgia and Utah have expressed interest in beginning programs. Additionally, Georgia has submitted an approved State Plan to participate, positioning it as the first of the interested States to be funded if additional funding is made available. The following participating State agencies have requested expansion funds for fiscal year 1997: California, Indiana, Iowa, Kentucky, Michigan, Minnesota, Missouri, Mississippi, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island and West Virginia.

Question. How would the additional \$5.25 million requested for fiscal year 1998 be allocated? Please provide a breakdown by state/Indian tribal organization.

Answer. By law, the first priority for these funds is to restore State agencies to their previous year's funding level. Of the remaining funds, 75 percent would be allocated to currently participating State agencies that request expansion funding. A funding formula, designed by the Department in consultation with State agencies, is used to distribute expansion. Basically, this formula ranks State agencies according to their previous year's average FMNP grant per WIC participant. Expansion requests are funded in rank order, beginning with the State agency with the lowest FMNP grant per participant. The remaining 25 percent would be allocated to new State agencies that are seeking to initiate a WIC Farmers' Market Nutrition Program (FMNP). A ranking process, based on factors specified in the law, is used to allocate funds to new State agencies. The law requires allocation on the basis of factors such as prior experience with a similar program, State plans that have the greatest access to farmers' markets, the highest concentration of eligible persons and such other factors as determined appropriate by the Department.

Because fiscal year 1998 State Plans, which are the vehicle for requesting expansion or new funding, are not due until November 30, 1997, FCS cannot provide a specific breakdown of the allocation of the \$5.25 million by State/Indian tribal organization at this time. FCS can, however, identify the States that have expressed interest in initiating the FMNP. The following States have expressed an interest in participation in the FMNP: Colorado, Florida, Georgia, Idaho, Mississippi, Montana, Nebraska and Utah.

Question. How many farmers are currently participating in this program? How many WIC participants?

Answer. Preliminary data indicate that in fiscal year 1996 there were 8,239 farmers representing 1,231 farmers' markets participating in the program. Additionally, there were 991,121 WIC participants enrolled in the Program.

Question. What are the Department's latest findings with respect to the significant benefits of this program to farmers and to WIC participants? How are these benefits measured?

Answer. The Department has not conducted a formal evaluation of the WIC Farmers' Market Nutrition Program (FMNP) since 1989 when the program was still in its pilot phase. As such, a conclusion must be drawn regarding the benefits of the program from informal survey data that are provided by each State agency.

Based on the most recent survey data available, reflecting fiscal year 1995 program operations, 51 percent of recipients who responded to the survey said they had never been to a farmers' market before taking part in the FMNP. In addition, 77 percent said they planned to eat more fruits and vegetables all year round and 89 percent said the quality of the fresh produce at farmers' markets was as good as or better than at their grocery stores.

PART 1

336

Regarding farmers who responded to the survey, 84 percent said that the FMNP increased their sales. In addition, 35 percent reported increased fruit/vegetable production and 32 percent stated that they plan to grow a wider variety of fruits or vegetables next year because of their involvement in the FMNP.

COMMODITY ASSISTANCE PROGRAM

Question. Beginning in fiscal year 1996, funding for the Commodity Supplemental Food Program, Soup Kitchens, and The Emergency Food Assistance Program was merged into a Commodity Assistance Program. The fiscal year 1998 President's budget proposes to add to the Commodity Assistance Program funding for the Nutrition Program for the Elderly and Pacific Island Assistance.

In its fiscal year 1997 report, the Committee encouraged the Department "to distribute the commodity assistance program funds more equitably among States, based on an assessment of the needs and priorities of each State, and the State's preference to receive commodity allocations" through each of the programs funded through the commodity assistance program account. Are you doing this? If not, why?

Answer. Of the \$166 million appropriated to this account for fiscal year 1997, the Department exercised discretion granted in the appropriations act to provide \$76 million, the amount requested in the President's budget, to the Commodity Supplemental Food Program (CSFP). The remaining \$90 million has been made available for the Emergency Food Assistance Program (TEFAP) administrative grants and commodity purchases. (TEFAP and the Soup Kitchens/Food Banks Program (SK/FB) were separate programs at the time of the appropriation, but SK/FB was absorbed by TEFAP under the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (Public Law 104-193) enacted two weeks later.) States have been given the discretion to request that all or any portion of their administrative grants be used instead to provide commodities. They also have full discretion to determine how to divide their TEFAP commodities between congregate meal service and household distribution.

The Department did not implement the Committee's suggestion because such action might have caused severe reductions in CSFP services in many of the 18 States and two Indian Tribal Organizations administering the program. The benefits in this program are well targeted to at-risk population groups, and the program delivers these benefits efficiently and effectively. In contrast to the extremely disruptive impact Nationwide dispersal of resources would have in areas where the program currently operates, such action would not provide the other States with a significant increase in resources. Moreover, the funding for TEFAP commodity purchases increased by \$100,000,000 in fiscal year 1997 by the enactment of Public Law 104-193. This increase in TEFAP funding was another reason for allocating CSFP funding in accordance with the Administration's fiscal year 1997 budget request.

Question. One of the programs funded under the commodity assistance program—the Commodity Supplemental Food Program—serves a very limited number of states. Are all states now allowed to receive funding under this program, or, conversely, to receive more soup kitchen/emergency food assistance funding if they elect not to participate in the Commodity Supplemental Food Program? If not, why?

Answer. The Department chose to devote \$76 million, the amount requested in the President's budget, to the CSFP. This funding was intended to maintain the program in the areas where it currently operates. CSFP funding was not increased beyond the budget request to support expansion of the program into other States, nor was program funding reduced to compensate States which do not currently administer the CSFP.

Question. If the Department is not giving states flexibility in receiving commodity assistance program funds but instead maintaining separate funding streams for the individual programs funded through this account, why is the Department not asking to restore separate appropriations for each of these programs rather than merge more programs into this account?

Answer. While the Department is maintaining separate funding for these programs included in this account, the merging of these programs in this manner maintains their discretionary status while simplifying the budget presentation.

Question. Most states do not opt for commodity assistance under the Nutrition Program for the Elderly program. They instead elect to receive a cash reimbursement for each meal served. Why is the Administration proposing to merge this program, which for the most part does not provide commodity assistance, with the Department's commodity assistance programs?

Answer. The Nutrition Program for the Elderly (NPE) provides States with the flexibility to receive commodities and/or cash. Since the States have the option to receive commodities, both entitlement and bonus, the program has always been clas-

PART 1

337

sified as a commodity program. In fiscal year 1996, nearly one third of the States elected to receive some level of their NPE entitlement in the form of commodities.

Question. The Administration proposed last year that funding for the Nutrition Program for the Elderly be transferred to the Department of Health and Human Services (DHSS). Does the Administration no longer believe that this program should be managed by the DHHS in conjunction with other elderly feeding programs? Why?

Answer. Unlike the other commodity programs, the Older Americans Act, which authorizes the Nutrition Program for the Elderly (NPE), expired last year. The Administration has determined that the better avenue for considering the transfer of NPE to the Department of Health and Human Services is through the reauthorization process. The Agency still believes that the recipients would be best served if NPE were combined and administered by HHS, since HHS' portion of the funding for the program is about 3 times greater than USDA's, and one set of rules would be easier to follow than two.

Question. What has been the decline in WIC-type participation in the Commodity Supplemental Food Program as eligibles shift into the WIC program in each of the last five fiscal years? Why not reduce funding for the Commodity Supplemental Food Program as eligibles shift into the WIC program?

Answer. Prior to fiscal year 1995, the number of women, infants, and children (WIC) participating in the Commodity Supplemental Food Program (CSFP) increased each year. In fiscal years 1995 and 1996 the number of WIC participants decreased by 36,315 and 26,761 respectively. Based on participation to date, it is estimated that the number of WIC participants will decrease by 8,744 in fiscal year 1997.

The Department does not request reduced funding for the CSFP as the participation of WIC declines because the CSFP provides an efficient and effective service to its low-income elderly participants as well. Whereas many women, infants, and children have WIC as an option to the CSFP, no such clear alternative or equivalent program exists for the elderly.

It should be noted that the elderly prefer participation in CSFP for various reasons. One primary reason is that the application process is much simpler than for other programs, such as food stamps and SSI. Moreover, the commodity distribution sites are sometimes more conveniently located than stores and for the homebound elderly, the commodities are taken directly to them. Lastly, participants report liking the types of commodities distributed. Therefore, funding not required to support women, infants, and children should be retained for service to the elderly.

Question. Although the fiscal year 1998 budget proposes a reduction in elderly participation in the Commodity Supplemental Food Program, the program's elderly population has increased over the past years. What assistance is provided to the elderly through this program which cannot be provided to this population through other federal food assistance programs?

Answer. Like child bearing women, infants and young children (the other populations served by the Commodity Supplemental Food Program (CSFP)), the elderly have special nutrient needs. The CSFP is designed to provide a nutrient dense food package to supplement the nutrient intake from other sources. CSFP is well-suited to the needs of the elderly for several reasons. Some CSFP sites deliver the commodities to the elderly person's home or centralized centers where the elderly, who often have transportation problems, are able to receive the assistance. In addition, anecdotal evidence suggests that the elderly associate programs such as the Food Stamp Program (FSP) with charity and therefore underutilize the program while viewing CSFP as acceptable assistance. In fiscal year 1994, only 35 percent of elderly eligible for the FSP participated in the program; the overall participation rate for all ages of eligibles in the FSP was 71 percent.

FOOD PROGRAM ADMINISTRATION

Question. The prepared testimony indicated that restrictive staff year ceilings in the Food Stamp and Child Nutrition accounts and limited appropriations have enabled you only to "deploy staff from crisis to crisis, which is making continuous, effective program administration nearly impossible."

How have staff year ceilings in the Food Stamp and Child Nutrition accounts and appropriations limitations affected the agency's staff? What has been the impact of staffing reductions on the Department's ability to properly administer and oversee these programs?

Answer. Since fiscal year 1995, FCS has had to reduce its staff by 60 to 80 staff years every fiscal year due to funding reductions in the Food Program Administration (FPA) account. Although the Agency is committed to the National Performance

PART 1

338

Review and the Vice President's goals of reducing the Federal workforce and FCS has been diligent in implementing efficiencies, the Agency believes that the cuts have been very deep. FCS reached its fiscal year 1999 streamlining target 3 years ago. Restrictive staff year ceilings in the Food Stamp and Child Nutrition accounts have made the Agency inflexible in its ability to shift staff to changing priority areas, such as program oversight. Due to the ceilings, increased focus on areas needing attention, such as program integrity and providing technical assistance to State agencies, cannot be properly staffed by the Food Stamp or Child Nutrition accounts where the effort is most vital. This has had a significant impact on the Agency's ability to carry out its mission.

Staff restrictions and reductions have also affected the Agency's ability to properly monitor and oversee everyday activities of FCS programs. Due to funding reductions, FCS has curtailed new travel that is crucial to monitoring sites and maintaining Federal presence in the field. Staffing reductions have placed highly labor-intensive activities, such as store investigations and maintaining program integrity at risk. Federal on-site management reviews are critical to the proper administration of Child Nutrition Programs. These reviews reveal administrative and operational problems at early stages. Additionally, external audits from GAO and OIG have consistently cited insufficient staff to exert proper oversight of State administrative costs and debt management practices.

The reductions in staff also affects the Agency's ability to respond to program changes. Implementing new legislation, such as Welfare Reform, the Healthy Meals for Healthy Americans Act, and the Government Performance and Results Act, impose significant, new, and ongoing administrative burdens on FCS. These new laws effect comprehensive program changes and are extremely important to our programs, but they are not receiving the full attention they deserve due to staff limitations and other demands. Agency workload has dramatically increased due to new legislation, several Department-wide initiatives, and the fact that our programs have tripled in size and complexity since 1980. There is not enough staff to handle the increased workload or proactively respond to problems to head off a crisis, all of which is having an adverse affect on morale.

The fiscal year 1998 budget requests a minimal increase to fund mandatory pay increases to support existing staff. Mandatory pay raises increase the cost of each staff year every fiscal year, requiring small increases in the FPA appropriation just to support existing staff. The cost of funding additional staff in the FPA appropriation or increasing the staff year ceilings in the Food Stamp and Child Nutrition accounts is millions of dollars less than the cost of increased fraud and abuse in our programs. The small amount of funding it will take to support our staff will provide programs that truly help those less fortunate, that respond appropriately and effectively to new needs and changing legislation, and that operate efficiently with savings to the taxpayer.

Question. The prepared testimony indicates that the fiscal year 1998 request includes no funds to update the agency's automated infrastructure which demands attention. What improvements are needed and how much is needed to address this problem?

Answer. The FCS began its Agency Infrastructure Modernization (AIM) in fiscal year 1996. By that time, much of the Agency's computer infrastructure had aged to the point where it had exceeded its life expectancy. In fiscal years 1996 and 1997 the Agency was able to replace much of its antiquated microcomputer hardware and software base. However, FCS still needs to upgrade over 400 microcomputers. Also, the Agency's file servers, network operating systems, wiring plant, certain standard software and advance application hardware and software are in need of modernization. Additionally, the Agency has only been able to make limited progress in Internet and Intranet applications.

The Agency's infrastructure modernization plan calls for the development or upgrade of these hardware and software tools in order to ensure a productive work environment for its employees. The plan is designed to upgrade all of this hardware and software by fiscal year 2001, pending the availability of resources.

The estimated cost for fiscal year 1998 is \$4,000,000 which is currently unfunded. These funds would be used to complete the microcomputer modernization, upgrade the Agency's file servers, network operating systems and wiring plants at headquarters and seven regional offices, and provide end-user and technical training in the new standard software. Additional infrastructure areas that require modernization are planned for fiscal years 1999 through 2001. These areas will need to be funded during those fiscal years.

Question. The fiscal year 1998 request for the Center for Nutrition Policy (CNPP) and Promotion is \$2.49 million. The budget indicates that an additional \$252,000

PART 1

339

is needed above the fiscal year 1997 level to support "unfunded staff." What do you mean by this?

Answer. In fiscal year 1996, the Center for Nutrition Policy and Promotion (CNPP) was allocated \$2,499,000 for salaries and expenses from the FPA appropriation. For fiscal year 1998, CNPP is requesting the same amount to fully fund current staff needs. CNPP believes, that at a minimum, it must have a critical core of 34 FTE's, mostly senior nutritionists and economists, to fulfill its mission and produce high quality nutrition policy analysis and deliver state-of-the-art nutrition education. This critical core staff is even more essential in fiscal year 1998 as CNPP is expected to provide most of the staff support for the Dietary Guidelines 2000. By tradition, USDA and the Department of Health and Human Services (DHHS) have rotated responsibility for staff and production costs incurred in producing the Dietary Guidelines. For the Fifth Edition of the Dietary Guidelines, due in the year 2000, USDA is responsible for staffing and production costs, most of which are expected to be provided by CNPP. In fiscal year 1997, CNPP is operating below its critical core need. In fiscal year 1998, CNPP needs to restore its resources to the critical core staff necessary for CNPP to fulfill its mission and produce the Dietary Guidelines 2000.

KENTUCKY-IOWA FOOD DEMONSTRATION PROJECTS

Question. Would you please provide a summary report on the Kentucky-Iowa food demonstration projects?

Answer. Since fiscal year 1989, Kentucky and Iowa have operated a demonstration project which allows for-profit child care centers to participate in the Child and Adult Care Food Program (CACFP) if 25 percent or more of their enrollment qualifies for free or reduced price lunch under the Income Eligibility Guidelines. Normally, for-profit centers can only participate in CACFP if at least 25 percent of their enrollment or licensed capacity is subsidized with Title XX child care funds.

Through fiscal year 1994, the centers participating in this demonstration project were treated as regular CACFP centers for funding purposes. Beginning in fiscal year 1995, the funding for the demonstration was classified as discretionary. A total of \$3.7 million was apportioned for the demonstration for fiscal year 1995 and is set to remain at that amount through fiscal year 1998.

The number of for-profit centers participating in the demonstration project in Kentucky increased from 77 centers in 1991 to 247 centers at the end of fiscal year 1994. Almost 90 percent of the participating centers would not have been eligible to participate in the CACFP due to the small number of Title XX beneficiaries attending these centers. The number of participating centers has declined slightly since that time as a result of the funding constraints established when the demonstration projects were classified as discretionary.

In Iowa, there was no significant increase in the number of for-profit centers participating in the demonstration project. There were six centers participating in fiscal year 1991 and 10 by the end of fiscal year 1994. Of these centers, 60 percent had sufficient Title XX beneficiaries to meet the regulatory requirements for participating in the CACFP.

During fiscal year 1996 there was an average of 180 sponsors, 170 in Kentucky and 10 in Iowa, and 228 centers, 218 in Kentucky and 10 in Iowa, approved for participation in the demonstration project. Enrollment in centers participating in the project averaged 13,696 in Kentucky and 688 in Iowa. A total of 1.6 million breakfasts, 2.0 million lunches, 1.0 million suppers, and 2.5 million snacks were served under the demonstration projects during fiscal year 1996.

SCHOOL MEALS INITIATIVE/TEAM NUTRITION

Question. For fiscal year 1997, \$10 million was provided for the school meals initiative. Of this amount, \$4 million was provided for food service training grants to states; \$2.5 million for in-school education materials; \$2.3 million for technical assistance materials; \$800,000 for cooperative agreements with the National Food Service Management Institute (NFSMI) for food service; and \$400,000 for print and electronic food service resource systems.

The Department reprogrammed \$3.75 million of the fiscal year 1997 funds provided for the school meals initiative to the Nutrition Education Program. The Committee was notified that no reduction would be made in the funds made available for food service training grants to states or for cooperative agreements with the NFSMI. Please explain from which other funded activities this \$3.75 million was taken and why the activities for which funding was reduced were considered to be of lowest priority.

PART 1

Answer. That information is provided for the record. All fiscal year 1997 Schools Meals Initiative funding for nutrition education along with part of the training and technical assistance funding was used to support NET activities. The specific nutrition education activities not funded included the printing and distribution of Spanish translations of existing Team Nutrition materials. This funding reduction also slowed the developmental process for the middle school materials, since the Agency had to rethink the method for transmitting the nutrition education messages to this audience given the reduction in funding for this activity. The Agency was unable to follow through with all of our commitments to the Team Nutrition Schools. Currently fiscal year 1996 carry-over funds are being used for other nutrition education activities while we await fiscal year 1998 funds.

The funding reduction for food service training and technical assistance prevented us from printing and distributing training and technical assistance support materials promised to program administrators. The Agency plans to fund these projects with fiscal year 1998 appropriations.

[The information follows:]

School Meals Initiative: Activities Not Funded

	<i>Fiscal year 1997</i>
I. Children's Education Resources, In-School Education Materials ..	\$2,500,000
II. Food Service Training and Technical Assistance, Technical Assistance Materials	1,250,000
Total	3,750,000

Question. The explanatory notes indicate that \$11.867 million is available for the school meals initiative. This would mean that \$7.6 million in funds provided in previous fiscal years have been carried over and are available for fiscal year 1997. For which specific activities is this additional \$7.6 million being made available?

Answer. The amount carried over from fiscal year 1996 and being made available for fiscal year 1997 has been revised to \$5,590,377. This amount is being used to fund six School Meals Initiative activities.

[The information follows:]

Children's Educational Resources	\$3,398,377
Mass Communication	75,000
Public-Private Partnerships	230,000
Technical Assistance Materials	1,000,000
National Food Service Management Institute	250,000
Evaluation/Administration	637,000
Total	5,590,377

Question. The fiscal year 1998 request for the school meals initiative is \$10 million. Please provide a detailed breakdown of this request, indicating the specific activities which would be funded—food service training grants to states; technical assistance materials; cooperative agreements with the National Food Service Management Institute, Children's Education Resources, Public-Private-Partnerships, Mass Communication and Evaluation, etc.—within the Nutrition Education and Training and Technical Assistance components of this initiative. Please provide a comparison of the funding made available for each of these specific activities in each of fiscal years 1995–1997.

Answer. That information is provided for the record. The fiscal year 1997 allocations represent the current budget plan and the fiscal year 1998 allocations will be estimates.

[The information follows:]

SCHOOL MEALS INITIATIVE: SPENDING BY CATEGORY AND APPROPRIATION

	Fiscal year—			
	1995	1996	1997 (estimate)	1998 (estimate)
I. Food Service Training and Technical Assistance:				
Technical Assistance Materials	\$3,904,105	\$1,910,734	\$1,050,000	\$1,000,000
Print and Electronic Food Service Resource Systems ...	1,097,720	97,755	400,000	400,000
NFSMI Cooperative Agreement for Food Service	424,659	250,000	800,000	500,000
II. Children's Education Resources: In-school Education Materials and Community Education Materials	7,884,363	4,821,785	3,200,000

PART 1

SCHOOL MEALS INITIATIVE: SPENDING BY CATEGORY AND APPROPRIATION—Continued

	Fiscal year—			
	1995	1996	1997 (estimate)	1998 (estimate)
III. Food Service Training Grants to States	¹ 4,042,391	1,920,665	4,000,000 ³ 3,750,000	4,000,000
IV. USDA/FCS Direct Training and Education	744,652	400,000
V. Children's Communications and Technology	328,130	75,000	200,000
VI. Team Nutrition Partnership Support: Resources for Team Nutrition Schools and Partnership Network Support	106,717	247,061	200,000
VII. Evaluation	1,702,736	² 777,000	500,000
Total	20,235,473	10,500,000	10,000,000	10,000,000

¹ Includes 1995 Team Nutrition Grants plus partial funding for 1996 Team Nutrition Grants.
² Includes \$140,000 for evaluation and \$637,000 for Administrative expenses.
³ \$3,750,000 was reprogrammed to Section 6(a)(3) of the National School Lunch Act to provide grants to States to fund activities that would have otherwise been supported by the NET Program.
⁴ Includes administrative expenses and evaluations.

Question. Management Institute, Children's Education Resources, Public-Private-Partnerships, Mass Communication and Evaluation, etc.—within the Nutrition Education and Training and Technical Assistance components of this initiative. Please provide a comparison of the funding made available for each of these specific activities in each of fiscal years 1995–1997.

Please provide detail on the food service training grants awarded to states in each of fiscal years 1995–1997, identifying the state, the amount of the grant, and a brief description of the project for which the award was made. For each fiscal year, please provide this same information for grant requests received by states for which no award was made.

Answer. The information is provided for the record.
 [The information follows:]

1995 TEAM NUTRITION TRAINING GRANTS

Arkansas Department of Education—\$185,875

The Arkansas Team Nutrition Training Project was designed to build teams of effective leaders who could maximize the use of available resources to provide healthful school meals that an increasing number of Arkansas students would enjoy. There were three objectives: increase the number of managers, assistants, directors, and State agency staff who are prepared to accept this leadership role; expand the number of school-wide teams of leaders prepared to share this role; and build a technology support system to help sustain leadership learning. The State held training workshops for managers, established technology support demo sites at schools and education cooperatives, and added Health Action Teams to the existing State network.

Georgia State Board of Education—\$199,000

This project involved developing a curriculum for use by a cadre of trainers who conducted customized training based on the manager's choice of meal planning options. The project objectives were: to provide managers with customized training that incorporates the meal planning option they will utilize to implement the Dietary Guidelines in school meals by September 1996; to provide managers implementing the food-based meal planning option with an easy-to-use training tool, the interactive compact disc, to teach consistent, reliable information on meal planning; and to compile up-to-date training materials that can be integrated into the required Training-in-Depth curriculum and other training.

Idaho State Department of Education—\$399,930

Consortium—Alaska, Idaho, and Nevada

This project developed a training infrastructure for four States, one of which used its own funding for the implementation of the School Meals Initiative for Healthy Children. The consortium of States hired a coordinator to develop a three-tiered training program for food service authorities. The first tier dealt with menu standardization, modification, and substitutions; the second tier, nutrient standard menu planning or food based menu planning; and the third tier, marketing and merchandising. A cadre of trainers were established and trained in each State to carry

PART 1

342

out the training. The training program will be incorporated into each State's Nutrition Education and Training Program over the next few years.

Illinois State Board of Education—\$199,984

This project focused on the support and marketing of a new training delivery system to be offered through community colleges. The training focused on developing a "train-the-trainer" session for instructors on implementation of the Department's nutrition requirements and the Dietary Guidelines and also on developing and implementing a marketing initiative to inform school administrators and food service professionals of the training delivery system. In addition, the project focused on training peer consultants who provide more advanced individualized training that food service managers need to implement nutrition requirements. Also, a teleconference to assist with menu planning issues was provided in an effort to reach a large number of food service personnel.

Kansas State Board of Education—\$160,307

The Kansas State Board of Education developed a sustainable Statewide infrastructure to support the Kansas Comprehensive Training System (KCTS) for School Nutrition Professional Development. The Team Nutrition Training Grant objectives involved developing key components of KCTS including quality training resources, a computerized training resource catalog, a Statewide training resource center, formal training, in-service training, independent study, leadership development, and nutrition education integrated with elementary education.

Louisiana Department of Education—\$400,000

Consortium—Louisiana, Oklahoma, and Texas

The objectives of the Louisiana, Oklahoma, and Texas Team Nutrition Training Project were to determine through a training needs assessment, the curriculum needs of school food authorities to implement the revised National School Lunch Program and School Breakfast Program meal pattern regulations. Based upon the needs assessment, a common set of curricula for training school food service personnel were developed. The training was delivered using NETPRO style resource sharing, a Louisiana college center, and electronic communications.

Maine Department of Education—\$66,774

The State agency coordinated with the Maine Technical College System to develop a sustainable training program for school nutrition personnel statewide. The program offered three levels of training. The first level included basic nutrition, sanitation, and safety, which provided basic knowledge and skills. These courses offered as interactive computer programs, and classes met three times during a semester. Grant funds were used to computerize the nutrition component. The sanitation and safety components developed at the Department of Agriculture were used. The second level used technical college faculty, school nutrition directors, State agency staff, local chefs, and other appropriate individuals to train school nutrition staff on implementation of the Dietary Guidelines. This training was broadcast over the Interactive Television Network to assure reaching the maximum number of individuals statewide. A Maine School Nutrition Certificate was awarded at completion of this level. Level three will be an update offered annually and will result in certificate renewal every three years. Grants were made to eight schools to become Team Nutrition Schools. Teams from these schools received training and served as models for other schools Statewide.

Minnesota Department of Education—\$199,868

This project provided school food and nutrition programs personnel with the education, training, and resources necessary to provide school meals that are consistent with the Department's nutrition requirements and Dietary Guidelines for Americans. The Team Nutrition Training Grant project included needs assessments, promotional information, resource development, training delivery systems, evaluation, and follow-up training and technical assistance. The project was done in collaboration with an advisory group involving partnerships with the education community, health organizations, local agriculture groups, and school food and nutrition programs personnel.

Mississippi State Department of Education—\$400,000

Consortium—Mississippi, Florida, and Kentucky

The Teaching Nutrition Techniques (TNT) project expanded the current training infrastructure in Florida, Kentucky, and Mississippi by providing an effective "train-the-trainer" network empowered to deliver user friendly training to site-based child nutrition (CN) employees, the personnel responsible for the quality of meals pre-

PART 1

pared and served. Through TNT, CN personnel in 5,500 schools in the three States were motivated, empowered, and trained to implement the nutrition principles of the Dietary Guidelines for Americans through use of quality food preparation methods for menu items. The consortium worked with outside sources to develop TNT Train the Trainer and Package modules which were used to train trainers and CN personnel.

Missouri Department of Elementary and Secondary Education—\$107,240

This project provided in-depth training for State staff on school lunch computer software and expanded training programs for school food service personnel to a year-round effort at multiple sites throughout the State, providing more technical and hands-on training in addition to basic training such as Healthy Edge. Teleconferences reached 9,841 food service personnel plus school administrators. Workshops targeting specific issues and skills followed the teleconferences. The training and teleconferences covered computers, healthy food production and introduction to Nutrient Standards, healthy cuisine for kids, and nutrient standard menu planning.

Montana Office of Public Instruction—\$291,916

Consortium—Montana and Wyoming

The main focus of this joint project was maintaining the health of school-aged children in Montana and Wyoming by strengthening the infrastructure of the nutrition education and school food service training efforts for teachers, school food service personnel, and community educators. Interrelated activities of the project encompassed components to enhance the infrastructure for delivering training on the implementation of the Dietary Guidelines in schools, to enhance the infrastructure of teacher training at the pre-service and inservice levels, to establish a "Team Nutrition School" concept in a rural state, to increase interest in shared healthy meals through a child's cooking program, and to integrate healthy school meals and nutrition education into school health programs. The States accomplished this by conducting training sessions on using fresh produce, recipe modification, three new menu planning systems and establishing a child's cooking program and the Team Nutrition School Model.

Nebraska Department of Education—\$57,100

The purpose of this project was to provide food service directors and managers with the knowledge, skills, and encouragement necessary to provide healthy meals that appeal to their students and meet the department's nutrition requirements through 22 Statewide mini-meetings. They started establish an infrastructure of trainers for school programs. Pre/post tests and assessment questionnaires were utilized to determine Dietary Guidelines implementation as a result of the mini-meeting. Registered dietitians interested in becoming State trainers were invited to attend one of the meetings. This project was accomplished by developing instructional material, pre/post tests, and assessment questionnaires; by collecting, testing, and analyzing recipes; and by scheduling and implementing the mini-meetings to disseminate the information.

New Hampshire Department of Education—\$80,000

New Hampshire provided an inexpensive, effective method for planning and providing children's meals that meet the Dietary Guidelines. It also provided the resources and expertise needed to help children gain the nutrition knowledge and skills necessary to make decisions for healthy lifestyles. Additionally, the State trained school food service personnel to provide training beyond the grant year and to set up a network for them to share solutions and solve problems. The State provided demonstrations and training in various approved software packages, established a resource library, trained personnel in various methods of menu planning, conducted needs assessments and workshops, and provided an electronic bulletin board for food service personnel.

New Mexico State Department of Education—\$199,542

New Mexico, faced with such issues as a diverse population, great geographic distance, and cultural and language differences, planned to form partnerships with nonprofit commodity groups, government agencies, and industry to help make its programs better. It has established a Team Nutrition Training New Mexico Ad Hoc Advisory Committee to address these needs. The State developed a culturally-appropriate menu cycle; identified available resources which support the Healthy Meals Initiative; set up a 1-800 help line, a newsletter, a lending library, and a catalog of local resource people and organizations; established five model demonstration school food authorities to pilot New Mexico Menus and the Healthy Meals Initiative;

PART 1

344

conducted workshops for food service personnel; and developed a long range training plan for implementing the Healthy Meals Initiative at the district/school levels.

North Dakota Department of Public Instruction—\$49,378

The training project utilized three approaches to design sustainable infrastructures to support the training of school nutrition personnel. The approaches were: (1) develop and broadcast two satellite training seminars on the implementation of the Dietary Guidelines for Americans in school meals; (2) organize a cadre of training professionals and conduct initial training of cadre members; and (3) enhance efforts to train local personnel on the use of the team approach to implementing the Dietary Guidelines for Americans in school meals, and to encourage participation in the developed training series plan, "Pathways to a Quality Future."

Rhode Island Department of Elementary and Secondary Education—\$66,330

The Team Nutrition Training Grant Project collaboration established a Statewide training system that provided the means to convey information that is relevant to the time, consistent with the goals, and practical to implement. The State of Rhode Island had three goals in this project: to provide school nutrition and food service personnel with the education, motivation, training, and skills necessary to provide healthy meals that appeal to the children served and meet the Department's nutrition requirements; to transform the cafeteria environment to a learning laboratory that encourages healthful eating habits through the marketing of healthful choices; and to establish a collaboration between school food services and Johnson & Wales University to enhance the image of the school food service profession.

Utah State Office of Education—\$156,708

The focus of this project was to create a network of professionals that possess the capability of training school food service staff throughout the State. This network used professional teachers and dietitians to instruct food service employees on how to use the Dietary Guidelines for Americans in making modifications in their menus and food preparation. The network used the same cadre of trainers to train the local school food service employees in the use of the NuMenus planning systems in their districts. The trainers were contracted from various regions throughout the State and were available to address the needs of the local districts. Their close proximity ensured that employees received proper training. The cadre provided training in areas identified by a needs assessment tool developed by the State Office of Education.

Vermont Department of Education—\$61,417

Building its current professional development system, Vermont planned a year's worth of seminars, workshops, and activities designed to (1) prepare schools to consistently offer meals that meet the Dietary Guidelines, (2) increase student participation in school meal programs, and (3) develop a sustainable body of material to use in future training and establish a support network. The State accomplished this through seminars, training sessions, mentor programs, nutrition education for students, and a model-school program.

West Virginia Department of Education—\$94,713

This project provided a comprehensive integrated approach to attaining nutrition integrity in West Virginia schools. Training and nutrition education opportunities addressed planning, preparing, and promoting healthy meals, and creating a school environment that enhances nutrition learning. Food service personnel, educators, students, and parents were provided team building opportunities. This was accomplished by strengthening the infrastructure (through collaboration, staff development, policy, and training network); providing district food service workshops; providing college courses for school managers; adapting point-of-choice training models; training and supporting school teams; and developing/distributing materials.

STATES NOT FUNDED

Below are the 12 Team Nutrition Training Grant applications that were not funded in 1995.

*New Jersey—*A collaboration between Pennsylvania Department of Education, New Jersey Department of Education and Penn State University would have been established to create a Statewide campaign to provided the immediate training needed for compliance with the new Federal regulations as well as establish a system for continuing education opportunities. This campaign was to include four components: 1) central to the educational campaign was to be a two day, Statewide, interactive satellite conference for all school food service directors—The Team Nutrition Training (TNT) Satellite Conference; 2) leading up to the conference—a pre-con-

PART 1

345

ference education and promotional component; 3) the establishment of an infrastructure within the State for electronic communication network; and 4) a sustainable infrastructure for continuing education. \$73,307

Ohio—This training program for local district staff would have included two levels of training. The first level focused on the understanding of the Dietary Guidelines for Americans and the integration of those principles into menu planning, recipe modification, and food preparation skills. The second level training focused on the skills necessary to accomplish nutrient analysis of menus and nutrient standard and food based menu planning. \$200,000

Oregon—The training project would have utilized an existing statewide training structure (NETPRO Oregon) to deliver Nutrient Standard Menu Planning training for healthy school meals to schools throughout Oregon. A comprehensive training program would be developed using multimedia equipment to effectively deliver training to schools on site and at state-wide workshops. Additionally, funds would be used to study the nutrient content of meals as selected and consumed by students in a choice-based meal service system. \$145,000

Pennsylvania—A collaboration between Pennsylvania Department of Education and Penn State University would have been established to create a statewide campaign to provide the immediate training needed for compliance with the new Federal regulations as well as establish a system for continuing education opportunities. This campaign consisted of four components: 1) central to the educational campaign—a two day, statewide, interactive satellite conference for all school food service directors—The Team Nutrition Training (TNT) Satellite Conference; 2) leading up to the conference a pre-conference education and promotional component; 3) to establish an infrastructure within the state for electronic communication network; and 4) a sustainable infrastructure for continuing education would be established. \$200,000

Puerto Rico—Train school food service personnel using the 10 hour course “Healthy E.D.G.E. curriculum, in order to incorporate the Dietary Guidelines for Americans in the preparation and service of appealing school meals for Puerto Rico’s younger population. \$200,000

Colorado—Target 35 rural school districts to provide training, assistance and resources to incorporate the Dietary Guidelines in school menus. Objectives were to: survey students to establish food preferences; standardize, modify and do a nutrient analysis of selected revised recipes; establish menus based on the Department’s nutrition standards; and provide nutrition information resources for use in cafeterias and classrooms which would render nutrition information about the school meals. \$98,943

New York—Subcontract with Madison-Oneida Board of Cooperative Education Services (BOCES), for continuation of a contract providing for the development and delivery of a training program in the following areas: dietary guidelines; planning menus to meet the dietary guidelines; use of technology to support nutrient and food based menu planning; and using standardized recipes and food production records. BOCES would also conduct an introductory training session on the Dietary Guidelines in a computer lab for Master Instructors of the Statewide Training Network. \$200,000

Connecticut—Build and expand a sustainable infrastructure for statewide delivery of training. Through a combination of courses, workshops and support resources, the grant would provide the necessary training, skills and motivation for school food service personnel to implement the Dietary Guidelines in school meals. \$199,997

Delaware—A collaboration between Delaware Department of Public Instruction and Penn State University would be established to create a statewide campaign to provide the immediate training needed for compliance with the new Federal regulations as well as establish a system for continuing education opportunities. This campaign would have four components: 1) central to the educational campaign—a two day, Statewide, interactive satellite conference for all school food service directors—The Team Nutrition Training (TNT) Satellite Conference; 2) leading up to the conference a pre-conference education and promotional component; 3) to establish an infrastructure within the State for electronic communication network; and 4) a sustainable infrastructure for continuing education would be established. \$62,527

Michigan—Develop and implement a train the trainer program for child nutrition and comprehensive school health educators, develop training modules on implementation of the Dietary Guidelines, and create an instructional video to be used with the modules. \$200,000

Maryland—Provide a train the trainer model course for the piloted C.H.E.F.S. program (Culinary and Healthful Enhancement of Food in Schools) in Maryland. Each school system would form a training team to train their employees in local settings and to engender the support of the professional chefs in their area to work

PART 1

346

with school nutrition personnel and instruction personnel to teach the course. \$98,057

Massachusetts—Develop a school nutrition training program based on a yearly plan with integral and comprehensive goals and objectives. The goal of the project was to entwine the Dietary Guidelines in areas related to and overlapping school food service programs. The training would target school food service directors, managers, workers, school teachers, health educators, parents, students and the community. \$194,664

1996 TEAM NUTRITION TRAINING GRANTS

Illinois State Board of Education—\$160,275

The Illinois State Board of Education plans to provide three major activities to assist school food service professionals in preparing healthy school meals. The first activity includes a director's and manager's conference held in two locations, providing participants with the chance to develop advanced skills in food service management. Training will include information on Federal program regulations, food purchasing, sanitation practices, and use of the Internet. The second activity planned is a teleconference targeted toward school food service production staff. The teleconference will provide information on the importance of standardized recipes, recipe components, recipe modification, and measuring student acceptance of menu items. Videotapes of the teleconference will be mailed to each school district to be used as a training tool for future staff development. The activity will culminate in a "cook-off," where school food service professionals will be given an opportunity to enter their recipes and menus. Twelve finalists will be selected and videotaped, showcasing the learned skills while promoting the National School Lunch Program. A winner will be selected by a panel of judges consisting of school food service personnel, students, media representatives, and parents. A CD-ROM will be developed showcasing the professionals demonstrating food preparation techniques. The third activity planned is the formation of an ad hoc advisory committee consisting of representatives from various National, State, and local agencies already involved in training. Their discussions on strategies and available resources will result in the goal of providing quality staff development for school food service personnel.

Massachusetts Department of Education—\$144,116

The Massachusetts State Department of Education will provide training and technical assistance for their school food service professionals. One project will be teaching nutrition requirements and the Dietary Guidelines for Americans through a traveling interactive workshop called *Dietary Guidelines on the Move*. Free Internet access will be offered to all public schools in the State, and a nutrition web page will be established on the State DOE Web Site as a sustainable way to communicate and transfer information. The State agency plans to offer food service directors of Team Nutrition Schools the opportunity to become members of a peer resource group. This group will submit newsletter articles on their efforts, develop school nutrition goals for schools, and act as a telephone resource for new approaches to introduce the Dietary Guidelines into school meals and the nutrition/health curriculum. Massachusetts also plans to complete a *Cafeteria to Classroom Nutrition* package using materials, curriculum, and cycle menus from the State Heart Association and from the Stalker Institute. Additionally, the State agency plans to provide training for Nutrition Education Health Teams, consisting of school food service directors, health teachers, nurses, guidance counselors, and home economics teachers.

Wyoming Department of Education—\$129,607

The Wyoming State Department of Education proposes a two-phase project. The first phase involves plans to develop five model schools in the State to implement Healthy School Meals. These schools will be the center of a post-project, self-guided, area-support network. On-site training will be provided by project leaders, consultants, and extension educators to school food service personnel, administrators, teachers, and other school or community representatives on successful implementation of the TN plan. A video will be produced on training issues, strategies, and results from the model schools, and will be used to help build partnerships with other organizations around the State. Training workshops on National Food Service Management Institute's *Healthy Cuisine for Kids* will be presented in five locations throughout the State for interested schools.

Michigan Department of Education—\$196,710

The Michigan Department of Education intends to target their high-need, larger school districts that serve about 70 percent of the students in the State. They plan to provide training and technical assistance for school food service personnel in two

PART 1

347

components. The first component will involve training 420 two-person teams (the director/supervisor and the head cook/manager) of school food service personnel to prepare and serve healthy meals meeting the Dietary Guidelines, using hands-on *Healthy Cuisine for Kids* curriculum developed by the National Food Service Management Institute. Once trained these teams will train their employees at the local level, resulting in 4,200 additional trained school food service personnel. The second component is designed to build partnerships at the local level to support and enhance TN Schools. They plan to develop and distribute video packets as a technical assistance piece designed to help food service personnel networking with county extension personnel, build community partnerships to support and foster implementation and expansion of TN School activities.

Colorado Department of Education—\$82,225

The Colorado Department of Education plans to target all Colorado school districts to provide training, assistance, and resources to implement the Department's Healthy School Meals Initiative (HSMI). Their efforts will begin with a student survey to determine their food preferences. The information will be used as a basis for creating menus which meet the HSMI using USDA standardized recipes, *Tool Kit* recipes, and local district standardized recipes. They also plan to provide training, technical assistance, and resources to school food authorities to help them incorporate USDA recipes with quality food preparation techniques. The training will include *Culinary Techniques for Healthy School Meals*, *Trimming the Fat*, and nutrient analysis software. They will also provide assistance and technical training to school district personnel that will help school food service personnel and educators provide information to students, parents, and the community about nutrition and the HSMI guidelines. TN curricula, menu templates, and other resources will be distributed, and presentations by the Junior Chefs will also be given to students in classrooms.

Idaho State Department of Education—\$399,588

Consortium—Alaska, Idaho, and Nevada

The consortium of Alaska, Idaho, and Nevada will expand the training infrastructure for their States and the State of Washington using their own funds for the implementation of the Healthy School Meals Initiative (HSMI). They will compile available resources and develop supplemental materials for the train-the-trainer workshops. Training will take place in each State. The consortium will also develop training materials for residential child care institutions (RCCI's), to include an analyzed and tested cycle menu which will include smaller sized recipes and food items commonly served in their programs. They also plan to develop a training tool for school food service personnel (servers, cashiers, part-time employees and substitutes) to provide education, motivation, training, and other skills necessary to provide healthy meals. Additional HSMI materials will be used, and offer versus serve materials expanded especially for cashiers. They want to promote HSMI through nutrition education in the classroom, community, and cafeteria by providing five Regional presentations. State and local partnerships will be developed, and training offered to teachers, principals, parents, and students on the importance of healthy school meals. At least five mini-grants will be awarded to schools for development of model programs to support healthy school meals. Food and Nutrition Information Center will deliver training to the trainers on the *Healthy Meals Resource System*, in turn, the trainers will go back to their States to deliver training on meeting the new regulatory requirements and the Dietary Guidelines.

Louisiana Department of Education—\$195,403

The Louisiana Department of Education plans to expand on their previous efforts by strengthening their training infrastructure. The first project they plan to undertake is the review and revision of the State agency's current food service technician and manager training program to reflect the changes in the Federal regulations and the National School Lunch and School Breakfast Programs. They plan to expand their pool of NETPRO trainers from 10 to 20, and work with the State Cooperative Extension Service and Office of Public Health to train State agency officials and key leaders in the State on the revised meal pattern regulations, allowing them the chance to serve as valuable resources to the local school food authorities. Louisiana also plans to expand the use of electronic networking among school food authorities by 50 percent. This will improve communications and support the access to information on nutrition, food preparation, and the changing requirements.

Minnesota Department of Children, Families and Learning—\$188,236

The Minnesota Department of Children, Families, and Learning plans to sustain the created training infrastructure by completing a multitude of projects. They plan

PART 1

348

to combine the activities of their established Team Nutrition (TN) Training network with the initiation of a mentorship program throughout the State. The mentors will be school food service personnel who have met the goals of the Healthy School Meals Initiative and who can provide leadership and support to those school food authorities that are striving to meet the Dietary Guidelines. Specialized TN trainers will be activated to promote and train food service personnel on NuMenus and the revised *Minnesota LunchPower Menus*. Minnesota will design training opportunities based on the learning style and educational needs of their food service personnel. The training opportunities will include mini-promotional workshops and regional carnivals. They also plan to show school food service personnel how to market their programs by using TN materials, a marketing guidebook, and student posters and newsletters. Finally, they plan to collaborate with communities by continuing their TN Partnership Advisory group and foster a collaboration with the Minnesota Extension Service to provide promotional training sessions.

Mississippi Department of Education—\$200,000

The Mississippi State Department of Education, in conjunction with the University of Southern Mississippi, plans to implement a database system called *Mississippi MiniMax Menus (4M)*. Using this database, Child Nutrition Program personnel in over 950 school sites will plan and serve meals that meet the nutrition standards of USDA and appeal to students. Recipes will be modified and standardized, and two sets of menus (for elementary and secondary schools) will be developed. All of the menus in the *4M* database will be analyzed by USDA-approved nutrient analysis software programs. Mississippi will also develop menu modification matrixes (exchanges) and print recipes that school food service personnel can use to create their meals in response to student preferences. Training manuals for *4M* will be developed, and training established on *4M* for the State's school food service administrators and managers, who will, in turn, train their own people.

Montana Office of Public Instruction—\$186,515

The Montana Office of Public Instruction, using the foundation established from the 1995 Team Nutrition Training Grant, will continue to expand statewide training opportunities for school food service personnel and educators in the implementation of the Dietary Guidelines for Americans to shape healthy eating habits in children. Montana plans to distribute their video *What is a Team Nutrition School?* as a marketing tool for promoting Team Nutrition. They will purchase multimedia equipment to be used to train school food service staff throughout the State during Regional training sessions and annual State conferences. Training subjects will include menu planning, procurement, food preparation and services, and nutrient analysis. They will also provide training to teachers on nutrition education during their Regional in-service and summer training sessions. Montana will continue their USDA recipe adaptation project, as well as complete and publish the student acceptance of meals research project findings. Finally, they will initiate a mini-grant program to establish new Team Nutrition Schools.

New Hampshire Department of Education—\$70,554

The New Hampshire Department of Education plans to provide additional training for the school food service professionals in their State with the help of their sister State, Vermont. They plan to provide training for food service directors in both States by pooling resources for high quality training on management issues. New Hampshire will contract with their State School Food Service Association (NHSFSA) to create training focusing on production team skills, teamwork, and the new regulations and will offer training in the *Keys to Excellence*, helping the NHSFSA move toward a peer review program in the State. They will also form a partnership with the State chapter of the American Culinary Federation to connect their members with school food service directors. They will offer NuMenus computer analysis training sessions for 150 school food service professionals and one basic Internet training. In addition, they will obtain assistance with computerized nutrient standard menu analysis for State staff. They will also contract with the National Food Service Management Institute for a Nutrition Education and Training Program needs assessment.

New York State Education Department—\$150,000

The New York State Education Department plans to contract with the Madison-Onieda Board of Cooperative Educational Services (BOCES) to provide training for the State's school food service personnel. BOCES will provide nutrient analysis computer training using a "traveling computer lab", as well as open a resource/informational telephone line for technical assistance once the training is completed. They will deliver the train-the-trainer programs on production records and standardized

PART 1

349

recipes to 30 master instructors. The master instructors will also receive training in the planning and preparation of meals that meet the Dietary Guidelines for Americans (DGA) from the Culinary Institute of America. The instructors will, in turn, go back to their areas and train the local food service directors and staff, teachers, and parents in the preparation of healthful, attractive school meals that will meet the DGA and that are appealing to children.

Rhode Island Department of Elementary and Secondary Education—\$104,168

The Rhode Island Department of Elementary and Secondary Education plans to expand and build upon the core training program established during the 1995 Team Nutrition Training Grant period. They will offer two-day training sessions to multi-level school food service staff, chefs, and other sponsors such as residential child care institutions (RCCIs). Training will cover topics such as low-fat cooking, the use of commodities, food safety, the Dietary Guidelines for Americans, and equipment purchasing. Rhode Island also plans to create a Team Nutrition Training (TNT) Institute at Johnson & Wales University. Upon its inception, chefs and nutritionists will attend one-day annual training sessions at the TNT Institute. They will be given updates on school meal issues and training on how to access resources. A resource center with a lending library is planned, along with an electronic access system, including the Internet. A multi-media TN Resource kit will be assembled using resources already developed. A Team Nutrition core team will plan nutrition activities for schools. Finally, a school food community service component will be added—in-kind service hours will be provided by culinary students at Johnson & Wales University. These students will provide technical assistance to the schools with on-site visits.

Pennsylvania Department of Education—\$192,641

The Pennsylvania Department of Education plans to deliver training in response to needs assessments. The training will be in the form of a series of workshops for school food service personnel. An advisory council and training cadre have been selected, and training has been held on choosing menu planning options and food production. A training workshop on documentation requirements for menu planning options will be offered in three five-hour sessions. Additionally, a *Skills Training* teleconference for school food service directors will be held in July 1997, providing the skills necessary to implement the Healthy School Meals Initiative. They also plan to train the cadre in computerized menu planning and analysis, who will then train directors at the local level.

South Carolina Department of Education—\$167,708

The South Carolina Department of Education plans to set specific standards for entry into the school food service field to ensure the service of quality meals served to students. They plan to establish a food service training resource center with mini-grants to districts or schools to acquire the needed technology to access and use these resources. They will also formulate three guidance books for district supervisors and site managers, giving them information on how to train their personnel on the Dietary Guidelines for Americans and how to implement Healthy School Meals Initiative (HSMI) in their cafeterias. The guidance books will be field tested and revised as necessary. Additionally, they will establish and advertise a training delivery system designed to deliver the majority of small group training in the State. Three training centers in different locations in the State will be used by local school food service personnel to train on HSMI.

Vermont Department of Education—\$83,418

The Vermont Department of Education's project plans to hold a series of training activities addressing how to manage and accomplish changes in food service programs, as well as integrating those programs with nutrition education efforts. The State will expand the nutrition education program by creating a plan for schools and teachers, offering them a day-long conference and mailing on how to implement nutrition education and how to access resources. They plan to increase the skills of food service managers by waging an extensive campaign to address the technological barriers schools face in implementing nutrient standard menu planning. They will contract out training centers at two State technical schools or colleges and offer training in word processing, spreadsheets, nutritional analysis and the Internet. They will also hold a technology fair, advertising it via brochure and by a State school meals web site. The State plans to expand an on-going technical assistance project specifically targeted toward 1/3 of the school food authorities that have 150 or fewer students. The *Small School Survival Strategies* training will cover program management and menu planning. Additionally, other efforts will focus on consolidating the management of as many as 13 separate small School Food Authority's under

PART 1

food service managers. They will also offer, in conjunction with the New Hampshire Department of Education, a repeat session of *Planning for Change*. Vermont Interactive TV (VIT) will air a “newsletter” for school food service directors to get updated Healthy School Meals Initiative information and other classes, such as *Prep'niques and Trimming the Fat*.

West Virginia Department of Education—\$59,756

The West Virginia Department of Education plans to build on their efforts toward achieving nutrition integrity in their schools. Under this project, all district menu planners and food service directors will be required to measure and validate the attainment of their nutritional goals for their meals. A six-hour workshop on computer analysis will be developed, along with four regional workshops in school computer labs. All directors and menu planners in the State will be afforded the opportunity to attend one of these trainings. The State will also provide technical assistance to school food authorities who want nutrient standard menu planning or food-based evaluations, and six State agency staff will get a workshop and at least one site visit to test field monitoring procedures, ensuring the transition into the new Healthy School Meals Initiative regulations progress smoothly.

STATES NOT FUNDED

All Team Nutrition Training Grant applications were funded in 1996.

1997 TEAM NUTRITION TRAINING GRANTS

On January 8, 1997, all State agencies that administer the National School Lunch Program and/or Nutrition Education and Training (NET) Program were invited to compete for a Team Nutrition Training Grant. Applications to apply for a grant are due to FCS April 16, 1997 and grant awards will be announced on July 31, 1997.

Question. Last year, Secretary Haas indicated to this Committee that Team Nutrition had entered into agreements with over 200 partners as part of the agency's efforts to leverage public resources.

Would you please provide a list of these agreements and the federal funding, by fiscal year, which has been provided for each.

Answer. Team Nutrition supporters receive no federal funds directly for being a supporter; however, some Team Nutrition funding is used to provide supporters with material designed to keep them up-to-date on Team Nutrition activities and to encourage them to become involved at the local level. A list of current Team Nutrition Supporters is provided for the record. The total exceeds 300 organizations. These Supporters have provided the Agency with a statement indicating their support of Team Nutrition's Mission and Principles. In return they are listed in publications as supporters and are kept informed of Team Nutrition activities and opportunities for their participation in Team Nutrition Schools. Supporters play a key role in the success of Team Nutrition. Their involvement multiplies the resources available to Team Nutrition Schools. They may be volunteers for activities or they may provide food or other supplies in direct support of activities. As a result, for a small federal investment Team Nutrition leverages its limited funds to benefit all participants.

Some organizations included in this listing received Team Nutrition funding through cooperative agreements or contracts for specific product development beyond their role as a supporter. These include the following groups and funds listed by funding year:

	Fiscal year—		
	1994	1995	1996
The Walt Disney Company	\$200,000	\$195,000
Scholastic, Inc	299,538	1,496,814	\$737,313

Many of these Supporters have been involved in Team Nutrition from the beginning through Leadership Forums. Supporters play an important role in mobilizing the community in support of improved child nutrition and these Leadership Forums provide the opportunity for all those interested in children's health to discuss how they can work together. Through Supporter involvement, Team Nutrition has taken hold locally and its principles will be sustained for years to come assuring a healthier future for our children.

Question. Last year, Secretary Haas indicated to this Committee that the Food and Consumer Service was working with the Economic Research Service to quantify the dollar value of private sector contributions to Team Nutrition; that the analysis was to be completed shortly and would be provided to the Committee. We did not receive a copy of that analysis. Would you please provide a copy for the record.

Answer. A copy of the analysis quantifying dollar value of private sector contributions to Team Nutrition is provided for the record.
[The information follows:]

TEAM NUTRITION LEVERAGING FEDERAL INVESTMENT THROUGH PRIVATE PUBLIC PARTNERSHIPS 7/10/96

Public-private partnerships are critical to the success of Team Nutrition, to ensure that Team Nutrition messages reach children through the media they use, to provide multiple, reinforcing messages, and to leverage scarce Federal resources with private sector support. Team Nutrition has developed an extensive network of partners and supporters, including agreements with two-hundred-forty partners.

USDA has focused on the leveraged value of public resources invested with private partner organizations through cooperative agreements with BVPD, Inc. (Disney) and Scholastic, Inc. Our analysis to date has focused on contributions from Dis-

PART 1

354

ney associated with the production and airing of public service announcements (PSAs) and Team Nutrition materials developed and distributed by Scholastic, Inc.

DISNEY—A WISE INVESTMENT IN CHILDREN'S HEALTH

Disney, in cooperation with Team Nutrition, has developed four PSAs featuring Disney characters from the movie *The Lion King*. Two of the four PSA's have been made available to all broadcast TV stations, networks and cable services for airing at their discretion. The third PSA will be released in June. Disney has also provided USDA with the rights to use Lion King characters on Team Nutrition materials. These images have been used on classroom and cafeteria posters and incorporated into publications to introduce grade school age children to the food guide pyramid concept and to highlight the importance of choosing foods that promote health.

- In the first year alone, for every dollar we invested in Disney, we are leveraging ten dollars of private resources.
- We conservatively estimate that the PSAs will receive at least \$4 million in free air time over the course of just one year.
- USDA did not pay any money to license the Disney characters. Private sector firms would have to pay millions for these rights. Private-public partnerships are critical to leverage scarce Federal resources with private sector support.
- USDA's \$395,000 partnership with Disney is producing nutrition education and promotion materials that teach children to make food choices for a healthy diet.
- The value of the PSAs alone exceed the cost of the investment. The production cost of one 30 second PSA ranges from \$120,000 to as much as \$300,000.

KIDS ARE GETTING THE MESSAGE

USDA's partnership with Disney provides access to children in ways public investment alone could never achieve. One out of every two children in America has seen *The Lion King*. It allows USDA to reach out to children with universally recognized characters. Through Disney's cable network, broadcast television and video rentals we communicate to children through multiple, reinforcing channels, in a language they can understand and in ways they can relate to and accept.

- The PSA's are shown 5 days a week on *Disney Afternoons* which is available in over 90 percent of the country.
- The PSA's are shown every day on the Disney Channel which reaches 15 million subscribers.
- Disney estimates that every day at least 580,000 children between the ages of 2 and 11 are viewing *Disney Afternoons* when PSA's are shown.
- Disney has also included the PSA's in three movie videos for rental throughout the country, each of which is expected to be viewed 27 million times. Disney also included the PSA's on three Lion King cartoon videos.
- USDA tested the PSA's and found that 90 percent of children liked them and most understood the messages to eat more fruits, grains and vegetables, and make healthy food choices.
- The PSA's are reaching children—data from our Team Nutrition pilot communities indicate that nearly two-thirds (63 percent) of the children in four pilot sites had seen the PSA's.

SCHOLASTIC—CRITICAL SCHOOL ACCESS

USDA entered into a cooperative agreement with Scholastic Inc., a leading publisher and distributor of educational materials, to develop Team Nutrition in-school curricula for pre-K to 12th grades. Scholastic estimates the value of services provided to FCS at \$3.0 million. FCS paid \$1.7 million.

- The first 10,000 Team Nutrition Schools are receiving Scholastic Classroom Kits at no charge.
- USDA negotiated a discounted price (\$55) for Scholastic materials that will save schools half the normal cost of the package (\$110). By facilitating the distribution of these kits at one-half their normal retail price, FCS will be leveraging its investment by \$1.7 million over four years.
- In addition to the services it has already provided, as part of its cooperative agreement with FCS, Scholastic has agreed to solicit sponsorship for the distribution of materials from corporations and associations in order to provide kits to low-income schools at no cost. Scholastic has estimated that this will create an additional \$2 million in private sector support. The combination of donated services, discounted material prices, and private donations will provide USDA with a \$3 return for every Federal dollar invested.

PART 1

355

USE, REUSE AND REPACKAGE

USDA is reinforcing Team Nutrition messages and stretching Federal investment by using materials developed by Disney and Scholastic, Inc. in multiple, reinforcing ways.

—Nutrition education activities developed for classrooms have been adapted and repackaged to provide parents and community groups that reach children on a daily basis with active, hands-on learning activities.

—Scholastic *“Take Out,”* a parent newsletter, provides parents with information to reinforce classroom messages.

—*Food, Family & Fun A Seasonal Guide To Healthy Eating*, features activities developed by Scholastic, the Disney characters Pumbaa and Timon, and recipes adapted from school menus. The book provides family learning activities that make nutrition fun.

—Disney PSA’s have been incorporated into classrooms curriculums, reinforcing and expanding the messages that children see on television.

—Scholastic articles in a wide array of publications targeting students, teachers, administrators and coaches feature Team Nutrition messages.

Question. In its fiscal year 1997 report, the Committee encouraged the Department to establish a panel to review and evaluate food service training grant applications submitted by States to ensure the award of funds to the highest quality projects benefiting the maximum number of students and school districts. Have you done this?

Answer. Yes, the FCS did establish a panel of headquarters and Regional office FCS employees to review and evaluate food service training grant applications. This panel followed evaluation criteria designed to ensure high quality projects that would benefit the largest possible number of students and school districts. However, FCS did not establish a panel of outside parties to review and evaluate Team Nutrition (TN) Training Grants for Healthy School Meals because it was determined that this could create a conflict of interest.

Question. Please explain the Department’s procedures for reviewing and evaluating food service training grant applications, including who participates in this process.

Answer. All Team Nutrition (TN) Training Grant Applications that meet the published deadline for submission are screened for completeness and conformity to the requirements stated in the application package. Applications meeting the screening requirements are then reviewed competitively by a panel composed of FCS staff. The panel reviews and ranks each application based on the technical evaluation criteria outlined in the application package and provides explanatory comments based on the criteria. Based on the availability of funds the highest ranking applications are then awarded funding. In 1996, all TN Training Grants were funded.

Question. Please describe the cooperative agreements with the National Food Service Management Institute (NFSMI) funded with the \$800,000 provided for fiscal year 1997. Of the \$10 million requested for the school meals initiative for fiscal year 1998, how much is included for cooperative agreements with the NFSMI? What cooperative agreement work is planned for fiscal year 1998?

Answer. Two Cooperative agreements were funded by the National Food Service Management Institute with the \$800,000 provided in fiscal year 1997. One is a National technical services project that the Institute will manage in cooperation with USDA/Food and Consumer Service and State Agencies. This project will provide one-on-one assistance to nearly 100 local schools on site with menu planning, quality food production, food procurement practices and nutrient analysis of menus. This project will target small to medium school systems across the Nation. Schools will request the service through their State Agencies. The Institute will be responsible for the training and assignments of a cadre of “out-post” nutrition and food service consultants who will respond to these requests. The second project will be the continuation of the Customer Service Help Desk into its third year. This project provides an 800 number phone line as well as an Internet address for the use of local school food service staff. Questions are answered and technical assistance and materials are provided in the areas of menu planning, nutrient analysis, food systems management, recipes, food production, Dietary Guidelines for Americans, marketing of healthy meals and quantity food service equipment, etc. Currently the Institute is receiving an average of 150 questions per month including phone and Internet requests.

In fiscal year 1998, funding for the National Food Service Management Institute is planned at \$500,000. Currently, the Agency is providing a yearly sum of \$250,000 for the ongoing services of the Customer Service Help Desk. Projects other than those discussed above have not yet been identified. The National Food Service Man-

PART 1

356

agement Institute and USDA/FCS work together with the Institute's National Advisory Committee to determine major projects and priority needs. The National Advisory Committee is made up of representatives from State Agencies, Local Programs, professional organizations, universities, food industries and Federal Agencies. The National Advisory Committee met on March 21–23, 1997.

Question. Please explain how the Team Nutrition in-school and other nutrition education materials which you have developed, produced and disseminated are being used by schools, teachers, parents, and communities to educate children to make healthy food choices.

Answer. Scholastic, Inc., in cooperation with USDA, developed an in-school curriculum which is the centerpiece of the elementary school material. This curriculum incorporates nutrition education and information into other curriculum area such as math, science, social studies and health. With this approach, children can be provided with nutrition information throughout the year. The objective is to raise the children's awareness of nutrition to encourage them to make behavior changes. We want them to make food choices that result in a healthy diet. To date, more than 20,000 of these kits have been distributed. The kits cover pre-kindergarten to kindergarten, grades 1–2 and grades 3–5.

Schools across the country have begun to use the Team Nutrition materials to engage children, eager to participate in hands-on activities. They are reinforcing positive nutrition messages through colorful posters displayed around the school—in classrooms and the cafeteria alike. In addition, they are conducting health, food or nutrition fairs which provide children the opportunity to taste test new foods, to learn how to read a nutrition label, plant a Team Nutrition garden, study the foods used in different regions of the Nation, assist food service staff in preparing a meal or any number of other activities which provide children the opportunity to experience and learn about food in fun ways.

Parents are becoming involved by participating in these fairs and through the parent materials provided to them. Materials developed and distributed in cooperation with PTA include parent Tip Sheets and the Team Up At Home activity booklet which is filled with fun educational activities for parents to do with their children. These materials are designed to reinforce the positive nutrition education messages children are receiving at school.

Communities are involved through the Cooperative Extension Service. The Community Nutrition Action Kit has received overwhelming positive response and is being utilized by Extension staff as well as public and private health professionals. All these efforts are directed toward educating children about the importance of the food choices they make. They are responsible for what they choose to eat which determines how healthy they are.

RESEARCH AND EVALUATION

Question. The fiscal year 1998 request proposes \$17 million to partially restore funding for research and evaluation in the food and nutrition assistance programs. As you are aware, funding for research and evaluation was reduced to \$7.5 million for fiscal year 1997 in large part due to constraints on discretionary funding. However, there was also concern over the value and priority of the research work being conducted. What process is used to make sure that only priority work is funded, and to discontinue any ongoing work that may not be of particular value?

Answer. Every year FCS follows a formal process to ensure that research studies are relevant to the concerns of Congress, policy officials, and other stakeholders. In doing so, FCS attempts to respond not only to current policy information needs, but also to anticipate emerging or future needs.

In the planning process, the highest priority goes to the formal and informal mandates received from Congress, these studies are funded before any others are considered. If sufficient funds remain to address additional policy questions, FCS reaches out simultaneously to policy officials and operating managers of food assistance programs; officials in other government agencies including the Congressional Budget Office, Congressional Research Office, other Federal agencies, and associations and public interest groups with a stake in food assistance. FCS seeks not only areas of important policy information needs, but also opportunities to collaborate with others to leverage existing resources as much as possible.

With these views in hand, the FCS prepares a 2-year Research & Evaluation Agenda, balancing the available resources with the most pressing policy information needs. The plan is reviewed by all operating divisions within the Agency, endorsed by the Agency Administrator, and submitted to the Under Secretary for Food, Nutrition, and Consumer Services for review and approval. Each project in the approved plan that requires advisory and assistance services—including virtually all research

PART 1

357

contracts—is individually reviewed and approved again by the Under Secretary before any funds are committed.

The 2-year plan is revisited in mid-stream to ensure that previously identified plans are still policy-relevant and adjusted as needed to reflect current funding levels. The Agency also reviews our ongoing studies continuously to endure their continued relevancy and priority, again making mid-course adjustments if needed.

FCS constantly seeks to improve this process to ensure that our work responds to the needs of all our audiences.

Question. For each of the food assistance programs, please identify the amount of funding spent on research and evaluation in each of fiscal years 1993–97 and proposed for fiscal year 1998, identifying the study funded, its purpose, who is carrying out the study, its cost, whether it is considered a new or ongoing study, and the estimated completion date.

Answer. The requested information for studies receiving funds in each of fiscal years 1993–97 is provided for the record. Because the procurement process for fiscal year 1997 studies is not final, some information on 1997 studies is still unknown.

The fiscal year 1997 appropriation reduced the funds available for research and evaluation from \$18.2 to \$7.5 million. The President's budget request includes \$17 million to partially restore these accounts to their previous levels. At the level requested for fiscal year 1998, FCS would use the funding to:

- Help States identify effective and efficient ways to design and run programs using the new flexibility provided by welfare reform. What works best in moving clients to self sufficiency? Which State work programs are most effective in moving the able-bodied into work? How can States take advantage of new options to increase child support payments, encourage personal responsibility, and reward work?
- Respond to Congress' mandate to study the effects of welfare reform on CACFP. Without these funds, FCS cannot address critical questions posed in the legislation.
- Develop cost-effective ways to improve program integrity and reduce administrative costs, focusing on operational improvements to reduce error and fight trafficking. Additional funds would enable extensions of ongoing food stamp research on recipient and retailer trafficking to better target investigations and focus WIC research on improving program management and efficiency. For example, how can States most efficiently manage food package and administrative costs?
- Respond to recommendations from the scientific community to strengthen the WIC Program, including development of tools to support eligibility determinations.
- Continue development and evaluation of cost-effective EBT systems for WIC.
- Sustain critical updates of the characteristics of food stamp and WIC participants and track compliance with Congressionally-mandated nutrition standards for school meals.

[The information follows:]

[CLERK'S NOTE.—The summaries of obligations for 1993–97 are not printed in the hearing record but are available for review in the subcommittee's files.]

Question. Last year the Economic Research Service indicated to this Committee that it had expanded and given elevated priority to work in the food, nutrition, and consumer service area. What specific work has the ERS carried out in each of fiscal years 1996 and 1997 at the request of or in collaboration with the Food and Consumer Service (FCS)? Is this work funded by the ERS, or by the FCS on a reimbursable basis? What work is planned for fiscal year 1998?

Answer. FCS and the Economic Research Service (ERS) have a mutual interest in research and analysis of the domestic food and nutrition programs. The Agency has worked with ERS in recent years to make the most efficient use of common data and complementary expertise. Our collaboration has taken two forms.

First, staff in FCS often consult with staff in ERS to draw on their professional expertise in particular areas. At the request of FCS in 1996, for example, ERS staff participated in an interagency working group on food security measurement, consulted on the design and analysis of two National surveys of Food Stamp Program participants and authorized retailers, served on an interagency expert panel on the feasibility of a rural food price monitoring system, and analyzed bidding procedures used to obtain WIC infant formula rebates. These consultations were funded by ERS.

Second, on some occasions FCS has found it more cost-effective to reimburse ERS for services that might otherwise be provided by a contract or grant. In 1996, FCS and ERS negotiated a Food Stamp Program Research Agreement in which FCS pro-

vided ERS \$250,000 in return for four basic research projects of mutual interest, including a comparison of food expenditure measures derived from the Food Security Supplement to the Current Population Survey with measures derived from the Consumer Expenditure Survey, an analysis of the relationship between food sufficiency and nutrient intakes, an analysis of measures of well-being collected as part of the Survey of Income and Program Participation, and a concept paper on issues, problems, data needs, and modeling approaches to develop comprehensive economic models of food assistance and agricultural programs. In addition, FCS provided ERS \$25,000 to support purchase of a commercial data set of prices paid for food in supermarkets.

With the reduction in appropriated funds for research in 1997, FCS was unable to continue the reimbursable agreement with ERS although the Agency continues to consult with them as appropriate. In particular, ERS staff are part of an inter-agency working group assembled to respond to the Congressional mandate for a study of the effects of allowing the purchase of vitamin and mineral supplements with food stamps. With funding at the level requested for 1998, FCS would again look for opportunities to coordinate and support research of mutual interest.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

WIC CASELOAD REDUCTIONS

Question. You indicate that without the supplemental request, WIC caseload would fall from 7.4 million to 7.0 million. What portion of this reduction would include removing current participants from the program and what portion of this reduction would include not replacing participants who are no longer eligible?

Answer. It is not possible to estimate the incidence of one strategy over another for caseload reduction. Depending on their specific circumstances, States utilize a number of strategies to bring their caseloads down when the need arises, depending on their specific situations. FCS does not require reporting of such data, and have no basis for estimating this information.

The expectation is that States will continue to do their best to carefully manage their caseloads and closely scrutinize and monitor their obligations, making adjustments to caseload as necessary, by not certifying persons, or by discontinuing benefits mid-certification. Most State data systems identify the certifications due for the upcoming month, so State agencies are aware of attrition rates for currently enrolled participants. Consequently, caseload reductions can be achieved effectively, and with least disruption to program participants, by either certifying only high priority individuals or by not doing any new certifications. However, if gradual attrition does not successfully achieve needed caseload reduction goals, State agencies may discontinue benefits mid-certification. This latter strategy is encouraged only as a last resort, when quick impact on caseload and expenditure levels is imperative.

WIC IMMUNIZATION

Question. Would you please provide an update on your activities to improve immunization services?

Answer. One of the major public health challenges of this decade is to improve our Nation's capacity to deliver age-appropriate immunizations to infants and young children in need. Failure to vaccinate preschool-aged children resulted in a resurgence of measles cases during 1989–1991 with over 8,000 cases of measles and 29 deaths among children in this age group alone.

The FCS and the Centers for Disease Control and Prevention (CDC), Department of Health and Human Services (DHHS), have an ongoing cooperative effort to increase immunization rates among preschool-aged participants in the WIC Program. Through a strong partnership, FCS and CDC, along with State cooperators, are working to improve the quality of services and the health status of children under 2 years of age who are in need of nutrition assistance and/or immunizations.

As a result of this National initiative, numerous special immunization promotion activities are taking place.

[The information follows:]

—In an effort to deliver needed immunizations to preschool-aged children, FCS and CDC sent a letter to all State Health Officers (January 1995) to encourage State Health Departments to promote a continuing partnership between the WIC and State Immunization Programs.

—FCS and CDC have developed a National Strategic Plan as a general guideline for States to consider using to facilitate an increase in immunization coverage

PART 1

359

rates among WIC participants. Many of the ideas advanced in the plan were adapted from State initiatives that employ creative service delivery and cost sharing approaches.

- CDC, in conjunction with WIC State agencies, conducted demonstration projects in several cities to determine the most effective methods of increasing access to immunization through the WIC Program. Data from these projects show that intensified collaboration and resource sharing between State/local WIC and immunization programs improve the service delivery capacity and quality of both programs.
- CDC and FCS supported the American Academy of Pediatrics and other organizations in producing a video which explains to low-income parents the importance of immunizations.

Current Status

- FCS is an active member of the Interagency Committee on Immunizations which is implementing an action plan to improve immunization services for pre-school-age children and target resources to high-risk and hard-to-reach populations. FCS is also an active participant of the Immunization Education and Action Committee of the Healthy Mothers, Healthy Babies Coalition and the National Vaccine Advisory Committee.
- Through the WIC Program and State and local program administrators, FCS cooperates with CDC and many other national organizations to actively promote the annual National Infant Immunization Week.
- The National Association of WIC Directors (NAWD), the Association of State and Territorial Health Officials (ASTHO), CDC, and FCS co-hosted a WIC immunization promotion conference, entitled “Working Together for Healthier Children,” February 12 and 13, 1997. The conference fostered positive communication at the State level between Immunization Programs and the WIC Program by increasing understanding of each programs’ goals and objectives and highlighting win—win situations in State and local WIC and immunization partnerships. The conference also focused on State WIC Directors’ and Immunization Program Managers’ concerns.
- FCS, CDC, NAWD, and ASTHO have formed the WIC/Immunization Research and Evaluation Subcommittee. The purpose of the this group is to coordinate research and evaluation activities directly related to immunization promotion efforts in WIC. The Subcommittee facilitates and reports on cost-effective strategies that improve vaccination coverage rates among WIC participants.
- The Administration’s Childhood Immunization Initiative provides funds to States to strengthen their immunization infrastructure. These funds make vaccination services more widely available by helping public programs buy more vaccines and improve community service and outreach efforts. Many States use the funds to extend clinic hours, hire more staff, increase education efforts, and help create a national tracking system.

FCS has been active and supportive of strengthening State Immunization Information Systems as a major initiative to improve immunization status assessment and referrals among WIC children. To further promote this linkage, in fiscal year 1996 FCS awarded grants totaling \$946,793 for State *WIC/Immunization System Linkage Grants* to nine WIC State agencies to design, develop, and implement information system linkages between State Immunization Information Systems and WIC data systems at the State and local levels. Made possible through funding from the Centers for Disease Control and Prevention’s National Immunization Program, the purpose of this partnership is to enhance automation capabilities in WIC clinics to facilitate accurate and efficient assessment of the immunization needs of WIC infants and children. Grants were awarded to the following States: Massachusetts, Rhode Island, Florida, Texas, Chickasaw Indian Nation, Virginia, Iowa, Nevada and Alabama.

WIC FARMERS’ MARKETS

Question. In what ways has it supported rural economies?

Answer. Approximately \$9,070,553 (Federal funds plus matching funds from non-Federal sources) in WIC Farmers’ Market Nutrition Program (FMNP) coupons were redeemed last year in 1,231 farmers’ markets, many of which were in rural communities. The FMNP combines incentives for local agricultural producers with incentives for WIC participants to make healthy food choices. Based on the most recent survey data available, compiled from a 1995 survey of farmers participating in the program, 84 percent said that participation in the FMNP increased their sales. In addition, 35 percent increased fruit/vegetable production and 32 percent stated that they plan to grow a wider variety of fruits or vegetables next year because of their

PART 1

360

involvement in the FMNP. The FMNP's emphasis on market development, including its provision of an additional 2 percent in administrative funds for this purpose, has increased the number of farmers' markets in rural areas.

Farmers' markets have proven to be a valuable outlet for family farmers to directly market their produce, often providing the primary source of revenue for these farmers. The Department's 1996 National Farmers' Market Directory reports that significant data document the strategic marketing advantages that local producers gain by selling through these facilities, including improved profit margins. This improved profit margin for farmers translates into improved revenue for rural economies. The Directory goes on to state that this method of direct marketing experienced phenomenal growth nationally in the last 2 years. The Directory documents 2,410 farmers' markets operating in the United States during the 1995 calendar year, an increase of 655 markets over 1994. This growth can be attributed in part to this program and its emphasis on market development.

Question. In what ways has it improved the nutrition in-take of WIC participants?

Answer. The WIC Farmers' Market Nutrition Program (FMNP) promotes the consumption of more vitamin and fiber-rich fresh fruits and vegetables. The FMNP's direct linkage of farmers and WIC participants has enabled low income people to become acquainted with where their food comes from, to meet the people that grow it, and to learn preparation tips from the growers. This is a valuable educational lesson for many of our FMNP participants who had never shopped at a farmers' market prior to their participation in the program. Based on 1995 survey data provided by FMNP State agencies, 71 percent of recipients who responded to the survey said they ate more fresh fruits and vegetables during the FMNP season. In addition, 77 percent said they planned to eat more fresh fruits and vegetables all year round.

Question. To what extent is the cost of this program, item for item, higher than expenditures for the regular WIC program?

Answer. FCS can not provide an item for item cost comparison of WIC Farmers' Market Nutrition Program (FMNP) expenditures to WIC expenditures, either for the foods in the program or the administrative and services costs of the programs. Comparative data is not reported to the Department, and the Program requirements, in terms of foods provided, services offered and administrative responsibilities required are vastly different.

With regard to foods provided, for example, the FMNP permits participants to select fresh fruits and vegetables up to a set dollar value on coupons used much like store coupons. The State defines which locally grown fruits and vegetables may be eligible for purchase. The FMNP foods are designed to complement WIC foods, which include an assortment of staple, versatile, readily available, and economical nutritious foods such as eggs, juice, cereal, and dry beans, peas or peanut butter. Using the most recent data, the Agency estimates that in fiscal year 1995, the WIC food package cost approximately \$33 every month for a woman participant. The FMNP benefit, which includes both Federal and non-Federal share, averaged annually about \$14 for fiscal year 1995, and may be provided on a participant basis or for an entire household, depending on State design of the FMNP.

With regard to non-food expenditures, the FMNP and WIC are very different. For example, FMNP has a market development component which is unique to this program, while WIC has other unique and costly administrative responsibilities such as nutrition risk assessment, including tests for anemia; certification of eligibility; referrals; immunization assessment; drug, alcohol and tobacco use counseling; voter registration; and others. Total administrative costs for the FMNP cannot exceed 17 percent of the funds allocated for the program. WIC Program nutrition services and administration expenditures represent about 27 percent for fiscal year 1996 of total program expenditures, however, of course, WIC's programmatic requirements are different from those of the FMNP, as noted above.

COMMODITY ASSISTANCE PROGRAM

Program duplication

Question. The request for the Commodity Supplemental Food Program includes \$86 million in support of 123,900 women, infants, and children.

Is this duplicative of the WIC program?

Answer. The budget request for the Commodity Supplemental Food Program (CSFP) is not duplicative of funding for the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). Section 17(c)(3) of the Child Nutrition Act of 1966 prohibits recipients from participating simultaneously in the CSFP and WIC.

In addition, the formula used to determine the amount of funds needed to support the WIC-eligible population excludes women, infants, and children participating in

PART 1

the CSFP. Therefore, the budget request for the CSFP in no way duplicated the amount requested for WIC. Also, over 60 percent of CSFP participants are elderly persons, and the elderly are categorically ineligible for WIC. While pregnant, breastfeeding, and postpartum women, infants and children participate in both programs, nonbreastfeeding women between 6 and 12 months postpartum and children between 5 and 6 years of age are categorically eligible for the CSFP, but not for WIC. Furthermore, CSFP sites serve some areas where WIC is not readily accessible.

Question. In addition to the similarities of CSFP and WIC, in terms of beneficiaries, there appear to be other programs administered by the Food and Consumer Service that serve the same or similar populations.

Can you provide information regarding duplication within various nutrition programs that could, at least potentially, serve the same clientele?

Answer. The Food Stamp Program (FSP) and the Food Distribution Program on Indian Reservations (FDPIR) are designed to help a broad array of low-income households obtain nutritionally adequate diets. Most other FCS nutrition programs are targeted to meet the nutritional needs of specific population groups. The targeted programs include the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), the Commodity Supplemental Food Program (CSFP), the Nutrition Program for the Elderly (NPE), and the Child Nutrition Programs. The Child Nutrition Programs are the National School Lunch Program (NSLP), the School Breakfast Program (SBP), the Special Milk Program (SMP), the Child and Adult Care Food Program (CACFP), the Summer Food Service Program (SFSP), and the Homeless Children Nutrition Program. Targeted programs provide prepared meals or supplemental food packages and other nutrition services to specific population groups. Finally, The Emergency Food Assistance Program (TEFAP) is designed to supplement the diets of low income households with food items.

It is possible in a limited number of cases that an individual may participate in food stamps as well as more than one targeted benefit program (i.e., WIC and CACFP). However, as these programs are designed to meet needs which are sufficiently different (i.e., nutritious supplemental foods for individual consumption and nutrition education in WIC versus nutritious CACFP meals in a child care setting), this should not be considered duplication.

It is also possible that an individual who participates in a targeted program may also reside in a household participating in the FSP or FDPIR, e.g., a child living in a FSP household who also participates in the NSLP. However, these and other arrangements where individuals participate in both the FSP or FDPIR and a targeted program do not constitute duplication of benefits, as the programs are designed to meet different needs.

Data from the 1977-78 National Food Consumption Survey (NFCS), the most reliable data available for this purpose, indicate that significant nutritional improvements can be made by supplementing the FSP with targeted programs. The NFCS found that only one in ten households with food expenditures comparable to the maximum FSP allotment consumed 100 percent of the Recommended Daily Allowance (RDA) of 11 key nutrients. NFCS also found that the proportion of households attaining this nutritional level increased rapidly with increased food expenditures: 1 in 3 households with expenditures one and one-half times the maximum FSP allotment and 2 in 3 households with expenditures two times the maximum FSP allotment attained this nutritional level. The NFCS data suggests that FCS's targeted programs complement the FSP and FDPIR and play an important role in helping individuals with special nutritional needs (such as children and the elderly) who reside in low-income households realize nutritionally sound diets.

Question. Are there opportunities to consolidate any of these programs?

Answer. A consolidation opportunity that FCS is currently pursuing within the Child Nutrition (CN) programs is combining the National School Lunch Program (NSLP) and the School Breakfast Program (SBP) into a unified School Nutrition Program. FCS is currently developing regulations to implement this consolidation. In addition, the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (Public Law 104-193), required that FCS develop a proposal to consolidate the NSLP, SBP and the Summer Food Service Program (SFSP). The Agency will be developing a proposal in accordance with the requirements of the law to integrate the portion of the SFSP which operates in schools into the consolidated School Nutrition Program.

Although the CN programs serve similar constituencies and provide similar benefits, the opportunities for increased efficiencies through consolidations, other than those noted above, are minimal. A table which displays all the CN programs and their key characteristics is submitted for the record. It shows that the main difference between the various CN programs is the location where benefits are pro-

PART 1

vided. The administrative network which schools belong to is very different than the administrative networks for day care centers and homes. The same is true of the networks for summer camps and homeless shelters. Other differences associated with location are the number of children being served, the amount of time the children are at the serving site each day, the cost associated with providing a meal, and the expertise that FCS can reasonably expect of the food service operators. These differences necessitate different regulations for reporting requirements, oversight and review requirements, nutrition requirements, site approval standards, accounting, etc. While Special Milk Program (SMP) benefits are provided in schools, as are NSLP and SBP benefits, the SMP operates only in schools without NSLP or SBP operations and provides students only with milk. In the case of the Summer Food Service Program (SFSP), the non-school SFSP sites, unlike NSLP/SBP schools, typically operate only a few months during the year, do not experience stable attendance, do not all have well developed administrative support structures, and do not have comparable food preparation expenses.

[The information follows:]

Program	Benefit recipients	Benefits provided to recipients	Location(s) benefits provided
National School Lunch Program (NSLP)	Elementary & secondary school students.	Prepared lunches	School.
School Breakfast Program (SBP)	Elementary & secondary school students.	Prepared breakfasts	School.
Special Milk Program (SMP)	Elementary & secondary school students in schools without the NSLP or SBP.	½ pints of milk	School.
Summer Food Service Program (SFSP)	Low-income children, below age 18, living in low-income areas.	Prepared meals	Summer camps, schools, etc.
Child and Adult Care Food Program (CACFP).	Children, below age 12, and disabled adults in day care.	Prepared meals	Day care homes & day care centers.
Homeless Children Nutrition Program	Homeless children in shelters	Prepared meals	Homeless shelters.

The other nutrition programs administered by FCS, in addition to the Commodity Supplemental Food Program (CSFP) and the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), are the Food Stamp Program (FSP), the Food Distribution Program on Indian Reservations (FDPIR), The Emergency Food Assistance Program (TEFAP), and the Nutrition Program for the Elderly (NPE). The FSP and FDPIR help a broad array of low-income families purchase nutritionally adequate diets, while TEFAP, NPE, and the CN programs provide targeted nutritional assistance to specific population sub-groups. The targeted programs complement, but do not duplicate, the nutritional support provided through the FSP and FDPIR.

A table which displays the FCS programs, except WIC and CSFP, and their key characteristics is submitted for the record. Unlike the CN programs, in which the location where benefits are provided is key, this table shows there is no summary differentiating characteristic for these FCS programs. Rather, what distinguishes them is the benefit delivery system each program needs to meet its goal of providing specific nutritional assistance to its target population.

For FDPIR the target population is low-income households on Indian reservations who do not have access to retailers accepting food stamps. Providing benefits to this population can require a distribution system capable of delivering food to places on Indian reservations far away from retail outlets. No other program in the table can provide benefits comparable to FDPIR for households on reservations.

In the NPE the targeted population is the elderly who participate in Department of Health and Human Services programs. Many NPE recipients cannot prepare their own meals, and the NPE is the only program in the table designed to provide prepared meals to immobile elderly recipients. As you know, FCS has proposed in the past, and still support the consolidation of NPE with its much larger sister feeding program run by HHS. We recommend that these programs be consolidated.

TEFAP a significant part of the targeted population is emergency feeding centers (e.g. soup kitchens). TEFAP is the only FCS program designed to provide bulk commodity shipments in support of emergency feeding centers. The focus of the FSP, FDPIR, CN programs, TEFAP, and the NPE are all different enough so as to require different benefit delivery systems. This diversity causes FCS to believe that

PART 1

further consolidation would not, at this time, produce noticeable savings or efficiencies.

[The information follows:]

Program	Benefit recipients	Benefits provided to recipients	Location(s) benefits provided
The Emergency Food Assistance Program (TEFAP).	Emergency feeding centers & needy individuals.	Commodities	Emergency feeding centers & households.
Nutrition Program for the Elderly (NPE)	Elderly participating in Department of Health and Human Services programs.	Prepared meals	Group settings, households.
The Food Stamp Program (FSP)	Low-income households	Food coupons	Retail grocery outlets.
Food Distribution Program on Indian Reservations (FDPIR).	Low-income households on Indian reservations.	Food packages	Indian reservations.
Child Nutrition Programs (CN)	Children	Prepared meals	Various away-from-home locations.

Question. Would such consolidation result in savings?

Answer. The consolidation of the National School Lunch Program (NSLP) and the School Breakfast Program (SBP) into the unified School Nutrition Program is unlikely to result in more than minor savings for State and local program administrators. The consolidation rule will provide for some administrative efficiencies, but will not reduce nutrition benefits to children. The FCS is currently working on a proposed rule to consolidate the NSLP and SBP and has not yet completed its formal assessment of the savings, if any, that will result from this consolidation.

Consolidation of the USDA and HSS components of NPE would not likely yield savings at the Federal level either. State and local agencies administering these important food programs for the elderly, including the unique meals-on-wheels program, would likely experience significant efficiencies although cost savings potential appears slim there too.

FCS believes that opportunities for significant further consolidation do not exist at this time, and that such consolidation would not produce further savings.

QUESTIONS SUBMITTED BY SENATOR KOHL

WIC SUGAR CAP

Question. USDA is proposing to reopen the issue of the sugar cap for cereal eligible for the WIC program. For people who are nutritionally at risk, as WIC recipients often are, it is critical that opportunities are provided to maximize the nutritional value of all food consumed, in order to achieve a close to a balanced diet as possible.

Given that goal, I am concerned that any increase of the sugar cap for WIC cereals above the current level will only increase intake of empty calories by WIC recipients, at the expense of the more nutritious foods that these WIC recipients so badly need.

It is my understanding that the sugar cap has been reviewed numerous times in recent years, without significant change. Why is USDA reopening this debate?

Answer. The Department is committed to ensuring that the Federal requirements and other guidelines for the WIC Program are based upon sound scientific evidence. The majority of contemporary studies fail to document an association between sugar consumption and an increased risk of developing the chronic diseases of coronary heart disease, diabetes mellitus, obesity and hyperactivity. Therefore, the Department sought public comment through a Federal Register Notice, published on March 18, 1996, on whether a change in the current 6-gram sugar limit for WIC-eligible cereals was still warranted. FCS does not plan to change the limit, but the Secretary has called for a review of permissible WIC foods in total. So the sugar limits will be looked at again in concert with all permissible foods.

Question. In December of 1996, in an effort to help bolster rapidly falling dairy prices, Secretary Glickman announced his intentions to increase the purchases of dairy products for the school lunch program and other USDA nutrition programs.

Could you provide me with data to demonstrate how USDA increased use of dairy products for nutrition programs since December, by volume and value of product, relative to previous years?

Answer. The accelerated purchases of cheese for National School Lunch Program (NSLP), for the period July 1996 through February 1997 shows a total of 58.3 mil-

PART 1

364

lion pounds valued at \$90.6 million. For the same period last year, July 1995 through February 1996, the total cheese purchases were 55.5 million pounds valued at \$77.7 million. It cost FCS \$8.6 million extra for current year purchases because of the price increases for cheese. In addition, an accelerated purchase of 2.8 million pounds of cheese valued at \$4.3 million was made, to support the dairy industry.

In addition to the accelerated purchases of cheese for the NSLP, the Department purchased for the Commodity Supplemental Food Program (CSFP) \$5 million in processed cheese for distribution in CSFP. The Department also plans to purchase 2.5 million pounds of cheese valued at \$4.0 million to supply CSFP with sufficient product for the remainder of fiscal year 1997.

The purchase and distribution of other dairy products is comparable to prior fiscal years.

FARMERS' MARKET NUTRITION PROGRAM

Question. I have long been a supporter of Farmers' Market Nutrition Program (FMNP) and was pleased to see the Administration's request for an increase in that program in fiscal year 1998, to the \$12 million level. The FMNP program has been very successful in the three Wisconsin sites where it has been implemented. However, it is my hope that more Wisconsin sites could be started in the near future. In that context, I have the following questions:

If the Subcommittee is able to fund the FMNP at the increased levels proposed in the budget, how does USDA propose to distribute those increased funds?

Answer. By law, the first priority for these funds is to restore State agencies to their previous year's funding level. Of the remaining funds, 75 percent would be allocated to currently participating State agencies that request expansion funding. A funding formula, designed by the Department in consultation with State agencies, is used to distribute expansion. Basically, this formula ranks State agencies according to their previous year's average FMNP grant per WIC participant. Expansion requests are funded in rank order, beginning with the State agency with the lowest FMNP grant per participant. The remaining 25 percent would be allocated to new State agencies that are seeking to initiate a WIC Farmers' Market Nutrition Program (FMNP). A ranking process, based on factors specified in the law, is used to allocate funds to new State agencies. The law requires allocation on the basis of factors such as prior experience with a similar program, State plans that have the greatest access to farmers' markets, the highest concentration of eligible persons and such other factors as determined appropriate by the Department.

Question. There has been some concern about the practice of funding the FMNP as part of the WIC program. Given that concern, would USDA support funding for the FMNP through AMS, or another agency other than the FCS? Are there any reasons why such a transfer would be ill-advised?

Answer. Because WIC participants or persons on a waiting list for WIC services are the only persons eligible to receive Federal benefits under the WIC Farmers' Market Nutrition Program (FMNP), it seems only natural that the funding for the two programs should be administered by the same Federal agency. FCS has worked closely with the FMNP State agencies to establish an infrastructure for the operation of the program, and is the only USDA agency with experience in the administration of both grant and entitlement Food Assistance Programs. AMS' strength is in administering direct marketing programs. As long as the FMNP and WIC continue to be linked legislatively to a shared population of recipients, FCS believes it is the best interests of both Programs to be administered and funded through FCS.

The WIC Farmers Market Nutrition Program Association at one point thought such a transfer of program administration might overcome problems under current appropriations law regarding WIC and FMNP. Under this legislation, annual funding for FMNP has for the last two years been contingent upon the ability of WIC to sustain its current participation with funding provided. Under this construct, FMNP can only receive continued funding if not needed by WIC to sustain its participation levels. This problem cannot be solved with such a transfer of administrative responsibility to another USDA agency.

SCHOOL MEAL DIETARY GUIDELINES

Question. The Healthy Meals for Children Act was passed last Congress to help provide flexibility in school lunch programs, while still focusing on nutritionally balanced meals. I have been contacted by school food service administrators in my state of Wisconsin, who are concerned about the time it has taken for USDA action on regulations for the law. This delay has an impact on their planning for the next school year. Can you provide an update on the status of the regulations and a timeline for implementation.

PART 1

365

Answer. A proposed regulation to incorporate the traditional meal pattern into the program regulations and to provide guidelines for authorizing other reasonable approaches to meal planning is in clearance. Since clearance procedures are quite extensive, it is difficult to predict exactly when the rule might be published, but the Agency anticipates that it will be available for public comment by late spring or early summer.

In the meantime, it is worth noting that schools are already able to continue to use the traditional meal pattern if they so choose, since the Department issued guidance on this provision promptly after the enactment of the Healthy Meals for Children Act. In fact, schools currently have unprecedented ability to choose a meal planning system that is right for them. Schools may select from two food-based meal patterns as well as two methods of planning and preparing meals using nutrient analysis. The Department is committed to authorizing other reasonable approaches that can ensure the nutritional integrity of meals served to children and the best use of Federal dollars.

QUESTIONS SUBMITTED BY SENATOR LEAHY

WIC FARMERS' MARKET NUTRITION PROGRAM

Question. I am a very strong supporter of the WIC farmers' market nutrition program since it helps farmers, it helps communities set up farmers' markets, and provides fresh farm products to WIC families. The President requested a funding increase to \$12 million for fiscal year 1998—which I support.

While Vermont participates in this program, I want to make certain that additional states are able to participate in this program. Will you work, if Congress appropriates sufficient additional funding, to help make sure that the benefits of this program reach more states?

Answer. Yes, FCS will continue to work with the National Association of Farmers' Market Nutrition Programs and our Regional offices to provide information on the program to nonparticipating States. FCS conducts a State Plan workshop every year at a National farmers' market meeting in order to provide guidance to potential new States on applying and completing a State Plan for the program. Additionally, the Agency works with our Regional offices in order to assist States in the application process. When FCS participates in Departmental meetings or conferences regarding farmers or nutrition with individuals not familiar with the program, the Agency provides information about the program and encourages individuals to generate State support in order to apply. FCS realizes outreach is very important to potential new States and use many opportunities to promote this effective program.

Question. One preliminary report issued by USDA some years ago raised some concerns about the WIC farmers' market nutrition program. Are you now convinced that this program is a good investment for farmers, for WIC participants and for rural communities?

Answer. The Department is very supportive of the WIC Farmers' Market Nutrition Program (FMNP). The FMNP supports local agricultural economies consisting primarily of small resource farmers. At the same time, the FMNP promotes the consumption of more vitamin-and fiber-rich fresh fruits and vegetables. The FMNP couples incentives for local agricultural producers with incentives for WIC participants to make healthy food choices. The FMNP's direct linkage of farmers and consumers has helped participants become acquainted with where their food comes from, to meet the people that grow it, and to appreciate new and different types of fresh produce. FCS believes the FMNP is a win-win situation for both farmers and WIC participants.

WIC INFANT FORMULA REBATES

Question. For each year starting in 1987 please list the amount of dollar savings (in effect, additional funds for use by the WIC program) generated by WIC infant formula cost containment procedures which were put in place because they were either permitted or required under federal statutory law (1987 and 1988) or were required by federal statutory law (1989 through present). Also, please estimate how many additional persons were able to be served through these recaptured funds for each year.

Please break this down on a yearly basis and please do not include cost containment savings for other WIC food items such as cereals.

Answer. Infant formula rebates received reduce the cost of infant formula, thereby allowing the program to serve additional participants per month within its annual appropriation. Provided for the record is a break down of the infant formula rebates

PART 1

the WIC Program has received since fiscal year 1988 and the additional participation the program was able to serve. The amounts reflect rebates for all WIC foods earning rebate dollars as infant formula rebates are not tracked separately. However, the vast majority of rebate savings are associated with contracts for infant formula.

[The information follows:]

Fiscal year	Rebates	Estimated participation increase due to rebates
1987	(¹)
1988	\$32,000,000	61,658
1989	293,000,000	548,945
1990	510,000,000	876,800
1991	656,000,000	1,087,715
1992	755,000,000	1,223,970
1993	880,000,000	1,407,139
1994	997,000,000	1,553,474
1995	1,051,000,000	1,620,981
1996	² 1,180,000,000	1,792,012

¹ Not available.

² Rebates reported by State agencies as of 2/24/97.

FOOD STAMP EBT SYSTEMS

Question. For years I have supported the elimination of the use of paper food stamp coupons in favor of electronic benefits transfer systems. I know USDA is making progress in this area. However, I think more effort needs to be made or more incentives need to be offered to states to get them to use EBT.

What concrete steps will USDA take to more greatly promote the use of EBT instead of food stamp coupons?

Answer. FCS does not believe that a greater promotional effort for use of EBT is needed at this time as most States are already well positioned to have systems in place by the end of fiscal year 1999—the Vice President’s goal for EBT implementation. However, the Agency will continue to provide technical assistance to these States, as well as the remaining States, to assist in the meeting of the 1999 goal. The Agency will approach the committee at a later time if any unforeseen difficulties are encountered in realizing this goal.

Question. While I voted against the welfare reform cuts in nutrition programs, I want to make certain that they are implemented properly by the states.

Do you need additional research funds to make certain that states implement these changes correctly and properly? If your answer is affirmative, please indicate what amount of funding would permit you to determine and monitor whether the state agencies are in compliance with the new rules?

Answer. Yes, additional research funds are needed to help States put programs in place that not only comply with the new rules but which also most effectively promote personal responsibility, reward work, and improve nutrition and health.

FCS plans to use some of the funds appropriated for 1997 to begin to address the policy information needs raised by welfare reform, but much more could be done. Continued funding at the fiscal year 1997 level will limit the Agency’s ability to provide solid, policy-relevant information to the States and to Congress. The research funding requested in the President’s budget will enable FCS to address a broader range of policy information needs.

For example, with the requested funds, FCS would be able to help States identify effective and efficient ways to design and run programs using the new flexibility provided by welfare reform. FCS would like to know what works best in moving clients to self-sufficiency, which State work programs are most effective in moving the able-bodied into work, how States can take advantage of new options to increase child support payments, encourage personal responsibility, and reward work. There is also a need to understand how these changes affect the nutrition status of people the programs are intended to serve.

In addition, with the requested funding, FCS would be able to respond more fully to the Congressional mandate to study the effects of welfare reform on the Child and Adult Care Food Program. Without these funds, FCS will not be able to address many critical questions posed in the legislation. Moreover, FCS will not be able to

PART 1

367

address key questions about the availability of care in targeted areas and the importance of this program in supporting the transition from welfare to work.

FOOD PROGRAM ADMINISTRATION MISSIONS

Question. You made some very strong arguments for additional staff to administer the nutrition programs and carry out your many missions. I am very concerned about the cuts which were made in your staff while your responsibilities greatly increased.

You are responsible for over 70 percent of the USDA budget expenditures yet you represent a very small fraction of the total USDA staff.

I am worried that this will interfere with your ability to prevent or investigate fraud, to carefully monitor State and store compliance with the rules, to properly implement program changes, and to carry out other functions.

Please advise us about any potential needs you have for increased appropriations for staff.

Answer. FCS needs to maintain its current staffing level. Our fiscal year 1998 budget request only asks for a minimal increase to fund half of the mandatory pay increases to support existing staff. In recent years, the President has requested more staff and funding than the Agency received in the appropriations, and this reduction in resources has put the Food Assistance Programs at increased risk.

Staffing levels have diminished from 2,762 in 1980 to 1,750 today. During the same time, demands on FCS staff have dramatically increased. FCS certainly understands how important downsizing is to the Federal government, especially to balance the budget, and the Agency is committed to the National Performance Review and the Vice President's goals of reducing the Federal workforce. To that end, FCS has been diligent in implementing efficiencies, such as eliminating unnecessary operations and overlap, capitalizing on information technology, encouraging teamwork, and paring back services to employees to the minimum necessary.

Despite all this, the cuts to FCS have been significant. The Agency reached its fiscal year 1999 streamlining target 3 years ago. Since fiscal year 1995, FCS has had to reduce its staff by 60 to 80 staff years every fiscal year due to funding reductions in the Food Program Administration (FPA) account. This has had an impact on FCS in two key areas.

First, reductions are affecting the Agency's ability to properly monitor and oversee the Food Assistance Programs and provide technical assistance to State agencies. Due to funding reductions, FCS has curtailed efforts that are crucial to monitoring sites and maintaining Federal presence in the field. Staffing reductions have placed highly labor-intensive activities such as store investigations and maintaining program integrity at risk—a reduction in the National Food Stamp error rate of just 1 percent can result in savings of over \$230 million, which is much more than paying for the staff needed to provide the proper oversight. FCS feels that the cost of funding additional staff in the FPA appropriation is millions of dollars less than the cost of increased fraud and abuse in the programs. Meanwhile, external audits from GAO and OIG have consistently cited insufficient staff to exert proper oversight of State administrative costs and debt management practices. If Congress does not maintain funding for the current staffing levels, these important activities will suffer further.

Second, the reductions in staff are affecting FCS' ability to adequately respond to program changes. FCS employees are forced to react as crises arise, rather than look ahead and plan for the future. The Agency is too busy attempting to remedy predicaments as they occur and has little or no time to foresee potential problems and address them early on to head off a crisis. Implementing new legislation, such as Welfare Reform and the Healthy Meals for Healthy Americans Act, impose significant, new, and ongoing administrative burdens on FCS. These new laws effect comprehensive program changes and are extremely important to the Food Assistance Programs. The CFO Act, the Government Performance and Results Act (GPRA), and Nationwide implementation of EBT are other examples of program changes to which the Agency is required to devote resources.

FCS asks that you at least maintain our current staff level. Mandatory pay raises increase the cost of each staff year every fiscal year, so maintaining current staff levels requires small increases in the FPA appropriation. If FCS must absorb the cost of increased salaries, the only option is to further reduce staff. Eighty-five percent of the FPA appropriation is for salaries alone, leaving us little flexibility in absorbing new costs. The remaining 15 percent is used for travel, training, and other expenses, such as rent, computer support, and supplies, all of which have been reduced to the minimum necessary. FCS wants to administer the programs as Con-

PART 1

368

gress has intended, meet mission goals, properly respond to new initiatives, and protect government funds from fraud and abuse.

The results of your support to the FCS staff will benefit all involved—the needy, American children, taxpayers, as well as Congress. The minimal funding it will take to support the staff will provide America with programs that truly help those less fortunate, that respond appropriately and effectively to new needs and changing legislation, and that operate efficiently with savings to the taxpayer.

SUBCOMMITTEE RECESS

Senator COCHRAN. This will conclude our hearing today. We appreciate the attendance of all witnesses.

Our next hearing will be on the budget request of the Department of Agriculture's Natural Resources Conservation Service, the programs and activities under that agency. That hearing will be at 10 a.m. on Tuesday, March 18.

At 2 p.m. on Thursday of this week, we will have a special hearing to explore alternatives to the dairy pricing system. Those hearings will be held in room SD-138 of the Dirksen Senate Office Building.

Until then, the subcommittee stands in recess.

[Whereupon, at 11:46 a.m., Tuesday, March 11, the subcommittee was recessed, to reconvene at 10:11 a.m., Tuesday, March 18.]

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

TUESDAY, MARCH 18, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:11 a.m., in room SD-138, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran and Bumpers.

SIS DIVISION**

OPENING REMARKS

Senator COCHRAN. The subcommittee on appropriations for the Department of Agriculture and related agencies will come to order.

This morning we continue our hearings, reviewing the President's budget request for the Department of Agriculture and other agencies that come under the jurisdiction of this subcommittee.

This morning we are happy to have representatives of the Natural Resources Conservation Service [NRCS]. James Lyons, the Under Secretary for Natural Resources and Environment is here, along with Paul Johnson, Chief of the Natural Resources Conservation Service and others.

PART 1

370

We welcome you, and we thank you for your cooperation with our committee, and for the statements that you have submitted, along with other materials from the President's budget that are helpful to us.

And, Mr. Lyons, we ask you to proceed after I first yield to my colleague, the distinguished Senator from Arkansas, who is ranking member of this subcommittee for any comments that he would have to make.

Senator Bumpers.

Senator BUMPERS. Thank you, Mr. Chairman. In the interest of expediting this, I will forgo an opening statement.

Senator COCHRAN. Mr. Lyons, you may proceed.

OPENING REMARKS BY UNDER SECRETARY LYONS

Mr. LYONS. Well, thank you very much, Mr. Chairman and Senator Bumpers, it is a pleasure to be here this morning.

I am joined today by, of course, Paul Johnson, Chief of the Natural Resources Conservation Service, Dennis Kaplan, and his staff. And also with me, I want to mention Larry Clark, Deputy Chief of Programs; Bob Reaves, from the NRCS budget shop; and Tom Weber, the Deputy Chief of Management who works with me on conservation issues.

Mr. Chairman, NRCS, of course, is an agency that has a long and, I think, successful history of helping farmers, ranchers, and local communities change the face of this land; helping them to practice conservation and manage their operations as stewards to protect the natural resources that we all care very dearly about.

Several things have made this success possible, not the least of which has been the support of this committee, which has given cause to conservation and I think demonstrated true commitment to protecting the productivity and the stewardship of the Nation's private lands. We appreciate your leadership in that regard.

But perhaps the most important reason for the success we have realized within NRCS is really attitude, a principle that the agency's focus should be aimed high on the objective of doing what is needed to help farmers, ranchers, and communities produce as many environmental benefits as they can while meeting the Nation's, in fact, the world's needs for food and fiber.

Mr. Chairman, that is exactly what the budget we are here today to discuss is about. What resources does it take? With today's changing technologies and challenges, for NRCS to be able to work effectively and in partnership with conservation districts and our other Federal, State, and local partners, to help agriculture produce not only food and fiber, but clean water, productive and high-quality soils, ample wildlife habitat, and many of the other environmental benefits that we in this country care about.

What does it take to help American private lands fulfill their promise, as Chief Johnson has said, to make them truly a geography of hope? These are key questions we had in mind as this budget was put together, and that we encourage this committee and the Congress to remember as you work out the details of our 1998 budget.

PART 1

371

We believe that this budget, structured and constrained as it is, due to our joint commitment to balance the budget, answers many of these questions.

The budget retains its emphasis on conservation operations as the key to getting conservation on the land, asking for increases to cover some of our pay costs, and in particular to increase the level of work on private grazing lands, increase the rate at which we are converting our operations to geographic information systems, and to enhance our ability to provide watershed-based planning assistance.

It is through conservation operations that our people are able to join with the conservation districts throughout the country to work on the national resource concerns and challenges that people at the local level care about and need to see addressed.

In today's budgetary world, which demands performance-based programming, it will be through conservation operations that we anticipate seeing the greatest benefit from NRCS' locally led conservation initiative, which is intended to energize and focus our efforts with our local partners and allow us to report to you and the country on exactly how our partnership is doing over time.

It is also through conservation operations that we will do the critical work of implementing the conservation compliance and swampbuster provisions of the Food Security Act.

NRCS' locally led initiative also will do something else. It will help guide and shape to the fullest extent possible every USDA conservation program activity at the State and local level.

This is our intent with the Small Watersheds Program, the new Environmental Quality Incentives Program, the Conservation Reserve Program's continuous signup for buffer and filter strips; the Wetlands Reserve Program, FIP, as well as the new Wildlife Habitat Incentives Program and the Farmland Protection Program.

All of these programs are either up and running or close to it. We are moving aggressively to prepare rules for EQIP, WHIP, and the other programs that have been authorized by the 1996 farm bill.

We are excited about the opportunity to work in partnership with the conservation districts and other local conservation leaders to put these programs to use.

Mr. Chairman, I think the 1996 farm bill was not only a historic farm bill, but probably the first ever conservation farm bill of its kind. Conservation clearly led the charge, and was the driving force to enactment of that legislation. Of course, you and Senator Bumpers played a critical role in that.

We see the conservation title as affording us a much broader toolkit than we have ever had before, to do the kind of work that we need to do across the landscape, to help farmers and ranchers and others in the community meet their needs and protect the resources they care dearly about.

Conservation operations is the key to ensuring that we have the people on the ground, the resources available to put that toolkit to use and to work closely with landowners and others to meet their overall conservation goals.

PART 1

372

Another prime example of a program that makes effective local action possible is the Resource Conservation and Development Program, or the RC&D Program.

Federal contribution to the RC&D Program is small, simply the salaries of local coordinators. But this investment gets this country much in return in the form of local initiative and a commitment of funds to develop and enhance economic activities.

This budget asks for an increase for RC&D of \$18 million, designed to help this program make a much greater contribution in watersheds needing assistance for work such as salmon head habitat recovery work in the Pacific Northwest. We stand ready to work with you on this proposal and to shape it to meet our overall needs and objectives.

One of the things that is so amazing and exciting about all of this is the fact that USDA and NRCS can even conceive of helping to make locally led conservation happen at the State and local level.

Agriculture has created a State and local delivery system that is the envy of all the other Federal agencies and a model for the world. When it comes time to get real work done on the ground on private lands, whether it is in times of emergency and crisis such as the floods we are seeing now, or in the times of normal need, it is this delivery system that people turn to.

This is truly a national asset of tremendous value, Mr. Chairman. And I believe we all owe a debt of great gratitude to those that came before us in Congress and in agriculture that have made it possible.

Mr. Chairman, as I said before, in all of this we have sought to create a budget that can really help agriculture on this country's private lands, realize the promise of a geography of hope.

I am sure that this is a goal that you and the members of the committee can support. We certainly look forward to working with you over these next several weeks and months as you finalize the budget and seek to make reaching this objective possible.

Thank you, Mr. Chairman, again for the opportunity to appear before you today, and we will certainly do our best to answer any questions you may have.

PREPARED STATEMENT

Senator COCHRAN. Thank you, Mr. Secretary. We have your complete statement, and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF JAMES R. LYONS

Mr. Chairman, Members of the Committee. It is my pleasure to outline for you the fiscal year 1998 budget request for the Department of Agriculture's Natural Resources Conservation Service (NRCS).

In the past month, Secretary of Agriculture Dan Glickman conveyed to each of you and all other members of Congress a copy of a new publication from NRCS. This publication, "America's Private Land, A Geography of Hope," articulates a new view of private land in America, most of which is in an agricultural use, and what we might refer to as our "working land." As the introduction of the publication suggests, people's relationship to the land has changed. Few Americans now live and work on farms and ranches. Most of us live in cities and suburbs. But what happens on our private land remains crucial to our economic and environmental well-being. We are reminded of our connection to the land every time we buy a loaf of bread,

PART 1

turn on the tap for a drink of water, or admire a flock of ducks or geese heading south in the fall.

Seventy-percent of the land in the United States, exclusive of Alaska, is held in private ownership. About half of this land—907 million acres—is cropland, pasture, and rangeland. The stewardship of these particular acres lies in the hands of fewer than 5 million individuals, which means the care of 50 percent of our land is in the hands of less than 2 percent of our citizens.

We rely on these fellow citizens and neighbors to produce the food and fiber we need, which they do exceedingly well. Our food prices remain the lowest in the industrialized world, and our agricultural industry contributes significantly to export revenues. But these farmers and ranchers, through their care of private land, produce much more than food and fiber. The products of their land also include safe drinking water, healthy soil, clean-flowing streams, valuable wildlife habitat, and scenic landscapes. We don't buy these commodities in the supermarket, and their prices are not listed on the Chicago Board of Trade, but most Americans value them just the same.

Realizing the importance of protecting private land and private landowners, our nation's policy-makers have made significant commitments over the years to conservation. Those commitments began in the 1930's in response to the devastating Dust Bowl. Today, in spite of important conservation gains over the past decade in particular, soil erosion remains a threat on 1 in 3 acres of cropland, water quality and supply problems confront many communities, and we have grown increasingly concerned about the loss of wildlife habitat and the conservation of biodiversity.

Fortunately, we have a number of new, voluntary, incentive-driven tools in the 1996 farm bill that should allow us to extend the important conservation gains of the past decade. To do so, however, will require a continued, if not renewed, commitment to private land and private landowners. We cannot afford to tell landowners that stewardship is their concern alone. Stewardship involves a shared responsibility between public and private interests alike.

The following budget request, therefore, strives for a balance in spending that will provide farmers and ranchers with sufficient financial incentives for conservation work, including targeted land retirement, while ensuring that sufficient resources are made available to USDA and NRCS for conservation operations generally and technical assistance in particular. A budget of this magnitude will allow us to continue to work cooperatively with state conservation agencies, local conservation districts, and our agency's many other public and private-sector partners in assuring an adequate measure of conservation on our Nation's working land.

The following table shows the major items in this year's budget request and contrasts them with the comparable figures from the two prior fiscal years.

[In thousands of dollars]

Appropriation	Fiscal year—		
	1996	1997	1998
Conservation operations	629,794	619,961	722,268
Wetlands Reserve Program	77,000
Watershed and flood prevention operations	180,514	164,036	40,000
Resource conservation and development	29,000	29,377	47,700
Watershed survey and planning	14,000	12,381
Colorado River Basin Salinity Control Program	2,681
Forestry Incentives Program	6,625	6,325	6,325
Outreach for socially disadvantaged farmers	N/A	¹ 5,500	5,000

¹ Includes \$4.5 million allotment from the Fund for Rural America.

Now, let me describe how NRCS differs from other federal agencies and summarize for you the agency's role. I will also outline the major programs NRCS administers and describes not only some of the things we have achieved with the help of our partners at state and local levels, but also some of what have planned.

STRATEGIC ASSETS OF THE NATURAL RESOURCES CONSERVATION SERVICE

NRCS provides natural resources conservation assistance primarily on private lands. More than 70 percent of the land in the contiguous United States is privately owned, including virtually all of the Nation's agricultural lands. It is on the private lands where millions of individual decisions are made by farmers and ranchers, that the ultimate success of the majority of our natural resource efforts will succeed or

PART 1

fail in helping meet the twin goals of productive agriculture and an economically and environmentally sustainable future.

NRCS is the only Federal agency whose major purpose is to provide consistent technical assistance to private landusers across the country. The agency's focus is on helping landowners and users achieve natural resource and environmental goals while maintaining productive and profitable operations and economically viable rural communities. NRCS has had some significant successes in the past, and the structure is designed to continue that success in the future. Let me describe some of the agency's assets in light of the implementation of the USDA Reorganization Act of 1994, including the Department's Field Office Streamlining efforts.

—*Delivery system.* NRCS has a nationwide network of professionally staffed local offices that provide conservation technical assistance to owners and users of privately-owned land. This nationwide delivery system is based on a partnership that combines a federal natural resource presence at the local level with locally sponsored and controlled conservation districts and their employees. This conservation infrastructure is interwoven and interconnected at the local, State, and Federal levels with complex relationships and program support systems that are interdependent. Local service will be continued, but with the reorganization and consolidation of field offices, this operation will be more efficient and enable our field staff to provide the kind of site-specific technical assistance individual private landowners need and want.

—*Technical skills.* NRCS' natural resource specialists are trained to deliver technological support to groups and individuals quickly, efficiently, and consistently nationwide. By regionalizing NRCS, our technical staff will be able to apply their knowledge of soil science, engineering, landscape architecture, agronomy, biology, range management, economics, geology, and other fields with a much greater degree of sensitivity to local conditions. NRCS field offices and staff working in partnership with the local conservation districts are used as a primary source of help by local people—and often by people administering programs for other Federal, State, and local agencies. About 9,000 staff are located at these offices.

—*Technical excellence.* Throughout government and private industry, NRCS specifications for soil and water conservation practices are the national standard. In addition, the agency is the leader in soil classification and soil mapping. Recently, in recognition of the vital importance of soil quality, NRCS has made a commitment to better understand and emphasize the fundamental role of soil quality.

—*Natural resource planning experience.* NRCS has vast experience in broad-scale planning in watersheds and other areas and site-specific planning on farms and ranches to address natural resource concerns. Effective natural resource planning in the future will require this type of planning process to develop effective solutions that meet the needs for a sustainable land and its people. NRCS is now serving as a catalyst by providing coordination to bring local people together with skilled technical people to develop and implement meaningful solutions. These planning efforts are provided through the Watershed Survey and Planning Program, the Resource Conservation and Development (RC&D) Program, and Coordinated Resource planning provided through Conservation Operations.

—*Partnerships and volunteerism.* Since its creation, NRCS has operated through voluntary cooperative arrangements with individuals, the private sector, and Federal, State, and local governments. The value of NRCS technical assistance is recognized by local and State partners; equally, we recognize the invaluable contribution of volunteers, who contribute immeasurably to conservation efforts. Americans from all walks of life have freely and generously given of their time to the volunteer arm of NRCS, known as the Earth Team. In fact, in fiscal year 1996, some 14,748 NRCS Earth Team volunteers donated 530,854 hours to conservation efforts. As calculated by the Points of Light Foundation, this equates to an additional \$6,400,000 in direct assistance to private landowners and national resource protection.

—*Local people as decision-makers.* When NRCS delivers conservation and program assistance, the agency works under cooperative agreements with some 3,000 conservation districts that are established under state law. About 17,000 local conservation district supervisors provide the agency with invaluable guidance. The NRCS cooperative team structure is an established and practical example of how Federal programs can be managed with local guidance at the local level. It is crucial to remember that the agency's approach is a voluntary one. Our professionals provide options for problem-solving—developed in conjunction with customers, but it is the customers who make the final decisions.

PART 1

375

—*Leverage.* State and local governments contribute substantially, with both people and dollars complementing NRCS technical assistance. In fiscal year 1997, State and local governments spent over \$500 million on conservation—a considerable increase from the \$247 million spent a decade ago. Without NRCS technical assistance, which greatly enhances the value of State and local efforts, these funds almost certainly would not have been spent on natural resource protection. In a sense, this cooperation constitutes a two-way leveraging: State and local programs and NRCS benefit from each other's involvement.

USDA REORGANIZATION

A major goal of this Administration has been to “reinvent government” so it works better and costs less, cutting waste and reducing bureaucracy. The National Performance Review (NPR) process, challenging all areas of the Federal Government to do a comprehensive bottom-up review of operations, resulted in innovative and creative ideas on how we ourselves could make necessary and appropriate improvements in the way our agencies do business. Taking these good ideas and incorporating additional improvements, Congress authorized USDA reorganization in the “Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994”. With this action, NRCS was given the green light to develop an implementation plan for these exciting new ideas.

In December of 1994, after extensive public input, NRCS unveiled its far reaching reinvention plan which is targeted for full implementation by 1999. In addition to the field office closings and consolidations previously announced by former Secretary Espy, the plan called for major restructuring above the field office level. The proportion of NRCS staff at the field office level will increase from the current 70 percent to 80 percent; operational functions are being delegated to the lowest level possible; headquarters operations are being reduced by over 50 percent; science and technology will be focused on areas important to our mission through the establishment of more than six NRCS Institutes which will improve our capabilities in areas such as grazing lands, natural resource inventory, wetland science, social science, watershed science, and soil quality; the ability of NRCS to address multi-state natural resource and program delivery issues is being improved through the establishment of regional offices; technical support functions are remaining strong and becoming better focused by being moved closer to where programs are carried out; and administrative and other support activities are being thoroughly reviewed for continued improvement in efficiency and better focused to support a modernized agency.

By October 1, 1995, all areas of the NRCS reorganization plan were in full implementation. This included all agency personnel knowing their new role, Regional Conservationists in place and operational, technical functions reassigned closer to the field, and the transfer of programs such as the Wetlands Reserve Program and Forestry Incentives Program completed, as provided in the 1994 Act. Further, NRCS field office streamlining efforts were fully under way with the Department, as we begin the multi-year process of moving from the historical field offices to field service centers.

This has not been an easy process, especially from the standpoint of the agency's most important resource—our employees. I am pleased we have been able to use the tools necessary, including authorities from Congress, to meet our goals without overly impacting our employees and their careers. I am indeed proud of how NRCS employees have embraced this change and have committed to seeing this reorganization completed—successfully. However, any change this massive cannot be without its bumps and mistakes.

We have learned a lot from the reorganization process as well, and have made further needed adjustments as identified. On January 30, 1997, further adjustments of the NRCS National Headquarters structure were approved by the Department. The changes are the result of recommendations and appraisals made one year after the agency-wide reorganization and from recommendations of our strategic planning and reports. Our new headquarters structure includes an increased emphasis on strategic planning and soil and natural resource assessment. Reflected in this, are a new Deputy Chief for Soil Survey and Resource Assessment and several realigned Divisions. We are encouraged by the results of the agency-wide reorganization and are equally optimistic that our present adjustments will render the agency better equipped than ever to tackle the mission ahead.

Now I will describe our programs and plans for fiscal year 1998.

PROGRAM EFFECTS AND THE FISCAL YEAR 1998 BUDGET REQUEST

Many programs provided by NRCS are a catalyst for local investment and as a result, enhance local economic activities. Other programs provide services that are

PART 1

376

voluntary in nature, and not available or provided by other government or private entities. These programs and activities are an essential component of the conservation fabric of the Nation. I will briefly highlight several for you.

Conservation operations is the foundation for most of the agency's activities. These activities are carried out through the conservation infrastructure, a complex array of local, State, and Federal agencies and organizations and local people working together for natural resource protection. The relationships are complex and NRCS is an integral part of these local, State, and Federal interdependent program support systems. Many grassroots programs and initiatives are funded by conservation operations. Several are described below.

Conservation Technical Assistance is the cornerstone for most agency activities. The fiscal year 1996 appropriations were \$538,904,000; and the fiscal year 1997 comparable appropriations are \$528,892,000, and the fiscal year 1998 budget request is \$549,241,000. As stated previously, this difference over fiscal year 1997 is due in large part to uncontrollable costs from inflation and pay costs, and costs to relocate NRCS operations to the USDA Service Centers, and the increased program responsibilities associated with implementation of the conservation programs of the Federal Agricultural Reform and Improvement Act of 1996 (1996 Act). During 1998, the Natural Resources Conservation Service will continue to provide technical assistance on prior year projects as needed for the Colorado River Basin salinity Control Program and ongoing activities of the Great Plains Conservation Program.

Conservation technical assistance provides assistance to private land users, communities, units of State and local government, and other Federal agencies for planning and implementing solutions to natural resource problems. This technical assistance is the cornerstone for locally-led conservation efforts that are conducted in partnership with state, local, and tribal governments, including conservation districts; private groups of farmers and ranchers; and environmental groups. In the past decade, major strides have been made in reducing erosion; improving soil and water quantity and quality, air quality, pasture and range conditions; improving and conserving wetlands and woodlands; enhancing fish and wildlife habitat; and reducing upstream flooding. This assistance is based on voluntary local landowner cooperation and recognizes the value of educational, technical, and financial assistance. These principles apply as we are responding to individual needs, local goals, and to nationally determined priorities. Still, more remains to be done. Also, because neither agriculture nor the environment is static, and both are constantly changing, the agencies and programs need also to be constantly evolving.

During fiscal year 1996, NRCS assisted approximately 814,000 private landowners in preparing conservation plans and implementing conservation systems, as well as providing assistance to units of government in developing area wide conservation plans and goals. This resulted in conservation treatment on over 100 million acres of land, including cropland, rangeland, pastureland, woodland, and other land.

Urban Conservation is an additional area for which we are particularly proud. It is an area for which I have taken particular interest and believe that we are making significant gains. While, much of my remarks have focused upon rural land to this point, it is the mission of NRCS to provide assistance to all of our nation's private land including urban, and suburban communities. Four years ago, the Department of Agriculture initiated an Urban Resources Partnership (URP). This is an effort which NRCS is co-leading to provide conservation assistance to the communities that need it most—urban and urbanizing areas. We are proud to report that over 4,000 non-profit and community-based organizations receive financial support and technical educational assistance from URP. Communities are responding with enthusiasm and have matched federal financial assistance with over fifty percent matches. We have eight major metropolitan cities under the program including New York City, Chicago, and Los Angeles. In these pilot cities, NRCS field staff provide assistance in a diverse range of projects from community gardening and forestry, to education of youth about soil science and the urban watersheds in their community.

But our work in this area only begins here. NRCS employees support numerous urban pilot cities and provide agency expertise on urban resource concerns. As many of you know, the nation's most productive farmland is located in our near urbanizing areas. NRCS staff address issues of "farming on the fringe" and help mitigate some of the difficult concerns that arise when agrarian and community interests are at odds. Through the Land Evaluation and Site Assessment system, NRCS staff provide advice to local government officials on land-use and zoning decisions. In addition, we provide planning support to landowners to remediate air and water quality concerns of their neighboring community. These services are all provided as part of the conservation technical assistance available to everyone.

PART 1

377

Highly Erodible Land Conservation (HELC). Since 1985, the Agency has devoted a significant portion of its technical assistance resources to helping farmers and ranchers meet the highly erodible land conservation provisions. With NRCS technical assistance, more than 1.7 million plans have been prepared covering about 142 million acres of highly erodible land, and 95 percent of those plans were implemented by the mandated deadline of December 31, 1994. Between 1985 and 1995, technical assistance was provided to an average of over a million decision-making land owners and users each year; one result is that soil erosion has been reduced by over a billion tons annually. By the end of fiscal year 1995, all the highly erodible plans were installed. The 1996 Act provided amendments that have reduced the burden of complying with the HELC provisions and have provided USDA with additional tools to use in working with producers. However, all producers who receive USDA program benefits must be fully applying a conservation plan on highly erodible land. Therefore NRCS assists producers in developing plans for land that they acquire and in making changes in their current plans so that their plan may reflect changes in cropping systems, weather conditions, and economic incentives. Our experience has shown that approximately 20 percent of producers will change their conservation systems each year. This figure may be slightly higher in the next few years as producers begin to respond to market signals as a result of the Agricultural Market Transition Act Program (AMTA). The 1997 enrollment in AMTA generated requests to NRCS for 137,234 highly erodible land determination on fields, 79,225 new conservation plans, and revisions on 146,239 conservation plans.

Preliminary 1996 Status Review data show that approximately 48 percent of farmers have conservation systems that are at sustainable levels of soil loss or levels that allow soil to be created at a faster rate than it is lost. With the amendments provided by the 1996 Act, NRCS will be ensuring that new conservation systems provided to farmers and ranchers result in a substantial reduction in soil erosion.

Wetland determinations and certifications. On January 6, 1994, four Federal agencies with wetland protection responsibilities signed an historic Memorandum of Agreement recognizing NRCS as the lead Federal agency for wetland determinations on agricultural lands. Farmers now turn to NRCS for determinations that identify the extent of wetlands under both the swampbuster provisions of the Food Security Act of 1985 and Section 404 of the Clean Water Act. This new responsibility brought increased commitment of staff resources to provide prompt, accurate, and effective service to our Nation's agricultural land owners and users.

Both the 1990 and 1996 Farm Bills called for the Secretary to "certify whether a map is sufficient for the purpose of making a determination of ineligibility for program benefits." This was interpreted to mean the review and certification of previously made wetland determinations. In 1991, the certification process was put on hold because of dialogue surrounding which version of the Corps of Engineers delineation manual was appropriate. Because of this debate, Congress commissioned the National Academy of Sciences to do a study and determine the appropriate definition of a wetland. In 1994, the National Academy of Sciences completed its work and affirmed the 1987 version best identified wetlands.

However, in April of 1995, the Secretary decided it was necessary to suspend all wetland determinations unless specifically requested by the client, or when a potential violation occurs. This decision resulted from the prospect of legislative changes in the Food Security Act of 1985 (1985 Act). The legislative changes to the 1985 Act generally reduced the cumbersome elements of compliance, while protecting wetland functions and values. The Food Security Act also provided that certified wetland delineation's will remain in effect until such time as the landscape is changed by natural events. All current determinations are frozen and the process of providing wholesale wetland resource information to customers is on hold, unless a determination is specifically requested. Landowners have continued to request a number of certified wetland determinations and these requests are expected to increase as these issues continue to play themselves out in Congress. The enrollment in Agriculture Market Transition Act (AMTA) generated requests to NRCS for approximately 25,417 wetland determinations.

The 1996 Act also required the Secretary to permit persons to secure technical assistance from approved sources, in addition to those services available through the NRCS. Other sources were not previously restricted; however, language in the 1996 Act now implies that a certification for measurement of crop residues and an approval process for conservation planning and implementation process are required. State Conservationists, in consultation with the State Technical Committee, are establishing methodologies for third parties to use to measure crop residue. NRCS and others will hold training sessions for interested persons in accordance with guidance. Upon completion of training, and after all requirements are met, third parties

PART 1

will be deemed “certified.” Producers may participate in training, but training is not required.

Certification or approval status only reflects that person(s) or groups have presented written assurances that they possess technical qualifications. Neither NRCS nor USDA will warrant or guarantee the quality of work done by third party providers of technical assistance. NRCS is, also, working with certification registries and associations to ensure that certification programs for approval of commercial sources of services reflect skill levels necessary to meet technical assistance needed.

Grazing Land Conservation Initiative (GLCI). This grassroots-driven initiative has helped NRCS better define the resource needs and benefits generated when grazing lands are improved. NRCS has been requested by this group to continue technical assistance to livestock producers on private grazing lands. Grazing lands include rangelands, pasture, hayland, and grazed forestlands. The latest 1992 National Resources Inventory (NRI), shows that grazing lands—mostly rangeland and pasture—represent 642 million acres, or almost half of the non-Federal lands in the United States.

The NRI analysis of range vegetation shows that over 15 percent of non-Federal rangelands are in poor condition; over 44 percent are in fair condition; 34 percent in good condition; and only 6 percent in excellent condition. The NRI indicates that 75 percent—nearly 299 million acres—of non-Federal rangelands need conservation treatment. Properly managed grazing land represents a renewable resource for producing food and fiber. Vegetative cover on well-managed grazing lands contributes to: 1) increased water quality and quantity; 2) improved wildlife habitat; 3) reduced soil erosion and sedimentation; and 4) improved riparian areas. Conservation Operations will continue to support technical assistance for these unmet conservation needs and will provide additional assistance within current funding levels as the field level workload permits. In fiscal year 1997, NRCS was able to provide enough resources to this initiative to ensure each of the 50 states has access to a Grazing Land Conservation Coordinator. This will enable us to provide multi-resource technical assistance to support grazing lands conservation and water quality improvement on rangelands and begin the process of rebuilding the agency’s expertise in rangeland conservation, a capability demanded by our customers.

Service Center Implementation, a customer-oriented initiative within USDA, will continue in 1997 within currently budgeted funding levels. It will improve delivery of services in USDA field-delivery programs through improved business process re-engineering (BPR) and information systems integration. Service Center Implementation will coordinate planning, acquisition, development, implementation, and management of information technology resources. Service Center Implementation will benefit the agency and customer partnerships by: 1) providing one-stop shopping to multi-agency programs; 2) significantly reducing paperwork required of customers and employees; 3) facilitating data sharing; and 4) reducing repetitive requests for information.

One of the areas where BPR has resulted in significant positive change in a core NRCS business process is in the design, construction, and implementation of the agency’s Field Office Computing System (FOCS). This system, developed by re-engineering the natural resource conservation planning model, steps away from the single resource plan used for Food Security Act compliance with its intensive record keeping requirements, and enables a much more holistic, natural resources oriented planning process for protecting and enhancing soil, water, air, plants, and animal resources while preserving agricultural profitability for farmers and ranchers. Literally hundreds of employees, customers, and partners were involved in this five year effort that is now coming to fruition. FOCS and the core conservation planning process it automates will be merged into the concept of the USDA Field Service Center within the Service Center Implementation interagency business and information strategic plan.

New technology. Most of the natural resource information used by NRCS is referenced to a geographic location on the ground, and there is a need to put this data in digital form for more accessible use in a geographic information system (GIS) available at state and field offices. This budget proposed an increase of \$10 million to accelerate the purchase of digital orthophotography and data digitization. This will improve customer service by providing more usable and accurate information for use in natural resource planning and decision-making, and for environmental assessments and evaluations. It will also reduce duplicative work done with the same customers in the USDA Service Center. Currently, about 200 NRCS field offices are using GIS. We are embarking on an important review of the information NRCS collects to assure that it meets the real resource information needs of farmers and ranchers. As part of this effort, we also are working on improving interagency cooperation, and the ways in which we share and display natural resource, economic,

PART 1

379

and other data so they conform to the national GIS database standards. Increasing the availability of such data is necessary for USDA reorganization and reinvention at the field level.

Under the 1977 Resources Conservation Act (RCA), USDA, through NRCS, with the assistance of nine other Federal agencies, conducts and analyzes ongoing comprehensive inventories and assessments of the status, condition, and trends of America's natural resources on all non-Federal lands. This information is used by USDA, other Federal agencies, State and local governments, and other organizations to support agriculture and conservation policy development and program evaluation. NRCS is working to assure the RCA Appraisal addresses the distinct characteristics of the regions of the country. The agency also will be developing, in the next 18 to 24 months, the third National Conservation Program, also called for under the RCA.

USDA Centers of Excellence initiative. USDA will continue to work in partnership with the 1890 Land Grant Institutions and Tuskegee University, to develop low cost conservation systems to improve water quality and reduce erosion. USDA is establishing Centers of Excellence at the 1890 schools. NRCS and the 1890 Institutions have a history of cooperative ventures that have provided knowledge and skills necessary to strengthen and broaden the application of technologies to the limited resource and socially disadvantaged farmers they serve. It is economical and efficient to support the Centers of Excellence with the universities than developing that capacity within USDA. The focus of the proposal is to develop and evaluate sustainable ecosystems that would improve and protect water quality and quantity. NRCS will continue the current level of support for this initiative.

Assistance to American Indians, Native Alaskans and Pacific Islanders. Many of the more than 310 reservations covering more than 50 million acres in the 48 contiguous states, four areas of trust land, 12 Alaska Native Regional Corporations and 217 Alaska Native Villages have been requesting technical assistance. We estimate receiving 150 requests to establish tribal land field offices each year. Staff in those offices provide basic technical assistance for resource problem identification and conservation planning and application. NRCS plans to provide technical assistance and capacity-building assistance needed on a full-time basis on Indian lands that have significant natural resource problems, within the current funding level as workload in the field permits. This assistance will begin the process of developing local capacity in natural resources management by establishing an internship/self reliance program similar to the one in operation at the Wind River Reservation in Wyoming. Tribal employees will be trained through on-the-job and educational experiences as a conservation work force on Indian lands. No additional funds are requested for this activity for fiscal year 1998, but additional assistance will be provided to this high priority activity to the extent possible within requested funding levels.

Snow survey and water supply forecasts provide western states and Alaska with vital information on summer water supplies. The fiscal year 1996 appropriations were \$5,852,000; the fiscal year 1997 appropriations are \$5,835,000; and the fiscal year 1998 budget request is \$5,888,000. NRCS field staffs provide necessary leadership, standardization of procedures, and automation to a partnership of Federal, State, and local personnel to collect snow-pack data from more than 1,200 remote high mountain sites. Data are collected with many partners, including Conservation Districts, Bureau of Indian Affairs, Bureau of Land Management, Forest Service, the National Weather Service, Army Corps of Engineers, Bonneville Power Administration, and many State and local entities both public and private. After compiling and analyzing the data, NRCS is able to provide snowpack estimates and water yield on a monthly basis throughout the snow melting period. The knowledge gained through this effort supports critical decisions on billions of dollars of agricultural production, municipal water supply, hydroelectric and industrial water supply, flood control, and water flow requirements for fish and wildlife. This modest program contributes substantially to the economic and environmental well-being of a very large part of the country.

Soil Surveys provide the public with local information on the uses and capabilities of their soil resources. The fiscal year 1996 appropriations were \$76,163,000; the fiscal year 1997 appropriations are \$76,409,000; and the fiscal year 1998 budget request is \$82,248,000. Soil surveys are based on scientific analysis and classification of soils and are used to determine land capabilities and conservation treatment needs. The published soil survey for a county or designated area includes maps and interpretations with explanatory information that is the foundation of resource policy, planning and decision-making for Federal, State, county, and local community programs. Homeowners and landowners also use soil survey information when making decisions. Soil surveys are conducted cooperatively with other Federal agencies,

land grant universities, State agencies, and local units of government, many of whom contribute funds and staff.

Soils information has been gathered over many years and is primarily contained in published soil survey manuscripts and maps. There is a need for digital soils data for use in geographic information systems (GIS). NRCS has the leadership role for coordinating the development, maintenance, and distribution of a modernized digital soils data base. Geographically referenced digitized soil survey data, along with orthophotography will provide the accurate reference base needed for computer-assisted conservation, natural resource planning, and for geographic referenced data sharing. In addition, digitizing the soil surveys provides efficiency when updating and maintaining the soil survey data. This budget contains \$5 million to support the updating of older soils information to current standards for digitization of soil surveys and the formation of a national database.

Plant Material Centers assemble and test plant propagation and the usefulness of plant species for biomass production, carbon sequestration, erosion reduction, wetland restoration, water quality improvement, stream bank and riparian area protection, coastal dune stabilization, and to meet other special conservation treatment needs. The fiscal year 1996 appropriations were \$8,875,000; the fiscal year 1997 appropriations are \$8,825,000; and the fiscal year 1998 budget request is \$8,891,000. Plant materials represent inexpensive, long-term conservation solutions to many environmental and natural resource problems and their maintenance costs are usually low. Many landowners and managers willingly use plant materials, if available, to meet their conservation needs.

The work at the 26 centers is carried out cooperatively with State and other Federal agencies, commercial businesses, and seed and nursery associations. Plant Materials Centers play an important research and development roles since most commercial nurseries will not develop new plant materials due to limited markets, but will grow and market the stock once a dependable plant has been developed. After species are proven, they are released to the private sector for commercial production.

Watershed and Flood Prevention Operations is the first and only national program that helps local organizations plan and install watershed-based projects on private lands. It provides site-specific technical expertise and locally based watershed planning and financial assistance for plan implementation. The Watershed Program provides a process to solve local natural resource problems and avoid excessive regulation. The fiscal year 1996 appropriations for Public Law 534 and Public Law 566 were \$180,514,000; the fiscal year 1997 appropriations are \$164,036,000; and the fiscal year 1998 budget request is \$40,000,000 plus \$60,000,000 in Conservation Operation for technical assistance. Therefore, the total funding this budget requests is \$100,000,000. The authorized purposes of watershed projects include watershed protection, flood prevention, water quality improvements, soil erosion reduction, rural, municipal and industrial water supply, irrigation water management, sedimentation control, fish and wildlife habitat enhancement, wetland creation and restoration, and public recreation. The program empowers local people as decision-makers, builds partnerships and requires local and State funding contributions and ownership.

The program has been subject to what we view as legitimate criticisms in recent years. However, we do not agree with those who would attempt to end the program. While I agree fundamentally with those who have criticized the historical use of large dams, reservoirs, and channelization to achieve flood management as destructive to many natural processes and functions in treated watersheds, I do not believe the program as currently administered should be scrapped. Judicious use of physical works to protect and manage watersheds can be constructive—both to natural systems and for protecting farm land from serious harm. For instance, the 1994 Galloway report on floodplain management shows that during the 1993 Midwest Flood, the Small Watershed Program was credited with avoiding \$400 million of damages to population centers, agriculture, and industry. USDA farm program disaster payments were significantly less in watersheds that had been treated with conservation measures through this program. This was also the case with Tropical Storm Alberto in parts of Florida, Alabama, and Georgia. Any project approved by the program for flood prevention will yield very high benefit/cost results.

The agency administers this program by authorizing local sponsoring organizations to begin the development of a plan. In fiscal year 1994 through fiscal year 1996, of the planning starts authorized, most were requested primarily to improve water quality from agricultural sources and to benefit fish and wildlife habitat. The remainder identified water quality as secondary purposes. Proposed project actions include agricultural waste management, nutrient and pesticide management, and other land treatment measures. An example is in Alaska where the first watershed

PART 1

381

project authorized under this program is improving water quality to protect critical salmon spawning habitat. This project is important because it protects salmon as a subsistence food source for Alaskan Natives and for the fishing industry on the coast.

Early in fiscal year 1995, the agency completed a Phase I review of authorized projects. With the agreement of everyone involved, including project sponsors, more than 500 dams and 1,800 miles of stream channel modifications were deleted and many other projects had previously planned measures replaced with more up to date and environmentally sound measures for watershed restoration. We are currently completing Phase II of this review during which the remaining projects are being given a more rigorous review, using the team approach, at the local level. This second phase review has, to date, deleted an additional 135 dams and 930 miles of stream channel. This brings the total to 635 dams and 2,730 miles of stream channel modification removed from current watershed plans, while maintaining the overall goals of those plans. It is important to note as well, that the process has identified and appropriately closed out 76 projects with additional projects being review for closing with the local sponsors.

The agency has undertaken a comprehensive effort to reevaluate the program and is in the process of refocusing it to approach watersheds in a more comprehensive, ecosystem-based fashion, involving all local people with a stake in the outcome, in the broad range of land use and conservation issues. Priority will be given to watersheds where local people have identified the need for natural resource restoration, water quality improvement, restoration of fish and wildlife habitat, flood damage reduction emphasizing non-structural measures, and where local sponsor support is strong. Watersheds located in agricultural and rural community settings with low-income and socially disadvantaged farmers, as well as those serving Native Americans also will receive priority. NRCS will ensure that assistance to local leaders through the Small Watershed Program is supported by appropriate Federal partnerships, is compatible with national natural resource issues and complements State and local priorities. The 1998 budget proposal would provide no additional funds for flood prevention work under the authority of Public Law 534, but would continue work on the remaining high priority projects that would qualify for assistance under the authority of the Small Watershed Program (Public Law 566). Additionally, technical assistance for these program activities would be combined (along with Watershed Surveys and Planning) into a single new line item for water resources assistance requested under the Conservation Operation appropriation.

The *Emergency Watershed Protection (EWP)* program provides assistance to reduce hazards to life and property in watersheds damaged by severe natural events. An emergency is considered to exist when floods, fires, droughts, or other natural disasters result in life and property being endangered by flooding, erosion, or sediment discharge. In the latter part of 1995, October through December, \$98,800,000 was used for emergency work, with the last \$35,500,000 originating in previously appropriated supplemental funds. EWP was utilized during the Midwest Floods in 1993, western wildfires, and Tropical Storm Alberto in 1994, and floods in California and the Southeast in 1995. In fiscal year 1996, an \$80,514,000 supplemental appropriation was appropriated to repair damages to waterways and watersheds resulting from flooding in the Pacific Northwest, the Northeast blizzards and floods and other natural disasters. An additional \$63,000,000 was provided for fiscal year 1997 to repair damages from Hurricanes Hortense and Fran.

During the past eight years, the program has been needed and used in an average of 26 states per year. Technical and financial assistance under the EWP program is available for small-scale, localized disasters not necessarily declared as national in scope. Among the emergency activities, generally performed with temporarily employed local labor, are disaster cleanup and subsequent rebuilding; restoring stream corridors, wetland and riparian areas; establishing quick vegetative cover on denuded land, steep land, and eroding banks; opening dangerously restricted channels; repairing diversions and levees, and assisting the Federal Emergency Management Agency when it plans and relocates communities away from floodplains.

Resource Conservation and Development (RC&D) is a program initiated and directed at the local level by volunteers. The fiscal year 1996 appropriations were \$29,000,000; the fiscal year 1997 appropriations are \$29,377,000; and the fiscal year 1998 budget request is \$47,700,000. The increase over the fiscal year 1997 appropriations will fund pay costs and local, non-Federal watershed and rangeland coordinators to assist in watershed planning and rangeland conservation.

Each RC&D area encompasses multiple communities, various units of government, municipalities, and grassroots organizations. The RC&D's represent an unusual approach for helping citizens address multi-jurisdictional natural resource and community development issues. NRCS provides coordination to the program which

PART 1

382

serves as a catalyst for these civic oriented groups to share knowledge and resources, and it leverages public and private funds to solve common problems—including economic development—in a given area. Assistance is obtained from the private sector, corporations, foundations, and all levels of government. Historically, every dollar of NRCS technical and financial assistance from this program and applied directly to local projects, has been matched by about \$13 from other sources. In fiscal year 1996, RC&D areas completed 2,342 projects and Council members and other volunteers donated 716,184 hours of time to these completed projects. There are currently 290 authorized RC&D areas involving 2,143 counties across the country. In addition, an increase of \$18 million is requested to fund local, non-Federal watershed coordinators to assist in rangeland and watershed planning for a wide range of environmental purposes such as the salmon recovery efforts on the Pacific Northwest.

Forestry Incentives Program. This program is authorized under the Cooperative Forestry Assistance Act of 1978, as amended by section 1214 of the Food, Agriculture, Conservation and Trade Act (FACT) of 1990. The Forestry Incentives Program was re-authorized under the 1996 Act, which extended the program through the year 2002. Authorizing legislation for FIP expired on December 31, 1995.

The FIP primary objective is to increase the Nation's supply of timber products from private non-industrial forest lands. The program encourages landowners to plant trees on suitable open lands or cut-over areas, and to perform timber stand improvements for the production of timber and other related forest resources. The program is carried out through annual and long-term cost sharing agreements with private landowners who improve a stand of forest trees or plant trees.

The fiscal year 1998 budget will provide cost-share funding at the fiscal year 1997 appropriated level of \$6.325 million. Program technical assistance will be provided by the Forest Service (FS). Forestry studies have indicated that over 30 percent of all tree planting on non-industrial, private lands is accomplished through FIP.

Outreach to Socially Disadvantaged Farmers and Ranchers. The budget proposes to continue this program at \$5,000,000. There was a direct appropriation of \$1 million and a transfer of \$4.5 million from the Fund for Rural America to this program in fiscal year 1997. The overall goal of the program is to increase service to small or limited resource and minority producers in order to improve the farm income of these producers. Objectives are to make grants and enter into agreements with community-based organizations and educational institutions to provide outreach and technical assistance. The Outreach to Socially Disadvantaged Farmers and Ranchers program was transferred from the Farm Service Agency to NRCS in October 1996.

COMMODITY CREDIT CORPORATIONS PROGRAMS

NRCS also administers, on behalf of the Commodity Credit Corporation (CCC), several cost-share programs, key among these being the programs set forth in the Federal Agriculture Reform and Improvement Act of 1996 (1996 Act) and also provides technical assistance to individuals and groups participating in the Conservation Reserve Program, which is administered by the Farm Service Agency. The new conservation programs provided by the 1996 Act, which NRCS administers on behalf of CCC, includes the Environmental Quality Incentives Program (EQIP), Wildlife Habitat Incentives Program (WHIP), Farmland Protection Program (FPP), and Conservation Farm Option (CFO). The 1996 Act also amended the Food Security Act of 1985, to the continued implementation of the Wetlands Reserve Program (WRP) which NRCS administers on behalf of CCC.

The *Environmental Quality Incentives Program (EQIP)* provides in a single, voluntary program, flexible technical, financial, and educational assistance to farmers and ranchers who face serious threats to soil, water, and related natural resources on agricultural land and other land, including grazing lands, wetlands, forestland, and wildlife habitat. Assistance will be provided in a manner that maximizes environmental benefits per dollar expended, to help producers comply with Title XII of the Food Security Act of 1985, as amended, and Federal and State environmental laws.

Funds of the CCC will be used to fund the assistance provided under EQIP. The program was funded at \$130 million in fiscal year 1996, of which program authorities for the ACP were used to obligate \$99 million and the program authorities of the GPCP and CRBSCP were used to obligate \$31 million. For fiscal year 1997, \$200 million has been apportioned to implement the EQIP. Of that amount 10 percent was apportioned by the Office of Management and Budget to pay the cost of assisting producers in developing conservation plans, engineering conservation systems, and following-up to successfully apply the systems called for in the EQIP con-

PART 1

tract. Fifty percent of the funding available for the program will be targeted at practices relating to livestock production.

The program will primarily be available in priority conservation areas throughout the Nation. The priority areas will be watersheds, regions, or areas of special environmental sensitivity or having significant soil, water, or related natural resource concerns. For fiscal year 1997, 65 percent of the EQIP financial assistance funding will be provided within priority areas. The process for selecting these priority areas begins with the local conservation districts convening local work groups, which are a partnership of the conservation district, NRCS, Farm Service Agency, Farm Service Agency county committees, Cooperative Extension Service, and other state, local, and tribal entities with an interest in natural resources conservation. They develop proposals for priority areas, develop ranking criteria to be used to prioritize producer's applications for EQIP, make program policy recommendations, and other related activities. The priority areas recommended to NRCS by the local work group are submitted to the NRCS State Conservationist, who with the advice of the State Technical Committee and concurrence of Farm Services Agency, sets priorities for the program, including approval of priority areas.

State Conservationists, with the advice of the State Technical Committee and concurrence of Farm Services Agency, may also determine that program assistance is needed by producers located outside of funded priority areas that are subject to environmental requirements, or who have other natural resource priority concerns. For fiscal year 1997, 35 percent of EQIP financial assistance funding will be provided for these significant statewide concerns.

Wetlands Reserve Program (WRP) is a voluntary incentive program to assist owners of eligible lands to restore and protect wetlands and necessary adjacent upland areas. The 1996 Act re-authorized the WRP and provided for funding through the CCC beginning in fiscal year 1997, extended the duration of the program to 2002, added cost-share agreements, and restructured the contract payment terms and length.

WRP preserves, protects, and restores valuable wetlands mainly on marginal agricultural lands where historic wetlands functions and values have been either totally depleted or substantially diminished. Wetland restoration of such marginal lands provides landowners with a financial alternative to continued attempts to produce agricultural products on such high risk lands. Program delivery is designed to maximize benefits to wildlife, to provide for water quality and flood storage benefits, and to provide for general aesthetic and open space needs. Many of the WRP project sites are within areas that are frequently subjected to flooding and the flood storage being provided will lessen the severity of future flood events. The WRP is making a substantial contribution to the restoration of the nation's migratory bird habitats, especially for waterfowl.

The WRP is a mandatory program from a budget perspective but is offered to program participants on a strictly voluntary basis. Under the WRP, the Secretary of Agriculture acquires permanent easements and 30-year easements, enters into restoration cost-share agreements/contracts, provides for overhead costs associated with the cost of purchasing an easement or establishing an agreement, develops wetland restoration plans, cost-shares the restoration, and monitors the maintenance of the easements and agreements. Close cooperation with other Federal and State agencies and private conservation entities is an integral aspect of program delivery. The State Conservationist, in cooperation with the State Technical Committee, is responsible for WRP implementation and operations.

Fiscal year 1996 was the final appropriation under the old program and provided \$77,000,000 to enroll approximately 93,000 acres. The fiscal year 1997 program will provide \$106,000,000 in CCC financial assistance funds to enroll approximately 130,000 acres. In fiscal year 1998, we propose to enroll an additional 212,000 acres. Technical assistance funding for fiscal year 1997, and fiscal year 1998 will be funded from fiscal year 1996 unobligated appropriated funds under the old WRP account due to the limitation on CCC reimbursements.

From inception of the program in 1992, through 1996, interest in the program has been exceptional, providing approximately 313,174 acres enrolled in the program through the end of fiscal year 1996, and coupled with the fiscal year 1997 and fiscal year 1998 program sign-ups, approximately 655,174 are expected to be enrolled by the end of fiscal year 1998. Historically there have been more than five fold as many acres offered than the program could enroll. The fiscal year 1997 sign-up is the fourth that has occurred under WRP since fiscal year 1992. Unlike previous sign-ups, the fiscal year 1997 effort provides landowners with the continuous opportunity to seek enrollment in the program. States periodically rank all unfunded offers and seek allocation of funding for the highest ranked offers. By following this process the maximum opportunity for landowner participation is provided and the WRP is

PART 1

assured of having the best possible list of ranked offers available for funding during the year.

In response to the 1996 Act and fiscal year 1997 Agriculture Appropriations Act, the fiscal year 1997 sign-up is separated into three components: permanent easements, 30-year easements, and cost-share agreements. Enrollment is targeted to achieve a balance, to the extent practicable, of each component. The level of enrollment established for 1997 is 130,000 acres with a requirement that the initial 43,333 acres of easements be limited to 30-year duration. Thus far approximately 46,000 acres of 30-year easements have been enrolled. This enrollment was completed before the enrollment of permanent easements was initiated. The 46,000 acres represents approximately 50 percent of the 30-year easement offers that have been received. Approximately 41,000 acres of permanent easements have been enrolled. This represents approximately 25 percent of the permanent easement offers. Approximately 9,000 acres of restoration cost-share agreements have been enrolled. This represents approximately 90 percent of cost-share agreement offers.

One aspect of the 1997 WRP is the authority provided by the 1997 Appropriations Act to incorporate non-Federal contributions into WRP projects and to augment the 130,000 acre enrollment cap for fiscal year 1997 by an acreage amount equal to the value of such contributions. Thus far approximately \$9,000,000 of such non-Federal participation has been identified and should eventually enable us to enroll an additional 11,000 acres. In most instances arrangements are made for the contributors to directly handle the funding aspects of those projects for which they wish to participate so that the Department does not become involved in handling of contributed funds. The primary sources of these contributions are private foundations, non-governmental conservation organizations, State agencies, and landowners.

The *Wildlife Habitat Incentives Program (WHIP)* provides for implementing wildlife habitat practices to develop upland wildlife habitat, wetland wildlife habitat, threatened and endangered species habitat and aquatic habitat. WHIP provides a significant opportunity to restore native habitat, help landowners understand how to best meet their own needs while supporting wildlife habitat development, and to develop new partnerships with State wildlife agencies, nongovernmental agencies and others.

During fiscal year 1997, WHIP implementation plans and ranking criteria have been developed, with advice from the State Technical Committee. We expect to allocate \$20 million of the \$50 million in CCC funds that were sanctioned for use by Congress through 2002, to reimburse participants for installing these practices during fiscal year 1997. We anticipate accessing \$30 million in funds to continue the implementation of WHIP plans during fiscal year 1998.

The *Farmland Protection Program (FPP)* protects prime or unique farmland, lands of State or local importance, and other productive soils from conversion to nonagricultural uses. This program is preserving our valuable farmland for future generations.

During fiscal year 1996, the \$14.5 million in CCC funds were provided to 17 states, who also provided their own funds, to purchase development rights from farmers and ranchers. That allocation led to the protection of at least 50,000 acres of valuable farmland, on 203 farms in 17 states. Qualifying farmland had to: be part of a pending offer from a state, tribe or local farmland protection program; be privately owned; have a conservation plan; be large enough to sustain agricultural production; be accessible to markets for what the land produces and have adequate infrastructure and agricultural support services; and have surrounding parcels of land that can support long-term agricultural production.

For fiscal year 1997, \$2 million was approved by Congress for use from CCC funds to purchase development rights from farmers and ranchers. \$18 million will be accessed in fiscal year 1998 to continue the critical process of protecting valuable farmland for the benefit of future generations.

The *Conservation Farm Option (CFO) pilot program* provides producers of wheat, feed grains, cotton, and rice who are enrolled in AMTA one consolidated USDA conservation program payment, in lieu of the many conservation programs that are available. Producers must implement a conservation plan that addresses soil, water, and related resources, water quality, wetlands, and wildlife habitat. The statute provides broad discretion in designing CFO pilots, and provides the opportunity to tap local agricultural initiatives and innovations for improving environmental quality.

We envision CFO as an opportunity to test the feasibility of innovative program delivery processes and innovative solutions to environmental concerns. We look to the locally-led effort to provide the ideas for innovative pilots. The innovations tested through the CFO may well be the basis for changes in statutory authorities for conservation programs into the 21st century. In fiscal year 1997, pilots will be determined through a Request For Proposal in the Federal Register. The fiscal year 1997

PART 1

385

funding is \$2.0 million. For fiscal year 1998, we are requesting authority to use \$15 million in CCC program funds.

CONCLUSION

In his opening message in "America's Private Land, A Geography of Hope," Secretary Glickman wrote: "In my view, our next great environmental goal is conserving our private land. To achieve this goal, we must accept stewardship on private land as a shared responsibility between public and private interests. The public funds we spend for private land conservation is one of our government's wisest investments, achieving multiple conservation benefits from modest expenditures on research, technical and financial assistance, and targeted land retirement."

As a Nation, we should continue to make wise investments in research, which underpins every form of assistance we provide to the owners and managers of private land. The 1996 farm bill also provided for significant investment in financial assistance through such new programs as the Environmental Quality Incentives Program, Wildlife Habitat Incentives Program, Farmland Protection Program, and Flood-risk Reduction Program. Targeted land retirement was also provided by the reauthorization of the Conservation Reserve Program and the Wetlands Reserve Program. Remaining to be addressed for fiscal year 1998, however, is funding for technical assistance, a primary objective of the budget proposal I've outlined.

The innovative programs in the 1996 farm bill and the financial assistance levels established for these programs offer the opportunity between now and the year 2002, when the farm bill expires, to not only maintain many of the important conservation gains achieved by our Nation's farmers and ranchers over the past 12 years but to add significantly to those gains over the life of the new farm bill. We can continue to reduce soil erosion over and above the substantial gains made under the sodbuster and conservation compliance policies and the Conservation Reserve Program. We can begin to help farmers and ranchers address water conservation and nonpoint-source water quality management problems on a scale heretofore not possible. Wildlife habitat enhancement, for the first time, has become an explicit goal of several national agricultural conservation programs. Likewise, air quality is recognized as a pressing conservation problem requiring attention in certain areas of the country.

But these policy and financial commitments become moot unless the Department of Agriculture and NRCS, its lead conservation agency, have sufficient resources to deliver the technical assistance that farmers and ranchers time and again say they need to take advantage of the conservation opportunities now confronting them. Our partners in state and local governments and the private sector, responding to widespread public support for environmental protection efforts, have increased their financial commitments to conservation on private land in recent years. At the same time, they look to the federal government for a continuing commitment to technical assistance for private land and private landowners, not the diminishing commitment in real dollars that has been the trend over the past two decades. It is this technical assistance that, when coupled with the contributions of our many public and private-sector partners, will allow us to realize the full promise of the 1996 farm bill.

We are all in this together. The task is enormous and complex. But we now have the opportunity in fiscal year 1998 to begin to create the conservation legacy that Secretary Glickman suggested in *A Geography of Hope* will likely determine our Nation's economic and environmental well-being for years to come.

That concludes my statement. I am looking forward to working with you in the months ahead to review the proposal and work together to maximize service to our customers and help them be good stewards of the land. I will take any questions that members of the committee might have.

BIOGRAPHICAL SKETCHES

LAWRENCE E. CLARK

Lawrence E. Clark is the Deputy Chief for the Natural Resources Conservation Programs for the Natural Resources Conservation Service (NRCS). He has been in this position since October of 1996. Larry began his career with the Soil Conservation Service in 1967 as a student trainee in Morgantown, West Virginia, and has held numerous positions with the agency in Indianapolis, Indiana; Washington, D.C.; Portland, Oregon; Phoenix, Arizona; and Raleigh, North Carolina. Originally from Scotland Neck, North Carolina, Larry went to the North Carolina Agricultural and Technical State University and received his B.S. degree in Agricultural Econom-

PART 1

386

ics. He also holds a master's degree in Public Administration from the J.F. Kennedy School of Government at Harvard University and a master's degree in Regional Planning from the University of North Carolina. Larry is married and the father of two children.

CAROLE JETT

Carole Jett is the Acting Deputy Chief for Soil Survey and Resource Assessment for the Natural Resources Conservation Service (NRCS). She has been in this position since October of 1996. Carole began her career with the Soil Conservation Service in 1975. She has held several positions within NRCS including State Conservationist in Michigan; Assistant State Conservationist, State Soil Scientist, State Soil Correlator, and Soil Scientist in California; and Soil Survey Party Leader in Nevada. A native of Reno, Nevada, she received a B.S. degree in Soil Science from the University of Nevada, as well as doing post-graduate work with minor course work in Hydrology and Range Science.

STATEMENT OF PAUL W. JOHNSON

Senator COCHRAN. Are there others on your panel who have opening statements?

Mr. LYONS. If I could, I'd like to let Chief Paul Johnson say a few words.

Senator COCHRAN. You may proceed, Mr. Johnson.

Mr. JOHNSON. Thank you, Mr. Cochran, Senator Bumpers, for the opportunity to be here with you today.

I would like to make a couple of other introductions. Since the last time I met with you, we have four new Deputy Chiefs. We actually have four Deputy Chiefs within our agency, and they are—although some were here a year ago, they are in a new position today.

Larry Clark is our Deputy Chief for Programs; Tom Weber for Management; Carole Jett for Soil Science and Resource Assessment; and Fee Busby, just on board as of yesterday, our new Deputy Chief for Science and Technology.

Mr. Bumpers, we stole him from Windrock. Thank you very much. I think he's been trained well and is ready to go.

Gary Margheim is also with us today. He is our new Acting Associate Chief.

Most of you know Pearlle Reed has been asked by the Secretary to become the new Assistant Secretary for Administration. So he is in that position now. Gary Margheim is acting in his place and is with us today.

This is my fourth appearance before you. And as you know, huge changes have occurred. I was counting up our State conservationists that are different today than what they were 3 or 4 years ago, and we have over 40 new State conservationists out of 52. We have six new regional conservationists.

I want to add right away that this should not be a cause for alarm. Every single one of these persons has come through our system from the ground up and knows the agency well. They all have many, many years of experience. And it just happens that this is their time to take their place.

It is a very professional agency, as you know. I think we probably have fewer political appointees than just about any agency in Government. And we have about 12,000 employees. As I have told you before, it is a national treasure, and there is a terrific amount of strength within our agency.

PART 1

387

Over the past 4 years, we have reduced our agency by over 1,500 people. And that is not because we did not need them. I would say right up front that I think we could use twice the people that we have today. The work is certainly out there.

We have continued to streamline our agency, and to get a higher percentage of our people in the field. Through an external review process, we have completely—or are beginning to revamp our information technology and our strategic planning efforts.

I think our partnerships with districts, with RC&D's, State agencies, and the private sector have never been stronger. We are very, very pleased with the support that is out there today, and our ability to work together.

As Jim Lyons mentioned, we have a very good set of programs in the new farm bill. And I think that this is very important. We thank you for giving us those tools to work.

Briefly, the Farmland Protection Program is up and running. And I believe the AFT will be issuing a report within the next couple days on farmland protection in this country. And I would urge us all to take a look at it.

I think that we have some serious problems facing us as we sprawl out across the countryside, whether it be prime land—or landscapes in the West are changing very rapidly. And it is probably something that we ought to be paying attention to.

WRP, the new program, is up and running. And we are in the midst of the usual very heavy signup on that. CRP, as you know, we are in the middle of a very, very busy month. And from my understanding of it, the signup is huge.

But there are important things going on out there. We never before have had so many people come together to help out in a program as this one and what is happening today.

We have people from State fish and game agencies. We have foresters. We have volunteers. The Farm Service Agency and NRCS, the conservation districts are all putting very large numbers of people to work on this. I do not think we have ever had a Federal program where we have had so much effort from so many people. And I think that is a real good sign.

Along with that, we have introduced the new buffer initiative. And we are suggesting the possibility of up to 2 million miles of buffers by the year 2000. These are vegetative buffers that include buffers, contour buffer strips, field borders, and the like.

For farmers who are going to bring their land back into production, we are going to be working with them to try to maintain some vegetative buffers on that land. As we are telling them, farm the best and buffer the rest. And we think we have some terrific opportunities there.

EQIP rules, the final rules, are going to OMB within the next few days. The allocations are out, and our people are already thinking and working with farmers on that.

Compliance is still working. Our reports are, through our status reviews, that farmers are still maintaining their systems that they put in place over the last 10 years.

Within the agency, we have new technical institutes that are up and running and producing the tools that we need to do the job.

PART 1

388

The grazing lands conservation initiative [GLCI], is now in almost every single State in the country. And there is a terrific amount of enthusiasm for it from the grassroots levels.

Our State technical committees are functioning. We think that this is an exciting part of the last farm bill, and the opportunity for State and Federal agencies and interest groups to come together to help guide our programs. And the feedback I am getting is that these are working in very good fashion.

Locally led conservation has been mentioned over and over again. It is really cranking up. It is not our locally led conservation. It is locally led conservation by people at the local level. Conservation districts, RC&D's are coming together on it, watershed coalitions and so on.

And briefly, what they are doing is assessing where they are, setting goals for themselves, and then using our programs and our technical assistance as tools to achieve those goals.

We think it is an exciting approach. It is one that we began 60 years ago and are renewing our efforts along those lines today.

Our watershed program continues, although we have, as you know, had concerns over the years that perhaps support for it is not as great as it used to be. And we are working together with a broad range of people to reach consensus on it.

And we are finding that there is a huge amount of interest in our watershed program. And we will continue to work with you on that.

We did get out, as you know, the new publication, "Geography of Hope." The idea there is to try to get the American public to better understand the important contribution that private lands make to the health and well-being of our Nation. We have it out across the country right now, and we are getting very good response from it.

What is happening on the ground? Our status reviews, as I have said, are showing we are at least maintaining the status quo there. We are not slipping.

We just did what we call the mini-NRI, where we went out and took a snapshot of soil erosion, a statistically valid sample on our croplands in this country. We are finding that erosion rates are about the same as they were the previous year.

So even with Freedom to Farm, we do not feel we are slipping backward. On the other hand, we all know that we have got a long way to go before we hit a sustainable level.

We still have problems, though. And I would be remiss to be in front of you today and not mention some of those. We still have cropland eroding at fairly high rates in some parts of the country, whether it be the west Texas, central plains of Colorado, the fields of Iowa. We still have erosion rates that in some cases exceed four times what we consider a sustainable level.

So we should not lull ourselves into thinking that the great progress that has been made in the last 10 years is all that we need to do. We still have a long way to go.

Even with our remarkable progress of the past 10 years, 44 million acres of highly erodible land still erode at more than two times the tolerable level, if we are looking at a sustainable level over the long haul. Over—

PART 1

389

Senator BUMPERS. Mr. Johnson, with the chairman's indulgence, and before I forget it—and I am also going to have to leave for a few minutes—let me ask you a specific question.

How many arable acres of land in this country are under cultivation?

CULTIVATION OF ARABLE ACRES

Mr. JOHNSON. If you look at what we call cropland, it is in the neighborhood of, I think, about 430 million acres. You add another 600-and-some million acres in grazing land, and we are over 1 billion acres, or close to 1 billion acres.

Senator BUMPERS. I would like to stick with cropland for just a moment, 430 million acres?

Mr. JOHNSON. Just about that, yes.

Senator BUMPERS. And how much do we lose a year to urban sprawl, that is, housing developments and shopping centers, highways?

LOSS OF CROPLAND TO URBAN SPRAWL

Mr. JOHNSON. It is slowed somewhat from previous years, although, as I mentioned, there is a concern of an explosion of that sprawl again taking place right now. But I think that the Farmland Trust and, in fact, our numbers show that we are probably losing in the neighborhood of 1 percent. That is probably close.

Senator BUMPERS. So that would be, roughly, a little over 4 million acres.

Mr. JOHNSON. Three million, somewhere in that neighborhood.

Senator BUMPERS. Three million is the figure I had heard.

Mr. JOHNSON. Yes, right.

Senator BUMPERS. But these things are rather alarming when you look at them. I have been watching this for years, but I just wanted to nail that down for the record, and for my own edification. Thank you, Mr. Johnson.

Mr. JOHNSON. I think beyond that, we need to look at some of the sprawl that is taking place in the West as well. So it may not be what we would consider prime farmland, or good cropland, but it certainly is changing the landscape of the West.

There is a great deal of concern about that among ranchers and farmers, and people who are in the West because of those grand landscapes that are now being chopped up. So I think it is something that we should be concerned about.

Senator BUMPERS. It is obvious that when you have an acreage of the country, the arable acreage planted to cropland going down and the population going up, you have got a real train wreck.

Mr. JOHNSON. Yes.

Senator BUMPERS. It is not going to happen in my lifetime, but obviously that cannot go on forever.

Mr. JOHNSON. I talked to a person in Chicago yesterday. In that area, between Chicago and Madison and Milwaukee, some of the best farmland in the country today is going under concrete, very, very rapidly, in fact.

In continuing in the needs and the concerns that we have, we have been working more over the past many years on sheet and real erosion.

PART 1

390

But we also need to focus much more on gully erosion. We are finding in looking at that closely that erosion is considerably more serious than we thought. We think that the new CRP vegetative buffer initiative will certainly help with that.

Most waters in the United States are graded close to OK, although there are serious concerns. We need to understand and recognize the fact that agriculture is a major contributor to our surface water and ground water problems. And we should not close our eyes to that.

Ground water over drafting is still serious. If you look into the West, particularly, but even in the East, we are seeing places where we are drawing far more water than is being replaced. We know that cannot go on forever.

Twenty-one States are reporting saltwater intrusions into freshwater aquifers, something to seriously be concerned about. And over 60 percent of our rangelands have serious ecological problems, still. This includes noxious and exotic weeds and serious erosion problems.

We need to make sure that we understand where we are on these things. Although the budget that we submit to you by some has been called aggressive and even unrealistic, we believe very strongly that it is not.

In fact, if we look to balancing our budgets, and we know we have to do that on the financial end, we need to tell you that we are not doing it on the natural resources end right now on private lands, in spite of the progress that we have made. But it is something that we must be aware of and pay attention to.

Our budgets are small compared to what they have been in the past. If you look at our 1937 contribution to conservation on private lands in this country, it was twice what it is today, in real dollars.

It is .17—seventeen one-hundredths of 1 percent of our total Federal budget is going to the Federal effort to provide conservation on over 70 percent of the land in this country.

People have chuckled at me when I have said that this effort probably needs to be twice the size of what it is today. But I call your attention to that. And I realize what we are up against, but I think it is very, very important that we pay attention to that.

I would like to close with a statement that we made at the end of our “Geography of Hope.”

As we move into the next millennium, our Nation must strive for a state of harmony. We can no longer be satisfied with slowing erosion, water pollution, and other forms of land degradation.

Harmony will demand that we set our sights higher, to improve the land upon which our destiny rests by restoring those places that are damaged, by enhancing those places whose condition is merely adequate, and by protecting those areas that remain pristine.

Achieving the ideal may well prove impossible, but helping farmers, ranchers, and others try is the fundamental mission of the Natural Resources Conservation Service. Only then will private land become an integral part of our Nation’s Geography of Hope.

Thank you, Mr. Chairman. And at this time, we would take questions.

CCC FUNDING

Senator COCHRAN. Thank you, Mr. Johnson.

PART 1

391

Thank you, Mr. Secretary, for your statements.

In looking at the budget request, one question strikes me as we start. Some of our programs this year, because of the passage of the farm bill last year are mandated by law to perform with no discretion in the amount of money to be appropriated. So the jurisdiction of this committee has changed somewhat by that law which Congress passed and the President signed.

Among the programs that are now mandated at specific levels of funding in the Authorization Act are the Wetlands Reserve Program, the Conservation Reserve Program, the EQIP Program, the Wildlife Habitat Incentives Program, and others, the Conservation Farm Options and the Farmland Protection Program.

My question is: In your statement—I guess this is the Secretary's statement—on page 3, there is a list described in a table showing the major items in this year's budget request, and it contrasts them with the comparable figures from the 2 prior fiscal years.

Included are some of these mandatory programs, the Wetlands Reserve Program, for example. It is pointed out that in fiscal year 1996, there was \$77 million in the budget for that program, and in 1997 and 1998, there are no funds in the budget.

Why would you not put money in the budget, recognizing that those were funds that were going to be spent under the operation of the farm bill?

Mr. LYONS. Mr. Chairman, we simply broke those out because, of course, those programs, by statute, are funded out of the CCC account, so they are broken out separately, identified as expenditures out of CCC.

Senator COCHRAN. The Conservation Reserve Program is not listed at all. Are there funds requested for any of those programs in your budget request?

Mr. JOHNSON. The Conservation Reserve Program is probably under the Farm Services Agency's budget. We will be needing funds out of the Conservation Reserve Program to service it, the technical assistance part of it. Otherwise, it is CCC right now.

And I believe that our technical assistance is probably going to be coming from carryover from the previous couple of years. So CRP is now CCC, as well.

FUNDING EQIP

Senator COCHRAN. There is a specific request, somewhere in here I saw, for the EQIP Program, or maybe it is an estimate that you included in the budget submission, showing the number of contracts and how much they would cost.

It is estimated, for example, that the Service will award 5,143 contracts, costing approximately \$170 million over fiscal years 1997 and 1998.

What will be the impact of this estimate on the appropriated accounts that we will have to approve?

Mr. JOHNSON. I believe you might be referring to WRP, but I am not—

Senator COCHRAN. Well, let me read the whole question here that my staff has given me some background on.

PART 1

392

They say the Department of Agriculture announced on March 10, 1997, preliminary State funding allocations for the Environmental Quality Incentives Program.

Mr. JOHNSON. Yes.

Senator COCHRAN. The Department allocated \$170 million for State priority areas. The remaining \$30 million would be allocated to the States when their final needs for technical, financial, and educational assistance are determined.

How did the NRCS decide on the number of contracts and the cost?

Mr. JOHNSON. The total number, the \$30 million that is there will be technical assistance to service those contracts. The actual contract numbers—maybe I could refer to Larry Clark on that, who is Deputy Chief of our programs, and let him give you specifics on it.

Mr. CLARK. Mr. Chairman, the \$170 million that was allocated to the States using a formula that we developed in partnership with a host of other agencies.

Not included in that amount is \$20 million of technical assistance. We also set aside \$5 million in the allocations to deal with native Americans' concerns and social disadvantaged producers.

We also are holding on to a small reserve in that amount to deal with unforeseen circumstances as States begin to implement the program.

ALLOCATION OF FUNDS

Senator COCHRAN. One complaint that I had in a meeting with conservation district representatives and others who came to see me this week was that because of some of these new programs—EQIP was one of them that was mentioned—there is less money being allocated for some of the traditional functions of the Natural Resources Conservation Service. Watershed was one area mentioned. Surveying and planning was another.

The actual money that is being given to the States to use as they choose is getting less and less because of these other programs that have come along, and are requiring the funds.

Is that an accurate assessment, or was my impression inaccurate?

Mr. CLARK. If I can try to answer that, the allocations that we make to the States, first, are based on appropriated funds, the amount that the Congress appropriates to the agencies.

The second part of the allocation deals with these mandatory programs. And those allocations are based on our estimations of how much we will earn in carrying out those programs. So it is somewhat variable.

In the CRP example, we assume that we will earn so much of that reimbursable amount based on an estimated level of signup. And the same thing goes for WRP and so on.

Mr. JOHNSON. I might add that there are some changes in this budget that perhaps as people have read it do not really recognize the Watershed Program. For example, if you put the financial assistance and technical assistance and planning together, in the past that was under the 08 and 06 budget lines, I believe.

PART 1

393

This budget is putting the technical assistance and planning up into our conservation operations, so it looks like there is only \$40 million left for financial—or for the Small Watershed Program.

There is still \$100 million. It is just that it has been divided out. And it could be that in reading that they felt that there is no longer \$100 million going into the Small Watershed Program. That could be one of the issues.

Another, of course, is there used to be ACP, which went out pretty much like a blanket across the country. Every district, just about, received some ACP funds.

The new EQIP Program will be divided this year into a 65–35 mix, 35 for priority concerns, which will be out across the States in most—well, I think most districts will be able to have access to some of that.

And so, I think the districts are saying, “We had this money before; now we do not.”

I think they will see that it will be there, but it is probably coming under a different title.

Mr. LYONS. We should not lose sight of the fact, though, Mr. Chairman, that while we have certain mandatory accounts, authorized levels of expenditures that were associated with the farm bill, that the remainder that is in our discretionary accounts is declining over time. And that is reality.

So certainly to some degree, there is less money to go around. That has been felt by conservation districts and other partners in terms of the work we have been able to do on the ground, and the support for things like technical assistance.

You know, just looking at the 1996 and 1997 reductions, we went from \$725 million down to \$706 million for conservation operations. We have asked for a little more money because we have much more demand.

You know, there is a lot of excitement across the landscape about the conservation tools that are out there. The key is we need the people out there to deliver the services.

So we have asked for a small increase, but, you know, we are constrained, as are you, in terms of what we can ask for, and what you can possibly provide us. So we should not lose sight of the fact that discretionary accounts decline, and they are declining.

Mr. JOHNSON. And I do not want to leave you with the impression that ACP is still there. The law changed that, of course. And it is now multiyear contracts.

But it is priority concerns, which may be water quality in a State, and then there are priority areas which focus on much more than that.

On the other hand, with the new CRP and the continuous signup, the opportunity for districts and for local county committees to be working with farmers on many, many more farms than we did before, I think is much greater.

So I think if we utilize that continuous signup on CRP, we are going to see that an awful lot of districts will still have a fairly strong program. And those vegetative buffers are very important throughout the landscape.

PART 1

394

CONSERVATION RESERVE PROGRAM

Senator COCHRAN. You mention that the Conservation Reserve Program is actually administered by another agency, and that you provide technical assistance.

Was it your assistance that led to a new emphasis in the kind of land that will be eligible for enrollment in this next year, as contrasted with previous years?

Mr. JOHNSON. That really came out of 10 years of experience, and a CRP that came about in 1985 under different conditions than today. We have learned a great deal about it.

We went out across the country and asked farmers and ranchers and conservationists. They suggested that it ought to be targeted more toward environmental benefits and not a land retirement program, as such.

And so, together with the Farm Services Agency, but primarily with the advice of farmers and ranchers across the country, and, of course, the Secretary as well being very supportive of this, the new CRP is probably focusing on more environmental benefits than we did the first time around.

Senator COCHRAN. I am told that one of the major results that has been noticeable, and very clear, is the wildlife habitat enhancement that has flowed from the Conservation Reserve Program.

Particularly in our State of Mississippi, we have noticed a tremendous amount of acreage now that is attractive for wintering habitat for water fowl that migrate through the lower Mississippi River Valley. Many other species of wildlife seem to have been nurtured, although now they are being drowned, I am afraid, or run up to higher ground, and will be under a lot of pressure because of flooding in our area right now.

Is this considered to be an important aspect of the Conservation Reserve Program, and will you continue to try to identify areas as eligible that will have a wildlife habitat enhancement factor?

CRP—MISSISSIPPI FLYWAY

Mr. LYONS. Mr. Chairman, I would mention that—and I am proud to say in partnership with you and some others, who have worked on these issues over the years, that wildlife is taking a prominent role in guiding programs like CRP.

In the environmental benefits index that we used to determine eligible acres, soil erosion, water quality, and wildlife habitat have, in essence, equal standing.

And there has been tremendous benefit associated with the CRP program. Yesterday, for example, Secretary Glickman was the keynote speaker at what is called the North American Wildlife and Natural Resources Conference, which is probably the Nation's biggest meeting of professional land managers, wildlife biologists, agencies such as Forest Service, Fish and Wildlife Service, et cetera.

I cannot remember having a Secretary of Agriculture being the keynote speaker at that conference. Highlighting the success stories associated with CRP, we can point to species—two species of birds that faced extinction that were—that extinction was curbed, or at least there is hope for recovery as a result of CRP.

PART 1

395

Twenty or so species of birds in the Mississippi flyway, in particular, their declines have been arrested as a result of CRP.

We now have a tremendous opportunity to use those programs to benefit wildlife, to protect water quality and, as we have traditionally done, to focus on soil erosion. And we are seeing the benefits. CRP probably gets the most focus, but through WRP, the WHIP Program, I think, affords us exciting opportunities to do some things to protect wildlife resources.

I can remember meeting in this room as a member of the staff of the House Agriculture Committee, along with my deputy, who was then staff to the Senate Agriculture Committee, talking about wildlife in 1990.

And unfortunately, wildlife was equated with endangered species by a lot of people, and seen as a threat, as opposed to what it has now come to be realized as a tremendous value, and a tremendous opportunity for landowners.

I am pleased to have been a part of that, and I am certainly grateful to you for the leadership you have demonstrated, going back to 1985 farm bill, and making that an important priority.

WHIP PROGRAM

Senator COCHRAN. Well, I thank you for that observation, Mr. Secretary. I know the WHIP Program was authorized in the recently passed farm bill. It calls for the Department to issue regulations.

I submitted some comments, hoping that they would be considered. I wonder when we can expect the regulations to actually be implemented.

Senator BUMPERS. This is good. We are going to pin him down on this one. [Laughter.]

Senator COCHRAN. It has not been published yet, I do not think. So we probably ought to start with that question, first. When will they be published?

Mr. JOHNSON. They are in the Department for review right now. And I think we are going to see them out within a month or two. So they are coming along. You need to know that.

Senator COCHRAN. But the sooner they get published, you know, the sooner we will get the program underway. We have money in this budget, I understand, of \$22.5 million for implementing the WHIP Program.

Will you have the ability to manage this program so that it will get started, and some of those moneys will actually be used—

Mr. JOHNSON. You bet.

Senator COCHRAN. In this fiscal year?

Mr. JOHNSON. Yes; we will. We can promise you that.

SAFE HARBOR PROVISION

Senator COCHRAN. There is a safe harbor provision in the program providing cost share funds for landowners to create a habitat that is conducive for endangered species during the life of the landowners' contract.

Are there safeguards being proposed or considered by the Department which will protect the landowner's long-term interest once his contract expires?

PART 1

396

Mr. LYONS. Mr. Chairman, we are working on developing an appropriate safe harbor mechanism, and working with the Fish and Wildlife Service to that end.

I am certain that we will be able to address those concerns and ensure that landowners realize the benefit and are not penalized for improving wildlife habitat, which certainly was an important part of the discussion when WHIP was considered in the farm bill.

YAZOO BASIN PROJECT

Senator COCHRAN. There is a demonstration erosion control issue in our State. The Yazoo Basin demonstration erosion control project was established in 1984. You may want to look at this for the record, so maybe I will just submit this for you to look at.

We had an original funding level of \$4.1 million. The Corps of Engineers is involved, and the Agriculture Research Service, with the NRCS, and are supposed to work jointly on a program to demonstrate the use of watershed system basis methods of reducing flooding, erosion, and sedimentation in six elected watersheds in the Yazoo Basin.

This area has been increased now to include 16 watersheds. There has been direct funding for the program. I am curious to know whether you have any requests for funds, or consider carrying on this program in the future.

This is a question that we have addressed to our State conservationist, and I am curious to know whether you intend to support this effort and allocate funds for this program in the future.

Mr. LYONS. Yes, we do, Mr. Chairman. We intend to continue the program and the positive working relationships in the basin.

Mr. JOHNSON. I think we can give you a more complete written answer on that as well to let you know exactly where we are right now.

Senator COCHRAN. I am specifically interested in knowing whether you have gotten any money from the Corps of Engineers, whether funds have been allocated to the NRCS.

Mr. JOHNSON. We have, and my understanding is that we are in the neighborhood of 95 percent complete on those funds to carry out what they were to do. But we will get you a written response on that to make sure that we get the numbers correct.

Senator COCHRAN. Well, we want to be able to have some influence in the energy and water appropriations bill, too, on this subject. If we need to specify with language what we expect the Corps of Engineers to continue to do, we are prepared to do that as well.

I just want you to know this is a high-priority area, and particularly with the flooding that we are experiencing now in this basin, it is a serious problem.

[The information follows:]

PART 1

397

MISSISSIPPI, YAZOO DEMONSTRATION EROSION CONTROL

[Fiscal years 1985-96]

Fiscal year	Amount requested from national headquarters	Amount of technical and financial assistance received for DEC from national headquarters	Amount NRCS received from DEC from corps	Language reference
1996	\$7,500,000		¹ \$1,785,000	Pg. 67, 1996 Committee Report. ¹
1995	3,000,000		¹ 4,430,000	Pg. 65, 1995 Senate Report 103-290. ²
1994	10,000,000	\$10,000,000	660,000	Report not available.
1993	10,000,000	8,500,000	115,000	1993 Senate Report 102-334. ³
1992	10,000,000	8,000,000	645,000	(⁴)
1991	10,000,000	7,000,000		1990 Senate Report. ⁵
1990	10,000,000	7,000,000	1,619,000	(⁶)
1989	5,000,000	5,000,000	120,000	(⁷)
1988	5,000,000	5,000,000	100,000	(⁸)
1987	5,000,000	5,400,000		
1986	5,000,000	5,000,000		
1985	5,000,000	4,100,000		

¹These funds were received from Corps for a fiscal year 1994 agreement.

²Fiscal year 1996 Committee Recommendation: The Committee expects progress to continue on the Yazoo basin demonstration erosion control project.

³Fiscal year 1995 Committee Recommendation: The Committee expects progress to continue on the Yazoo basin demonstration erosion control project.

⁴Fiscal year 1993 Committee Recommendation: \$10,000,000 needed by SCS.

⁵Fiscal year 1992 Committee Recommendation: Included within the Public Law 534 amount is \$8,500,000 to cover the Soil Conservation Service share of the Yazoo Basin, Mississippi, demonstration erosion control projects.

⁶Fiscal year 1991 Committee Recommendation: The bill includes \$7,000,000 for the Soil Conservation Service to continue work on eligible projects.

⁷Fiscal year 1990 Committee Recommendation: The bill includes \$5,000,000 for the SCS to continue work in eligible projects.

⁸Fiscal year 1989 Committee Recommendation: The Committee concurs with the House provision of \$5,000,000 for the Yazoo demonstration project.

SOCIALLY DISADVANTAGED FARMERS

Senator COCHRAN. You mentioned in your comments the program for socially disadvantaged farmers. I think that was the phrase that was used.

Is it my understanding that this program has been transferred from the Farm Service Agency to the Natural Resources Conservation Service? And if so, why was the program transferred?

Mr. JOHNSON. I believe it was transferred because there was a feeling that we probably were better connected with the 1890's Institution, and with a good delivery system to move forward on it.

I believe it was transferred last October. We are housing that program within our agency right now.

I think that as the civil rights issues move forward, that program and where it will be will certainly be up to the Secretary, and where it is housed right now may not be where it is in the future. I think there is going to be some discussion of that as we move forward.

Senator COCHRAN. I do not know how you spend the money for that program, but I would suggest that you consider some of the historically black colleges and universities, such as Alcorn State University and Mississippi Valley State University, which have had a history of working with farmers in our State. There are probably colleges and universities in other States that are similarly experienced in some of these initiatives.

PART 1

398

To involve them in an active way would be, in my view, very appropriate and a good use of these funds.

Mr. JOHNSON. And we are doing that. The program, as we received it, had been funded at, I believe, \$1 million. And then I think that the fund for rural America put another \$4 million into it in fiscal year 1997. So we are up to \$5 million, and we are asking that that be continued in our 1998 budget.

Senator COCHRAN. I noticed that a number of entities have been funded by the program; 28, I am told. For the record, we would like to have a list of those so we will know the kinds of things that you are spending the money on.

Mr. JOHNSON. We will get that to you.

Senator COCHRAN. Thank you.

CONSOLIDATION OF FSA AND NRCS

Senator COCHRAN. I have a number of questions that I am going to submit. Senator Bumpers may be returning here, and he may have questions to either submit or discuss with you.

One thing I noticed in here was this consolidation of administrative expenses between the Farm Service Agency and the NRCS which confuses me a little bit.

They are two distinct missions, it seems. Matter of fact, I think a concise statement of the NRCS' mission is to provide national leadership in a partnership effort to help people conserve, improve, and sustain the Nation's national resources environment. This is in the budget.

When you talk about FSA in the budget, its mission is to ensure the well-being of American agriculture and the American public through the efficient, equitable administration of funds, commodities, credit, conservation, environmental emergency assistance, domestic and international food assistance, and international export credit programs.

PART 1

399

How can you combine or consolidate your functions at the headquarters level with these two, what appear to be, distinct missions? How do you decide how much goes to each of these mission functions at the headquarters level?

Mr. JOHNSON. I do not have the license to say this, but it confuses me a little bit, too. We think that we do have some opportunities to share. We are trying to do it now at USDA service centers.

I think the important thing here is that we maintain our very well defined missions as agencies. And I do not believe that we are saying here that two agencies should become one, or that we should lose our missions, but that where they can service us and we can service them, we ought to look for ways in which we can do that.

I have been working with Grant Buntrock on this now for 3 years, trying to figure out ways where we can provide services to them; if we can do it better than they, and they to us, without our taking over their policy, for example, or they taking over our policy.

And I think there are possibilities to do that. We need to continue to explore it.

Senator COCHRAN. Well, there is an indication in the budget that there will be an independent entity asked to examine FSA and NRCS for opportunities for further consolidation and centralization of these agencies.

Is this something that is going to be contracted out and studied? Do you have a request for funds for that purpose in the budget?

Mr. JOHNSON. This is to be done in fiscal year 1997, I believe. I think that we are now scoping out the opportunity to do that with an outside contractor. It will probably be absorbed within our operating budget.

Mr. LYONS. This is currently being discussed, Mr. Chairman, in the Secretary's office as to the structure, and how his study would proceed. So we are really not in a position, I think, to offer as many details as you might need.

OFFICE CLOSINGS—STAFF LEVELS

Senator COCHRAN. I know that we are going to see the agency closing field offices and consolidating offices throughout the country.

Are you going to reduce the levels of staffing in the process? What are some of the practical results and consequences for farmers and landowners that we will notice?

Mr. JOHNSON. Well, to a very great extent, that is up to you. We do need a strong conservation operations budget. And we have submitted that to you.

Our view on this is that we do not see the Natural Resources Conservation Service cutting back further than what we are right now, or than what we set out to do by the end of this fiscal year in the consolidation of the service center effort.

Rural Development, for example, is down to 800 offices now, or a little over 800. And we are in most of those offices with them.

The Farm Services Agency is at 2,500 offices, and they are trying to work through their budget and their workload to see how many they should be in. And we will continue to be in those with them.

PART 1

400

But then I think that we will continue to work with our conservation districts and be out there where the work is. There is still as much land as there was before, even though there may be fewer farmers, and the commodity programs may not be there in the future. We do not know for sure yet.

But I think you could view it in terms of maybe a nesting process where we may all be in some offices. Farm Services may in another batch with us, and then we are going to probably be in further offices out there across the country.

Even when we have pulled back to 2,500, we have kept the presence in some areas. I keep telling people that the idea of a service center is a good one, because these are hubs through which—or out of which we work, but that we keep saying that if we get this together right, an office is also a laptop and a pickup truck, and that with the new technology, we ought to be in a number of places across the country, and not necessarily in four walls that look a certain way.

So we will continue to work with the other agencies so that we plug in and try to be seen less in terms of our customers. But we see this as something that does not have to be confined within four walls at a certain number of places.

SUPPLEMENTAL FUNDS

Senator COCHRAN. You mentioned the 1997 fiscal year as the year that you are going to be looking at ways to further consolidate and make the agency's operations more efficient in working with companion agencies.

Do you expect that you will be submitting a request for supplemental funds, particularly in view of the flooding and the other problems that have arisen this year in the Ohio River Valley and the lower Mississippi River Valley?

Mr. LYONS. Yes, Mr. Chairman; in fact, the administration is working up the numbers, so to speak, in terms of the funds we feel are going to be needed to address flooding and other natural disasters that have occurred on the west coast and the Great Plains, the Mississippi Basin area.

I believe right now we are looking at the Ohio and the impacts of flooding on the Ohio so we can estimate some of the damages that have occurred there, so we can complete this package.

PREVIOUS EMERGENCY WATERSHED PROJECTS

Senator COCHRAN. We had some previous emergency watershed projects that were identified in earlier years that were never finished because the money ran out, or it was not sufficient to cover all of the projects that were identified.

I know in our State we have had emergency watershed projects characterized and studied, but never actually completed because of insufficient funds.

Is there any consideration being given to permitting some of the funds that might be approved in a supplemental to be used to meet the needs that have already been previously identified as emergency in nature and in need of Federal assistance?

Mr. JOHNSON. The process that we are going through right now is to try to collect all of those needs, including the needs from last

PART 1

401

year's hurricanes, for example. And we have needs going back to the early nineties.

So we have not forgotten those, and we recognize that there still are needs out there. But we are proposing that to the Department, and then on through the system.

Mr. LYONS. I think, Mr. Chairman, there is a need to assess the backlog of needs, as you have suggested, and also, I think to take a forward look.

I know one of the issues we are discussing within the administration is what constitutes an emergency need. And if, for example, in the case of restoring flood damage, we are simply going to put things back the way they were, or take advantage of the opportunity, perhaps, to make needed improvements, whether it is in setting levies back, or in other watershed improvements that reduce the risk of future flooding; in essence, do it right the first time.

And I would just say that this is an issue I hope we will have a chance to discuss more, because there is a little bit of a debate within the administration right now as to what constitutes an emergency.

In my mind, it would be foolish to simply limit what we do to restoring the damage done if there is a way to be more efficient and reduce, hopefully, the likelihood that we will have to revisit those areas in future years, because we failed to make needed investments today to reduce the risks of damage down the road.

UNFUNDED NEEDS

Senator COCHRAN. It would be instructive for us to know how many unfunded needs have been identified by the State conservationists around the country. Can we have a breakdown of the unfunded needs by State, and how you plan to distribute supplemental funds that might be appropriated to the States for emergency watershed protection activities?

Mr. JOHNSON. We will get that to you in writing.

Senator COCHRAN. Thank you very much.

¹ Requires special authority for expanded debris removal.

² Requires special authority to address storm damage.

³ Flooding potential from 300-400 percent of normal snowpack melt.

EQIP

Senator COCHRAN. We talked about the EQIP Program earlier. I have some other specific questions about that, and what would happen if the States do not use all of their allocations in a fiscal year.

What happens to the money? Maybe you can answer that for me right now. If you cannot, you can answer that for the record.

Mr. JOHNSON. I am being told that if we do not use it, we lose it. I have a feeling we are going to use it. [Laughter.]

PART 1

403

FARMLAND PROTECTION PROGRAM

Senator COCHRAN. The Farmland Protection Program was one of those programs that is on my list of mandatory programs. But your budget, unlike some of the other mandatory programs, requests \$17.3 million for that program.

I assume that will conclude the funding for the program, and that will be the end. Is that a correct assessment?

Mr. JOHNSON. I think that completes the funding. I hope it is not the end.

Senator COCHRAN. Well, is that program worth continuing?

Mr. LYONS. Yes, sir.

Mr. JOHNSON. I believe it is, but I believe we need to continue to look at ways to be innovative in using it. As you know, it is—we are not—

Senator COCHRAN. You just pay farmers not to sell their property to developers, is that what it is?

Mr. JOHNSON. Well, first of all, we are putting funds to existing programs that are going on. And so we are helping State and local programs that have taken a look at themselves, in their home place, and recognized a real need to maintain good, high-quality, unique farmland, close to urban areas.

And so it is not our doing it here in Washington saying, "You ought to do that," but rather people at the local levels saying, "This is very important to us."

And then as a nation, we are committing to helping them with that. We do not go out and pay 100 percent of any easement, or that is not the idea. The idea is to work together with States and local governments that already have programs going. So it is a support system for them.

Mr. LYONS. Mr. Chairman, I think one of the benefits to this program is that it really is a partnership effort with States that have similar programs in place.

And having grown up in the urbanized East, I have seen a lot of farmland converted to condominiums. And it is a tremendous loss because, of course, some of the most productive soils we have are in or near these urban areas.

So I think there is a tremendous need. Certainly there is more need than we can satisfy with the resources that have been allocated to the program. We would certainly like to work with you to see if we could expand and improve the program.

RESOURCE CONSERVATION AND DEVELOPMENT

Senator COCHRAN. There is a provision in your budget that calls for an increase of \$3 million under the Resource Conservation and Development Program to fund 400 non-Federal watershed and rangeland coordinators in 25 States for high-priority watersheds.

What is the need for these 400 new positions that would be funded in this program? Why do we need these 400 new people?

Mr. LYONS. Mr. Chairman, actually I think the number is \$18 million in terms of the RC&D increase in that particular area.

The rationale is that there are mechanisms that are developing, have developed, in parts of the country that really mirror or use as a model the RC&D Program, where coordinators are brought in

PART 1

404

to help bring entire communities together to help guide conservation work done in particular watersheds.

We see a need or a value in using that as one alternative tool for reaching consensus on what kinds of improvements and conservation practices are needed in watersheds.

I would suggest that though one of the critical parts that has got to be linked to this is to make sure that we have the dollars in the conservation operations to provide the technical assistance to these watershed councils.

This is a program—or this is an idea, I should say, that has had its origins in Oregon where watershed councils have been established to deal with concerns related to loss of salmon habitat, for example.

We are working very closely with existing watershed councils, and with conservation districts that have assumed a similar role, to try and improve the delivery of conservation technical assistance in those watersheds to deal with the declines in salmon habitat and other resource degradation.

I think this is an area where we would like to work with the committee to see if we could not structure the most effective delivery systems, and capitalize on watershed councils and conservation districts, and RC&D's, and use them to the best benefit, to ensure we get the kind of delivery systems we need in place where appropriate.

CENTERS OF EXCELLENCE—1890 INSTITUTIONS

Senator COCHRAN. There is a provision in the budget request that talks about Centers of Excellence at the 1890 Institutions.

Do you know which institutions have been selected, or has there been a selection process to identify the Centers of Excellence around the country? Could you let us know which 1890 Institutions have been included in this list, and what that means in terms of what you are going to do for them?

Mr. JOHNSON. We will do that. We will get it in writing to you, what each center of excellence is about, and how it is being funded, and what we expect of it. Yes.

[The information follows:]

CENTERS OF EXCELLENCE

The Centers of Excellence Program was designed to establish partnerships between 1890 Institutions and USDA agencies. Each Center is to provide a USDA presence on the 1890 campus, enhance the capability of the Institution to assist in the delivery of USDA programs, ensure support from the agribusiness community, and provide assistance to outstanding students who commit to careers in USDA. Currently, NRCS has participated in the establishment of one Center.

In fiscal year 1995, NRCS established the Geographic Information System and Remote Sensing (GIS/RS) Laboratory at Lincoln University. The GIS/RS Laboratory laid the foundation for the Center of Excellence of Leadership in GIS and Wildlife Management at Lincoln University. In fiscal year 1996, NRCS contributed \$250,000 to the Center. In fiscal year 1997 and fiscal year 1998, it is estimated NRCS will contribute another \$250,000 for each year. Through the Center, Lincoln University will become nationally and internationally known for academic excellence in GIS and wildlife management.

Senator COCHRAN. Is there a specific line item in this budget request for funding the Centers of Excellence, or carrying out that program?

PART 1

405

Mr. JOHNSON. I do not believe there is a specific line item in it. We do not intend to increase it this year over where we were last year.

Senator COCHRAN. Does that money come from the conservation operations budget, or where does it come from?

Mr. JOHNSON. Yes; it is in our conservation operations.

Senator COCHRAN. Is that sort of a pot of money where nobody knows what you are going to do with it until you do it?

CONSERVATION OPERATIONS

Mr. JOHNSON. No; our conservation operations is not that at all. It really is the basic conservation program for the Nation on private lands.

Where it is allocated is based on needs and on strategic planning, and where we think we can get the greatest return in conservation on private lands in the Nation. It shifts from year to year.

As we get better at assessing land health and looking at partners that we can work together with to beef up the effort, we try to allocate it as best we can for that. I would not call it a huge pot of money. [Laughter.]

Senator COCHRAN. But I have noticed that that gets bigger. You know, the Secretary talked about how the budget for the service gets smaller.

Mr. JOHNSON. Yes.

Senator COCHRAN. Conservation operations seems to get bigger.

Mr. JOHNSON. Well, of course—

Senator COCHRAN. The mandatory programs seem to get bigger. I get the impression that is one way to keep this committee from having as much influence over how the money gets spent. [Laughter.]

Mr. LYONS. I do not think we—

Senator COCHRAN. Whether intended or not, I know it is not intended. [Laughter.]

Mr. LYONS. Mr. Chairman, I would—you know, I use the analogy of a toolkit to describe all the various conservation programs we now have in place. I would equate conservation operations to the funds that we use to hire the carpenters.

A toolkit is not worth much if you do not have people who know how to use it and apply it, and work with landowners. And that is why it is critical. And perhaps the request for those funds has increased simply because the demands are so much greater.

And the Congress has created so many more new tools which are extremely valuable, but we have to have money to do it the old fashioned way, as they say, to get out on the ground and connect landowners with those tools, and then get the conservation work applied on the landscape as the landowners see their needs.

That is why conservation operations is critical. And frankly, if we can get more money in there, that would be great, because we need a lot more people out there applying those conservation tools across the landscape.

CONSERVATION TECHNICAL ASSISTANCE

Mr. JOHNSON. Mr. Cochran, I think that you need to be aware that the CO-1 budget, the conservation operations, this next year

PART 1

406

is larger because the watershed technical assistance has been thrown up into that.

If you look at where we have been over the last, oh, 15 or 20 years, we have been flat or declining in our technical assistance. And as I said in my earlier remarks, we have in the past put a much greater emphasis on this technical assistance out to land-owners.

And if you ask the private sector how we can get conservation on the land, the one that always rises to the top is more technical assistance. And that is out of that budget. In fact, that is that budget.

Mr. LYONS. Mr. Chairman, just one last point I would make, and I hope you have a copy of or have seen a copy of the "Geography of Hope" document that Paul and NRCS generated.

But there is an interesting table in here, and I will give you this copy that tracks trends in appropriations for technical assistance, financial assistance, in our land retirement programs, basically the three areas in which we work and focus.

And what this trimline shows, going back to 1934 when we first started doing business, is that funds for financial assistance have declined in real dollars over time, that the funding for technical assistance increased slightly, but really has been flat for the past, oh, 15 or 20 years.

And, of course, the Land Reserve Program funding has increased, in part because we have moved toward creating programs like CRP and WRP, et cetera.

It is an interesting trimline, because as Paul said, we used to put a lot more money into conservation on the landscape in terms of financial assistance.

And the demand is increasing for technical assistance. But really that program has flat-lined, and I will be glad to share that with you.

[The information follows:]

Major U.S. Department of Agriculture, State, and Local Conservation Programs 1934-1996
Appropriations for Technical Assistance, Financial Assistance and Land Reserve
1996 Constant Dollars

PART 1

408

CLOSING REMARKS

Senator COCHRAN. Well, I think overall, we have to be impressed with the work that has been done in the conservation area to help protect our soil and water resources, and help assure that we have the capacity to continue to produce in an efficient way the food and fiber we need, and the huge exports that we see each year going out of this country.

It is a very impressive success story, in my opinion. I am quick to give credit where it is due in this area. I think the NRCS deserves a lot of credit, as well as the conservationists in the districts all over the country, especially in my State where they are very active. It is a serious effort that is being undertaken.

The State NRCS departments have worked hard on it. We have had a lot of emphasis in this area by State government in my State. A lot of people have done a lot of good work to bring us where we are today.

I do not have any other questions at this point. But I do have some which I will submit and Senator Bumpers may have some comments.

I am going to have to go to another meeting. And I am prepared now to turn over the gavel to this guy. We do not have a quorum so we cannot pass anything.

Senator BUMPERS. Mr. Chairman, you do not have to turn the gavel over. I am going to submit questions in writing to Mr. Lyons about three water projects in my State, Bethtensal, Palo Mato, and the prairie water systems. Those are becoming increasingly critical in our State.

And, you know, we produce 43 percent of the rice. In another 20 years, we will be producing about 10 percent of the rice if we do not do something pretty dramatic pretty soon.

SUBMITTED QUESTIONS

And I will phrase those questions in such a way—I think you are familiar with those things. I will submit those in writing, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR COCHRAN

CONSERVATION OPERATIONS

MOLOKAI SOIL AND WATER CONSERVATION DISTRICT

For fiscal year 1997, the Committee included \$250,000, for continued support of agricultural development and resource conservation in Hawaiian areas serviced by the Molokai Agriculture Community Committee.

Question. What assistance does NRCS provide in this regard?

Answer. NRCS provides technical assistance to the Molokai Soil and Water Conservation District (SWCD) and the farmers, ranchers, and other participants in the Molokai Agriculture Community Committee (MACC) program. The technical assistance NRCS provides is funded from the NRCS budget, not the \$250,000 appropriation to the SWCD for the Molokai Agriculture Community Committee program. The SWCD uses the \$250,000 appropriation for cost sharing conservation project applications and administrative costs.

PART 1

409

The technical assistance NRCS provides is mainly focused on preparing and implementing natural resource conservation plans. Implementing these conservation plans involves designing irrigation systems, grazing management systems, windbreaks, and other resource conservation practices. In addition, NRCS provides educational and technical assistance to the clients they serve. NRCS also provides work space, equipment, and training to the MAC and SWCD staff.

Question. Is funding for this activity included in the budget request for fiscal year 1998? How much is included?

Answer. NRCS did not specifically request funds for the MAC in the fiscal year 1998 budget. However, every year since fiscal year 1992, the Molokai Soil and Water Conservation District (SWCD) has spent \$250,000 for the Molokai Agriculture Community Committee (MACC) program.

BAYOU METO AND BOEUF/TENSAS AREAS

For fiscal year 1997, the Committee directed NRCS to continue supporting programs related to Bayou Meto and Boeuf/Tensas areas and to continue planning and design activities in the Kuhn Bayou project, all in Arkansas.

Question. Please provide for the Committee an explanation of the work completed to date on these projects, and estimates of the funds needed in the future, by fiscal year, to complete each of these projects. What is included in the fiscal year 1998 request for each of these?

Answer. Work has continued on the Bayou Meto, Boeuf/Tensas and Kuhn Bayou projects in 1997 which was the third year of this effort at the direction of Congress.

Specifically in Bayou Meto, the inventory work for the on-farm part of the work is now complete and the report is being reviewed by the sponsoring local organization. Public meetings to inform the public of the results of these studies and the establishment of a hydrology data base will be carried out during the remainder of this year. The Corps of Engineers has been authorized to plan a flood control/irrigation project in this area and NRCS will play a major role in that effort with funding anticipated from the COE.

Boeuf/Tensas local sponsors continue to inform the public of the water decline and water quality status. They are in the process of organizing an irrigation district. NRCS is working on developing geographic information system (GIS) data for use in the study. Work is about 50 percent complete on this project.

Kuhn Bayou is part of the Eastern Arkansas project and NRCS is performing some of the survey and design functions for this project. A natural resources conservation plan has been developed. The sponsors are seeking funding sources for implementation.

The fiscal year 1998 budget request contains funds which could be used for these projects.

LOESS HILLS OF IOWA

For fiscal year 1997, \$400,000 was included for continuation of the pilot program to address erosion in the Loess hills of Iowa.

Question. What is the status of this pilot project? When is it scheduled to be completed? How much will this project require, by fiscal year, to complete? What funds, if any, are included in the fiscal year 1998 request.

Answer. Fiscal year 1997 funds have been provided to the Loess Hills Development and Conservation Authority (LHDCA). The LHDCA is an entity that was created by the Iowa Legislature in 1993 to help deal with the special natural resource concerns in the deep Loess area of the State.

The funds are being used together with state appropriations to provide cost-share to local units of government that are installing stream channel grade stabilization measures on targeted degrading streams. Fiscal year 1997 funds have been obligated for structures in 11 counties. In addition to the \$400,000 in Federal funds, \$1,012,000 in State and local funds are being committed to these projects.

Projects receiving fiscal year 1997 funds should be completed by the end of this calendar year, and the 1998 budget does not specifically identify funds for the pilot program.

The issue will require approximately \$24.1 million in Federal and State funding over the next 10-12 years in order to complete needed installations. Local leaders are suggesting that this amount be split evenly from Federal and State sources. Additional local dollars will be used to supplement these funds, and to operate and maintain channel stabilization measures.

PART 1

410

FRANKLIN COUNTY LAKE

Funding of \$750,000 was included in the fiscal year 1997 appropriations for Conservation's Operations to provide design and technical assistance in Franklin County, Mississippi.

Question. What is the status of this project?

Answer. In fiscal year 1997 NRCS received \$550,000 for the Franklin County Lake to complete the in-house engineering design, soil mechanics work and A&E for final spillway design. An interagency agreement was prepared to transfer \$300,000 from NRCS to the US Forest Service to be used for land acquisition and exchange support, securing permits, environmental mitigation and support for removal of timber.

The work is on schedule and construction plans specifications are currently being initiated. The design is to be completed this fall and ready for construction next fiscal year.

Question. What environmental and economic benefits will be realized upon completion of this project?

Answer. The project is expected to provide recreational benefits to the citizens of Franklin County as well as Mississippi and surrounding states. A mitigation plan is being completed to assure that fish and wildlife and other environmental benefits are maximized for the project area.

Question. What funding is included in the fiscal year 1998 request?

Answer. No specific funding is included in the fiscal year 1998 request. However, the fiscal year 1998 budget request contains funds that could be used for the project.

GREAT LAKES BASIN PROGRAM

For fiscal year 1997, \$250,000 was included to continue work on the Great Lakes Basin Program for soil and erosion and sediment control.

Question. What is the status of the project? Are there other federal agencies which contribute funding for this project? Which agencies and how much is each contributing?

Answer. This project has been active since its inception in 1991. No other federal agency contributes funding for this project. NRCS is contributing \$350,000 in fiscal year 1997.

Question. What is the timetable to complete this project? What funding will be needed in each fiscal year to complete this project?

Answer. The project is expected to continue through the year 2002. \$750,000 will be needed in each fiscal year through the year 2002 to complete this project.

Question. How much is included in the fiscal year 1998 budget request?

Answer. \$750,000 is available in the fiscal year 1998 budget request for this project.

GREAT LAKES WATERSHED INITIATIVE

For fiscal year 1997, the Committee stated its expectation that the Department provide technical assistance and funding to assist the Great Lakes watershed initiative.

Question. What is the status of this project?

Answer. Twelve demonstration farms, six in the Lake Erie drainage and six in the Lake Ontario drainage, are currently being established. The next phase of compiling data and analyzing results on practices such as integrated pest management, constructed wetlands for dairy facilities, bark bed filter strips, grass filter strips, stabilized livestock crossing systems, chemical mixing and rinsing pads, packed gravel barnyard treatment systems and alternative watering systems has been initiated.

Question. What is the timetable to complete this project? What funding will be needed in each fiscal year to complete this project?

Answer. This initiative is scheduled to run through the year 2002. NRCS technical assistance funds in the amount of \$75,000 will be needed each fiscal year through the year 2002.

Question. How much is included in the fiscal year 1998 budget request?

Answer. \$75,000 is available in the fiscal year 1998 budget request.

CHESAPEAKE BAY

The Committee provided \$4.75 million for continued work on the Chesapeake Bay.

Question. What is the nature and status of this work? What are the environmental benefits of this work?

PART 1

411

Answer. This work entails providing technical assistance to farmers throughout the Chesapeake Bay drainage basin to plan and install best management practices (BMP's) to control runoff, reduce erosion, manage nutrients and pesticides, and improve and maintain wildlife habitat. Specific accomplishments to date include the installation of nearly 1,500 animal waste systems to safely contain manure, nutrient management plans on over one million acres to keep nutrients from washing into or infiltrating water supplies, dead bird composting facilities on more than one third of the poultry operations to reduce the volume of carcasses, kill pathogens, prevent odors and protect water quality and resource management systems have been applied to more than 100,000 acres to reduce erosion and water runoff from agricultural land. Integrated pest management is now being practiced on over 1.2 million acres in the basin. About 3,000 acres have been enrolled in the Wetland Reserve Program. The work is on schedule to reach the goal of a 40 percent reduction of nutrients in the Bay by the year 2000.

Environmental benefits include improved water quality in the Bay and its tributaries, through a reduction of sediment, nutrients and pesticides. Improved wildlife/fisheries habitat in the Bay and throughout its drainage basin is also an environmental benefit.

Question. How much funding will be needed, by fiscal year, to complete this project?

Answer. A base level of \$4.75 million will be needed through fiscal year 2000 to reach the primary goal of a 40 percent reduction of nutrients the Bay.

Question. How much is included in the fiscal year 1998 request?

Answer. The fiscal year 1998 budget request includes \$4.75 million to continue this work.

GIS CENTER FOR ADVANCED SPATIAL TECHNOLOGY

The Committee has supported the GIS Center for Advanced Spatial Technology in Arkansas and its work with digital soil maps and the continuation of the National Digital Orthophotography Program.

Question. Has NRCS maintained its strong relationship with the center and has NRCS remained the lead agency within the USDA for the development of GIS capabilities?

Answer. Yes, the NRCS has continued to maintain a strong relationship with the GIS Center for Advanced Spatial Technology (CAST) in Arkansas.

The NRCS is a leader within the USDA for the development of digital GIS information such as the digital orthophotography, soils databases and Natural Resource Inventory (NRI) databases. The Forest Service is also a major user of GIS within the USDA. With the increasing availability of digital geospatial databases, the NRCS is using GIS technology in more offices than ever before. GIS is being used at all levels of the organization, this includes the field service centers, state, regional and national headquarters offices.

We foresee the largest use of GIS will happen at the field service center level. The NRCS has about 300 sites presently using GIS. The NRCS and the Farm Service Agency are currently working on a GIS Business Process Reengineering project with the goal to provide improved services to USDA customers by using GIS and digital geospatial data. We believe business processes which acquire, access, analyze, update, share and display geospatial data may have the greatest potential to increase information accuracy, data-sharing and at the same time reduce duplication and customer time spent at the field service centers.

MUD RIVER DAM PROJECT

The Committee in fiscal year 1997 encouraged the Department to continue working on the upper MUD River Dam project in West Virginia.

Question. What is the status of this project? What other Federal or State agency's funding is available for the project? What funds are needed, by fiscal year, to complete this project? How much is included in the fiscal year 1998 budget request?

Answer. The Upper Mud River Watershed Project is about 95 percent completed. A contract for the recreation facilities was awarded and construction is underway for the final recreation phase. A contract for dam repairs is planned to be awarded in April 1997, with work beginning in June 1997. All work will be contracted in fiscal year 1997 and project completion is expected by December 1997. No fiscal year 1998 budget request is anticipated.

MISSISSIPPI DELTA WATER RESOURCES STUDY

The Committee provided fiscal year 1997 funding for the Mississippi Delta water resources study at the fiscal year 1996 funding level.

PART 1

412

Question. What is the status of this study?

Answer. The Mississippi Delta Water Resources Study is approximately two-thirds completed with about 75 percent of the needed data collected. Draft reports have been prepared. Approximately 5 staff years will be dedicated to this project from within NRCS and the remaining staff time needed will be from other sources.

Question. What funds are needed, by fiscal year, to complete this study? How much is included in the fiscal year 1998 budget request?

Answer. The study is scheduled for completion at the end of fiscal year 1997. No funds are requested for the study in the fiscal year 1998 budget.

GOLDEN MEADOW, LOUISIANA PLANT MATERIALS CENTER

The Committee provided \$100,000 to Golden Meadow, Louisiana, Plant Materials Center for fiscal year 1997 to facilitate the testing of application technologies in the development of an artificial seed for smooth cordgrass.

Question. What is the status of the project?

Answer. The project has gone well. Protocols have been worked out that permit production of artificial seed at will. The plan is to produce large numbers of them during the spring of 1996 in order to establish field plantings. The field plantings will evaluate establishment and survival characteristics under different environmental conditions. Depending on the success of field plantings, it may be necessary to "fine-tune" planting methodology and/or production techniques of the artificial seed.

Question. What funds are needed, by fiscal year, to complete this study? How much is included in the fiscal year 1998 budget?

Answer. The 1998 budget will continue funding at a comparable level in order to maintain the momentum and progress that has already been achieved. A funding level of \$150,000 annually would allow for completion of the project by the year 2001.

CROWLEY, LOUISIANA, RICE RESEARCH STATION

Question. Has the NRCS continued its work with the Crowley, LA, Rice Research Station on the development of additional species which will help stop erosion on inland wetlands and barrier islands? What programs have the NRCS helped with the Station? How much is requested in your fiscal year 1998 budget to help with this research?

Answer. The relationship between the NRCS and Crowley Rice Research Station has been a productive one which has led to development of an artificial seed for smooth cordgrass. This species can be very effective in reducing erosion on inland wetlands and barrier islands. Since the species seldom produces viable seed, however, a unique approach of using artificial seed was adopted to provide adequate materials. The effort has now reached the point where field testing will be undertaken.

Another species, California bullwhip, with proven erosion control characteristics also has potential for tissue culture work. This is being considered by the Research Station, and preliminary evaluations of their potential are being undertaken in order to develop a new release. NRCS has helped the Station in identifying those species that: have both the greatest application for conservation uses, and the potential for tissue culture work. NRCS also assists in field testing of new materials and has been able to accelerate such efforts through productive interactions with the Station. Examples include: efficiency of transplant methodology and hydro-mulching of artificial seed. Continuation of the interaction between NRCS and the Crowley Rice Research Institute would cost \$125,000 in fiscal year 1998.

RESEARCH ON NUTRIA-RESISTANT MATERIALS

The Committee provided in fiscal year 1997 \$150,000 to continue a program for research on nutria-resistant materials.

Question. What is the status of this research and the location where the research is on-going?

Answer. The work to date has focused on smooth cord grass with an underlying strategy of producing sufficient plants in a restoration effort to survive impact of nutria activities. The effort has reached the stage where it can now be field-tested in 1996 on a broader scale. Previous evaluations have been undertaken at the Crowley Rice Research Station. Current plans are to establish 10 evaluation plots in Cameron Parish, LA. It is estimated that restoration success can probably be achieved even with a 10-20 percent loss to nutria during plant establishment. Other options such as including chemical additives to gel capsules will be explored as warranted.

PART 1

413

Question. Is funding requested for fiscal year 1998 for this project? How much?
Answer. The 1998 budget proposes to fund this work at the current level of \$150,000 in order to maintain momentum that has been generated.

RURAL RECYCLING AND WATER RESOURCE PROTECTION INITIATIVE

The Committee provided \$3 million for the continuation of the multiyear rural recycling and water resource protection initiative in the Mississippi Delta region of Louisiana, Arkansas and Mississippi.

Question. What is the status of this project?

Answer. The project is approximately one third complete.

Question. What funds are needed, by fiscal year, to complete this initiative? How much is included in the fiscal year 1998 budget request?

Answer. Approximately \$3 million is needed in each fiscal year from 1998 through fiscal 2002 to complete the initiative. The fiscal year 1998 budget request includes \$3 million for the rural recycling and water resource protection initiative.

NEW YORK CITY WATERSHED AGRICULTURE PROGRAM

Question. How did the Department assist in the evaluation of the New York City Watershed Agriculture Program? How much money does the fiscal year 1998 budget request for this program?

Answer. The Congressional earmark stated that NRCS would assist the Watershed Agricultural Council with the evaluation of its programs to be conducted by EPA in 1997. To date there has been no contact from the Watershed Agricultural Council or EPA indicating the assistance they desire from NRCS. The 1998 budget did not include a specific request for this program.

INDIAN CREEK WATERSHED PROJECT

How is the Department providing assistance to complete the Indian Creek Watershed project in Mississippi in fiscal year 1997?

Question. What is the status of this project?

Answer. The plan for the Indian Creek Watershed in Mississippi has been completed by NRCS and is now undergoing review here in the National office. Planned works of improvement provide flood protection to approximately 350 socially and economically disadvantaged residents and business owners in the rural community of Luka, Mississippi. The cost of the project is estimated at \$3.6 million and the benefit/cost ratio is 0.3/1.0.

Question. What funds are needed, by fiscal year, to complete this initiative? How much is included in the fiscal year 1998 budget request?

Answer. Approximately \$3.06 million of Public Law 83-566 funds would be needed to implement this project. The project will compete with other approved projects for funding.

TRINITY BASIN COOPERATIVE STUDY

The Committee urged the Department in fiscal year 1997 to provide necessary funding to meet Federal obligations to complete the upper Trinity basin cooperative study in Texas.

Question. What is the status of this study?

Answer. The study is progressing well. This is the fifth year of this seven year study being carried out with the Tarant County Water District.

Question. How much is the Department providing in fiscal year 1997? How much is in the fiscal year 1998 budget request for this study?

Answer. Funding for fiscal year 1997 was \$200,000 and is being used for further development of the SWAT model to include in stream dynamics. With that capability, the model will be able to be linked with several EPA models such as WASP4 for reservoirs. In addition, extensive sampling and monitoring of streams is being carried out so that the model can be calibrated to existing conditions. The fiscal year 1997 funding should provide enough money to complete the project.

MONROE COUNTY, WEST VIRGINIA, PLANT MATERIALS CENTER

In the fiscal year 1997 Committee report, the Department was instructed to begin construction of the plant materials center in Monroe County, West Virginia, from funds earmarked for this purpose in previous appropriations.

Question. What is the status of this plant materials center?

Answer. The conceptual design package dealing with buildings to be constructed at the plant materials center is nearing completion. It is scheduled to be reviewed by the end of March so that bids can be received. In late April, it is anticipated that

PART 1

414

the contract can be awarded for the construction of buildings. Construction should begin later this summer.

Question. What is the amount that the Department will use in fiscal year 1997 for this project? How much money is in the fiscal year 1998 budget request for this project?

Answer. The fiscal year 1997 budget estimate for this plant materials center being constructed at Alderson, West Virginia is \$401,000. We anticipate that the funding level for fiscal year 1998 will be the same.

Question. Does the Department have a feasibility study on the establishment of this plant materials center? When will you provide it to the Committee?

Answer. During the course of the development of the fiscal year 1996 appropriations bill and the accompanying report, agency officials discussed with Subcommittee staff several ways to approach the plant materials center in West Virginia. As those discussions concluded, the Subcommittee staff relayed that it was decided to include language which would direct the construction of this center utilizing funds normally included in the appropriations for this program. Even though a feasibility study was discussed, the usefulness of the center and the Subcommittee's intent was clear. Therefore, no agency staff time or funds were dedicated to a study and we have proceeded with design and anticipated construction of the plant materials center.

NATIONAL NATURAL RESOURCES CONSERVATION SERVICE FOUNDATION

Question. The Committee included bill language in the fiscal year 1997 Appropriations bill which allowed up to \$250,000 of conservation operations to be used for the National Natural Resources Conservation Service Foundation. How much did the Department provide in fiscal year 1997?

Answer. The Department did not Fund the Foundation in fiscal year 1997. A small amount of staff time was used to collect the nominations for the Board, file them, and to respond to questions about the status of the Foundation.

Question. How much is requested in the fiscal year 1998 budget?

Answer. No funds are requested for the Foundation in fiscal year 1998 because some members of Congress have questioned using Federal funds for this purpose.

WATERSHED AND FLOOD PREVENTION OPERATIONS

DEVIL'S LAKE BASIN

Question. Please provide a summary of the situation in the Devil's Lake basin, the actions that NRCS has taken to address this situation, and the funding included in the fiscal year 1998 request to address this problem.

Answer. Devils Lake residents and agencies are preparing for a lake level of 1,440.5' in June. The snow pack is still heavy with 3" of stored moisture. The Corps of Engineers is raising the City of Devils Lake dikes to 1,440 for spring runoff. The North Dakota Department of Transportation is raising three state highways and one federal highway to 1,440 and adding erosion barriers. The North Dakota Soil and Water Commission is promoting the As Soon As Possible (ASAP) wetland restoration program, and with the newest 70 applications will achieve 10,200 acre-feet of storage.

NRCS is participating on the Devils Lake Interagency Task Force and assisting the State of North Dakota in implementing the Devils Lake Emergency Response Plan for Upper Basin Water Retention.

Eight NRCS Field Offices are providing priority scope and effect determinations where health and safety are issues.

NRCS detailed the Watershed Regional Technology Team from Lakewood, Colorado to develop a comprehensive water management plan for the St. Joe and Calio Sub-Watershed Basins.

NRCS is working with the Devils Lake Task Force to develop comprehensive water management plans in nine sub-basins over a 9 year period. The expected cost is \$4.3 million and a funding source has not yet been identified. However, the Basin has been declared a priority area for both the Conservation Reserve and Environmental Quality Incentives Programs.

WATERSHED PROJECTS STATUS

The Committee expressed its expectation that work continue on the Little Sioux and Mosquito Creek watersheds in Iowa; the Little Auglaize watershed in Ohio; Little Whitestick-Cranberry Creek in West Virginia; the Potomac headwaters in West Virginia; and Virgil Creek in New York.

PART 1

415

Question. What is the status of each of these projects? What is the timetable for completion for each of these projects? What funding will be needed in each fiscal year to complete each project?

Answer. The Little Sioux Watershed Project in Iowa is one of the eleven watersheds authorized under the Flood Control Act Public Law 78-534. The project received directed funds of \$1.4 million in fiscal year 1997 and is about 68 percent completed. The remaining structural work could be installed by 2016 at an annual cost of \$750,000 and the remaining land treatment could be applied by 2041 at an annual Federal cost of \$1,400,000.

Mosquito Creek Watershed in Iowa is authorized under the Watershed Protection and Flood Control Act Public Law 83-566. The project received directed funds of \$100,000 in fiscal year 1997 and is about 85 percent completed. Expected future funding needs are about \$1.5 million.

The Little Auglaize Watershed in Ohio is authorized under Public Law 83-566 for flood control. The project received directed funds of \$1.3 million in fiscal year 1997 and is about 95 percent completed. At present funding levels and Ohio priorities, the project will be completed in fiscal year 1999.

Little Whitestick-Cranberry in West Virginia is authorized under Public Law 83-566 and received directed funding of \$3.4 million in fiscal year 1997. This installs the first phase of the project and the remaining needs are about \$3.0 million.

Potomac Headwaters Watershed is a large Public Law 78-534 project in West Virginia, Virginia, and Maryland and is administered by West Virginia. The project received \$2.3 million in directed funds in fiscal year 1997 and the remaining needs are about \$80 million. A portion of the fiscal year 1997 funds are being utilized to begin Community-based Comprehensive Resource Management Plans where 1996 floods occurred.

Virgil Creek Watershed in New York is a Public Law 83-566 Flood Prevention project with a single dam. The project received directed funds in fiscal year 1997 of \$2.0 million to contract for the first phase of the dam. Every effort will be made to direct the remaining \$2.5 million in fiscal year 1998.

Question. How much is included in the fiscal year 1998 budget request for each of these projects?

Answer. No project specific budget requests are made by NRCS for Public Law 83-566 and Public Law 78-534. The Watershed Protection and Flood Prevention Operations appropriation is allocated according to the quality of the approved projects, their contributions to the NRCS Strategic Plan, and commitments of sponsors.

LOWER AMAZON AND FLAT CREEK PROJECT

The Committee encouraged the Department in the fiscal year 1997 Appropriations bill to work with local government entities and using other conservation programs in Oregon to provide assistance on the Lower Amazon and Flat Creek project.

Question. What is the status of this project? Which local government entities is the Department working with? Were other conservation programs used? If so, which ones?

Answer. The Lower Amazon and Flat Creek project is a proposal to modify existing flood control measures to restore flood plains and wildlife habitat near Eugene, Oregon. The project is in active planning by the U.S. Army Corps of Engineers, Bureau of Land Management, Natural Resources Conservation Service, City of Eugene, and the Lane County Council of Governments. Opportunities for other conservation programs are being examined, including State of Oregon as well as USDA Wildlife Habitat Incentives Program and the Wetland Reserve Program.

Question. How much money is requested in the fiscal year 1998 budget for this project?

Answer. Again, no project specific fiscal year 1998 budget proposals have been made by NRCS.

WEST VIRGINIA RESOURCE MANAGEMENT PLANS

The Committee directed the NRCS in the fiscal year 1997 Appropriations bill to provide resources to complete resource management plans for communities in West Virginia where the 1996 floods occurred.

Question. What is the status of these community-based comprehensive resource management plans?

Answer. NRCS in West Virginia has provided the necessary resources to complete innovative community-based comprehensive resource management plans for communities devastated by the floods of 1996. fiscal year 1997 funds were made available from the Potomac Headwaters Public Law 534 allocation and is being used to secure

PART 1

416

an A/E consulting firm to develop a North Fork South Branch Potomac River Watershed Plan. The consultant will work under the direction of a NRCS Community Based Assistance planner and will provide direct assistance to the local resident North Fork Watershed Committee.

Question. What is the amount of necessary resources provided in fiscal year 1997? How much is requested in the President's fiscal year 1998 budget?

Answer. \$300,000 was made available in March, 1997, and no specific additional needs or budget requests have been identified for fiscal year 1998.

WATER STORAGE AND DELIVERY SYSTEMS ON HAWAII AND MAUI

Question. How has the Department enhanced the water storage and delivery systems on the islands of Hawaii and Maui as the Committee directed in the fiscal year 1997 Appropriations? How much does the Department estimate that it will cost to enhance these systems? How much is requested in the President's fiscal year 1998 budget?

Answer. NRCS and Hawaii state sponsors have developed three water storage and delivery system plans on the islands of Hawaii and Maui under authority of the Watershed Protection and Flood Control Act Public Law 566.

On Maui, the Upcountry Maui Watershed Plan/Environmental Impact Statement (EIS) proposes storage and a distribution system to irrigate 473 acres in Upper Kula, supply irrigation water for the Hawaiian farmers in the Department of Hawaiian Homelands Keokea agriculture plots, and better utilize Other Important farmland. The project also relieves the demands on the Olinda Water Treatment Plant and will aid potable water supplies. The total cost of the project is \$9.0 million with about 49 percent paid by the local sponsors. The Final Plan/EIS is complete.

On the Big Island of Hawaii, two water storage and delivery system projects are developed. The Waimea-Paauiilo Draft Plan/EIS has been completed. The Plan proposes a 131 million gallon reservoir at Kauahi, a reservoir supply line, extended irrigation system, and a livestock drinking water distribution system. The project will serve 167 farmers on 1,985 acres and 265 ranchers on 22,900 acres. Most of the farmers and ranchers are of native Hawaiian ancestry. Total installation will be \$17.4 million.

The Lower Hamakua Watershed Project on Hawaii was initiated in response to serious social and resource problems that followed the failure of a major sugar plantation. The draft Plan/EIS is being revised to address botany, stream archaeology, and land rights. Preliminary costs are \$5.0 million.

Again, no project specific budget requests are made by NRCS for Public Law 566. The Watershed Protection and Flood Prevention Operations appropriation is allocated according to contributions to the NRCS Strategic Plan, quality of plans and readiness of sponsors.

EWP FUNDING TO MISSISSIPPI COUNTIES

Question. How much did NRCS allocate to the following Mississippi counties with EWP funds appropriated for fiscal year 1997: Adams, Alcorn, Clairborne, Covington, DeSoto, Forrest Grenade, Hinds, Holmes, Itawamba, Jones, Leake, Lee, Lowndes, Madison, Monroe, Neshoba, Panola, Perry, Pontotoc, Prentiss, Rankin, Tippah, Union, Warren and Yazoo. How much is requested in the President's fiscal year 1998 budget for these counties? What is the status of the emergency watershed needs for each of these counties?

FIRST GROUP UNDER WATERSHED AND FLOOD PREVENTION OPERATIONS

	Fiscal year 1997 appropriation	Status of needs
Adams	\$5,463,000	\$1,500,000
Alcorn		300,000
Clairborne		500,000
Covington		200,000
DeSoto		1,000,000
Forrest		1,000,000
Grenada		600,000
Hinds		3,000,000
Holmes		500,000
Itawamba		200,000

PART 1

417

FIRST GROUP UNDER WATERSHED AND FLOOD PREVENTION OPERATIONS—Continued

	Fiscal year 1997 appropriation	Status of needs
Jones		500,000
Leake		200,000
Lee		1,500,000
Lowndes		200,000
Madison		5,000,000
Monroe		200,000
Neshoba		500,000
Panola		200,000
Perry		100,000
Pontotoc		200,000
Prentiss		200,000
Rankin		1,500,000
Tippah		200,000
Union		200,000
Warren		300,000
Yazoo		200,000
Total	5,463,000	¹ 20,000,000

¹This need for \$20 million for Emergency Watershed Protection funds is a special authority within the President's request for Emergency Supplemental Appropriations for fiscal year 1997. This authority would allow NRCS to address damages in Mississippi from storms in 1991-94. EWP funding requests are not a part of the fiscal year 1998 budget process.

VERMONT PROJECTS

In the fiscal year 1997 appropriations bill the Committee encouraged the Department to complete work on the following projects in Vermont as funding allowed: Lower Otter and Dead Creek, Lemon Fair River, lower Winooski River, lower LaMoille River, lower Black River, and the Barton and Clyde River projects.

Question. What is the status and costs of each of these projects?

Answer. The Lower Otter and Dead Creek, Lemon Fair River, Lower Winooski River, Lower LaMoille River, Lower Black River, and the Barton and Clyde River projects received \$425,000 in directed funds in fiscal year 1997 for work on these projects. An additional \$60,000 is needed in fiscal year 1998 for completing them.

Question. How much is requested for each of these projects in the President's fiscal year 1998 budget?

Answer. No specific projects were identified in the fiscal year 1998 budget request.

WATERSHED PLANNING

ZUNI RIVER WATERSHED

The Committee provided fiscal year 1997 funding of \$300,000 for the Zuni River watershed.

Question. What is the status of work on this project? What is the timetable for completion of the project? What funding will be needed in each fiscal year to complete this project?

Answer. The Zuni River Watershed Act (ZRWA) was passed by Congress in August 1992 with the purpose of authorizing the development of a plan for the management of natural and cultural resources within the Zuni River Watershed and upstream from the Zuni Indian Reservation. An advisory group of 22 different agencies, groups, and individuals was formed to direct the development of a plan. A working group of eight individuals was organized to provide detailed guidance. Ten technical teams were formed to carry out the actual study. A full time coordinator has been provided by NRCS.

Accomplishments in fiscal year 1996 include the completion of field work by the Field Resource Inventory Team. This data became available for the technical teams to begin evaluating the watershed and developing recommendations. The field work by the Hydrology/Erosion Team was completed. This information will be the basis for the erosion assessment and recommendations. A field review by the Advisory Committee was held and landowners interviews were carried out.

Question. How much is included in the fiscal year 1998 budget request?

PART 1

418

Answer. Plans for fiscal year 1997 are to complete the project and issue the final plan in September 1997. A video is also planned for the presentation of the report. However, no additional construction costs were identified for the 1998 fiscal year.

LITTLE AUGLAIZE AND PINEY CREEK WATERSHEDS

The Committee expressed its expectation that work continue on the Little Auglaize watershed in Ohio and the Piney Creek Watershed in Mississippi.

Question. What is the status of the work on these watersheds? What is the timetable for completion of these projects? What funding will be needed in each fiscal year to complete each project?

Answer. The Little Auglaize Watershed is authorized under the Watershed Protection and Flood Control Act Public Law 566 for flood control. The project received directed funds of \$1.3 million in fiscal year 1997 and is about 95 percent complete. At the present funding levels and Ohio priorities, the project will be completed in fiscal year 1999.

Piney Creek Project is a sub-watershed within the Yazoo Watershed authorized by the Flood Control Act of 1944 (Public Law 534). Of the total Yazoo allocation to Mississippi, Piney Creek received about \$200,000 and installed two structures in fiscal year 1996. Allocations to the Yazoo are expected to continue at present levels with the Piney Creek share determined by state priorities.

Question. How much is included in the fiscal year 1998 budget request?

Answer. Again, no project specific budget requests are made by NRCS for Public Law 566. The Watershed Protection and Flood Prevention Operations appropriation is allocated according to contributions to the NRCS Strategic Plan, quality of plans and readiness of sponsors.

TECHNICAL ASSISTANCE FOR GANGLAND CONSERVATION

The Administration's request includes an increase of \$4.1 million for Conservation Technical Assistance for training for gangland conservation and the improvement of conservation district skills.

Question. The budget states that the money requested will be supplemented with up to \$944,000, for a total of \$5 million to train NRCS staff. From which account does this supplemental money come?

Answer. The additional \$944,000 that may be utilized to implement the grazing lands training program will come from a variety of sources. Conservation Technical Assistance funds can be used to support the training if necessary. Additionally, funding may be leveraged with those from federal, state and local partners to provide training to a wider audience that would include representatives from federal, state, and local governments, industry, private livestock producers and the public. Participating partners may include the member organizations of the National GULCH Steering Committee, Conservation Districts, Universities, and others.

Question. How many full-time equivalent employees will be hired with these additional funds?

Answer. The funds have not been requested to hire new federal employees. However, approximately 1,000 employees will benefit from this training. A majority of the training will be developed to include a variety of partners, including university, extension, industry, private grazing land owners and managers, as well as the public that benefit from properly managed grazing lands.

DIGITIZATION OF THE GEOGRAPHICAL INFORMATION SYSTEMS

The President's fiscal year 1998 request proposes an increase of \$10 million to accelerate the recent rate of acquisition of the digital orthophotography maps and data digitization. The request states that an increase from the base of \$7.5 million would allow USDA to continue the 1997 initiative of providing the service centers with digital orthophotography map and digitized soil survey data for completed soil surveys for the entire United States in about 9-10 years.

Question. Should less than \$10 million be available for this function, how does one calculate the rate of digitization?

Answer. This money will be used to accelerate both soil survey digitizing, and the production of digital orthophotography. However, before the soils can be digitized, two significant business processes which constitute two-thirds of the work involved to develop a digital product must be completed. First, the older soil maps must be updated and recompiled to fit the new accurate orthophoto base map. The updated maps are quality controlled for accuracy and matching to adjoining maps. Second, information about the soils such as descriptions and soil correlations must be completed. The digitizing process itself is usually the least expensive and time consuming of the three major business processes. The rate of digitizing alone is based

PART 1

419

on the complexity of the individual soil survey areas. In areas where the soil surveys are complex, mapping of the soils to the new digital orthophotography base map and digitizing requires more time as compared to areas where the patterns of soils and the detail on the maps are not as complex. Based on our experience, the average cost to just digitize a soil survey area is \$20,300. If less than the \$10 million is available for digitizing soil surveys, fewer soil survey areas will be digitized based on the cost for digitizing.

The rate of digital orthophotography production is calculated on a single map basis, approximately \$1,000 per digital orthophoto map. An average county has approximately 70 maps for complete coverage, this translates to an average of about \$70,000 per county.

To ensure easy access to soils and natural resource information by our customers and partners, the NRCS goal is to have the digital orthophotography and digital soils data completed for the nations private lands by the year 2002. This date matches the USDA target for putting geographic information systems (GIS) in Field Service Centers to improve business process efficiencies, reduce duplication and improve customer satisfaction. If \$10 million is made available, the acquisition of digital orthophotography and the digitizing of soils will be completed in year 2003. If the \$10 million is not approved, the acquisition of digital orthophotography and the soil digitizing will not be completed on schedule.

Question. How will the work be accomplished without additional USDA employees being added to the payroll if the \$10 million increase requested is provided?

Answer. The additional \$10,000,000 being requested is to accelerate the digitizing and acquisition of digital orthophotography initiative started in fiscal year 1997. In fiscal year 1997, we are putting into place an infrastructure of people and technology to provide quality digitized soil surveys. Once this infrastructure is operational and the staffs are sufficiently trained, our digitizing capacity will be greater than it currently is. Taking advantage of this increased production capacity will not require adding more people to the payroll of NRCS. In addition, we plan to increase the amount of digitizing to be contracted. Re-direction of staff already employed by the agency for this accelerated initiative will provide more staff years to do this work.

Digitizing the soil maps is only part of the work that has to be done to provide a quality product as we transition the soil survey program from one originally designed to produce hard-copy publications to one that develops maps and related soil descriptions and correlations into digital format. Having the maps and associated resource data developed for use in an information system that is accessible by the public allows many customers to produce their own information without having the NRCS to do it all for them. Bringing older soil survey information to up-to-date standards is a heavy workload, but must be done to ensure that the maps and related data match between differently soil surveys. This will take several years to complete as the soil surveys that we call modern soil surveys have been conducted over the last 50 years. With the changing needs of modern customers, this has left us with a patch work quilt of soil surveys across the nation. Some surveys meet current needs, however many do not meet current standards. We estimate that about 20 percent of the soil surveys are out of date, and need some form of updating to meet customer expectations. This would be about 400 soil surveys. This updating requires field mapping work, and associated quality assurance checks to ensure our surveys meet the National Cooperative Soil Survey quality standards.

No additional employees will be needed to acquire digital orthophotography since the work is contracted to the private sector. The US Geological Survey administers the digital orthophotography contract, and staffing is already in place for this function. Digital orthophotography is delivered to the NRCS in a form ready to use in a GIS and for soil mapping and digitizing.

SOIL SURVEY RESOURCE INFORMATION

The fiscal year 1998 budget request proposed an increase of \$5 million to fund 75 Full Time Equivalents (FTE) to prepare 2,400 completed soil surveys for digitizing and to provide information to update soils data.

Question. Would this function be completed in fiscal year 1998? If not, when will you expect to finish this function and how much more money would you anticipate needing for those fiscal years beyond 1998?

Answer. The initiative for updating soils data in association with the digitizing of soil survey areas was proposed for a 6 year project funded at \$5 million each year. Soil Survey information, like any other kind of information, must meet the current needs of customers if it is to remain useful. Soil Survey information is now available for about 94 percent of the nation's privately owned land and for about 76 percent

PART 1

420

of the entire country. The soil surveys we call modern soil surveys have been conducted over the last 50 years, and with the changing needs of modern customers that has left us with a patch work quilt of soil surveys across the nation. Some meeting current needs, some not. This \$5 million a year would be used to ensure critical data needed to provide current interpretations would be available for those soil surveys digitized. This would not however, do the entire job of bring all soil surveys up to current standards

Question. Is the NRCS currently doing any soil surveys? If so, how much money will be allocated for these surveys in fiscal year 1998? How many will be completed in fiscal year 1998?

Answer. NRCS is currently conducting soil surveys in 640 areas that have not been previously mapped, and is updating older soil surveys in 224 areas where the information is no longer adequate to meet current customer needs. Assuming similar funding as we received in fiscal year 1997 we will allocate \$76.4 million dollars to this initiative. Of that approximately 25 percent or \$19 million is used in providing soil science expertise to assist the agency and our customers in the use of soil information. The remainder is used for soil survey and the associated support activities.

Approximately 50 to 55 soil surveys are completed each year.

TECHNICAL ASSISTANCE FOR RESOURCE CONSERVATION AND DEVELOPMENT PROGRAM

The fiscal year 1998 budget calls for an increase of \$18 million under the Resource Conservation and Development program to fund 400 non-federal watershed and rangeland coordinators in 25 states for high-priority watersheds.

Question. Which are the 25 states that have high-priority watersheds? Are these recently designated high-priority watersheds?

Answer. The states and the particular high-priority watersheds that would benefit from the assignment of coordinators have not been selected at this time. The selections of locations would be made by the Deputy Chief for Programs and the state conservationists based upon recommendations from the state technical committees, local leaders and partners. The list would be developed once funding for the coordinators was allocated.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

The Department of Agriculture announced on March 19, 1997, preliminary state funding allocation for the Environmental Quality Incentives Program (EQIP). The Department allocated \$170 million for state priority areas. The remaining \$30 million will be allocated to the states when their final needs for technical, financial, and educational assistance are determined.

Question. It is estimated that NRCS will award 5,143 contracts costing approximately \$170 million over fiscal years 1997 and 1998. How did NRCS decide on this number of contracts and these costs?

Answer. NRCS conducted a workload analysis to estimate this information. For the analysis, we assumed that \$180 million would be available each year for financial assistance in contracts and that 10 percent, or \$20 million, of EQIP funds would be available for technical assistance costs related to operating the EQIP program. The actual technical assistance costs to carryout EQIP will be more than the \$20 million. Using our experience in the Great Plains Conservation Program and the Colorado River Salinity Control Program, which used long-term contracts, we assumed that an average contract would cost about \$35,000 based on about 40 percent of contracts would be at the \$50,000 per contract payment limit, and about 60 percent of contracts would average \$25,000 per contract. This results in 5,143 contracts per year.

Question. When do you think that the states' final needs will be assessed? How will the Department assess these needs?

Answer. The final allocations will be made when the final rule is effective. The preliminary funding information was distributed in March so that state conservationists could make decisions as to the amount of funds that are provided for significant state-wide natural resource concerns and the amount that will be allocated to each priority area. National guidance provides that at least 65 percent of the funds allocated to the State must be allocated to priority areas. However, the State conservationist, with the advice of the State Technical Committee and concurrence of FSA, may allocate a higher percentage to priority areas and less than 35 percent to significant state-wide natural resource concerns. The state funding decisions will be shared with the national office about April 7th. We will review them to ensure that on the national level 50 percent of the funds are targeted to natural resource concerns related to livestock production, and then finalize allocations.

PART 1

NEW WORLD MINE

Question. The Clinton Administration has offered \$65 million to Crown Butte Mines, Inc., in a cash deal to stop development of a proposed mine near Yellowstone National Park. To offset the \$65 million, the administration proposes deferring entry of 2 million acres into the Conservation Reserve Program (CRP) from 1997 to 1998. I understand this proposal will require legislative action. Is that correct?

Answer. Yes, legislation will be necessary to complete the proposed exchange of assets.

Question. Why did the Administration offer up CRP funds as an offset?

Answer. Since protecting the New World Mine is an important natural resource concern, it seemed appropriate to find an offset from another Federal natural resource protection program. The offset proposed from the CRP would provide the needed savings with limited impact on the program.

Question. How will this impact the CRP?

Answer. The impact on the CRP will be minimal. There will be no change in the maximum enrollment target for additional acreage for the two years combined, fiscal years 1997 and 1998. The target is to enroll 28 million acres over this period of which the amount for fiscal year 1997 will still be at least a very ambitious 17 million acres. The Administration's proposal will not reduce the amount of acreage eventually eligible for the CRP and we still intend to enroll the same 36.4 acres by 2002.

Question. CRP unobligated balances are essential to fund technical assistance for program needs in fiscal year 1997, fiscal year 1998 and future years. Do you believe that this proposal will set a precedent by the Administration as other PAYGO problems arise?

Answer. The Administration will have to address PAYGO problems as they arise and will always seek the best alternative to address them. We do not think this proposal will set a precedent as far as using the CRP enrollment activity for fiscal year 1997 made this an attractive alternative this year.

Question. How will it impact the funds required for CRP/WRP technical assistance in future years?

Answer. It should not impact future technical assistance needs for CRP/WRP in 1997 and 1998 since this will be funded through unobligated 1996 CRP funds. Technical assistance for the CRP and WRP are more directly affected by the 1996 Farm Bill which amended Section 11 of the CCC Act by limiting the total amount of CCC funds made available for non-program payments to the total amount spent in 1995.

Question. Is it not true that the enrollment for CRP is unpredictable because farmers are watching crop prices before they decide how much land to enroll?

Answer. The number of farmers that will bid in any CRP sign-up is unpredictable. Short-term and long-term consideration of prices is certainly a factor. A high price scenario that farmers project may only be temporary.

Question. What are the CRP enrollment projects in fiscal year 1998 and the out-years?

Answer. The fiscal year 1998 budget assumes the following enrollment projects for CRP:

	<i>Acres</i>
1998	19,000,000
1999	8,500,000
2000	5,300,000
2001	758,000
2002	1,000,000

Question. What are the assumptions underlying these projections?

Answer. CRP enrollment is assumed to gradually increase to 36.4 million acres by 2002 which is the maximum enrollment level authorized for this program. With 21.4 million acres scheduled to expire on September 30, 1997, 4.8 million acres the following year and 3.4 million acres on September 30, 1999, it is not practical to expect full replacement of all expiring acres during fiscal year 1997. Therefore, at the time the budget estimates were completed, 19 million acres were projected as the maximum amount likely to be replaced in 1997 with the remaining expiring acres and additional acres needed to return to the 36.4 million acres occurring over several years.

Question. Please explain the PAYGO offset. How much would be saved by delaying the sign-up of 2 million acres of farmland in the Conservation Reserve Program from 1997 to 1998?

Answer. Legislation is required to authorize the use of royalties under this proposal. A critical factor in being able to exchange the royalties is compliance with the so called "PAYGO" requirements of the Budget Enforcement Act of 1990 which

PART 1

422

requires legislation to be budget neutral and to have no net impact on the Federal budget deficit. The Administration estimates that deferring two million acres from the current CRP sign-up for one year will save about \$103 million over five years.

Question. Would this be fiscal year 1998 savings?

Answer. These savings are projects over a five year period so a portion would come in 1998.

Question. Why would it not increase the amount needed to reach your CRP acreage target in fiscal year 1999?

Answer. The proposal only serves to postpone the sign-up of a small portion of the projected acreage, not to reduce the size of the program. The target of enrolling 28 million acres over the next two years will not change.

PLANT MATERIALS CENTERS

Question. Which of the 26 Plant Materials Centers have completed their research? How many products has each center produced and what are they?

Answer. None of the plant centers have completed their work. The work of developing and transferring new plant technology for NRCS Field Offices is an ongoing process which will continue to require new state-of-the-art information to adequately meet emerging resource challenges. The 1996 Farm Bill, for example, has a number of provisions and technology needs which can best be met by information from the plant materials program. Some of the technology needs are yet to be developed.

Centers organize their work load into separate projects that are comprised of individual studies addressing specific conservation needs. At the present time there are approximately 500 active studies receiving attention. As the objectives of individual studies are met, the study is terminated and new ones are initiated. Projects are undertaken to work on high priority needs, and a typical study takes 3–4 years from its inception, to implementation, to transfer of information at the current funding level.

Products from centers most commonly include: releases of new materials; printed information on where, how, and when to use plants; presentations to Field Office staff and land users; revisions of plant science information in NRCS's Field Office Technical Guides; and new/revised plant technical guides that evaluate critical land management approaches. Products like these number in the hundreds annually on a program-wide basis. On a per center basis, a "typical" number would be 20 or more. There is some year-to-year variation depending on the number of studies reaching completion.

Question. What products are currently in the pipeline?

Answer. The plant materials program is a diverse one with many projects underway. Specifically, the program is developing plant recommendations, technology, and products for: Farm Bill Programs such as the Conservation Reserve Program (CRP), Environmental Quality Incentives Program (EQIP), Wildlife Habitat Improvement Program (WHIP), and Wetlands Reserve Program (WRP); critical habitats like wetlands, riparian corridors, and disturbed areas; environmental concerns relating to native plants, noxious/invasive plants, threatened and endangered species; management practices including buffer strips, soil bioengineering, waste management; and, program outreach efforts on tribal issues and with limited resource farmers.

TECHNICAL ASSISTANCE

Question. In the fiscal year 1997 Committee report, the Department was urged to implement CRP and the Wetlands Reserve program (WRP) in their entirety, including technical assistance, through the Commodity Credit Corporation (CCC) as authorized in the 1996 FAIR Act. You indicated in your prepared testimony that the CCC reimbursement cap prevents this. Why does it, when Section 341 of the FAIR Act directs you to use CCC funds to "carry out" these programs?

Answer. Section 161 of the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act) amended Section 11 of the Commodity Credit Corporation Charter Act to restrict the transfer of funds from CCC to any agency of the Federal government, any State, the District of Columbia, any territory or possession or any agencies thereof. Transfers may not exceed the amount that was transferred in fiscal year 1995. This restriction was effective October 1, 1996. Section 341 of the 1996 Act amended section 1241(a) of the Food Security Act of 1985 (the 1985 Act) to provide mandatory funding through the Commodity Credit Corporation to carry out Conservation Reserve Program, Wetlands Reserve Program and EQIP. While section 1241(a) authorizes use of CCC funds, section 161 restricts the amount of CCC funds that can be used by agencies to administer programs on behalf of CCC. The reference in section 1241 of the 1985 Act is similar to other statutes that authorize

PART 1

423

CCC to carryout specific functions. Similarly, the section 11 cap restricts the use of CCC funds under these other programs.

EQIP is exempt from the section 11 cap because section 1241(b) specifically provides that "Of the funds of the Commodity Credit Corporation, the Secretary shall make available \$130,000,000 for fiscal year 1996, and \$200,000,000 for each of fiscal years 1997 through 2002, for providing technical assistance, cost-share payment, incentive payments, and education under" EQIP. The specific language in subparagraph (b) provides authority to utilize CCC funds for EQIP technical and educational assistance in amounts greater than specified in section 11 of the CCC Charter Act.

ENVIRONMENTAL QUALITY INCENTIVES PROGRAM

Question. Many of the local conservation districts have written regarding the use of Conservation Operations technical assistance funds for technical assistance for the Environmental Quality Incentives Program (EQIP).

Have Conservation Operations Technical Assistance funds been used to provide technical assistance for EQIP? If so, why? What is the percentage of this money that has been used?

Answer. In fiscal year 1996, NRCS had to utilize some conservation operations technical assistance funds to implement EQIP or we would not be able to administer the program in all States. For 1997, NRCS has not yet used the \$20 million, or 10 percent, of CCC funds approved by the Office of Management and Budget for technical assistance. Discussions about the total funding for technical assistance provided from the CCC will continue with OMB as better information is developed. NRCS will continue to analyze its conservation technical assistance program in order to determine a more accurate estimate of how much is needed to operate EQIP, other farm bill programs, and the ongoing conservation assistance underway with Conservation Districts.

Question. What is the percentage of technical assistance from CCC needed to provide adequate technical assistance for EQIP? What about CRP?

Answer. NRCS estimates that at least 19 percent of EQIP funds are needed for use in 1997 in providing technical assistance for producers. The technical assistance needs will probably increase in subsequent years. Early analysis indicates it is possible that higher technical assistance needs may be required in future years because: EQIP contracts are 5 to 10 year contracts—there will be engineering, design, oversight, and follow-up activities by NRCS in each of the years of the contract; and, some of the EQIP contracts will have structural practices, such as animal waste facilities, waterways, terraces, etc., which will require significant time commitment from NRCS engineers and technicians for the design, building, and follow-up. However, some of the conservation technical assistance program funds will continue to subsidize the implementation of EQIP because the CCC Charter language does not permit CCC funds to be used for equipment and computers which are necessary to carryout the program.

NRCS and FSA have entered into an agreement concerning reimbursement for the costs of providing technical assistance for CRP that provides that NRCS will receive \$77 per bid offered for fiscal year 1997 and \$456 per bid accepted into the program, if the land is newly enrolled or requires a new conservation plan. In addition, NRCS is beginning to tract actual time spent working on CRP so that in future years reimbursement will be calculated based on actual time spent. For fiscal year 1997, the reimbursement for NRCS technical assistance for CRP will not be paid using CCC funds, but CRP unobligated balances from the appropriated account.

WETLANDS RESERVE PROGRAM TECHNICAL ASSISTANCE

Question. Under current law, reimbursement for NRCS technical assistance for WRP is limited to available funds under the section 11 cap. The FAIR ACT amended the Commodity Credit Corporation Charter Act, section 11, limiting the total amount of CCC funds made available for reimbursement to the 1995 level, effecting reimbursement agreements of all other Agencies competing for the limited funding source available. In addition to the section 11 cap, the FAIR Act prevents the use of reimbursable funds for purposes other than salary. CCC funds cannot be used for supplies, equipment, transportation expenses, etc., thus these funds will have to be absorbed through the Conservation Operations Account.

What is the estimated amount of funds needed for those purposes not covered by CCC funds?

Answer. The technical assistance funds needed for CCC conservation programs affected by the section 11 cap are as follows.

PART 1

424

<i>Program</i>	<i>Fiscal year 1998</i>
Wetland Reserve Program	\$18,200,000
Wildlife Habitat Incentives Program	7,500,000
Conservation Farm Option	3,750,000
Farmland Protection Program	720,000
Conservation Reserve Program	20,642,073
Total	50,812,073

These funds, however, should be available in fiscal year 1998 assuming sufficient levels of unobligated 1996 CRP and WRP funds which were appropriated and therefore not subject to the Section 11 cap.

Question. What unobligated funds will be used and what amount?

Answer. Unobligated WRP appropriations will be used to fund the \$18,200,000 needed for WRP. Unobligated CRP appropriations will be used to fund the \$20,642,073 needed for CRP and the \$7,500,000 needed for WHIP.

Question. Will appropriated funds be necessary? If so, how much?

Answer. For fiscal year 1998, the \$3,750,000 needed for CFO and the \$720,000 needed to fund FPP are proposed to come from the section 11 cap. However, since CCC funds cannot be used for personal property. NRCS will need to fund the purchase of such items from the conservation operations technical assistance account. Approximately 27 percent of the technical assistance costs normally are spent on personal property. Therefore, we expect that approximately \$200,000 would be needed to pay the cost of doing business in the implementation of CFO and FPP in fiscal year 1998.

WATERSHED AND FLOOD PREVENTION OPERATIONS

Question. How many new projects do you anticipate approving in fiscal year 1998?

Answer. We anticipate approving 7 new watersheds operation projects in fiscal year 1998.

In your statement Mr. Under Secretary, you state that the fiscal year 1998 budget request for Watershed and Flood Prevention Operations is \$40 million plus \$60 million in Conservation Operations for technical assistance.

Question. Why has NRCS moved technical assistance for water resources from the Watershed and Flood Prevention Operations?

Answer. Technical Assistance for water resources has been moved from the Watershed and Flood Prevention Operations to Conservation Operations in an attempt to consolidate all technical assistance activities except for the Resource Conservation and Development program under one appropriation account.

Question. How will this impact the activities currently funded under these functions?

Answer. This consolidation of technical assistance funds will not impact the activities currently funded under these functions. The \$60 million, which is approximately the current level, will be allocated to states to be used for implementation of Watershed and Flood Prevention Projects as is the current practice.

WATERSHED AND FLOOD PREVENTION LANGUAGE CHANGES

Question. The NRCS request has changes to the appropriations language. Please explain the rationale for each of the following: language that makes funds available to high-priority projects; deletes language for providing \$15 million under Public Law 534 authority; deletes language for the \$200,000 for employment under the Organic Act of 1944; and, language that allows up to \$15 million to be used to offer subsidized loans through the Rural Utilities Service or Rural Business Cooperative Service.

Answer. As a result of a \$881 million unfunded commitment and limited funding to reduce that amount, NRCS plans to give priority and fund those approved projects which have the highest net benefits. Projects will be evaluated regionally and priorities established. However, many projects have been waiting their turn for funding and commitments made in the past will have to be honored.

Deletion of the \$15 million under Public Law 78-534 represents a combining of the funds for Public Law 83-566 and Public Law 78-534 into a single line item which was proposed in the 1997 President's budget. These programs are very similar in purpose, scope and procedures. Combining of the fund allows us more flexibility to utilize the money where the greatest need exists regardless of the program.

In the past loan money was available to sponsors through the Farmer's Home Administration for loan under the Public Law 83-566 program. Because of high interest rates on the money, loans were rarely made over the past 10 years. During the past two years or so no money was provided to the Rural Development agencies for

PART 1

425

these loans. Under the 1998 proposal, this program has a more attractive interest rate because the funds would be used to buy down the interest rate that sponsors would have to pay for their loans. The use of \$15 million for subsidized loans through the Rural Utilities Service or Rural Business Cooperative Service is an attempt to revitalize the loan program, and allow sponsors the option of borrowing funds at a reduced rate to more quickly complete their projects.

Question. Will this loan from RUS or RBCS be used only for existing Small Watershed Projects?

Answer. The appropriation and funding allocation is for Public Law 83-566, therefore, the Public Law 566 funds for subsidized loans through RUS or RBCS could only be used for these small watershed projects.

FUNDING HIGH PRIORITY PUBLIC LAW 534 PROJECTS

Question. You suggest deleting language that provides for \$15 million under Public Law 534 and shifts the funding of high-priority projects under Public Law 566 authority. What would not be funded as a result of this shift in funding?

Answer. The funding for projects in Public Law 534 and Public Law 566 will largely not change as a result of this shift in funding. Deletion of the \$15 million under Public Law 78-534 represents a combining of the funds for Public Law 83-566 and Public Law 78-534 which was done in the 1997 appropriation language. These programs are very similar in purpose, scope and procedures. Combining of the fund allows us more flexibility to utilize the money where the greatest need exists regardless of the program.

NRCS SALARIES AND EXPENSES

Mr. Under Secretary, you state in your testimony that since December 1994 NRCS has been closing field offices and consolidating services, and reducing staffers at headquarters.

Question. Please give the levels of staffing from 1994 to present that have been cut at the field office level and the headquarters operations.

Answer. We will provide a table showing the percentage of staffing levels for NRCS locations.

NRCS STAFFING LEVELS (PERCENT)

	Fiscal year—		
	1997	1996	1994
National headquarters	13	3	4
Field offices	77	75	72
State offices	15	17	22
Other	5	5	2

¹ In fiscal year 1996 staff for NHQ was 392, down from 536 in fiscal year 1994, the fiscal year 1999 target is 258.

NRCS INSTITUTES

You also state that the establishment of 6 NRCS Institutes will occur so that science and technology can be focused on.

Question. What are these institutes and where are they located?

Answer. Two new Institutes, the Wildlife Habitat Management Institute and the Information Technology Institute, in addition to six original Institutes, have now been established. The eight Institutes, their mission, and their headquarters location will be provided.

EIGHT NRCS INSTITUTES

1. Soil Quality Institute—Ames, Iowa. Mission is to provide leadership in soil quality, build partnerships, and develop, acquire, and transfer soil quality information and technology.

2. Wetland Science Institute—Laurel, Maryland. Mission is to develop, adapt, and transfer science and technology to protect and restore wetlands.

3. Social Science Institute—Greensboro, North Carolina. Mission is to develop and transfer information, procedures, training, and guidance related to the social and economic aspects of human behavior.

PART 1

426

4. Natural Resources Inventory and Analysis Institute—Ames, Iowa. Mission is to improve NRCS's potential to assess status, condition, and trends of our Nation's natural and environmental resources.

5. Watershed Science Institute—Seattle, Washington. Mission is to incorporate ecological principles into natural resource conservation and accelerate development and transfer of watershed-based technology.

6. Grazing Lands Technology Institute—Fort Worth, Texas. Mission is to acquire, develop, coordinate and transfer economically and ecologically sound grazing lands technology.

7. Information Technology Institute—Fort Worth, Texas. Mission is to explore, develop, and transfer the science and technology of state-of-the-art automated processes and tools.

8. Wildlife Habitat Management Institute—Jackson, Mississippi. Mission is to cooperate with conservation partners in acquiring, developing, and transferring wildlife habitat restoration and management technology.

NRCS NATIONAL HEADQUARTERS STRUCTURE ADJUSTMENTS

Question. The Department approved on January 31, 1997, further adjustments to the NRCS National Headquarters structure. What were these further adjustments?

Answer. The goal of the NHQ reorganization was to realign and restructure the current NHQ organization based on our reorganization appraisals and the Blue Ribbon Report on National Resources Inventory and Performance Management. The goal was not to reduce staffing levels, but to ensure an optimum organization structure for the Agency. Every employee has a position at the same grade level and in the same local commuting area under the new structure. There are no changes to the Agency's budget as a result of the reorganization. We will provide highlights of the major functional changes for the record.

HIGHLIGHTED MAJOR FUNCTIONAL CHANGES

1. Establish a new Deputy Chief for Soil Survey and Resource Assessment. This new deputy is responsible for all programs and activities related to the collection of natural resource and soils data, the assessment of natural resource status, natural resources conditions and trends, policy analysis, and strategic planning.

2. Deputy Chief for Programs to better reflect the focus of the Deputy Area. It established a Department of Agriculture Program Outreach Division as a result of the transfer of the Secretary's Section 2501 program from the Farm Service Agency to NRCS. Also transferred to this division are the 1890 and Hispanic Association of Colleges and Universities programs from the Deputy Chief for Management. It established a Civil Rights Program Compliance Division to align Title 6 responsibilities with program operations.

3. Name change from Deputy Chief for Soil Science and Resources Assessment to Deputy Chief for Science and Technology to more adequately align the Deputy Chief with the science and technology consortium of divisions, institutes, and centers which the Deputy Chief supervises.

4. Name change from Deputy Chief for Management and Strategic Planning to Deputy Chief for Management due to the transfer of strategic planning functions to the new Deputy Area. As the result of the separation of Title 6 and 7 responsibilities, it established the Civil Rights Employment Division to provide leadership for Title 7. The old Information Resources Management Division is now called the Information Technology Division to reflect a refocus on technology, and the addition of the Chief Information Officer centralized leadership and decision-making relative to information technology agency-wide.

WORKLOAD SHIFTS RELATED TO FAIR ACT

You state that the President's request for Conservation Operations is increased from fiscal year 1997 because of uncontrollable costs from inflation and pay costs, the cost to relocate NRCS operations to the USDA Service Centers, and increased program responsibilities with the implementation of the conservation programs of the FAIR Act.

Question. What workload shifts did NRCS encounter as a result of the passage and implementation of the FAIR Act?

Answer. There are several steps that we have taken to manage the increases in workload from the new conservation programs and the possible shifts in workload relative to implementation of the 1996 Act, including new AMTA contracts. In allocating fiscal year 1997 funds for EQIP, a natural resource-based allocation formula was developed so the allocation of funds could be primarily based on conservation needs.

PART 1

427

The 15th sign-up for CRP has resulted in tremendous workload in certain areas of the country. We are managing this workload by detailing employees from surrounding areas to assist in completing the sign-up activities. On a Regional level, the Regional Conservationists are coordinating the need for detailees between States.

NRCS is attempting to manage the workload shifts resulting from implementation of the 1996 Act conservation programs without a precipitous shift in employees from any area of the country. We assume that there may be a gradual shift to certain high workload areas as programs are implemented.

RELOCATION COST REQUIREMENTS

Question. What are the fiscal year 1997 relocation cost requirements?

Answer. NRCS has not tracked the costs for USDA Service Center implementation agency-wide which have been funded within the annual funds available to the agency. However, the database on service centers will be enhanced to capture this information.

SMALL WATERSHED OPERATIONS

Question. What process is NRCS using to revisit all Public Law 566 plans to reduce the backlog of work? How many plans do you anticipate will be revised?

Answer. NRCS recently completed a "Backlog Review" where every active watershed project was examined by NRCS, local sponsors, and stakeholders. The intent of the review was to work out those projects and structural works of improvement which were economically or environmentally unsound. As a result of that review, 131 supplements were prepared deleting 1900 miles of channel work and 410 structures. Seventy nine projects were declared completed. About one third of the measures needing to be deleted remain in the plans. These will be deleted in fiscal year 1997 through an estimated 69 supplements to the original plans.

BACKLOG OF WATERSHED PROJECTS

Question. What is the number and dollar amount of project backlogs? How much is included in the fiscal year 1998 request to address this?

Answer. The backlog is presently estimated at \$881 million for Public Law 566. The fiscal year 1998 budget proposes \$40.0 million be used to reduce the backlog.

HIGH PRIORITY FLOOD PREVENTION PROJECTS

Question. The 1998 budget proposal provides no additional funds for flood prevention work under the authority of Public Law 534, but would continue work on the remaining high priority projects that qualify for funding under Public Law 566. Which high priority projects remain?

Answer. We have not developed a specific list of projects that would remain, however, all active Public Law 534 projects contain sub-basin with high priority projects. Priority will be determined by Congressional language, states priorities, funding availability, contribution to the NRCS Strategic Plan, and sponsor commitment.

INFORMATION SYSTEMS

On March 7, 1997, the Colorado Springs Gazette announced that the National Systems and Research Company had won a \$212 million, five-year contract to upgrade computer and communication systems for FSA and NRCS.

Question. Why was this contract awarded at this time? Did this not fall under the Department's moratorium on the new information system technology investments?

Answer. National Systems and Research Company is one of 6 vendors awarded a contract under a competitive procurement by the Farm Services Agency for a wide range of IRM support services.

The procurement resulted in the award of 6 indefinite delivery, indefinite quantity contracts to separate vendors. The 212 million dollars is the total amount of delegated procurement authority issued to the FSA contracting officer for contracts. Each of the 6 contracts has a minimum guarantee of \$5,000 per year, and a maximum amount of \$43,240,000 per year.

When appropriate and approved, specific task orders are to be competed among the 6 contractors. Task orders are subject to the constraints of the current Department moratorium. The contracts may be used for certain investments permitted by the moratorium, or by moratorium waivers. The contracts may not be used for investments prohibited by the moratorium. While it is in effect, the moratorium will constrain the use of these contracts.

PART 1

428

The contracts are expected to support maintenance of current NRCS and FSA computing systems, and the development, deployment, and support of new computing systems for service centers, administrative convergence, and other initiatives under the auspices of the departmentally coordinated technical architecture and approved agency information system plans.

CONSERVATION OPERATIONS

LANGUAGE TO LIMIT AGREEMENTS WITH DISTRICTS FOR TRAINING

Question. Under Conservation Operations, the fiscal year 1998 budget requests appropriations language to impose a funding limitation of up to \$5 million for agreements with conservation districts to support training in rangeland conservation. Why is this funding limitation requested?

Answer. This language provides funding limitation for agreements with conservation districts to support training in rangeland conservation.

EMERGENCY WATERSHED PROTECTION FUNDS

Mississippi has specific needs for funds in Mississippi that do not qualify for the EWP. These funds are needed to repair damages resulting from storms occurring in 1991 and 1993. The counties in Mississippi effected were Alcorn, Hinds, Claiborne, Madison, Rankin, Forrest, and Yazoo.

Question. Will funding from the fiscal year 1997 Emergency Supplemental be available for non-exigency needs?

Answer. These needs were not part of the President's Emergency Supplemental request.

Question. Does this request place any emphasis on any long term solution to the non-structural flood damages?

Answer. Long-term flood damage solutions are addressed under Watershed Operations and Flood Prevention Program (Public Law 566 and Public Law 534) planning and installation rather than under the Emergency Watershed Protection Program. However, the 1996 Farm Bill included flood plain easements as an eligible EWP measure. We will investigate non-structural easement opportunities in Mississippi.

EMERGENCY MEASURE FUNDING NEEDS IN MISSISSIPPI

Question. What are Mississippi's needs for any pending fiscal year 1997 EWP projects and what is the projected cost? What Mississippi needs are outstanding from past fiscal years and what is the estimated costs?

Answer. Mississippi pending fiscal year 1997 EWP current needs as a recent of the March tornado and rains are for a total cost of \$2.4 million. Outstanding requests for storm damage for 1991-94 are \$20 million dollars.

Question. If funding for the special projects are received, can you implement the projects in a timely manner?

Answer. The special projects for 1991-94 could be installed over a three-year period.

DEMONSTRATION EROSION CONTROL (DEC)

The Yazoo Basin Demonstration Erosion Control Project was established in 1984. It authorized the Natural Resources Conservation Service, U.S. Corps of Engineers and the Agricultural Research Service to work jointly on a program to demonstrate on a watershed system basis methods of reducing flooding, erosion, and sedimentation in 6 selected watershed of the foothills area in the Yazoo Basin. Today the DEC area has been increased to include 16 watersheds in the area. From fiscal year 1985 until fiscal year 1992, the NRCS received direct funding for this program.

Question. Was any Demonstration Erosion Control (DEC) funding available for the NRCS in fiscal year 1997?

Answer. The initial funding for the DEC program was received in fiscal year 1985 and the Congress earmarked \$4,100,000 for continuation of the joint NRCS-Corps of Engineers project begun in 1984 to alleviate flood and drainage problems in the Yazoo River Basin. The NRCS has received directed funding for the DEC watershed in the amounts of \$4.1 million in fiscal year 1985; \$5 million in fiscal year 1986; \$5.4 million in fiscal year 1987; \$5 million in fiscal year 1988; \$5 million in fiscal year 1989; \$7 million in fiscal year 1990; \$7 million in fiscal year 1991 and \$8 million in fiscal year 1992. No funding was provided for NRCS for the Demonstration Erosion Control (DEC) in fiscal year 1997.

Question. Has the NRCS acquired any money from the Corps of Engineers for DEC funding in fiscal year 1993 through fiscal year 1997? If not, why?

PART 1

429

Answer. The Corps of Engineers provided NRCS funding for the DEC project as follows: \$115,000 in fiscal year 1993; \$660,000 in fiscal year 1994; \$4,430,000 in fiscal year 1995; and \$1,785,000 in fiscal year 1996. No funding was provided by the Corps for NRCS funding of DEC in fiscal year 1997.

SHARKEY SERIES SOILS

The Committee is aware that a PEER-reviewed study has been conducted which indicates that a significant percentage of Sharkey Series Soils in Sharkey County, Mississippi, which have been previously considered "wet", have now been determined to possess characteristics as "non-hydric soil".

Question. I have been told that NRCS concurs with the findings of the Sharkey Soils Studies initiated by Dr. David Pettry, a soil scientist for Mississippi State University. Is this true?

Answer. Dr. Pettry and others published a bulletin in 1996 suggesting that the Sharkey soil as mapped in Mississippi was given an incorrect taxonomic classification of Inceptisols, and that the correct classification should be Vertisols. It was also suggested that the Sharkey soil had been incorrectly designated as a Hydric Soil and that that designation should be dropped.

At the time of the meeting with Dr. Pettry, the NRCS was aware of the problems with the taxonomic placement of Sharkey soil into the order of Inceptisols and was already in the process of reclassifying the soils into the order of Vertisols, so yes, NRCS was in agreement with Dr. Pettry on that issue.

The field study was to review the actual mapping of the soils designated as Sharkey and to review their designation as Hydric soils. This field study verified that there is a hydric component and a non-hydric component within the Sharkey series as mapped, and that the designation of Sharkey series as a Hydric soil in the list of "Hydric Soils of the United States" should remain. On this issue therefore NRCS differed with Dr. Pettry.

Question. Please provide an explanation of any existing or future implications which Dr. Pettry's findings might reflect upon wetlands regulations for purposes of Section 404 of the Clean Water Act, Swampbuster provisions, or any other field and on-site determinations carried out by USDA, the Corps of Engineers, or other federal agencies.

Answer. The implications of Dr. Pettry's findings on the taxonomic placement of Sharkey soils into the Vertisol order are mostly academic and important to soil scientists in having the proper concept of the formation of the soil and its location on the landscape for mapping purposes.

The implications of the designation of Sharkey soil as a Hydric soil do not change since that designation is to remain the same.

What this study does point out is the continuing need to update soil survey information as new uses and interpretations of that information develop. The Sharkey soils have been mapped in many areas and a soil survey published before there was such a designation as Hydric Soil. Had that been an important concept at the time Sharkey soil was being mapped in those areas, perhaps fewer inclusions of soils with better drainage or poorer drainage would have been included in the design of the mapping unit. However, this is not greatly significant for the purposes of the wetlands regulations of Section 404 of the Clean Water Act, Swampbuster provisions, or any other field and on-site determinations carried out by USDA and others because the designation of a wetland must be verified in the field. The Hydric soil designation is only one indicator that an area may qualify as a wetland.

The 1990 Farm Bill defined a 'wetland', except when such term is part of the term 'converted wetland', to mean land that "has a predominance of hydric soils; is inundated or saturated by surface or ground water at a frequency and duration sufficient to support a prevalence of hydrophytic vegetation typically adapted for life in saturated soil conditions; and under normal circumstances does support a prevalence of such vegetation".

It is unlikely that any of the acres identified and delineated as jurisdictional wetlands on non-agricultural lands in the Mississippi Delta will not change as a result of this study.

WETLANDS RESERVE PROGRAM

Question. Please describe the current relationship with the private organization that was selected to support the implementation of the Wetlands Reserve Program.

Answer. On January 19, 1996 the NRCS and the National Fish and Wildlife Foundation entered into a cooperative agreement in furtherance of the WRP effort. Under that agreement the Foundation was to receive and match \$5,000,000 of WRP funds and help identify and establish ecologically sound and cost-effective ease-

PART 1

ments. On February 7, 1997 the agreement period was extended to August 30, 1997 to provide the Foundation with additional time in which to raise matching funds and complete easement efforts with the program funds that were provided under the original January 19, 1996 agreement.

PRIVATE DELIVERY OF FEDERAL CONSERVATION PROGRAMS

It is my understanding that the Department of Agriculture is considering contracting out certain delivery activities associated with one or all of the following federal conservation programs: the Wetlands Reserve Program (WRP), Conservation Reserve Program (CRP), or the Wildlife Habitat Incentives Program (WHIP). As I understand it, this contracting would be to non-profit and state conservation agencies in the name of "partnerships"

As I understand it, the reason this new delivery system is being developed is because of a lack of resources and staff to successfully carry these out.

I realize this Committee instituted a pilot program two years ago with the National Fish and Wildlife Foundation, a government-sponsored entity, to implement the Wetlands Reserve Program. Now this is being expanded to totally private organizations.

Question. The President's budget proposes the closure of significant numbers of Farm Service Agency field offices. How can you justify contracting out the delivery of federal programs at the same time we are closing these offices?

Answer. The partnerships that NRCS is striving to establish do not focus on type of administrative services that are available from the Farm Service Agency. We are seeking to work with those entities with unique special experience and proven ability in the implementation of projects of the same type in the same local areas as NRCS is now charged with implementing through the WRP. Entities that, based on their years of experience and similar wetlands and wildlife conservation mission, bring unique talents and independent resources to the WRP are the focus of the effort (e.g., Ducks Unlimited, The Nature Conservancy, Pheasants Forever, State Waterfowl Associations such as the Wisconsin Waterfowl Association and the California Waterfowl Association, and State Wildlife Agencies). Through this partnership approach we believe that NRCS will be able to learn from and work closely with those most skilled and knowledgeable and who are established in the local areas involved. We also believe that the project results achieved through such partnership efforts will achieve the greatest ecological benefits in the most cost efficient manner and of the most benefit to private landowner participants. The necessity of increases in agency personnel will also be moderated by this partnership effort.

Question. What protection is there to prevent these private organizations from assisting their big contributors in enrolling land in the government programs they are implementing?

Answer. WRP project recommendation is a direct function of the State driven ranking process that is in place in each State. The State Conservationist, with the advice of the State Technical Committee, develops the ranking criteria by which all applications are to be rated. The ecological merits of the restoration that could be expected to occur on the site is the dominant consideration. Cost factors associated with the site are the second major consideration. Determination of all ecological measures of the value of the site for restoration are under the ultimate control of the NRCS field representative who conducts the field review of the application. Cost factors are based on projected easement land values and engineering restoration considerations. These also are the responsibility of the local NRCS field representative and other NRCS specialists as may be needed (e.g. engineering and soils assistance). Development and administration of the prioritized ranking list is under the full control of the NRCS State Office.

Question. Under what authority would these partnerships be entered into?

Answer. Generally, the basic authorizing legislation for the Agency as amended by the 1985, 1990, and 1996 Farm Bills and other legislation provide the authority for NRCS to enter into partnership agreements. The Soil Conservation and Domestic Allotment Act of 1935 (the Soil Conservation Act), 16 U.S.C. 590a, provides authority for the Secretary to cooperate or enter into agreements with, or to furnish financial or other aid to, any agency, governmental or otherwise, or any person, subject to such conditions as he may deem necessary, for the purposes of this Act. The WRP final rule, promulgated under the authority of both the Wetlands Reserve Program statute (16 U.S.C. 3837 et seq.) and the Soil Conservation Act, states that the Department may enter into cooperative agreements with Federal or State agencies, conservation districts, and private conservation organizations to assist the Department with educational efforts, easement management and monitoring, and program implementation assistance. 7 CFR 146.2(f).

PART 1

431

THE CONSERVATION FARM OPTION PROGRAM (CFO)

Question. The regulations have not been promulgated for the Conservation Farm Option Program (CFO). When will the final regulations be published?

Answer. We expect to publish the final rule in the Federal Register by September 30, 1997.

Question. The President's request makes available \$2 million in fiscal year 1997 and \$15 million in fiscal year 1998 for the purposes of a CFO pilot program. In what areas is the pilot program being implemented? On what assumption does NRCS base the estimation of the number of contracts for fiscal year 1997 and 1998?

Answer. The information on specific pilot areas is not available at this time. Proposals for participation in the fiscal year 1997 program have not yet been received. However, an effort will be made to distribute the program funding geographically as well as among the producers of wheat, feed grains, cotton and rice.

The number of contracts are estimated using an average value of \$50,000 divided into the available funding for each fiscal year.

Question. How much do you estimate will be needed for each of fiscal years 1999–2002?

Answer. Funding for each of those fiscal years is authorized by the Federal Agriculture and Reform Act of 1996 as follows: fiscal year 1999, \$25 million; fiscal year 2000, \$37.5 million; fiscal year 2001, \$50 million and fiscal year 2002, \$62.5 million.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

REIMBURSEMENT FOR NRCS TECHNICAL ASSISTANCE

Question. I understand the Department has taken the position that the 1996 Farm Bill has placed restrictions on section 11 transfers from CCC even for programs that were converted from appropriated to direct spending. I further understand that carryover funds from the CRP and WRP accounts may be available for the costs of technical assistance in fiscal year 1997 and perhaps fiscal year 1998.

To what extent will these carryover funds be available to meet the demands of providing technical assistance for NRCS and related programs in fiscal year 1998 and future years?

Answer. With respect to the WRP, the 1996 unobligated appropriated funds available of approximately \$31 million, are proposed to support the NRCS technical assistance needs for WRP in the fiscal year 1997 and fiscal year 1998 program sign-ups only. Of the \$31 million available, approximately \$12.327 million will be used for NRCS technical assistance supporting the 1997 WRP program sign-up to enroll 130,000 acres, and \$18.200 million in support of technical assistance for 1998 to enroll 212,000 acres. The full \$31 million requested for 1997 and 1998 are not available under the limited 1995 CCC spending level cap enacted under the Federal Agriculture Improvement and Reform Act of 1996. A similar situation exists for the CRP where about \$111 million in 1996 unobligated appropriated funds will be available for technical assistance in fiscal years 1997 and 1998.

Question. What plans do you have in the event these funds are exhausted?

Answer. I would hope some joint effort between the Administration and Congress could be reached to resolve this matter in the future, and provide needed technical assistance funding in support of the WRP, and other conservation programs now limited under the CCC section 11 cap. The technical assistance funding level needs of the WRP presently are not sustainable under the Conservation Operations account at the current funding level without reducing conservation work being conducted out of NRCS field offices. Technical assistance for the implementation of conservation practices, in support of the vast conservation issues facing this nation, are vital to the health of our nations lands. I would hope resolve on this important key issue is reached in the near future.

Question. How would the implementation of conservation programs (mandatory and discretionary) be affected if this subcommittee would limit funding for technical assistance to a baseline equal to previous year discretionary spending for technical assistance?

Answer. The fiscal year 1998 Presidents budget proposes an increase of \$20,349,000 for the NRCS Conservation Technical Assistance account, to support partial pay increases for 90 FTE's who will provide technical assistance to approximately 9,000 farmers and ranchers who own approximately 700,000 acres of land, developing soil survey data, and enhancing the infrastructure of the base program to broaden skills for delivery of the 1996 Farm Bill programs.

The NRCS technical staff are the cornerstone for the implementation of the conservation programs, who develop the critical conservation plans so needed for pro-

PART 1

432

gram delivery. In our efforts to reorganize the agency, great efforts were made to sustain this critical work force, comprised of natural resource science expertise and capable of utilizing developments in new scientific technologies in the area of natural resource sciences for the implementation of conservation programs.

Setting a limit on technical assistance funding in fiscal year 1998 would effect NRCS training for rangelands and improvements of conservation skills. NRCS technical assistance is utilized under a voluntary partnership with landowners, and is the primary vehicle through which needed improvements in the management, and establishing the condition of private grazing land is achieved.

A limit would also inhibit growth towards enhancements of the conservation districts skills which are needed to carry out the delivery of the 1996 Farm Bill programs, through cooperative agreements with professionals trained in the management of pasture lands, grazing lands, forests, and rangelands to assist in local program delivery.

A limit would also effect Soil Survey data developed through Geographic Information Systems. This natural resource science technology is vital to the implementation of the 1996 Farm Bill programs. Soil survey data is an important component of program delivery, used by all resources to make critical land use decisions that range from taxation and development to farming and natural resource protection under a voluntary approach with landowners. GIS provide orthophotographic maps of reference points needed to make decisions on soils, farm field boundary's, rivers, roads, for the land users. This technology is a vital tool for Service Centers in addressing local landowner concerns.

CCC programs for fiscal year 1998 will also require an increased workload from the NRCS technical staff responding to enacted legislation for CRP, WRP EQIP, WHIP, CFO, and FPP. Technical assistance funding for these programs other than WHIP, which is funded from CRP, are all subject to CCC and its restrictions. After exhausting all available funds to support technical assistance needs, NRCS would still be faced with critical funding choices and the operation of the agency in regards to program delivery of the new programs. The impact of a change to this effect would be far reaching.

TECHNICAL ASSISTANCE FOR EQIP

Question. I understand that you will provide an amount for technical assistance equal to 10 percent of full EQIP funding to carry out these program.

How do you justify that amount?

Answer. The 1997 apportionment provided by the Office of Management and Budget authorized 10 percent of EQIP funds for technical assistance. Initial workload estimates for EQIP were based on data gathered for a 1995 evaluation of the conservation technical assistance program. This data indicates that actual costs to operate EQIP could be higher than the 10 percent now apportioned. NRCS realizes that additional data is needed by OMB and have therefore begun a process to develop a new work measurement and program accountability system. We hope that these improvements will provide a better justification for future technical assistance needs relating to EQIP, other farm bill related programs, and ongoing conservation assistance with Conservation Districts.

Question. Is it not true that historically a larger percentage of funding was required for technical assistance related to these programs?

Answer. Yes. In researching the level of technical assistance required to implement EQIP, we completed an analysis of the technical assistance provided in 1995 to the four programs which have been replaced by EQIP. The analysis indicates that in 1995 the technical assistance provided was 767 FTE's—or about \$41.5 million—or 31 percent of the appropriated funds for ACP, CRSC, WQIP, and GPCP.

Question. What will be the effect on implementing these programs if discretionary spending for technical assistance is not made available for EQIP?

Answer. The impact of not receiving sufficient funds to provide technical assistance for EQIP are numerous. Field offices will have major delays in getting plans and engineering designs prepared for producers. In addition, programs that have been historically delivered through the Conservation partnership—that is conservation districts, state conservation agencies, and NRCS—will be disrupted.

The presence of Federal technical assistance leveraged over \$734 million dollars in state and local financial and technical assistance in 1996. This is about six times the 1995 NRCS field office base program expenditures. Another \$37 million was leveraged through assistance in implementing EPA's 319 program grants directed at reducing nonpoint source pollution from agriculture. Without the NRCS technical presence in the base program, other agencies would not be able to ensure that their cost sharing programs are technically sound and professionally accountable. Diver-

PART 1

433

sion of staff from activities supporting local and state initiatives will result in reduced capacity to implement state cost-share programs. The unintended consequence may be that the new Federal programs could substitute for, rather than augment, state and local initiatives.

Diverting staff from the base program reduces support critical to natural resources inventories and assessments which are used in the National Conservation Program, strategic planning, and budget formulation and accountability.

As part of the locally-led conservation effort, NRCS assists districts in helping individuals and communities with a broad range of natural resource issues including urban conservation, wellhead protection, irrigation management, and wildlife habitat improvement. Some of these locally-based concerns will not be addressed if funds are shifted away from support of the base conservation program. NRCS will providing technical assistance to nearly 200 state and local programs. A reduction in NRCS resources seriously impacts the success of the local and state cost sharing programs.

Many socially disadvantaged farmers and ranchers do not participate in cost-sharing or Federal loan or commodity program. The base program meets a critical outreach need by assisting limited resource farmers with solving their natural resource problems. Servicing this group requires substantially more time and effort than servicing NRCS's traditional customers. Reducing staff time allocated to base activities may disproportionately weaken service provided to limited resource farmers and ranchers.

The base program provides a network of well trained and technically competent conservationists located in most counties who are able to respond to emergencies. Recent examples of disaster assistance include the 1993 Midwest flood, flooding in California and the Northwest, and hurricane Hugo. The base program provides the foundation for the agency's rapid and efficient response to emergencies. The Emergency Conservation Program treated 927,000 acres in 1994, 874,000 acres in 1995, and 1,354,000 acres in 1996. The Emergency Watershed Program obligated \$123 million in 1994, \$134 million in 1995, and \$139 million in 1996 to protect flood damaged natural resources. Much of the Emergency Watershed work protects streambanks from erosion and restores hydraulic conditions to pre-disaster conditions.

Development of conservation planning standards, technical guidance, soil surveys, and natural resource information is a fundamental function of the base program. This information is the foundation for implementing EQIP, as well as the other Federal, state, and local cost-sharing programs. As staffing is directed away from the base program, the science-based credibility of the agency will erode and application of conservation technology will vary from county to county since national technical standards will not be available.

ORTHOGRAPHY

Question. Could you please provide an update on the progress of NRCS's Orthophotography activities and the agency's relationship with the GIS Center for Advanced Spatial Technology in Arkansas?

Answer. The NRCS, Farm Service Agency and the US Geological Survey continue to cost share and partner with state and federal agencies in the development of digital orthophotography base maps. At this time, approximately 21 percent of the conterminous US is complete, and another 27 percent is in-work. This is an overall increase of 15 percent in one year. In Arkansas, the NRCS, Farm Service Agency and the USGS are cost sharing in the development of digital orthophotography for seven counties in fiscal year 1997.

The interest in using digital orthophotography as a base map is increasing as the use of Geographic Information Systems (GIS) becomes more widespread. Digital orthophotography provides a rich source of information for a GIS. The images are accurate, current and contain more information than traditional data input such as line maps. With the advent of Pentium chips and increased disk storage for computers, digital imagery is now easily accessible. The NRCS has increased the use of digital orthophotography for soil mapping, soil digitizing, and as the base map for all natural resource information collected and analyzed for decision making at the Field Service Centers.

The NRCS has an excellent relationship with the GIS Center for Advanced Spatial Technology (CAST) in Arkansas. The NRCS State GIS Specialist for Arkansas is headquartered at the CAST facility. The NRCS GIS Specialist utilizes the GIS technology and staff expertise provided by CAST to help NRCS implement GIS at the county Field Service Centers. CAST provides 1/4 technical and administrative support to the NRCS GIS Specialist.

PART 1

434

Through a cooperative agreement with NRCS, the CAST also provides NRCS professionals with training in GIS, remote sensing and Global Positioning Systems (GPS). The NRCS provides direct funding to help carry out this cooperative agreement. The CAST has developed GIS software to allow NRCS to more easily input a variety of digital data into our GIS for NRCS activities. The CAST is working with the Washington County NRCS and Farm Service Agency (FSA), and the County Assessor's office on a GIS project to reduce the time NRCS and FSA is required to collect information about the location of a farm when a landowner applies for USDA farm program assistance. When this project is complete, the farmer could point on the digital orthophoto map showing the location of his farm, and another database will provide land ownership information about the property. The automatic linkage to county records will reduce errors in manually filling out forms and provide the information almost instantly. The CAST is using GIS and remote sensing analysis tools to provide NRCS field service centers with land use/land cover maps for our use in working with the Fish and Wildlife Service in improving wildlife habitats.

EAST AND CENTRAL ARKANSAS WATER RESOURCES

Question. Could you please provide an update on agency activities in respect to the East Arkansas ground water study and the Bayou Meto, Boeuf/Tensas, and Kuhn Bayou (Point Remove) projects?

Answer. Efforts have continued with the implementation of on-farm water conservation measures in critical ground water decline areas. This is a 26-county area experiencing critical ground water decline and saltwater intrusion problems. In 1997, 338 irrigation system plans were developed, 260,000 feet of pipeline installed, 13,880 acres of land leveled, 15,900 acres of tail water recovery systems installed, and extensive monitoring and water quality samples taken.

Work has continued on the Bayou Meto, Boeuf/Tensas and Kuhn Bayou projects in 1997 which was the third year of this effort at the direction of Congress.

Specifically in Bayou Meto, the inventory work for the on-farm part of the work is now complete and the report is being reviewed by the sponsoring local organization. Public meetings to inform the public of the results of these studies and the establishment of a hydrology data base will be carried out during the remainder of this year. The Corps of Engineers has been authorized to plan a flood control/irrigation project in this area and NRCS will play a major role in that effort with funding anticipated from the COE.

Boeuf/Tensas local sponsors continue to inform the public of the water decline and water quality status. They are in the process of organizing an irrigation district. NRCS is working on developing GIS data for use in the study. Work is about 50 percent complete on this project.

Kuhn Bayou is part of the Eastern Arkansas project and NRCS is performing some of the survey and design functions for this project. A natural resources conservation plan has been developed. The sponsors are seeking funding sources for implementation.

The fiscal year 1998 budget request contains funds which could be used for these projects.

COOPERATION WITH CORPS OF ENGINEERS IN THE DELTA

Question. Would you provide your views on the willingness of USDA to work cooperatively with the Corps of Engineers and state, local, and private sources toward long-term solutions to water resource problems in the state, especially in the Delta?

Answer. NRCS has been partnering with the COE in this area on these projects since 1987. Also involved is the Arkansas Conservation Agency. All three parties are dedicated to this effort and must participate for it to be successful. NRCS is anxious for this partnership to continue so as to help the landowners in this region solve their problems.

QUESTIONS SUBMITTED BY SENATOR KOHL

WETLANDS RESERVE PROGRAM

In the 1996 farm bill, the Wetland Reserve Program (WRP) was reauthorized, with changes in the program that required new enrollments to be divided between 3 categories. One-third of the acres enrolled are to be for permanent easements, one-third for 30-year easements, and one-third for 10-year contracts. However, subsequent to the WRP reauthorization, the Conservation Reserve Program (CRP) has been modified to allow cropped or prior-converted wetlands to be enrolled in that program.

PART 1

435

Question. Has the fact that cropped and converted wetlands are now permitted to be enrolled in the CRP affected interest in the WRP ten-year contracts? If so, would you recommend any change in the WRP structure to avoid future duplication between the two programs?

Answer. Landowner interest in the restoration cost-share agreement component of the WRP is very low. While the CRP enrollment of wetlands may have a bearing on this situation, it is not clear if this is a major factor or just one of many related factors. We believe these programs compliment each other rather than duplicate efforts by allowing landowners more options for the conservation of wetlands.

Question. Your testimony regarding the Wetland Reserve Program (WRP) suggests that you are getting more demand for the permanent easement enrollments than for the other types of enrollments (30-year easements or 10-year contracts). Given this demand for the permanent easements, do you believe that the program should be modified to better reflect the demand?

Answer. Our demand for permanent easements is very heavy. The demand for 30-year easements is moderate and the demand for restoration cost share agreements is very light. We are attempting to enroll the 130,000 acres in fiscal year 1997 in the one-third permanent, one-third 30-year easement, and one-third restoration cost-share agreement as provided for in the 1996 FAIRA Act. It is obvious that, based on landowner interest, we are badly under funding permanent easements, are pretty much on target on 30-year easements, and are placing far too much emphasis on restoration cost-share agreements. To achieve the most cost effective and ecologically sound restoration results, it would be more practicable if the ratio were 45 percent permanent easement, 40 percent 30-year easement, and 15 percent restoration cost-share agreement. Even though the restoration cost-share agreements are in less demand than easements we do fully support having this as one of our WRP options.

Question. In the Fiscal Year 1997 Agriculture Appropriations Act, language was included to allow for the 130,000-acre enrollment cap for the Wetland Reserve Program to be exceeded if non-federal cost share funds were secured to pay for these additional enrollments. Can you tell me whether this provision has been helpful to the WRP implementation in fiscal year 1997? Do you have an estimate of how many additional acres will have been enrolled in fiscal year 1997 as a result of this provision? Would you recommend that the subcommittee continue to include this provision in fiscal year 1998? Are there other such modifications that you would find helpful in fiscal year 1998 in implementing the WRP?

Answer. The opportunity to work with partners, receive non-Federal contributions, and apply these contributions to acres above the 130,000 fiscal year 1997 acreage cap has been very helpful.

With the \$8,089,700 of non-Federal contributions, we will ultimately be able to enroll approximately 9,000 acres of additional easements. Because these funds were largely associated with permanent and 30-year easements we are able to apply them back to these types in the same proportion as they were received.

We would definitely appreciate having this option continued in fiscal year 1998. Perhaps of equal value to the actual funds that are being received and the additional acres that are being enrolled is the fact that this provision has attracted a lot of partner attention. With their funding participation comes very beneficial expert assistance in the many and varied aspects of wetland restoration. This partnership relationship is making the on-the-ground results of even greater value to the involved landowners and the national wetland conservation purpose as well.

It would be beneficial to the WRP and would allow us to be more responsive to the tremendous level of landowner interest if the acres that are enrolled in response to the level of non-Federal contribution could be considered outside of the fiscal year 1998 acreage cap and the overall program cap as well. An indication from the Congress that the relative proportion of acres in each of the three categories of WRP land should more nearly match the level of landowner interest in each category would also be very helpful. In order to assist us in our efforts to work with the many non-governmental conservation partners and to enable us to enlist their support in the WRP effort, the specific provision of authority for the use of CCC funds in conjunction with such partnership agreements is needed.

QUESTIONS SUBMITTED BY SENATOR LEAHY

ALLOCATION OF EQUIP FUNDS

Question. Last week NRCS allocated a majority of the fiscal year 1997 funds for financial assistance. Even though 50 percent of these funds are intended for assist-

PART 1

ance to livestock operations, my state, which is almost 90 percent livestock, received less than the two-year average NRCS used as a base. How do the criteria in the formula used by NRCS to allocate the EQIP funds account for livestock and what weight do these criteria have on the overall formula?

Answer. We will provide a table sets forth each of the 26 elements that we used in the 1997 allocation formula, it also shows the weight that was assigned to each factor and whether the factor is considered to affect livestock. This formula is used to determine the basic percentage of the EQIP funds that each state should receive. As you can see in the weights assigned to each of the factors, that the livestock factors are assigned 50.2 percent of the total weight.

The basic amount determined by the formula was adjusted so that no state would receive a dramatic increase or decrease in conservation assistance funds which might negatively impact their ability to manage or deliver the program. A historical funding level was used to limit major shifts. The average amount received in a state for fiscal year 1994 and 1995 for the ACP, WQIP, GPCP, and CRSCP was used to establish the historical level.

ELEMENTS OF ALLOCATIONS FORMULA

Element	Measurement	Source	Total weight (percent)—	
			Livestock	Nonlivestock
Cropland	Acres	NRI	5.9
Cropland eroding above T	Acres	NRI	6.4

Limited resource producers	Number	Census	0.75	0.75
Total	50.2	49.8

PRIORITY DISTRIBUTION OF EQIP FUNDS

Question. In allocating EQIP funds, NRCS placed a priority in the first year on capitalizing on the experience of those States that had a successful relationship with the State agriculture program, a solid reputation for assisting farmers to improve their conservation practices and a commitment by the State to contribute to the cost-share program. I'm certain that lake Champlain and Memphremagog must have ranked high under these criteria and I know you're familiar with the commitment of farmers in these watersheds and the capability of the NRCS staff in Vermont. But, I would imagine that many of the States receiving large increases in the fiscal year 97 allocation may not be able to use all of their allocation. Would you agree that when that occurs, funds should be redistributed to States that have the previously mentioned attributes? Would you also agree that States that can show

PART 1

437

a considerable interest, even a list of farmers who want to participate in EQIP should receive a higher allocation of those remaining funds?

Answer. Yes, we intend to monitor the obligation of funds in each State throughout the summer and will redistribute funds to ensure that all 1997 EQIP funds are obligated before the end of the fiscal year. States that can show that they have producers ready to enroll will be able to receive additional allocations to the extent that funds are available.

LIMITATION ON PERCENTAGE INCREASE IN EQIP BY STATE

Question. Finally, when you allocated this year's funds, you placed a 30 percent cap on the increase any one State could receive over the previous year. I can understand why that cap would be placed on States receiving a large allocation because it may dramatically increase the workload. But I would think that this cap is not necessary for smaller States because even 50 percent increase would be very manageable. Is the cap necessary for small States and does NRCS believe it could be a negative incentive for programs to expand as much as possible in the next year?

Answer. We believe that the 30 percent cap is necessary in large, as well as small States. Small States may actually have more difficulty handling a rapid increase in funds than a larger State because a small State does not have the depth of resources in all specialized technical fields that are needed to implement a program such as EQIP. Large States usually have on staff more than one employee with technical expertise, such as engineer, biologist, or economist. In smaller States, often employees with specialized expertise are shared with another State. Large increases in workload, without more than one employee to complete the task could result in a State having difficulty in managing the program. We will be evaluating the implementation of the program in all States during 1997 and will use the feedback we receive from both large and small States to evaluate whether the cap was set at an appropriate level and whether the cap was appropriate for both large and small States.

INCREASED SCOPE OF CRP, WRP, AND EQIP

Question. As CRP, WRP, and EQIP expand their scope, there will be an increased demand for technical assistance from NRCS. Assuming the Department does not increase staff to meet this demand, has the Department considered developing partnerships with non-profit organizations that can offer similar or complementary services, such as the Sustainable Agriculture Research and Education or the Appropriate Technology Transfer for Rural Areas programs?

Answer. The Department is evaluating all legal opportunities to expand our partnerships to improve the implementation of conservation programs in the field. One of the opportunities that we have been researching is to increase partnerships with non-profit groups so that program participants can benefit from the specialized expertise that may be available within a non-profit group.

CONSERVATION FARM OPTION

Question. During the drafting of the Farm bill, we all recognized the need to insure that the various conservation programs are complementary and can be used by farmers as a "toolbox" of conservation assistance. The Conservation Farm Option was intended to help meet this goal. I see in your fiscal year 98 request that you are going to begin implementation of the program in pilot areas. What type of areas are you looking for to launch these program pilots?

Answer. Areas where there are diversified and well manifested and documented natural resource problems would be suitable pilot areas. Such areas that have a high number of eligible producers that are willing to participate in the CFO program would be high priority areas. This would provide the opportunity to plan and implement a variety of innovative practices, combine several of our traditional programs and have high probability of achieving measurable results. However, an effort will be made to distribute the program funding geographically as well as among the producers of wheat, feed grains, cotton and rice.

AMERICAN HERITAGE RIVERS INITIATIVE

Question. When the President announced the American Heritage Rivers initiative it was stated that some of the funding would come through NRCS conservation programs. What is the NRCS involvement in developing the guidelines for this initiative? How does NRCS plan to re-focus its programs for the rivers that are designated?

PART 1

438

Answer. NRCS has a representative and alternate on the working group developing guidelines for the American Heritage Rivers initiative. The mechanism has not been established for focusing federal services on designated rivers.

FARMLAND PROTECTION PROGRAM

Question. The Farmland Protection Program, and its predecessor Farms for the Future, has been highly successful in Vermont. How many farms have the program helped purchase easements on? How many did the new program assist with fiscal year 1997 funds? What is the estimated need for this program?

Answer. When easement acquisitions are completed, the Farmland Protection Program will acquire contingent remainder rights on approximately 203 farms. For fiscal year 1997, \$2 million was approved by the Congress. We are currently in the process of making recommendations to the Secretary of Agriculture to implement the program for this year. We will find out how many that the program may assist in 1997 when allocation of funds is completed. The need of Federal funds for this program in the immediate future is estimated at \$460 million based on the current pending offers that the State and local government entities have.

WETLANDS RESERVE PROGRAM TECHNICAL ASSISTANCE

Question. In 1998, the Wetlands Reserve Program estimated to have a program increase of \$44,885,000. Assuming a resulting increased demand for technical assistance that NRCS is now unable to address through program funds, how will NRCS meet this increased demand over the long-term? What is the projected need for this assistance over the next five years? How does this technical assistance lower the cost to the farmer in enrolling land in the WRP?

Answer. The NRCS has no access to Commodity Credit Corporation funds (CCC) for agency WRP technical assistance funding needs in fiscal years 1997 or 1998. Consequently, the WRP technical assistance need for fiscal years 1997 and 1998 will be covered through the use of 1996 prior year appropriated unobligated WRP funds that were initially scheduled to be utilized in the purchase of 1996 WRP easements. Approximately \$31,000,000 of such prior year funds will be utilized. To enable us to honor and complete these 1996 easement commitments we will in turn utilize Commodity Credit Corporation Funds of approximately \$31 million. Only through this switching of funds was the agency able to find a way to fund technical assistance needs for fiscal years 1997 and the projected technical assistance need associated with the Administration's 1998 budget request. In the longer term, it will be necessary for NRCS to be able to utilize CCC funds to cover WRP technical assistance needs, since prior year appropriated WRP funds will not be available in fiscal year 1999 and beyond.

Excluding fiscal years 1997 and 1998, since prior year WRP appropriated funds are available for technical assistance needs for these years, the WRP technical assistance funding need through fiscal year 2002 will be approximately \$38,188,000.

Technical assistance funding is required if the agency is to provide landowner's who wish to enroll in the WRP with that opportunity. Such funding also provides landowners with assistance in achieving the most cost effective restoration results, thus lowering the cost of the restoration effort by minimizing the likelihood that restoration actions will fail and need to be subsequently reinstalled. The assistance also enables landowners to receive help in monitoring their restoration results and the terms and conditions of their easement commitments so as to achieve the optimum wetland restoration and protection benefits from the WRP.

WATERSHED SCIENCES INSTITUTE

Question. I am pleased that Vermont is a part of the NRCS Watershed Sciences Institute. What is the current status of the Institute and what future activities are planned?

Answer. The Watershed Sciences Institute is one of eight functioning National Institutes in NRCS. Its mission is "To incorporate ecological principles into natural resource conservation and accelerate the development and transfer of appropriate technology in response to comprehensive watershed needs and environmental sustainability at the watershed and landscape scales." The Institute is acquiring and developing technologies such as those associated with resource management and planning on a watershed scale; functional restoration of streams and associated riparian areas; evaluation and management of agricultural nonpoint source runoff and waterborne pollutants; and agricultural sustainability.

PART 1

SUBCOMMITTEE RECESS

Senator COCHRAN. Our next hearing will be on Tuesday, April 8, at 10 a.m., in room 124 of the Dirksen Senate Office Building. At that time, we will review the budget request for the Department's farm and foreign agricultural services.

The subcommittee stands in recess.

[Whereupon, at 11:20 a.m., Tuesday, March 18, the subcommittee was recessed, to reconvene at 10:10 a.m., April 8.]

PART 1

PART 1

AGRICULTURE, RURAL DEVELOPMENT, AND RELATED AGENCIES APPROPRIATIONS FOR FISCAL YEAR 1998

TUESDAY, APRIL 8, 1997

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 10:10 a.m., in room SD-124, Dirksen Senate Office Building, Hon. Thad Cochran (chairman) presiding.
Present: Senators Cochran, Burns, Bumpers, and Kohl.

DEPARTMENT OF AGRICULTURE

**STATEMENT OF DALLAS R. SMITH, ACTING UNDER SECRETARY, FARM
AND FOREIGN AGRICULTURAL SERVICES**

ACCOMPANIED BY:

**CHRISTOPHER E. GOLDTHWAIT, GENERAL SALES MANAGER
DENNIS KAPLAN, DEPUTY DIRECTOR, OFFICE OF BUDGET AND
PROGRAM ANALYSIS, DEPARTMENT OF AGRICULTURE**

FARM SERVICE AGENCY

STATEMENT OF BRUCE R. WEBER, ACTING ADMINISTRATOR

FOREIGN AGRICULTURAL SERVICE

STATEMENT OF AUGUST SCHUMACHER, ADMINISTRATOR

RISK MANAGEMENT AGENCY

STATEMENT OF KENNETH D. ACKERMAN, ADMINISTRATOR

OPENING REMARKS

Senator COCHRAN. The subcommittee will please come to order.

This morning we continue our hearings, reviewing the President's budget request for fiscal year 1998, as it relates to agriculture, rural development, and related agencies. This morning we will specifically review the budget request of the Farm Service Agency, the Foreign Agricultural Service, and the Risk Management Agency.

Our witness list this morning includes Dallas Smith, who is Acting Under Secretary for Farm and Foreign Agricultural Services; Bruce Weber, Acting Administrator for the Farm Service Agency; August Schumacher, Administrator for the Foreign Agricultural Service; Christopher Goldthwait, General Sales Manager; Kenneth Ackerman, Administrator for the Risk Management Agency; and

PART 1

442

Dennis Kaplan, with the Department's Office of Budget and Program Analysis.

We have received your written statements, which we appreciate very much. We will make them all a part of the record in full, and we encourage you to proceed to summarize those statements, if you like, and make whatever comments you think would be helpful to our understanding of this budget request. We will then have an opportunity to discuss your comments and ask questions.

PREPARED STATEMENT

We have a prepared statement from Senator Bumpers, and it will be made part of the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BUMPERS

Mr. Chairman: Thank you and welcome to all our guests today.

To the average American, the term "Department of Agriculture" is likely to suggest images of farmers tilling the soil and moving their products to feed a hungry world. We all know that the Department of Agriculture is much more than that simple pastoral symbol. The Department of Agriculture of today includes a vast research capability, marketing and inspection, food safety, conservation, rural development, food and nutrition assistance, and much, much more. But of all the panels that will appear before this subcommittee, none better than this represents the traditional, perhaps stereotypical, client of the Department of Agriculture, the American farmer.

Although the goal of the American farmer at the time the Department of Agriculture was created has little changed, the means by which he meets that goal today would not even be recognizable to the farmer of the 1860's. The farmer of 130 years ago had much of a continent yet to settle in which new fertile lands reached to the horizon and natural resources seemed ever abundant. With the closing of the frontier came a realization that we needed to better manage our finite resources and a role of government was created to help the farmer accomplish his task. From region to region, farming practices and structure might vary, but a constant champion and protector of the farmer has been the USDA.

Nuances to that farmer/government relationship are ever changing and last year has witnessed some of the greatest changes in a generation. I fear that too many of us have lost the memory of farm economies gone awry, leaving the nation in a wrenching depression. I fear for the worst and hope for the best.

Our national economy is strongly founded on the principle of free enterprise. So it may seem strange to some that for so long agriculture, the mainstay of the American economy, was tied to a system of production controls and price supports. The American farmer is a small individual producer playing to a global market. He represents one of the very few, perhaps the only, member of our economy who buys his inputs retail and sells his products wholesale. The farmer is virtually unable to pass any of his costs on to anyone else and his livelihood, sometimes his very life, is often held in the balance by the forces of nature. If we feel that abundant food is an important resource of our society, and I believe we do, then it is understandable that society has a stake in the well-being of the American farmer.

Today we will hear from the agencies responsible for delivery of government services to the farmer on the farm and in the development and maintenance of foreign markets. With the changes of the past few years, exports opportunities are more important than ever. With the changes of last year, new challenges face the farmers in the countryside and the changing face of USDA is yet to finish this transformation. Risk management may become the new by-word for our new farmer/government relationship. Certainly, with the loss of programs farmers have relied on for a generation, much is at risk.

UNDER SECRETARY'S OPENING STATEMENT

Senator COCHRAN. Mr. Smith, you may proceed.

Mr. SMITH. Thank you, Mr. Chairman, Senator Burns.

I am pleased to have this opportunity to discuss the 1998 budget and program proposals for the Farm and Foreign Agricultural

PART 1

443

Services mission area of USDA. You have already introduced the Administrators and also our representative from the budget office at USDA. Statements by the Administrators have also been submitted for inclusion in the record. I will summarize my own prepared statement, after which we will be pleased to respond to your questions.

Mr. Chairman, a fundamental goal of the Farm and Foreign Agricultural Services mission area is to secure the long-term economic vitality and global competitiveness of American agriculture by expanding trade and economic opportunities, and promoting income growth and development throughout rural America. We are the production agriculture mission area at USDA. How we accomplish our mission will, in large part, be determined by the new policies set in place by the 1996 farm bill. And one of our primary tasks this past year has been to implement the policy and program changes provided in that act.

As a result of our efforts, nearly 99 percent of eligible acres were entered into production flexibility contracts last year. Although the new farm bill has provided much greater flexibility to our farmers in their production and marketing decisions, it has also increased the risk inherent in farming by reducing the Federal Government's role in supporting income and managing supplies.

Consequently, we remain concerned about the adequacy of the safety net for our producers and have been working diligently to expand and improve programs which help producers manage their price and production risk. At the same time, we have continued our efforts to reduce expenses, improve efficiency, and deliver responsive, quality service to our farm and rural customers.

The Farm Service Agency [FSA] is a major part of our mission area. The Farm Service Agency administers the farm credit programs, several conservation programs, and the domestic commodity price and income support programs of the Commodity Credit Corporation.

The farm credit programs administered by FSA continue to serve as a vital source of credit for our Nation's farmers and ranchers. The budget continues the trend toward emphasizing guaranteed loans, which are made in partnership with private lenders and have a low subsidy cost for the taxpayers. We remain responsive, however, to the continued need for direct loans, which are targeted to beginning farmers and members of socially disadvantaged groups who show promise for success but would be unable to obtain credit elsewhere.

The Conservation Reserve Program is the major conservation program administered by FSA. The 1996 farm bill reauthorized the CRP, set maximum enrollment at 36.4 million acres, and switched the program's financing from direct appropriations to CCC funding. The 1998 budget assumes that a competitive bid process will be used to enroll nearly 19 million acres of new and expiring CRP contract acreage in 1997. Enrollments in subsequent years are assumed to gradually increase total enrollment to 36.4 million acres by the year 2002.

Signup for CRP regular enrollment was held March 3 through March 28. Preliminary results from the field indicate that landowners submitted nearly 302,000 offers to enroll almost 26 million

PART 1

444

acres, of which about 18 million acres are currently under contracts that expire at the end of September.

With technical assistance from the Natural Resources Conservation Service, FSA will undertake the voluminous task of evaluating the environmental benefits of all offers and, by mid-June, will notify producers as to which acres have been accepted in the program. Continuous signup is also in place for certain high-priority practices involving small acreages, such as riparian buffers, filter strips, and windbreaks.

The budget also reflects provisions of the 1996 farm bill authorizing CCC funding for a number of new conservation programs, including the Environmental Quality Incentives Program, which replaces the Agricultural Conservation Program [ACP]. EQIP is administered by the Natural Resources Conservation Service, in cooperation with the Farm Service Agency.

Reflecting the trend for Federal outlays for farm price and income support programs, total CCC outlays have declined from the 1986 peak of \$26 billion to \$4.6 billion in 1996. This is the first time CCC outlays have dropped below the \$5 billion mark since 1981.

Including conservation programs and other programs for which CCC funding was authorized by the 1996 farm bill, CCC outlays are projected to total \$7.8 billion in 1997, and \$9.9 billion in 1998, and decline to about \$7.6 billion by the year 2002.

Changes made by the 1996 farm bill have diminished the traditional role of the farm programs as a buffer against fluctuations in production and commodity prices. Our greatest challenge is to find new ways to help farmers thrive in an increasingly risky environment and yet not be involved in the micromanagement of agricultural decisions.

The budget reflects legislation that we will be proposing to the authorizing committees to improve the safety net for farmers. Our legislation provides discretionary authority to extend commodity loans for 6 months during periods of depressed market prices or market disruptions, allows managed haying and grazing of CRP acreage, increases fruit and vegetable planting flexibility for acreage enrolled in the production flexibility contracts, and provides for greater flexibility in the timing of contract payments.

For the salaries and expenses of the Farm Service Agency, we are requesting a total appropriated level of \$954 million, a net decrease of \$1.9 million from 1997. Our staffing reductions for 1998 continue to run well ahead of those projected in the Department's reorganization plan. The 1998 budget calls for staffing levels of about 5,900 Federal staff-years and 9,900 non-Federal county office staff-years—reductions of about 270 and 1,850 staff-years, respectively, from the 1997 levels. We expect to achieve this reduction through a combination of about 530 buyouts and a reduction in force of about 1,600 staff-years.

In addition, as part of the Department's streamlining initiative and reflecting changes made by the farm bill, the budget projects that 500 Farm Service Agency offices will be closed by the end of 1999. This issue of office closures is a very sensitive topic, and I want to take a moment here to put the issue in an appropriate context.

PART 1

445

First of all, although there have been many stories out in the States—and I know that many of you have heard from your constituents on this—the Secretary has not yet approved any plan for how the closures might be accomplished. Moreover, he has made it clear there will be no further office closures at this time beyond a few remaining closures that have been planned for some time in order to reach our original goal of about 2,500 service centers.

Second, the Secretary has asked each of the involved agencies, including the Farm Service Agency as well as the USDA Service Center Implementation Team, to give their best advice as to how we can organize within the budget levels. As you know, the service center approach means that the number of offices open for our customers relates to the budgets of other agencies in addition to the Farm Service Agency.

Third, as USDA develops its approach to meeting the budget requirements over time, it will do so in close consultation with those that would be most affected.

In short, while we have made a general commitment that we will reduce the number of our service centers, we have made no decisions about individual offices. We are committed to working with the Congress as we proceed with our review, and will keep you fully apprised of our planning.

The Risk Management Agency [RMA] is also a very important agency within our mission area. The Risk Management Agency and the Federal Crop Insurance Corporation play a pivotal role in fulfilling the mandates of the 1996 farm bill, while ensuring that American agriculture remains solid, solvent, and globally competitive into the 21st century. To accomplish these tasks, RMA intends to refine existing products, create innovative, cost-effective tools, educate farmers and the public, and expand its partnership with the private insurance sector and the agriculture community.

The administration's proposal to make revenue insurance available nationwide reflects the strong demand among producers that we have seen for new revenue insurance products, such as crop revenue coverage, income protection, and revenue assurance. In implementing the revenue insurance programs, no additional premium subsidy has been paid, and the expected 1996 loss ratio experience is within the statutory limits and comparable to RMA's standard multiperil production risk coverage.

To offset the additional delivery expenses and the expected growth involved in expanding revenue insurance nationwide, the administration proposes to reduce the reimbursement rate paid to private insurance companies for delivery expense, as well as the loss ratio used to establish the premium rate structure.

Under this proposal, the reimbursement rate for delivery expenses would be reduced from 28 percent under current law to 24.5 percent of the premium for multiperil coverage. This reduction is based on extensive analysis conducted by our Risk Management Agency and the General Accounting Office and would reduce discretionary spending for delivery expenses by \$203 million under current law to \$150 million under the proposal. Further, our proposal would make a portion of the overall reimbursement rate discretionary and subject to appropriation, whereas current law treats only the sales commissions portion of the reimbursement as discre-

PART 1

446

tionary. We believe this change offers insurance companies more flexibility for adjusting to the reduced reimbursement rate.

The budget provides \$68 million in discretionary spending to pay Risk Management Agency's administrative expenses, which reflects a modest increase of \$4 million for full-time staff positions, to adjust for recent losses and to improve RMA's ability to service participating private sector companies.

Turning now to the international side of the Farm and Foreign Agricultural Services mission area, I am pleased to report that exports of U.S. farm and food products posted another sales record in 1996. Exports climbed to \$59.8 billion, a gain of more than \$5 billion from the previous year. With the strong back-to-back gains of the last 2 years, U.S. agricultural exports have increased by some \$19 billion—or close to 50 percent—since 1990. As a result, agricultural exports supported 1 million jobs both on and off the farm, one-third of which were in rural areas.

Continued progress in the international arena is crucial to the economic security of American farmers and ranchers. The changes made in domestic farm programs by the 1996 farm bill have made U.S. producers more dependent than ever on exports to maintain and expand their incomes. American agriculture is currently twice as dependent on overseas sales as the U.S. economy as a whole, and the sector will be 2½ times as export-dependent by the turn of the century. It is critical, therefore, that we continue our aggressive trade promotion efforts to help U.S. producers and exporters take full advantage of emerging export market opportunities. The 1998 budget continues USDA's commitment to export promotion and growth by providing a total program level of just under \$7.7 billion for international programs and activities.

For the CCC export credit guarantee programs, the budget provides a total program level of \$5.7 billion. Our proposals continue two initiatives designed to increase the utility of the CCC export credit programs, supplier credit guarantees, and facilities finance guarantees.

The budget provides higher program levels for our two export subsidy programs, the Export Enhancement Program [EEP] and the Dairy Export Incentive Program. In the case of EEP, we propose to make available \$500 million, the maximum level permitted by the 1996 farm bill.

For the Market Access Program, the budget continues funding at its maximum authorized level of \$90 million.

For Public Law 480 foreign food assistance, the budget proposes a total program level of \$990 million, a reduction of \$57 million from the current estimates for 1997. Our 1998 request level is expected to provide for approximately 3.2 million metric tons of commodity assistance, unchanged from the current tonnage estimate for 1997.

For the Foreign Agricultural Service, the budget proposes a funding level of \$151 million, an increase of \$15 million above the 1997 level. Most of the proposed increase will be used to help meet the cost of several FAS activities which are currently supported with CCC funds made available to FAS through reimbursable agreements. These activities include the Emerging Markets Program and the operating costs of the CCC computer facility, which serves

PART 1

447

as the Department's collection point for international production intelligence and crop estimates.

The FAS appropriations request also includes \$2.4 million for the Cochran Fellowship Program, which will continue the program at its current 1997 level. The budget also includes new provisions to address the difficulties in accurately estimating and funding the annual operating cost of FAS overseas offices.

First, the budget provides an advance appropriation of \$3 million for 1999 to fund documented wage and price increases and/or exchange rate losses incurred during 1998. Second, the budget proposes that funds appropriated to FAS in 1998 be available for obligations for 2 years rather than 1 year.

In closing, I would like to note that today's budget realities mean that the Government must be leaner and more efficient, but the era of responsive and responsible Government is not over. While there are things that Government cannot do or Government should not do, there are many legitimate public needs that only Government can meet. When it comes to advancing the stability, sustainability and economic vitality of American agriculture and of our farmers and ranchers, who are the bedrock of our Nation's agricultural bounty, the FFAS mission area has a vital role to play.

Mr. Chairman, members of the committee, that concludes my statement. We will be pleased to answer any questions that you might have.

PREPARED STATEMENTS

Senator COCHRAN. Thank you very much, Mr. Secretary. We thank you again for being here and for helping us to understand the details of this budget request. We have your written statements and they will be made part of the record.

[The statements follow:]

PREPARED STATEMENT OF DALLAS SMITH

Mr. Chairman and members of the Subcommittee, I am pleased to have this opportunity to discuss the 1998 budget and program proposals for the Farm and Foreign Agricultural Services mission area of USDA. With me today are August Schumacher, Administrator of the Foreign Agricultural Service; Christopher Goldthwait, the General Sales Manager; Randy Weber, Acting Administrator of the Farm Service Agency; Kenneth Ackerman, Administrator of the Risk Management Agency; and Dennis Kaplan from the Office of Budget and Program Analysis.

Statements by the Administrators, providing details on their agencies' budgets and program proposals for 1998, have been submitted to the Subcommittee. My statement will summarize the proposals, after which we will be pleased to respond to your questions.

A fundamental goal of the Farm and Foreign Agricultural Services mission area is to secure the long-term economic vitality and global competitiveness of American agriculture by expanding trade and economic opportunities and promoting income growth and development throughout rural America. We are the "production agriculture" mission area. We work to keep America's farmers and ranchers—the linchpins of our agricultural economy—in business.

How we accomplish our mission will in large part be determined by the new policies set in place by the Federal Agriculture Improvement and Reform Act of 1996 (the 1996 Act), and one of our primary tasks this past year has been to implement the policy and program changes provided for in the Act. As a result of our efforts, nearly 99 percent of eligible acres were entered into production flexibility contracts last year.

Although the 1996 Act has provided much greater flexibility to our farmers in their production and marketing decisions, it has also increased the risks inherent in farming by reducing the Federal government's role in supporting incomes and

PART 1

448

managing supplies. Consequently, we remain concerned about the adequacy of the safety net for our producers and have been working diligently to expand and improve programs which help producers manage their price and production risks. At the same time, we have continued our efforts to reduce expenses, improve efficiency, and deliver responsive, quality service to our farm and rural customers.

FARM SERVICE AGENCY

The Farm Service Agency (FSA) administers the farm credit programs, several conservation programs, and the domestic commodity price and income support programs of the Commodity Credit Corporation (CCC). The CCC is also the source of funding for most of the cost-share and land retirement conservation programs administered by the FSA and the Natural Resources Conservation Service (NRCS), and many of the export programs administered by the Foreign Agricultural Service (FAS).

Farm Credit Programs

The farm credit programs administered by FSA continue to serve as a vital source of credit for our nation's farmers and ranchers. They provide a safety net for producers who suffer a financial setback.

This budget continues the trend toward emphasizing guaranteed loans, which are made in partnership with private lenders and have a low subsidy cost for taxpayers. We remain responsive, however, to the continued need for direct loans, which are targeted to beginning farmers and members of socially disadvantaged groups who show promise for success but would be unable to obtain credit elsewhere. Our goal is to assist borrowers, through supervised credit, to achieve a successful agricultural operation and graduate to private credit. Far more attention than in prior years is being paid to repayment ability and adequate security.

The 1998 budget provides for a total of about \$2.8 billion in farm credit program loans and guarantees, which is about \$300 million less than the amount that can be supported by the 1997 appropriation. Of the reduction, about \$200 million is in the guaranteed farm ownership loan program. However, the 1998 budget level of \$400 million is consistent with the actual demand for the program in recent years. The unsubsidized guaranteed farm operating loan program would be maintained at a level of about \$1.7 billion. The remaining farm ownership and operating programs are generally funded at the 1997 supportable levels with a modest increase for the credit sales program. In addition, the 1998 budget proposes to maintain the emergency disaster loan program at \$25 million.

Commodity Credit Corporation

Reflecting the trend for Federal outlays for farm price and income support programs, total CCC outlays have declined from the 1986 peak of \$26 billion to \$4.6 billion in 1996. This is the first time CCC outlays have dropped below \$5 billion since 1981. Including conservation programs and other programs for which CCC funding was authorized by the 1996 Act, CCC outlays are projected to total \$7.8 billion in 1997 and \$9.9 billion in 1998, and decline to about \$7.6 billion by 2002.

Beginning in 1998, in response to recommendations of the Office of the Inspector General, the request for appropriations to reimburse CCC for net realized losses will cover the actual amount of the unreimbursed losses incurred 2 years earlier. The 1998 budget requests \$784 million for the balance of 1996 losses not reimbursed through appropriations in 1996 and 1997. Appropriations to reimburse CCC for net realized losses incurred in 1997 will be requested in the 1999 budget.

Provisions of the 1996 Act also limit CCC expenditures for computer equipment and cap reimbursements to agencies for administrative support services at 1995 levels.

Conservation Programs

The Conservation Reserve Program (CRP) is the major conservation program administered by FSA. The 1996 Act reauthorized the CRP, set maximum enrollment at 36.4 million acres, and switched the program's financing from direct appropriations to CCC funding. The legislation also redefined the program, changing its primary focus from highly erodible land conservation and supply management to environmental protection, with wildlife habitat and water quality improvements joining erosion reduction as primary program objectives.

The 1998 budget assumes a competitive bid process will be used to enroll nearly 19 million acres of new and expiring CRP contract acres in 1997. This figure is not, however, a target such as was used by CRP in the 1980's. Instead, enrollment will depend upon the nature of the bids. The goal of the CRP is to only retire lands where the benefits to society from the retirement from agricultural production ex-

PART 1

449

ceed the costs. Enrollments in subsequent years are assumed to gradually increase total enrollment to 36.4 million acres by 2002.

Signup for CRP regular enrollment was held March 3 through March 28. Results as of March 21 indicate that landowners submitted over 240,200 offers to enroll almost 20 million acres, of which about 14.7 million are currently under contracts that expire in September. With technical assistance from NRCS, FSA will undertake the voluminous task of evaluating the environmental benefits of all offers, and by mid-June will notify producers as to which acres have been accepted into the program. Continuous signup is also in place for certain high priority practices involving small acreages, such as riparian buffers, filter strips and windbreaks.

The budget also reflects provisions of the 1996 Act authorizing CCC funding for a number of new conservation programs, most of which will be administered by NRCS in cooperation with FSA.

The Agricultural Conservation Program, the Colorado River Basin Salinity Control Program, the Water Quality Incentives Program, and the Great Plains Conservation Program were replaced by the Environmental Quality Incentives Program. The Flood Risk Reduction Program provides incentives to move farming operations from frequently flooded land, and the Conservation Farm Option gives producers incentives to create comprehensive farm plans. The Wildlife Habitat Incentives Program provides cost-share assistance to landowners to implement management practices improving wildlife habitat. The Farmland Protection Program provides for the purchase of easements limiting nonagricultural uses on prime and unique farmland.

Under the Emergency Conservation Program (ECP), the Department shares the cost of carrying out practices to assist and encourage farmers to rehabilitate farmland damaged by natural disasters. ECP received emergency funds of \$25 million in 1997, and on March 19 the Administration transmitted to Congress a request for ECP supplemental funding of \$20 million, plus a contingency reserve of \$17 million to be available at the request of the President. The 1998 President's budget does not include a request for funding ECP, but proposes the establishment of a new \$5.8 billion contingent reserve for emergency funding requirements for various disaster assistance needs. This fund would be available to the President for disaster relief purposes, including use in the Department's emergency conservation activities.

CCC outlays for CRP and other conservation programs are projected in the 1998 budget to increase from negligible levels in 1996, when rental payments were funded through appropriations, to \$1.9 billion in 1997 and to \$2.2 billion in 1998.

Commodity Programs

The 1996 Act replaced the deficiency payment program which had been in place since the 1970's with a new program of payments that generally are not tied to market prices or to current plantings. Dairy policy also is changed under the 1996 Act with a phaseout of price support and consolidation of milk marketing orders. The new law also alters the sugar and peanut programs. As a result, a great deal of the volatility associated with forecasting commodity program outlays has been removed.

Commodity program outlays are a barometer of changing programs and policies. The 1998 budget projects that CCC outlays for commodity programs will increase from about \$5 billion in 1997 to \$6.2 billion in 1998, and then decline again to about \$4 billion by 2002.

This budget also reflects legislation that we will be proposing to the authorizing committees to improve the safety net for farmers, reflecting the President's pledge when he signed the 1996 Act. Our legislation provides discretionary authority to extend commodity loans for 6 months during periods of depressed market prices or market disruptions, allows managed haying and grazing of CRP acreage, increases fruit and vegetable planting flexibility for acreage enrolled in production flexibility contracts, and provides for greater flexibility in the timing of contract payments. The change in CRP haying and grazing provisions is estimated to reduce CRP outlays by about \$25 million per year.

Legislation will also be proposed to expand revenue insurance coverage nationwide, improve farm credit services, and make other technical adjustments to improve farm programs.

Changes made by the 1996 Act have diminished the traditional role of the farm programs as a buffer against fluctuations in production and commodity prices. Our greatest challenge is to find new ways to help farmers thrive in an increasingly risky environment and yet not be involved in the micromanagement of agricultural decisions. That is why risk management has become a top priority, and why the President and the Department attach such importance to enactment of legislation designed to improve the programs that help farmers better manage price and production risk.

PART 1

450

FSA Salaries and Expenses

For FSA salaries and expenses we are requesting a total appropriated level of \$954 million, a net decrease of \$1.9 million from 1997.

Our staffing reductions for 1998 continue to run well ahead of those projected in the Department's reorganization plan. The 1998 budget calls for staffing levels of 5,877 Federal staff-years and 9,879 non-Federal county office staff-years—reductions of 269 and 1,850 staff-years, respectively, from 1997 levels. We expect to achieve this reduction through a combination of about 530 buyouts and a reduction in force of about 1,589 staff-years.

Since 1993, FSA has downsized its work force by approximately 4,700 FTE's, or about 21 percent, due to streamlining efforts and the programmatic impacts of the 1996 Act. The additional reduction of 2,119 FTE's proposed in the 1998 budget would bring the cumulative FSA work force reduction since 1993 to 30 percent. This breaks down to 34 percent for non-Federal county office employees and 23 percent for Federal employees, including Federal county farm credit staff.

As part of the Department's streamlining initiative, the budget projects that 500 county FSA offices will close by the end of 1999. No decisions have been made as to which offices will be affected, and none will be made without the appropriate consultations with Congress. In 1997, the Department will contract for an independent study of FSA and NRCS to look for additional opportunities for streamlining and increasing the efficiency of our service to customers, as well as undertake a major review of our regulations, in conjunction with NRCS, to significantly reduce the paperwork burden on farmers.

RISK MANAGEMENT AGENCY

Farmers today face a risk environment dramatically different from that which existed a few years ago. Deficiency payments and ad hoc disaster aid have been eliminated, and a number of other price and production assistance programs have been significantly reduced by the 1996 Act and other legislation. To fill this void, producers must take active steps to reduce their agricultural risks.

The 1996 Act created the Risk Management Agency (RMA) to administer the crop insurance program and to carry out other risk management functions. Previously, the crop insurance program was administered by the FSA, which retains responsibility for the Noninsured Crop Disaster Assistance Program (NAP), and which provides basic catastrophic crop insurance through its county offices in States where private crop insurance resources are limited.

The RMA and the Federal Crop Insurance Corporation (FCIC) play a pivotal role in fulfilling the mandates of the 1996 Act while ensuring that American agriculture remains solid, solvent, and globally competitive into the 21st century. To accomplish these tasks, RMA intends to refine existing products, create innovative, cost-effective tools, educate farmers and the public, and expand its partnerships with the private insurance sector and the agricultural community.

The 1998 budget provides funding for the crop insurance program administered by RMA under both current law and new legislation to be submitted to the authorizing committees to improve the safety net for farmers by establishing a nationwide program for revenue insurance. Revenue insurance protects producers' incomes against shortfalls due to either price or yield fluctuations. Our legislative proposal is intended to be budget neutral overall. However, it provides for a reduction in the discretionary spending portion of program expenses.

Under current law, funding for sales commissions, which has been treated as mandatory spending, shifts to discretionary spending in 1998. All other expenses of RMA are treated as mandatory, although subject to appropriation, for which the budget provides "such sums as may be necessary."

The Administration's proposal to make revenue insurance available nationwide reflects the strong demand among producers that we have seen for new revenue insurance products, such as Crop Revenue Coverage, Income Protection, and Revenue Assurance. However, current law limits RMA's authorities in the revenue insurance area to pilot programs. In implementing the revenue insurance programs, no additional premium subsidy has been paid, and the expected 1996 loss ratio experience is within the statutory limits and comparable to RMA's standard multiperil production risk coverage. The additional cost to the Federal government has been an increase in delivery expenses, including underwriting gains paid to the insurance companies.

To offset the additional delivery expenses and the expected growth involved in expanding revenue insurance nationwide, the Administration proposes to reduce the reimbursement rate paid to private insurance companies for delivery expenses, as well as the loss ratio used to establish the premium rate structure.

PART 1

451

Under this proposal, the reimbursement rate for delivery expenses would be reduced from 28 percent under current law to 24.5 percent of the premium for multi-peril coverage. This reduction is based on extensive analysis conducted by RMA and the General Accounting Office and would reduce discretionary spending for delivery expenses from \$203 million, under current law, to \$150 million under the proposal. Further, our proposal would make a portion of the overall reimbursement rate discretionary and subject to appropriation whereas current law treats only the sales commissions portion of the reimbursement as discretionary. We believe this change offers insurance companies more flexibility for adjusting to the reduced reimbursement rate.

Finally, our legislative proposal will provide more flexibility for determining subsidy amounts and establishing pilot programs. It will also make certain changes in program compliance requirements. None of these changes is expected to have a budgetary impact.

The current law budget also includes funding for \$257 million in mandatory account spending to reimburse the reinsured companies for the delivery of limited and buy-up coverage. This is a decrease from 1997 due to the legislative mandate that a portion of administrative expenses paid to the reinsured companies be transferred to the discretionary account. Under proposed legislation, it is estimated that an additional \$10 million in administrative reimbursements to reinsured companies would be required.

RMA Salaries and Expenses

Staff levels for RMA have decreased dramatically in recent years even as the program has grown in size, scope, and expectations. Overall staff resources, including administrative resources from the FSA, have been reduced by more than 20 percent since 1993. As of September 30, 1996, there were 536 employees in RMA, at headquarters and in 10 regional service offices and 6 compliance offices.

Under current law, the budget provides \$68 million in discretionary spending to pay RMA's administrative expenses, which reflects a modest increase of \$4 million for full-time staff positions to adjust for recent losses and to improve RMA's ability to service participating private sector companies. Funding for the new and expanded programs is intended to ensure that the programs are implemented as expeditiously as possible. The current law budget also includes \$203 million for the payment of sales commissions out of the discretionary account. Our legislative proposal would reduce the discretionary portion of the administrative reimbursements paid to reinsured companies to \$150 million and allow for the payment of expenses other than just sales commissions.

FOREIGN AGRICULTURAL SERVICE

Turning now to the international side of the FFAS mission area, I am pleased to report that exports of U.S. farm and food products posted another sales record in 1996. Exports climbed to \$59.8 billion, a gain of more than \$5 billion from the previous year.

With the strong, back-to-back gains of the last 2 years, U.S. agricultural exports have increased by some \$19 billion, or close to 50 percent since 1990. As a result, agriculture led all U.S. trade categories as the most significant contributor to the U.S. balance of trade and supported one million jobs both on and off the farm, one-third of which were in rural areas.

Early forecasts of agricultural exports for the current year suggest a more moderate sales pace. Current projections for 1997 call for exports to reach \$56.5 billion, down about 6 percent from 1996, but still the second highest value on record. The anticipated reduction mainly reflects increased foreign production of grains and lower average prices for wheat and coarse grains. High-value exports are forecast to set another record this year.

These strong export gains provide convincing evidence that American agriculture is reaping the benefits of the North American Free Trade Agreement, the Uruguay Round Agreement on Agriculture, and the more than 200 other trade agreements the Administration has successfully negotiated. As a result of these agreements, we now have the most open world market of this century and enormous opportunities for additional export growth.

Continued progress in the international arena is crucial to the economic security of American farmers and ranchers. The changes made in domestic farm programs by the 1996 Act have made U.S. producers more dependent than ever on exports to maintain and expand their incomes. American agriculture is currently twice as dependent on overseas sales as the U.S. economy as a whole, and the sector will be two-and-a-half times as export-dependent by the turn of the century. It is critical, therefore, that we continue our aggressive trade promotion efforts to help U.S. pro-

PART 1

452

ducers and exporters take full advantage of emerging export market opportunities. At the same time, we must continue to adapt and improve these efforts to meet today's challenges and keep pace with intense competition.

Much of our recent export success can be directly linked to the combined effects of our trade policy initiatives, export assistance programs, and the market development efforts of FAS working with our agricultural cooperators and others, including participants in the Market Access Program (MAP).

Overseas, FAS field offices support USDA programs and the U.S. agricultural export drive in 95 locations around the globe. These offices continue to function as the "eyes and ears" for U.S. agricultural exporters, and the thousands of attaché reports that they prepare each year are now available to the widest possible U.S. audience almost instantly via the Internet. In line with the Department's Long-Term Agricultural Strategy, we have increased staff in the Pacific Rim and Latin America, and decreased staff in Europe.

Domestically, FAS has expanded its outreach and information efforts to educate U.S. businesses about the tremendous potential of global markets. A key part of this effort is the location of export advisors at the state level—at the California, Colorado, and Oregon State Departments of Agriculture and the Iowa State Office of the FSA.

FAS has joined forces with cooperators and MAP participants such as the American Hardwood Export Council and the American Seafood Institute, and with local entities such as state departments of agriculture across the country to sponsor export seminars for small and new-to-export businesses. Last July, in conjunction with FSA, FAS conducted outreach efforts in 47 states plus Puerto Rico. The state-hosted events attracted over 2,000 participants, bringing together producers, bankers, agribusinesses, exporters, shippers, universities, and Federal, state, and local officials.

Through these and other programs, the Department plays a vital role in working with the private sector to identify emerging market opportunities overseas and in using our export promotion and market development tools to achieve our shared trade objectives.

The 1998 budget continues USDA's commitment to export promotion and growth by providing a total program level of just under \$7.7 billion for international programs and activities.

For the CCC export credit guarantee programs, the budget provides a total program level of \$5.7 billion, which includes \$5.3 billion for GSM-102 short-term guarantees and \$400 million for GSM-103 intermediate-term guarantees. The overall increase of \$200 million above the 1997 level consists of guarantees which will be made available to emerging markets for U.S. agricultural products.

The GSM-102 program level continues two other credit initiatives—supplier credit guarantees and facilities financing guarantees. The budget provides for \$350 million of supplier credit guarantees, an increase of \$100 million above the 1997 level. These guarantees, which were first made available in late 1996, allow exporters of U.S. agricultural products to obtain CCC guarantees for short-term credit extended directly to foreign buyers. Supplier credit guarantees are expected to be particularly useful in facilitating sales of processed and consumer-ready products, which are among the fastest-growing components of U.S. agricultural exports. To date, supplier credit guarantees have been made available to facilitate U.S. agricultural exports to Mexico, Guatemala, El Salvador, Panama, Jamaica, Indonesia, Malaysia, Singapore and the Philippines.

Also under GSM-102 authority, the budget includes \$100 million of facilities financing guarantees, unchanged from the current estimate for 1997. Under this initiative, CCC will provide guarantees for the establishment or improvement of facilities and/or services designed to address infrastructure barriers to increased export sales. We anticipate publishing an interim final rule this spring for this program.

The budget provides higher program levels for our two export subsidy programs in 1998—the Export Enhancement Program (EEP) and Dairy Export Incentive Program (DEIP). In the case of EEP, we propose to make available \$500 million, the maximum level permitted by the 1996 Act and a \$400 million increase over 1997. The budget includes \$89 million for DEIP in anticipation of higher sales under this program.

One of the more promising developments in 1996 was the virtual suspension of global export subsidies, which mask market signals and distort trade. EEP and DEIP program activity was reduced in 1996 as a result of world commodity supply and competitive conditions. Unfortunately, the responsible restraint by the United States has been tested by renewed European Union subsidization, which began last September. We must be ready to protect our agricultural trade interests including the resumption of EEP, if necessary, and therefore, we have provided full funding for EEP in 1998.

PART 1

453

For the Market Access Program (MAP), formerly the Market Promotion Program, the budget continues funding at its maximum authorized level of \$90 million. The MAP provides cost-share assistance to nonprofit agricultural trade organizations, state and regional trade groups, and private companies which carry out export promotion activities overseas. The program has proven to be particularly effective in promoting sales of high-value products.

During the past year, changes have been made in MAP to target more resources to small businesses. In 1996, 56 percent of the funds for promotion of branded products was made available to small entities, up from 41 percent in 1994, and another 20 percent was made available to farmer cooperatives. Additional program improvements recently have been made which are designed to broaden participation, clarify program criteria, strengthen evaluation and accountability, and simplify program requirements for participants.

The budget includes a proposed rescission of \$50 million in budget authority for the Public Law 480 Title I concessional sales program in 1997 in order to provide a partial offset for a supplemental appropriations request for the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). This proposal will reduce the Title I program level by \$60 million and estimated commodity shipments by 200,000 metric tons. However, allocations of commodity assistance already announced for 1997 will not be affected by the rescission because the reduction will be taken from a reserve of unallocated funds and from unobligated funds carried over from 1996.

For 1998, the budget proposes a total Public Law 480 program level of \$990 million, a reduction of \$57 million from the revised estimate for 1997. This reduction will occur in the Title I concessional sales program; funding for Titles II and III will remain largely unchanged from 1997 enacted levels. Our 1998 request level is expected to provide for approximately 3.2 million metric tons of commodity assistance, unchanged from the revised tonnage estimate for 1997.

The 1998 budget for Public Law 480 also shifts the budget and expenditures for the Title I program from the international affairs function to the agriculture function of the Federal budget. This proposal is an outgrowth of recent changes in the Title I statutory authorities, which have placed a much greater emphasis on the program's market development objectives. With these changes, the role and importance of the Title I program in the Department's overall long-term market development strategy has increased. Shifting Title I to the agriculture function will allow the program to be managed and budgeted as part of a consistent package of agricultural export programs.

FAS Salaries and Expenses

The Foreign Agricultural Service administers the Department's important trade, export, and international cooperation activities. As the Subcommittee will recall, last year's budget continued the pro-active approach to the fundamental objective of increasing U.S. agricultural exports by 50 percent by the year 2000. With the resources provided for 1997, FAS has expanded market development activities, including the Cooperator Program, and our domestic outreach efforts to facilitate the entry of small and medium sized producers into the international marketplace.

For 1998, the FAS budget proposes a funding level of \$150.9 million and 885 staff-years, an increase of \$15.4 million above the 1997 level. Most of the proposed increase will be used to help meet the costs of several FAS activities which are currently supported with CCC funds made available to FAS through reimbursable agreements. The budget proposes that future funding of these activities will be included in the FAS appropriation. With this change, their funding will no longer be subject to the annual limitation on CCC reimbursable agreements established by the 1996 Act.

These activities include the Emerging Markets Program, under which technical assistance and training are provided to promising overseas growth markets where there is potential to increase U.S. exports significantly over the long term. They also include the operating costs of the CCC Computer Facility, which serves as the Department's collection point for international production intelligence and crop estimates, and for other, related FAS Information Resources Management costs.

An increase of \$500,000 is requested to implement a systematic process to review, identify, and catalog technical barriers to trade and other technical requirements that limit export opportunities in the top 30 export markets accounting for the majority of U.S. agricultural trade. This review will lead to recommendations for overcoming the identified barriers and expanding U.S. exports to these markets.

For the Cochran Fellowship Program, the budget provides funding of \$2.4 million, unchanged from this year's level.

PART 1

454

The budget also includes new provisions to address the difficulties in accurately estimating and funding the annual operating costs of our overseas offices. First, the budget provides an advance appropriation of \$3 million for 1999 to fund documented wage and price increases and/or exchange rate losses incurred during 1998. Second, the budget proposes that funds appropriated to FAS in 1998 be available for obligation for 2 years rather than 1 year. This will allow any savings that may be realized in the cost of overseas operations to be carried over for use the following year.

In conclusion, today's budget realities mean that government must be leaner and more efficient, but the era of a responsive and responsible government is not over. While there are things that government can't do, or shouldn't do, there are many legitimate public needs that only government can meet. When it comes to advancing the stability, sustainability, and economic vitality of American agriculture, and of the farmers and ranchers who are the bedrock of our nation's agricultural bounty, the FFAS mission area has a vital role to play.

Mr. Chairman, that concludes my statement. We will be pleased to answer any questions you and other members of the Committee may have.

PREPARED STATEMENT OF BRUCE R. WEBER

Mr. Chairman and Members of the Subcommittee, I am pleased to present the fiscal year 1998 budget for the Farm Service Agency (FSA). When our statement was presented to you last year, Congress had just enacted the Federal Agriculture Improvement and Reform Act of 1996. That legislation made significant changes in the design and funding of the programs that this agency administers. Implementing the legislative changes and working toward increased cost savings are our major tasks in 1997. Our 1998 budget reflects the new direction in farm programs coupled with a significant contribution toward the bipartisan effort to balance the Federal budget by 2002. As I discuss the budget estimates for our various activities—price and income support and related programs of the Commodity Credit Corporation, conservation programs funded by the Commodity Credit Corporation, the farm credit programs of the Agricultural Credit Insurance Fund, and a number of others—I will highlight the major changes. To conclude, I will summarize our request for administrative support, noting the impact of the program and budget changes on FSA staffing.

COMMODITY CREDIT CORPORATION

Domestic farm commodity price and income support programs are administered by the Farm Service Agency and financed through the Commodity Credit Corporation, a government entity for which FSA provides operating personnel. The CCC is also the source of funding for most of the conservation programs administered by FSA and NRCS, and it funds most of the export programs administered by FAS. Funds are borrowed by the Corporation from the Treasury to finance CCC programs. The Corporation has the authority to have outstanding Treasury borrowings of up to \$30 billion at any one time. Commodity support operations, handled primarily through loans and payment programs, and some limited purchase programs, currently include those for wheat, corn, soybeans, minor oilseed crops, cotton (upland and extra long staple), rice, tobacco, milk and milk products, barley, oats, sorghum, peanuts and sugar.

COMMODITY PROGRAM OUTLAYS

The CCC budget attempts to capture the impact of economic or other conditions 2 years into the future. The current 1998 budget estimates largely reflect estimated supply and demand conditions for the 1997 crop. However, a great deal of the volatility associated with forecasting commodity program outlays has been removed due to the provisions of the 1996 Farm Bill. The price and income support program funded by CCC for the 1996 crops and beyond are determined by that legislation, which has fundamentally restructured income support programs and discontinued supply management programs for producers of feed grains, wheat, upland cotton, and rice. The deficiency payment program, which was tied to market prices and had been in place since the early 1970's, has been replaced with a new income support program of payments that generally are not related to current plantings or to market prices. The new law also expands planting flexibility and suspends the authority for the Secretary to require farmers to idle a certain percentage of their cropland in order to be eligible for income support payments.

The budget includes proposed legislation that will build better programs to help farmers manage risk and thereby improve the safety net for farmers, reflecting the

PART 1

455

President's concerns when he signed the 1996 Farm Bill. The proposed legislation would provide discretionary authority to extend commodity loans for 6 months during periods of depressed market prices or market disruptions, allow for managed haying and grazing on CRP acres, increase fruit and vegetable planting flexibility for acreage enrolled in production flexibility contracts, and provide greater flexibility in the timing of production flexibility contract payments. The change in CRP haying and grazing provisions is estimated to reduce CRP outlays by about \$25 million per year.

Mr. Chairman, reflecting the trend for Federal outlays for farm price and income support programs, total CCC outlays have declined from the fiscal year 1986 high of \$26 billion to \$4.6 billion in fiscal year 1996. This is the first time CCC outlays have dropped below \$5 billion since fiscal year 1981. Including conservation programs and other programs for which CCC funding was authorized by the 1996 Farm Bill, CCC outlays are projected to total \$7.8 billion in fiscal year 1997 and \$9.9 billion in fiscal year 1998, and decline to about \$7.6 billion by fiscal year 2002. This outlay trend is shown on the graph below.

For fiscal year 1998, total net outlays are expected to increase by \$2.1 billion to \$9.9 billion—about a 27-percent increase, reflecting higher net commodity lending outlays of \$467 million; the absence of deficiency payment refunds in fiscal year 1998, whereas \$1.1 billion will be received in 1997; an increase of \$400 million in the export enhancement program; higher net interest expenditures of \$297 million; and increased conservation program expenses of \$241 million. While no deficiency payment refunds are estimated for fiscal year 1998, production flexibility contract payments will decline by \$644 million.

ADP Expenses and other Section 11 Activities

Section 161 of the 1996 Farm Bill significantly limits the use of CCC funds for operating expenses. CCC no longer has authority to purchase personal property, except within authorized limitations. CCC spending for equipment or services relating to automated data processing (ADP), information technologies or related items (including telecommunications equipment and computer hardware and software, but excluding reimbursable agreements), was limited by the 1996 Act to \$170 million in fiscal year 1996, and \$275 million for the six-year period including fiscal years 1997 through 2002, unless additional amounts for such contracts and agreements

PART 1

456

are provided in advance in appropriation acts. The amount actually obligated for ADP-related expenses in fiscal year 1996 was \$144 million. The 1996 Act also requires that CCC submit to Congress on a quarterly basis an itemized report of all expenditures over \$10,000, excluding program payments.

Section 161 of the 1996 Act also amended Section 11 of the CCC Charter Act to limit the uses of CCC funds for reimbursable agreements and transfers and allotments of funds to State and Federal agencies. Starting in fiscal year 1997, the total of CCC fund uses under that section in a fiscal year, including agreements for ADP or information resource management activities, may not exceed the total of such allotments and transfers in fiscal year 1995. CCC obligations for Section 11 activities in fiscal year 1995 were \$45.6 million, and obligations in fiscal year 1996 were \$49.4 million.

The 1998 budget assumes that expenditures for computer and telecommunications equipment will total \$109 million in fiscal year 1997 and \$104 million in fiscal year 1998. The budget projects annual spending under the cap on reimbursable agreements will total \$41.2 million in fiscal year 1997 and \$35.6 million in fiscal year 1998.

Reimbursement for Realized Losses

The 1998 budget reflects an estimated need for \$784 million to reimburse CCC for its realized losses, a reduction of \$716 million from the fiscal year 1997 reimbursement of \$1.5 billion. In prior years, the request for appropriations to reimburse the CCC for net realized losses has been based on an estimate of losses incurred one year earlier which have not been previously reimbursed. The estimate could exceed or fall short of the actual amount of loss. Beginning in 1998, in response to OIG recommendations, the request for appropriations to reimburse CCC for net realized losses will cover the actual amount of the unreimbursed losses incurred 2 years earlier. Fiscal year 1996 losses totaled \$7.8 billion, of which \$5.5 billion was restored by appropriations in 1996 and \$1.5 billion was restored by appropriations in 1997, leaving a balance of \$784 million to be restored in 1998. Appropriations to reimburse CCC for net realized losses to be incurred in 1997, currently estimated to total \$9 billion, will be requested in the 1999 budget.

Appropriation Language Changes

Two CCC appropriation language changes are proposed in the budget:

- New language establishing a minimum program level for export credits for emerging markets.
- A shift in funding for the Emerging Markets Technical Assistance Program from CCC to FAS appropriation. With this change, these activities will be carried out with discretionary, rather than mandatory funding and will no longer be included in the annual limitation on Section 11 CCC reimbursable agreements and other transfers. The increase in FAS funding is offset by a \$10 million decrease in the fiscal year 1998 CCC reimbursable agreements and other transfers cap.

CCC-FUNDED CONSERVATION PROGRAMS

Conservation Reserve Program

The 1996 Farm Bill reauthorized the Conservation Reserve Program, established maximum enrollment at 36.4 million acres, and changed the program's financing from direct appropriation to CCC funding. The legislation also redefined the program, changing its primary focus from highly erodible land conservation and supply management to environmental protection, with wildlife habitat and water quality joining soil erosion reduction as primary program objectives.

Continuous signup is available for certain high priority practices involving small acreages, such as riparian buffers, filter strips, and windbreaks. Signup for CRP regular enrollment was held March 3 through March 28. I am pleased to report that as of March 21, the end of the third week of the 4-week signup, landowners had offered to enroll almost 20 million acres, of which about 14.7 million are currently under contracts that expire in September. The remaining 5.3 million acres are new offers. With technical assistance from the Natural Resources Conservation Service, FSA will carry out the massive job of evaluating the environmental benefits of all offers, and will notify producers by mid-June as to the acres that have been accepted into the program.

In 1997, CCC is making payments of approximately \$1.765 billion for rental costs and about \$8 million for sharing the cost of permanent cover on replacement acres. Fiscal year 1997 CRP technical assistance costs of \$83 million for NRCS and FS are funded by unobligated balances of CRP funds appropriated prior to enactment of the 1996 Farm Bill. For 1998, CCC program costs are expected to total approximately

PART 1

457

\$1.928 billion, consisting of \$1.667 billion for rental payments on previously enrolled and extended acres; \$246 million for cost-sharing of permanent cover on enrolled acres; and \$15 million for NRCS technical assistance funded under the CCC Section 11 cap on reimbursables and transfers. An additional \$24 million in NRCS and FS technical assistance costs in 1998 will be funded by unobligated balances of CRP appropriated funds.

Other CCC-Funded Conservation Programs

The 1996 Farm Bill restructured many of USDA's conservation programs and, as with the CRP, changed the financing to CCC funding. With the exception of the Flood Risk Reduction Program, the CCC-funded conservation programs are administered under the lead of NRCS. NRCS will discuss these programs with you in detail, and I will just mention them briefly.

The Wetlands Reserve Program was reauthorized by the 1996 Farm Bill, and funding of \$163.6 million is included in the CCC budget. The new Environmental Quality Incentives Program encompasses the objectives of four previous conservation programs: the Agricultural Conservation Program, the Water Quality Incentives Program, the Great Plains Conservation Program, and the Colorado River Basin Salinity Control Program. The CCC budget reflects \$200 million for the EQIP in 1998. The Conservation Farm Option is a pilot program which allows an eligible producer to receive a single payment totaling what he or she would have received separately under the CRP, WRP, and EQIP. For 1998, \$15 million is included for the CFO in the CCC budget. The new Farmland Protection Program will use \$18 million in 1998 to share with State and local governments the cost of acquiring conservation easements on specified farmland. CCC funding of \$22.5 million will be used in 1998 for the Wildlife Habitat Incentives Program, which shares the cost of developing habitat for upland wildlife, wetland wildlife, threatened and endangered species, fish, and other types of wildlife. The Flood Risk Reduction Program enables production flexibility program participants with acreage that is frequently flooded to receive in advance up to 95 percent of the production flexibility contract payments they are projected to receive from the time of enrollment in the FRRP through September 30, 2002. In exchange the producer must agree to terminate the production flexibility contract on FRRP acres, comply with swampbuster and conservation compliance requirements, and forgo future payments for disasters, crop insurance, and conservation programs, as well as loans for contract commodities, oilseeds, and extra-long staple cotton. The FRRP is funded at \$10 million in 1997, but no funding is proposed for 1998.

APPROPRIATED CONSERVATION PROGRAMS

Agricultural Conservation Program

As I indicated, the 1996 Farm Bill repealed the Agricultural Conservation Program in its sixtieth year and incorporated its objectives into the new Environmental Quality Incentives Program funded by CCC.

The fiscal year 1996 ACP appropriation of \$75 million remained available after April 4, 1996, to fund previously approved practices as well as new practices that met the objectives of the EQIP. Outlays under the program from 1996 and prior obligations, including long-term agreements, will continue for a number of years.

Emergency Conservation Program

The Emergency Conservation Program assists producers in rehabilitating farmland damaged by natural disaster and in carrying out emergency water conservation measures during periods of severe drought. The program shares the cost of practices to restore the land to its productive capacity as it existed prior to the disaster. As might be expected, funding needs for this program vary widely from year to year, depending upon the occurrence of natural disasters.

No ECP funding was provided in the fiscal year 1997 Appropriations Act, but supplemental funding of \$25 million was made available by the Omnibus Consolidated Appropriations Act. All of those funds were allocated, along with over \$8 million in unused allocations for prior disasters that were returned from the States and reallocated. As of March 28, \$277 thousand remains. As a result of winter storms in the West, flooding in the Ohio Valley, and other recent disasters, requests for emergency conservation assistance are expected to be substantial when flood waters recede and realistic estimates can be made. On March 19, the Administration forwarded to Congress a request for emergency supplemental appropriations, which includes an ECP request of \$20 million plus another \$17 million in contingency funding for ECP to be released upon the official request of the President.

The Budget requests no specific funding for the ECP for fiscal year 1998 but instead includes a request for a Governmentwide disaster contingency account.

Dairy Indemnity Program

The Dairy Indemnity Program compensates dairy farmers and manufacturers who, through no fault of their own, suffer income losses on milk or milk products removed from commercial markets due to residues of certain chemicals or other toxic substances. Payees are required to reimburse the Government if they recover their losses through other sources such as litigation. The 1998 appropriation request of \$100 thousand would cover program needs in an average year with no major contamination incidents. However, 1997 has already proven to be exceptional, with Arizona alone experiencing a loss in excess of \$120 thousand due to contamination of feed grown in soil containing residues of a pesticide used years ago. This claim, along with a sizable aflatoxin problem in Texas and smaller ones in six other States, has exhausted the full \$257 thousand available for allocation at the start of the year. Although additional requests from producers have come in, we have notified our county offices that no funds are currently available.

FARM CREDIT AND RELATED PROGRAMS

Agricultural Credit Insurance Fund

The programs of the Agricultural Credit Insurance Fund provide a variety of loans and loan guarantees to farm families who would be unable to obtain credit otherwise. The majority of FSA lending activity occurs in partnership with private lenders through the guarantee programs, which provide a safety net for producers by providing a means for them to continue to obtain credit from their regular lenders when they have suffered a financial setback. This budget continues the trend toward emphasizing guaranteed loans, which are most cost-efficient for the taxpayer because of their low subsidy cost. We remain responsive, however, to the continued need for direct loans, which are targeted to beginning farmers and members of socially disadvantaged groups. Our goal is to assist borrowers, through supervised credit, to achieve a successful agricultural operation and graduate to private credit.

The 1998 budget provides for a total program level of \$2.8 billion in ACIF loans and guarantees, approximately \$300 million less than the current estimate for 1997. Of this amount, \$2.3 billion would be for subsidized and unsubsidized loan guarantees, and \$532 million would be for direct loans.

Farm Ownership Loans.—For direct farm ownership loans we are requesting a loan level of \$30.8 million, which requires an appropriation of just over \$4 million. For guaranteed farm ownership loans in fiscal year 1998, we are requesting a loan level of \$400 million, which requires an appropriation of \$15.4 million.

Farm Operating Loans.—We are requesting a subsidy appropriation of \$29.6 million to enable us to make direct farm operating loans of \$450 million. For guaranteed farm operating loans, an appropriation of \$19.3 million will make possible \$200 million in loans with subsidized credit. For our largest farm operating loan program, unsubsidized guarantees, a request for \$19.9 million in appropriated funds will cover the Federal cost of \$1.7 billion in loans.

Other Loan Programs.—The Budget requests \$25 million for credit sales of acquired property, which requires budget authority of \$3.3 million. This program assists qualified applicants to purchase property in FSA inventory.

The Budget also proposes a subsidy of just over \$6 million to support a program level of \$25 million in emergency disaster loans in fiscal year 1998. I would like to note that in fiscal year 1997, in addition to the \$6.4 million regular appropriation, we have a carryover subsidy of \$28.9 million that will support additional emergency disaster loans of \$95.2 million. The carryover is from the funds that were made available in fiscal year 1996 by the 1997 Agriculture Appropriations Act, to remain available until expended. We expect to fully utilize these funds in the current fiscal year.

In addition, we are requesting \$132 thousand to provide \$1 million in Indian tribe land acquisition loans.

The 1998 budget proposes a farm credit program level close to the 1997 level but at a reduced cost, thanks to a combination of agency efforts to reduce direct loan delinquency rates and the benefits of expected lower interest rates in a strong economy. In 1997, total direct lending authority is \$568 million, supported by a subsidy of \$74 million. The budget, in contrast, estimates total direct lending authority of \$532 million for 1998, with a subsidy of \$43 million. So, while total direct lending authority decreases by about 6 percent, the supporting subsidy decreases by more than 40 percent. Through better management of the credit programs and by utilizing the tools provided in the 1996 Farm Bill, we will be able to continue to serve the credit needs of the Nation's small, family farmers while producing the kind of cost cutting performance necessary to achieve a balanced budget.

PART 1

459

State Mediation Grants

Since 1987, State Mediation Grants have enabled a number of States to develop programs to deal with conflicts involving distressed agricultural loans. The Department of Agriculture Reorganization Act of 1994 expanded the program from farm credit cases only, to include disputes concerning wetland determinations, conservation compliance, pesticides, and other issues. Operated primarily by State universities or departments of agriculture, the program provides a neutral mediator to assist producers in resolving disputes before they result in litigation, bankruptcy, or other serious consequences. Moreover, mediation, at \$200 to \$250 per case, offers significant savings over national level administrative hearings, which cost about \$3,000 to \$4,000 per case, not including indirect costs such as travel and salary of FSA employees involved in the appeal.

Currently 22 States have programs that qualify for grants. Three other States are developing programs, and additional States are considering doing so. For fiscal year 1998 the Budget requests \$4 million, an increase of \$2 million over fiscal year 1997, to meet the rising demand expected as a result of the program's broadened scope and to accommodate newly participating States.

ADMINISTRATIVE SUPPORT

The costs of administering all FSA programs are funded by a consolidated Salaries and Expenses account. The account is comprised of direct appropriation, transfers from program loan accounts under credit reform procedures, user fees, and advances and reimbursements from various sources. These reimbursements include funding from the Foreign Agricultural Service and Risk Management Agency for common administrative support activities provided by FSA personnel.

For FSA Salaries and Expenses we are requesting a total appropriated level of \$954 million, a net decrease of \$1.9 million from fiscal year 1997.

Our staffing reductions for 1998 continue to run well ahead of those projected in the Department's reorganization plan. The budget for FSA calls for 1998 staffing levels of 5,877 Federal staff-years and 9,879 non-Federal county office staff-years—reductions of 269 and 1,850 staff-years, respectively, from the 1997 levels of 6,146 and 11,729. We estimate that this total reduction of 2,119 staff-years will be achieved through a combination of about 530 buyouts and a reduction in force of about 1,589 staff-years. Salary and benefit savings of \$75.9 million from the proposed staffing reductions will be mostly offset by one-time separation costs estimated at \$56.3 million and by pay-related costs of \$18.9 million for remaining staff.

As a result of the 1996 Farm Bill, 1998 workload in some areas such as commodity program payments, conservation, basic farm record maintenance, and compliance will continue the decline begun this year. Other activities are expected to remain constant or, in some cases such as commodity loan activity, to increase.

Although FSA workload is lower in 1997 due to the 1996 Act, FSA is faced with a CRP signup that, as you know, was held March 3 through March 28 and will enroll as much as 19 million acres. The associated workload was not considered in the agency's analysis of Farm Bill workload because, although that Act provided the opportunity to increase enrollment, decisions concerning alternate enrollment levels had not been completed at the time of the analysis. The addition of this workload will stretch current resources and may require the hiring of temporary employees. The decision to increase enrollment levels includes enrolling an additional 8 million acres in 1998. Although workload is expected to continue to decline in 1998, required staffing reductions coupled with the increased enrollment level may again require relying upon temporary employees to fully accomplish CRP-related workload.

From 1993 through the current fiscal year, FSA has downsized its work force by approximately 4,700 FTE's, or about 21 percent, due to streamlining efforts and the programmatic impacts of the 1996 Farm Bill. The additional reduction of 2,119 FTE's proposed in the 1998 budget would bring the cumulative FSA work force reduction since 1993 to 30 percent, which breaks down to 34 percent for non-Federal county office employees and 23 percent for Federal employees, including Federal county farm credit staff.

The President's Budget projects that, as part of the USDA streamlining initiative, 500 county FSA offices will close by the end of fiscal year 1999. I would like to emphasize, however, that no decisions have been made as to which offices will be affected. We are currently in the planning stages of determining the various criteria that will be used as a basis for these decisions. However, we will not make any decisions without the appropriate consultations with Congress.

The Department is also planning an independent study of FSA, the Natural Resources Conservation Service, and other county-based agency activities to look for

PART 1

460

additional opportunities for streamlining and increasing the efficiency of our service to our customers.

Mr. Chairman, this concludes my prepared statement. I will be happy to answer your questions and those of the other Subcommittee Members at any time.

PREPARED STATEMENT OF AUGUST SCHUMACHER, JR.

Mr. Chairman, members of the Subcommittee, I appreciate the opportunity to review the work of the Foreign Agricultural Service (FAS) and to present the President's budget request for fiscal year 1998.

1996—A RECORD YEAR FOR EXPORTS

Exporters of U.S. farm and food products posted another sales record in fiscal year 1996 in both volume and value. Exports climbed to \$59.8 billion, a gain of more than \$5 billion from the previous year. This marked the second straight year of robust trade growth. In fiscal 1995, U.S. agricultural exports surged to \$54.6 billion, up 25 percent from 1994.

With the strong, back-to-back gains of the past two years, U.S. agricultural exports in 1996 were up by some \$19 billion or close to 50 percent since 1990. In an average week this past year, U.S. producers, processors and exporters shipped more than \$1.1 billion worth of food and farm products to foreign markets, compared with about \$775 million per week at the start of this decade.

Fiscal year 1996 sales were up in two of the three major categories of agricultural exports—bulk commodities (such as grains), and consumer-oriented products (mainly foods and beverages). In the intermediate products category (semi-processed commodities, live animals and seeds), exports were off 4 percent from 1995's record level.

The overall export gains out paced the more moderate growth in imports, raising the fiscal year 1996 agricultural trade surplus to a new record of \$27.4 billion—up from \$25.0 billion in fiscal 1995. In the most recent comparisons among 11 major industries, agriculture ranked No. 1 as the leading positive contributor to the U.S. merchandise trade balance.

U.S. wood and fishery products didn't fare quite as well as agricultural products this past year. Wood product exports were valued at \$7.1 billion, off 4 percent from 1995's record. Sales of edible fish and seafood, at \$2.9 billion, were down about 10 percent. However, combined U.S. exports of agricultural, wood and fish products in fiscal 1996 rose 7 percent to a record-high \$69.7 billion.

As you can see, we've experienced solid growth in export demand as our product mix becomes more diversified and as we implement the trade agreements that have improved market access. But we have much hard work ahead of us. As domestic farm supports are reduced, export markets become even more critical for the economic well-being of our farmers and rural communities, as well as suburban and urban areas that depend upon the employment generated from increased trade.

Today, U.S. agricultural exports support about 1 million American jobs—with about one third of them in the farm sector. The other two-thirds are off-farm in processing, marketing and transportation. These jobs, on average, are higher paying than non-export related jobs.

Early forecasts of agricultural exports for the current year suggest a more moderate sales pace. In December, USDA analysts projected fiscal year 1997 exports at \$56.5 billion, down about 6 percent from 1996, but still the second highest value on record. The anticipated reduction mainly reflects increased foreign production of grains and lower average prices for wheat and coarse grains. High-value exports such as livestock, poultry and soybean products are forecast to set another record this year.

Mr. Chairman, one of Secretary Glickman's goals for the Department is to expand economic security for all of our farmers and ranchers. To do that, we have to expand economic opportunities, and increasingly, these opportunities lie overseas.

To help American agriculture tap into these opportunities, FAS works to:

- identify constraints to U.S. exports and implement strategies for overcoming these constraints;
- aggressively pursue reductions of trade barriers and trade-distorting practices on the part of key trading partners;
- provide export assistance through expanding credit, market promotion and market development beyond what the private sector could do by itself;
- ensure that U.S. farmers and our research community have information about areas of emerging foreign demand;

PART 1

461

- defend U.S. agricultural interests by keeping U.S. policy views before the international community;
- strengthen the export knowledge and skills of producers, processors and exporters so they can compete more effectively in the international marketplace;
- educate foreign buyers on the merits of U.S. products and how they can be purchased; and
- support economic development efforts, especially in emerging markets and developing countries.

Through these aggressive measures we are helping our farmers and ranchers meet the competitive challenges both now and in the future.

Market Access and Development

Much of our recent export success can obviously be linked to the combined effects of our trade policy initiatives, export assistance programs, and the market development efforts of FAS working with our agricultural cooperators and others, including participants in the Market Access Program (MAP). For over 40 years, USDA and U.S. agricultural producers and processors have had a unique partnership that allows us to pool our technical and financial resources to conduct market development activities around the world. When the Uruguay Round Agreement was reached, our cooperators had, in many cases, already laid the groundwork for export sales through their on-going market development activities. And in many instances, use of our export assistance programs, such as Public Law 480 and the export credit guarantee programs, had served to introduce quality American products to foreign buyers. So, in fiscal year 1996, the first full year of implementation of the Uruguay Round Agreement, U.S. agriculture was able to take advantage of the solid foundation built over the years and post some notable gains.

Pork.—For the first time, Korea opened its market for pork, both fresh and processed. As a result of the increased market access and preparatory work to introduce U.S. pork by the U.S. Meat Export Federation, U.S. pork suppliers now have a 30-percent share of the Korean processed pork market, a 10-fold increase over the token 3-percent market share for the United States in 1994. In addition, the Round enabled U.S. suppliers to crack the Korean market for fresh/chilled pork. The first U.S. container of fresh pork was shipped in September 1996 and now the product is being shipped at the rate of a container a day.

In the Japanese market, the U.S. Meat Export Federation has also been helping to pave the way for U.S. pork exporters to take advantage of increased access, despite stiff competition from Denmark and until recently, Taiwan. Several years of trade servicing, and, more recently, promotion directly to consumers have culminated in the United States capturing a phenomenal 46 percent of the market for fresh and chilled product valued at \$950 million market.

Beef.—In Korea, where the U.S. Meat Export Federation has also been active for many years, the U.S. beef industry has seen its export volume rise more than 50 percent as a result of a successfully negotiated bilateral agreement. In 1995, U.S. exporters shipped 91,000 tons of beef to Korea, capturing 63 percent of the market.

Rice.—Increased market access and the U.S. Rice Federation's success in persuading Japanese rice traders and consumers of the dependability of high quality U.S. supplies at competitive prices led to more than \$125 million in U.S. sales this crop year. This accounts for almost half of the market—up from virtually zero in 1993.

Soybeans and meal.—Capitalizing on increased market access to the Philippines, the American Soybean Association has been promoting the use of soybean meal to poultry and swine producers. Over the past two years, the value of U.S. soybean and product exports to the Philippine market has grown 122 percent to \$160 million.

In Indonesia, increased market access, reduced tariffs and the American Soybean Association's promotion of soybean meal in poultry rations helped to boost U.S. soybean meal exports from zero to 100,000 tons valued at \$20 million over the past two years.

Cotton.—Under the sanitary and phytosanitary provisions of the Uruguay Round, Guatemala changed a phytosanitary provision that had increased the cost of U.S. cotton, making it uncompetitive with cotton from other countries. To educate Guatemalan officials about the quality of U.S. cotton and the thoroughness of USDA cotton inspection procedures, FAS organized a training program for Guatemalan plant health officials. Cotton Council International's sponsorship of trade team exchanges and technical assistance have also helped U.S. exporters capture 90 percent of the Guatemalan cotton market with exports valued at \$42 million in the 1995/96 marketing year.

Feed grains.—In the Philippines, U.S. corn exporters registered about \$66 million in sales for the 1995/96 marketing year, capturing 75 percent of this once-closed

PART 1

462

market. The U.S. Feed Grains Council played a key role through its market development and trade servicing activities.

Fruit.—The California Table Grape Commission's technical assistance was invaluable to U.S. government negotiators in their successful efforts to gain access to the Korean fresh table grape market in 1996 and to resolve subsequent sanitary and phytosanitary barriers. U.S. grape exports for the first 10 months of 1996 were valued at \$1.3 million and are expected to grow substantially in the future as the U.S. industry works to develop the market.

The Agreement also opened the Korean market for oranges in 1995. U.S. exporters registered sales of \$5.3 million in 1995, a figure that rose to \$13.6 million in 1996. The U.S. agricultural office in Korea is projecting significantly higher sales for 1997.

Processed Products.—Tariff cuts for processed products, in some cases substantial, provided for in the Uruguay Round Agreement are expected to help boost the United States' competitive position in markets around the world. This is especially true in markets where consumers are increasingly looking for convenient, ready-to-eat food products. For example, Thailand will cut in half its tariffs on french fries, potato chips and other processed potato products. The National Potato Promotion Board, a MAP participant, has broadened its promotion activities to higher-valued items such as speciality and battered/coated fry products, resulting in significant new sales. For example, U.S. frozen french fry exports to Thailand have shown steady growth, increasing from \$2.2 million in 1994 to more than \$4.4 million in 1996.

These are just some of the gains that have come about as a result of the Uruguay Round Agreement and the willingness of U.S. agricultural exporters to devote the time and resources to develop these opportunities—a task that may take years, but one that pays good dividends when trade agreements are concluded. The Agreement represents real progress toward creating a trading environment where markets, not governments, determine the production and marketing decisions of farmers and exporters. But this Agreement is only the beginning of a process to achieve fairer trade—it is by no means the end. In 2000, we will continue the reform process and will begin negotiations for continuing the process of progressive reductions in support and protection, building on the successes of the Uruguay Round.

Bilateral Trade Issues

We also realized notable accomplishments with some of our bilateral trading partners. Working with other U.S. government agencies, we encouraged European Union (EU) and Japanese officials to decide the issues surrounding genetically modified organisms using scientific arguments. As a result, the EU approved Round-Up Ready soybeans and BT corn, and Japan approved seven new genetically modified products.

Working with USDA's health and safety agencies and the USA Poultry and Egg Export Council, we were able to preserve our largest and fastest growing markets for poultry, resolving disputes with Russia and China. Following the discovery of Karnal bunt in the southwest U.S. wheat crop, FAS, working closely with other USDA agencies, the U.S. Wheat Associates and several state wheat commissions, overcame a significant threat to U.S. exports by successfully negotiating with 33 countries and the EU on alternative phytosanitary certification procedures to keep U.S. wheat exports flowing to these countries. These markets traditionally take half of U.S. wheat exports, representing \$2-\$3 billion in annual U.S. sales.

Overseas Offices

Overseas, FAS field offices support USDA programs and the U.S. agricultural export drive in 95 locations around the globe. These offices continue to function as the "eyes and ears" for U.S. agricultural exporters, and the thousands of attache reports that they prepare each year are now available to the widest possible audience almost instantly via the Internet.

FAS has moved aggressively to adjust overseas staff in line with the Department's Long-Term Agricultural Strategy. Over the past decade, we have increased staff in the Pacific Rim and Latin America, and decreased staff in Europe. In addition, the number of foreign national staff employees working primarily on market development activities has been increased by about 5 percent.

Domestic Outreach

Domestically, FAS expanded its outreach and information efforts to educate U.S. businesses about the tremendous potential of the international marketplace. A key part of this effort is the location of export advisors at the State level—at the California, Colorado, and Oregon State Departments of Agriculture and the Iowa State Office of USDA's Farm Service Agency.

PART 1

463

FAS has joined forces with cooperators and MAP participants such as the American Hardwood Export Council and the American Seafood Institute, and with local entities such as State departments of agriculture across the country to sponsor export seminars for small and new-to-export business. We have enlisted the local expertise of banking institutions to help explain financing options, both those supported by FAS and other financing tools, and have asked other Federal agencies such as APHIS to help explain foreign country import requirements. The goal of these and other activities is to excite small companies about the opportunities opening to them in export markets and to educate them to ensure their initial forays into international trade are successful.

Last July, FAS, in conjunction with the Farm Service Agency, conducted outreach efforts in 47 states plus Puerto Rico. These outreach efforts were an outgrowth of the Global Attache Conference that was held July 15–19, 1996. The states hosted export events that were attended by one of USDA's 50 diplomats serving as agricultural attaches or trade officers worldwide. The events included farm and plant tours, along with an FAS presentation explaining the importance of agricultural exports to the national and local economy, global opportunities, and USDA services and programs. Over 2,000 people attended the events, bringing together producers, bankers, agribusinesses, exporters, freight-forwarders, university officials, and Federal, State and local government officials.

Cooperation and Development

In fiscal 1996, the Cochran Fellowship Program provided training in the United States for nearly 700 participants from 44 countries. A number of Cochran participants have furthered U.S. trade initiatives by, for example, assisting in resolving sanitary and phytosanitary issues in Korea, Mexico, and Indonesia. Participants from Russia, Uzbekistan, Cote d'Ivoire and China purchased U.S. agricultural commodities as a result of contacts made during their training. Many of these purchases were first-time sales to new international customers and could result in future sales as well. In addition, former Cochran participants have influenced policy within their countries. The privatization of state-collective farms and rural land mortgage systems in Russia, for example, are being implemented by former Cochran participants.

FAS' Scientific Cooperation Program supports efforts to improve the competitiveness of U.S. farmers by developing new food and fiber products; developing novel processing technologies for safe, convenient, value-added products; and developing technologies that create new products from residuals, byproducts, and wastes generated by food and agricultural production and processing operations. So far in this fiscal year, the Program has awarded 35 research projects and 15 exchange visits involving 40 different countries and representing a wide range of U.S. universities and USDA agencies. Priority subjects covered include trade barriers and phytosanitary issues, food safety, exotic diseases and pests, and biological control.

Through our programs of technical assistance, research, and training, we've conducted over 2,200 activities in over 90 countries around the world. These activities helped to enhance the competitiveness of U.S. agriculture, preserve our natural resources, and assist countries in enhancing their national food security. As part of our key role in the international effort to increase global food security, FAS led the U.S. government's intensive interagency efforts in preparation for the World Food Summit that brought world leaders to Rome last November. In partnership with the U.S. private sector and non-government organization (NGO) communities, we will continue to play an important role by following through on the U.S. commitments made as a result of the Summit.

Export Programs

Our export programs and services continue to play a key role in supporting U.S. exporters in overseas markets. FAS constantly seeks to refine and expand all of its export programs to meet changing demands of the international marketplace and keep pace with the competition. We are seeking continued budget support for these programs, which will allow us to continue to improve these export tools and reach out to additional potential exporters.

Our export credit guarantee programs provide assistance to U.S. exporters in emerging markets where the financial markets provide insufficient credit and international competitors are offering credit or subsidized commodity prices. Exporters using GSM-102 and GSM-103 export credit guarantee programs registered sales totaling \$3.2 billion for 18 countries and 5 regional markets in 1996. Mexico, our third largest export market, was the largest export credit guarantee program last year with U.S. sales totaling \$1.4 billion—or over 27 percent of our exports to Mexico. Mexico's credit repayments are fully on schedule. For 1997 we anticipate total GSM

PART 1

464

export credit guarantees to be about the same or slightly higher than the fiscal 1996 level.

We have launched a new export credit guarantee program—a supplier guarantee program—designed to help expand exports of processed and other high-value products. Under this program, which is a component of GSM-102, the Commodity Credit Corporation (CCC) guarantees a portion of the risk of default by an importer on short-term credits, up to 180 days, extended by a U.S. exporter. A \$50 million program has been authorized (\$30 million has been announced) for exports to Mexico, a \$10 million program announced for Guatemala, a \$5 million program announced for Jamaica, and a \$35 million program announced for Southeast Asia. Programs are also being developed for Latin and Central America and the Caribbean. Since this is a new activity, we are undertaking an extensive outreach effort to both overseas and U.S. audiences to expand the understanding of this activity. We are confident this program will help us further increase our exports of these products.

Another new program to be carried out under GSM-102 authority will be a facilities guarantee program. We anticipate publishing an interim final rule this spring for this program.

In addition, our food aid authorities—Public Law 480, Title I and Food for Progress—provided about 1.2 million metric tons of food assistance with a program value of about \$370 million to 27 countries during fiscal year 1996.

In 1997, funding for Public Law 480, including the Titles II and III grant programs, totals over \$1 billion and provides about 3.2 million metric tons of commodity assistance. This amount is sufficient to provide for anticipated programming needs and to more than meet our 2.5-million-ton commitment to the international Food Aid Convention. Within FAS, we are seeking to improve the market development impact of Title I, particularly by working with private sector entities as authorized by the Federal Agriculture Improvement and Reform Act of 1996.

In the Market Access Program, we continue to hone our allocation procedures, particularly with respect to participant contributions and export performance, to target resources more effectively to those programs offering the best prospects for success and to encourage increasing private sector contributions. The success of these efforts is in part reflected in the growth in U.S. participant and industry contributions as a share of government costs. Participant and industry contributions rose from 48 percent in 1994 to almost 54 percent in 1995, the most recently completed year. In addition, as directed by Congress, 70 percent of the resources allocated for brand promotion has been awarded to small companies or cooperatives.

Among the more promising developments in fiscal 1996 was the virtual suspension of global export subsidies, which mask market signals and distort trade. The restrained use of the Export Enhancement Program (EEP) in 1996 allowed U.S. exporters to market their products unaffected by government actions. We don't consider that current world market conditions warrant the use of subsidies by anyone. In general, U.S. supplies are relatively tight and we are exporting what we have available without the need to use subsidies. Unfortunately, the responsible restraint by the United States has been tested by renewed EU subsidization, which began in September 1996. We must be ready to protect our agricultural trade interests including the resumption of EEP, if necessary, and, therefore, have requested full funding of the EEP for 1998.

U.S. dairy exporters sold nearly 48,000 metric tons of cheeses, nonfat dry milk and whole milk powder with the help of the Dairy Export Incentive Program (DEIP) in fiscal 1996

CHALLENGES AHEAD

As you can see, 1996 was a busy year, and 1997 and 1998 promise to be just as busy as we work to build prosperity for America's farmers and ranchers. On the trade policy front, we have set our sights on 2000, when multilateral negotiations for continuing the process of progressive reductions in agricultural support and protection will be initiated. This year, we will begin to set the U.S. objectives and goals for agriculture for those negotiations.

We will also continue to place high priority on the important work done in international organizations that contribute to U.S. farm exports. This includes science-based standard setting by the Codex Alimentarius Commission, the International Plant Protection Convention and the International Office of Epizootics.

Bilaterally, the accession of China to the WTO is a top priority. We will work to ensure that we reach a commercially meaningful agreement with the Chinese, and we must resolve several outstanding sanitary and phytosanitary issues.

In addition to China, we also face both short- and long-term sanitary and phytosanitary issues with other countries as well. We continue to work with our

PART 1

465

trading partners through the WTO and bilaterally to address these concerns and to ensure that such import restrictions are based on sound science.

Another critical area is the trade treatment of biotechnology products. New developments in biotechnology have the potential to increase food production, lower farming costs, improve food quality and safety, and enhance environmental quality. However, the benefits for both farmers and consumers will not easily be realized without greater transparency and efficiency in the approval process.

We also continue to address issues with our partners in the North American Free Trade Agreement (NAFTA). The road is not always smooth, and a number of contentious issues remain to be addressed. Work also continues with Congress to develop fast-track legislation to begin the process by which Chile will join the NAFTA.

With our export assistance programs, we face the constant challenge of ensuring that our programs help exporters compete in the constantly changing world marketplace. For example, we are currently reviewing our operational requirements for the GSM programs, seeking ways to expand the programs' benefits to U.S. agriculture. As I noted earlier, we expect to launch another new export credit guarantee program—the facilities guarantee program—later this year. This program is designed to provide guarantees for the sale of capital goods and services that are used for the improvement or establishment of agricultural facilities in emerging markets.

We are seeking to improve the market development impact of Title I, particularly through agreements with private sector entities as authorized by the Federal Agriculture Improvement and Reform Act of 1996.

Our work with developing countries will also be challenging. These countries are important to U.S. agricultural interests now and will become even more so as we move into the next century. Two dollars out of every five that U.S. farmers earn overseas come from developing country markets, and these markets are where the biggest growth opportunities lie for U.S. agriculture. So what are we doing to focus on them? We will follow up the work begun at the World Food Summit. In addition, we will continue to use all the tools available to us—the Cochran Fellowship program, scientific exchanges and collaborative research, for example—to help ready American agriculture for the next century.

But in the end, we believe that open markets and expanded trade offer the best and surest ways to economic growth and prosperity. But just as we have targeted markets for export growth, so have other exporters, and we will continue to face stiff competition around the globe.

FAS recently completed an annual review of the export promotion activities of 22 countries that account for our major competition. The study found that just like the United States, many of our competitors have announced ambitious export goals and are reorienting their export programs to attract larger numbers of small- and medium-sized firms to exporting. The EU and other countries assist their producers and small businesses to develop foreign markets through activities similar to our Market Access Program (MAP) and Foreign Market Development (FMD) Program. Market promotion by EU countries is estimated at \$350.2 million in 1995/96, with slightly less than half of that amount provided by EU-member governments. The rest of the funds comes from producer boards and other fees. Australia, Canada, and New Zealand have strong national government promotion agencies and rely heavily on their statutory marketing boards to carry out market development activities for producers of specific agricultural products.

In addition to market promotion activities, the EU also carries out an extensive subsidy program. Of the \$9 billion budgeted by the EU in 1996 for export subsidies, over 85 percent was for exports of high-value products such as fresh and processed fruits and vegetables, wine, dairy products, and meat and meat products.

As our study shows, our competitors are not standing still. We in the United States can not stand still either. Our Long-Term Trade Strategy and the FAS Strategic Plan we are developing in accord with the Government Performance and Results Act will provide the blue print that we are and will continue to follow to identify and meet our export goals. We must continue to work aggressively to meet the competitive challenges facing us now and in the future.

FAS BUDGET REQUEST

The challenges I just described illustrate why I believe FAS must continue to play a prominent role in export expansion. Today's budget realities mean that government must be leaner and more efficient, but the era of a responsive and responsible government is not over. While there are things that government can't or shouldn't do, there are many legitimate public needs that only government can meet. Whether it's working to resolve trade disputes, supporting the American private sector as it

PART 1

466

battles in export markets against foreign competitors flush with funds from their national treasuries, or educating potential exporters, FAS has a vital role to play.

Mr. Chairman, in the current year FAS is continuing the aggressive approach to achieving our fundamental objective of increasing U.S. agricultural exports by 50 percent by the year 2000. With the resources provided by this Committee, FAS is expanding market development activities, including the Cooperator Program and our domestic outreach efforts, to facilitate the entry of small and medium sized producers into the export market.

Overseas, FAS is moving aggressively to adjust overseas staff in line with the Department's Long-Term Agricultural Strategy. We have recently opened an office in Hanoi, a new Agricultural Trade office in Indonesia, and an Agricultural Trade Office for the Caribbean region in Miami, Florida. Within the next few months we will open an Agricultural Trade Office in Moscow and an office on the U.S./Mexico border. By this summer, we will have augmented American staffing in Tokyo, Seoul, Geneva, and Moscow. The number of foreign national staff employees working primarily on market development activities has been increased by about 5 percent.

While maintaining necessary activities in mature markets, we will continue to look for ways that we can strengthen USDA's presence in areas of the world that are experiencing the most rapid development and changes.

We believe the future offers continued opportunity for the expansion of U.S. agricultural exports. Strengthening our ability to compete globally has the direct payoff of increased farm income for America's farmers and ranchers and the continued economic development of rural communities.

The world marketplace is intense and our competitors are upping the stakes. For example, in fiscal year 1996, FAS expenditures for all activities: export promotion, trade servicing, FAS personnel and operating costs—everything—was less than the European Union spent that year just to subsidize its barley exports.

Mr. Chairman, the fiscal year 1998 FAS budget proposes a direct funding level of \$150.9 million and 885 staff-years, an increase of \$15.4 million above fiscal year 1997 funding levels. The activity structure of the fiscal year 1998 FAS budget reflects implementation of the Government Performance and Results Act and transition to a performance-based management system. In this regard, FAS has adopted a new budget activity structure that incorporates the policy objectives of USDA's Long-term Agricultural Trade Strategy.

Significant proposals by policy objective include:

Strategic Outreach and Market Intelligence.—The 1998 President's budget proposes that funding for the operating costs of the CCC Computer Facility and other, related FAS information Resources Management costs, which in the past have been funded through a reimbursable agreement with CCC, shall be funded through the FAS appropriation. This change will shift funding for these activities from mandatory to the more appropriate category of discretionary spending. Also, future funding for these activities will no longer be subject to the annual limitation on CCC reimbursable agreements established by provisions of the 1996 Farm Bill.

The total of the Computer Facility and other IRM costs is estimated at \$9.7 million in 1998. The budget provides increased funding of \$4.0 million to partially meet these costs; the remaining \$5.7 million will be met through a reduction in marketing programs carried out through the ATO's and increased cost-share contributions by participants in the Cooperator Program.

Market Access.—The budget includes an increase of \$500,000 to implement a systematic process to review, identify, and catalog technical barriers to trade and other technical requirements that limit export opportunities for U.S. agricultural products in the top 30 U.S. export markets. The review will lead to recommendations for overcoming the identified barriers to expanded U.S. agricultural exports to these markets. These markets account for the majority of U.S. agricultural export trade. The catalog will include codified and non-codified information from the various governmental agencies regulating or affecting imports in these major markets.

Long-term Market Development.—The 1998 President's budget proposes that technical assistance activities carried out under the Emerging Markets Program and authorized by section 1542(d) of the 1990 FACT Act be funded through FAS appropriations rather than through CCC funds made available to FAS under a reimbursable agreement. This change shifts the costs of these activities from mandatory to discretionary spending, but funding will remain at the currently authorized level of \$10 million annually, which corresponds to provisions of its authorizing statute. The fiscal year 1998 budget also proposes to continue the Cochran Fellowship Program at the fiscal year 1997 level of \$2.4 million.

The budget also includes new provisions to address the difficulties in accurately estimating and funding wage and price increases associated with the operations of our overseas Counselor, Attache and Trade Offices. First, the budget provides an ad-

PART 1

467

vance appropriation of \$3 million for fiscal year 1999 to fund documented wage and price increases and/or exchange rate losses incurred during fiscal year 1998. Second, in conjunction with the advance appropriation, the budget proposes that funds appropriated to FAS in fiscal year 1998 be available for obligation through September 30, 1999.

EXPORT PROGRAMS

Mr. Chairman, the commercial export programs we administer are expected to grow in importance as the market-opening provisions of the Uruguay Round Agreement are implemented. Our program proposals provide the tools to meet these new sales opportunities, tempered by the need to reduce Federal spending.

For the export credit guarantee programs, the budget proposes a total program level of \$5.7 billion. This includes \$5.3 billion for the GSM-102 program and \$400 million for the GSM-103 program. As part of the GSM-102 program, the budget includes \$350 million for supplier credit guarantees and \$100 million for our new facilities financing guarantees. We are continuously looking at ways to use this guarantee authority to meet changing market needs.

To provide a partial offset for a high priority supplemental appropriations request for the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), a \$50-million rescission of budget authority is proposed for Public Law 480, Title I. This proposal will reduce the Title I program level by \$60 million and estimated commodity shipments by 200,000 metric tons. This proposed reduction does not change the country allocations already announced.

For 1998, the budget provides a total program level of \$990 million for Public Law 480 foreign food assistance, a reduction of \$57 million from the revised estimate for 1997. The reduction in Public Law 480 funding proposed for 1998 will occur in the Title I program; funding for Titles II and III will remain largely unchanged from 1997 enacted levels. The 1998 request level is expected to provide total estimated shipments of Public Law 480 commodities of 3.2 million metric tons, unchanged from the revised tonnage estimate for 1997.

The 1998 President's budget shifts the budget and expenditures for the Public Law 480 Title I credit sales program from the International Affairs Function (Function 150) to the Agriculture Function (Function 350) of the Federal budget. Provisions of both the 1990 and 1996 Farm Bills have redirected the focus of the Title I credit sales program to place far greater emphasis on its market development objectives. With these changes, the importance and role of the Title I program in the Department's overall long-term market development strategy has increased. As a result, the Department strongly believes that the Title I program should be managed and budgeted as a part of a consistent package of agricultural export programs. Because all other USDA export programs are included in the Agriculture Function of the budget, the Title I program should be included in that Function as well. In addition, this shift in Title I to the Agriculture Function will not affect the overall level of U.S. foreign food aid efforts because Title I program activities will continue to contribute to U.S. international food aid commitments.

For the Market Access Program, the budget proposes a program level of \$90 million for fiscal 1998, the maximum program level authorized by the FAIR Act, and unchanged from fiscal year 1997.

For our subsidy programs, the proposed levels for EEP and DEIP allow for changed market conditions and provide the necessary tools to respond to other governments' actions. Program activities in fiscal year 1996 were much lower than in previous years due to world market conditions. The budget provides \$500 million for EEP, the maximum level established by the 1996 Farm Bill and \$89 million for DEIP in anticipation of higher sales under this program.

This concludes my statement, Mr. Chairman. I will be glad to answer any questions.

PREPARED STATEMENT OF KENNETH D. ACKERMAN

Mr. Chairman and Members of the Subcommittee, I am pleased to present the fiscal year 1998 budget for the Risk Management Agency (RMA), which supervises the Federal Crop Insurance Corporation (FCIC). It is my privilege to appear before you as Administrator of the newly formed Agency.

Farmers today face a risk environment dramatically different from that which existed a few years ago. In 1996, Congress enacted the Federal Agriculture Improvement and Reform Act (1996 Act), which is designed to strengthen the Federal crop insurance program by giving American farmers much improved and expanded risk management tools, as well as education programs that will enable them to make

PART 1

468

more informed decisions. However, this Act and previous legislation changed the landscape of American agriculture by phasing out the traditional Federal programs that have provided a safety net to farmers for price and production risks over the past 60 years. Deficiency payments and ad hoc disaster aid have been eliminated, and a variety of other price and production assistance programs have been significantly reduced. To fill this void, producers today must take active steps to reduce their agricultural risks. They must rely on an increasingly wide and sometimes confusing array of risk management products being offered primarily by or through the private sector.

RMA plays a pivotal role in fulfilling the mandates of the 1996 Act while assuring that American agriculture remains solid, solvent and globally competitive into the 21st century. To accomplish these tasks, RMA intends to refine existing products, create innovative, cost-effective tools, educate the public, and expand its partnerships with the agricultural community.

ORGANIZATION, SIZE AND LOCATION, AND FIELD STRUCTURE

Provisions of the 1996 Act required the Secretary to establish an independent office responsible for supervision of FCIC, administration and oversight of programs authorized under the Federal Crop Insurance Act, and development of programs involving revenue insurance, risk management savings accounts, and other programs designed to help producers manage risk and support farm income. Consequently, RMA was established as an independent entity in April of 1996. The more than 22,000 county crop programs are formulated, implemented, and monitored in coordination with the RMA headquarters office located in Washington, D.C., and the national operations office in Kansas City, Missouri. The programs are administered in the field through ten Regional Service Offices and six Compliance Offices. As of September 30, 1996, there were 536 employees in RMA.

INITIATIVES AND GOALS

Revenue Insurance Products

In fiscal year 1996, RMA witnessed a strong response from commodity groups, producers, and insurance agents to revenue insurance products which are designed to help producers manage both price and yield risks. In the post-1996 Farm Bill environment, American farmers need such programs to manage risks with confidence and security. The demand for these products highlights the importance of private sector alternatives in the risk management environment and reflects producers' awareness of their individual responsibilities in managing risks.

For fiscal year 1998, RMA intends to improve the safety net for farmers by seeking authority to make revenue insurance available nationwide. RMA anticipates this will increase purchases of risk management tools by farmers, resulting in greater Federal outlays. To be cost neutral, the additional delivery expenses paid from the discretionary fund will be offset by reducing the reimbursement rate used to determine administrative expenses paid to reinsured companies. RMA also proposes to reduce the overall program loss ratio to offset the mandatory account costs of producer premium subsidy and a portion of the expense reimbursement.

Risk Management Education

In the new risk environment, RMA must not only provide producers with new tools to manage their risks, the Agency must also educate producers on the wide array of risk management tools which are currently available. In the past 3 years, Congress has adopted two provisions mandating the Department of Agriculture to establish a crop insurance/risk management education program geared toward orienting farmers about the wide array of risk management products.

Accordingly, RMA, in conjunction with the Cooperative State Research, Education and Extension Service and the Commodity Futures Trading Commission, has developed a plan to conduct and evaluate a risk management education program based on a coordinated team effort of Federal agencies and private groups. Our goals in pursuing this educational effort will be to (1) develop training programs for farmers which integrate basic information on risk management from all relevant sectors (such as insurance, futures and forward contracting) and (2) provide a source of up-to-date information on new risk management products that farmers and agricultural advisors across the country can use when confronted with decisions, questions and solicitations. The delivery system for this program will rely primarily on the private sector, including not just the crop insurance industry, but also the futures industry, the farm lending community, and farm and commodity organizations. Costs for this initiative will be paid to the maximum extent possible by the FCIC insurance fund.

PART 1

469

Renegotiation of Standard Reinsurance Agreement

Given the dramatic changes to the crop insurance program and the diverse and expanded role of RMA, we elected this year to renegotiate the Standard Reinsurance Agreement (SRA) which governs the relationship between RMA and the 17 private insurance companies participating in the reinsurance program. Since 1994 when the SRA was last renegotiated, the crop insurance program has more than doubled in size in terms of policies sold, acres covered, and premiums collected. Today, crop insurance sold and serviced through reinsured companies accounts for nearly 74 percent of the total number of policies and 89 percent of total premiums.

Renegotiating the SRA will allow RMA to systematically resolve a wide range of issues. For instance, preliminary analysis suggests that the current SRA formula provides participating companies with too large an opportunity for financial gain compared with the underwriting risks which they bear. Questions have been raised regarding the methodology of providing administrative expense reimbursement (AER) to participating companies. Preliminary findings by the General Accounting Office suggest that although the current AER is set at 29 percent of net book premium, companies are actually spending between 25 and 27 percent of net book premium on actual program-related administrative expenses. The budget contains a discretionary spending reduction of approximately \$53 million in AER payments by proposing both a lower AER and providing for 10.5 percentage points of the reimbursement rate to be discretionary spending.

FCIC FUND

Under current law, the budget for the FCIC Fund proposes an increase of \$14 million in premium subsidy for policies with buy-up coverage. For catastrophic risk protection, an additional amount of \$7 million in premium subsidy over the 1997 crop year will be required. This recognizes that indemnity payments for crops planted in the 1997 crop year will continue to be paid in the 1998 fiscal year. Under proposed legislation, there would be an additional estimated increase in buy-up coverage subsidy of \$25 million.

Under current law, the budget also includes funding for \$257 million in mandatory account spending to reimburse the reinsured companies for the delivery of limited and buy-up coverage. This is a decrease from 1997 due to the legislative mandate that a portion of administrative expenses paid to the reinsured companies be transferred to the discretionary account. Under proposed legislation, it is estimated that an additional \$10 million in administrative reimbursements to reinsured companies would be required.

ADMINISTRATIVE AND OPERATING EXPENSES

Under current law, discretionary account expenses have increased by \$207 million from the fiscal year 1997 level. This increase is a result of sales commissions estimated at \$203 million which will be reimbursed to reinsured companies and paid from discretionary funds; increases of \$465,000 for a portion of the estimated pay increase and annualization of the fiscal year 1997 pay raise; and \$4 million for an increase in full-time equivalency positions. Under proposed legislation, the discretionary portion of the administrative reimbursements paid to reinsured companies, no longer just for sales commissions, is estimated at \$150 million which reflects a savings of \$53 million.

Staff levels for RMA have decreased dramatically in recent years as the program has grown in size, scope, and expectations. Overall staff resources, including administrative resources from the Farm Service Agency, have been reduced by more than 20 percent since 1993. The modest growth in staff positions proposed here is intended to adjust for recent losses and to improve our ability to service participating private sector companies. Funding for implementation of the reform costs for the new and expanded programs will increase to assure that the programs are implemented as expeditiously as possible.

In closing, I appreciate the opportunity to outline the many positive initiatives that RMA has taken to improve the crop insurance program and to discuss some of the programs being proposed. Mr. Chairman, this concludes my testimony. I will be happy to answer any questions that you may have.

EXPANSION OF CROP INSURANCE

Senator COCHRAN. I notice that in your prepared statement, on page 2, you make the observation that you have expanded and im-

PART 1

470

proved programs to help producers manage their price and production risks. My question is, how have you done that?

Mr. SMITH. Mr. Chairman, much of the work in this area has been done with our risk management programs and our revenue insurance-type programs. I would like to ask the Administrator of our Risk Management Agency, Mr. Ken Ackerman, to expound on that.

Mr. ACKERMAN. Thank you, Mr. Chairman.

Very briefly, in the past 2 years, we have expanded the traditional Federal Crop Insurance Program from simply a production risk-based program to now, in many parts of the country, include price risk, as well, through revenue insurance products. There are three basic revenue products that are now being offered in different areas of the country on an experimental basis: crop revenue coverage, income protection, and revenue assurance.

We anticipate that, over the next several years, sales of these products will increase probably nationwide. We have submitted a legislative proposal to that effect.

EXPENSE REIMBURSEMENT IN DISCRETIONARY FUNDS

Senator COCHRAN. Is there a request now pending in the Congress from the administration to provide up to \$200 million additional funding for this increased protection for producers?

Mr. ACKERMAN. The request for \$200 million is an existing request. It is not new money. The change this year is that for 1995, 1996, and 1997, the delivery expense of reinsured companies for delivery of Federal crop insurance was paid for fully on the mandatory side of the budget. This year, a portion of the delivery cost is funded from the discretionary side. The split is part of a compromise, essentially, that was worked into the Crop Insurance Reform Act of 1994.

We have proposed a reduction in that amount to help ease the burden. We are proposing that the expense reimbursement to the companies be reduced from 28 percent of premium down to 24.5 percent. That would reduce the number you referred to from \$200 million down to about \$150 million.

Senator COCHRAN. Thank you.

FARM CREDIT FUNDING LEVELS

Mr. Secretary, on page 3 of your statement you mention the trend is emphasizing guaranteed loans to farmers and, I am assuming, in order to get away from direct lending. My question is, Why do you request less money for the guaranteed loans in the next fiscal year's budget than the current fiscal year and more money for direct ownership loans?

Mr. SMITH. One of the focus areas of our direct ownership loans is beginning farmers and socially disadvantaged farmers. We are focusing the direct loans in that area. Our guaranteed loan program is the major growth area and one of the areas in which we have historically experienced the fewest delinquency problems.

I would like to ask Randy Weber, the Acting Administrator of the Farm Service Agency, to expound on that, as well.

Senator COCHRAN. Randy, go ahead; proceed.

Mr. WEBER. Yes, Mr. Chairman.

PART 1

471

In 1997, we have a subsidy to support direct farm ownership loans of \$28 million. Under the 1998 budget, we are requesting subsidies that would give us authority to loan approximately \$31 million—a slight increase there. However, under the direct farm operating loans, the projected loan level is down about \$20 million from this year.

The activity with regard to 1997 is quite brisk right now, and we are likely to run out of direct operating loan money earlier this year than we normally do. We are looking right now at sometime in May.

Senator COCHRAN. Will there be a supplemental request made by the administration for that account?

EMERGENCY FUNDING

Mr. WEBER. We are working on that effort right now, yes.

Senator COCHRAN. I have one other question, then I am going to yield to my colleagues for any comments or questions that they may have. On page 7 in your statement, Mr. Secretary, you say that no funds are requested for the Emergency Conservation Program. This is a disaster assistance program. That caught my eye, in view of the fact that we have had a lot of disasters that have occurred, that have affected agriculture producers.

I notice you suggest that there is a \$5.8 billion contingent reserve that the administration wants to establish for emergency requirements. Now, I am concerned about that part of the request. I wonder how we maintain our accountability to the taxpayers in the appropriations process if we make available a huge amount of money to the administration without any guidance or restrictions as to how it is spent. The President can just declare an emergency or declare that this was the result of a disaster and spend it for whatever the administration wants.

Under this proposal, how would we guarantee that some of that \$5.8 billion will go to agriculture producers or landowners under the authority of existing statutes that provide for these programs?

Mr. SMITH. Mr. Chairman, historically, for the Emergency Conservation Program, the budget has not asked for funding in advance, because it is very difficult to predict what experience we are going to have in the area of a natural disaster. Historically, this program has been funded through supplementals.

In fact, we have an ECP supplemental request that has been submitted to Congress for \$20 million, plus a contingency reserve of \$17 million, to accommodate current need. So the fact that we do not have funding proposed in the 1998 budget is consistent with this past practice.

Under the proposed \$5.8 billion contingency reserve for emergency funding requirements, we have the Emergency Farm Loan Program that is part of our safety net, in addition to ECP. And there are continuous needs that are difficult to predict in advance for a particular program.

We are currently experiencing considerable problems with livestock in the Dakotas and in Minnesota due to the weather damage there. Historically, our largest programs have focused on the commodity side, in terms of a safety net.

PART 1

472

Different disasters have different characteristics, and in order to have broad discretion in how to deal with these disasters, we are proposing to have a contingency fund that is not necessarily earmarked for a specific use.

I would like to ask Mr. Kaplan if he would care to expand from the budget perspective on that.

Senator COCHRAN. Mr. Kaplan?

Mr. KAPLAN. My understanding is that OMB would talk to the appropriate committees of Congress before any money is released out of that emergency fund, so that you would have some impact on how the money is spent.

Senator COCHRAN. Is there any predetermined percentage that would go to any kind of disaster?

Mr. KAPLAN. No, sir.

Senator COCHRAN. I see. Well, that is not going to happen, is it?

Mr. KAPLAN. No, sir.

Senator COCHRAN. I do not think it is going to happen. [Laughter.]

Senator BURNS. Do not be so optimistic. [Laughter.]

FSA COUNTY EMPLOYEES

I guess I would just like to submit my statement, Mr. Chairman. I do not have very many questions, other than the fact that we sort of have a concern among our farmers in Montana, of trying to make your farm service agent in the local city an employee of USDA, rather than a member of the committee. They are a little bit nervous about that. Are you still going forth with that program?

Mr. SMITH. Senator, it is one of the proposals that we have under consideration within the Department. When we reorganized in 1994, and we pulled several functions, such as the old Farmers Home programs and the old ASCS programs into the same office for administration, we moved Federal employees at the county level and non-Federal employees into the same offices. Under the law, we cannot have a non-Federal employee supervising a Federal employee.

Senator BURNS. I think that is the best of all worlds, just personally speaking.

Mr. SMITH. And we now have functions at the local level that are being administered by both Federal and non-Federal employees.

In order to gain efficiency in terms of our service centers and be responsive to the needs of our producers in those areas, we are looking at this proposal as one way to gain that efficiency, by having just one category of employee right down to the county level.

USE OF CRP FUNDS FOR CROWN BUTTE

Senator BURNS. One area that really caught everybody's attention is using CRP funds for Crown Butte. Anybody want to make a comment on that—where that is?

Senator BUMPERS. Yes; I would like to comment. [Laughter.]

Senator BURNS. I suspect you would.

There is a lady out there that owns that land where you do not want her to mine. She would kind of like to have the same amount as the gold company got. She wants \$65 million, too. Do you want to take that out of CRP?

PART 1

473

Senator COCHRAN. Direct your questions to the witnesses.

Senator BURNS. Oh. [Laughter.]

Where is that? I have a hard time justifying that with my farmers. This was a decision that was made by this President. And I do not feel that that money should come from American agriculture or be taken out of agriculture to justify this action.

Mr. SMITH. Senator, I am not an expert on budget reconciliation and budget caps and things, but it is my understanding that the decision to use part of the CCC funding for CRP will in no way impact our ability to enroll the acreage that is authorized under the CRP program. We do have Dennis Kaplan here as an expert, and I would like to ask Dennis if he has a view on this.

Senator BURNS. He is about 10 degrees off plumb. [Laughter.]

Mr. KAPLAN. I am not an expert by any means. But all the proposal would do would be to delay the signup of 2 million acres for 1 year. Funds would not be taken out of CRP. Instead, the signup of 2 million acres would be postponed from 1997 into 1998. No money is going to be taken out of farmers' pockets under the proposal.

Senator BURNS. OK. Well, I do not think any of it should be used. And I would be very disappointed if it was diverted from the CRP to buy out this mine to keep them from mining up there. I find this very interesting the way they have proposed to do this.

ANNOUNCEMENT OF ACCEPTED CRP ACRES

Another thing in your CRP—of course, you all are not in the policy business, but on the CRP thing, do you think you can complete all of the applications for CRP by the middle of June or the end of June that are coming in now? Can the completions be made?

Mr. SMITH. Well, we were very pleased at the work of our county offices and the cooperation that we have had between the Natural Resources Conservation Service employees and the FSA employees at the local level, to get the producers in and get their bids into the system during this signup. And we feel pretty sure that we will also be able to go through the analysis within the allotted time period and announce the accepted acres before the middle of June.

I would like to ask Randy to just give us an update as to what the agency foresees.

Mr. WEBER. Senator Burns, this week and last week, the counties along with NRCS are looking at the documents they received and are completing. We had some States in which they had a register after the 28th. So we have spent last week finalizing all of those documents.

Everything seems to be on track right now, and we are hopeful that all of the records will be submitted to Washington at the end of next week. We then will begin the review process. At this point, we currently are having some problems in North Dakota and Minnesota because of the weather, and we may have some slight delays there. But we generally think we are going to be able to meet the deadline, and hope to have announcements out to farmers before June 15.

Senator BURNS. Mr. Weber, I do not have to tell you that this is really time sensitive.

Mr. WEBER. We fully understand that.

PART 1

474

Senator BURNS. We could lose a crop.

Mr. WEBER. Yes.

Senator BURNS. We could completely lose a crop in the State of Montana and the northern tier, especially on our spring grains. And I think the way you are approaching this thing is going to, as far as the conservation acres, you are going to be disappointed in the fact that there is a lot of these people—the intention to take some of those marginal acres out of production, which I fully support, I think we are going to find just the opposite may happen, whenever we see the bids and the acres taken out and the way they can track or chop up a man's farm.

I hope I am wrong. I just hope I am wrong. But you have probably heard that before, though.

Mr. WEBER. We have heard those concerns. But the preliminary data that we have gotten in is very good.

Senator BURNS. Well, I am very hopeful then. I am going to give you the benefit of the doubt.

Mr. WEBER. I am hopeful that your concerns are not going to be a reality.

Senator BURNS. Well, I hope you are right and I hope I am wrong. And I still stand corrected. But I am just afraid it may go the other way. It sure could awful easy. And I think we are time sensitive. And I will tell you, I will fight like a bearcat to take any CRP out of agriculture to pay a bunch of miners on that little deal. I will just fight like a bearcat. I ain't going to die in the ditch, but I will fight.

And here is my statement. Thank you.

PREPARED STATEMENT

Senator COCHRAN. Senator, we will make your statement part of the record in full. Thank you.

[The statement follows:]

PREPARED STATEMENT OF SENATOR BURNS

Thank you, Mr. Chairman. I appreciate you calling this hearing today.

We have all, just in the past few days, returned from our States. If you had any kind of break like mine, I am sure you got an earful of the concerns which are facing our farmers in the field this year. Many of the concerns I heard about, were based on the actions of the Farm and Foreign Agriculture Services.

The concerns which were shared with me in various locations around Montana, dealt with the way that the Department of Agriculture deals with them as producers. These concerns are based upon what the producer perceives as the future for his way of living. Our American agricultural producer is concerned about what they see as the trend in the Department of Agriculture to remove their local control over a variety of issues and circumstances.

The chief among the questions asked of me, during the past two weeks, was why does the Department of Agriculture want to close their local Farm Service Agency office. Although I am not sure that any in Montana have been slated for closure, the word on the street is that there are offices that are going to close. With this in mind the local person begins to get the idea that it is their office. I must admit, I am sure that there are areas in this country where we have offices very close together and that there is a way that we could remove some duplication. However, in rural western America, I am not sure that this is what we need.

When people have to drive hours as it is to reach their local USDA office, they cannot understand why they will be asked to drive even further in the future. It is their understanding that you are there to help them and to make their life in relation to farm programs easier.

I have stated for all the years that I have been in this town that if we are going to reduce the Federal work force, that the first and most logical place to look is in

PART 1

475

Washington. We have an abundance of personnel downtown here who duplicate the jobs of others in the workplace at the Department of Agriculture.

One of my own personal key concerns deals with the thought that the Department wants to make the local Farm Service agent a Federal employee, and take control of that person out of the local decisionmaking process. These people are, at this time, obligated to answer to the local committee and as such really respond to the needs of the local citizenry. If these people are made Federal employees, they lose this incentive to respond to the needs of the people in their local community. We are left with another level of bureaucracy in a time when we already have too much of it. The role of this government, in these times, should be to make government more localized for the agricultural producer.

I have heard concerns also about the manner in which we are marketing our agricultural products in the foreign marketplace. The producer is concerned about the way in which our competitors are able to get the upper hand on us in so many deals. One thing that Congress heard loud and clear last year, was that get government out of our daily operation and we will be able to make a decent living on the farm. They also asked that we provide them with the tools to enable them to market their production in the world marketplace. Well, Congress did that, but the producer is still concerned about the way that their products are being marketed in the global economy. I share many of their concerns.

Finally, we come to the issue of crop insurance. The producer in Montana is well aware of the perils that face them on a daily basis. Because of this understanding, they have been willing participants in the program. They have worked with my office and with the Federal Crop Insurance program to implement changes for the benefit of all producers in this country. They still see a need for additional changes, but overall they are pleased with the performance of the program.

Mr. Chairman, I look forward to listening to the panel today, to hear about what they foresee of the coming year in their program areas. I hope that they will provide the committee with some explanation of the reasoning for the changes that they are instituting at both the national and local levels.

Thank you, Mr. Chairman, I will have some questions later for the panel, and I may submit some afterward for written answers.

CROWN BUTTE

Senator COCHRAN. Senator Bumpers.

Senator BUMPERS. Mr. Chairman, I wanted to ask Senator Burns, is the woman you refer to, is she, the landowner, expecting royalties?

Senator BURNS. Yes.

Senator BUMPERS. Do you know how much?

Senator BURNS. I do not know how much.

Senator BUMPERS. I would be willing to vote to give her the same amount of royalties you vote to give the United States from mining on Federal lands every year.

Senator BURNS. I would do that. We can make a deal.

Senator BUMPERS. That is zero.

Senator BURNS. I will take it. That is more than I have got now.

Senator BUMPERS. I am talking about the woman who owns the land, expecting royalties. Do you know what her contract provides for?

Senator BURNS. We will talk about this over coffee sometime.

Senator BUMPERS. You have always voted to keep the 1872 mining law going, which allows the biggest mining companies in the world to mine 3 billion dollars' worth of gold a year and not pay the Federal Government a dime for it. So I thought we might treat this woman the same way.

Senator COCHRAN. Senators, I am going to call the committee to order. [Laughter.]

Senator BUMPERS. Mr. Smith, how many Under Secretaries do we have down there that are acting? [Laughter.]

PART 1

476

Senator BURNS. About one-half of them.

Senator BUMPERS. I believe there are three Acting Under Secretaries and one Acting Assistant Secretary.

On the Conservation Reserve Program, Senator Burns has raised a concern that all of us share who come from agricultural States—about using Conservation Reserve money. Now, I want to get rid of Crown Butte Mining Co. very badly. I will do almost anything, short of mayhem, to keep them from mining that land outside Yellowstone. And my staff tells me that the effect of this would be to delay the use of CRP money by 1 year—\$65 million for 1 year—is that correct?

Mr. KAPLAN. Yes, sir; that is correct.

Senator BUMPERS. You are the expert on this, Mr. Kaplan?

Mr. KAPLAN. Again, I am not an expert, but I am involved a little bit. [Laughter.]

TENTATIVE CRP SIGNUP RESULTS

Senator BUMPERS. Let me put it another way. How many acres would we sign up under CRP this year that we would not be able to sign up if we give \$65 million to get rid of Crown Butte?

Mr. KAPLAN. Our budget has proposed to sign up 19 million acres this year. So we would only sign up 17 million acres rather than the 19 million that is in the budget.

Senator BUMPERS. Of the 19 million you are prepared to sign up this year, 14.7 million of that is old acreage, is it not—contracts that are expiring? I think that is what you said in your testimony, Mr. Smith.

Mr. SMITH. The latest information, which became available after I submitted my statement, shows that about 18 million of the 26 million acres that have been offered are currently enrolled.

Senator BUMPERS. So the effect of this would be—I mean there is some damage to the farmers, who may be anticipating—you have got 20 million—you said in your testimony also that there are 20 million acres in applications right now to take up this 19 million that you propose to enroll, is that right, Mr. Kaplan? So you already have enough applications to fulfill the 19 million?

Mr. KAPLAN. Yes, sir.

Mr. SMITH. We now have approximately 26 million applications as a result of the signup.

Senator BUMPERS. You do not mean applications?

Mr. SMITH. I am sorry?

Senator BUMPERS. You do not mean 26 million applications; you mean 26—is that what you are saying, 26 million applications?

Mr. SMITH. No, sir; we had 26 million acres bid during the signup period, of which about 18 million are acres that are currently in the CRP. And those contracts will be expiring September 30 of this year.

Senator BUMPERS. Maybe I should submit a question in writing to you, asking for detailed information on what the effect of taking \$65 million—is it your information that we would use that \$65 million this year to cut this deal with Crown Butte?

Mr. SMITH. My statement is that we do not believe that it will affect our ability ultimately to enroll the full 36.4 million acres in the CRP over the duration of the program. I will point out that the

PART 1

477

26 million acres that were bid were out of a pool of about 230 million eligible acres. There were about 230 million acres that we felt were environmentally sensitive and eligible to be offered by producers into the CRP. So out of that pool we had 26 million acres offered.

Now, as we go through and evaluate these offers, the acceptable offers may yield fewer than the 19 million acres that we had in the budget baseline. If the acceptable offers fall below the 17 million acres, there would be no impact from a decision to use part of the CRP funding for the mine.

If the acceptable offers were to reach above the 17 million, it would simply delay the enrollment of the additional acres for 1 year.

Senator BUMPERS. What is the average cost per acre on CRP per year?

Mr. WEBER. It currently runs about \$50 an acre.

Senator BUMPERS. \$50 an acre per year?

Mr. WEBER. Yes; that is what the annual rental payments are.

Senator BUMPERS. Now, Mr. Smith, you stated in your testimony that you have a new program of allowances on CRP, which you think will reduce your cost by \$25 million. Do you remember saying that in your testimony? For example, haying and grazing; you allow haying and grazing.

Mr. SMITH. Yes, sir.

Senator BUMPERS. How will that reduce the cost of the program?

Mr. SMITH. Normally, when we implement haying and grazing, it is on the basis that the producers forfeit a portion or all of their CRP payment. So this would be a savings, to the extent that we permitted the haying and grazing.

MARKET ACCESS PROGRAM

Senator BUMPERS. OK. You may or may not know that the old Market Promotion Program was one of my favorite programs. I tried to kill it for 6 years and have not gotten it done yet. Why did you change the name of the Market Promotion Program to the Market Access Program?

Mr. SMITH. Let me ask—

Senator BUMPERS. I want to ask everybody why you change the names of all these programs every 6 months. [Laughter.]

Just about the time I get used to the acronyms, they are all changed again.

Go ahead, Mr. Schumacher.

Mr. SCHUMACHER. Senator, thanks for your question.

We have made quite a few changes in that program over the last 2 or 3 years—working with Congress. We basically eliminated most of the funding for the large branded companies. We are phasing them out. Next year there will be no money provided to any firm that does not meet the SPA guidelines.

This year no money is provided directly, and we have phased down the indirect funding to about 4 percent of the total program. It is rather a different program, focusing on cooperatives, medium and small enterprises, to meet some of the vigorous competition that is coming from Europe and even the southern cone, in Chile and other areas.

PART 1

478

Senator BUMPERS. Mr. Schumacher, let me give fair warning. I am not going to get into it now, because you really have not had enough experience under the new mandate of Congress on this program. Senator Bryan and I, last year—you are operating under the amendment that we got adopted last year—of making people put up—cost-share. Also, limiting it to small businesses and co-ops and things like that.

In Mr. Smith's testimony, he stated that the program had been very effective. But I think I got the impression that it has been effective in dispersing the money. What I want to know is how effective is it in accomplishing the goals that we have set for spending the money? In other words, how is it enhancing—if it is in fact enhancing—our exports? And how is it helping small business people to export?

Now, as I say, you have not had enough experience yet to really give a good answer to that question. But we oftentimes—these hearings are not only to review the budget, but they are oversight hearings to determine how well these programs are working so we can set the budget. But, next year, I would like to see some definitive numbers on what we are getting for our money. Are we actually increasing exports? And is this program—how is this program working? And is it effective, so far as increasing exports are concerned?

U.S. AGRICULTURAL EXPORTS

Which brings me to my next question. Why—you state that you expect exports to be down this year, from \$59 billion—you think it is going to be down around 6 percent—is that about right?

Mr. SCHUMACHER. \$56.5 billion is the current forecast.

Senator BUMPERS. From \$59 billion?

Mr. SCHUMACHER. \$59 billion.

Senator BUMPERS. And you state that one of the reasons for that is because of the increased yields in crops that some of the people that we export to are experiencing; is that correct?

Mr. SCHUMACHER. Many of our importing countries had very good crops—Argentina, Australia—have record crops on wheat. We had a light crop on wheat last year. Prices have come down.

Senator BUMPERS. Well, how much impact is the increased price of commodities having, if any?

Mr. SCHUMACHER. I do not understand the—

Senator BUMPERS. Well, let me—corn and wheat are both considerably higher now than they were, say, 1½ or 2 years ago. Is that a factor in reduced exports, or is it just the fact that these other people are doing better in their own agricultural programs?

Mr. SCHUMACHER. On the—

Senator BUMPERS. The importers.

Mr. SCHUMACHER. On the bulk, we have come down on wheat and corn in price and some volume. We had record corn exports—55 to 56 million tons in 1994–95. But then the prices, of course, as you recall, were very, very high in many of the bulk commodities last year. Price had quite an effect reaching the \$59.5 billion export level. We originally forecast a drop in 1997 mainly on the bulk, with value-added moving very, very nicely—mainly meat exports.

PART 1

479

We have increased our projection to \$56.5 billion because of the expected increase in value-added. And we are looking forward to seeing how we make out with the difficulties that Taiwan has had in its aftosa outbreak in Japan. We may see an additional increase as our pork industry gears up to meet the Japanese demand.

So we think we are doing well—very well—in value-added. That is sort of like the Energizer Bunny. It just keeps going and going and going. But the bulk has been more volatile.

There is one issue, though, I would like to bring to the committee's attention. And that is, as we look at our corn and soybean exports, one thing we have not focused on as much as I think we should is the amount of corn and beans that is going to meat. Let us assume we will do 48 million tons this year of corn. But we will probably do another 9 or 10 million tons in corn, through poultry, pork, and beef. And that was not there when we hit our record exports of corn, of 61 million tons, in 1981.

Senator BURNS. Do you want to explain that again?

Mr. SCHUMACHER. Yes, sir; this year we are forecasting 48 to 49 million metric tons of corn to be exported. In 1980–81, we hit our record of 61 million metric tons of corn that were exported from the United States. But back then, we were not exporting the amount of meat that we are exporting now.

Senator BURNS. Oh, OK.

Mr. SCHUMACHER. So if you look at the amount of meat that is going out, factor in the standard conversion ratios, we are hitting 9 or 10 million value-added tons that is staying here creating jobs and employment. This then effectively brings the total amount of corn fairly close to that record, and will exceed that if we continue the very strong meat exports that we have been seeing in the last few years. We expect those—

OUTLOOK FOR MEAT EXPORTS

Senator BUMPERS. Meat exports are climbing?

Mr. SCHUMACHER. They are doing very well, with poultry particularly. Pork is going to do even better, with the opportunities in Japan. And the Meat Export Federation, in large part due to the money from the cooperators and the MAP Program, is going to continue to hit very, very nice markets in Japan, Korea, and many other countries as well, as they do very, very well in those markets.

They really have done a wonderful job in meeting the food safety issues in Japan, and are very well positioned in promoting American meat as extremely safe, very high quality, with timely delivery, to the specifications the Japanese like to eat.

FOOD AID TO NORTH KOREA

Senator BUMPERS. Just two quick questions, Mr. Chairman.

Are you prepared, if the President gives the order, to—are we prepared to ship commodities to North Korea? Is that something that is on the front burner with you all?

Mr. SCHUMACHER. The Commerce Department has permitted an order, up to 500,000 tons, to Cargill, if they were to have a commercial sale. Yesterday we heard that there was a barter arrangement for American wheat to North Korea.

Senator BUMPERS. With Cargill?

PART 1

480

Mr. SCHUMACHER. With Cargill.

Senator BUMPERS. 500,000 tons?

Mr. SCHUMACHER. Well, 500,000 tons is the ceiling. We understand a modest amount was—

Senator BUMPERS. Up to 500. Well, I think the Commerce Department has only authorized up to 500,000, is that right?

Mr. SCHUMACHER. That is right.

RICE EXPORTS TO JAPAN

Senator BUMPERS. We shipped 125 million dollars' worth of rice to Japan last year. Do you know whether they consumed all of that or whether they used some of it to export to other countries?

Mr. SCHUMACHER. Under the sell/buy system, they did consume about 60 percent of that amount. The rest, we believe, went into their stocks. To our surprise, Senator, the Japanese have actually increased their production and particularly their stocks of rice.

I have been there a number of times on this issue, giving speeches and talking with them, on the need to get more of our rice going directly to their consumers. And we are debating and having discussions with them on the amount of the reexport, through food aid, that they would have from our rice. So it is a lively discussion, and we are fully engaged in it.

STATE MEDIATION PROGRAM

Senator BUMPERS. Who is the mediation expert for the Mediation Program, Mr. Smith?

Mr. SMITH. Well, the Farm Service Agency has the primary responsibility within our mission area, so I would like to ask Randy to respond.

Senator BUMPERS. Mr. Weber, that program was started in 1988, the Mediation Program, to mediate with farmers that were delinquent, and try to work out some kind of a payback. The IRS does this routinely. I thought it was a good program. We now have 22 States, including Arkansas, who have mediation grants. Let me ask you the question, How many dollars are involved, that are delinquent, that we are trying to mediate the collection of?

Mr. WEBER. We currently have \$2.3 billion delinquent under direct loans and approximately \$115 million delinquent under the Guaranteed Loan Program, but only a portion of these amounts have been mediated.

Senator BUMPERS. The Office of Inspector General has been critical of the program. That is what I am coming to. I personally think the concept is good and, so far as I know, the program has been working reasonably well. It has in my State, in any event.

Mr. WEBER. Yes; we very much support the program, and we believe it has been working well.

Senator BUMPERS. The average delinquent debt in my State, among those who are being mediated, is \$400,000. That is a pretty high average.

Mr. WEBER. Yes, it is.

Senator BUMPERS. If we get one-half of that, it is a good program. But, in any event, we have 22 States doing these mediation programs, trying to collect these delinquent bills. And my question is, What was the Office of the Inspector General's specific com-

PART 1

481

plaints about the way the program is working? Or maybe it was about the way the money was being spent.

Mr. WEBER. The concern that the inspector general has had with regard to mediation is not being able to access some of the records they feel they need in order to ensure that the money is being spent properly. We have been cooperating with the inspector general, and I believe the States have been cooperating to the extent possible under their respective privacy laws. There are some concerns with regard to some Northern States, and those are being worked through.

We are also in the process of changing our regulations to better define what mediation is and to clarify what requirements we intend the States to meet. We have reviewed the proposed changes with the inspector general, as well as the State mediation programs, and they generally feel that the new regulations will be acceptable. We are looking forward to putting those out very shortly, this year.

We are also requesting a doubling of the mediation funds, because we believe this is a very good program.

Senator BUMPERS. Did you give me a figure a moment ago when I asked you how much money is delinquent that we are trying to mediate?

Mr. WEBER. I gave you a total of how much is delinquent.

Senator BUMPERS. Is that \$3 billion?

Mr. WEBER. Yes; but I do not know how much of that is under mediation.

Senator BUMPERS. Well, \$258 million of that is in my State. That is rather shocking.

Mr. Chairman, I will not pursue this any further. Could I get a copy of the inspector general's report on that? Is that privileged in any way?

Mr. SMITH. I am not sure of the status of it, Senator, but we certainly will inquire when we get back to the Department and make it available if we can.

Senator BUMPERS. Thank you. Thank you, Mr. Chairman.

[CLERK'S NOTE.—The Office of Inspector General's Evaluation Report is not printed in the hearing record but is available for review in the subcommittee's files.]

Senator COCHRAN. Thank you, Senator.

Senator Kohl.

DAIRY OPTIONS PILOT PROPOSAL

Senator KOHL. Thank you, Mr. Chairman.

I have a question for Mr. Ackerman, another question for Mr. Schumacher, and a question for Mr. Smith.

Mr. Ackerman, when Secretary Glickman testified before this committee in February, we discussed what is being done to help dairy farmers better manage price risk, especially in light of the great volatility that we have seen in dairy prices over the last year. At that time, the Secretary indicated that he was reviewing a proposal for an options pilot program for dairy.

The 1996 farm bill authorized the Secretary to establish pilot programs to determine whether commodity options can help pro-

PART 1

482

ducers deal with fluctuating prices. And it seems to me that dairy farmers need it the most.

Now, why do I say it?

Well, the dairy price support program will be phased out by the end of 1999, No. 1. Dairy farmers are not covered by crop insurance, No. 2. And unlike most commodities, they get no transition payments. Dairy farmers have very few ways to manage risk. Really, they are on their own. And that is why I think an options pilot program should be a high priority for USDA as you seek to address the dairy price problems.

It is my understanding that the Coffee, Sugar, and Cocoa Exchange has submitted a dairy options pilot proposal. Mr. Ackerman, do you believe that this proposal has merit?

Mr. ACKERMAN. Yes, Senator; we are looking at that proposal. We view it as a very promising proposal for many of the reasons that you mention. It is very consistent with the approach we are taking with other crops, with other areas of agriculture, in developing a safety net, where farmers rely more on private market mechanisms rather than Government support programs.

Dairy, as you mention, is somewhat different in that it is not covered by crop insurance. The futures market mechanisms for dairy are relatively new. And dairy farmers do not have the background and experience in using these kinds of mechanisms for their price risk protection. A lot of work went into this proposal by the Coffee, Sugar, and Cocoa Exchange, with assistance from the dairy community. They reviewed the old options pilot program. They looked at a number of the problems that it had, and developed ways to overcome them in the new program.

So we view it as a very promising proposal.

Senator KOHL. Can you give me some indication that it is going to start some time in the very near future? Where is it in terms of your sense of priority, sense of urgency? How soon can we get this thing underway?

Mr. ACKERMAN. I cannot give you a timetable at this point. We are looking at it very actively. There are a number of issues involved with it. There are a number of questions about the structure of the program that we would like to pursue with the dairy community including the nature of the subsidies involved in it. There are ways we think it can be made more cost effective, so that farmers can participate in it, with less dependence on Government subsidy.

There is also a question of the funding source for it. The statute requires that the Secretary, to the maximum extent practicable, operate this program in a budget-neutral manner. We are examining what that means—how large of an obstacle that is and what potential budget sources would be available.

Senator KOHL. All right. Well, as I understand it, the program, in its present pilot form, is intended to cost perhaps \$10 million, which is a lot of money, but not a lot of money. And it could be modified somewhat if that becomes the big hangup. Also, moneys could be obtained from unexpended balances in other CCC programs. So, I guess what I am telling you is that I would like to hope that, beyond expressing your interest in the program, we in fact can get something off the ground. And I would like to have the

PART 1

483

opportunity to work with you to move that process, if you do not mind.

Mr. ACKERMAN. Senator, I appreciate it. And it is something that we are looking at very actively. As I say, the budget-neutrality question is one that we are examining, to see what is practicable and what is doable. Once we work through that issue, we would like to focus on this and see what we can do.

Senator KOHL. Thank you, Mr. Ackerman.

STATE TRADING ENTERPRISES

Mr. Schumacher, you and I have had several conversations about our mutual concerns with respect to state trading enterprises, such as the New Zealand Dairy Board and the Canadian Wheat Board, and the hindrances that they pose to United States exports. I believe that monopoly export boards such as these have an unfair trading advantage over countries such as ours, where the standard rules of competition apply. But this is not just an export issue. We are now seeing concerns raised on the import side also, where countries like China have monopoly import agencies.

I have appreciated the administration's support on this issue, and the strong statement made by Deputy Secretary Rominger at the WTO meeting in Singapore recently. Could you explain what the administration is doing currently with regard to cracking down on the activities of state trading enterprises? And could you tell us what, if anything, more the Congress can do to help on this matter?

Mr. SCHUMACHER. Thank you, and I appreciate that question.

Chris Goldthwait and I are working very hard on this, along with Ambassador Barshefsky and her team. In Singapore, we had very lengthy discussions—Deputy Secretary Rominger—on the issue of state trading, both the exporting and importing. Under the Singapore agreement, we are working very hard right now in Geneva and in the OECD. Chris has just returned, last week, from those two places, and he can outline where we are specifically on the 1997 preparation for the 1999 round.

We are taking it very seriously. It is also a very major part of our China WTO accession discussions between our STR and the Chinese officials, on the role of state trading. We have made a few breakthroughs, we believe, recently. We continue to make more as we go into that accession agreement.

Mr. GOLDTHWAIT. Senator Kohl, we are taking this step by step. We are seeking, first of all, transparency as to the operation of the state trading enterprises. By that, we mean we want information about their sales activity, about their pricing. We are in the process, in the working group on state trading enterprises, in Geneva, of developing a questionnaire that all countries will agree to answer with respect to both their importing and their exporting state trading enterprises.

We are making some progress, although, as of course you recognize, people like the New Zealanders, like the Canadians, are not wanting to be very forthcoming in the provision of information. And I think, based on the pressure we are applying in Geneva, the pressure we are applying in other negotiations that are ongoing on credit guarantees, in the OECD in Paris, and even the discussions

PART 1

484

that are ongoing in the Free Trade Area of the Americas initiative, I think we will get some degree of transparency.

If we, over the next year or two, can arrive at a better picture of what these entities are actually doing, what their trade-distorting behavior is, then we will be in a position to formulate the negotiating demands that we will place in the next multilateral trade round, which, for agriculture, is due to begin, as Mr. Schumacher said, in 1999.

So that is basically where we are. It is a front-burner issue.

Senator KOHL. Thank you.

Is there something more we can be doing up here on the Hill? Mr. SCHUMACHER. Why do not we discuss this with our STR people, and I could come back and talk to you on that?

Senator KOHL. All right.

Mr. SCHUMACHER. With someone from STR in the next week or so.

Senator KOHL. I would like that.

Mr. SCHUMACHER. We would enjoy that, too.

Senator KOHL. Thank you.

TIMING OF ADVANCE MARKET TRANSITION PAYMENTS

And, finally, Mr. Smith, in order to receive advance transition payments under the new farm bill, farmers are being required to have all of their lease arrangements finalized and disclosed to USDA by January 15 of each year. Now, in warmer climates, that might be a reasonable date. But in States like Wisconsin, final decisions about which fields a farmer is going to lease are not made until the early spring.

It seems to me that it makes more sense for farmers to be able to receive their advance payments whenever they meet the requirements, instead of having a strict deadline. It is my understanding that the administration may be sending a package of proposed farm bill technical corrections to Congress. Will you, Mr. Smith, be requesting a clarification in the farm bill language regarding that deadline of January 15?

Mr. SMITH. Senator, yes, we are. As you recall, in the farm bill, it specifically required that we make the AMTA payments on December 15 or January 15. And because of the difficulty the producers encounter in meeting that requirement, we are proposing legislation to give us more flexibility, so that we can accommodate the differences in farm planning across the country.

Senator KOHL. So there will be a clarification, then?

Mr. SMITH. Yes, sir.

Senator KOHL. Along the line of what I have suggested?

Mr. SMITH. Yes, sir; and I would like to ask Randy if he has any additional comments on how this could benefit the producers with regard to their leases.

Mr. WEBER. Certainly you raise a good question and a question that has been raised by many producers, because there are vast parts of the country in which leasing arrangements are not completed by January 15. And under current law, if the rental arrangement has not been made by January 15, then we cannot make an advance payment to a producer.

PART 1

485

The legislation that we are proposing would broaden the period of time in which producers could request advance payments—from November 1 through August 1. We think that would be broad enough to allow anyone to receive an advance payment and not have to wait until September 30 to receive the final AMTA payment.

Senator KOHL. Well, that is good. I do appreciate that very much. Thank you.

Thank you, Mr. Chairman.

Senator COCHRAN. Thank you, Senator.

CCC OUTLAY ESTIMATES

Mr. Secretary, on page 8 of your prepared statement, at the top of the page, it says the 1998 budget projects that CCC outlays for commodity programs will increase from about \$5 billion in 1997 to \$6.2 billion in 1998, and then decline again, to about \$4 billion by 2002. What are the reasons for these projected increases in CCC outlays from 1997 to 1998?

Mr. SMITH. Mr. Chairman, I would like to ask either Dennis Kaplan or Randy to respond to that. Some of the fluctuation is due to repayment of advance deficiency payments, which impacted the CCC outlays. But I am not sure whether that accounts for all of it.

Mr. WEBER. Mr. Chairman, we are estimating that the total CCC outlays in fiscal year 1998 will be \$9.9 billion, \$2 billion higher than fiscal year 1997. And that is principally because in fiscal year 1998 we will not receive repayments of advance deficiency payments, whereas in fiscal year 1997 we are receiving repayments of 1995-crop overpayments. CCC commodity assistance to producers, including loan programs, is expected to be about \$1.1 billion higher. And then, in each of the succeeding years, it is going down simply because the AMTA payments are declining in those years.

Senator COCHRAN. The what kind of payments?

Mr. WEBER. The AMTA payments.

Senator COCHRAN. What is that for?

Mr. WEBER. Agricultural Market Transition Act payments.

Senator COCHRAN. OK. These are the contracts that are entered into?

Mr. WEBER. Yes; these are the contracts that are entered into.

Senator COCHRAN. By the producers with the Government?

Mr. WEBER. Yes; those payments decline, from a fiscal year 1998 level of \$5.8 billion, down to just slightly over \$4 billion in 2002.

Senator COCHRAN. Are there assumptions made about the commodity prices and what effect that will have on CCC outlays? Or does that become irrelevant under this new program?

Mr. WEBER. Prices have much less effect under the 1996 act than they had under the previous farm bill, because then the payment rate was dependent upon whatever the market price was. Now, with the guaranteed payments, that is not a factor. It can still be a factor with regard to loan activity, however. Depending on where the market price is, we can have changes in loan activity.

As a matter of fact, this year, despite the higher market prices, we still have a fairly high volume of loans, especially in wheat and corn. They are running higher than they did last year.

PART 1

486

Senator COCHRAN. Is that a surprise, or was that expected?

Mr. WEBER. Somewhat of a surprise, but it is not unusual in a declining market. The loan program tends to provide producers with a fairly favorable interest rate, and they find that this gives them some interim financing and allows them to more readily market their grain.

Senator COCHRAN. We had always heard that our commodity programs—particularly the loan program—was a marketing tool. What, if anything, is going to be the practical consequence of the change that we have seen under the new farm program with respect to the marketability by producers of their commodities?

Mr. WEBER. Well, as you know, Mr. Chairman, the 1996 farm bill essentially freezes loan rates at the 1995 levels. In the case of rice, that is \$6.50 per hundredweight for the entire duration of the farm bill. Wheat is \$2.58. The only commodity for which there is some level of fluctuation is soybeans, and it has a very small range. The soybean loan rate for 1997 will be at its maximum of \$5.26 per bushel.

So, again, the loan rate in relation to the market prices will determine how much farmers use this program. But I tend to think, over the years, farmers do use it for interim financing. So even when prices are relatively high, we do have loan activity.

Mr. SMITH. Mr. Chairman, there is one observation I will make, as well, and that is with the price volatility that we are experiencing because of the flexibility in the planning by our producers domestically, and also because of the global demand for our agricultural commodities, our producers may experience more need to use the loan program as a tool, because they can see considerable price fluctuation between harvest time and the end of that loan period. And so, in order to take advantage of that fluctuation, you may find more producers parking their commodities temporarily in loans, at the low interest rate, to see what volatility will be introduced in the market in a given year.

LONG-RANGE EXPORT MARKET OUTLOOK

Senator COCHRAN. I know Mr. Schumacher talked about the record harvest in some of our competitor countries as having an impact on the level of our exports next year. What are the long-range expectations for export markets for American farmers?

Mr. SCHUMACHER. We have looked at the ERS baseline. And that shows that we are going to dip a little bit this year. But next year and the following years, it looks to be 5, 5.5 percent growth in our value-added; 4, 4.5 percent in our bulk. So it looks quite steady, Senator, through the next 6 to 8 years, to the year 2005.

Particularly, I think, noteworthy is that we are projecting, under our ERS baseline, to reach \$80 billion in exports by the year 2005, and that the trade surplus will in fact widen. Our export growth will move along about 5, 5.5 percent overall. Our import growth, though, will be 3, 3.5 percent. We are looking at a trade balance widening to \$34 to \$35 billion in exports over imports by the year 2005.

PART 1

487

TRADE BARRIERS TO U.S. EXPORTS

Senator COCHRAN. Does any of this take into account efforts that our Government is making to break down barriers to our entry into markets or expansion of markets? I notice, for example, this annual report the U.S. Trade Representative filed, and which was reported in the Washington Post on April 1, 1997, that talked about the fact that many markets around the world remain closed to U.S. exports and, to the extent our trade deficit is the result of these barriers, they must be reduced. That was a quote attributed to U.S. Trade Representative Charlene Barshefsky.

The article says:

In addition to 46 countries, the report of the most onerous trade barriers around the world also included four trading groups, including the 15-nation European Union. On the European Union, Barshefsky said she was, "particularly concerned by the EU's pervasive discrimination against U.S. agriculture exports—including rice, wheat, wheat flour, bananas, beef, dairy products, and certain fruit."

On China, Barshefsky said that United States companies and farmers still faced numerous barriers trying to get into that huge market.

Do these projections presume that we are going to continue to have these difficulties, or do they assume that we are going to break down these barriers? And, if so, how are we going to do it? And what, if anything, is the Department of Agriculture doing to help break down these barriers?

Mr. SCHUMACHER. Yes; we are, in fact, proposing some modest additional funding to continue to rigorously identify and then take action to break down these barriers. As you may be aware, we have quite a few problems right now with Europe. There is an EU veterinary team here trying to solve this difficult issue on our EU equivalency agreement. We are now at the WTO, awaiting an agreement, which we hope will be quite satisfactory to us, on discrimination against our beef going into Europe.

We are gradually resolving the rice issue on the tariff rate quota. And we hope to make progress within the next few weeks on the rice cumulative recovery system. But, again, it is very difficult, it is very time consuming, and it is slogging-type work that we are undertaking very aggressively with our friends in the Special Trade Representative's Office.

On China, as I mentioned earlier, we are in the midst of difficult negotiations on their WTO accession. So these barriers need to be further identified and action taken, especially on some of the smaller issues that do not appear all the time but that do have an impact. For example, we are working very closely in Mexico, of all things, with Christmas trees out of North Carolina and in the Northeast. A small issue, but an important issue for those growers in that area, as the TCK issue is in China to major wheatgrowers.

So we are aggressive. We are tightening up our work. We are re-allocating resources to deal with these market access barriers.

On the specific question, does the ERS baseline projection take into account all of these? I will have to come back to you in writing, and talk to our friends in the Economic Research Service to see how much of this they have captured, and what they have implied in their assumptions on market access barrier reduction over the next 8 years.

PART 1

488

[The information follows:]

The export growth projections in the ERS baseline are based on the current trading environment. They do not assume resolution of market barriers cited in the annual report of the U.S. Trade Representative, however, they do incorporate market access gained in the Uruguay Round and NAFTA agreements. Resolution of these numerous barriers would translate into greater global trade of agricultural products.

EFFECT OF POSSIBLE TRADE SANCTIONS ON CHINA

Senator COCHRAN. In the case of China, there appears to be a huge market there. And there is a lot of controversy about the extent to which we ought to be trading with China. Some think that because they have exported missile technology and have done other things that we disapprove of that we ought to impose further sanctions. What effect, if any, would be the imposition of economic or trade sanctions against China with respect to our agriculture exports? And how will that affect agriculture producers here in America?

Mr. SCHUMACHER. Two responses, Senator. One, I think people forget, or they may not be looking at the data, that China, in fact, is a net food exporter. They export 11 to 12 billion dollars' worth of food and import \$9 or \$10 billion. Their grain imports have fallen from 19 million tons to our forecast this year of around 7 million tons. They are a strong competitor of the United States with value-added in the Pacific rim, and recently have been exporting a modest amount of corn.

So our exports this year to China, excluding Hong Kong, are a little less than \$2 billion, projected, primarily in the soy complex and in poultry. And cotton is very, very important. Cotton, soybean oil, and poultry, and some beef parts as well.

Senator COCHRAN. So those are the commodities where we could see a dropoff in trade if sanctions were imposed; is that what you are saying?

Mr. SCHUMACHER. Those are the four major commodities that we are currently exporting to China.

Senator COCHRAN. Do you know what the dollar value is for any of those?

Mr. SCHUMACHER. Chicken is about \$550 million. Mostly the chicken feet, of all things. They eat a lot of chicken feet. Then the soy oil—I will have to get back to you precisely on that. Cotton—the other three I will get back to you on that, Senator.

[The information follows:]

Exports of U.S. soybeans, meal and oil to China totaled \$230 million in 1996, but could easily top \$1 billion this year. Last year cotton exports were \$800 million, and hides and skins were \$170 million. We also shipped \$200 million plus in fruits, vegetables, and tree nuts.

Senator COCHRAN. OK. The assumption, then, is that we are going to continue to work—and it would be good to know what the expectations are about the possibilities of success in breaking down these barriers and what that would mean in terms of increased exports. I think the reason it is important, from an Appropriations Committee point of view, is the impact that that might have on CCC outlays or the prices of commodities to producers.

The overall effect of increasing exports ought to be to increase the opportunity for profit in production agriculture, and less and

PART 1

489

less need for farm operating loans and maybe some of these other programs that we use to support production agriculture. In the risk management area, that can have an impact.

FURTHER CROP INSURANCE REFORM

Mr. Ackerman, let me ask you this. There have been suggestions that we expand the programs for risk management. As long as I have been in the Senate, we have always heard about the difficulties of the Crop Insurance Program, the unpredictability of disaster assistance when natural disasters occur, where there is clear evidence that crop insurance is not adequate to protect farmers against huge losses that are often sustained. What is the administration's view toward further reforms in this area?

We heard your comments earlier, but I continue to hear from other Senators who think that this is a major problem and that Congress and the administration need to get together and work out some new program for protecting against the harmful consequences of natural disasters for production agriculture.

Mr. ACKERMAN. Senator, I appreciate the question.

Crop insurance has changed fundamentally in the last 3 years. We have gone from a program that covered about 30 percent of covered crops to one that covers almost 80 percent. We have gone from a program that was based on average yields to one that is based on individual yields. We now have a program that, up until the early nineties, was a perpetual money loser as far as underwriting fundamentals were concerned to a program that now has an actuarial loss ratio the past 3 years within our target.

We also have a program that has expanded into new crops, into new pilot areas, and into new concepts like revenue insurance and the program that Senator Kohl was mentioning earlier, the options pilot program. So, I think, when you look at crop insurance today, it is really a very different program, a very different organization than what existed 3 or 4 years ago. The changes of the last few years, I think at this point, are just starting to kick in.

FAS MARKET BARRIER INITIATIVE

Senator COCHRAN. In connection with the question I was asking about barriers to trade, I notice there is a request in the budget for an increase of \$500,000 for a market barrier identification initiative. Why is this needed, if we have the USTR filing this annual report that I just cited and which we have available to us? Why do we have a proposal for a Department of Agriculture initiative identifying market barriers as well?

Mr. SCHUMACHER. The Special Trade Representative's Office is identifying quite a few of the general barriers, as I mentioned earlier. There are a lot of specific barriers that affect a number of areas in commodities in this country. I mentioned the issue of Christmas trees, which is not a huge export, but a very important one for North Carolina, Pennsylvania, and New York.

We not only want to identify these specific barriers, we also want to start taking identifiable actions to address these barriers in detail through our trade policy work as we begin to formulate our programs at the WTO. We would like to get a lot of these resolved prior to getting into negotiations at the WTO. Those that we cannot

PART 1

490

resolve, we are going to take them up as we move toward the 1999 rounds.

CHANGES IN THE COOPERATOR PROGRAM

Senator COCHRAN. I notice there are some changes in the Cooperator Program. You are suggesting an increase in the contribution from the private companies or groups who participate in that program. What is the practical consequence of that? Are they going to quit participating or are they going to come up with the extra money? What is your expectation on that?

Mr. SCHUMACHER. Well, Mr. Chairman, we are working quite closely with the cooperators, as the intent of Congress and the report language last year was to make it a bit more competitive. And we are looking at competitive criteria, which we are keen to discuss with your staff—the criteria would have a number of aspects to it, one, on contributions and, two, on measuring performance on exports.

And I think that very few cooperators would have problems with this. In our discussions—we have had three meetings with them. It is basically adjusting the Cooperator Program to broadly similar competitive criteria that we have with the Market Access Program, as we made reforms in that program as well, putting them on a competitive basis.

Senator COCHRAN. Well, our committee report, or at least the statement of managers accompanying the conference report for this fiscal year suggested that the Department develop procedures and criteria for a competitive bidding process for awarding these funds. Has anything been done in response to that suggestion?

Mr. SCHUMACHER. We are right in the midst of our discussions with our staff. And we want to also consult with both Houses of Congress before we implement agreements with the cooperators and put this into practice. We have work to do yet, sir, on introducing the competitor measures, and we do not want to do that before we have adequate consultation with the cooperators and with both Houses of Congress.

PUBLIC LAW 480 RESCISSION

Senator COCHRAN. There is a proposed rescission before the committee to remove \$50 million in funding for the Public Law 480 title I program—that we rescind \$3.5 million of ocean freight differential funds and \$46.5 million in subsidy budget authority in the Direct Credit Program. What is the reason for the rescission request?

Mr. SCHUMACHER. I would like Mr. Goldthwait, with your permission, to answer that question, sir.

Mr. GOLDTHWAIT. Senator, this is one of those cases where we have had to make some very, very difficult decisions about conflicting budget demands and tradeoffs. The reason for the rescission that we have proposed is because of additional funding needs with respect to domestic feeding programs that are managed elsewhere in the Department.

Senator COCHRAN. Is that the WIC Program particularly?

Mr. GOLDTHWAIT. Yes, indeed.

PART 1

491

Senator COCHRAN. Let me ask you this. The domestic feeding programs that are funded in this budget, including the Food Stamp Program, seem to continue to grow in spite of reduced rates of unemployment, in spite of economic conditions that would indicate greater job opportunities, better access to health care, a lot of changes in our society that seem to make access to a higher standard of living within reach of more and more Americans. But yet the cost of these subsidy programs seem to continue to go up.

I know that is not within the jurisdiction of this committee, but it seems to me that we ought to be doing the kind of job that manages those programs so they do reach those who need them. We have seen a lot of reforms made and a lot of changes made in the legislation. But now the administration is coming in with assumptions that will expand those programs even further in this budget year and requesting this rescission of funds for the Public Law 480 title I program.

The budget indicates that commodity shipments would be reduced by approximately 200,000 metric tons as a result of this proposed rescission. But it also indicates that allocations of title I commodity assistance that have already been announced would not be affected by the rescission, because the reduction in program funding will be taken from a reserve of unallocated funds and from unobligated funds carried over from 1996.

What is the total of unallocated funds and unobligated funds carried over from 1996?

Mr. GOLDTHWAIT. The \$50 million rescission breaks down roughly 50–50 between the current fiscal year reserve and the carryover. The carryover is actually \$22 or \$23 million, and the unallocated reserve is about \$26 or \$27 million. So it is very close to a 50–50 split there.

As you may know, our programming practice at the beginning of each fiscal year is to allocate the majority of the Public Law 480 title I funds, but to maintain a small reserve for needs that cannot be foreseen at the very beginning of the fiscal year, but which develop in the course of the fiscal year. And, in effect, the proposed rescission draws on those funds, plus this small carryover.

PUBLIC LAW 480 TITLE I CARRYOVER BALANCES

Senator COCHRAN. Why were Public Law 480 title I funds carried over from 1996? And since they were, why were they not included in the initial funding allocation for fiscal year 1997?

Mr. GOLDTHWAIT. In many years there is a small funding carryover. This arises for a couple of reasons. It arises when we have a planned program that falls through very late in the fiscal year, when, for one reason or another, a foreign country cannot complete the negotiations with us and actually sign its program in time to ship the commodity in a timely basis.

It also occurs because of shifts in commodity prices and because of shifts in freight costs—the estimated value or the estimated cost associated with a particular country program is in fact different from the actual cost. And, indeed, the carryover was a little larger this year than usual. We did see a situation where, at the end of the fiscal year, we were beginning to see a reduction in commodity

PART 1

492

prices for some of the commodities that were heavily programmed—wheat, for example.

So that is the origin of the carryover. And it was in fact a little larger going into fiscal year 1997 than we would have expected under normal circumstances.

Senator COCHRAN. But it is just confusing to me that we can see a rescission being requested, and then the budget documents explain that this really does not matter. We have got carryover funds, and we have got unobligated funds. Why does it matter? Why do we just not appropriate what you are asking for next year?

Mr. GOLDTHWAIT. It is not a case of not mattering. I think the point we were trying to get across in the budgetary description was that we will not find it necessary to, if you will, renege on any existing fiscal year 1997 commitments to countries that we have already made. In other words, there is just enough unobligated funding that is available to cover this rescission without having to go to any country to whom we have already offered a fiscal year 1997 program and saying to that country we are not going to be able to follow through with that commitment.

Senator COCHRAN. But if there are any additional requests made, they cannot be met?

Mr. GOLDTHWAIT. That is correct, unless some other existing fiscal year 1997 program fails to materialize.

Senator COCHRAN. You do have the authority within the Public Law 480 program though to transfer funds within and between titles, do you not?

Mr. GOLDTHWAIT. That is correct, within limits.

Senator COCHRAN. Well, has the administration concluded that if unobligated and carryover funds are not required for title I, they also will not be required to supplement funding for titles II or III of the program this year?

Mr. GOLDTHWAIT. That is our best estimate as of the current time.

Senator COCHRAN. That is enough to give you a headache, is it not, trying to figure that out?

COCHRAN FELLOWSHIP PROGRAM

I was glad to hear that you have requested \$2.4 million for the fellowship program, which the Department, several years ago, described as the Cochran Fellowship Program. I just came back, incidentally, from a trip with Senator Stevens, chairman of our full Committee on Appropriations, to the Russian far east and to South and North Korea. I had an opportunity to meet with some participants in this program on that trip.

And from what I hear from those who work in the consulates and the embassies around the world where there are eligible countries, it seems that this is a program that provides a unique opportunity for participants to learn more about our free market and economic systems. Through this program, developing countries and emerging democracies can learn from us and develop closer ties that result in better trade opportunities for U.S. exporters and economic development opportunities for the participating countries.

I wonder the extent to which we are able to get the appropriated funds for this program supplemented by the Emerging Markets

PART 1

493

Program and by AID programs. I know that we have had moneys allocated from these other programs. Do we expect to have any money allocated in the next budget year to supplement these funds?

Mr. SCHUMACHER. Yes; because the program has been, as you mentioned, very successful. We are looking at \$1.8 million, maybe \$2 million, from USAID and from the Emerging Markets Program about \$1 million. So with the \$2.4 million of appropriated funding, we are looking at nearly \$5.5 million, to sustain this very successful, innovative program.

Senator COCHRAN. That is good to hear. One person I met, had come back from California to Vladivostok—that is an open city now, for the first time in many, many years, as everyone knows—where they are beginning to develop an indigenous agriculture productivity and food marketing capability. And there is a lot of excitement about the close relationship that exists between our west coast and the Russian east coast.

The State of Washington, for example, is having great success in marketing apples in that part of the world now. We also are seeing other new relationships developing. Even on the Island of Sakhalin, I ran into an Embassy person who was very excited about the fact that she had been involved in recruiting participants for the Cochran Fellowship Program. She told me what a success that had been. So I am very pleased to have your report.

I am submitting for the record some questions for further information about participant levels and examples of what the program has actually accomplished to date. We are hopeful we can get the committee to continue to support it.

Mr. SMITH. Senator.

Senator COCHRAN. Yes.

COCHRAN FELLOWS FROM SOUTH AFRICA

Mr. SMITH. I had the pleasure of working with the program, primarily with the Gore and Baake binational with South Africa. And my experience with the Cochran fellows that have come to the United States from South Africa has been very rewarding.

For example, one young man who operated a small dairy in South Africa came to the United States on a Cochran fellowship to learn how to expand his production through improving the feeding of his dairy herd. But on the way back, he told me he learned something else, and that was to focus on developing co-ops in his community. So he came for personal reasons and he left with a perspective on how to help his entire community. And he went back with the intent of developing a marketing co-op to help market not only his milk from his dairy herd, but his neighbors' as well.

Senator COCHRAN. That is very interesting. I have had some other experiences in the former Eastern bloc countries, such as Poland, where they now have an alumni group which meets every month. They get together and talk about their experiences in the United States and what they learned. They stay together. It tends to generate a lot of camaraderie. But the benefits are that they have learned new strategies for themselves. They have developed a new sense of confidence in being able to succeed in a free market economy. It was quite something to see—the level of excitement

PART 1

494

and optimism that was generated by these participants. It seems contagious and that was very gratifying.

FISCAL YEAR 1998 EXPORT ENHANCEMENT PROGRAM BUDGET REQUEST

There are a number of other questions on various subjects that I have here that I am going to submit for the record. I do want to ask about the Export Enhancement Program though. The budget proposes \$500 million, which is the maximum authorized level of funding, as you point out. This year we have a \$100 million limitation on the program that was included in the appropriations act. The reason for that was that our discussions with those who were interested in the program indicated that they did not think that there would be a demand for any more than \$100 million this year.

Why do you believe that there will be a demand for more than \$100 million in fiscal year 1998?

Mr. GOLDTHWAIT. Senator, we believe very strongly that we need the Export Enhancement Program, as Secretary Glickman has said, as a potential tool, in the event that we face aggressive subsidization by our competitors, particularly the European Union, although we could also face price discounting by some of the state trading enterprises that Senator Kohl alluded to earlier.

The fact of the matter is that under their GATT allowance, the European Union will have, in terms of subsidy authorization, close to or perhaps even a little more than \$10 billion to promote their commodities through price discounting. We believe that we very much need to have the \$500 million allocation to fall back on in the event that we face competitive conditions that are considerably more difficult than what we have been fortunate to face in the current year.

As Mr. Schumacher noted earlier, this year we had somewhat smaller availabilities for export of wheat and some of the other commodities for which we traditionally use the Export Enhancement Program. We simply do not know, until we have a better idea of what Northern Hemisphere harvests are going to be, what we might be called upon to do in the new marketing year and the new fiscal year.

EU TRADE-DISTORTING SUBSIDIES

Senator COCHRAN. It seems that we entered the Uruguay Round hoping to be able to negotiate an end to trade-distorting subsidies. Now we hear more about what the Europeans are doing to increase their allocation of funding to enhance their commodities in overseas marketplaces which is to our disadvantage. If this is not a trade-distorting subsidy by the EU, what is it?

Mr. GOLDTHWAIT. It certainly is a trade-distorting subsidy. And in fact, in the Uruguay Round we did achieve limits on that. And over the life of the phase-in period, the EU will be required to reduce their expenditures on export subsidies by a total of 36 percent. The fact that here, midway through the process, they still have the ability, if you will, to use up to \$10 billion simply says a lot about their starting point.

Senator COCHRAN. Well, it seems that we have got our work cut out for us to protect our interests in this global market. And I am in favor of a robust and aggressive marketing program, where our

PART 1

495

Government works in a cooperative way with our private sector to ensure that we do not get mistreated by trade barriers being erected or unfair practices of any kind.

So I do not know what the wishes of our committee will be with this particular request, but I am inclined to support what you are asking. I hope that we have the funds allocated to our committee that will permit us to make this available if needed.

IMPORTANCE OF MARKET ACCESS PROGRAM

The Market Access Program has already been discussed and mentioned. I am hopeful that we can continue the current level for that, the fully authorized permanent funding level of \$90 million which is included in the budget. Does this program continue to be important for us in order to promote and expand agricultural exports from the United States?

Mr. SCHUMACHER. Senator, this program is vital. As mentioned earlier, our value-added programs are moving forward. Our cooperators are being much more innovative in the wheat area and in corn and in soybeans. Soybeans have been terrific in using this money to get access in new markets like China for soybean oil. I mentioned earlier the Meat Export Federation did a marvelous job as did the cotton folks in South America on value-added cotton. I could go on for much more time than I think is appropriate here.

I have been at this now nearly 3 years, and I am just excited about what is going on among our exporters, the cooperators, and participants in the Market Access Program. I can assure you the Europeans, the Chileans, the Argentineans, and even the Uruguayans, who were in yesterday, are very admiring of this program. The Minister of Agriculture specifically mentioned the extraordinary performance of the Meat Export Federation, and how they would love to duplicate that.

We have market penetration because of the cumulative success of this program. I am going to work very, very hard to make that a continuing success, with our private sector.

Senator COCHRAN. I appreciate hearing that good report. It would be helpful if we could have for the record a description of the program requirements for participants now. We know there have been legislative changes made. Senator Bumpers referred to them. We are familiar with them. We argued on the floor of the Senate, in debate, over amendments that were proposed, maintaining that this program could be improved. It would be good to have a summary of the changes that have been made and how they are working, so we will become better able to argue against any amendments that might be designed to delete the funds provided for this program when we get to the floor.

I assume that Senator Bumpers is not going to give up. Maybe the program has not been improved enough. But whatever the facts are, we need to know them so we can describe what is going on with this program to the Senate when the bill gets to the floor. That would be very helpful to us.

Mr. SCHUMACHER. We will do that, sir.

[The information follows:]

Consistent with the Administration's commitment to streamline government programs, new MAP regulations were published on February 1, 1995, that increased

PART 1

496

flexibility and simplified program requirements for the participants. The MAP regulations reflect public comments and changes made by the Omnibus Budget Reconciliation Act of 1993 and most recently, the Federal Agriculture Improvement and Reform Act of 1996. Specific changes in the MAP include:

- eliminated the requirement for an applicant to show that the represented U.S. agricultural commodity faces an unfair trade practice in an overseas market;
- give priority assistance in the allocation of brand promotion funding to small businesses and cooperatives;
- established procedures for appealing compliance findings;
- simplified contracting standards and procedures;
- extended the time period during which expense claims may be submitted for reimbursement; and
- liberalized U.S. origin identification requirements to permit the use of generally recognized states or regions within the U.S.

In addition, the Department has administratively implemented the following improvements to streamline and expedite program management:

- simplified reporting requirements for end-of-year contributions;
- delegated to FAS Commodity Division Directors the authority to approve routine administrative issues;
- eliminated the requirement for formal amendments to effect changes in approved activity plans other than those that are deemed “significant”;
- delegated authority to the State Regional Trade Groups to approve brand company plans valued at no more than \$50,000, thus expediting the approvals for primarily small companies participating in the MAP;
- eliminated the need for all brand companies, 80 percent of which are classified as “small,” to track and report expenditures by multiple cost categories for brand activities.

The Department also undertook an extensive analysis of the methodology and criteria used to evaluate MAP applications and allocate funding among participants. Based on public comments received in response to a Federal Register notice on proposed changes and the results of the analysis, the Department adopted and published revised evaluation criteria that included:

- export performance criteria that is now based on three years of historic export data, rather than one year;
- industry contribution levels that now include actual past contributions for prior year participants, not only the level projected for the coming year; and
- the competitive review process was modified to compare the relative performance of each applicant based on four weighted criteria: contributions (40 percent), export performance (30 percent), export goals (15 percent), and accuracy of past projected export goals (15 percent).

Background: In response to GAO and OMB, the regulations have also been tightened with regard to funding additionality and evaluation. Participants must certify and demonstrate that any funds received will supplement, but not supplant, any private party contributions to the program. For evaluation, we added reference to the Government Performance and Results Act (GPRA) in the activity plan and evaluation sections. The critical point is that language now appears in the rule which states that “a participant that can demonstrate additional sales compared to a representative base period, * * * will have met the overall objective of the GPRA and the need for evaluation.”

The streamlining of the MAP has been well received, and the Department continues to make program modifications to further streamline operations and ease administrative requirements for program applicants and participants.

CREDIT RULES FOR BRAZILIAN IMPORTERS

Senator COCHRAN. You mentioned South America. I notice that there are some concerns about the Brazilian Government's recent decision to establish some different credit rules for companies importing agricultural commodities, compared to those who are purchasing commodities from domestic sources. I understand that exports of U.S. cotton and wheat could be particularly disadvantaged.

Are you aware of this new development? Can you tell us about it and what we may be doing to persuade the Brazilian Government to treat exports in a fair way?

PART 1

497

Mr. GOLDTHWAIT. The Brazilians basically are setting some rules for the import of agricultural products that benefit from credit arrangements. In effect, what they are doing is applying limitations on the use of short-term credit, up to 1 year. In effect, we have been very successfully using our Credit Guarantee Program, the GSM-102 program, in Brazil. You have mentioned its success in supplying cotton. We have sold about 12 million dollars' worth of cotton so far this fiscal year under the program. We have sold a total of about 20 million dollars' worth of agricultural commodities to Brazil under the program so far this fiscal year.

We are in the process of adjusting the credit term that we use for our program to Brazil so that it will be a little longer and it will conform to the requirements of the Brazilian arrangements. And we believe that the credit program will continue to be a useful tool, with this small adjustment. And we intend to put out a press release that makes that adjustment formal within the next 2 or 3 days.

BOLL WEEVIL ERADICATION LOANS

Senator COCHRAN. Speaking of cotton, we have the boll weevil eradication loans that were funded in the fiscal year 1997 appropriations act. We understand that FSA has not yet released the money because the regulations have not been promulgated. It is necessary that these funds be made available by May 15, so that the planned programs can be continued and the program expansion that was contemplated can be initiated.

APHIS tells us that they have supplied the Farm Service Agency with all the information the agency has requested. What is the problem here about getting these funds out? Does anybody know the answer to that?

Mr. WEBER. Mr. Chairman, we are about ready to go forward with publishing the rules. We are hopeful that they will be out in May and that we can start the program in May and have all of the funds obligated by the end of the fiscal year.

Senator COCHRAN. Is there any timetable for making the loan program available to qualified users?

Mr. WEBER. We are hopeful that we can start making those loans available sometime in May.

Senator COCHRAN. Today?

Mr. WEBER. No; sometime in May.

Senator COCHRAN. Oh. [Laughter.]

Mr. WEBER. Sorry. I would like to have made it today.

Senator COCHRAN. Well, I had heard that there was possibly a meeting today with the Secretary on this subject, or some subject relating to the cotton industry and the boll weevil program.

Mr. SMITH. Senator, I have a meeting scheduled this afternoon with the National Cotton Council to bring them up to speed as to where we are in that process of clearing the regulations. There are a couple of concerns that, even after we get our regulations out, may affect our implementing the program. I understand that we have a lawsuit in Texas that may encumber us in our ability to make a loan to that association until that lawsuit is settled.

PART 1

498

But we hope to be able to discuss those things with the participants. They should not hold up our regulations; they may just impact our ability to implement the regulations for those associations.

Senator COCHRAN. Well, we appreciate your working with the industry to deal with this problem. It seems that we have a program now that is moving along. And if we keep it moving and keep the Federal agencies that have a role in it on target with the contributions that are being made by individual producers, in a concerted effort, we may be able to eradicate the boll weevil and increase the proficiency and productivity of our cotton farms across the country. That will mean a lot to our economy, particularly in the cotton-producing regions.

So we appreciate your assistance and your understanding of the importance of these issues, and the promulgation of the regulations and the making available of the \$34 million in loan authority that we have authorized for this program.

SUBMITTED QUESTIONS

Well, you all have been very patient with the questions of the members of our committee and with me this morning. We appreciate your cooperation. I have a number of questions on these and other subjects to submit so we can have a complete record that will help us explain and answer questions that we might have to answer when this bill comes before our committee and then is on the floor of the Senate for consideration.

[The following questions were not asked at the hearing, but were submitted to the Department for response subsequent to the hearing:]

FARM SERVICE AGENCY

QUESTIONS SUBMITTED BY SENATOR COCHRAN

FARM OWNERSHIP LOANS

Question. How has the Farm Service Agency tried to increase participation in the guaranteed loan area?

Answer. FSA has tried to increase participation by making the guaranteed loan program more accessible and easier to understand for both lenders and loan applicants. Many improvements have been made over the past several years. For example, we implemented a Certified Lender Program to provide our most experienced lenders with a streamlined application and quicker turnaround on guarantee requests. Also, we consolidated over 14 separate forms and certifications into a new application. In addition, we have recently issued a new Lender Manual to assist lenders in making and servicing guaranteed loans. This summer we will continue to gather suggestions for improvements and implement program enhancements by meeting with lenders and other parties interested in our program. We intend to address concerns over application processing time, consistency between Agency field offices, and application requirements for small loans. These suggestions will be considered as the Agency modifies its Guaranteed Program regulations.

Question. The fiscal year 1998 budget request proposes a \$4 million increase for emergency loans. Farmers use these low-interest loans to help recover from natural disasters. How did the Agency derive this program level for fiscal year 1998?

Answer. The fiscal year 1998 program level was basically derived as an extension of the loan level amount originally requested, and subsequently appropriated, for the fiscal year 1997 Budget. When the 1998 Budget was being formulated in the summer of 1996, the Department approved an extension for 1998 of the then-pending 1997 Budget request of \$25 million. However, after enactment of the 1997 USDA Appropriations Act, the appropriated subsidy of \$6,365,000 resulted in a supportable program level of only \$20,931,000.

PART 1

499

Under credit reform procedures, more recent data on interest rates can affect actual funding levels that are available on October 1. Because the supportable level decreased for 1997, the 1998 Budget appears to be an increase of \$4 million, but the original intent was to have \$25 million available in each year.

Question. The President's budget requests funds to support an increase of \$766,000 in Indian tribe land acquisition loans. The explanatory notes show the level requested will provide 2 direct loans in fiscal year 1998. Who has applied for these loans?

Answer. With the availability of funds in fiscal year 1998 for this program, field staffs will be able to promote and receive applications from Indian tribes interested in purchasing land for use by its members. Based upon historical interest in this program, FSA anticipates receiving, at a minimum, two applications for assistance.

Question. The fiscal year 1998 budget requests an increase of \$11 million for credit sales of acquired property. The budget indicates that this program will be targeted to new and beginning farmers. How will new and beginning farmers be targeted for assistance by this program?

Answer. The 1996 Farm Bill requires FSA inventory farms to be advertised for sale to a beginning farmer or rancher no later than 15 days after acquisition. If no acceptable offer is received from a qualified beginning farmer or rancher within 75 days of acquisition, the property will be offered at a public sale to the highest bidder. FSA offers financing through the credit sales program to beginning farmers to purchase these properties during the 75 days in which the properties are advertised for sale only to beginning farmers.

STATE MEDIATION GRANTS

Question. The President's fiscal year 1998 budget request is \$4 million for State Mediation Grants, an increase of \$2 million from fiscal year 1997. The budget indicates that this request reflects the anticipated level of grants needed for 25 States. Currently, 22 certified States are participating in the program. Have more than three States applied to participate in the program? If so, which States? And which 3 are proposed to receive assistance in fiscal year 1998?

Answer. There has been considerable interest by States in participating in USDA's mediation program. In fact, the fiscal year 1997 funding level of \$2 million was insufficient to fund all requests by the 24 participating States. Florida and Missouri received certification of their programs in fiscal year 1997, but lack of Federal funding has forced these States to fund the programs themselves, limiting their scope. Several States have scaled back their programs or delayed planned expansions as a result of limited Federal funding. USDA anticipates that Idaho and Pennsylvania will submit certification applications soon, raising the total number of participating States to 26.

Question. The USDA Inspector General released a report on the agricultural mediation program administered by the FSA. The Inspector General (IG) identified about "\$2.1 million in excessive or questionable reimbursements of operating costs for activities that did not involve mediation." The IG recommended that monitoring was needed in order to disburse the appropriations properly. How has FSA strengthened its monitoring efforts and addressed the need to institute cost requirements?

Answer. FSA has reviewed the IG findings and accepts its recommendations on providing closer scrutiny of State programs' grant applications and has implemented many of these recommendations for fiscal year 1997 grants. FSA and State mediation officials are interested in jointly developing a common reporting format and uniform performance indicators and measures to assist in evaluating State programs' effectiveness. The Agency expects to publish revised mediation regulations this year to provide uniformity to the grant application and evaluation process.

The Agency believes IG relied on the Federal administrative dispute resolution statute for a definition of mediation during its evaluation of the State mediation programs. Because this definition of mediation excludes various financial analysis, credit counseling, and other services, the IG findings pertaining to the relative costs of mediation by the State-certified programs overstate the questioned and unsupported costs cited in the report. We believe State programs should not be penalized over a definition of mediation that does not reflect the flexibility designed to meet individual State needs. It is this flexibility that makes the State mediation programs so successful.

Agency and State mediation officials are working on identifying the information necessary to track cases for audit purposes, while at the same time maintaining confidentiality, a cornerstone of successful mediation. Certain data that is measurable and common to all State programs will be gathered and reported to USDA to enable better tracking of overall program effectiveness, efficiency, and accountability. We

PART 1

500

believe this can be implemented to satisfy IG audit needs, yet protect the integrity of mediation confidentiality.

DAIRY INDEMNITY PROGRAM

Question. The budget requests \$100,000 for the Dairy Indemnity Program for fiscal year 1998. How much of the fiscal year 1997 appropriation has been obligated to date?

Answer. Carryover fund balances of \$157,305 from fiscal year 1996, as well as the 1997 appropriation of \$100,000, are available for obligation needs of the program. As of April 8, the entire amount of \$257,305 has been obligated for this program, and subsequent claims remains unfunded.

Question. What is the current balance in this account?

Answer. As of April 8, the unobligated balance is \$0.

SALARIES AND EXPENSES

Question. The fiscal year 1998 request proposes a decrease of \$64 million for FSA salaries and expenses reflecting a reduction of 1,784 direct county office staff years. USDA Secretary Glickman has announced a moratorium on office closings through the end of the year. Approximately how many county offices would be closed at the fiscal year 1998 budget request level?

Answer. The 1998 Budget Appendix made mention of a reduction of about 500 service centers, to 2,000, by the end of 1999. There was some internal FSA contingency planning associated with the proposed county staff year reduction because reductions of that magnitude imply some office closings. However, no specific number of office closings were built into the 1998 Budget, and no closures will occur without full consultation with the Congress and approval by the Secretary.

Question. Are the proposed 1,784 direct county office staff year reductions a part of the Administration's plan to reduce county office staffing to 2,000 by the year 2000?

Answer. The proposed 1,784 direct non-Federal county office staff-year reductions in the fiscal year 1998 budget estimate are a part of the Administration's proposal to reduce non-Federal county office staffing to a total of 4,879 by the end of fiscal year 2002. There are no plans to reduce staffing below the 4,879 FTE level.

Question. What process will USDA use to reduce the number of county offices in the States?

Answer. The total number of FSA offices within the USDA service centers has not yet been determined. To assure that USDA provides the best service possible to our customers, any decisions to close USDA field offices or reduce an agency presence in a USDA service center must be done in coordination with other agencies located at the site, including Rural Development and Natural Resources Conservation Service. The original office closing plan that was developed under Secretary Espy focused on six basic criteria to allocate the office reductions: program delivery cost, service group and customer base, complexity, geographic service area, collocation status, and workload intensity and productivity of the office. We would strongly consider the use of these or similar criteria in any additional office closing effort.

Question. The Secretary announced that no county offices would be closed this year. How much savings did you anticipate as a result of county office closings in fiscal year 1997? Will you still achieve this savings?

Answer. The fiscal year 1998 President's Budget did not assume any county office closures or associated savings in 1997 beyond those already approved under the Department's adjusted 1994 plan.

Question. As a result of the 1996 FAIR Act have farm program changes decreased or increased the workload of the Farm Service Agency and its staffing needs?

Answer. Generally speaking, the 1996 FAIR Act has reduced FSA workload. For example, the pre-Farm Bill fiscal year 1997 President's Budget Estimates prepared in January 1996 included county workload staffing needs of 13,224 FTE's for fiscal year 1996. Following passage of the 1996 Act in April 1996, FSA performed an internal workload analysis that showed lower staffing needs for 1996, down to an estimated 12,835 county office FTE's. The actual FTE's worked for 1996 were 12,738. FSA's analysis also showed declining workload for fiscal year 1997, to 11,946 FTE's. Actual use of FTE's in 1997 will be somewhat less than that. For fiscal year 1998, additional workload decreases were projected in FSA's analysis, with workload stabilizing thereafter. However, an independent study will be performed that will seek to identify other operating efficiencies in order to achieve further FTE reductions.

Question. How many RIF's and buyouts will occur in fiscal year 1997?

Answer. The most current data, as of April 7, 1997, shows a total of 1,241 separations in Federal and county offices.

PART 1

501

Question. What is the cost of the RIF's? What is the cost of buyouts?

Answer. The total cost of the fiscal year 1997 separations is \$42 million; buyout costs were \$34.7 million and RIF costs were \$7.3 million.

Question. What additional RIF's or buyouts are assumed for fiscal year 1998? How will these be funded?

Answer. The fiscal year 1998 President's Budget proposal for the FSA Salaries and Expenses account includes proposed funding of \$56.2 million for separation costs in order to achieve staffing reductions of 2,119 staff years. This amount includes \$6.7 million to separate 269 Federal office employees and \$49.5 million to separate 1,850 non-Federal county office employees. Because these separations are planned for approximately October 1, 1997, salary and benefit savings of the separated employees of about \$64 million more than offset the separation costs.

Question. What impacts will the proposed reductions in FSA personnel have on FSA's ability to serve the crop insurance needs of producers adequately and efficiently where the agency has maintained FSA delivery?

Answer. The reductions in FSA personnel will require FSA to prioritize workload in order to service the needs of all producers, including crop insurance needs.

BOLL WEEVIL ERADICATION PROGRAM

Question. Boll Weevil Eradication loans were funded in the fiscal year 1997 Appropriations Act. The FSA has not yet released this money because the regulations have not been promulgated. I understand that the requirements for the environmental impact evaluation have been met, and that APHIS has supplied FSA with all information the agency requested. However, the regulations have not been published for comment. It is necessary that these funds be available by May 15 so that current planned programs can be continued and program expansion can be initiated. Please provide an estimate of the amount of the loan authority, which is approximately \$35 million, that you expect to utilize if the loan program is available.

Answer. All environmental requirements have been met and provided there are no serious challenges to the environmental assessment, it is anticipated that FSA will begin making Boll Weevil Eradication loans within the next 45 days. At this time, we do not know how much of the available loan authority will be utilized this fiscal year. A recent recalculation of the program's subsidy rate has increased the loan authority from approximately \$35 million to \$40 million.

Question. If this loan program is not established in fiscal year 1997, the money will not be available for the next fiscal year. Has the USDA considered proposing that this funding be made available until expended?

Answer. We have not asked for the funds to be made available until expended. However, the Department would not object to having the funds made no year funds to allow for unforeseen circumstances which could impede utilization of the money this fiscal year.

Question. The Committee Report accompanying the fiscal year 1997 appropriations bill explicitly directs "FSA local offices to require cotton producers to report acreage planted in cotton in post-eradication zones, active eradication zones, and any area in which a referendum is scheduled to be conducted in the next 3 years." Please provide an explanation of the status of this directive and the schedule for action.

Answer. A Decision Memorandum for the Secretary on accepting acreage reports for the Boll Weevil Eradication Program has been drafted jointly by FSA and APHIS and is currently in clearance.

Question. What is FSA's position on collecting data for this program?

Answer. The FSA position is included in the Decision Memorandum, but we do not wish to preempt the Secretary's prerogative regarding compliance with the congressional directive.

Question. Is FSA eliminating the commodity analysts subdivision under the guise of reorganization or is FSA consolidating this subdivision?

Answer. FSA has no intent of disbanding the Economic Policy and Analysis Staff or any of its subgroups. Retention of a core group of commodity and natural resource analysts working together recognizes the synergy that exists between these analysts, which is necessary for accurate and timely response to Administration, congressional, and private sector concerns. Although this Staff has downsized significantly, from 53 slots in January 1993 to 32 slots currently, this downsizing reflects adjustments due to workload changes.

Question. What is your opinion regarding the need for a cotton analyst in light of the Committee report language directive to collect all cotton acreage data for the boll weevil program?

PART 1

Answer. Regarding the collection of acreage data for purposes of administering the Boll Weevil Eradication Program (BWEP), the exact means by which the data should be collected, and by whom, are still under discussion. We want the BWEP to succeed, and I am sure that the necessary data will be collected in a manner which will meet the program's objectives efficiently.

CONSERVATION RESERVE PROGRAM

Question. The Conservation Reserve Program (CRP) sign-up closed on March 28, 1997. How many acres were offered during the sign-up for enrollment in the CRP?

Answer. The preliminary results of the March sign-up are that 301,649 offers were received to enroll 25,639,485.6 acres.

Question. How many of these acres are currently enrolled in the CRP?

Answer. The offers included 18,081,930 acres that are currently in CRP.

Question. What amount is new?

Answer. The offers included 7,557,555 new acres.

Question. When will you notify the farmers that their land has been accepted into the program?

Answer. We anticipate notifying producers whether their CRP offers are accepted by June 2, 1997.

Question. Has Secretary Glickman made a decision whether to enroll the full 19 million acres or stick with the recent announcement that only 17 million acres would be enrolled to save money to fulfill a Clinton campaign promise to buy a mine on the edge of Yellowstone? If not, then when should we expect this announcement?

Answer. A final decision on the purchase of the New World Mine has not yet been made. The Administration is still exploring various options for providing an offset for the costs of this acquisition, and an announcement will be made, hopefully in the near future, when this decision is reached.

INFORMATION TECHNOLOGY

Question. The 1996 FAIR Act limits the use of Commodity Credit Corporation (CCC) funds for operating expenses. It limited the amount for the six year period fiscal year 1997–2002 to \$275 million to be spent on information technologies and automated data processing. The fiscal year 1998 budget assumes expenditures for computer and telecommunications equipment will total \$109 million in fiscal year 1997 and \$104 million in fiscal year 1998. Is FSA currently subject to the Department's moratorium?

Answer. Yes, FSA has been operating under the information technology Investments Moratorium since Deputy Secretary Rominger issued the notification memo on November 12, 1996.

Question. What will these monies be used for exactly?

Answer. The estimates included in the budget were prepared prior to the Secretary's moratorium and do not represent spending with the moratorium in place. The fiscal year 1997 and fiscal year 1998 CCC monies in the budget reflect information technology requirements in support of all FSA program missions. The missions that USDA must execute under the Farm Bill and other recent legislation hold promise for increasing service and reducing cost to the taxpayer. It is equally true that revised responsibilities assigned to the FSA, newly established service centers, crop insurance reform initiatives such as the nationwide non-insured crop disaster assistance program and catastrophic insurance coverage in underserved States, the Conservation Reserve Program, administrative support for the Environmental Quality Incentives Program, and realigned farm loan activities require an ongoing information technology infrastructure to deliver services.

The following major budget categories show how the monies (dollars in thousands) are distributed in the fiscal year 1998 Budget. However, these estimates are subject to subsequent OMB apportionment and reevaluation.

[Dollars in thousands]

	Fiscal year—	
	1997	1998
Hardware and software	\$56,617	\$19,195
Operations and maintenance	21,806	26,418
Systems analysis, programming	15,858	46,211
Studies and training	10,521	4,371
Digital orthophotography	2,000	6,000

PART 1

503

[Dollars in thousands]

	Fiscal year—	
	1997	1998
Other	2,149	1,962
Total	108,951	104,157

FSA State and county offices mainly rely on mid-1980 information technology to deliver program benefits. Recent engineering upgrades to minicomputers supporting the FSA programs have stabilized an important piece of the support structure necessary to sustain operations required by the Farm Bill. However, workstations in excess of 12 years old, along with printers near the end of their useful life, increasingly risk disruptions of service to the customers and will need emergency attention. Approximately 10 percent of each year's budget is for maintenance of the current ADP delivery system in the field. Efforts are underway to replace this technology through the USDA Service Center (SC) Initiative, a collaborative project involving several USDA agencies—NRCS, RD and FSA. CCC fiscal year 1997 funding of \$28.0 million (25.7 percent of the fiscal year 1997 total) is identified towards purchase of a common computing platform for SC's. FSA/CCC's share of other SC initiatives total \$20.5 million (18.6 percent) in fiscal year 1997 and \$35.8 million (33.7 percent) in fiscal year 1998.

During the first quarter of fiscal year 1997, the placement of the technical infrastructure (integrated telephone and data communications) needed to support SC's was started. Target completion of this phase is December 1997. After partner agencies complete business process reengineering/improvement projects which will streamline and improve program delivery, the next phase will involve the establishment of a common computing environment for SC's supporting those business functions. This common computing environment will improve delivery of mission critical programs to FSA and other SC agencies producers, and advance USDA initiatives of reduced customer burden, better customer service, and easier and more timely information sharing. FSA is also providing funding support for the acquisition of digital orthophotography and maximization of data sharing opportunities within the current systems.

Other major efforts supported with this budget are the integration of FSA's divergent program and administrative information technology systems and support, continued operations and programming support for the Processed Commodities Inventory Management System (\$4.75 million each year), modification of the financial management systems of the CCC (approximately \$4 million each year), and continued use of contractor support for other agency systems that support program delivery and require modifications to accommodate the Year 2000 conversion project.

Question. How much did the FSA spend on information technologies and automated data processing in each of the last 5 fiscal years?

Answer. A table showing the actual amount of CCC funds used for equipment and other ADP-related costs for the last 5 years follows.

[The information follows:]

NON-INSURED ASSISTANCE PROGRAM

Question. Since the inception of the non-insured assistance program (NAP), problems have arisen regarding the geographic area used to determine a loss and trigger payment, the delivery of payments once a disaster is declared, and a general misunderstanding of the program. What is the status of NAP?

Answer. FSA has received 979 NAP area requests/recommendations for the 1995 and 1996 crop years. Of these, 705 have been approved, 105 have been disapproved, 73 were either withdrawn or canceled, and 96 NAP area recommendations remain on hand.

Question. Has the agency taken any action to address the problems mentioned above?

Answer. FSA issued multiple program directives to State and county offices in 1996 to provide updated instructions that addressed new program provisions as well as issues raised by field offices. Many of these directives provided clarifications to procedures for assembling NAP area recommendations and addressed crop and producer eligibility issues.

FSA also provided on-going training to State office specialists by rotating these personnel into headquarters on two-week temporary assignments. This initiative had a significant impact on improving the knowledge and expertise of FSA staff who were delivering the program at the field office level. FSA issued a new NAP handbook, 1-NAP, on March 28, 1997. In addition, FSA is conducting national NAP training April 8 through April 11, 1997. State offices will provide subsequent training to county office personnel immediately following the national training sessions.

Handbook 1-NAP and the national training were critically needed. Improvements in the quality of analyses and documentation provided in support of NAP area requests are already apparent. The instruction and training provided to FSA personnel will help expedite NAP area recommendations and delivery of the program.

Notwithstanding the progress made over the past 12 months, there is unfinished work. FSA plans to provide improved automated tools at all levels that will support information management initiatives, perform computations of eligibility, and process loss claims, applications for payment, and annually reported acreage and production data.

One difference between NAP and the former ad hoc disaster payment programs is "area eligibility." Prior to 1995, an individual producer of a crop suffering a loss due to eligible disaster conditions was basically eligible for payment consideration without regard to whether the crop, and possibly other disinterested producers, suffered an aggregate area loss in excess of some threshold. The NAP concept of extending disaster-type assistance only in cases where a widespread catastrophic loss

PART 1

505

occurred in a geographical area was somewhat new to many producers and FSA offices. We believe employees and producers are becoming more familiar with this concept.

QUESTIONS SUBMITTED BY SENATOR BURNS

FARM LOAN DELINQUENCIES

Question. It is my understanding that a moratorium is in effect on farm foreclosures. What I would like to know is the number of farm loans and dollar amounts that are delinquent for one year, five years, ten years, fifteen years, and over fifteen years?

Answer. We are unable to provide the information in the detail you requested. However, the following reflects delinquency status of direct loans as of March 31, 1997. Number of borrowers: One payment delinquent, 18,252; two payments delinquent, 2,946; and more than two payments delinquent, 4,756.

Question. As a supporter of the family farmer, I do have some concern over the number of delinquent loans. What kind of message does this send to farmers who are paying their loans or to other government borrowers who pay their loans?

Answer. The FSA is sending this message to its borrowers: we expect repayment of funds lent to you. We will work with borrowers who are experiencing a temporary inability to make regular repayments through circumstances that are not their fault.

Question. When will the moratorium be lifted and what plans does your agency have for loans that are multi-year delinquent?

Answer. FSA does not have a moratorium on foreclosures. The Secretary has suspended foreclosure sales until a review is completed to make sure that no program inconsistencies or discrimination is found. This demonstrates that the Agency is performing the task assigned to it by Congress in making every effort to eliminate any inequitable treatment in the delivery of its programs.

Under current statute, the Agency is required to notify all borrowers who are 60 days delinquent of their right to apply for Primary Loan Servicing to resolve those delinquencies within the Agency's authority to reschedule, defer, or write down the loans. If their operations cannot show a possibility of success even with these options, they are offered the opportunity to purchase their debt at the current market value of the security. Only after these options have been considered does the law allow the Agency to proceed to foreclosure. With the right to appeal at every step of the process, this procedure can take several years. When all other possibilities are exhausted, the Agency does pursue foreclosure in accordance with the laws of the State in which the borrower lives.

Question. When and how does your agency determine that a loan is so seriously delinquent that there is no possibility of repayment?

Answer. If a delinquent loan cannot be brought current through rescheduling, deferral or write down, or debt cancellation in exchange for a conservation contract, the Agency assumes that repayment is not possible, and the borrower is provided the opportunity to purchase it at the market value of the security. If this cannot be accomplished, other methods of debt settlement are discussed with the borrower and then foreclosure is pursued, if necessary.

USE OF AUCTIONS

Question. Your agency has been reluctant to use auctions when selling foreclosed farms; what is your reasoning for not using auctions more often?

Answer. Federal law requires the Agency to advertise its inventory farms suitable for agriculture to new and beginning farmers at their current market value, based on an FSA appraisal. If there is more than one such applicant, the winner is chosen by a random drawing; no bidding is allowed between these applicants. Auctions, sealed bids and other methods of sale can be and are pursued only if no new or beginning farmer expresses an interest in purchasing the farm.

Question. I have been told that before a farm property can be sold at auction, the use of an auction must be approved by headquarters in Washington. Other sales methods do not have to be approved by Washington, why is that requirement in place for auctions?

Answer. There is no such requirement. Auctions may be used at the option of the respective State Office, as long as no new and beginning farmers have applied or been found qualified to purchase the farm. If the cost of an auction firm exceeds the State's authority to contract for small purchases, the sale would require ap-

PART 1

506

proval from Washington for contracting reasons, but not for the use of an auction as such.

CRP AND CROWN BUTTE

Question. In questioning it was stated that there would be no impact on the farmer in the use of CRP funds to pay for Crown Butte. I would like to hear your reasoning on this and how you would explain that to a farmer that is expecting payment of CRP land this year, that might lose out due to this action?

Answer. The proposal has no impact on acreage currently under contract but would delay the enrollment of acreage for one year. Since all offers to participate in CRP are evaluated in comparison to the environmental benefits and costs of other offers, whether or not an offer is accepted is primarily dependent on the quality of the offer.

FSA FIELD OFFICE CLOSURES AND PERSONNEL CHANGES

Question. In the hearing you stated that it is not proper to have county committee personnel overseeing Federal personnel. Is this law, and what would be necessary to make the current operation legal?

Answer. The Federal Crop Insurance Reform and Department of Agriculture Reorganization Act of 1994 provides that Federal and non-Federal employees can be used interchangeably, but a non-Federal employee cannot supervise a Federal employee. Operating a dual employee delivery system at the county level has been difficult. Recently, the USDA Civil Rights Action Team (CRAT) recommended that the FSA county committee system be modernized by converting all county non-Federal positions to Federal status. The Secretary will be submitting a legislative package later this year to Congress supporting the conversion of all FSA non-Federal positions to Federal status.

Question. I can understand the need for closing offices in areas of high concentration, but does the agency propose closing offices in highly rural areas with long distances between offices, and what is the rationale for these closures?

Answer. Workload levels reflect the staffing resource needs at a given location and not necessarily whether a physical presence is needed. A large workload office is generally more efficient than a small workload office because of the numbers of employees available to perform specialized services and the general efficiencies associated with volume transactions. A criterion such as a minimum 25 mile limit between offices reflects an assumption associated with all producers having reasonable access to service. In the 1930's when most USDA offices were established, local transportation was limited. Today, with the significant improvements in transportation and the technological capabilities available, the distance a producer would travel to receive services can be increased without any significant hardship. Workload is certainly an important factor in determining staff levels for field offices and will be considered in FSA's analysis of ways it will operate within budget realities and how it will apply staff reductions. However, other factors must also be considered to assure that USDA provides customers the best service possible. Any decisions to close USDA field offices or reduce an agency presence within a USDA service center must be done in coordination with the other agencies involved, including Rural Development and the Natural Resources Conservation Service.

QUESTIONS SUBMITTED BY SENATOR BUMPERS

DISASTER ASSISTANCE

Question. Do the estimates in the supplemental request for the Emergency Conservation Program (ECP) reflect losses from tornadoes in Arkansas, flooding along the Ohio River, and other events that have occurred since March 1st?

Answer. On March 19, 1997, the President submitted a \$20 million supplemental request to Congress for the Emergency Conservation Program and a request for an additional \$17 million in contingency funding. The estimates partially reflect losses due to natural disasters since March 1st. The amount being requested will fund losses in the western States due to the January flooding but fund only part of the pending requests due to tornado damage in Arkansas and flood damage along the Ohio River. Estimates related to flooding in North Dakota, South Dakota, and Minnesota cannot be made until the flood waters have receded.

Question. Do the estimates include anticipated damage from the snow melt in the upper plains?

Answer. The \$17 million contingency was for "spring flooding," including flooding due to snow melt.

PART 1

507

Question. Do you believe the contingency amounts included in the request will be adequate, especially given the fact that these estimates were made far in advance of receding flood waters or more recent storm events?

Answer. We don't really know the magnitude of the need at this time, given the more recent storms occurring in various locations across the country.

EMERGENCY FARM LOANS

Question. I further note the supplemental request includes no funding for emergency farm credit. Do you think the carryover of emergency farm credit will be adequate given the magnitude of current and anticipated losses?

Answer. The supplemental request did not include additional funding for FSA's emergency loan program since, at the time it was prepared, FSA believed that it had adequate funds available to cover the flooding in the Northwest assuming no further widespread disasters occurred. The recent blizzards and flooding in the Midwest could not have been anticipated. Given the magnitude of these new disasters, the remaining emergency loan funds will not be sufficient to meet the demand for loans for the remainder of this fiscal year.

Question. Could you please provide State by State estimates of identified and projected needs for all emergency assistance under the jurisdiction of your agency relating to those events?

Answer. It is too early in the disaster recovery process for many areas to project the need for emergency assistance for the remainder of the year. We are still assessing the scope of potential loan demand.

DISASTER CONTINGENCY RESERVE

Question. Rather than requesting an amount for ECP in fiscal year 1998, you suggest the establishment of a contingency reserve for disaster assistance. Who would have the authority to use this reserve and how would it be triggered?

Answer. The President's budget proposes that the Congress appropriate \$5.8 billion as a contingency fund for use through specified disaster assistance programs including the Emergency Conservation Program. The proposed contingency fund would be administered by the Office of Management and Budget on behalf of the President, but only the President could make funds available. The release of any amount of the contingency fund could not occur until 15 days after the President has officially notified the Congress. This built-in constraint is designed to give Congress time to respond, but also ensures that the Government will be able to assist communities stricken by a natural or other disaster in a timely way.

Question. Which appropriations subcommittee would likely be responsible for funding?

Answer. Since the contingency funds would be appropriated to the President, we assume that the funding request would be considered by the House and Senate Appropriations Subcommittees on Treasury, Postal Service, and General Government.

SECTION 11 REIMBURSABLES

CRP

Question. You indicate you will notify producers by mid-June of CRP enrollments using NRCS technical assistance. Do you intend to reimburse NRCS for that service using section 11 authorities?

Answer. In fiscal year 1997, no Section 11 CCC funds will be used to pay CRP technical assistance for NRCS. Unobligated funds from the appropriated CRP account will be for used for NRCS and Forest Service CRP technical assistance until the funds are fully expended.

Question. Would you be able to enroll those areas if NRCS was not provided funds through this subcommittee for any technical assistance for those programs converted to direct spending from the CCC?

Answer. As noted above, the source of funding for NRCS technical assistance for the fiscal year 1997 CRP program is unobligated CRP appropriated funds. NRCS would be unable to provide the necessary technical support needed to implement the CRP without any technical assistance funds.

Question. Is the fact that the fiscal year 1997 and 1998 estimates for section 11 transfers are below the 1995 amounts an indication that the conservation technical assistance is not needed to implement CRP and WRP and similarly situated programs as much as in previous years? If so, how can that be true in light of the new "environmental benefits" test for CRP which, I would imagine, will require an extensive analysis by NRCS?

PART 1

508

Answer. The budget projects annual spending under the cap on Section 11 reimbursable agreements will total \$41.2 million in fiscal year 1997 and \$35.6 million in fiscal year 1998. CCC obligations for Section 11 activities in fiscal year 1995 were \$45.6 million. The fiscal year 1997 level is below fiscal year 1995 because CRP and Wildlife Habitat Incentives Program technical assistance costs in fiscal year 1997 are being funded from unobligated funds in the CRP appropriated account and not Section 11 transfers. Fiscal year 1997 CCC transfers would have been at the 1995 level without this ability to use CRP unobligated funds for technical assistance costs in fiscal year 1997. The fiscal year 1998 level of \$35.6 million is \$10 million below the fiscal year 1995 level because of the proposed shift in FAS' Emerging Markets Technical Assistance program from the CCC Section 11 reimbursable agreement to an FAS appropriation. In subsequent years, the full \$45.6 million will be available for expenses, with the Emerging Markets funded elsewhere.

Question. You estimate that you have used \$83 million in carryover funds from CRP to fund the technical assistance portion of that program and that you estimate you will use \$24 million in carryover funds in fiscal year 1998. How much is left in the CRP carryover account?

Answer. At the end of fiscal year 1996, there was approximately \$111 million in unobligated funds in the CRP appropriated account. The budget also projects that \$4 million in refunds of prior year payments will be credited to the CRP account in both fiscal years 1997 and 1998. Only a small amount of funds will be left in the CRP account after 1998 since \$12.5 million will also be used for the Wildlife Habitat Incentives Program as authorized by Section 387(c) of the Federal Agriculture Improvement and Reform Act of 1996.

Question. What do you intend to use for this purpose when the carryover funds are depleted?

Answer. It is estimated that a very small amount of carryover funds from the CRP account (resulting from refunds of prior year payments) will be used in fiscal years 1999 through 2002 to pay CRP technical assistance costs. Section 11 funds will be used to pay technical assistance as long as the total level of CCC Section 11 transfers does not exceed \$45.6 million. In some years it may be possible for technical assistance needs to exceed available funding.

FLOOD RISK REDUCTION PROGRAM

Question. What has been your experience with the Flood Risk Reduction Program in fiscal year 1997?

Answer. Regulations are currently being drafted to seek comments on program implementation. It is anticipated that the program will be offered beginning October 1, 1997.

Question. Why are you not providing an estimate for fiscal year 1998?

Answer. The funding source is the CCC AMTA funding. Participants earn 95 percent of their AMTA payments in one up-front payment. The President's Budget assumed that the one up-front payment would be made in fiscal year 1997 with no payments in subsequent years. However, based on current estimates, the one up-front payment will be made in fiscal year 1998 instead of fiscal year 1997. FSA economists estimate 4.7 million acres classified as frequently flooded to be eligible for the Flood Risk Reduction Program. Flood risk reduction payments in fiscal year 1998 would be about \$266 million, offset by reductions in production flexibility contract payments of about \$284 million during fiscal years 1998-2002.

Question. Why was this program not assigned to NRCS along with other conservation programs?

Answer. The Flood Risk Reduction Program (FRRP) is not a conservation program. The Secretary assigned FSA the responsibility of administering the FRRP because FRRP contracts are offered as an alternative only to those producers with production flexibility contracts (PFC) administered by FSA under the Agricultural Market Transition Act. FRRP payments are directly correlated to the PFC payments issued by the Commodity Credit Corporation that the producer would otherwise receive. Also, the majority of program benefits that FRRP participants are required to forgo are administered by FSA. FRRP participants must meet the highly erodible land and wetland conservation provisions. However, there are no other conserving use or other conservation requirements for producers who enroll in FRRP.

BOLL WEEVIL ERADICATION

Question. What is the status of implementing the Boll Weevil Loan Program for fiscal year 1997?

PART 1

509

Answer. It is currently projected that FSA will begin accepting applications for the Boll Weevil Eradication Loan program in the next 45 days provided that no unforeseen circumstances delay its implementation.

Question. Why did FSA not include this program in the budget request for fiscal year 1998?

Answer. With regard to fiscal year 1998 funding, it is the Department's understanding that the Boll Weevil Eradication Loan program was not intended to replace the cost-share grants provided by APHIS to the foundations that operate the boll weevil program at the State level. Rather, the program was intended to allow the foundations to finance their share of the program costs, at a minimal Federal subsidy cost. In the past, the Department has worked with some of the foundations in response to inquiries about using the business and industry guaranteed loan program to assist in obtaining credit from private lenders. It remains the Department's position that the credit needs of the boll weevil eradication program can be adequately addressed through existing programs, such as the business and industry guaranteed loan program, and that there is no reason to maintain a separate program for this purpose.

FARM CREDIT

Question. Since enactment of Beginning Farmer legislation earlier this decade, what has been the rate of graduation?

Answer. Regulations for implementing the graduation provisions of the Beginning Farmer legislation went into effect last year. Between October 1, 1996, and March 31, 1997, a total of 2,517 borrowers has graduated to commercial credit. This figure represents some duplication for individual borrowers with more than one type of loan, such as an operating loan and a farm ownership loan.

LOAN SUBSIDY RATES

Question. You mentioned you expect a reduced cost of farm credit programs due to efforts to reduce loan delinquencies. Do you know if CBO is willing to translate those efforts into lower subsidy rates?

Answer. The Agency is unaware of any CBO requirements related to subsidy rates. The subsidy rates are calculated following OMB's requirements as stated in OMB Circular A-11, Preparation and Submission of Budget Estimates, dated June 1996. The calculation of loan subsidy costs is based on two factors: (1) explicit technical terms and conditions, and (2) the Treasury discount interest rate. Loan delinquencies are only one of many explicit technical terms and conditions used to calculate the subsidy rate. The Treasury discount rate is provided directly by OMB, and all explicit technical terms and conditions, including reduced loan delinquencies, are approved by OMB before use in the President's Budget.

Question. Also, recent shifts in interest rates indicate that the program level per dollar of BA may be falling. In order to prevent program levels from falling below your budget estimates, will you provide this subcommittee current reestimates of loan subsidy costs to better coordinate the effective program level in these accounts for the coming fiscal year?

Answer. Although the Agency could, with OMB approval, provide current reestimates for fiscal year 1998 loan subsidy costs, any revision to the Treasury interest rate component would again be an estimate. The actual program level for fiscal year 1998 will not be known until the Treasury interest rates in effect on October 1 are published through the Commerce Economic Bulletin Board.

Explicit technical terms and conditions used in the President's Budget to calculate loan subsidy costs cannot be changed except by permission of OMB and only to reflect enacted legislation and any regulatory action which affects the making or guaranteeing of loans. Currently, the only change allowed between the subsidy cost estimated for the President's Budget and the actual subsidy cost calculated on October 1 is the difference between the Treasury discount rate estimated by OMB for budget formulation and the Treasury rate in effect on October 1, 1997.

STATE MEDIATION PROGRAM

Question. Can you document the Federal savings achieved by the State Mediation Program, on an annual basis, since the program was first established?

Answer. Federal savings achieved by the State Mediation Program remains a difficult area to assess. Depending on what assumptions are used, the amount can vary greatly. Savings to the Federal Government is apparent when mediation results in a restructured loan which offers a greater return than a net recovery buy out. Mediation also saves staff time and effort by quickly resolving the dispute outside of the appeals or court system. However, these savings are difficult to quantify

PART 1

510

because the costs can vary substantially depending on the nature and complexity of the issues involved.

The Marketing and Economics Division at the Alabama Department of Agriculture and Industries reported in its September 30, 1995, annual report that their benefit-to-cost ratio for agricultural mediation is estimated to be \$8.00 in benefits for every \$1.00 of mediation costs. Researchers at Texas Tech University studying the Texas Agricultural Loan Mediation program reported that creditors in Texas received an estimated \$4.14 in benefits for every \$1.00 in providing mediation services. The Oregon Department of Agriculture reported in its September 1995 annual report that the benefit-to-cost ratio was estimated at \$2.56 to \$1.00 for mediation program expenditures.

Annual funding has been \$2 to \$3 million for the State Mediation Program. A high estimate of net annual Federal savings, using the Alabama benefit-to-cost ratio of 8 to 1 and an annual funding level of \$3 million, is \$21 million. A low estimate of net annual Federal savings, using the Oregon benefit-to-cost ratio of 2.56 to 1 and an annual funding level of \$2 million, is \$3.12 million. Legal fees and costs for administering or selling a property through foreclosure or bankruptcy and the added costs of maintaining a non-performing asset on the books are often avoided by mediation but are difficult to estimate and are not included in these estimates.

Question. Are you aware of the OIG report released to this subcommittee on March 4, 1997?

Answer. Yes, we are.

Question. I understand that one of the findings of the OIG was that State agencies administering this program would not release mediation documents when, in fact, State statutes clearly provide for the confidentiality of such records and provide for a means, through the courts, for parties such as OIG to obtain them. To your knowledge, did OIG make attempts to secure records pursuant to the means provided by law?

Answer. OIG conducted audits of State mediation programs in Michigan, Minnesota, North Dakota, and Texas. Program officials in these States denied OIG access to certain mediation records considered confidential under their State laws. State laws governing mediation confidentiality vary, but most State programs are subject to such laws. OIG has not pursued such records by issuing subpoenas under its subpoena authority. State mediation officials have advised FSA that they will comply with any court order to release mediation records to OIG, as this will satisfy their State confidentiality statutes.

Question. Why is confidentiality important to the integrity of the mediation process?

Answer. Confidentiality in the mediation process is very important. The basic concept of mediation is to allow parties a free and open forum in which to air differences without the fear of retaliation. Confidentiality is the cornerstone of successful mediation in each State and without this assurance, participants cannot feel comfortable in expressing their feelings and discussing personal information.

Question. Has your agency had any difficulty obtaining necessary information from the State administering agencies?

Answer. Each State is able to generate a list of producers with whom FSA has entered into mediation. The case files of each of these producers are available for USDA review in the FSA county office. FSA believes that these records will allow USDA to evaluate program actions resulting from the mediation process.

The structures and formats of State programs differ greatly and were designed to reflect individual State needs. FSA has worked and continues to work with State mediation officials to improve the information reporting on mediation services. Certain data that is measurable and common to all State programs will be gathered and reported to USDA to enable better tracking of overall program effectiveness, efficiency, and accountability. Reporting requirements will need consideration, so as not to overburden State programs with excessive paperwork which might divert scarce funds and staff from the field work of providing the actual mediation services.

CCC REIMBURSEMENT FOR NET LOSSES

ACTUAL STATUS OF CCC LOSSES

Question. Since the reimbursement for net losses in fiscal year 1999 is estimated at \$9 billion (compared to \$784 million for fiscal year 1998) due to changing the reimbursement period from a one-year to a two-year timeframe, what does this really tell us about the current state of net losses?

Answer. In recent years, the appropriations to CCC have been gradually reducing the large balances of unreimbursed losses from previous years. Cumulative unreim-

PART 1

511
